**OAKWOOD VALLEY ALTERNATIVE B CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance        | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C proposes a ROLA on the Oakwood Valley Fire Road to the junction with Oakwood Valley Trail. Double gates would be located at both ends, with continuous fencing to protect sensitive habitat. Oakwood Valley Trail would allow on-leash dog walking from the junction with Oakwood Valley Fire Road to a new gate at the

junction with Alta Trail. Dogs under voice and sight control in the ROLA on the Oakwood Valley Fire Road would have access to the land between the edge of the trail and the fence (LOD area). The vegetation in this area would be affected by physical disturbance from dog activities. Dogs in the ROLA would be confined to a smaller area, potentially increasing the impacts on the adjacent natural habitat and vegetation. There is also a potential for an increase in nutrient loading from dog waste due to having more dogs confined to a smaller area directly adjacent to natural habitat. Dogs would affect vegetation in the LOD area of the on-leash portion of Oakwood Valley Trail as well. Impacts would result from physical disturbance, such as trampling, digging, and dog waste. Impacts on vegetation in the LOD area and in the ROLA would be long term, minor, and adverse because effects would be measurable and perceptible, but would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area and ROLA would occur in a relatively small area compared to the site as a whole. Physically restraining dogs on leash would protect vegetation off trail. Therefore, assuming compliance, the overall impacts on coastal scrub/chaparral/grassland vegetation from dog walking at Oakwood Valley would be negligible because impacts would result in no measurable or perceptible changes in the plant communities.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Oakwood Valley is not one of the park sites where permits would be issued allowing dog walkers to have more than three dogs. Since commercial dog walking is not common at Oakwood Valley, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** The negligible impacts on the coastal scrub/chaparral/grassland communities from dogs at Oakwood Valley under alternative C were considered together with the effects of the projects mentioned above under alternative A. Cumulatively, alternative C would have negligible impacts on the coastal scrub/chaparral/grassland communities at this park site when added to the effects from these projects.

**OAKWOOD VALLEY ALTERNATIVE C CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance        | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Under alternative D, on-leash dog walking would be allowed on the Oakwood Valley Fire Road and Oakwood Valley Trail to the junction of the fire road and trail. Impacts in areas adjacent to the fire road would be long term, minor, and adverse since these areas support existing vegetation that would be affected by trampling and dog waste. The impacts from dogs would be measurable and perceptible, but would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area would occur in a relatively small area compared to the site as a whole. Physically restraining dogs on leash would protect vegetation off trail. Therefore, assuming compliance, the overall impacts on vegetation from on-leash dog walking at Oakwood Valley would be negligible because impacts would result in no measurable or perceptible changes in the coastal scrub/chaparral/grassland plant communities.

## Chapter 4: Environmental Consequences

No commercial dog walking would be allowed and no permits to walk more than three dogs would be issued under alternative D; therefore, commercial and permitted dog walking would have no impact on vegetation.

**Cumulative Impacts.** The negligible impacts on the coastal scrub/chaparral/grassland communities from dogs at Oakwood Valley under alternative D were considered together with the effects of the projects mentioned above under alternative A. Cumulatively, alternative D would have negligible impacts on the coastal scrub/chaparral/grassland communities at this park site when added to the effects from these projects.

**OAKWOOD VALLEY ALTERNATIVE D CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Impacts | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect vegetation off trail; the fire road and the LOD area are a small portion of the site | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E proposes a ROLA on the Oakwood Valley Fire Road to the junction with Oakwood Valley Trail. Double gates would be located at both ends, with noncontinuous fencing where needed to protect sensitive habitat. Oakwood Valley Trail would allow on-leash dog walking from the junction with Oakwood Valley Fire Road to the junction with Alta Trail. Impacts would be the same as those under alternative C, assuming compliance: long term, minor, and adverse in the LOD area and ROLA and negligible overall.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Oakwood Valley is not one of the park sites where permits would be issued allowing dog walkers to have more than three dogs. Since commercial dog walking activity is not common at Oakwood Valley, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** Under alternative E, the cumulative impacts on the coastal scrub/chaparral/grassland communities at this park site would be the same as those under alternative C: negligible cumulative impacts.

**OAKWOOD VALLEY ALTERNATIVE E CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Impacts | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect vegetation off trail; trails and LOD areas and ROLAs are a small portion of the site | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative would allow on-leash dog walking on the Oakwood Valley Fire Road and on the Oakwood Valley Trail from the junction with the fire road to the junction with the Alta Trail. Dogs would affect vegetation in the LOD area of the on-leash portion of Oakwood Valley Fire Road and Trail. Impacts in areas adjacent to the trail would be long term, minor,

and adverse since these areas support existing vegetation that would be affected by trampling and dog waste. Impacts on vegetation would be measurable and perceptible, but would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area would occur in a relatively small area compared to the site as a whole. Physically restraining dogs on leash would protect vegetation off trail. Therefore, assuming compliance, the overall impact on coastal scrub/chaparral/grassland vegetation from on-leash dog walking at Oakwood Valley would be negligible because impacts would result in no measurable or perceptible changes in the plant communities.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Oakwood Valley is not one of the park sites where permits would be issued allowing dog walkers to have more than three dogs. Since commercial dog walking is not common at Oakwood Valley, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have negligible impacts on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** Projects and actions in and near Oakwood Valley were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs initiative projects provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils. Ongoing parkwide restoration and enhancement efforts, such as GGNRA natural resource stewardship programs and the *Marin Countywide Plan* (County of Marin 2007), can also beneficially affect vegetation at GGNRA park sites such as Oakwood Valley. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance. Habitat restoration and the implementation of projects funded by the Wildland/Urban Interface Initiative on private lands could also impact Oakwood Valley.

Additional actions have had, are currently having, or have the potential to have adverse impacts on vegetation at or in the vicinity of Oakwood Valley, such as development or construction actions. Coastal scrub habitat in California is threatened by habitat loss, fragmentation, and degradation (USDA 2005, 613). Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts.

The negligible impacts on the coastal scrub/chaparral/grassland communities from dogs at Oakwood Valley under the preferred alternative were considered together with the effects of the projects mentioned above. Cumulatively, the preferred alternative would have negligible impacts on the coastal scrub/chaparral/grassland communities at this park site when added to the effects from these projects.

**OAKWOOD VALLEY PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance        | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance                     | Negligible cumulative impacts |

### Marin Headlands Trails

**Alternative A: No Action.** Under current conditions, on-leash dog walking is allowed along the Coastal Trail from Hill 88 to Muir Beach, the Batteries Loop Trail, North Miwok Trail from Tennessee Valley to Highway 1, County View Trail, and Marin Drive. Dog walking under voice control (or on leash) is allowed along other portions of the Coastal Trail (Golden Gate Bridge to Hill 88, including portions of the Lagoon Loop Trail); the Coastal, Wolf Ridge, and Miwok Trail Loop; and the Old Bunker Fire Road Loop (includes a section of the Coastal Trail). These trails experience low to moderate use by dog walkers. Dog-related incidents are high at this site, with a total of 269 from 2008 through 2011, with the majority of incidents for having dogs within areas closed to pets (table 16). The Marin Headlands Trails area contains diverse habitat, including coastal scrub, serpentine coastal scrub, chaparral, grassland, and mission blue butterfly habitat and host plants; there are large tracts of coastal scrub habitat in the Marin Headlands Trails that extend north into Muir Beach. Physical disturbance and nutrient addition are currently happening along the trails and fire roads and in off-trail areas throughout the site due to unleashed dogs. In general, in larger tracts such as the Marin Headlands Trails, more dog walkers and their dogs will be concentrated at the trailheads, and the ability of dog walkers to disperse provides a dilution that will actually spread impacts to a greater area or throughout the site. At trailheads and other congregating areas, in addition to physical damage, scent marking and dog waste by dogs can cause alteration of habitat conditions as well as furthering the spread of invasive plant species. Due to their nature, dogs are not expected to stay on the fire roads/trails.

Since dogs would be allowed under voice control in portions of the site under alternative A, there is a higher likelihood that dogs would go off trail than if they were on leash, thus affecting vegetation in adjacent undisturbed areas. Therefore, impacts on coastal scrub/chaparral/grassland vegetation as a result of this alternative would continue to be long term, minor, and adverse because effects would be measurable and perceptible, but would be localized in a relatively small area.

Under alternative A, no permit system exists for dog walking. At the Marin Headlands Trails, commercial dog walking is uncommon; therefore, commercial dog walking would have negligible impacts on vegetation.

**Cumulative Impacts.** Projects and actions in and near the Marin Headlands Trails were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils. Ongoing parkwide restoration and enhancement efforts, such as GGNRA natural resource stewardship programs and the *Marin Countywide Plan* (County of Marin 2007), can also beneficially affect vegetation at GGNRA park sites such as the Marin Headlands Trails. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance. Habitat restoration and the implementation of projects funded by the Wildland/Urban Interface Initiative on private lands could also impact the Marin Headlands Trails.

Additional actions have had, are currently having, or have the potential to have adverse impacts on vegetation at or in the vicinity of Marin Headlands Trails, such as development or construction actions. Coastal scrub habitat in California is threatened by habitat loss, fragmentation, and degradation (USDA 2005, 613). Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts.

The long-term minor adverse impacts on the coastal scrub community from dogs at the Marin Headlands Trails under alternative A were considered together with the effects of the actions mentioned above. The benefits to vegetation from the park stewardship programs and other restoration projects in the area of this

site would not be expected to reduce the adverse impacts of this alternative; therefore, the cumulative analysis for this park site will focus on the results of the impact analysis for this alternative. The beneficial effects from the park stewardship programs and other restoration projects combined with the long-term minor adverse impacts from alternative A would result in long-term minor adverse cumulative impacts on the coastal scrub community.

**MARIN HEADLANDS TRAILS ALTERNATIVE A CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Impacts</b> | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>                  |
|--|--|---|--|
| Long-term minor adverse impacts                        | Impacts on vegetation from dogs would be caused through physical damage such as trampling, digging, and dog waste; these effects, as well as fragmentation, could lead to the spread of invasive plant species | N/A   | Long-term minor adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would prohibit dogs on the trails at the Marin Headlands Trails. Not allowing dog walking on the Marin Headlands Trails would eliminate physical disturbance by dogs and nutrient addition from dog waste. Therefore, assuming compliance, alternative B would result in no impact on coastal scrub/chaparral/grassland vegetation at the site.

Since dogs would not be allowed at the Marin Headlands Trails, there would be no impact from commercial dog walkers on the coastal scrub/chaparral/grassland vegetation communities.

**Cumulative Impacts.** The lack of impacts on the coastal scrub/chaparral/grassland communities from dogs at the Marin Headlands Trails under alternative B was considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the park stewardship programs and other restoration projects combined with the lack of impacts on the coastal scrub/chaparral/grassland communities from alternative B would result in beneficial cumulative impacts.

**MARIN HEADLANDS TRAILS ALTERNATIVE B CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Impacts</b> | <b>Rationale</b>                     | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|--------------------------------------|---|-------------------------------|
| No impact  | Dogs would be prohibited at the site | Beneficial, assuming compliance                     | Beneficial cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would allow on-leash dog walking along the Lower Rodeo Valley Trail Corridor. This corridor extends from the Rodeo Beach parking lot to the intersection of Bunker and McCullough Roads via North Lagoon Loop Trail, a section of the Miwok Trail, and the Rodeo Valley Trail, and includes the connector trail from the Rodeo Valley Trail to the Smith Road Trailhead. On-leash dog walking would also be allowed on the Old Bunker Fire Road Loop (including a section of the Coastal Trail), and the Batteries Loop Trail. This alternative would allow dog access only on these perimeter trails in the Marin Headlands Trails, while preserving and maintaining the integrity of interior habitat. Impacts in areas adjacent to the trails/fire roads would be long term, minor, and adverse since this vegetation would be affected by trampling and dog waste. Impacts would be measurable and perceptible, but would be localized in a relatively small area.

## Chapter 4: Environmental Consequences

The long-term minor adverse impacts from dogs in the LOD area would occur in a relatively small area compared to the site as a whole. Physically restraining dogs would protect vegetation off trail. Therefore, assuming compliance, the overall impacts on coastal scrub/chaparral/grassland vegetation from on-leash dog walking would be negligible because impacts would result in no measurable or perceptible changes in these plant communities.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Marin Headlands Trails is not one of the park sites where permits would be issued allowing dog walkers to have more than three dogs. Since commercial dog walking is not common on Marin Headlands Trails, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** The negligible impacts on the coastal scrub/chaparral/grassland communities from dogs at the Marin Headlands Trails under alternative C were considered together with the effects of the projects mentioned above under alternative A. Cumulatively, alternative C would have negligible impacts on the coastal scrub/chaparral/grassland communities at this park site when added to the effects from these projects.

**MARIN HEADLANDS TRAILS ALTERNATIVE C CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Alternative D would have the same dog walking restrictions as alternative B (dogs would be prohibited on the trails); therefore, no impact on coastal scrub/chaparral/grassland vegetation would occur as a result of alternative D, assuming compliance.

Since dogs would not be allowed at the Marin Headlands Trails, there would be no impact from commercial dog walkers on the coastal scrub/chaparral/grassland vegetation communities.

**Cumulative Impacts.** Under alternative D, the cumulative impacts on the coastal scrub/chaparral/grassland communities at this park site would be the same as those under alternative B: beneficial cumulative impacts.

**MARIN HEADLANDS TRAILS ALTERNATIVE D CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Impacts | Rationale                            | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--------------------------------------|--|-------------------------------|
| No impact                                       | Dogs would be prohibited at the site | Beneficial, assuming compliance              | Beneficial cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would allow on-leash dog walking on the Conzelman Coastal Trail from Highway 101 to the McCullough intersection and then to the Coastal Trail Bike Route, including Julian Road, to Rodeo Beach parking lot. On-leash dog walking would also be available on the Old Bunker Fire Road Loop (which includes a section of the

Coastal Trail), the Batteries Loop Trail, North Miwok Trail from Tennessee Valley to Highway 1, County View Trail, Marin Drive, Rodeo Avenue Trail, and Morning Sun Trail. This alternative would allow dog access only on these perimeter trails in the Marin Headlands, while preserving and maintaining the integrity of interior habitat. The impacts in areas adjacent to the trails/fire roads (LOD area) would be long term, minor, and adverse since vegetation in these areas would be affected by trampling and dog waste. Nutrient addition from dog waste may also occur as a result of runoff, which could also affect the coastal scrub/chaparral/grassland plant communities. Even though alternative E would allow more dog access at the site, the difference in dog use between alternatives E and C is not considered large enough to cause a change in the intensity of the impact relative to the area of the site. Impacts on vegetation would be measurable and perceptible, but would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area would occur in a relatively small area compared to the site as a whole. Although more trails would be available to dogs in alternative E compared to alternative C, the overall impacts on coastal scrub/chaparral/grassland vegetation from on-leash dog walking would be the same. Physically restraining dogs on leash would protect vegetation off trail. Therefore, assuming compliance, the overall impacts on coastal scrub/chaparral/grassland vegetation would be negligible because impacts would result in no measurable or perceptible changes in these plant communities.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Marin Headlands Trails is not one of the park sites where permits would be issued allowing dog walkers to have more than three dogs. Since commercial dog walking activity is not common at the Marin Headlands Trails, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** The negligible impacts on the coastal scrub/chaparral/grassland communities from dogs at the Marin Headlands Trails under alternative E were considered together with the effects of the projects mentioned above under alternative A. Cumulatively, alternative E would have negligible impacts on the coastal scrub/chaparral/grassland communities at this park site when added to the effects from these projects.

**MARIN HEADLANDS TRAILS ALTERNATIVE E CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance        | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative would allow on-leash dog walking along the Lower Rodeo Valley Trail Corridor, extending from the Rodeo Beach parking lot to the intersection of Bunker and McCullough Roads via the North Lagoon Loop Trail, a section of the Miwok Trail, and the Rodeo Valley Trail. The corridor includes the connector trail from Rodeo Valley Trail to the Smith Road trailhead. On-leash dog walking would also be available on the Old Bunker Fire Road Loop (including a section of the Coastal Trail), the Batteries Loop Trail, Rodeo Avenue Trail, and Morning Sun Trail. This alternative would allow dog access only on these perimeter trails in the Marin Headlands, while preserving and maintaining the integrity of interior habitat. Impacts in areas adjacent to the trails/fire roads would be long term, minor, and adverse since this vegetation would be affected by trampling and

## Chapter 4: Environmental Consequences

dog waste. Impacts would be measurable and perceptible, but would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area would occur in a relatively small area compared to the site as a whole. Physically restraining dogs on leash would protect vegetation off trail. Therefore, assuming compliance, the overall impact on coastal scrub/chaparral/grassland vegetation from on-leash dog walking would be negligible because impacts would result in no measurable or perceptible changes in these plant communities.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Marin Headlands Trails is not one of the park sites where permits would be issued allowing dog walkers to have more than three dogs. Since commercial dog walking activity is not common at the Marin Headlands Trails, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have negligible impacts on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** Projects and actions in and near the Marin Headlands Trails were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs initiative projects provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils. Ongoing parkwide restoration and enhancement efforts, such as GGNRA natural resource stewardship programs and the *Marin Countywide Plan* (County of Marin 2007), can also beneficially affect vegetation at GGNRA park sites such as the Marin Headlands Trails. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance. Habitat restoration and the implementation of projects funded by the Wildland/Urban Interface Initiative on private lands could also impact the Marin Headlands Trails.

Additional actions have had, are currently having, or have the potential to have adverse impacts on vegetation at or in the vicinity of Marin Headlands Trails, such as development or construction actions. Coastal scrub habitat in California is threatened by habitat loss, fragmentation, and degradation (USDA 2005, 613). Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts.

The negligible impacts on the coastal scrub/chaparral/grassland communities from dogs at the Marin Headlands Trails under the preferred alternative were considered together with the effects of the projects mentioned above. Cumulatively, the preferred alternative would have negligible impacts on the coastal scrub/chaparral/grassland communities at this park site when added to the effects from these projects.

**MARIN HEADLANDS TRAILS PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance        | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance                     | Negligible cumulative impacts |

## Fort Baker

**Alternative A: No Action.** Under current conditions, on-leash dog walking is allowed throughout Fort Baker except on the Chapel Trail or the pier, where dogs are not allowed. This site experiences moderate visitor use and low dog walking use. Documented leash law violations at this site totaled 52 from 2008 through 2011 (table 17). Drown Fire Road, lined by post and cable fencing, traverses natural habitat where extensive mission blue butterfly habitat restoration has occurred. Battery Yates Trail also has mission blue butterfly habitat that is partially fenced (post and cable), but this fencing, similar to that along Drown Fire Road, does not physically exclude dogs. Dogs have been observed off leash at the Parade Ground, Drown Fire Road, Battery Yates Trail, and behind the Bay Area Discovery Museum. Dogs on leash have access to areas adjacent to the trails/fire roads, where viable plant communities exist. Impacts on this vegetation would include physical disturbance through trampling and digging, as well as nutrient addition, which would prevent the growth of new vegetation. Since compliance is an issue at this site, it is likely that many dogs are off leash and go beyond the trails and fire roads. Runoff of nutrients from trails into the adjacent habitat may result in some changes in soil nutrient levels, which could also affect plant communities.

Under alternative A, long-term minor adverse impacts on coastal scrub, chaparral, and grassland vegetation would continue to occur at Fort Baker.

No permit system exists for dog walking under alternative A. At Fort Baker, commercial dog walking is uncommon; therefore, commercial dog walking would have negligible impacts on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** Projects and actions in and near Fort Baker were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils. Ongoing parkwide restoration and enhancement efforts, such as GGNRA natural resource stewardship programs and the *Marin Countywide Plan* (County of Marin 2007), can also beneficially affect vegetation at GGNRA park sites such as Fort Baker. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance. Habitat restoration and the implementation of projects funded by the Wildland/Urban Interface Initiative on private lands could also impact Fort Baker.

Additional actions have had, are currently having, or have the potential to have adverse impacts on vegetation at or in the vicinity of Fort Baker, such as development or construction actions. Coastal scrub habitat in California is threatened by habitat loss, fragmentation, and degradation (USDA 2005, 613). Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts.

The long-term minor adverse impacts on the coastal scrub/chaparral/grassland communities from dogs at Fort Baker under alternative A were considered together with the effects of the actions mentioned above. The benefits to vegetation from the park stewardship programs and other restoration projects in the area of this site would not be expected to reduce the adverse impacts of this alternative; therefore, the cumulative analysis for this park site will focus on the results of the impact analysis for this alternative. The beneficial effects from the park stewardship programs and other restoration projects combined with the long-term minor adverse impacts from alternative A would result in long-term minor adverse cumulative impacts on the coastal scrub, chaparral, and grassland communities.

FORT BAKER ALTERNATIVE A CONCLUSION TABLE

| Coastal Scrub, Chaparral, and Grassland Impacts | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts                           |
|---|--|--|--|
| Long-term minor adverse impacts                 | Impacts on vegetation from dogs would be caused through physical damage such as trampling, digging, and dog waste; these effects, as well as fragmentation, could lead to the spread of invasive plant species | N/A  | Long-term, minor, adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking on Drown Fire Road (which traverses natural habitat where extensive mission blue butterfly habitat restoration has occurred), the Bay Trail (not including Battery Yates Trail), Vista Point Trail (to be built), the Lodge/Conference Center Grounds, and the Parade Ground. The impacts in the LOD area under alternative B would be the same as alternative A: long term, minor, and adverse. The impacts would result from physical disturbance from trampling as well as nutrient addition, which would prevent the growth of new vegetation. The effects would be measurable and perceptible, but would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area would occur in a relatively small area compared to the site as a whole. Physically restraining dogs on leash would protect vegetation off trail. Therefore, assuming compliance, the overall impacts on coastal scrub, chaparral, and grassland vegetation from on-leash dog walking at Fort Baker would be negligible because impacts would result in no measurable or perceptible changes in these plant communities.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is not common in this area, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have negligible impacts on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** The negligible impacts on the coastal scrub/chaparral/grassland communities from dog activities at Fort Baker under alternative B were considered together with the effects of the projects mentioned above under alternative A. Cumulatively, alternative B would have negligible impacts on the coastal scrub, chaparral, and grassland communities at this site when added to the effects from these projects.

FORT BAKER ALTERNATIVE B CONCLUSION TABLE

| Coastal Scrub, Chaparral, and Grassland Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would have the same dog walking restrictions as alternative B, except for the addition of on-leash dog walking on the Battery

Yates Trail (supports protection of sensitive mission blue butterfly habitat). Long-term minor adverse impacts on the coastal scrub/chaparral/grassland vegetation in areas adjacent to the trail (6-foot corridor or LOD area) would occur as a result of this alternative because mission blue butterfly habitat is present along on-leash dog walking areas and would result in perceptible changes in the habitat.

The long-term minor adverse impacts from dogs in the LOD area would occur in a relatively small area compared to the site as a whole. Physically restraining dogs on leash would protect vegetation off trail outside the LOD. Assuming compliance, the overall impacts on coastal scrub, chaparral, and grassland vegetation from on-leash dog walking at Fort Baker would be negligible because impacts would result in no measurable or perceptible changes in these plant communities.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash at Fort Baker (excluding Drown Fire Road), with a limit of six dogs; permits could restrict use by time and area. Impacts on coastal scrub/chaparral/grassland vegetation from permit holders with four to six dogs would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is not common at Fort Baker, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** Under alternative C, the cumulative impacts on the coastal scrub/chaparral/grassland communities at this site would be the same as those under alternative B: negligible cumulative impacts.

**FORT BAKER ALTERNATIVE C CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Under alternative D, on-leash dog walking would be allowed on the grounds of the Lodge/Conference Center, Bay Trail (not including Battery Yates Trail), and Vista Point Trail (to be built). Impacts in areas adjacent to the trail would be long term, minor, and adverse since these areas support existing vegetation that would be affected by trampling and dog waste. Impacts would not be large enough to create a measureable or perceptible change in the coastal scrub/chaparral/grassland plant communities. Nutrient addition from dog waste may also occur beyond the LOD area as a result of runoff. Even though alternative D would allow less dog access at the site, the difference in dog impacts between alternatives D and B is not considered large enough to cause a change in the intensity of the impact, because of the developed nature of the site.

The long-term minor adverse impacts from dogs in the LOD area would occur in a relatively small area compared to the site as a whole. Physically restraining dogs on leash would protect vegetation off trail. Therefore, assuming compliance, the overall impacts on coastal scrub, chaparral, and grassland vegetation from on-leash dog walking at Fort Baker would be negligible.

## Chapter 4: Environmental Consequences

No commercial dog walking would be allowed and no permits to walk more than three dogs would be issued under alternative D; therefore, commercial and permitted dog walking would have no impact on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** The negligible impacts on the coastal scrub/chaparral/grassland communities from dog activities at Fort Baker under alternative D were considered together with the effects of the projects mentioned above under alternative A. Cumulatively, alternative D would have negligible impacts on the coastal scrub, chaparral, and grassland communities at this site when added to the effects from these projects.

**FORT BAKER ALTERNATIVE D CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Impacts | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect vegetation off trail; the trail and the LOD area are a small portion of the site | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would have the same dog walking restrictions as alternative C, and impacts would be the same, assuming compliance: long term, minor, and adverse in the LOD area and negligible overall.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash at Fort Baker (excluding Drown Fire Road), with a limit of six dogs; permits could restrict use by time and area. Impacts on coastal scrub/chaparral/grassland vegetation from permit holders with four to six dogs would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is not common at Fort Baker, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** Under alternative E, the cumulative impacts on the coastal scrub/chaparral/grassland communities at this site would be the same as those under alternative C: negligible cumulative impacts.

**FORT BAKER ALTERNATIVE E CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative would allow on-leash dog walking in the same areas as alternative C: on Drown Fire Road (which traverses natural habitat where extensive mission blue butterfly habitat restoration has occurred), the Bay Trail (including Battery Yates Trail), Vista Point Trail (to be built), the Lodge/Conference Center Grounds, and the Parade Ground. The impacts in the LOD area would be long term, minor, and adverse. The impacts would result from physical disturbance

from trampling as well as nutrient addition, which would prevent the growth of new vegetation. The effects would be measurable and perceptible, but would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area would occur in a relatively small area compared to the site as a whole. Physically restraining dogs on leash would protect vegetation off trail. Therefore, assuming compliance, the overall impacts on vegetation from on-leash dog walking at Fort Baker would be negligible because impacts would result in no measurable or perceptible changes in the coastal scrub/chaparral/grassland plant communities.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash at Fort Baker (excluding Drown Fire Road), with a limit of six dogs; permits could restrict use by time and area. Impacts on coastal scrub/chaparral/grassland vegetation from permit holders with four to six dogs would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is not common at Fort Baker, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have negligible impacts on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** Projects and actions in and near Fort Baker were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs initiative projects provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils. Ongoing parkwide restoration and enhancement efforts, such as GGNRA natural resource stewardship programs and the *Marin Countywide Plan* (County of Marin 2007), can also beneficially affect vegetation at GGNRA park sites such as Fort Baker. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance. Habitat restoration and the implementation of projects funded by the Wildland/Urban Interface Initiative on private lands could also impact Fort Baker.

Additional actions have had, are currently having, or have the potential to have adverse impacts on vegetation at or in the vicinity of Fort Baker, such as development or construction actions. Coastal scrub habitat in California is threatened by habitat loss, fragmentation, and degradation (USDA 2005, 613). Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts.

The overall negligible impacts on the coastal scrub/chaparral/grassland communities from dog activities at this site under the preferred alternative were considered together with the effects of the projects mentioned above. Cumulatively, the preferred alternative would have negligible impacts on the coastal scrub, chaparral, and grassland communities at this site when added to the effects from these projects.

**FORT BAKER PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance        | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance                     | Negligible cumulative impacts |

## SAN FRANCISCO COUNTY SITES

### Baker Beach and Bluffs to Golden Gate Bridge

**Alternative A: No Action.** Under current conditions, dogs are allowed under voice control on the beach north of Lobos Creek, with on-leash dog walking required for trails leading to the beach; however, social trails exist at the site and traverse sensitive coastal scrub/chaparral/grassland habitat. This site has documented low to high visitor use (depending on weather, holidays, and weekend use) and dog walking use is considered low to moderate (table 9). Baker Beach and Bluffs to Golden Gate Bridge supports plant communities in the following habitats: coastal scrub, chaparral, serpentine outcroppings, serpentine scrub, and serpentine grassland. The unique vegetation that grows in serpentine soils includes several threatened and endangered plants and is particularly sensitive to changes in soil properties.

Under alternative A, continued impacts on vegetation would be long term, minor, and adverse, and would include physical disturbance through trampling and digging, as well as nutrient addition; effects would be measurable and perceptible, but would be localized in a relatively small area.

No permit system exists for dog walking under alternative A. At Baker Beach and Bluffs to Golden Gate Bridge, commercial dog walking is uncommon; therefore, commercial dog walking would have negligible impacts on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** Projects and actions in and near Baker Beach and Bluffs to Golden Gate Bridge were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils. Ongoing parkwide restoration and enhancement efforts can also beneficially affect vegetation at GGNRA park sites such as Baker Beach and Bluffs to Golden Gate Bridge. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance, which can beneficially affect vegetation at park sites such as Baker Beach and Bluffs to Golden Gate Bridge. Between August and November of 2007, 73,000 tons of landfill debris was unearthed by excavators at Baker Beach and Bluffs to Golden Gate Bridge and conveyed to the top of the cliffs as part of a remediation and restoration effort (Presidio Trust 2010a). The Lobos Creek Valley dune restoration near Baker Beach and Bluffs to Golden Gate Bridge involved efforts to restore the coastal scrub and help increase the population of the listed San Francisco lessingia (NPS 2010c, 1). The PTMP was adopted in 2002 and includes the preservation of the Presidio's cultural, natural, scenic, and recreational resources in Area B, managed by the Presidio Trust. The PTMP focuses on the long-term preservation of the park, including replacing pavement with green space, improving and enlarging the park's trail system, restoring stream corridors and natural habitats, and reusing historic structures (Presidio Trust 2002, 3). Management objectives in the PTMP that are applicable to vegetation include identifying and protecting sensitive wildlife species, and restoring and maintaining their habitats. The PTMP also preserves, enhances, and increases natural habitats managed by the Presidio Trust. For example, historic forest is being rehabilitated, wetlands are being enhanced, and native plant and wildlife species are being protected (Presidio Trust 2002, ii). As a result, the PTMP has beneficial impacts on vegetation at or in the vicinity of Baker Beach and Bluffs to Golden Gate Bridge.

Additional actions have had, are currently having, or have the potential to have adverse impacts on vegetation at or in the vicinity of Baker Beach and Bluffs to Golden Gate Bridge, such as development or construction actions. Coastal scrub habitat in California is threatened by habitat loss, fragmentation, and degradation (USDA 2005, 613). Generally, construction projects that affect this community require

project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts.

The long-term minor adverse impacts on the coastal scrub/chaparral/grassland communities from dogs at Baker Beach and Bluffs to Golden Gate Bridge under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from the park stewardship programs, the PTMP, and the dune restoration project should reduce some of the adverse impacts on vegetation from alternative A. Therefore, cumulative impacts on the coastal scrub/chaparral/grassland communities under this alternative would be expected to be negligible.

**BAKER BEACH AND BLUFFS TO GOLDEN GATE BRIDGE ALTERNATIVE A CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Impacts | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Long-term minor adverse impacts                 | Impacts on vegetation from dogs would be caused through physical damage such as trampling, digging, and dog waste; these effects, as well as fragmentation, could lead to the spread of invasive plant species | N/A  | Negligible cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would prohibit dog walking on the Batteries to Bluffs Trail and the Battery Crosby Trail, but would allow on-leash dog walking on all other trails all the way to the Golden Gate Bridge in the vicinity of Baker Beach and Bluffs to Golden Gate Bridge, as well as on the entire beach within the GGNRA boundary. In general, impacts would be limited to the 6-foot corridors immediately adjacent to the trails. Nutrient addition from dog waste may also occur beyond the LOD area as a result of runoff. Impacts would affect the plants that grow in the serpentine soils immediately adjacent to the Coastal Trail. Therefore, impacts in areas adjacent to the trail (LOD area) would be long term, minor, and adverse since these areas support the growth of existing vegetation; impacts would be measurable and perceptible, but would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area would affect only a portion of the site. Physically restraining dogs on leash would protect vegetation off trail. Therefore, assuming compliance, the overall impacts on coastal scrub/chaparral/grassland vegetation from on-leash dog walking at Baker Beach and Bluffs to Golden Gate Bridge would be negligible.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is not common at Baker Beach and Bluffs to Golden Gate Bridge, it is likely that this alternative would not affect the number of dog walkers. Therefore, commercial dog walking under alternative B would have negligible impacts on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** The negligible impacts on the coastal scrub/chaparral/grassland communities from dogs at Baker Beach and Bluffs to Golden Gate Bridge under alternative B were considered together with the beneficial effects from the park stewardship programs, the PTMP, and the dune restoration project, as described under alternative A. Cumulatively, alternative B would have beneficial impacts on the coastal scrub/chaparral/grassland communities at this park site when added to the beneficial effects from these projects.

**Chapter 4: Environmental Consequences**

**BAKER BEACH AND BLUFFS TO GOLDEN GATE BRIDGE ALTERNATIVE B CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance        | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance                     | Beneficial cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would have the same dog walking restrictions as alternative B, and impacts would be the same, assuming compliance: long term, minor, and adverse in the LOD area and negligible overall.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs; permits could restrict use by time and area. Permits would be allowed for Baker Beach. Impacts on coastal scrub/chaparral/grassland vegetation from permit holders with four to six dogs would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is not common at Baker Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** Under alternative C, the cumulative impacts on the coastal scrub/chaparral/grassland communities would be the same as those under alternative B: beneficial.

**BAKER BEACH AND BLUFFS TO GOLDEN GATE BRIDGE ALTERNATIVE C CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance        | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance                     | Beneficial cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Alternative D would allow on-leash dog walking on the section of Baker Beach south of the north parking lot and on all trails leading to that section of beach, as well as on the Coastal Trail. Dogs would be prohibited in the section of beach north of the north parking lot (approximately half of the beach) and on the trails leading to the northern section of the beach. The beach does not contain coastal scrub, chaparral, or grassland habitat. In general, impacts would be limited to the 6-foot corridors immediately adjacent to the trails. Nutrient addition from dog waste may also occur beyond the LOD area as a result of runoff. Impacts would affect the plants that grow in the serpentine soils immediately adjacent to the Coastal Trail. Therefore, impacts in areas adjacent to the trail (LOD area) would be long term, minor, and adverse since these areas support the growth of existing vegetation; impacts would be measurable and perceptible, but would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area would affect only a portion of the site. Physically restraining dogs would protect vegetation off trail. Therefore, assuming compliance, the overall impacts on coastal scrub/chaparral/grassland vegetation from on-leash dog walking at Baker Beach and Bluffs to Golden Gate Bridge would be negligible.

No commercial dog walking would be allowed, and no permits to walk more than three dogs would be issued under alternative D; therefore, commercial and permitted dog walking would have no impact on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** The negligible impacts on the coastal scrub/chaparral/grassland communities from dogs at Baker Beach and Bluffs to Golden Gate Bridge under alternative D were considered together with the beneficial effects from the park stewardship programs, the PTMP, and the dune restoration project, described under alternative A. Cumulatively, alternative D would have beneficial impacts on the coastal scrub/chaparral/grassland communities at this park site when added to the beneficial effects from these projects.

**BAKER BEACH AND BLUFFS TO GOLDEN GATE BRIDGE ALTERNATIVE D CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance              | Beneficial cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would allow on-leash dog walking on the northern portion of the beach and on all trails except the Batteries to Bluffs Trail and the Battery Crosby Trail. A ROLA would be established on the portion of the beach south of the north parking lot. The beach does not contain coastal scrub, chaparral, or grassland habitat. In general, impacts would be limited to the 6-foot corridors immediately adjacent to the trails. Nutrient addition from dog waste may also occur beyond the LOD area as a result of runoff. Impacts would affect the plants that grow in the serpentine soils immediately adjacent to the Coastal Trail. Therefore, impacts in areas adjacent to the trail (LOD area) would be long term, minor, and adverse since these support the growth of existing vegetation; impacts would be measurable and perceptible, but would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area would affect only a portion of the site. Physically restraining dogs on leash would protect vegetation off trail. Therefore, assuming compliance, the overall impacts on vegetation from dog walking at Baker Beach and Bluffs to Golden Gate Bridge would be negligible.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. In a ROLA, permit holders may walk one to six dogs off leash, and the permit may restrict use by time and area. Permits would be allowed for Baker Beach. Impacts on coastal scrub/chaparral/grassland vegetation from permit holders with four to six dogs off leash would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is not common at Baker Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** The negligible impacts on the coastal scrub/chaparral/grassland communities from dogs at Baker Beach and Bluffs to Golden Gate Bridge under alternative E were considered together with the beneficial effects from the park stewardship programs, the PTMP, and the dune restoration project, as described under alternative A. Cumulatively, alternative E would have beneficial impacts on the coastal

## Chapter 4: Environmental Consequences

scrub/chaparral/grassland communities at this park site when added to the beneficial effects from these projects.

**BAKER BEACH AND BLUFFS TO GOLDEN GATE BRIDGE ALTERNATIVE E CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site; the ROLA is located on the beach, not in coastal scrub/chaparral/grassland habitat | Beneficial, assuming compliance              | Beneficial cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative D, allowing on-leash dog walking on the beach south of the north parking lot, in picnic and parking areas, on the trails to the southern beach area, and the Coastal Trail. Dogs would be prohibited in the section of beach north of the north parking lot (approximately half of the beach) and on the trails leading to the northern section of the beach, and the Batteries to Bluffs and Battery Crosby trails. The beach does not contain coastal scrub, chaparral, or grassland habitat. In general, impacts would be limited to the 6-foot corridors immediately adjacent to the trails. Nutrient addition from dog waste may also occur beyond the LOD area as a result of runoff. Impacts would affect the plants that grow in the serpentine soils immediately adjacent to the Coastal Trail. Therefore, impacts in areas adjacent to the trail (LOD area) would be long term, minor, and adverse since these areas support the growth of existing vegetation; impacts would be measurable and perceptible, but would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area would affect only a portion of the site. Physically restraining dogs on leash would protect vegetation off trail. Therefore, assuming compliance, the overall impacts on coastal scrub/chaparral/grassland vegetation from on-leash dog walking at Baker Beach and Bluffs to Golden Gate Bridge would be negligible.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs; permits could restrict use by time and area. Permits would be allowed for Baker Beach. Impacts on coastal scrub/chaparral/grassland vegetation from permit holders with four to six dogs would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is not common at Baker Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have negligible impacts on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** Projects and actions in and near Baker Beach and Bluffs to Golden Gate Bridge were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs initiative projects provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils. Ongoing parkwide restoration and enhancement efforts can also beneficially affect vegetation at GGNRA park sites, such as Baker Beach and Bluffs to Golden Gate Bridge. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance, which can beneficially affect vegetation at park sites such as Baker Beach and Bluffs to Golden Gate Bridge. Between August and November of 2007, 73,000 tons of landfill debris was unearthed by excavators at Baker Beach and

Bluffs to Golden Gate Bridge and conveyed to the top of the cliffs as part of a remediation and restoration effort (Presidio Trust 2010a). The *Lobos Creek Valley Dune Restoration* near Baker Beach and Bluffs to Golden Gate Bridge involved efforts to restore the coastal scrub and help increase the population of the listed San Francisco lessingia (NPS 2010c, 1). As stated previously, the PTMP identifies and protects sensitive wildlife species, and restoring and maintaining their habitats. The PTMP also preserves, enhances, and increases natural habitats managed by the Presidio Trust. For example, historic forest is being rehabilitated, wetlands are being enhanced, and native plant and wildlife species are being protected (Presidio Trust 2002, ii). As a result, the PTMP has beneficial impacts on vegetation at or in the vicinity of Baker Beach and Bluffs to Golden Gate Bridge.

Additional actions have had, are currently having, or have the potential to have adverse impacts on vegetation at or in the vicinity of Baker Beach and Bluffs to Golden Gate Bridge, such as development or construction actions. Coastal scrub habitat in California is threatened by habitat loss, fragmentation, and degradation (USDA 2005, 613). Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts.

The negligible impacts on the coastal scrub/chaparral/grassland communities from dogs at Baker Beach and Bluffs to Golden Gate Bridge under the preferred alternative were considered together with the beneficial effects from the park stewardship programs, the PTMP, and the dune restoration project. Cumulatively, the preferred alternative would have beneficial impacts on the coastal scrub/chaparral/grassland communities at this park site when added to the beneficial effects from these projects.

#### BAKER BEACH AND BLUFFS TO GOLDEN GATE BRIDGE PREFERRED ALTERNATIVE F CONCLUSION TABLE

| Coastal Scrub, Chaparral, and Grassland Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance              | Beneficial cumulative impacts |

### Lands End

**Alternative A: No Action.** Under current conditions, dogs are allowed under voice control at the Lands End site, which includes the Lands End Coastal Trail and the El Camino del Mar Trail. This site has low to moderate visitor use by hikers, bicyclists, and dog walkers (table 9). Lands End contains coastal scrub, chaparral, and serpentine coastal scrub vegetation. Off-leash dog activities would contribute to physical disturbance of these communities and nutrient addition in off-trail areas occurs throughout the site. Due their nature, dogs are not expected to stay on the trails. Since dogs are currently allowed under voice control at the site, there is a higher likelihood that dogs would go off trail than if they were on leash, creating impacts on vegetation in the adjacent, undisturbed areas located along the trails. Impacts in these areas would include trampling and digging, as well as the addition of nutrients to the soil, which would impact vegetation. The Lands End area also contains rare serpentine soils that support sensitive plant species, but no threatened or endangered plants.

Therefore, impacts on vegetation would continue to be long term, minor to moderate, and adverse under alternative A because effects would be measurable and perceptible, potentially over a relatively large area, and may affect the overall integrity of the plant communities at the site.

## Chapter 4: Environmental Consequences

Under alternative A, no permit system exists for dog walking. At Lands End, commercial dog walking is uncommon; therefore, commercial dog walking would have negligible impacts on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** Projects and actions in and near Lands End were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils and vegetation. Ongoing parkwide restoration and enhancement efforts can also beneficially affect vegetation at GGNRA park sites such as Lands End. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance, which can beneficially affect vegetation at park sites such as Lands End. The efforts of park stewardship programs at Lands End have included resurfacing and stabilizing segments of the trails, eliminating social trails, replanting native species in the local forest and surrounding areas, and engaging the community in park stewardship (GGNPC 2010c, 1).

Additional actions have had, are currently having, or have the potential to have adverse impacts on vegetation at or in the vicinity of Lands End, such as development or construction actions. Coastal scrub habitat in California is threatened by habitat loss, fragmentation, and degradation (USDA 2005, 613). Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts.

The long-term minor to moderate adverse impacts on the coastal scrub/chaparral/grassland communities from dogs at Lands End under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from the park stewardship programs should reduce some of the adverse impacts on the coastal scrub, chaparral, and grassland communities from alternative A. Therefore, cumulative impacts on the coastal scrub/chaparral/grassland communities under this alternative would be expected to be negligible to long term, minor, and adverse.

**LANDS END ALTERNATIVE A CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Impacts | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts                                       |
|---|--|--|--|
| Long-term minor to moderate adverse impacts     | Impacts on vegetation from dogs would be caused through physical damage such as trampling, digging, and dog waste; these effects, as well as fragmentation, could lead to the spread of invasive plant species | N/A  | Negligible to long-term minor adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking at Lands End on the El Camino del Mar Trail, Lands End Coastal Trail, and connecting steps, where much of the coastal scrub/chaparral habitat occurs. In general, impacts would be limited to the 6-foot LOD corridors immediately adjacent to the trails. Vegetation would be affected through physical disturbance such as trampling and dog waste. The Lands End area also contains rare serpentine soils, which support unique vegetation; this vegetation is particularly sensitive to changes in soil properties. Nutrient addition from dog waste may also occur beyond the LOD area as a result of runoff. Therefore, impacts in the LOD area would be long term, minor, and adverse since the area supports existing vegetation and because effects would be measurable and perceptible, but would be localized in a relatively small area.

The long-term minor adverse impacts on vegetation adjacent to the trails would occur in a relatively small area compared to the site as a whole, and Lands End receives low to moderate use by dog walkers. Also, physically restraining dogs on leash would protect vegetation off trail. Therefore, assuming compliance, the overall impacts on coastal scrub/chaparral/grassland vegetation at Lands End would be negligible because impacts would result in no measurable or perceptible changes in these plant communities.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is not common at Lands End, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have negligible impacts on coastal scrub/chaparral/grassland vegetation at Lands End.

**Cumulative Impacts.** The negligible impacts on the coastal scrub/chaparral/grassland communities from dogs at Lands End under alternative B were considered together with the beneficial effects of the park stewardship programs, described under alternative A. Cumulatively, alternative B would have beneficial impacts on the coastal scrub/chaparral/grassland communities at this park site when added to the beneficial effects from these actions.

**LANDS END ALTERNATIVE B CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance        | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance                     | Beneficial cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would be the same as alternative B, thus impacts would be limited to the 6-foot LOD corridors immediately adjacent to the trails. Vegetation would be affected through physical disturbance such as trampling and dog waste. The Lands End area also contains rare serpentine soils, which support unique vegetation; this vegetation is particularly sensitive to changes in soil properties. Nutrient addition from dog waste may also occur beyond the LOD area as a result of runoff. Therefore, impacts in the LOD area would be long term, minor and adverse and would result from physical disturbance; effects would be measurable and perceptible, but would be localized in a relatively small area.

The long-term minor adverse impacts on coastal scrub/chaparral/grassland vegetation would occur in a relatively small area compared to the site as a whole. Physically restraining dogs on leash would protect vegetation off trail, and Lands End receives low to moderate use by dog walkers. Therefore, assuming compliance, the overall impacts on coastal scrub/chaparral/grassland vegetation at Lands End would be negligible because impacts would result in no measurable or perceptible changes in these plant communities.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Lands End is not one of the GGNRA sites where permits to walk more than three dogs would be issued. Since commercial dog walking is not common at Lands End, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on coastal scrub/chaparral/grassland vegetation.

## Chapter 4: Environmental Consequences

**Cumulative Impacts.** The negligible impacts on the coastal scrub/chaparral/grassland communities from dogs at Lands End under alternative C were considered together with the effects of the projects mentioned above in alternative A. Cumulatively, alternative B would have beneficial impacts on the coastal scrub/chaparral/grassland communities at this park site when added to the beneficial effects from these actions.

**LANDS END ALTERNATIVE C CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance        | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial to no change, assuming compliance        | Beneficial cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Alternative D would allow on-leash dog walking on the El Camino del Mar Trail, and on the Lands End Coastal Trail as far as the junction with, and on the connector trail/steps leading to the El Camino del Mar Trail. The impacts would be similar to those under alternative B because the on-leash areas coincide with the coastal scrub/chaparral/grassland habitat of Lands End. In general, impacts would be limited to the 6-foot corridors immediately adjacent to the trails. Vegetation would be affected through physical disturbance such as trampling and dog waste. The Lands End area also contains rare serpentine soils, which support unique vegetation; this vegetation is particularly sensitive to changes in soil properties. Nutrient addition from dog waste may also occur beyond the LOD area as a result of runoff. Therefore, impacts in the LOD area would be long term, minor, and adverse since the area supports existing vegetation and because effects would be measurable and perceptible, but would be localized in a relatively small area.

The long-term minor adverse impacts on vegetation in the land adjacent to the trails would occur in a relatively small area compared to the site as a whole, and Lands End receives low to moderate use by dog walkers. Also, physically restraining dogs on leash would protect vegetation off trail. Therefore, assuming compliance, the overall impacts on coastal scrub/chaparral/grassland vegetation at Lands End would be negligible because impacts would result in no measurable or perceptible changes in these plant communities.

No commercial dog walking would be allowed and no permits to walk more than three dogs would be issued under alternative D; therefore, commercial and permitted dog walking would have no impact on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** The negligible impacts on the coastal scrub/chaparral/grassland communities from dogs at Lands End under alternative D were considered together with the beneficial effects of the park stewardship programs, as described under alternative A. Cumulatively, alternative D would have beneficial impacts on the coastal scrub/chaparral/grassland communities at this park site when added to the beneficial effects from these actions.

**LANDS END ALTERNATIVE D CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance        | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance                     | Beneficial cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would have the same dog walking restrictions as alternative B, and impacts would be the same, assuming compliance: long term, minor, and adverse in the LOD area and negligible overall.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Lands End is not one of the GGNRA sites where permits to walk more than three dogs would be issued. Since commercial dog walking is not common at Lands End, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** Under alternative E, the cumulative impacts on the coastal scrub/chaparral/grassland communities at this park site would be the same as those under alternative B: beneficial cumulative impacts.

**LANDS END ALTERNATIVE E CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance        | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial to no change, assuming compliance        | Beneficial cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative B, allowing on-leash dog walking on the El Camino del Mar Trail, Lands End Coastal Trail, and the connecting steps, where much of the coastal scrub/chaparral habitat occurs. In general, impacts would be limited to the 6-foot corridors immediately adjacent to the trails. Vegetation would be affected through physical disturbance such as trampling and dog waste. The Lands End area also contains rare serpentine soils, which support unique vegetation; this vegetation is particularly sensitive to changes in soil properties. Nutrient addition from dog waste may also occur beyond the LOD area as a result of runoff. Therefore, impacts in the LOD area would be long term, minor, and adverse since the area supports existing vegetation and because effects would be measurable and perceptible, but would be localized in a relatively small area.

The long-term minor adverse impacts on coastal scrub/chaparral/grassland vegetation adjacent to the trails would occur in a relatively small area compared to the site as a whole, and Lands End receives low to moderate use by dog walkers. Also, physically restraining dogs on leash would protect vegetation off trail. Therefore, assuming compliance, the overall impacts on coastal scrub/chaparral/grassland vegetation at Lands End would be negligible because impacts would result in no measurable or perceptible changes in these plant communities.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Lands End is not one of the GGNRA sites where permits to walk more than three dogs would be issued. Since commercial dog walking is not common at Lands End, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have negligible impacts on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** Projects and actions in and near Lands End were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part

## Chapter 4: Environmental Consequences

of park stewardship programs initiative projects provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils and vegetation. Ongoing parkwide restoration and enhancement efforts can also beneficially affect vegetation at GGNRA park sites such as Lands End. GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance, which can beneficially affect vegetation at park sites such as Lands End. The efforts of park stewardship programs at Lands End have included resurfacing and stabilizing segments of the trails, eliminating social trails, replanting native species in the local forest and surrounding areas, and engaging the community in park stewardship (GGNPC 2010c, 1).

Additional actions have had, are currently having, or have the potential to have adverse impacts on vegetation at or in the vicinity of Lands End, such as development or construction actions. Coastal scrub habitat in California is threatened by habitat loss, fragmentation, and degradation (USDA 2005, 613). Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts.

The negligible impacts on the coastal scrub/chaparral/grassland communities from dogs at Lands End under the preferred alternative were considered together with the beneficial effects of the park stewardship programs. Cumulatively, the preferred alternative would have beneficial impacts on the coastal scrub/chaparral/grassland communities at this park site when added to the beneficial effects from these projects.

**LANDS END PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance        | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance                     | Beneficial cumulative impacts |

## SAN MATEO COUNTY SITES

### Mori Point

**Alternative A: No Action.** Mori Point contains coastal scrub habitat and grasslands that are dominated by purple needlegrass. On-leash dog walking is currently allowed on all trails and on the portion of beach owned by the NPS. This site has moderate visitor use by dog walkers, and some visitors do not comply with the leash law; off-leash violations totaled 146 from 2008 through 2011 (table 26). The NPS has invested time and money in extensive restoration projects at Mori Point, and the impacts from dogs are negating the benefits of these restoration projects.

Under alternative A, dogs would continue to affect vegetation at Mori Point through digging, trampling, and nutrient addition. In addition, some dogs under voice control may go off trail into adjacent, undisturbed areas and impact vegetation in these areas. Therefore, impacts on vegetation as a result of this alternative would continue to be long term, minor, and adverse at this site because effects would be measurable and perceptible, but would be localized in a relatively small area.

No permit system exists for dog walking under alternative A. At Mori Point, commercial dog walking is uncommon; therefore, commercial dog walking would have negligible impacts on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** Projects and actions in and near Mori Point were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of the park stewardship programs initiative projects provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of vegetation communities at park sites such as Mori Point. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance, which can beneficially affect vegetation at park sites such as Mori Point. The *Mori Point Restoration and Trail Plan* includes preserving and restoring habitat by reducing threats to native plant communities and natural processes, ensuring habitat connectivity between upland and wetland areas, and developing a safe and sustainable trail system to improve recreational experiences and reduce impacts on park resources (NPS 2010e, 1). The scope of the SNRAMP analysis includes a natural area managed by the SFRPD in Pacifica (Sharp Park, located near Mori Point), and addresses dog walking (including on-leash dog walking and off-leash DPAs) in this area (SFPD 2011, 261-262). Project activities included in the SNRAMP, including the restoration of the Laguna Salada at Sharp Park would protect and improve habitat and provide long-term beneficial impacts to vegetation.

Additional actions have had, are currently having, or have the potential to have adverse impacts on vegetation at or in the vicinity of Mori Point, such as development or construction actions. Coastal scrub habitat in California is threatened by habitat loss, fragmentation, and degradation (USDA 2005, 613). Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts.

The long-term minor adverse impacts on the coastal scrub/chaparral/grassland communities from dogs at Mori Point under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from the park stewardship programs and from the *Mori Point Restoration and Trail Plan* should reduce some of the adverse impacts on the coastal scrub, chaparral, and grassland communities from alternative A. Therefore, cumulative impacts on the coastal scrub/chaparral/grassland communities under this alternative would be expected to be negligible.

**MORI POINT ALTERNATIVE A CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Long-term minor adverse impacts                        | Impacts on vegetation from dogs would be caused through physical damage such as trampling, digging, and dog waste, and these effects would continue to negate restoration efforts | N/A   | Negligible cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking on the Mori Coastal Trail and the portion of beach owned by the NPS, but dogs would not be allowed on the Pollywog Trail, which is located adjacent to the ponds. The Mori Coastal Trail, where on-leash dog walking is allowed, winds through coastal scrub and grassland habitats. The vegetation in the areas adjacent to the trail would be affected by dogs through trampling and dog waste. The impacts in the LOD area caused by dog activities would be long term, minor, and adverse because effects would be measurable and perceptible, but would be localized in a relatively small area.

## Chapter 4: Environmental Consequences

Compared to the size of the Mori Point site, the areas of coastal scrub/chaparral/grassland vegetation that could be impacted by on-leash dog walking are small. Additionally, physically restraining dogs on leash would protect vegetation off trail at the site. Therefore, assuming compliance, the overall impacts on the coastal scrub and grassland vegetation under alternative B would be negligible because impacts would result in no measurable or perceptible changes in the plant communities.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is not common in this area, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have negligible impacts on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** The negligible impacts on the coastal scrub/chaparral/grassland communities from dogs at Mori Point under alternative B were considered together with the beneficial effects of the park stewardship programs and the *Mori Point Restoration and Trail Plan*, as described under alternative A. Cumulatively, alternative B would have beneficial impacts on the coastal scrub/chaparral/grassland communities at this park site when added to the beneficial effects from these projects.

**MORI POINT ALTERNATIVE B CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance        | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance                     | Beneficial cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would allow on-leash dog walking on the Mori Coastal Trail, Old Mori Trail, and the portion of beach owned by the NPS, but dogs would not be allowed on the Pollywog Trail, which is located adjacent to the ponds. Impacts under alternative C would be similar to those for alternative B. Coastal scrub and grassland vegetation could be impacted in the LOD area along the Mori Coastal Trail. The vegetation in the areas adjacent to the trail would be affected by dogs through trampling and dog waste. The impacts caused by dog activities in the LOD area would be long term, minor, and adverse because effects would be measurable and perceptible, but would be localized in a relatively small area.

Compared to the size of the Mori Point site, the areas of vegetation that could be impacted by on-leash dog walking are small. Additionally, physically restraining dogs on leash would protect vegetation off trail at the site. Therefore, assuming compliance, the overall impacts on the coastal scrub/chaparral/grassland vegetation communities under alternative C would be negligible because impacts would result in no measurable or perceptible changes in these plant communities.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Mori Point is not one of the GGNRA sites where permits to walk more than three dogs would be issued. Since commercial dog walking is not common at Mori Point, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** The negligible impacts on coastal scrub/chaparral/grassland communities from dogs at Mori Point under alternative C were considered together with the beneficial effects of the park

stewardship programs and the *Mori Point Restoration and Trail Plan*, described under alternative A. Cumulatively, alternative C would have beneficial impacts on the coastal scrub/chaparral/grassland communities at this park site when added to the beneficial effects from these projects.

**MORI POINT ALTERNATIVE C CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance              | Beneficial cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Under alternative D, dogs would not be allowed at this site. Therefore, assuming compliance, there would be no impact on coastal scrub/chaparral/grassland vegetation from dogs at this site.

Since dogs would not be allowed at Mori Point, there would be no impact from commercial dog walkers on the coastal scrub/chaparral/grassland vegetation communities.

**Cumulative Impacts.** The lack of impacts on the coastal scrub/chaparral/grassland communities from dogs under alternative D was considered together with the beneficial effects of the park stewardship programs and the *Mori Point Restoration and Trail Plan*, described under alternative A. Cumulatively, alternative D would have beneficial impacts on the coastal scrub/chaparral/grassland communities at this park site when added to the beneficial effects from these projects.

**MORI POINT ALTERNATIVE D CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Impacts | Rationale                            | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--------------------------------------|--|-------------------------------|
| No impact                                       | Dogs would be prohibited at the site | Beneficial, assuming compliance              | Beneficial cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would allow on-leash dog walking on the same trails and beach as alternative C, with the addition of the Pollywog Trail. The areas surrounding the Pollywog Trail do not support coastal scrub or grassland vegetation. Therefore, the impacts under alternative E would be the same as those described for alternative C. In general, impacts would be limited to the beach and the 6-foot corridors immediately adjacent to the trails. The Mori Coastal Trail and Old Mori Trail, where on-leash dog walking is allowed, wind through coastal scrub and grassland habitats. The vegetation in the areas adjacent to the trail would be affected by dogs through trampling and dog waste. The impacts in the LOD area caused by dog activities would be long term, minor, and adverse because effects would be measurable and perceptible, but would be localized in a relatively small area.

Compared to the size of the Mori Point site, the areas of vegetation that could be impacted by on-leash dog walking are small. Additionally, physically restraining dogs on leash would protect vegetation off trail at the site. Therefore, assuming compliance, the overall impacts on the coastal scrub/chaparral/grassland vegetation community under alternative E would be negligible because impacts would result in no measurable or perceptible changes in these plant communities.

## Chapter 4: Environmental Consequences

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Mori Point is not one of the GGNRA sites where permits to walk more than three dogs would be issued. Since commercial dog walking is not common at Mori Point, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** The negligible impacts on the coastal scrub/chaparral/grassland communities from dogs at Mori Point under alternative E were considered together with the beneficial effects of the park stewardship programs and the *Mori Point Restoration and Trail Plan*, as described under alternative A. Cumulatively, alternative E would have beneficial impacts on the coastal scrub/chaparral/grassland communities at this park site when added to the beneficial effects from these projects.

**MORI POINT ALTERNATIVE E CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance              | Beneficial cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative E, allowing on-leash dog walking on the Mori Coastal Trail, Old Mori Trail, Pollywog Trail, and the portion of beach owned by the NPS. Coastal scrub and grassland vegetation could be impacted in the LOD area along the Mori Coastal Trail. The vegetation in the areas adjacent to the trail would be affected by dogs through trampling and dog waste. The impacts caused by dog activities in the LOD area would be long term, minor, and adverse because effects would be measurable and perceptible, but would be localized in a relatively small area.

Compared to the size of the Mori Point site, the areas of vegetation that could be impacted by on-leash dog walking are small. Additionally, physically restraining dogs on leash would protect vegetation off trail at the site. Therefore, assuming compliance, the overall impacts on the coastal scrub/chaparral/grassland vegetation community under the preferred alternative would be negligible because impacts would result in no measurable or perceptible changes in these plant communities.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Mori Point is not one of the GGNRA sites where permits to walk more than three dogs would be issued. Since commercial dog walking activity is not common at Mori Point, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have negligible impacts on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** Projects and actions in and near Mori Point were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of the park stewardship programs initiative projects provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of vegetation communities at park sites such as Mori Point. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance, which can beneficially affect vegetation at park sites such as Mori Point. The *Mori Point Restoration and Trail Plan* includes preserving and restoring habitat by reducing threats

to native plant communities and natural processes, ensuring habitat connectivity between upland and wetland areas, and developing a safe and sustainable trail system to improve recreational experiences and reduce impacts on park resources (NPS 2010e, 1).

Additional actions have had, are currently having, or have the potential to have adverse impacts on vegetation at or in the vicinity of Mori Point, such as development or construction actions. Coastal scrub habitat in California is threatened by habitat loss, fragmentation, and degradation (USDA 2005, 613). Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts.

The negligible impacts on the coastal scrub/chaparral/grassland communities from dogs at Mori Point under the preferred alternative were considered together with the beneficial effects of the park stewardship programs and from the *Mori Point Restoration and Trail Plan*. Cumulatively, the preferred alternative would have beneficial impacts on the coastal scrub/chaparral/grassland communities at this park site when added to the beneficial effects from these projects.

**MORI POINT PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance              | Beneficial cumulative impacts |

## Milagra Ridge

**Alternative A: No Action.** Nearly the entire site of Milagra Ridge is composed of coastal scrub vegetation, although the site also supports coastal chaparral and grassland habitat. On-leash dog walking is currently allowed on all trails and fire roads. This site has documented moderate visitor use by bicyclists, walkers, and hikers, and low to moderate visitor use by dog walkers (table 9). Although current GGNRA regulations require dogs to be leashed at Milagra Ridge, unleashed dogs have been observed at the site; violations totaled 35 from 2008 through 2011 (table 27).

Under alternative A, dogs would continue to contribute to physical disturbance to vegetation through digging, trampling, and nutrient addition. In addition, some of the off-leash dogs at the site may go off trail into adjacent, undisturbed areas and impact vegetation in these areas. Therefore, impacts would continue to be long term, minor, and adverse because effects would be measurable and perceptible, but would be localized in a relatively small area. In addition, the NPS has invested time and money in extensive restoration projects at Milagra Ridge, and the impacts from dogs would continue to negate the success of these restoration projects.

No permit system exists for dog walking under alternative A. At Milagra Ridge, commercial dog walking is uncommon; therefore, commercial dog walking would have negligible impacts on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** Projects and actions in and near Milagra Ridge were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of the park stewardship programs provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils at park sites such as Milagra Ridge. The GGNRA Maintenance Division conducts many ongoing operations

## Chapter 4: Environmental Consequences

throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance, which can beneficially affect vegetation at park sites such as Milagra Ridge. The scope of the SNRAMP analysis includes a natural area managed by the SFRPD in Pacifica (Sharp Park, located near Milagra Ridge) and addresses dog walking (including on-leash dog walking and off-leash DPAs) in this area (SFPD 2011, 261-262). Project activities included in the SNRAMP would protect and improve habitat and provide long-term beneficial impacts to vegetation.

Additional actions have had, are currently having, or have the potential to have adverse impacts on vegetation at or in the vicinity of Milagra Ridge, such as development or construction actions. Coastal scrub habitat in California is threatened by habitat loss, fragmentation, and degradation (USDA 2005, 613). Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts.

The long-term minor adverse impacts on the coastal scrub/chaparral/grassland communities from dogs at Milagra Ridge under alternative A were considered together with the effects of the actions mentioned above. The benefits to vegetation from the park stewardship programs and the SNRAMP would not be expected to reduce the adverse impacts of this alternative; therefore, the cumulative analysis for this park site will focus on the results of the impact analysis for this alternative. The beneficial effects from the park stewardship programs combined with the long-term minor adverse impacts from alternative A would result in long-term minor adverse cumulative impacts on the coastal scrub/chaparral/grassland communities.

**MILAGRA RIDGE ALTERNATIVE A CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Impacts</b> | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>                  |
|--|--|---|--|
| Long-term minor adverse impacts                        | Impacts on vegetation from dogs are caused through physical damage such as trampling, digging, and dog waste, and these effects would continue to negate restoration efforts | N/A   | Long-term minor adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking on the Fire Road, the trail to the westernmost overlook and World War (WW) II bunker, and Milagra Battery Trail (the future connector to lower Milagra). However, the trail to the top of the hill would not be open for dog walking in this alternative. In general, impacts on vegetation would be limited to the 6-foot corridors immediately adjacent to the trails/fire road. Impacts in areas adjacent to the trail in the 6-foot corridors or LOD area would be long term, minor, and adverse since the area supports existing vegetation. Impacts on vegetation could include trampling and nutrient addition from dog waste and urine; these impacts on vegetation would be measurable and perceptible, but would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area would occur in a relatively small area compared to the site as a whole. Physically restraining dogs on leash would protect vegetation off trail. Therefore, assuming compliance, the overall impact on coastal scrub/chaparral/grassland vegetation from on-leash dog walking at Milagra Ridge would be negligible because impacts would result in no measurable or perceptible changes in these plant communities.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking at Milagra Ridge is not common, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have negligible impacts on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** The negligible impacts on the coastal scrub/chaparral/grassland communities from dogs at Milagra Ridge under alternative B were considered together with the effects of the projects mentioned above under alternative A. Cumulatively, alternative B would have negligible impacts on the coastal scrub/chaparral/grassland communities at or in the vicinity of Milagra Ridge when added to the effects from these projects.

**MILAGRA RIDGE ALTERNATIVE B CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance        | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would have the same dog walking restrictions as alternative B and impacts on coastal scrub/chaparral/grassland vegetation at this site would be the same, assuming compliance: long term, minor, and adverse in the LOD area and negligible overall.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Milagra Ridge is not one of the GGNRA sites where permits to walk more than three dogs would be issued. Since commercial dog walking activity is not common at Milagra Ridge, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** Under alternative C, the cumulative impacts on the coastal scrub/chaparral/grassland communities at this park site would be the same as those under alternative B: negligible cumulative impacts.

**MILAGRA RIDGE ALTERNATIVE C CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance        | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Under alternative D, dogs would not be allowed at this site. Therefore, assuming compliance, no impact on coastal scrub/chaparral/grassland vegetation from dogs would occur.

## Chapter 4: Environmental Consequences

Since dogs would not be allowed at Milagra Ridge, there would be no impact from commercial dog walkers on the coastal scrub/chaparral/grassland vegetation communities.

**Cumulative Impacts.** The lack of impacts on the coastal scrub/chaparral/grassland communities from dogs at Milagra Ridge under alternative D was considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from park stewardship programs and the SNRAMP combined with the lack of impacts on the coastal scrub/chaparral/grassland communities from alternative D would result in beneficial cumulative impacts.

**MILAGRA RIDGE ALTERNATIVE D CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Impacts | Rationale                            | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--------------------------------------|--|-------------------------------|
| No impact                                       | Dogs would be prohibited at the site | Beneficial, assuming compliance              | Beneficial cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would allow on-leash dog walking on the same trails as alternative B, with the addition of a trail to the top of the hill, and impacts would be the same, assuming compliance: long term, minor, and adverse in the LOD area and negligible overall.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Milagra Ridge is not one of the GGNRA sites where permits to walk more than three dogs would be issued. Since commercial dog walking is not common at Milagra Ridge, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** Under alternative E, the cumulative impacts on the coastal scrub, chaparral, and grassland communities would be the same as those under alternative B: negligible cumulative impacts.

**MILAGRA RIDGE ALTERNATIVE E CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative B, allowing on-leash dog walking on the fire road, the trail to the westernmost overlook and WW II bunker, and Milagra Battery Trail (the future connector to lower Milagra). However, the trail to the top of the hill would not be open for dog walking in this alternative. In general, impacts on vegetation would be limited to the 6-foot corridors immediately adjacent to the trails/fire road. Impacts in areas adjacent to the trail in the 6-foot corridors or LOD area would be long term, minor, and adverse since the area supports existing vegetation. Impacts on vegetation could include trampling and nutrient addition from dog waste and urine; these impacts on vegetation would be measurable and perceptible, but would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area would occur in a relatively small area compared to the site as a whole, and physically restraining dogs on leash would protect vegetation off trail. Therefore, assuming compliance, the overall impact on coastal scrub/chaparral/grassland vegetation from on-leash dog walking at Milagra Ridge would be negligible because impacts would result in no measurable or perceptible changes in these plant communities.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Milagra Ridge is not one of the GGNRA sites where permits to walk more than three dogs would be issued. Since commercial dog walking is not common at Milagra Ridge, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have negligible impacts on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** Projects and actions in and near Milagra Ridge were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of the park stewardship programs initiative projects provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils at park sites such as Milagra Ridge. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance, which can beneficially affect vegetation at park sites such as Milagra Ridge. The scope of the SNRAMP analysis includes a natural area managed by the SFRPD in Pacifica (Sharp Park, located near Milagra Ridge) and addresses dog walking (including on-leash dog walking and off-leash DPAs) in this area (SFPD 2011, 261-262). Project activities included in the SNRAMP would protect and improve habitat and provide long-term beneficial impacts to vegetation.

Additional actions have had, are currently having, or have the potential to have adverse impacts on vegetation at or in the vicinity of Milagra Ridge, such as development or construction actions. Coastal scrub habitat in California is threatened by habitat loss, fragmentation, and degradation (USDA 2005, 613). Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts.

The negligible impacts on the coastal scrub/chaparral/grassland communities from dogs at Milagra Ridge under the preferred alternative were considered together with the effects of the projects mentioned above. Cumulatively, the preferred alternative would have negligible impacts on the coastal scrub/chaparral/grassland communities at or in the vicinity of Milagra Ridge when added to the effects from these projects.

**MILAGRA RIDGE PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance        | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance                     | Negligible cumulative impacts |

### **Sweeney Ridge/Cattle Hill**

**Alternative A: No Action.** Currently, on-leash dog walking is allowed on all trails at Sweeney Ridge except the Notch Trail, which is closed to dogs. The site is dominated by coastal scrub and chaparral vegetation, with grassland vegetation occurring along the Notch Trail and the western portions of the

## Chapter 4: Environmental Consequences

Sweeney Ridge Trail. This site has documented low to moderate visitor use by dog walkers and off-leash incidents totaled 115 from 2008 through 2011 (table 28). Therefore, off-leash dog walking is currently occurring along the trails of Sweeney Ridge. Cattle Hill is not yet part of GGNRA, but unrestricted dog walking occurs at this site, and dogs have contributed to physical disturbance of vegetation.

Under alternative A, dogs would continue to contribute to physical disturbance at Sweeney Ridge and Cattle Hill through trampling, digging, and dog waste. In addition, since off-leash dog walking currently occurs at the sites, it is likely that dogs would continue to walk or run through other undisturbed areas adjacent to existing trails. Therefore, impacts on coastal scrub/chaparral/grassland vegetation as a result of alternative A would continue to be long term, minor, and adverse at these sites because effects would be measurable and perceptible, but would be localized in a relatively small area.

No permit system exists for dog walking under alternative A. Commercial dog walking is uncommon at Sweeney Ridge and Cattle Hill; therefore, commercial dog walking would have negligible impacts on coastal scrub/chaparral/grassland vegetation at these sites.

**Cumulative Impacts.** Projects and actions in and near Sweeney Ridge/Cattle Hill were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of the park stewardship programs provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils at park sites such as Sweeney Ridge. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance, which can beneficially affect vegetation at park sites such as Sweeney Ridge. The scope of the SNRAMP analysis includes a natural area managed by the SFRPD in Pacifica (Sharp Park, located near Sweeney Ridge) and addresses dog walking (including on-leash dog walking and off-leash DPAs) in this area (SFPD 2011, 261-262). Project activities included in the SNRAMP would protect and improve habitat and provide long-term beneficial impacts to vegetation.

Additional actions have had, are currently having, or have the potential to have adverse impacts on vegetation at or in the vicinity of Sweeney Ridge, such as development or construction actions. Coastal scrub habitat in California is threatened by habitat loss, fragmentation, and degradation (USDA 2005, 613). Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts.

The long-term minor adverse impacts on the coastal scrub/chaparral/grassland communities from dogs at Sweeney Ridge and Cattle Hill under alternative A were considered together with the effects of the actions mentioned above. The benefits to vegetation from the park stewardship programs and the SNRAMP would not be expected to reduce the adverse impacts of this alternative; therefore, the cumulative analysis for these park sites will focus on the results of the impact analysis for this alternative. The beneficial effects from the park stewardship programs combined with the long-term minor adverse impacts from alternative A would result in long-term minor adverse cumulative impacts on the coastal scrub/chaparral/grassland communities.

**SWEENEY RIDGE/CATTLE HILL ALTERNATIVE A CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>                  |
|--|---|---|--|
| Long-term minor adverse impacts                        | Impacts on vegetation from dogs would be caused through physical damage such as trampling, digging, and dog waste | N/A   | Long-term minor adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Under alternative B, dogs would not be allowed at Sweeney Ridge and Cattle Hill. Therefore, assuming compliance, no impact on coastal scrub/chaparral/grassland vegetation from dogs would occur at these sites.

Since dogs would not be allowed at Sweeney Ridge and Cattle Hill, there would be no impact from commercial dog walkers on the coastal scrub/chaparral/grassland vegetation communities.

**Cumulative Impacts.** The lack of impacts on the coastal scrub/chaparral/grassland communities from dogs at Sweeney Ridge/Cattle Hill under alternative B was considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from park stewardship programs combined with the lack of impacts on the coastal scrub/chaparral/grassland communities from alternative B would result in beneficial cumulative impacts.

**SWEENEY RIDGE/CATTLE HILL ALTERNATIVE B CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Impacts</b> | <b>Rationale</b>                       | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|--|---|-------------------------------|
| No impact  | Dogs would be prohibited at both sites | Beneficial, assuming compliance                     | Beneficial cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Under alternative C, dogs would not be allowed at Sweeney Ridge. Therefore, no impact on coastal scrub/chaparral/grassland vegetation from dogs would occur at this site. At Cattle Hill, on-leash dog walking would be allowed on the Baquiano Trail from Fassler Avenue up to, and including, the Farallon View Trail. In general, impacts on coastal scrub/chaparral/grassland vegetation would be limited to the 6-foot corridors immediately adjacent to the trails. Impacts in the LOD area would be long term, minor, and adverse since the area supports existing vegetation; impacts on vegetation could include trampling and nutrient addition from dog waste and urine. Impacts would be measurable and perceptible, but would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area at Cattle Hill would occur in a relatively small area compared to the site as a whole. Physically restraining dogs on leash would protect vegetation off trail. Therefore, assuming compliance, the overall impacts on coastal scrub/chaparral/grassland vegetation from on-leash dog walking at Cattle Hill would be negligible because impacts would result in no measurable or perceptible changes in these plant communities.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Sweeney Ridge/Cattle Hill are not GGNRA sites where permits to walk more than three dogs would be issued. Since dog walking would not be allowed at Sweeney Ridge, commercial dog walking under alternative C would have no impact on coastal scrub/chaparral/grassland

## Chapter 4: Environmental Consequences

vegetation. Since commercial dog walking is not common at Cattle Hill, it is likely that this alternative would not have an impact on the number of dog walkers.

**Cumulative Impacts.** The lack of impacts on the coastal scrub/chaparral/grassland communities from dogs at Sweeney Ridge under alternative C was considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the park stewardship programs and the SNRAMPS combined with the lack of impacts from the alternative C would result in beneficial cumulative impacts on the coastal scrub/chaparral/grassland communities at Sweeney Ridge. Cumulatively, alternative C would have negligible impacts on the coastal scrub, chaparral, and grassland communities at Cattle Hill when added to the effects from these projects.

**SWEENEY RIDGE/CATTLE HILL ALTERNATIVE C CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Impacts                 | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts                             |
|---|---|--|--|
| No impact at Sweeney Ridge                                      | Dogs would be prohibited at Sweeney Ridge   | Beneficial, assuming compliance              | Beneficial cumulative impacts at Sweeney Ridge |
| Overall negligible impacts, assuming compliance, at Cattle Hill | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance              | Negligible cumulative impacts at Cattle Hill   |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Under alternative D, dogs would not be allowed at Sweeney Ridge and Cattle Hill. Therefore, assuming compliance, no impact on coastal scrub/chaparral/grassland vegetation from dogs would occur at these sites.

Since dogs would not be allowed at Sweeney Ridge and Cattle Hill, there would be no impact from commercial dog walkers on the coastal scrub/chaparral/grassland vegetation communities.

**Cumulative Impacts.** Under alternative D, the cumulative impacts on the coastal scrub/chaparral/grassland communities would be the same as those under alternative B: beneficial cumulative impacts.

**SWEENEY RIDGE/CATTLE HILL ALTERNATIVE D CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Impacts | Rationale                              | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| No impact                                       | Dogs would be prohibited at both sites | Beneficial, assuming compliance              | Beneficial cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** At Sweeney Ridge, alternative E would allow on-leash dog walking along Sweeney Ridge Trail from Portola Discovery Site to the Notch Trail and to the junction with Mori Ridge Trail, and on Sneath Lane. At Cattle Hill, on-leash dog walking would be allowed on the Baquiano Trail from Fassler Avenue up to and including the Farallon View Trail. In general, impacts on coastal scrub/chaparral/grassland vegetation would be limited to the 6-foot corridors immediately adjacent to the trails. Impacts in the LOD area would be long term, minor, and adverse since the area supports existing vegetation; impacts on vegetation could include trampling and nutrient addition from dog waste and urine. Impacts would be measurable and perceptible, but would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area would occur in a relatively small area compared to the sites as a whole. Physically restraining dogs on leash would protect vegetation off trail. Therefore, assuming compliance, the overall impacts on coastal scrub/chaparral/grassland vegetation from on-leash dog walking at Sweeney Ridge and Cattle Hill would be negligible because impacts would result in no measurable or perceptible changes in these plant communities.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Sweeney Ridge/Cattle Hill are not GGNRA sites where permits to walk more than three dogs would be issued. Since commercial dog walking is not common at Sweeney Ridge or Cattle Hill, it is likely that this alternative would not have an impact on the number of dog walkers.

**Cumulative Impacts.** The negligible impacts on the coastal scrub/chaparral/grassland communities from dogs at Sweeney Ridge/Cattle Hill under alternative E were considered together with the effects of the projects mentioned above under alternative A. Cumulatively, alternative E would have negligible impacts on the coastal scrub/chaparral/grassland communities at these park sites when added to the effects from these projects.

**SWEENEY RIDGE/CATTLE HILL ALTERNATIVE E CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Impacts</b> | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|--|---|-------------------------------|
| Overall negligible impacts, assuming compliance        | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the sites | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** On-leash dog walking would be allowed at Sweeney Ridge on Sneath Lane and on Sweeney Ridge Trail between Portola Discovery Site and the Nike Missile Site. On-leash dog walking would be allowed at Cattle Hill on the Baquiano Trail from Fassler Avenue up to and including the Farallon View Trail. In general, impacts on vegetation would be limited to the 6-foot corridors immediately adjacent to the trails. Impacts in the LOD area would be long term, minor, and adverse since the area supports existing vegetation; impacts on vegetation could include trampling and nutrient addition from dog waste and urine. Impacts would be measurable and perceptible, but would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area at Sweeney Ridge/Cattle Hill would occur in a relatively small area compared to the sites as a whole. Physically restraining dogs on leash would protect vegetation off trail. Therefore, assuming compliance, the overall impacts on coastal scrub/chaparral/grassland vegetation from on-leash dog walking at Sweeney Ridge and Cattle Hill would be negligible because impacts would result in no measurable or perceptible changes in these plant communities.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Sweeney Ridge/Cattle Hill are not GGNRA sites where permits to walk more than three dogs would be issued. Since commercial dog walking activity is not common at Sweeney Ridge and Cattle Hill, it is likely that this alternative would not have an impact on the number of dog walkers.

## Chapter 4: Environmental Consequences

**Cumulative Impacts.** Projects and actions in and near Sweeney Ridge/Cattle Hill were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of the park stewardship programs initiative projects provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils at park sites such as Sweeney Ridge/Cattle Hill. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance, which can beneficially affect vegetation at park sites such as Sweeney Ridge/Cattle Hill. The scope of the SNRAMP analysis includes a natural area managed by the SFRPD in Pacifica (Sharp Park, located near Sweeney Ridge/Cattle Hill) and addresses dog walking (including on-leash dog walking and off-leash DPAs) in this area (SFPD 2011, 261-262). Project activities included in the SNRAMP would protect and improve habitat and provide long-term beneficial impacts to vegetation.

Additional actions have had, are currently having, or have the potential to have adverse impacts on vegetation at or in the vicinity of Sweeney Ridge/Cattle Hill, such as development or construction actions. Coastal scrub habitat in California is threatened by habitat loss, fragmentation, and degradation (USDA 2005, 613). Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts.

The negligible impacts on the coastal scrub/chaparral/grassland communities from dogs at Sweeney Ridge and Cattle Hill under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from the park stewardship programs and the SNRAMP combined with the negligible impacts from the preferred alternative would result in negligible cumulative impacts on the coastal scrub/chaparral/grassland communities at Sweeney Ridge and Cattle Hill when added to the effects of these projects.

**SWEENEY RIDGE/CATTLE HILL PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance              | Negligible cumulative impacts |

### Pedro Point Headlands

**Alternative A: No Action.** Although this site is currently not part of GGNRA, unrestricted dog walking occurs at this site, and dogs have contributed to disturbance of the plant communities along created social trails. Pedro Point Headlands contains coastal scrub, chaparral, and grassland vegetation. This site has documented low to moderate visitor use, but the numbers of citations and incident reports related to dog activities at the site are unknown since the NPS does not currently own the property and it is not patrolled by NPS rangers (table 9).

Under alternative A, dogs would continue to contribute to physical disturbance through trampling and digging, as well as contributing nutrients to the soil along the trails through dog waste. In addition, the NPS has invested time and money in extensive restoration projects at Pedro Point Headlands and the impacts from dogs would continue to negate the benefits of these restoration projects. Therefore, impacts on coastal scrub/chaparral/grassland vegetation as a result of this alternative would be long term, minor, and adverse because effects would be measurable and perceptible, but would be localized in a relatively small area.

No permit system exists for dog walking under alternative A. There are currently no commercial dog walking regulations at Pedro Point Headlands and it is unknown if commercial dog walkers contribute to coastal scrub/chaparral/grassland vegetation impacts. Therefore, commercial dog walking would have negligible impacts on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** Projects and actions in and near the Pedro Point Headlands were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of the park stewardship programs provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils at park sites such as Pedro Point Headlands. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance, which can beneficially affect vegetation at park sites such as Pedro Point Headlands. The *Pedro Point Headland Stewardship Project* aims to maintain and improve the ecological status of Pedro Point Headlands, and habitat restoration and trail development efforts include minimizing erosion (City College of San Francisco 2008; Coastsider 2010). Other projects benefit and enhance coastal scrub/chaparral/grassland habitat, including the proposed fire management policies of the *Fire Management Plan* (NPS 2005b), the *San Bruno Elfin and Mission Blue Butterflies Recovery Plan* (USFWS 1984), the *Pedro Point Headland Stewardship Project* (PLT 2008, 1), and the Martini Creek watershed assessment (San Mateo County) (CCC 2008).

Coastal scrub habitat in California is threatened by habitat loss, fragmentation, and degradation (USDA 2005, 613). The implementation of current projects and future projects both in GGNRA and beyond park boundaries could have a cumulative impact on coastal scrub/chaparral/grassland communities. Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would not likely contribute to cumulative impacts.

The long-term minor adverse impacts on the coastal scrub/chaparral/grassland communities from dogs at the Pedro Point Headlands under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from trail rehabilitation projects and actions from the *San Bruno Elfin and Mission Blue Butterflies Recovery Plan* (USFWS 1984) should reduce some of the adverse impacts from alternative A. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on vegetation, since those impacts were found to be negligible due to mitigation. Therefore, cumulative impacts on the coastal scrub/chaparral/grassland communities under this alternative would be expected to be negligible.

**PEDRO POINT HEADLANDS ALTERNATIVE A CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Impacts | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Long-term minor adverse impacts                 | Impacts on vegetation from dogs would be caused through physical damage such as trampling, digging, and dog waste, and these effects would continue negating restoration efforts | N/A  | Negligible cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking on the Coastal Trail. No dog walking would be allowed on the trails proposed by the Pacifica Land Trust. In general, impacts on coastal scrub/chaparral/grassland vegetation would be limited to the 6-foot corridors

## Chapter 4: Environmental Consequences

immediately adjacent to the trail (LOD area). Impacts in the LOD area would be long term, minor, and adverse since the area supports existing vegetation. Impacts on coastal scrub/chaparral/grassland vegetation could include trampling and nutrient addition from dog waste and urine; impacts would be measurable and perceptible, but would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area would occur in a relatively small area compared to the site as a whole. Physically restraining dogs on leash would protect vegetation off trail. Therefore, assuming compliance, the overall impact on coastal scrub/chaparral/grassland vegetation from on-leash dog walking at the Pedro Point Headlands would be negligible.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is not common at Pedro Point Headlands, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have negligible impacts on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** The negligible impacts on the coastal scrub/chaparral/grassland communities from dogs at the Pedro Point Headlands under alternative B were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from trail rehabilitation projects and projects that enhance mission blue butterfly habitat combined with the negligible impacts from alternative B would result in beneficial cumulative impacts on the coastal scrub/chaparral/grassland communities.

**PEDRO POINT HEADLANDS ALTERNATIVE B CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance        | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance                     | Beneficial cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would have the same dog walking restriction as alternative B (on-leash dog walking on the Coastal Trail), and impacts would be the same, assuming compliance: long term, minor, and adverse in the LOD area and negligible overall.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Pedro Point is not one of the GGNRA sites where permits to walk more than three dogs would be issued. Since commercial dog walking is not common at the Pedro Point Headlands, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** Under alternative C, the cumulative impacts on the coastal scrub/chaparral/grassland communities would be the same as those under alternative B: beneficial cumulative impacts.

**PEDRO POINT HEADLANDS ALTERNATIVE C CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance        | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance                     | Beneficial cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Under alternative D, dogs would not be allowed at the Pedro Point Headlands. Therefore, no impact on coastal scrub/chaparral/grassland vegetation from dogs would occur at this site.

Since dogs would not be allowed at Pedro Point Headlands, there would be no impact from commercial dog walkers on the coastal scrub/chaparral/grassland vegetation communities.

**Cumulative Impacts.** The lack of impacts on the coastal scrub/chaparral/grassland communities from dogs at the Pedro Point Headlands under alternative D was considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from trail rehabilitation projects and projects that enhance mission blue butterfly habitat combined with the lack of impacts from alternative D would result in beneficial cumulative impacts on the coastal scrub/chaparral/grassland communities.

**PEDRO POINT HEADLANDS ALTERNATIVE D CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Impacts</b> | <b>Rationale</b>                     | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|--------------------------------------|---|-------------------------------|
| No impact, assuming compliance                         | Dogs would be prohibited at the site | Beneficial, assuming compliance                     | Beneficial cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** On-leash dog walking would be allowed on the Coastal Trail and trails proposed by the Pacifica Land Trust. In general, impacts on coastal scrub/chaparral/grassland vegetation would be limited to the 6-foot corridors immediately adjacent to the trail (LOD area). Impacts in the LOD area would be long term, minor, and adverse since the area supports existing vegetation and areas of native plant restoration. Impacts on coastal scrub/chaparral/grassland vegetation could include trampling and nutrient addition from dog waste and urine; impacts would be measurable and perceptible, but would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area would occur in a relatively small area compared to the site as a whole. Physically restraining dogs on leash would protect vegetation off trail. Therefore, assuming compliance, the overall impact on coastal scrub/chaparral/grassland vegetation from on-leash dog walking at the Pedro Point Headlands would be negligible.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Pedro Point is not one of the GGNRA sites where permits to walk more than three dogs would be issued. Since commercial dog walking activity is not common at Pedro Point Headlands, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** Under alternative E, the cumulative impacts on the coastal scrub/chaparral/grassland communities would be the same as those under alternative B: beneficial.

PEDRO POINT HEADLANDS ALTERNATIVE E CONCLUSION TABLE

| Coastal Scrub, Chaparral, and Grassland Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance              | Beneficial cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative B: on-leash dog walking would be allowed along the Coastal Trail, but no dog walking would be permitted on the trails proposed by the Pacifica Land Trust. In general, impacts on coastal scrub/chaparral/grassland vegetation would be limited to the 6-foot corridors immediately adjacent to the trail (LOD area). Impacts in the LOD area would be long term, minor, and adverse since the area supports existing vegetation. Impacts on coastal scrub/chaparral/grassland vegetation could include trampling and nutrient addition from dog waste and urine; impacts would be measurable and perceptible, but would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area would occur in a relatively small area compared to the site as a whole. Physically restraining dogs on leash would protect vegetation off trail. Therefore, assuming compliance, the overall impact on coastal scrub/chaparral/grassland vegetation from on-leash dog walking at Pedro Point Headlands would be negligible.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Pedro Point is not one of the GGNRA sites where permits to walk more than three dogs would be issued. Since commercial dog walking is not common at Pedro Point Headlands, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have negligible impacts on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** Projects and actions in and near Pedro Point Headlands were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of the park stewardship programs initiative projects provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils at park sites such as Pedro Point Headlands. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance, which can beneficially affect vegetation at park sites such as Pedro Point Headlands. The *Pedro Point Headland Stewardship Project* aims to maintain and improve the ecological status of Pedro Point Headlands, and habitat restoration and trail development efforts include minimizing erosion (City College of San Francisco 2008, 1; Coastsider 2010, 1).

Other projects benefit and enhance coastal scrub/chaparral/grassland habitat, including the proposed fire management policies of the *Fire Management Plan* (NPS 2005b), the *San Bruno Elfin and Mission Blue Butterflies Recovery Plan* (USFWS 1984), the *Coastal Corridor Enhancement Project* (Marin County, San Francisco County, and San Mateo County), the *Pedro Point Headland Stewardship Project*, and the Martini Creek watershed assessment (San Mateo County).

The negligible impacts on the coastal scrub/chaparral/grassland communities from dogs at the Pedro Point Headlands under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from trail rehabilitation projects and projects that enhance

mission blue butterfly habitat combined with the negligible impacts from the preferred alternative would result in beneficial cumulative impacts on the coastal scrub/chaparral/grassland communities.

**PEDRO POINT HEADLANDS PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance              | Beneficial cumulative impacts |

## Rancho Corral de Tierra

**Alternative A: No Action.** Currently, on-leash dog walking is allowed at Rancho Corral de Tierra. Some areas of Rancho are dominated by coastal scrub, chaparral, and grassland vegetation, including areas along trails at the site. Staff regularly working at Rancho characterize use by dog walkers as low to moderate, and compliance with the leash law is generally low. At Rancho, NPS rangers have observed off-leash dogs running in areas with unmarked, potentially sensitive habitat.

Under alternative A, dogs would continue to contribute to physical disturbance at Rancho through trampling, digging, and dog waste. In addition, since off-leash dog walking currently occurs at Rancho, it is likely that dogs would continue to walk or run through other undisturbed areas adjacent to existing trails. Therefore, impacts on coastal scrub/chaparral/grassland vegetation as a result of alternative A would continue to be long term, minor, and adverse at Rancho because effects would be measurable and perceptible, but visitor use is low to moderate at the site, and impacts from on-leash dogs would be localized in a relatively small area. According to information from the Montara Dog Group and subsequent staff observations, dog walkers, particularly off-leash dog walkers, primarily use the lower elevations of the site at both the Montara and El Granada areas. The terrain at El Granada is particularly steep and challenging, thus dog walking use in that area appears to be concentrated mostly in the lower elevations. Although the Montara area is less steep, visitor use there is similarly concentrated in the lower elevations, but some dog walkers in the Montara area do use trails that connect to the top of the Rancho site. Noncompliant dogs off leash would continue to run through undisturbed areas.

No permit system exists for dog walking under alternative A. Commercial dog walkers typically use the El Granada area off of Coral Reef Avenue; however, commercial dog walking is considered a low use at the site overall. Therefore, commercial dog walking would have negligible impacts on coastal scrub/chaparral/grassland vegetation at this site.

**Cumulative Impacts.** Projects and actions in and near Rancho were considered for the cumulative impacts analysis (appendix K). Since the Rancho Corral de Tierra site has been transferred to the NPS, general maintenance and protection of the site and associated natural resources have been occurring, although some impacts may remain from prior unregulated off-leash dog walking.

The GGNRA Maintenance Division conducts many ongoing functions throughout GGNRA that include, but are not limited to road, trail, and stormwater system maintenance, which can beneficially affect vegetation at park sites. Additional actions have had, are currently having, or have the potential to have adverse impacts on vegetation at or in the vicinity of Rancho Corral de Tierra, such as development or construction actions. One example is the CalTrans Devil's Slide Tunnel project, which involves constructing two tunnels beneath San Pedro Mountain to provide a dependable highway between Pacifica and Montara (CADOT 2013, 1). Coastal scrub habitat in California is threatened by habitat loss,

## Chapter 4: Environmental Consequences

fragmentation, and degradation (USDA 2005, 613). Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts.

The long-term minor adverse impacts on the coastal scrub/chaparral/grassland communities from dogs at Rancho Corral de Tierra under alternative A were considered together with the effects of the actions mentioned above. The benefits to vegetation from the park stewardship programs would not be expected to reduce the adverse impacts of this alternative; therefore, the cumulative analysis for this park site will focus on the results of the impact analysis for this alternative. The beneficial effects from the park stewardship programs combined with the long-term minor adverse impacts from alternative A would result in long-term minor adverse cumulative impacts on the coastal scrub/chaparral/grassland communities.

**RANCHO CORRAL DE TIERRA ALTERNATIVE A CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts                         |
|---|---|--|--|
| Long-term minor adverse impacts                 | Impacts on vegetation from dogs would be caused through physical damage such as trampling, digging, and dog waste | N/A  | Long-term minor adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** On-leash dog walking would be allowed on designated trails in two areas open to dog walking near Montara and El Granada which were identified by the local dog walking group as key areas for this use. In general, impacts on coastal scrub/chaparral/grassland vegetation would be limited to the 6-foot corridors immediately adjacent to the trail (LOD area). Impacts in the LOD area would be long term, minor, and adverse since the area supports existing vegetation. Impacts on coastal scrub/chaparral/grassland vegetation could include trampling and nutrient addition from dog waste and urine; impacts would be measurable and perceptible, but would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area would occur in a very small area compared to the site as a whole. Physically restraining dogs on leash would protect vegetation off trail. Therefore, assuming compliance, the overall impact on coastal scrub/chaparral/grassland vegetation from on-leash dog walking at Rancho would be negligible.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking at Rancho is not common, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have negligible impacts on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** The lack of impacts on the coastal scrub/chaparral/grassland communities from dogs at Rancho under alternative B was considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from park stewardship programs combined with the lack of impacts on the coastal scrub/chaparral/grassland communities from alternative B would result in beneficial cumulative impacts.

**RANCHO CORRAL DE TIERRA ALTERNATIVE B CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance        | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance                     | Beneficial cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Under alternative C, dog walking under voice and site control would be allowed in a ROLA located between Le Conte and Tamarind Street, in a vegetated open area across the street and east of the Farallone View School. On-leash dog walking would be allowed on designated trails in two areas open to dog walking near Montara and El Granada. The vegetation in the ROLA is not comprised of sensitive coastal scrub/chaparral/grassland vegetation, but is mostly annual, non-native grasses in a wet area. This area would become trampled and could become muddy in the winter rainy season which may cause erosion during rain events. In general, impacts on coastal scrub/chaparral/grassland vegetation would be limited to the 6-foot corridors immediately adjacent to the trail and within the small-sized ROLA (LOD area). Impacts in the LOD area would be long term, minor, and adverse since the area supports existing vegetation, that would be impacted. Other impacts on coastal scrub/chaparral/grassland vegetation could include trampling and nutrient addition from dog waste and urine; impacts would be measurable and perceptible, but would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area would occur in a very small area compared to the site as a whole. Physically restraining dogs on leash would protect vegetation off trail. Therefore, assuming compliance, the overall impact on coastal scrub/chaparral/grassland vegetation from on-leash dog walking at Rancho would be negligible.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Rancho Corral de Tierra is not one of the park sites where permits to walk more than three dogs, with a maximum of six, would be issued. Since commercial dog walking is not common at Rancho, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** Under alternative C, the cumulative impacts on the coastal scrub/chaparral/grassland communities would be the same as those under alternative B: beneficial cumulative impacts. Although alternative C allows a ROLA (alternative B does not), the vegetation in the ROLA is mostly annual, non-native grasses and the ROLA is small in size compared to the entire Rancho Corral de Tierra site. Therefore, beneficial cumulative impacts are appropriate under alternative C.

**RANCHO CORRAL DE TIERRA ALTERNATIVE C CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance        | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site; ROLA is small and comprised of annual, non-native grasses that would be trampled | Beneficial, assuming compliance                     | Beneficial cumulative impacts |

## Chapter 4: Environmental Consequences

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Under alternative D, on-leash dog walking would be allowed in the Montara area on two existing trails that allow dog walking: Old San Pedro Mountain Road and the Farallon Cutoff. Dogs would be prohibited in other areas of the site, including the entire El Granada area. Impacts in the LOD area would be long term, minor, and adverse since the area supports existing vegetation. Impacts on coastal scrub/chaparral/grassland vegetation could include trampling and nutrient addition from dog waste and urine; impacts would be measurable and perceptible, but would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area would occur in a relatively small area compared to the site as a whole. Therefore, assuming compliance, the overall impact on coastal scrub/chaparral/grassland vegetation from on-leash dog walking at Rancho would be negligible because impacts would result in no measurable or perceptible changes in these plant communities.

No commercial dog walking would be allowed and no permits to walk more than three dogs would be issued under alternative D; therefore, no impact would occur as a result of commercial and permitted dog walking.

**Cumulative Impacts.** Under alternative D, the cumulative impacts on the coastal scrub/chaparral/grassland communities would be the same as those under alternative B: beneficial cumulative impacts.

**RANCHO CORRAL DE TIERRA ALTERNATIVE D CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance        | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance                     | Beneficial cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Dog walking under alternative E would be the same as under alternative C and impacts on coastal scrub/chaparral/grassland vegetation would also be the same. Impacts on the trail and within the small-sized ROLA would be long term, minor, and adverse since the area supports existing vegetation which would be trampled and impacts overall would be negligible, assuming compliance.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Rancho Corral de Tierra is not one of the park sites where permits to walk more than three dogs, with a maximum of six, would be issued. Since commercial dog walking activity is not common at Rancho, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** Under alternative E, the cumulative impacts on the coastal scrub/chaparral/grassland communities would be the same as those under alternative B: beneficial cumulative impacts. Although alternative C allows a ROLA (alternative B does not), the vegetation in the ROLA is mostly annual, non-native grasses and the ROLA is small in size compared to the entire Rancho Corral de Tierra site. Therefore, beneficial cumulative impacts are appropriate under alternative E.

**RANCHO CORRAL DE TIERRA ALTERNATIVE E CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance        | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site; ROLA is small and comprised of annual, non-native grasses that would be trampled | Beneficial, assuming compliance                     | Beneficial cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative B: on-leash dog walking would be allowed on designated trails in two areas open to dog walking near Montara and El Granada. Physically restraining dogs on leash would protect vegetation off trail. Therefore, assuming compliance, the overall impact on coastal scrub/chaparral/grassland vegetation from on-leash dog walking at Rancho would be negligible.

Under alternative F, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Rancho Corral de Tierra is not one of the park sites where permits to walk more than three dogs, with a maximum of six, would be issued. Since commercial dog walking activity is not common at Rancho, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative F would have negligible impacts on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** Projects and actions in and near Rancho were considered for the cumulative impacts analysis (appendix K). Since the Rancho Corral de Tierra site has been transferred to the NPS, general maintenance and protection of the site and associated natural resources have been occurring, although some impacts may remain from prior unregulated off-leash dog walking.

The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance, which can beneficially affect vegetation at park sites. Additional actions have had, are currently having, or have the potential to have adverse impacts on vegetation at or in the vicinity of Rancho Corral de Tierra, such as development or construction actions. One example is the CalTrans Devil's Slide Tunnel project, which involves constructing two tunnels beneath San Pedro Mountain to provide a dependable highway between Pacifica and Montara (CADOT 2013, 1). Coastal scrub habitat in California is threatened by habitat loss, fragmentation, and degradation (USDA 2005, 613). Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts.

The negligible impacts on the coastal scrub/chaparral/grassland communities from dogs at Rancho Corral de Tierra under the preferred alternative were considered together with the effects of the actions mentioned above. The beneficial effects from the park stewardship programs combined with the negligible impacts under the preferred alternative would result in beneficial cumulative impacts on the coastal scrub/chaparral/grassland communities.

RANCHO CORRAL DE TIERRA PREFERRED ALTERNATIVE F CONCLUSION TABLE

| Coastal Scrub, Chaparral, and Grassland Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance              | Beneficial cumulative impacts |

### IMPACTS TO WETLANDS AND AQUATIC HABITATS BY SITE AND ALTERNATIVE

GGNRA contains both freshwater wetlands and coastal (estuarine) wetlands (riparian forest and stream corridors are considered separately). Vegetation in these wetlands is composed of both herbaceous and woody plant species; detailed descriptions have been presented in chapter 3 for wetland plant communities. Wetlands are located at Rodeo Beach/South Rodeo Beach (Rodeo Lagoon and Rodeo Lake), Muir Beach (tidal lagoon), Crissy Field, and Mori Point. Some of the wetlands in GGNRA have already been restored or are currently undergoing restoration. In general, dogs are prohibited from accessing most wetlands in GGNRA, but citations and incident reports related to dog activities at some of these sites do exist (table 9 and appendix G).

#### MARIN COUNTY SITES

##### Muir Beach (Lagoon)

**Alternative A: No Action.** The lagoon located at Muir Beach is described as a small tidal lagoon fringed by wetland vegetation. A wetland restoration project was completed at this site in 2009, which included increasing its size and depth, adding woody debris and revegetating the shoreline; invasive vegetation was also removed as part of the restoration project (NPS 2013c). Phase I of this project reconnected the creek to the flood plain and expanded the tidal lagoon. Under current conditions, dog walking is allowed on leash or under voice control at the site. The park has closed the lagoon and Redwood Creek to dogs, although there is no physical barrier to prevent dogs from accessing the lagoon or Redwood Creek, and it has been observed that these closures have been violated (table 6). The area is considered a moderate to high use site, and dogs do gain access to the lagoon and surrounding wetland habitat.

Therefore, alternative A would result in continued long-term minor to moderate adverse impacts on wetland and aquatic vegetation at this site because effects on sensitive habitat would be measurable and perceptible, but would be localized in a relatively small area.

Under alternative A, no permit system exists for commercial dog walking. At Muir Beach, commercial dog walking is uncommon; therefore, commercial dog walking would have negligible impacts on wetland vegetation.

**Cumulative Impacts.** Projects and actions in and near Muir Beach were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils. The initiative at Pirates Cove, just south of Muir Beach, included efforts to control invasive non-native plants such as pampas grass to support the dense and relatively undisturbed coastal scrub, prairie, and riparian habitats (GGNPC 2010a, 1). Ongoing parkwide restoration and enhancement efforts, such as GGNRA natural resource stewardship programs and the *Marin Countywide Plan* (County of Marin 2007), can also beneficially affect vegetation at GGNRA park sites such as Muir Beach. The GGNRA Maintenance

Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance. Habitat restoration and the implementation of projects funded by the Wildland/Urban Interface Initiative on private lands could also impact Muir Beach. The Muir Beach Wetland and Creek Restoration Project restored the lagoon in 2009 to provide a functional, resilient ecosystem while also providing habitat for special-status species and reducing flooding on Pacific Way. This project restored and enhanced ecological processes near the mouth of Redwood Creek, contributing to the quality of habitat, particularly as a result of restoration and enhancement of habitat and improvement of erosion and sedimentation conditions (NPS 2009j, 1). Phase I of this project reconnected the creek to the flood plain and expanded the tidal lagoon. Similarly, the NPS and the California State Lands Commission formulated the Giacomini Wetland Restoration Project (Marin County, near Tomales Bay) that restored 560 acres of pastures to wetlands of increased complexity and diversity of vegetation and aquatic habitats (NPS 2009k; NPS and CSLC 2007). The Lower Redwood Creek Floodplain and Salmonid Habitat Restoration restored channel function to reduce flooding and reconnect the creek to its floodplain, as well as expanding vegetation at the Banducci site (NPS 2010b, 1). The *Dias Ridge Restoration and Trail Improvement Project* is currently realigning trail segments and restoring degraded areas on Dias Ridge above Muir Beach (NPS 2009i, 1).

Additional actions have had or have the potential to have adverse effects on wetland and aquatic habitats at or in the vicinity of GGNRA sites. Larger, more regional development projects like the GGNRA *Long-range Transportation Plan Update* (NPS 2008g) and the *Doyle Drive Project* (Presidio Parkway 2008) will impact or have the potential to negatively affect wetland resources within and beyond park boundaries. However, wetland impacts from the implementation of these and other proposed projects in the area should be sufficiently offset by mitigation, project by project, such that there should be no net loss of wetland acreage, functions, or values.

The loss of more than 90 percent of California's original wetlands is the largest loss of any state in the nation and is directly related to economic development (NOAA 2010a). The *Clean Water Act* and the state's coastal wetlands statute have succeeded in reducing the rate of wetland loss in California, but development pressures remain a threat (NOAA 2010a, 1). Therefore, projects that protect or degrade wetland and aquatic habitats will have a cumulative effect, whether beneficial or adverse, on wetlands.

The long-term minor to moderate adverse impacts on wetland and aquatic vegetation from dogs at Muir Beach under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from wetland restoration/creation projects should reduce some of the adverse impacts on vegetation from alternative A. However, the impacts resulting from any development projects at or in the vicinity of GGNRA and the loss of more than 90 percent of California's original wetlands may add adversely to the cumulative impacts on vegetation, even with wetland mitigation. There would be a combination of beneficial and adverse effects from actions in and around Muir Beach; when combined, these projects would balance out, resulting in negligible impacts. Therefore, the cumulative analysis for this park site will mainly focus on the results of the impact analysis for each alternative. Cumulative impacts on wetland and aquatic vegetation under this alternative would be expected to be long term, minor to moderate, and adverse.

**MUIR BEACH ALTERNATIVE A CONCLUSION TABLE**

| Wetland and Aquatic Habitat Impacts          | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts                                       |
|--|---|--|--|
| Long-term minor to moderate, adverse impacts | Wetland vegetation around lagoon would be affected by dogs through trampling and increased turbidity; there would be no physical barrier to prevent dogs from accessing the lagoon shoreline and closures would continue to be violated regularly | N/A  | Long-term, minor to moderate, adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking on the beach, the bridge, and path to the beach, the parking area, and the proposed Muir Beach Trail. Under alternative B, protection of wetland and aquatic habitat would occur through requiring on-leash dog walking. If dogs at this site are physically restrained on leash, they should not gain access to the lagoon or its shorelines. As part of the restoration plan at this site, post-and-cable fencing would be installed between the tidal lagoon and Muir Beach to discourage visitors from accessing the lagoon, but the fencing would not physically exclude noncompliant dogs from the area. Therefore, assuming compliance, alternative B would result in negligible impacts on wetland and aquatic vegetation at this site because no measurable or perceptible changes in wetland and aquatic plants would occur as a result of this alternative.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is not common at Muir Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have negligible impacts on wetland vegetation.

**Cumulative Impacts.** The negligible impacts on wetland and aquatic vegetation from dogs at Muir Beach under alternative B were considered together with the effects of the projects mentioned above under alternative A. There would be a combination of beneficial and adverse effects from projects in and around Muir Beach; when combined, these projects would balance out, resulting in negligible impacts. Therefore, these negligible impacts combined with the negligible impacts from alternative B would result in negligible cumulative impacts on wetland and aquatic vegetation.

**MUIR BEACH ALTERNATIVE B CONCLUSION TABLE**

| Wetland and Aquatic Habitat Impacts     | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Negligible impacts, assuming compliance | Physically restraining dogs would protect wetlands along the shoreline of the lagoon | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would have the same dog walking restrictions as alternative B, and impacts would be the same, assuming compliance: negligible.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Muir Beach is not one of the park sites where permits to walk more than three dogs, with a maximum of six, would be issued. Since commercial dog walking activity is not common at Muir Beach, it is likely that this alternative would not have an impact on the number of dog

walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on wetland and aquatic vegetation.

**Cumulative Impacts.** Under alternative C, the cumulative impacts on wetland and aquatic vegetation at this park site would be the same as those under alternative B: negligible cumulative impacts.

**MUIR BEACH ALTERNATIVE C CONCLUSION TABLE**

| <b>Wetland and Aquatic Habitat Impacts</b> | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|--|---|-------------------------------|
| Negligible impacts, assuming compliance    | Physically restraining dogs would protect wetlands along the shoreline of the lagoon | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** In the vicinity of Muir Beach, alternative D would allow on-leash dog walking in the parking area and on the proposed Muir Beach Trail, which has some adjacent wetland habitat. Dogs would not be allowed along the lagoon shoreline. Assuming compliance, dogs would not be able to gain access to wetland vegetation. Therefore, assuming compliance, alternative D would result in negligible impacts on wetland and aquatic vegetation at this site because no measurable or perceptible changes in wetland and aquatic plants would occur as a result of this alternative.

No commercial dog walking would be allowed and no permits to walk more than three dogs would be issued under alternative D; therefore, commercial and permitted dog walking would have no impact on wetland vegetation.

**Cumulative Impacts.** The negligible impacts on wetland and aquatic vegetation from dogs at Muir Beach under alternative D were considered together with the effects of the projects mentioned above under alternative A. There would be a combination of beneficial and adverse effects from projects in and around Muir Beach; when combined, these projects would balance out, resulting in negligible impacts. Therefore, these negligible impacts combined with the negligible impacts from alternative D would result in negligible cumulative impacts on wetland and aquatic vegetation.

**MUIR BEACH ALTERNATIVE D CONCLUSION TABLE**

| <b>Wetland and Aquatic Habitat Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Negligible impacts, assuming compliance    | Physically restraining dogs would protect wetlands along the shoreline of the lagoon because dogs would not be allowed along the lagoon shoreline, but only on the proposed Muir Beach Trail, which has some adjacent wetland habitat | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would allow on-leash dog walking on the proposed Muir Beach Trail, the bridge and path to the beach, and the parking lot, and would establish a ROLA on the beach south of the boardwalk/path to the beach; the remainder of the beach would be closed to dog walking. This alternative would protect wetland and aquatic habitat through requiring on-leash dog walking and prohibiting dogs on the portion of beach adjacent to the

## Chapter 4: Environmental Consequences

lagoon. The ROLA is not located in or adjacent to wetland vegetation surrounding the lagoon. Therefore, assuming compliance, alternative E would result in negligible impacts on wetland vegetation.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Muir Beach is not one of the park sites where permits to walk more than three dogs, with a maximum of six, would be issued. Since commercial dog walking is not common at Muir Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on wetland vegetation.

**Cumulative Impacts.** The negligible impacts on wetland and aquatic vegetation from dogs at Muir Beach under alternative E were considered together with the effects of the projects mentioned above under alternative A. There would be a combination of beneficial and adverse effects from projects in and around Muir Beach; when combined, these projects would balance out, resulting in negligible impacts. Therefore, these negligible impacts combined with the negligible impacts from alternative E would result in negligible cumulative impacts on wetland vegetation.

**MUIR BEACH ALTERNATIVE E CONCLUSION TABLE**

| <b>Wetland and Aquatic Habitat Impacts</b> | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|--|---|-------------------------------|
| Negligible impacts, assuming compliance    | Compliance in the ROLA and physical restraint of dogs would protect wetlands along the shoreline of the lagoon | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative would allow on-leash dog walking on the beach, bridge and path to the beach, and the proposed Muir Beach Trail. Assuming compliance, dogs would not be able to gain access to wetland and aquatic vegetation. The protection of wetland and aquatic habitat would occur through requiring on-leash dog walking. If dogs at this site are physically restrained on leash they should not gain access to the lagoon or its shorelines, because dogs would not be allowed along the lagoon shoreline. As part of the restoration plan at this site, post-and-cable fencing would be installed between the tidal lagoon and Muir Beach to discourage visitors from accessing the lagoon, but the fencing would not physically exclude noncompliant dogs from the area. Therefore, assuming compliance, the preferred alternative would result in negligible impacts on wetland and aquatic vegetation at this site because no measurable or perceptible changes in wetland and aquatic plants would occur as a result of this alternative.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Muir Beach is not one of the park sites where permits to walk more than three dogs, with a maximum of six, would be issued. Since commercial dog walking activity is not common at Muir Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have negligible impacts on wetland and aquatic vegetation.

**Cumulative Impacts.** Projects and actions in and near Muir Beach were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils. The park stewardship programs initiative at Pirates Cove, just south of Muir Beach, included efforts to control invasive non-native plants such as pampas grass to support the dense and relatively undisturbed coastal

scrub, prairie, and riparian habitats (GGNPC 2010a, 1). Ongoing parkwide restoration and enhancement efforts, such as GGNRA natural resource stewardship programs and the *Marin Countywide Plan* (County of Marin 2007), can also beneficially affect vegetation at GGNRA park sites such as Muir Beach. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance. Habitat restoration and the implementation of projects funded by the Wildland/Urban Interface Initiative on private lands could also impact Muir Beach. The Muir Beach Wetland and Creek Restoration Project restored the lagoon in 2009 to provide a functional, resilient ecosystem while also providing habitat for special-status species and reducing flooding on Pacific Way. This project restored and enhanced ecological processes near the mouth of Redwood Creek, contributing to the quality of habitat, particularly as a result of restoration and enhancement of habitat and improvement of erosion and sedimentation conditions (NPS 2009j, 1). Similarly, the NPS and the California State Lands Commission formulated the Giacomini Wetland Restoration Project (Marin County, near Tomales Bay), which restored 560 acres of pastures to wetlands of increased complexity and diversity of vegetation and aquatic habitats (NPS 2009k; NPS and CSLC 2007). The Lower Redwood Creek Floodplain and Salmonid Habitat Restoration restored channel function to reduce flooding and reconnect the creek to its floodplain as well as expanding vegetation at the Banducci site (NPS 2010b, 1). The *Dias Ridge Restoration and Trail Improvement Project* is currently realigning trail segments and restoring degraded areas on Dias Ridge above Muir Beach (NPS 2009i, 1). Additional vegetation benefits would be expected from wetland and creek restoration at the tidal lagoon, which would reduce flooding on Pacific Way.

Additional actions have had or have the potential to have adverse effects on wetland and aquatic habitat at or in the vicinity of GGNRA sites. Larger, more regional development projects like the GGNRA *Long-range Transportation Plan Update* and the *Doyle Drive Project* will impact or have the potential to negatively affect wetland resources within and beyond park boundaries. However, wetland and aquatic impacts from the implementation of these and other proposed projects in the area should be sufficiently offset by mitigation, project by project, such that there should be no net loss of wetland acreage, functions, or values.

The negligible impacts on wetland and aquatic vegetation from dogs at Muir Beach under the preferred alternative were considered together with the effects of the projects mentioned above. There would be a combination of beneficial and adverse effects from projects in and around Muir Beach; when combined, these projects would balance out, resulting in negligible impacts. Therefore, these negligible impacts combined with the negligible impacts from the preferred alternative would result in negligible cumulative impacts on wetland and aquatic vegetation.

**MUIR BEACH PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| <b>Wetland and Aquatic Habitat Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Negligible impacts, assuming compliance    | Physically restraining dogs would protect wetlands along the shoreline of the lagoon because dogs would not be allowed along the lagoon shoreline; dogs would be allowed on leash on the proposed Muir Beach Trail, which supports some wetland habitat | Beneficial, assuming compliance                     | Negligible cumulative impacts |

### Rodeo Beach/South Rodeo Beach (Rodeo Lagoon)

**Alternative A: No Action.** Under current conditions, dogs are allowed on leash or under voice control on both beaches (Rodeo Beach and South Rodeo Beach). On-leash dog walking is allowed on the footbridge and access trail to those beaches. Rodeo Lagoon and Rodeo Lake (discussed under “Marin Headlands Trails” for Wetlands and Aquatic Habitat Impacts) are currently closed to dogs. The NPS has restricted people and their pets from accessing the lagoon and its shoreline for overall resource protection. A fence is proposed along the western shoreline of the lagoon that will deter but not physically exclude dogs from accessing the lagoon from the beach. The voice control areas are located immediately adjacent to the shoreline of the lagoon. The area receives moderate to high use by beachgoers and low to moderate use by dog owners/walkers (table 9). Park staff members have estimated that they observe dogs in the lagoon at least once a week, and on a daily basis during good weather. Trampling can affect wetland and aquatic plant species either directly, by reducing the integrity of the plants’ root systems, or indirectly, by causing increased turbidity (sedimentation) that may smother emergent plants.

Therefore, because dogs would continue to access Rodeo Lagoon and its shoreline, alternative A would result in continued long-term minor adverse impacts on wetland and aquatic vegetation at Rodeo Lagoon because effects would be measurable and perceptible, but would be localized in a relatively small area.

Under alternative A, no permit system exists for commercial dog walking. At Rodeo Beach/South Rodeo Beach, commercial dog walking is uncommon; therefore, commercial dog walking would have negligible impacts on wetland vegetation.

**Cumulative Impacts.** Projects and actions in and near Rodeo Beach/South Rodeo Beach were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs initiative projects provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils. Ongoing parkwide restoration and enhancement efforts, such as GGNRA natural resource stewardship programs and the *Marin Countywide Plan* (County of Marin 2007), can also beneficially affect vegetation at GGNRA park sites such as Rodeo Beach/South Rodeo Beach. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance. Habitat restoration and the implementation of projects funded by the Wildland/Urban Interface Initiative on private lands could also impact Rodeo Beach/South Rodeo Beach. A specific example of a project that will provide beneficial effects to wetlands is the Giacomini Wetland Restoration Project (Marin County, near Tomales Bay), which restored 560 acres of pastures to wetlands of increased complexity and diversity of vegetation and aquatic habitats (NPS 2009k; NPS and CSLC 2007).

Additional actions have had or have the potential to have adverse effects on wetlands at or in the vicinity of GGNRA sites. Larger, more regional development projects like the GGNRA *Long-range Transportation Plan Update* and the *Doyle Drive Project* will impact or have the potential to negatively affect wetland resources within and beyond park boundaries. However, wetland and aquatic impacts from the implementation of these and other proposed projects in the area should be sufficiently offset by mitigation, project by project, such that there should be no net loss of wetland acreage, functions, or values.

The loss of more than 90 percent of California’s original wetlands is the largest loss of any state in the nation and is directly related to economic development (NOAA 2010a, 1). The *Clean Water Act* and the state’s coastal wetlands statute have succeeded in reducing the rate of wetland loss in California, but development pressures remain a threat (NOAA 2010a, 1). Therefore, projects that protect or degrade wetland and aquatic habitats will have a cumulative effect, whether beneficial or adverse, on wetlands.

The long-term minor adverse impacts on wetland and aquatic vegetation from dogs at Rodeo Beach/South Rodeo Beach under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from wetland restoration/creation projects should reduce some of the adverse impacts on wetland and aquatic vegetation from alternative A. However, the impacts resulting from any development projects at or in the vicinity of GGNRA and the loss of more than 90 percent of California's original wetlands may add adversely to the cumulative impacts on wetland and aquatic vegetation, even with mitigation. There would be a combination of beneficial and adverse effects from projects in and around Rodeo Beach/South Rodeo Beach; when combined, these projects would balance out, resulting in negligible impacts. Therefore, the cumulative analysis for this park site will mainly focus on the results of the impact analysis for each alternative. Cumulative impacts on wetland vegetation under this alternative would be expected to be long term, minor, and adverse.

**RODEO BEACH/SOUTH RODEO BEACH (RODEO LAGOON) ALTERNATIVE A CONCLUSION TABLE**

| Wetland and Aquatic Habitat Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts                           |
|-------------------------------------|---|--|--|
| Long-term minor, adverse impacts    | Wetland vegetation around lagoon would be affected by dogs through trampling and turbidity; no physical barrier would exist to prevent dogs from accessing the lagoon, and closures would continue to be violated regularly | N/A  | Long-term, minor, adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Under alternative B, on-leash dog walking would be allowed on Rodeo Beach, South Rodeo Beach, and on the footbridge and access trail to the beaches. Rodeo Lagoon and Rodeo Lake are currently closed to dogs. As part of an already approved project, a post-and-cable fence would be constructed on the western edge of Rodeo Lagoon that would discourage visitors but not physically exclude visitors or dogs from accessing the lagoon. If dogs at this site are physically restrained on leash and deterred by the fence, they should not gain access to the lagoon or its shoreline. Therefore, assuming compliance, alternative B would result in negligible impacts on the wetland and aquatic vegetation associated with Rodeo Lagoon because no measurable or perceptible changes in wetland and aquatic plants would occur as a result of this alternative.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is not common at Rodeo Beach/South Rodeo Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have negligible impacts on wetland and aquatic vegetation.

**Cumulative Impacts.** The negligible impacts on wetland and aquatic vegetation from dogs at Rodeo Beach/South Rodeo Beach under alternative B were considered together with the effects of the projects mentioned above under alternative A. There would be a combination of beneficial and adverse effects from projects in and around Rodeo Beach/South Rodeo Beach; when combined, these projects would balance out, resulting in negligible impacts. Therefore, these negligible impacts combined with the negligible impacts from alternative B would result in negligible cumulative impacts on wetland and aquatic vegetation.

**Chapter 4: Environmental Consequences**

**RODEO BEACH/SOUTH RODEO BEACH (RODEO LAGOON) ALTERNATIVE B CONCLUSION TABLE**

| <b>Wetland and Aquatic Habitat Impacts</b> | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|--|---|-------------------------------|
| Negligible impacts, assuming compliance    | Physically restraining dogs would protect wetlands along the shoreline of the lagoon | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Under alternative C, on-leash dog walking would be allowed on the footbridge to the beach, and dogs would be allowed under voice and sight control in a ROLA on Rodeo Beach. Rodeo Lagoon and Rodeo Lake are currently closed to dogs. The ROLA would include portions of the sparsely vegetated foredunes that extend from the crest of the beach east to the lagoon and south to the ridge on the beach north of South Rodeo Beach. The installation of a post-and-cable fence along the beach end of Rodeo Lagoon to be constructed as part of a concurrent project would discourage visitors from accessing the lagoon, but would not physically exclude noncompliant dogs from the lagoon. With the addition of the fence as a deterrent, assuming compliance, this alternative would result in negligible impacts on wetland and aquatic vegetation, because no measurable or perceptible changes in wetland and aquatic plants would occur as a result of this alternative.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. In a ROLA, permit holders may walk one to six dogs off leash, and the permit may restrict use by time and area. Permits would be allowed for Rodeo Beach/South Rodeo Beach. Impacts on wetland and aquatic vegetation from permit holders with four to six dogs off leash would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is not common at Rodeo Beach/South Rodeo Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on wetland and aquatic vegetation.

**Cumulative Impacts.** The negligible impacts on wetland and aquatic vegetation from dogs at Rodeo Beach/South Rodeo Beach under alternative C were considered together with the effects of the projects mentioned above under alternative A. There would be a combination of beneficial and adverse effects from projects in and around Rodeo Beach/South Rodeo Beach; when combined, these projects would balance out, resulting in negligible impacts. Therefore, these negligible impacts combined with the negligible impacts from alternative C would result in negligible cumulative impacts on wetland and aquatic vegetation.

**RODEO BEACH/SOUTH RODEO BEACH (RODEO LAGOON) ALTERNATIVE C CONCLUSION TABLE**

| <b>Wetland and Aquatic Habitat Impacts</b> | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|--|---|-------------------------------|
| Negligible impacts, assuming compliance    | Compliance in the ROLA and physical restraint of dogs would protect wetlands along the shoreline of the lagoon | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Under alternative D, on-leash dog walking would be allowed on the beach in areas north of the footbridge and on the footbridge to the beach only. Rodeo Lagoon and Rodeo Lake (discussed under “Marin Headlands Trails” for Wetlands

and Aquatic Habitat Impacts) are currently closed to dogs. If dogs at this site are physically restrained on leash and deterred by the fence, they should not gain access to the lagoon or its shoreline. Therefore, assuming compliance, alternative D would result in negligible impacts on the wetland and aquatic vegetation associated with Rodeo Lagoon, because no measurable or perceptible changes in wetland and aquatic plants would occur as a result of this alternative.

No commercial dog walking would be allowed and no permits to walk more than three dogs would be issued under alternative D; therefore, commercial and permitted dog walking would have no impact on wetland and aquatic vegetation.

**Cumulative Impacts.** The negligible impacts on wetland vegetation from dogs at Rodeo Beach/South Rodeo Beach under alternative D were considered together with the effects of the projects mentioned above under alternative A. There would be a combination of beneficial and adverse effects from projects in and around Rodeo Beach/South Rodeo Beach; when combined, these projects would balance out, resulting in negligible impacts. Therefore, these negligible impacts combined with the negligible impacts from alternative D would result in negligible cumulative impacts on wetland and aquatic vegetation.

**RODEO BEACH/SOUTH RODEO BEACH (RODEO LAGOON) ALTERNATIVE D CONCLUSION TABLE**

| <b>Wetland and Aquatic Habitat Impacts</b> | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|--|---|-------------------------------|
| Negligible impacts, assuming compliance    | Physically restraining dogs would protect wetlands along the shoreline of the lagoon | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Under alternative E, dog walking under voice and sight control would be allowed in ROLAs on both Rodeo Beach and South Rodeo Beach. A total of 0.56 mile of beach would be available for off-leash dog walking. On-leash dog walking would be allowed on the footbridge and access trail to the beaches. Rodeo Lagoon and Rodeo Lake would remain closed to dogs. The installation of a post-and-cable fence along the beach side of Rodeo Lagoon proposed as part of an already approved project would discourage visitors from accessing the lagoon, but would not physically exclude noncompliant dogs. Although this alternative includes a ROLA, the addition of the fence as deterrent and compliance with regulations would result in protection of wetland vegetation surrounding Rodeo Lagoon. Assuming compliance with proposed regulations, alternative E would result in negligible impacts on wetland and aquatic vegetation; habitat would be protected and no measurable or perceptible changes in the vegetation would occur.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. In a ROLA, permit holders may walk one to six dogs off leash, and the permit may restrict use by time and area. Permits would be allowed for Rodeo Beach/South Rodeo Beach. Impacts on wetland vegetation from permit holders with four to six dogs off leash would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is not common at Rodeo Beach/South Rodeo Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on wetland vegetation.

**Cumulative Impacts.** The negligible impacts on wetland vegetation from dogs at Rodeo Beach/South Rodeo Beach under alternative E were considered together with the effects of the projects mentioned above under alternative A. There would be a combination of beneficial and adverse effects from projects

## Chapter 4: Environmental Consequences

in and around Rodeo Beach/South Rodeo Beach; when combined, these projects would balance out, resulting in negligible impacts. Therefore, these negligible impacts combined with the negligible impacts from alternative E would result in negligible cumulative impacts on wetland vegetation.

**RODEO BEACH/SOUTH RODEO BEACH (RODEO LAGOON) ALTERNATIVE E CONCLUSION TABLE**

| Wetland and Aquatic Habitat Impacts     | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Negligible impacts, assuming compliance | Compliance in the ROLA and physical restraint of dogs would protect wetlands along the shoreline of the lagoon | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative would allow on-leash dog walking on the footbridge to the beach, and dogs would be allowed under voice and sight control in a ROLA on Rodeo Beach to the sea stacks dividing the main beach from South Rodeo Beach. Rodeo Lagoon and Rodeo Lake are currently closed to dogs. The ROLA would include portions of the sparsely vegetated foredunes that extend from the crest of the beach east to the lagoon and south to the ridge on the beach just north of South Rodeo Beach. The installation of a post-and-cable fence along the beach end of Rodeo Lagoon to be constructed as part of a concurrent project would discourage visitors from accessing the lagoon, but would not physically exclude noncompliant dogs from the lagoon. With the addition of the fence as a deterrent, and assuming compliance, this alternative would result in negligible impacts on wetland vegetation, because no measurable or perceptible changes in wetland and aquatic plants would occur as a result of this alternative.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. In a ROLA, permit holders may walk one to six dogs off leash, and the permit may restrict use by time and area. Permits would be allowed for Rodeo Beach/South Rodeo Beach. Impacts on wetland vegetation from permit holders with four to six dogs off leash would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is not common at Rodeo Beach/South Rodeo Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have negligible impacts on wetland vegetation.

**Cumulative Impacts.** Projects and actions in and near Rodeo Beach/South Rodeo Beach were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs initiative projects provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils. Ongoing parkwide restoration and enhancement efforts, such as GGNRA natural resource stewardship programs and the *Marin Countywide Plan* (County of Marin 2007), can also beneficially affect vegetation at GGNRA park sites such as Rodeo Beach/South Rodeo Beach. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance. Habitat restoration and the implementation of projects funded by the Wildland/Urban Interface Initiative on private lands could also impact Rodeo Beach/South Rodeo Beach. A specific example of a project that will provide beneficial effects to wetlands is the Giacomini Wetland Restoration Project (Marin County, near Tomales Bay), which restored 560 acres of pastures to wetlands of increased complexity and diversity of vegetation and aquatic habitats (NPS 2009k; NPS and CSLC 2007).

Additional actions have had or have the potential to have adverse effects on wetlands at or in the vicinity of GGNRA sites. Larger, more regional development projects like the GGNRA *Long-range Transportation Plan Update* and the *Doyle Drive Project* will impact or have the potential to negatively affect wetland resources within and beyond park boundaries. However, wetland and aquatic impacts from the implementation of these and other proposed projects in the area should be sufficiently offset by mitigation, project by project, such that there should be no net loss of wetland acreage, functions, or values.

The negligible impacts on wetland and aquatic vegetation from dogs at Rodeo Beach/South Rodeo Beach under the preferred alternative were considered together with the effects of the projects mentioned above. There would be a combination of beneficial and adverse effects from projects in and around Rodeo Beach/South Rodeo Beach; when combined, these projects would balance out, resulting in negligible impacts. Therefore, these negligible impacts combined with the negligible impacts from the preferred alternative would result in negligible cumulative impacts on wetland and aquatic vegetation.

#### RODEO BEACH/SOUTH RODEO BEACH (RODEO LAGOON) PREFERRED ALTERNATIVE F CONCLUSION TABLE

| Wetland and Aquatic Habitat Impacts     | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Negligible impacts, assuming compliance | Compliance in the ROLA and physical restraint of dogs would protect wetlands along the shoreline of the lagoon | Beneficial, assuming compliance              | Negligible cumulative impacts |

### Marin Headlands Trails

**Alternative A: No Action.** Currently, on-leash dog walking is allowed along the Coastal Trail from Hill 88 to Muir Beach, the Batteries Loop Trail, North Miwok Trail from Tennessee Valley to Highway 1, County View Trail, and Marin Drive. Dog walking under voice control (or on leash) is allowed along the section of the Coastal Trail from the Golden Gate Bridge to Hill 88 (which includes the Lagoon Loop Trail), the Coastal, Wolf Ridge, and Miwok Trail Loop, and the Old Bunker Fire Road Loop (includes section of the Coastal Trail). These trails experience low to moderate use by dog walkers, but dog-related incidents are high at this site, with a total of 269 from 2008 through 2011. The majority of dog-related incidents at the Marin Headlands Trails were for having dogs within areas closed to pets (table 16). The Marin Headlands Trails area contains wetland vegetation around Rodeo Lake (which is currently closed) and extensive areas of wetlands in the valley bottom along Rodeo Valley Trail. These wetlands are being affected by dogs through trampling and turbidity; there is no physical barrier to prevent dogs from accessing the lake and closures are violated regularly. Physical disturbance and nutrient addition are currently happening along the trails and fire roads and in off-trail areas throughout the site due to unleashed dogs.

Since dogs would continue to be allowed under voice control in portions of the site under alternative A, there is a higher likelihood that dogs would go off trail than if they were on leash, thus affecting vegetation in adjacent undisturbed areas. Therefore, impacts on wetland and aquatic vegetation as a result of this alternative would continue to be long term, minor, and adverse because effects would be measurable and perceptible, but would be localized in a relatively small area.

Under alternative A, no permit system exists for dog walking. At the Marin Headlands Trails, commercial dog walking is uncommon; therefore, commercial dog walking would have negligible impacts on wetland vegetation.

## Chapter 4: Environmental Consequences

**Cumulative Impacts.** Projects and actions in and near the Marin Headlands Trails were considered for the cumulative impacts analysis (appendix K). Many wetland restoration/creation projects have been completed or are proposed in GGNRA and beyond the boundaries of the park. Impacts resulting from completed, ongoing, and future restoration/creation projects at the Marin Headlands Trails and projects beyond the park boundaries will generally provide an overall benefit to wetland (including tidal marsh) and aquatic habitats. A specific example of a project that will provide beneficial effects to wetlands is the Giacomini Wetland Restoration Project (Marin County, near Tomales Bay), which restored 560 acres of pastures to wetlands of increased complexity and diversity of vegetation and aquatic habitats (NPS 2009k; NPS and CSLC 2007). Another such project is the Gulf of the Farallones National Marine Sanctuary's proposed Bolinas Lagoon Ecosystem Restoration Project (near Stinson Beach), which will benefit the vegetation at the Bolinas Lagoon (GFNMS Working Group 2008).

Additional actions have had or have the potential to have adverse effects on wetlands at or in the vicinity of GGNRA sites. Larger, more regional development projects like the GGNRA *Long-range Transportation Plan Update* and the *Doyle Drive Project* will impact or have the potential to negatively affect wetland resources within and beyond park boundaries. However, wetland and aquatic impacts from the implementation of these and other proposed projects in the area should be sufficiently offset by mitigation, project by project, such that there should be no net loss of wetland acreage, functions, or values.

As stated previously, the loss of more than 90 percent of California's original wetlands is the largest loss of any state in the nation and is directly related to economic development (NOAA 2010a, 1). The *Clean Water Act* and the state's coastal wetlands statute have succeeded in reducing the rate of wetland loss in California, but development pressures remain a threat (NOAA 2010a, 1). Therefore, projects that protect or degrade wetland and aquatic habitats will have a cumulative effect, whether beneficial or adverse, on wetlands.

The long-term minor adverse impacts on wetland and aquatic vegetation from dogs at the Marin Headlands Trails under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from wetland restoration/creation projects should reduce some of the adverse impacts on vegetation from alternative A. However, the impacts resulting from any development projects at or in the vicinity of GGNRA and the loss of more than 90 percent of California's original wetlands may add adversely to the cumulative impacts on vegetation, even with mitigation. There would be a combination of beneficial and adverse effects from projects in and around the Marin Headlands Trails; when combined, these projects would balance out, resulting in negligible impacts. Therefore, the cumulative analysis for this park site will mainly focus on the results of the impact analysis for each alternative. Cumulative impacts on wetland and aquatic vegetation under this alternative would be expected to be long term, minor, and adverse.

**MARIN HEADLANDS TRAILS ALTERNATIVE A CONCLUSION TABLE**

| <b>Wetland and Aquatic Habitat Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>                    |
|--|---|---|--|
| Long-term minor adverse impacts            | Wetland vegetation around Rodeo Lake would be affected by dogs through trampling and turbidity; no physical barrier would exist to prevent dogs from accessing the lake and closures would continue to be violated regularly; extensive areas of wetlands exist in the valley bottom along Rodeo Valley Trail | N/A   | Long-term, minor, adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would prohibit dogs on the trails at the Marin Headlands Trails. Not allowing dog walking on the Marin Headlands Trails would eliminate physical disturbance by dogs and nutrient addition from dog waste. Therefore, assuming compliance, alternative B would result in no impact on wetland vegetation at the site.

Since dogs would not be allowed at the Marin Headlands Trails, there would be no impact from commercial dog walkers on the wetland vegetation.

**Cumulative Impacts.** The lack of impacts on wetland and aquatic vegetation from dogs at the Marin Headlands Trails under alternative B was considered together with the effects of the projects mentioned above under alternative A. There would be a combination of beneficial and adverse effects from projects in and around the Marin Headlands Trails; when combined, these projects would balance out, resulting in negligible impacts. Cumulatively, there would be negligible impacts on wetland and aquatic vegetation at this park site.

**MARIN HEADLANDS TRAILS ALTERNATIVE B CONCLUSION TABLE**

| <b>Wetland and Aquatic Habitat Impacts</b> | <b>Rationale</b>                     | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|--------------------------------------|---|-------------------------------|
| No impact assuming compliance              | Dogs would be prohibited at the site | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Under alternative C, on-leash dog walking would be allowed along the Lower Rodeo Valley Trail Corridor. This corridor runs from the Rodeo Beach parking lot to the intersection of Bunker and McCullough Roads via the North Lagoon Loop Trail, Miwok Trail, and Rodeo Valley Trail including the connector trail from the Rodeo Valley Trail to Smith Road Trailhead. On-leash dog walking would also be allowed on the Old Bunker Fire Road Loop (including a section of the Coastal Trail), and the Batteries Loop Trail. This alternative would allow dog access only on these perimeter trails in the Marin Headlands, while preserving and maintaining the integrity of interior habitat. The valley bottom along the Rodeo Valley Trail Corridor is adjacent to extensive areas of freshwater vegetation, and the Miwok Trail is adjacent to Rodeo Lake, which supports shoreline wetland vegetation and is currently closed. Impacts in areas adjacent to the trails/fire roads (LOD area) would be long term, minor, and adverse since this wetland and aquatic vegetation would be affected by trampling and dog waste. Impacts would be measurable and perceptible, but would be localized in a relatively small area.

## Chapter 4: Environmental Consequences

The long-term minor adverse impacts from dogs in the LOD area would occur in a relatively small area compared to the site as a whole. Physically restraining dogs on leash would protect vegetation off trail, and dogs would not be allowed in Rodeo Lake. Therefore, assuming compliance, the overall impact on wetland and aquatic vegetation from on-leash dog walking would be negligible because impacts would result in no measurable or perceptible changes in these plant communities.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Marin Headlands Trails is not one of the park sites where permits to walk more than three dogs, with a maximum of six, would be issued. Since commercial dog walking is not common at the Marin Headlands Trails, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on wetland vegetation.

**Cumulative Impacts.** The negligible impacts on wetland vegetation from dogs at the Marin Headlands Trails under alternative C were considered together with the effects of the projects mentioned above under alternative A. There would be a combination of beneficial and adverse effects from projects in and around the Marin Headlands Trails; when combined, these projects would balance out, resulting in negligible impacts. Therefore, these negligible impacts combined with the negligible impacts from alternative C would result in negligible cumulative impacts on wetland and aquatic vegetation.

**MARIN HEADLANDS TRAILS ALTERNATIVE C CONCLUSION TABLE**

| <b>Wetland and Aquatic Habitat Impacts</b>      | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--|---|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect Rodeo Lake wetland vegetation and habitat off trail along the Rodeo Valley Trail Corridor, which supports wetlands | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Alternative D would have the same restrictions as alternative B (dogs would be prohibited on the trails) and impacts would be the same, assuming compliance: no impact.

Since dogs would not be allowed at the Marin Headlands Trails, there would be no impact from commercial dog walkers on the wetland vegetation.

**Cumulative Impacts.** Under alternative D, the cumulative impacts on wetland and aquatic vegetation at this park site would be the same as those under alternative B: negligible cumulative impacts.

**MARIN HEADLANDS TRAILS ALTERNATIVE D CONCLUSION TABLE**

| <b>Wetland and Aquatic Habitat Impacts</b> | <b>Rationale</b>                     | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|--------------------------------------|---|-------------------------------|
| No impact assuming compliance              | Dogs would be prohibited at the site | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would allow on-leash dog walking on the Conzelman Coastal Trail from Highway 101 to the McCullough intersection and then to the Coastal Trail Bike Route, including Julian Road, to the Rodeo Beach parking lot. On-leash

dog walking would also be available on the Old Bunker Fire Road Loop (which includes a section of the Coastal Trail), the Batteries Loop Trail, North Miwok Trail from Tennessee Valley to Highway 1, County View Trail, Marin Drive, Rodeo Avenue Trail, and Morning Sun Trail. This alternative would allow dog access only on these perimeter trails in the Marin Headlands, while preserving and maintaining the integrity of interior habitat. The valley bottom along Rodeo Valley Trail Corridor is adjacent to extensive areas of freshwater vegetation, and the Miwok Trail is adjacent to Rodeo Lake, which supports shoreline wetland vegetation and is currently closed. Impacts in areas adjacent to the trails/fire roads (LOD area) would be long term, minor, and adverse since this wetland and aquatic vegetation would be affected by trampling and dog waste. Impacts would be measurable and perceptible, but would be localized in a relatively small area. Even though alternative E would allow more dog access at the site, the difference in dog use between alternatives E and C is not considered large enough to cause a change in the intensity of the impact relative to the area of the site.

The long-term minor adverse impacts from dogs in the LOD area would occur in a relatively small area compared to the site as a whole. Although more trails would be available to dogs in alternative E compared to alternative C, the overall impacts on wetland vegetation from on-leash dog walking would be the same. The continued closure of Rodeo Lake and physically restraining dogs on leash would protect wetland vegetation off trail. Therefore, assuming compliance, the overall impact on wetland and aquatic vegetation would be negligible because impacts would result in no measurable or perceptible changes in the plant communities.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Marin Headlands Trails is not one of the park sites where permits to walk more than three dogs, with a maximum of six, would be issued. Since commercial dog walking is not common at the Marin Headlands Trails, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on wetland and aquatic vegetation.

**Cumulative Impacts.** The negligible impacts on wetland vegetation from dogs at the Marin Headlands Trails under alternative E were considered together with the effects of the projects mentioned above under alternative A. There would be a combination of beneficial and adverse effects from projects in and around the Marin Headlands Trails; when combined, these projects would balance out, resulting in negligible impacts. Therefore, these negligible impacts combined with the negligible impacts from alternative E would result in negligible cumulative impacts on wetland vegetation.

**MARIN HEADLANDS TRAILS ALTERNATIVE E CONCLUSION TABLE**

| <b>Wetland and Aquatic Habitat Impacts</b>      | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--|---|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect Rodeo Lake wetland vegetation and habitat off trail along the Rodeo Valley Trail Corridor, which supports wetlands | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative would allow on-leash dog walking along the Lower Rodeo Valley Trail Corridor, from the Rodeo Beach parking lot to the intersection of Bunker and McCullough Roads via the North Lagoon Loop Trail, Miwok Trail, and the Rodeo Valley Trail, including the connector trail from Rodeo Valley Trail to the Smith Road Trailhead. On-leash dog walking would also be available on the Old Bunker Fire Road Loop (including a section of the Coastal Trail), the Batteries Loop Trail, Rodeo Avenue Trail, and Morning Sun Trail. This alternative would allow dog

## Chapter 4: Environmental Consequences

access only on these perimeter trails in the Marin Headlands, while preserving and maintaining the integrity of interior habitat. The valley bottom along Rodeo Valley Trail Corridor is adjacent to extensive areas of freshwater vegetation, and the Miwok Trail is adjacent to Rodeo Lake, which supports shoreline wetland vegetation and is currently closed. Impacts in areas adjacent to the trails/fire roads would be long term, minor, and adverse since this wetland and aquatic vegetation would be affected by trampling and dog waste. Impacts would be measurable and perceptible, but would be localized in a relatively small area. Even though alternative F would allow more dog access at the site, the difference in dog walking use between alternatives F and C is not considered large enough to cause a change in the intensity of the impact relative to the area of the site.

The long-term minor adverse impacts from dogs in the LOD area would occur in a relatively small area compared to the site as a whole. Physically restraining dogs on leash would protect wetland and aquatic vegetation off trail. Therefore, assuming compliance, the overall impact on wetland and aquatic vegetation from on-leash dog walking would be negligible because impacts would result in no measurable or perceptible changes in the plant communities.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Marin Headlands Trails is not one of the park sites where permits to walk more than three dogs, with a maximum of six, would be issued. Since commercial dog walking is not common at Marin Headlands Trails, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have negligible impacts on wetland and aquatic vegetation.

**Cumulative Impacts.** Projects and actions in and near the Marin Headlands Trails were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils. Ongoing parkwide restoration and enhancement efforts, such as GGNRA natural resource stewardship programs and the *Marin Countywide Plan* (County of Marin 2007), can also beneficially affect vegetation at GGNRA park sites such as the Marin Headlands Trails. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance. Habitat restoration and the implementation of projects funded by the Wildland/Urban Interface Initiative on private lands could also impact the Marin Headlands Trails. Another project that will provide beneficial effects to wetlands is the Giacomini Wetland Restoration Project (Marin County, near Tomales Bay), which restored 560 acres of pastures to wetlands of increased complexity and diversity of vegetation and aquatic habitats (NPS 2009k; NPS and CSLC 2007).

Additional actions have had or have the potential to have adverse effects on wetlands at or in the vicinity of GGNRA sites. Larger, more regional development projects like the GGNRA *Long-range Transportation Plan Update* and the *Doyle Drive Project* will impact or have the potential to negatively affect wetland resources within and beyond park boundaries. However, wetland and aquatic impacts from the implementation of these and other proposed projects in the area should be sufficiently offset by mitigation, project by project, such that there should be no net loss of wetland acreage, functions, or values.

The negligible impacts on wetland and aquatic vegetation from dogs at the Marin Headlands Trails under the preferred alternative were considered together with the effects of the projects mentioned above. There would be a combination of beneficial and adverse effects from projects in and around the Marin Headlands Trails; when combined, these projects would balance out, resulting in negligible impacts. Therefore, these negligible impacts combined with the negligible impacts from the preferred alternative would result in negligible cumulative impacts on wetland vegetation.

## MARIN HEADLANDS TRAILS PREFERRED ALTERNATIVE F CONCLUSION TABLE

| Wetland and Aquatic Habitat Impacts             | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance              | Negligible cumulative impacts |

## SAN FRANCISCO COUNTY SITES

## Crissy Field

**Common to All Alternatives.** Impacts from dogs as a result of the two different definitions of the Crissy Field WPA [the 36 CFR 7.97(d) definition for alternative A (Warming Hut to approximately 700 feet east of the former Coast Guard Station pier), and the definitions for alternatives B–F of Warming Hut to approximately 900 feet east of the former Coast Guard Station Pier] will be the same for all alternatives. Even though the WPA would be expanded for alternatives B–F, this change would not influence the overall impacts analysis at this site because it would neither increase nor decrease the impacts at Crissy Field described in the paragraphs that follow. Further explanation of these two definitions can be found in the “Current Regulations and Policies” section of chapter 2.

**Alternative A: No Action.** Both freshwater and tidal wetlands are present at Crissy Field. A restoration project reestablished a narrow and steep fringe of salt marsh vegetation at approximately 18 acres of an unvegetated tidal lagoon that links with San Francisco Bay (referred to as the tidal marsh). As part of the restoration, California seablite (a federally listed plant species) and Point Reyes bird’s-beak (a CNPS-listed species) were introduced into the tidal marsh. Despite protection of the restored tidal marsh (which is currently closed) by installed fencing, dogs under voice control have been documented as gaining access to the tidal marsh through the tidal inlet that allows exchange of water between the marsh and San Francisco Bay. In general, compliance with dog walking regulations at Crissy Field is low, and from 2008 through 2011 a total of 510 incidents were reported. Of the 510 incidents, 283 incidents were for having dogs off leash within the Crissy Field WPA when the seasonal leash restriction was in effect (table 19). Other common incidents include violation of a closed area (58 incidents), having dogs off leash (65 incidents), and possession of a pet in a closed area (15). Other violations were issued for having pets in Crissy Field Lagoon, which is closed to both humans and pets. Specifically, the park has documented that dogs entering the marsh typically go under the bridge that spans the inlet and onto the flood shoal and adjacent areas along the marsh. Alternative A would continue to result in long-term minor adverse impacts on salt marsh vegetation from physical damage by dogs (trampling and increased turbidity). The freshwater wetlands at Crissy Field would continue to receive negligible impacts from dog activities because they are almost completely enclosed by fencing, to prohibit access by dogs and people.

No permit system exists for commercial dog walking under alternative A. However, commercial dog walking at Crissy Field occurs regularly. Commercial dog walking would continue to contribute to the long-term minor adverse impacts on salt marsh vegetation. Commercial dog walkers with multiple dogs under voice control would impact wetland and aquatic vegetation through trampling.

**Cumulative Impacts.** Projects and actions in and near Crissy Field were considered for the cumulative impacts analysis (appendix K). Many wetland restoration/creation projects have been completed or are proposed in GGNRA and beyond the boundaries of the park. Impacts resulting from completed, ongoing, and future restoration/creation projects at Crissy Field and projects beyond the park boundaries will generally provide an overall benefit to wetland and aquatic habitats. A specific example of a project that

## Chapter 4: Environmental Consequences

will provide beneficial effects to wetlands is the Giacomini Wetland Restoration Project (Marin County, near Tomales Bay), which restored 560 acres of pastures to wetlands of increased complexity and diversity of vegetation and aquatic habitats (NPS 2009k; NPS and CSLC 2007). Another such project is the Gulf of the Farallones National Marine Sanctuary's proposed Bolinas Lagoon Ecosystem Restoration Project (near Stinson Beach), which will benefit wildlife species that currently use Bolinas Lagoon (GFNMS Working Group 2008). Beginning in 1997, efforts to remediate and restore Crissy Field included the removal of hazardous waste and the re-creation of the 18-acre tidal marsh. The subsequent 5-year monitoring program included tracking of hydrology and geomorphology, water quality, soils and sedimentation, vegetation, fish, invertebrates, and birds (NPS 2010a, 1-2).

The PTMP was adopted in 2002 and includes the preservation of the Presidio's cultural, natural, scenic, and recreational resources in Area B, managed by the Presidio Trust. The PTMP focuses on the long-term preservation of the park, including replacing pavement with green space, improving and enlarging the park's trail system, restoring stream corridors and natural habitats, and reusing historic structures (Presidio Trust 2002, 3). Management objectives in the PTMP that are applicable to vegetation include identifying and protecting sensitive wildlife species, and restoring and maintaining their habitats. The PTMP also preserves, enhances, and increases natural habitats managed by the Presidio Trust. For example, historic forest is being rehabilitated, wetlands are being enhanced, and native plant and wildlife species are being protected (Presidio Trust 2002, ii). As a result, the PTMP has beneficial impacts on wetland vegetation at or in the vicinity of Crissy Field. In addition to the PTMP at the Presidio, the Quartermaster Reach Project is also being conducted and will benefit wetlands at the Presidio and Crissy Marsh. The Quartermaster Reach Project includes "daylighting" about 850 feet of stream currently in a subsurface culvert that discharges to Crissy Marsh (Presidio Trust 2012e, 1). The project will provide an ecological corridor and pedestrian trail through Quartermaster Reach that will connect a recently restored 450-foot stretch of stream and native habitat to the south (known as Thompson Reach) to Crissy Field Tidal Marsh (Presidio Trust 2012e, 1).

Additional actions have had or have the potential to have adverse effects on wetlands at or in the vicinity of GGNRA sites. Larger, more regional development projects like the GGNRA *Long-range Transportation Plan Update* and the *Doyle Drive Project* will impact or have the potential to negatively affect wetland resources within and beyond park boundaries. However, wetland impacts from the implementation of these and other proposed projects in the area should be sufficiently offset by mitigation, project by project, such that there should be no net loss of wetland acreage, functions, or values.

The loss of more than 90 percent of California's original wetlands is the largest loss of any state in the nation and is directly related to economic development (NOAA 2010a, 1). The *Clean Water Act* and the state's coastal wetlands statute have succeeded in reducing the rate of wetland loss in California, but development pressures remain a threat (NOAA 2010a, 1). Therefore, projects that protect or degrade wetlands and aquatic habitats will have a cumulative effect, whether beneficial or adverse, on wildlife species that inhabit wetlands.

The negligible to long-term minor adverse impacts on wetland vegetation from dogs at Crissy Field under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from wetland restoration/creation projects should reduce some of the adverse impacts on vegetation from alternative A. However, the impacts resulting from any development projects at or in the vicinity of GGNRA and the loss of more than 90 percent of California's original wetlands may add adversely to the cumulative impacts on vegetation, even though mitigation has contributed to reducing impacts. There would be a combination of beneficial and adverse effects from projects in and around Crissy Field; when combined, these projects would balance out, resulting in negligible impacts. Therefore, the cumulative analysis for this park site will mainly focus on the results of the impact analysis

for each alternative. Cumulative impacts on wetland and aquatic vegetation under this alternative would be expected to be negligible to long term, minor, and adverse.

**CRISSY FIELD ALTERNATIVE A CONCLUSION TABLE**

| <b>Wetland and Aquatic Habitat Impacts</b>   | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>                                |
|--|--|---|--|
| Long-term minor adverse impacts on tidal wetlands; negligible impacts on freshwater wetlands | Tidal marsh vegetation would be affected by dogs through trampling and increased turbidity; despite fencing, dogs under voice control would continue to gain access to the tidal marsh through the tidal inlet; freshwater wetland areas would be fenced to prohibit access by dogs and people | N/A   | Negligible to long-term minor adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking on the promenade, Crissy Airfield, East and Central beaches, paths leading to Central Beach, trails and grassy areas near East Beach, around the Old Coast Guard Station, and on the Mason Street Bike Path. Dogs would be prohibited from the WPA and the tidal marsh. Since dogs would be physically restrained on leash (or prohibited from portions of the site), they should not gain access to the tidal marsh through the tidal inlet. Therefore, assuming compliance, negligible impacts on wetland and aquatic vegetation could occur as a result of this alternative; no measurable or perceptible changes in wetland and aquatic plants would occur as a result of this alternative.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Even though the percentage of commercial dog walkers is considered moderate to high at Crissy Field, dogs would be required to be on leash, preventing dog access to the tidal marsh and wetland vegetation. Therefore, impacts on wetland and aquatic vegetation from dogs walked by both commercial dog walkers and private individuals would be negligible.

**Cumulative Impacts.** The negligible impacts on wetland vegetation from dogs at Crissy Field under alternative B were considered together with the effects of the projects mentioned above under alternative A. Cumulatively, alternative B would have negligible impacts on wetland vegetation at or in the vicinity of Crissy Field.

**CRISSY FIELD ALTERNATIVE B CONCLUSION TABLE**

| <b>Wetland and Aquatic Habitat Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Negligible impacts, assuming compliance    | The existing fence and physical restraint of dogs would protect tidal marsh wetlands, which would be closed to dogs | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** The addition of one ROLA on Central Beach and a second on Crissy Airfield in alternative C would allow dog walking under voice and sight control. On-leash dog walking would be available along the promenade, the eastern and western

## Chapter 4: Environmental Consequences

sections of Crissy Airfield, Mason Street Bike Path, trails and grassy areas near East Beach, around the Old Coast Guard Station, paths to Central Beach, picnic areas, and parking areas. All fenced areas, including the tidal marsh, are currently closed to dogs, and the WPA and East Beach would be closed under this alternative. Since dogs would be physically restrained on leash in areas surrounding the tidal marsh, dogs should not gain access to the tidal marsh through the tidal inlet. Therefore, assuming compliance, alternative C would result in negligible impacts on wetland and aquatic vegetation because no measurable or perceptible change in the wetland and aquatic plant community would be anticipated at this site.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. In a ROLA, permit holders may walk one to six dogs off leash, and the permit may restrict use by time and area. Permits would be allowed at Crissy Field. Even though the percentage of commercial dog walkers is considered moderate to high at Crissy Field, dogs would be required to be on leash, preventing dog access to the tidal marsh and wetland vegetation. Impacts on wetland and aquatic vegetation from commercial dog walkers would be similar to impacts from other dog walkers, as summarized in the previous paragraph; therefore, impacts from commercial dog walking would be negligible.

**Cumulative Impacts.** The negligible impacts on wetland and aquatic vegetation from dogs at Crissy Field under alternative C were considered together with the effects of the projects mentioned above in alternative A. Cumulatively, alternative C would have negligible impacts on wetland and aquatic vegetation at or in the vicinity of Crissy Field when added to the effects from these projects.

**CRISSY FIELD ALTERNATIVE C CONCLUSION TABLE**

| Wetland and Aquatic Habitat Impacts     | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Negligible impacts, assuming compliance | The existing fence and physical restraint of dogs would protect tidal marsh wetlands, which would be closed to dogs | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Alternative D would prohibit dogs on all beaches, but would establish a ROLA on the western section of Crissy Airfield. On-leash dog walking would be allowed on the trails and other areas open to dogs in this alternative. All fenced areas, including the tidal marsh, are currently closed to dogs, and the WPA, Central Beach, and East Beach would be closed to dogs under this alternative. Assuming compliance, negligible impacts on wetland and aquatic vegetation would occur as a result of alternative D because no measurable or perceptible changes in wetland and aquatic plants would occur as a result of this alternative.

No commercial dog walking would be allowed and no permits to walk more than three dogs would be issued under alternative D; therefore, commercial and permitted dog walking would have no impact on wetland and aquatic vegetation.

**Cumulative Impacts.** The negligible impacts on wetland and aquatic vegetation from dogs at Crissy Field under alternative D were considered together with the effects of the projects mentioned above in alternative A. Cumulatively, alternative D would have negligible impacts on wetland and aquatic vegetation at or in the vicinity of Crissy Field when added to the effects from these projects.

**CRISSY FIELD ALTERNATIVE D CONCLUSION TABLE**

| <b>Wetland and Aquatic Habitat Impacts</b> | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|--|---|-------------------------------|
| Negligible impacts, assuming compliance    | Compliance in the ROLA, physical restraint of dogs, and the existing fence would protect tidal marsh wetlands, which would be closed to dogs | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would allow on-leash dog walking in the WPA, on the promenade, East Beach, paths to Central Beach, trails and grassy areas near East Beach, around the Old Coast Guard Station, and on the Mason Street Bike Path. Dogs would not be allowed in the tidal marsh, but dogs would be allowed under voice and sight control in two ROLAs established on the Crissy Airfield and Central Beach. Compliance in the ROLAs, physical restraint of dogs on leash in other areas of the site, and the existing fence would protect tidal marsh wetlands at the site. Assuming compliance, alternative E would result in negligible impacts on wetland and aquatic vegetation in the tidal marsh because no measurable or perceptible change in the wetland and aquatic plant community would be anticipated as a result of this alternative.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. In a ROLA, permit holders may walk one to six dogs off leash, and the permit may restrict use by time and area. Permits would be allowed at Crissy Field. Even though the percentage of commercial dog walkers is considered moderate to high at Crissy Field, compliance in the ROLAs, physical restraint of dogs on leash in other areas of the site, and the existing fence would protect tidal marsh wetlands at the site. Impacts on wetland and aquatic vegetation from commercial dog walkers would be similar to impacts from other dog walkers, as summarized in the above paragraph; therefore, impacts from commercial dog walking would be negligible.

**Cumulative Impacts.** The negligible impacts on wetland and aquatic vegetation from dogs at Crissy Field under alternative E were considered together with the effects of the projects mentioned above in alternative A. Cumulatively, alternative E would be negligible impacts on vegetation at or in the vicinity of Crissy Field.

**CRISSY FIELD ALTERNATIVE E CONCLUSION TABLE**

| <b>Wetland and Aquatic Habitat Impacts</b> | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|--|---|-------------------------------|
| Negligible impacts, assuming compliance    | Compliance in the ROLA, physical restraint of dogs, and the existing fence would protect tidal marsh wetlands, which would be closed to dogs | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** A ROLA on Central Beach and a second on the eastern section of Crissy Airfield in the preferred alternative would allow dog walking under voice and sight control; on-leash dog walking would be required in all other areas of Crissy Field that would be open to dog walking in this alternative. All fenced areas, including the tidal marsh, are currently closed to dogs, and the WPA and East Beach would be closed under this alternative. Since dogs would be physically restrained on leash in areas surrounding the tidal marsh, dogs should not gain access to the tidal marsh through the tidal inlet. Therefore, assuming compliance, the preferred alternative would result in negligible impacts on wetland

## Chapter 4: Environmental Consequences

and aquatic vegetation because no measurable or perceptible change in the wetland and aquatic plant community would be anticipated at this site.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. In a ROLA, permit holders may walk one to six dogs off leash, and the permit may restrict use by time and area. Permits would be allowed at Crissy Field. Even though the percentage of commercial dog walkers is considered moderate to high at Crissy Field, dogs would be required to be on leash, preventing dog access to the tidal marsh and wetland vegetation. Impacts on wetland and aquatic vegetation from commercial dog walkers would be similar to impacts from other dog walkers, as summarized in the above paragraph; therefore, impacts from commercial dog walking would be negligible.

**Cumulative Impacts.** Projects and actions in and near Crissy Field were considered for the cumulative impacts analysis (appendix K). Many wetland restoration/creation projects have been completed or are proposed in GGNRA and beyond the boundaries of the park. Impacts resulting from completed, ongoing, and future restoration/creation projects at Crissy Field and projects beyond the park boundaries will generally provide an overall benefit to wetland and tidal marsh habitats. Specific examples of projects and plans that will cumulatively provide beneficial effects to wetlands include the Giacomini Wetland Restoration Project (Marin County, near Tomales Bay), which restored 560 acres of pastures to wetlands of increased complexity and diversity of vegetation and aquatic habitats (NPS 2009k; NPS and CSLC 2007). The Gulf of the Farallones National Marine Sanctuary has proposed the Bolinas Lagoon Ecosystem Restoration Project (near Stinson Beach), which will benefit wildlife species that currently use Bolinas Lagoon (GFNMS Working Group 2008). Beginning in 1997, efforts to remediate and restore Crissy Field included the removal of hazardous waste and the re-creation of the 18-acre tidal marsh. The subsequent 5-year monitoring program included tracking of hydrology and geomorphology, water quality, soils and sedimentation, vegetation, fish, invertebrates, and birds (NPS 2010a, 1-2).

The PTMP was adopted in 2002 and includes the preservation of the Presidio's cultural, natural, scenic, and recreational resources in Area B, managed by the Presidio Trust. The PTMP focuses on the long-term preservation of the park, including replacing pavement with green space, improving and enlarging the park's trail system, restoring stream corridors and natural habitats, and reusing historic structures (Presidio Trust 2002, 3). Management objectives in the PTMP that are applicable to vegetation include identifying and protecting sensitive wildlife species, and restoring and maintaining their habitats. The PTMP also preserves, enhances, and increases natural habitats managed by the Presidio Trust. For example, historic forest is being rehabilitated, wetlands are being enhanced, and native plant and wildlife species are being protected (Presidio Trust 2002, ii). As a result, the PTMP has beneficial impacts on wetland vegetation at or in the vicinity of Crissy Field. In addition to the PTMP at the Presidio, the Quartermaster Reach Project is also being conducted and will benefit wetlands at the Presidio and Crissy Marsh. The Quartermaster Reach Project includes "daylighting" about 850 feet of stream currently in a subsurface culvert that discharges to Crissy Marsh (Presidio Trust 2012e, 1). The project will provide an ecological corridor and pedestrian trail through Quartermaster Reach that will connect a recently restored 450-foot stretch of stream and native habitat to the south (known as Thompson Reach) to Crissy Field Tidal Marsh (Presidio Trust 2012e, 1).

Additional actions have had or have the potential to have adverse effects on wetlands at or in the vicinity of GGNRA sites. Larger, more regional development projects like the GGNRA *Long-range Transportation Plan Update* and the *Doyle Drive Project* will impact or have the potential to negatively affect wetland resources within and beyond park boundaries. However, wetland and aquatic impacts from the implementation of these and other proposed projects in the area should be sufficiently offset by

mitigation, project by project, such that there should be no net loss of wetland acreage, functions, or values.

The loss of more than 90 percent of California's original wetlands is the largest loss of any state in the nation and is directly related to economic development (NOAA 2010a, 1). The *Clean Water Act* and the state's coastal wetlands statute have succeeded in reducing the rate of wetland loss in California, but development pressures remain a threat (NOAA 2010a, 1). Therefore, projects that protect or degrade wetland and aquatic habitats will have a cumulative effect, whether beneficial or adverse, on wildlife species that inhabit wetlands.

Under the preferred alternative, the negligible impacts on wetland and aquatic vegetation from dogs at Crissy Field were considered together with the effects of the projects mentioned above. There would be a combination of beneficial and adverse effects from projects in and around Crissy Field; when combined, these projects would balance out, resulting in negligible impacts. Therefore, the cumulative analysis for this park site will mainly focus on the results of the impact analysis for this alternative. Cumulatively, the preferred alternative would have negligible impacts on wetland and aquatic vegetation at or in the vicinity of Crissy Field.

**CRISSY FIELD PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| <b>Wetland and Aquatic Habitat Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Negligible impacts, assuming compliance    | Compliance in the ROLAs, physical restraint of dogs, and the existing fence would protect tidal marsh wetlands, which would be closed to dogs | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

## **SAN MATEO COUNTY SITES**

### **Mori Point**

**Alternative A: No Action.** Dogs are currently allowed on leash on all trails at Mori Point. This site has moderate visitor use by dog walkers and some visitors are not complying with the leash law; off-leash violations totaled 146 from 2008 through 2011 (table 26). Although current GGNRA regulations require dogs to be leashed at Mori Point, unleashed dogs are often observed at the site. The NPS created four ponds at Mori Point to enhance the freshwater wetland habitat for California red-legged frog, and to provide foraging habitat for the San Francisco garter snake. Educational signs and fences have been placed around the ponds and wetland habitat at Mori Point to prevent direct impacts on frogs and frog habitat; however, dogs have occasionally been observed in the ponds.

Alternative A would result in continued negligible impacts on freshwater wetland vegetation because impacts would generally result in no measurable or perceptible changes in the plant community due to the exclusionary fences that protect wetland vegetation.

No permit system exists for commercial dog walking under alternative A. At Mori Point, commercial dog walking is uncommon; therefore, commercial dog walking would have negligible impacts on wetland vegetation.

**Cumulative Impacts.** Projects and actions in and near Mori Point were considered for the cumulative impacts analysis (appendix K). Many wetland restoration/creation projects have been completed or are

## Chapter 4: Environmental Consequences

proposed in GGNRA and beyond the boundaries of the park. Impacts resulting from completed, ongoing, and future restoration/creation projects at Mori Point and projects beyond the park boundaries will generally provide an overall benefit to wetland and aquatic habitats. The Sharp Park Golf Course, located in Pacifica in San Mateo County (adjacent to Mori Point) has a wetland complex, consisting of a lagoon (Laguna Salada), a pond (Horse Stable Pond), and a channel, which provides important habitat for the San Francisco garter snake and California red-legged frog (SFRPD 2009). Under the SNRAMP, plans at the golf course range from restoration to entirely natural habitat, to minor modifications that would improve habitat connectivity for frogs and snakes. The *Mori Point Restoration and Trail Plan* includes preserving and restoring habitat by reducing threats to native plant communities and natural processes, ensuring habitat connectivity between upland and wetland areas, and developing a safe and sustainable trail system to improve recreational experiences and reduce impacts on park resources (NPS 2010e, 1). These projects would provide long-term beneficial impacts on wetland vegetation.

Additional actions have had or have the potential to have adverse effects on wetlands at or in the vicinity of GGNRA sites. Larger, more regional development projects like the GGNRA *Long-range Transportation Plan Update* could negatively affect wetland and aquatic resources within and beyond park boundaries. However, wetland impacts from the implementation of these and other proposed projects in the area should be sufficiently offset by mitigation, project by project, such that there should be no net loss of wetland acreage, functions or values.

The loss of more than 90 percent of California’s original wetlands is the largest loss of any state in the nation and is directly related to economic development (NOAA 2010a, 1). The *Clean Water Act* and the state’s coastal wetlands statute have succeeded in reducing the rate of wetland loss in California, but development pressures remain a threat (NOAA 2010a, 1). Therefore, projects that protect or degrade wetland and aquatic habitats will have a cumulative effect, whether beneficial or adverse, on wetlands.

The negligible impacts on wetland and aquatic vegetation from dogs at Mori Point under alternative A were considered together with the effects of the projects mentioned above. There would be a combination of beneficial and adverse effects from projects in and around Mori Point; when combined, these projects would balance out, resulting in negligible impacts. Therefore, the cumulative impacts on wetland vegetation under this alternative would be expected to be negligible.

**MORI POINT ALTERNATIVE A CONCLUSION TABLE**

| Wetland and Aquatic Habitat Impacts       | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Negligible impacts on freshwater wetlands | Exclusionary fences have been placed around the ponds and wetland habitat; however, dogs have occasionally been observed in ponds | N/A  | Negligible cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking on the Mori Coastal Trail and the portion of beach owned by the NPS, but dogs would not be allowed on Old Mori Trail or the Pollywog Trail, which is located adjacent to the ponds. Impacts on freshwater wetland vegetation under alternative B would be negligible because impacts would result in no measurable or perceptible changes in the plant community due to the on-leash requirements, no dogs on the Pollywog Trail or Old Mori Trail, and the exclusionary fences that protect wetland and aquatic vegetation.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is not common in this area, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have negligible impacts on wetland vegetation.

**Cumulative Impacts.** The negligible impacts on wetland and aquatic vegetation from dogs at Mori Point under alternative B were considered together with the effects of the projects mentioned above in alternative A. There would be a combination of beneficial and adverse effects from projects in and around Mori Point; when combined, these projects would balance out, resulting in negligible impacts. Therefore, the cumulative impacts on wetland and aquatic vegetation under this alternative would be expected to be negligible.

**MORI POINT ALTERNATIVE B CONCLUSION TABLE**

| <b>Wetland and Aquatic Habitat Impacts</b> | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|--|---|-------------------------------|
| Negligible impacts, assuming compliance    | Physical restraint of dogs, fewer on-leash dog walking areas, and existing fences would protect wetlands | No change, assuming compliance                      | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would allow on-leash dog walking on Old Mori Trail, the Mori Coastal Trail, and the portion of beach owned by the NPS, but dogs would not be allowed on the Pollywog Trail, which is located adjacent to the ponds. In addition, the ponds and the vegetation surrounding them are enclosed by exclusionary fences. Impacts would be similar to those for alternative B. Therefore, assuming compliance, the impacts on freshwater wetland vegetation from dogs would be negligible because impacts would result in no measurable or perceptible changes in the plant community due to the on-leash requirements, no dogs on the Pollywog Trail, and the exclusionary fences that protect wetland and aquatic vegetation.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Mori Point is not one of the park sites where permits to walk more than three dogs, with a maximum of six, would be issued. Since commercial dog walking is not common at Mori Point, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on wetland and aquatic vegetation.

**Cumulative Impacts.** The negligible impacts on wetland and aquatic vegetation from dogs at Mori Point under alternative C were considered together with the effects of the projects mentioned above in alternative A. There would be a combination of beneficial and adverse effects from projects in and around Mori Point; when combined, these projects would balance out, resulting in negligible impacts. Therefore, the cumulative impacts on wetland and aquatic vegetation under this alternative would be expected to be negligible.

**MORI POINT ALTERNATIVE C CONCLUSION TABLE**

| <b>Wetland and Aquatic Habitat Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Negligible impacts, assuming compliance    | Existing fences and physical restraint of dogs would protect wetlands | No change, assuming compliance                      | Negligible cumulative impacts |

## Chapter 4: Environmental Consequences

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Alternative D would prohibit dogs at the entire Mori Point site. Therefore, assuming compliance, alternative D would result in no impact on freshwater wetland vegetation.

Since dogs would not be allowed at Mori Point, there would be no impact from commercial dog walkers on the wetland and aquatic vegetation.

**Cumulative Impacts.** The lack of impacts on wetland and aquatic vegetation from dogs at Mori Point under alternative D was considered together with the effects of the projects mentioned above in alternative A. There would be a combination of beneficial and adverse effects from projects in and around Mori Point; when combined, these projects would balance out, resulting in negligible impacts. Therefore, the cumulative impacts on wetland and aquatic vegetation under this alternative would be expected to be negligible.

**MORI POINT ALTERNATIVE D CONCLUSION TABLE**

| Wetland and Aquatic Habitat Impacts | Rationale                            | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|-------------------------------------|--------------------------------------|--|-------------------------------|
| No impact                           | Dogs would be prohibited at the site | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would allow on-leash dog walking on the same trails and beach as alternative C, with the addition of on-leash dog walking on the Pollywog Trail. The Pollywog Trail, which borders the freshwater wetland vegetation, would be open for dog walking, but there are exclusionary fences surrounding the ponds that would protect the vegetation. Therefore, assuming compliance, impacts on freshwater wetland vegetation from dogs would be negligible because impacts would result in no measurable or perceptible changes in the plant community due to the on-leash requirements and the exclusionary fences that protect wetland vegetation.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Mori Point is not one of the park sites where permits to walk more than three dogs, with a maximum of six, would be issued. Since commercial dog walking is not common at Mori Point, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on freshwater wetland vegetation.

**Cumulative Impacts.** The negligible impacts on wetland and aquatic vegetation from dogs at Mori Point under alternative E were considered together with the effects of the projects mentioned above in alternative A. There would be a combination of beneficial and adverse effects from projects in and around Mori Point; when combined, these projects would balance out, resulting in negligible impacts. Therefore, the cumulative impacts on wetland and aquatic vegetation under this alternative would be expected to be negligible.

**MORI POINT ALTERNATIVE E CONCLUSION TABLE**

| Wetland and Aquatic Habitat Impacts     | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Negligible impacts, assuming compliance | Existing fences and physical restraint of dogs would protect wetlands | No change, assuming compliance               | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative E, allowing on-leash dog walking on Old Mori Trail, the Mori Coastal Trail, Pollywog Trail (which is located adjacent to the ponds), and the portion of beach owned by the NPS. The ponds and the vegetation surrounding them are enclosed by exclusionary fences. Assuming compliance, impacts on freshwater wetland vegetation from dogs would be negligible because impacts would result in no measurable or perceptible changes in the plant community due to the on-leash requirements and the exclusionary fences that protect wetland vegetation.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Mori Point is not one of the park sites where permits to walk more than three dogs, with a maximum of six, would be issued. Since commercial dog walking activity is not common at Mori Point, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have negligible impacts on wetland and aquatic vegetation.

**Cumulative Impacts.** Projects and actions in and near Mori Point were considered for the cumulative impacts analysis (appendix K). Many wetland restoration/creation projects have been completed or are proposed in GGNRA and beyond the boundaries of the park. Impacts resulting from completed, ongoing, and future restoration/creation projects at Mori Point and projects beyond the park boundaries will generally provide an overall benefit to wetland and tidal marsh habitats. The Sharp Park Golf Course, located in Pacifica in San Mateo County (adjacent to Mori Point) has a wetland complex, consisting of a lagoon (Laguna Salada), a pond (Horse Stable Pond), and a channel, which provides important habitat for the San Francisco garter snake and California red-legged frog (SFRPD 2009). Under the SNRAMP, plans at the golf course range from restoration to entirely natural habitat to minor modifications that would improve habitat connectivity for frogs and snakes. The *Mori Point Restoration and Trail Plan* includes preserving and restoring habitat by reducing threats to native plant communities and natural processes, ensuring habitat connectivity between upland and wetland areas, and developing a safe and sustainable trail system to improve recreational experiences and reduce impacts on park resources (NPS 2010e, 1). These projects would provide long-term beneficial impacts on wetland vegetation.

Additional actions have had or have the potential to have adverse effects on wetlands at or in the vicinity of GGNRA sites. Larger, more regional development projects like the GGNRA *Long-range Transportation Plan Update* could negatively affect wetland resources within and beyond park boundaries. However, wetland and aquatic impacts from the implementation of these and other proposed projects in the area should be sufficiently offset by mitigation, project by project, such that there should be no net loss of wetland acreage, functions or values.

The loss of more than 90 percent of California's original wetlands is the largest loss of any state in the nation and is directly related to economic development (NOAA 2010a, 1). The *Clean Water Act* and the state's coastal wetlands statute have succeeded in reducing the rate of wetland loss in California, but development pressures remain a threat (NOAA 2010a, 1). Therefore, projects that protect or degrade wetland and aquatic habitats will have a cumulative effect, whether beneficial or adverse, on wetlands.

The negligible impacts on wetland and aquatic vegetation from dogs at Mori Point under the preferred alternative were considered together with the effects of the projects mentioned above. There would be a combination of beneficial and adverse effects from projects in and around Mori Point; when combined, these projects would balance out, resulting in negligible impacts. Therefore, the cumulative impacts on wetland vegetation under this alternative would be expected to be negligible.

MORI POINT PREFERRED ALTERNATIVE F CONCLUSION TABLE

| Wetland and Aquatic Habitat Impacts     | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Negligible impacts, assuming compliance | Existing fences and physical restraint of dogs would protect wetlands | No change, assuming compliance               | Negligible cumulative impacts |

**IMPACTS TO NATIVE HARDWOOD FORESTS AND DOUGLAS-FIR/COAST REDWOODS BY SITE AND ALTERNATIVE**

In the planning area at GGNRA, native hardwood forests exist at Oakwood Valley, Alta Trail/Orchard Fire Road/Pacheco Fire Road, and Fort Baker. The Douglas-fir and coast redwood community is found sporadically in portions of Homestead Valley and in Oakwood Valley but outside the area accessed by dogs; therefore, impacts on this community at these sites is not discussed further in this section. Therefore, the native hardwood forest and/or Douglas-fir/coast redwood communities exist at Oakwood Valley, Alta Trail/Orchard Fire Road/Pacheco Fire Road, and Fort Baker, and impacts on these communities at these sites are discussed in more detail in the paragraphs that follow.

**Alta Trail/Orchard Fire Road/Pacheco Fire Road**

**Alternative A: No Action.** Under current conditions, dogs are allowed under voice control or on leash on the trails and roads from Marin City to Oakwood Valley. These areas experience high use by commercial dog walkers (table 9), with typically 5 to 12 dogs under voice control per commercial walker. However, native hardwood communities occur adjacent to Alta Trail, Orchard Fire Road, and Pacheco Fire Road.

Under alternative A, physical damage to vegetation from dogs through trampling, digging, and dog waste would continue to occur since dogs would be allowed under voice control and there is a higher likelihood of dogs going off the trail and fire roads than if they were on leash. Impacts in these areas could prevent the growth of vegetation or allow the establishment of non-native invasive species. These impacts would be considered long term, minor, and adverse due to the high use by commercial dog walkers and because effects would be measurable and perceptible, but would be localized in a relatively small area.

No permit system exists for commercial dog walking under alternative A. However, commercial dog walking at Alta Trail, Orchard Fire Road, and Pacheco Fire Road is common, with commercial dog walkers having 5 to 12 dogs under voice control at one time. Commercial dog walking would continue to create long-term minor adverse impacts on vegetation. Dogs under voice control would continue to disturb vegetation due to trampling, digging, and dog waste.

**Cumulative Impacts.** Projects and actions in and near Alta Trail, Orchard Fire Road, and Pacheco Fire Road were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils. Ongoing parkwide restoration and enhancement efforts, such as GGNRA natural resource stewardship programs and the *Marin Countywide Plan* (County of Marin 2007), can also beneficially affect vegetation at GGNRA park sites such as Alta Trail, Orchard Fire Road, and Pacheco Fire Road. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance. Habitat restoration and the implementation of projects funded by the Wildland/Urban Interface Initiative on private lands could also impact Alta Trail, Orchard Fire Road, and Pacheco Fire Road.

The long-term minor adverse impacts on native hardwood communities from dogs at Alta Trail, Orchard Fire Road, and Pacheco Fire Road under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from the restoration and trail rehabilitation projects should reduce some of the adverse impacts on native hardwood communities from alternative A. Therefore, cumulative impacts on native hardwood communities under this alternative would be expected to be negligible.

**ALTA TRAIL/ORCHARD FIRE ROAD/PACHECO FIRE ROAD ALTERNATIVE A CONCLUSION TABLE**

| Native Hardwood Forest and Douglas-fir/Coast Redwood Impacts | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|--|--|-------------------------------|
| Long-term minor adverse impacts                              | Impacts on vegetation from dogs would be caused through physical damage such as trampling, digging, and dog waste; these effects, as well as fragmentation, could lead to the spread of invasive plant species | N/A  | Negligible cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking on the Alta Trail to Orchard Fire Road and on Orchard and Pacheco fire roads. Impacts on native hardwood vegetation could include physical damage from trampling as well as nutrient addition from dog waste and urine. Impacts in areas adjacent to the trail (LOD area) would be long term, minor, and adverse since this habitat supports the growth of native vegetation. Impacts would be measurable and perceptible, but would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area would occur in a relatively reduced area compared to the site as a whole. Physically restraining dogs on leash would protect vegetation off trail. Therefore, assuming compliance, the overall impact on native hardwood vegetation from on-leash dog walking at Alta Trail, Orchard Fire Road, and Pacheco Fire Road would be negligible because impacts would result in no measurable or perceptible changes in the plant community.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since the percentage of commercial dog walkers is considered high at Alta Trail/Orchard Fire Road/Pacheco Fire Road, dogs walked by commercial dog walkers would cause the majority of the adverse impacts on native hardwood vegetation from dogs at the site. Overall impacts on native hardwood vegetation from dogs walked by both commercial dog walkers and private individuals are summarized above.

**Cumulative Impacts.** The negligible impacts on native hardwood communities from dogs at Alta Trail/Orchard Fire Road/Pacheco Fire Road under this alternative were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the park stewardship programs and other restoration projects combined with the negligible impacts from alternative B would result in negligible impacts on native hardwood communities at this park site.

**Chapter 4: Environmental Consequences**

**ALTA TRAIL/ORCHARD FIRE ROAD/PACHECO FIRE ROAD ALTERNATIVE B CONCLUSION TABLE**

| Native Hardwood Forest and Douglas-fir/Coast Redwood Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance              | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would have the same dog walking restrictions as alternative B, and impacts would be the same, assuming compliance: long term, minor, and adverse in the LOD area and negligible overall.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs; permits could restrict use by time and area. Permits would be allowed for Alta Trail/Orchard Fire Road/Pacheco Fire Road. Impacts on native hardwood vegetation from permit holders with four to six dogs would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since the percentage of commercial dog walkers is considered high at Alta Trail/Orchard Fire Road/Pacheco Fire Road, dogs walked by commercial dog walkers would cause the majority of the adverse impacts on native hardwood vegetation from dogs at the site. Overall impacts on native hardwood vegetation from dogs walked by both commercial dog walkers and private individuals are summarized above. Since commercial dog walking is common at Alta Trail/Orchard Fire Road/Pacheco Fire Road, impacts on native hardwood vegetation would be expected. Impacts on native hardwood vegetation from commercial dog walkers would be similar to impacts from other dog walkers; therefore, impacts from commercial dog walking would be negligible.

**Cumulative Impacts.** Under alternative C, the cumulative impacts on native hardwood communities at this park site would be the same as those under alternative B: negligible cumulative impacts.

**ALTA TRAIL/ORCHARD FIRE ROAD/PACHECO FIRE ROAD ALTERNATIVE C CONCLUSION TABLE**

| Native Hardwood Forest and Douglas-fir/Coast Redwood Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance              | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Under alternative D, dogs would not be allowed at this site. Therefore, assuming compliance, no impact on native hardwood vegetation from dogs would occur at this site.

Since dogs would not be allowed at Alta Trail, Orchard Fire Road, and Pacheco Fire Road, there would be no impact from commercial dog walkers on native hardwood forest and Douglas-fir/coast redwood vegetation.

**Cumulative Impacts.** The lack of impacts on native hardwood communities from dogs at Alta Trail, Orchard Fire Road, and Pacheco Fire Road under alternative D was considered together with the effects

of the projects mentioned above in alternative A. The beneficial effects from the restoration and trail rehabilitation projects combined with the lack of impacts on native hardwood communities from alternative D would result in beneficial cumulative impacts.

**ALTA TRAIL/ORCHARD FIRE ROAD/PACHECO FIRE ROAD ALTERNATIVE D CONCLUSION TABLE**

| Native Hardwood Forest and Douglas-fir/Coast Redwood Impacts | Rationale                            | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|--------------------------------------|--|-------------------------------|
| No impact assuming compliance                                | Dogs would be prohibited at the site | Beneficial, assuming compliance              | Beneficial cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Under alternative E on-leash dog walking would be allowed on the Alta Trail from Donahue Street to the junction with the Morning Sun Trail and on the Orchard and Pacheco fire roads. Impacts on native hardwood vegetation could include physical damage from trampling as well as nutrient addition from dog waste and urine. Impacts in areas adjacent to the trail (LOD area) would be long term, minor, and adverse since this habitat supports the growth of native vegetation, some of it rare. Impacts would be measurable and perceptible, but would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area would occur in a relatively small area compared to the site as a whole. Physically restraining dogs on leash would protect vegetation off trail. Therefore, assuming compliance, the overall impact on native hardwood vegetation from on-leash dog walking at Alta Trail, Orchard Fire Road, and Pacheco Fire Road would be negligible because impacts would result in no measurable or perceptible changes in the plant community.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs; permits could restrict use by time and area. Permits would be allowed for Alta Trail/Orchard Fire Road/Pacheco Fire Road, but permit holders would only be allowed as far as the intersection of Alta Trail and Orchard Fire Road. Impacts on native hardwood vegetation from permit holders with four to six dogs would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since the percentage of commercial dog walkers is considered high at Alta Trail/Orchard Fire Road/Pacheco Fire Road, dogs walked by commercial dog walkers would cause the majority of the adverse impacts on native hardwood vegetation from dogs at the site. Impacts on native hardwood vegetation from dogs walked by both commercial dog walkers and private individuals are summarized above.

**Cumulative Impacts.** The negligible impacts on native hardwood communities from dogs at Alta Trail, Orchard Fire Road, and Pacheco Fire Road under alternative E were considered together with the effects of the actions mentioned above in alternative A. The benefits to vegetation from the park stewardship programs and other restoration projects in the area of this site combined with the negligible impacts from alternative E would result in negligible cumulative impacts.

ALTA TRAIL/ORCHARD FIRE ROAD/PACHECO FIRE ROAD ALTERNATIVE E CONCLUSION TABLE

| Native Hardwood Forest and Douglas-fir/Coast Redwood Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance              | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative E, allowing on-leash dog walking on the Alta Trail from Donahue Street to the junction with the Morning Sun Trail and on the Orchard and Pacheco fire roads. Impacts on native hardwood vegetation could include physical damage from trampling as well as nutrient addition from dog waste and urine. Impacts in areas adjacent to the trail (LOD area) would be long term, minor, and adverse since this habitat supports the growth of native vegetation, some of it rare. Impacts would be measurable and perceptible, but would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area would occur in a relatively reduced area compared to the site as a whole. Physically restraining dogs on leash would protect vegetation off trail. Therefore, assuming compliance, the overall impact on native hardwood vegetation from on-leash dog walking at Alta Trail, Orchard Fire Road, and Pacheco Fire Road would be negligible because impacts would result in no measurable or perceptible changes in the plant community.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs; permits could restrict use by time and area. Permits would be allowed for Alta Trail/Orchard Fire Road/Pacheco Fire Road, but permit holders would be allowed only to the Alta intersection with the Orchard Fire Road. Impacts on vegetation from permit holders with four to six dogs would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since the percentage of commercial dog walkers is considered high at Alta Trail/Orchard Fire Road/Pacheco Fire Road, dogs walked by commercial dog walkers would cause the majority of the adverse impacts on native hardwood vegetation from dogs at the site. Overall impacts on native hardwood vegetation from dogs walked by both commercial dog walkers and private individuals are summarized above.

**Cumulative Impacts.** Projects and actions in and near Alta Trail, Orchard Fire Road, and Pacheco Fire Road were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs initiative projects provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils. Ongoing parkwide restoration and enhancement efforts, such as GGNRA natural resource stewardship programs and the *Marin Countywide Plan* (County of Marin 2007), can also beneficially affect vegetation at GGNRA park sites such as Alta Trail/Orchard Fire Road/Pacheco Fire Road. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance. Habitat restoration and the implementation of projects funded by the Wildland/Urban Interface Initiative on private lands could also impact Alta Trail, Orchard Fire Road, and Pacheco Fire Road.

Under the preferred alternative, the negligible impacts on native hardwood communities from dogs at Alta Trail/Orchard Fire Road/Pacheco Fire Road under this alternative were considered together with the effects of the projects mentioned above. The beneficial effects from the park stewardship programs and

other restoration projects combined with the negligible impacts from the preferred alternative would result in negligible impacts on native hardwood communities at this park site.

**ALTA TRAIL/ORCHARD FIRE ROAD/PACHECO FIRE ROAD PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| Native Hardwood Forest and Douglas-fir/Coast Redwood Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance              | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance              | Negligible cumulative impacts |

### Oakwood Valley

**Alternative A: No Action.** Currently, dogs are allowed under voice control or on leash on the Oakwood Valley Fire Road and Oakwood Valley Trail from the junction with the fire road to the junction with Alta Trail. On-leash dog walking is also available on the Oakwood Valley Trail from the trailhead to the junction with Oakwood Valley Fire Road. However, many dog walkers allow their dogs off leash as soon as they enter the site. This site is moderately used by dog walkers (table 9) and the number of commercial dog walkers using this site is relatively low. Oakwood Valley contains native hardwood vegetation; this site also contains Douglas-fir and coast redwood communities, but these occur outside the areas accessed by dogs.

Under alternative A, physical disturbance from dog activities would continue to occur along the fire road and trail and in off-trail areas throughout the site. Due to their nature, dogs are not expected to stay on the fire road/trail. Since dogs would be allowed under voice control in some areas of the site, there is a higher likelihood that dogs would go off trail than if they were on leash, creating impacts on native hardwood vegetation in adjacent areas. Therefore, these impacts would be considered long term, minor, and adverse because effects would be measurable and perceptible, but would be localized in a relatively small area.

No permit system exists for commercial dog walking under alternative A. At Oakwood Valley, commercial dog walking is uncommon; therefore, commercial dog walking would have negligible impacts on native hardwood vegetation.

**Cumulative Impacts.** Projects and actions in and near Oakwood Valley were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils. Ongoing parkwide restoration and enhancement efforts, such as GGNRA natural resource stewardship programs and the *Marin Countywide Plan* (County of Marin 2007), can also beneficially affect vegetation at GGNRA park sites such as Oakwood Valley. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance. Habitat restoration and the implementation of projects funded by the Wildland/Urban Interface Initiative on private lands could also impact Oakwood Valley.

The long-term minor adverse impacts on native hardwood communities from dogs at Oakwood Valley under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from trail rehabilitation projects should reduce some of the adverse impacts on native hardwood communities from alternative A. Therefore, cumulative impacts on native hardwood communities under this alternative would be expected to be negligible.

OAKWOOD VALLEY ALTERNATIVE A CONCLUSION TABLE

| Native Hardwood Forest and Douglas-fir/Coast Redwood Impacts | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|--|--|-------------------------------|
| Long-term minor adverse impacts                              | Impacts on vegetation from dogs would be caused through physical damage such as trampling, digging, and dog waste; these effects, as well as fragmentation, could lead to the spread of invasive plant species | N/A  | Negligible cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Under alternative B, on-leash dog walking would be allowed on the Oakwood Valley Fire Road and the Oakwood Valley Trail from the junction of the trail and fire road. Impacts in areas adjacent to the trail (LOD area) would be long term, minor, and adverse since this habitat supports the growth of existing vegetation, which would be affected by trampling and dog waste. Impacts would be measurable and perceptible, but would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area would occur in a relatively small area compared to the site as a whole. Physically restraining dogs on leash would protect vegetation off trail. Therefore, assuming compliance, the overall impacts on vegetation from on-leash dog walking at Oakwood Valley would be negligible because impacts would result in no measurable or perceptible changes in the plant community.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is not common at Oakwood Valley, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have negligible impacts on native hardwood vegetation.

**Cumulative Impacts.** The negligible impacts on native hardwood communities from dogs at Oakwood Valley under alternative B were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the park stewardship programs and other restoration projects combined with the negligible impacts from alternative B would result in negligible impacts on native hardwood communities at this park site.

OAKWOOD VALLEY ALTERNATIVE B CONCLUSION TABLE

| Native Hardwood Forest and Douglas-fir/Coast Redwood Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance              | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C proposes a ROLA on the Oakwood Valley Fire Road to the junction with Oakwood Valley Trail. Double gates would be located at both ends, with continuous fencing to protect sensitive habitat. Oakwood Valley Trail would

allow on-leash dog walking from the junction with Oakwood Valley Fire Road to a new gate at Alta Trail. Dogs under voice and sight control in the ROLA on the Oakwood Valley Fire Road would have access to the land between the edge of the trail and the fence (LOD area). The vegetation in this area would be affected by physical disturbance from dog activities. Dogs in the ROLA would be confined to a smaller area, potentially increasing the impacts on the adjacent natural habitat and vegetation. There would be impacts from locating and constructing the fence and gates that would extend beyond the ROLA. After the ROLA is open to dogs, the area would be devoid of any vegetation; therefore, there would be impacts in the ROLA where the shoulders of the trails, which are currently vegetated, would become part of the ROLA. There is also a potential for an increase in nutrient loading from dog waste due to having more dogs confined to a smaller area directly adjacent to natural habitat. Dogs would affect vegetation in the LOD area of the on-leash portion of Oakwood Valley Trail as well. Impacts would result from physical disturbance, such as trampling, digging, and dog waste. Impacts on vegetation in the LOD area and ROLA would be long term, minor, and adverse because effects would be measurable and perceptible, but would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area and the ROLA would occur in a relatively small area compared to the site as a whole. Physically restraining dogs on leash in all areas outside the ROLA would protect vegetation off trail, and the areas in the ROLA would be fenced. Therefore, assuming compliance, the overall impact on native hardwood vegetation from dog walking at Oakwood Valley would be negligible because impacts would result in no measurable or perceptible changes in the plant community.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Oakwood Valley is not one of the park sites where permits to walk more than three dogs, with a maximum of six, would be issued. Since commercial dog walking is not common at Oakwood Valley, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on native hardwood vegetation.

**Cumulative Impacts.** The negligible impacts on native hardwood communities from dogs at Oakwood Valley under alternative C were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the park stewardship programs and other restoration projects combined with the negligible impacts from alternative C would result in negligible impacts on native hardwood communities at this park site.

**OAKWOOD VALLEY ALTERNATIVE C CONCLUSION TABLE**

| Native Hardwood Forest and Douglas-fir/Coast Redwood Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance              | Physically restraining dogs would protect vegetation off trail; LOD area and ROLAs are a small portion of the entire site | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Alternative D would have the same dog walking restrictions as alternative B, and impacts would also be the same. Impacts on native hardwood vegetation in the LOD area would be long term, minor, and adverse and would be caused by trampling and dog waste; impacts would be measurable and perceptible, but would be localized in a relatively small area.

## Chapter 4: Environmental Consequences

The long-term minor adverse impacts from dogs in the LOD area would occur in a relatively small area compared to the site as a whole. Physically restraining dogs on leash would protect vegetation off trail. Therefore, assuming compliance, the overall impact on native hardwood vegetation from on-leash dog walking at Oakwood Valley would be negligible because impacts would result in no measurable or perceptible changes in the plant community.

No commercial dog walking would be allowed and no permits to walk more than three dogs would be issued under alternative D; therefore, commercial and permitted dog walking would have no impact on native hardwood vegetation.

**Cumulative Impacts.** Under alternative D, the cumulative impacts on native hardwood communities at this park site would be the same as those under alternative B: negligible cumulative impacts.

**OAKWOOD VALLEY ALTERNATIVE D CONCLUSION TABLE**

| <b>Native Hardwood Forest and Douglas-fir/Coast Redwood Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance                     | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E proposes a ROLA on the Oakwood Valley Fire Road to the junction with Oakwood Valley Trail. Double gates would be located at both ends, with non-continuous fencing where needed to protect sensitive habitat. Oakwood Valley Trail would allow on-leash dog walking from the junction with Oakwood Valley Fire Road to a new gate at Alta Trail. Alternative E would have the same impacts as alternative C, assuming compliance: long term, minor, and adverse in the LOD area and ROLA and negligible overall.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Oakwood Valley is not one of the park sites where permits to walk more than three dogs, with a maximum of six, would be issued. Since commercial dog walking is not common at Oakwood Valley, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on native hardwood vegetation.

**Cumulative Impacts.** Under alternative E, the cumulative impacts on native hardwood communities at this park site would be the same as those under alternative C: negligible cumulative impacts

**OAKWOOD VALLEY ALTERNATIVE E CONCLUSION TABLE**

| <b>Native Hardwood Forest and Douglas-fir/Coast Redwood Impacts</b> | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--|---|-------------------------------|
| Overall negligible impacts, assuming compliance                     | Physically restraining dogs would protect vegetation off trail; trails and LOD areas and ROLAs are a small portion of the site | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative would allow on-leash dog walking on the Oakwood Valley Fire Road, and on the Oakwood Valley Trail from the junction with the fire road to the junction with Alta Trail. Dogs would affect vegetation in the LOD area of the on-leash portion of Oakwood Valley Trail and the Oakwood Valley Fire Road. Impacts would result from physical disturbance, such as trampling and dog waste. Impacts on vegetation in the LOD area would be long term, minor, and adverse because effects would be measurable and perceptible, but would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD would occur in a relatively small area compared to the site as a whole. Physically restraining dogs on leash would protect vegetation off trail areas. Therefore, assuming compliance, the overall impact on native hardwood vegetation from dog walking at Oakwood Valley would be negligible because impacts would result in no measurable or perceptible changes in the plant community.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Oakwood Valley is not one of the park sites where permits to walk more than three dogs, with a maximum of six, would be issued. Since commercial dog walking is not common at Oakwood Valley, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have negligible impacts on native hardwood vegetation.

**Cumulative Impacts.** Projects and actions in and near Oakwood Valley were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils. Ongoing parkwide restoration and enhancement efforts, such as GGNRA natural resource stewardship programs and the *Marin Countywide Plan* (County of Marin 2007), can also beneficially affect vegetation at GGNRA park sites such as Oakwood Valley. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance. Habitat restoration and the implementation of projects funded by the Wildland/Urban Interface Initiative on private lands could also impact Oakwood Valley.

The negligible impacts on native hardwood communities from dogs at Oakwood Valley under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from the park stewardship programs and other restoration projects combined with the negligible impacts from the preferred alternative would result in negligible impacts on native hardwood communities at this park site.

**OAKWOOD VALLEY PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| Native Hardwood Forest and Douglas-fir/Coast Redwood Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance              | Physically restraining dogs would protect vegetation off trail; LOD areas are a small portion of the site | Beneficial, assuming compliance              | Negligible cumulative impacts |

## Chapter 4: Environmental Consequences

### Fort Baker

**Alternative A: No Action.** Currently, dogs are required to be on leash throughout Fort Baker. Dogs are not allowed on the Chapel Trail or the pier. This site experiences low dog walking use, although there were 52 leash law violations at this site from 2008 through 2011 (table 17). Dogs have been observed off leash at the Parade Ground, Drown Fire Road, Battery Yates Trail, and behind the Bay Area Discovery Museum (NPS 2009c). Dogs off leash on trails/fire roads can access adjacent habitat, where viable plant communities exist. Impacts on this vegetation would include physical disturbance through trampling and digging, as well as nutrient addition, which would prevent the growth of new vegetation. Since compliance has been an issue at this site, it is likely that many dogs are off leash and go beyond the trails and fire roads.

Under alternative A, long-term minor adverse impacts would continue to occur on the native hardwood vegetation that occurs in the northeast portion of the Fort Baker site because impacts would be measurable and perceptible but would be localized in a relatively small area.

No permit system exists for commercial dog walking under alternative A. At Fort Baker, commercial dog walking is uncommon; therefore, commercial dog walking would have negligible impacts on native hardwood vegetation.

**Cumulative Impacts.** Projects and actions in and near Fort Baker were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils. Ongoing parkwide restoration and enhancement efforts, such as GGNRA natural resource stewardship programs and the *Marin Countywide Plan* (County of Marin 2007), can also beneficially affect vegetation at GGNRA park sites such as Fort Baker. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance. Habitat restoration and the implementation of projects funded by the Wildland/Urban Interface Initiative on private lands could also impact Fort Baker.

The long-term minor adverse impacts on native hardwood communities from dogs at Fort Baker under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from the projects provided by the park stewardship programs should reduce some of the adverse impacts on native hardwood communities from alternative A. Therefore, cumulative impacts on native hardwood communities under this alternative would be expected to be negligible.

**FORT BAKER ALTERNATIVE A CONCLUSION TABLE**

| Native Hardwood Forest and Douglas-fir/Coast Redwood Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Long-term minor adverse impacts                              | Impacts on vegetation from dogs would be caused by physical damage such as trampling, digging, and dog waste; these effects, as well as fragmentation, could lead to the spread of invasive plant species | N/A  | Negligible cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking on Drown Fire Road, the Bay Trail (not including Battery Yates Trail), Vista Point Trail (to be built), the Lodge/Conference Center Grounds, and the Parade Ground. Dogs would not be allowed on the Battery Yates Trail as part of this alternative, due to the presence of mission blue butterfly habitat. Impacts from dogs would result through physical disturbance from trampling and nutrient addition, which would prevent the growth of new vegetation. The impacts in the LOD area under alternative B would be long term, minor, and adverse because the effects would be measurable and perceptible, but would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area would occur in a relatively small area compared to the site as a whole. Physically restraining dogs on leash would protect vegetation off trail. Therefore, assuming compliance, the overall impacts on native hardwood vegetation from on-leash dog walking at Fort Baker would be negligible because impacts would result in no measurable or perceptible changes in the plant community.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is not common in this area, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have negligible impacts on native hardwood vegetation.

**Cumulative Impacts.** The negligible adverse impacts on native hardwood communities from dog activities at this site under alternative B were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the park stewardship programs and other restoration projects combined with the negligible impacts from alternative B would result in negligible impacts on native hardwood communities at this park site.

**FORT BAKER ALTERNATIVE B CONCLUSION TABLE**

| <b>Native Hardwood Forest and Douglas-fir/Coast Redwood Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance                     | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would have the same dog walking restrictions as alternative B, with the addition of on-leash dog walking on the Battery Yates Trail, and impacts would be the same, assuming compliance: long term, minor, and adverse in the LOD area and negligible overall.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs; permits could restrict use by time and area. Permits would be allowed for Fort Baker excluding Drown Fire Road. Impacts on vegetation from permit holders with four to six dogs would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is not common at Fort Baker, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on native hardwood vegetation.

**Chapter 4: Environmental Consequences**

**Cumulative Impacts.** Under alternative C, the cumulative impacts on native hardwood communities at this park site would be the same as those under alternative B: negligible cumulative impacts.

**FORT BAKER ALTERNATIVE C CONCLUSION TABLE**

| Native Hardwood Forest and Douglas-fir/Coast Redwood Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance              | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Under alternative D, on-leash dog walking would be allowed on the Lodge/Conference Center Grounds, Vista Point Trail (to be built), and on the Bay Trail (excluding the Battery Yates Trail), and no dogs would be allowed on the Parade Ground. Impacts in the LOD area would be long term, minor, and adverse since these areas support the growth of existing vegetation and would be affected by trampling and dog waste. Effects would be measurable and perceptible, but would be localized in a relatively small area. Even though alternative D would allow less dog access at the site, the difference in dog impacts between alternatives D and B is not considered large enough to cause a change in the intensity of the impact due to the developed nature of the site.

The long-term minor adverse impacts from dogs in the LOD area would occur in a relatively small area compared to the site as a whole. Physically restraining dogs on leash would protect vegetation off trail. Therefore, assuming compliance, the overall impacts on native hardwood vegetation from on-leash dog walking at Fort Baker would be negligible because impacts would result in no measurable or perceptible changes in the plant community.

No commercial dog walking would be allowed and no permits to walk more than three dogs would be issued under alternative D; therefore, commercial and permitted dog walking would have no impact on native hardwood vegetation.

**Cumulative Impacts.** The negligible adverse impacts on native hardwood communities from dog activities at this site under alternative D were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the park stewardship programs and other restoration projects combined with the negligible impacts from alternative D would result in negligible impacts on native hardwood communities at this park site.

**FORT BAKER ALTERNATIVE D CONCLUSION TABLE**

| Native Hardwood Forest and Douglas-fir/Coast Redwood Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance              | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would have the same dog walking restrictions as alternative C, and impacts would be the same, assuming compliance: long term, minor, and adverse in the LOD area and negligible overall.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs; permits could restrict use by time and area. Permits would be allowed for Fort Baker excluding Drown Fire Road. Impacts on native hardwood vegetation from permit holders with four to six dogs would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is not common at Fort Baker, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on native hardwood vegetation.

**Cumulative Impacts.** Under alternative E, the cumulative impacts on native hardwood communities at this park site would be the same as those under alternative B: negligible cumulative impacts.

**FORT BAKER ALTERNATIVE E CONCLUSION TABLE**

| Native Hardwood Forest and Douglas-fir/Coast Redwood Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance              | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative C. The preferred alternative would allow on-leash dog walking on Drown Fire Road, the Bay Trail, Vista Point Trail (to be built), the Battery Yates Trail, the Lodge/Conference Center Grounds, and the Parade Ground. Impacts from dogs would result through physical disturbance from trampling and nutrient addition, which would prevent the growth of new vegetation. The impacts in the LOD area would be long term, minor, and adverse because the effects would be measurable and perceptible, but would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area would occur in a relatively small area compared to the site as a whole. Physically restraining dogs on leash would protect vegetation off trail. Therefore, assuming compliance, the overall impacts on native hardwood vegetation from on-leash dog walking at Fort Baker would be negligible because impacts would result in no measurable or perceptible changes in the plant community.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs; permits could restrict use by time and area. Permits would be allowed for Fort Baker excluding Drown Fire Road. Impacts on vegetation from permit holders with four to six dogs would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is not common at Fort Baker, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have negligible impacts on native hardwood vegetation.

**Cumulative Impacts.** Projects and actions in and near Fort Baker were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils. Ongoing parkwide

## Chapter 4: Environmental Consequences

restoration and enhancement efforts, such as GGNRA natural resource stewardship programs and the *Marin Countywide Plan* (County of Marin 2007), can also beneficially affect vegetation at GGNRA park sites such as Fort Baker. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance. Habitat restoration and the implementation of projects funded by the Wildland/Urban Interface Initiative on private lands could also impact Fort Baker.

Development or construction actions at or in the vicinity of GGNRA sites have had or may have the potential to have adverse impacts on native hardwood forest communities. Even though these efforts both within and beyond park boundaries would affect vegetation, mitigation for these projects would reduce the potential for impacts.

The negligible impacts on native hardwood communities from dog activities at this site under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from the park stewardship programs and other restoration projects combined with the negligible impacts from the preferred alternative would result in negligible impacts on native hardwood communities at this park site.

**FORT BAKER PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| <b>Native Hardwood Forest and Douglas-fir/Coast Redwood Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance                     | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance                     | Negligible cumulative impacts |

### IMPACTS TO RIPARIAN FOREST AND STREAM CORRIDORS BY SITE AND ALTERNATIVE

Riparian plant communities in GGNRA include streamside corridors of forests, shrubs, and herbaceous vegetation that tolerate moist conditions. The sites in GGNRA that possess riparian habitat include: Easkoot Creek at Stinson Beach, Redwood Creek at Muir Beach in Marin County, Marin Headlands Trails along the Rodeo Valley Trail Corridor from Rodeo Beach to Capehart Housing, and Lobos Creek at Baker Beach. The area at the Lobos Creek inlet that supports riparian vegetation is generally not used by visitors with dogs and is not affected by this draft plan/SEIS (NPS 2009k). At Easkoot Creek, the creek is densely vegetated with riparian plant species and generally difficult to access. Therefore, impacts on riparian vegetation as a result of alternatives A through F at both Lobos Creek at Baker Beach and Easkoot Creek at Stinson Beach would be negligible and are not discussed further in this section. Below and discussed in more detail include the following sites: Muir Beach (Redwood Creek) Marin Headlands Trails (along the Rodeo Valley Trail Corridor from Rodeo Beach to Capehart Housing), and Rancho Corral de Tierra.

#### MARIN COUNTY SITES

##### Muir Beach

**Alternative A: No Action.** At Muir Beach, riparian forest habitat surrounds the parking lot to the north and east and continues south adjacent to the grassland habitat. Under alternative A, on-leash dog walking is allowed in the parking lot and on the bridge and path to the beach; dogs are allowed under voice control on the beach. This site has moderate to high visitor use by beachgoers and hikers (table 9). The park has

closed the lagoon and Redwood Creek, although it has been observed that these closures have been violated and dogs have accessed Redwood Creek (appendix G).

Under alternative A, dogs in the parking lot could enter the areas containing riparian forest. As a result, continued long-term minor adverse impacts on riparian vegetation would occur under this alternative because the integrity of the plant community could be negatively affected by dogs through trampling, digging, and dog waste; these effects would be measurable and perceptible, but would be localized in a relatively small area.

No permit system exists for commercial dog walking under alternative A. At Muir Beach, commercial dog walking is uncommon; therefore, commercial dog walking would have negligible impacts on riparian vegetation.

**Cumulative Impacts.** Projects and actions in and near Muir Beach were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs initiative projects provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils. Ongoing parkwide restoration and enhancement efforts, such as GGNRA natural resource stewardship programs and the *Marin Countywide Plan* (County of Marin 2007), can also beneficially affect riparian forest vegetation at GGNRA park sites such as Muir Beach. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance. Habitat restoration and the implementation of projects funded by the Wildland/Urban Interface Initiative on private lands could also impact Muir Beach. The *Lower Redwood Creek Floodplain and Salmonid Habitat Restoration* plan restored channel function to reduce flooding and reconnect the creek to its floodplain, as well as expanding riparian vegetation at the Banducci site (NPS 2010b, 1). The *Dias Ridge Restoration and Trail Improvement Project* is currently realigning trail segments and restoring degraded areas on Dias Ridge above Muir Beach (NPS 2009i, 1). Additional vegetation benefits would be expected from the *Muir Beach Wetland and Creek Restoration*, through restoring and enhancing ecological processes near the mouth of Redwood Creek as well as enhancing habitat and improving erosion and sedimentation conditions (NPS 2009j, 1). The park stewardship programs initiative at Pirates Cove, just south of Muir Beach, included efforts to control invasive non-native plants such as pampas grass to support the dense and relatively undisturbed coastal scrub, prairie, and riparian habitats (GGNPC 2010a, 1).

Generally, construction and development projects that affect the riparian forest and stream corridor communities, such as the GGNRA *Long-range Transportation Plan Update*, require project-specific mitigation measures to address impacts on these communities and their wildlife. Therefore, these projects would not likely contribute to negative cumulative impacts. In addition to construction and development projects, implementation of some of the proposed fire management policies of the GGNRA *Fire Management Plan* may affect riparian areas and stream corridors through vegetation removal, although non-emergency fire management actions would not take place within 100 feet of riparian areas (NPS 2005b). Work in riparian and streamside areas for the GGNRA *Fire Management Plan* would be carefully managed to ensure that impacts are mitigated to an acceptable level, and cumulative impacts would be long term and beneficial due to restoration of riparian habitat associated with this project (NPS 2005b). Loss of riparian vegetation can lead to elevated water temperatures, reducing the ability of the water to hold dissolved oxygen (NPS 2005b), which can ultimately affect the fisheries in the stream.

The long-term minor adverse impacts on riparian vegetation from dogs at Muir Beach under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from the rehabilitation and improvement projects should reduce some of the adverse impacts on riparian vegetation

## Chapter 4: Environmental Consequences

from alternative A. Therefore, cumulative impacts on riparian vegetation under this alternative would be expected to be negligible.

**MUIR BEACH ALTERNATIVE A CONCLUSION TABLE**

| Riparian Forest and Stream Corridor Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Long-term minor adverse impacts             | Redwood Creek has been closed to dogs by the NPS to protect sensitive habitat in the watershed, but there is no physical barrier and off-leash dogs enter the riparian areas as well as the creek; this habitat would continue to be subject to impacts from dogs through trampling, digging, and dog waste | N/A  | Negligible cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking on the beach, the bridge and path to the beach, the parking area, and the proposed Muir Beach Trail. The riparian forest located adjacent to Muir Beach would be generally protected by physically restraining dogs on leash. Riparian forest vegetation located in the 6-foot areas adjacent to the trail and parking lot (LOD area) would receive long-term minor adverse impacts from dogs trampling in vegetated areas; nutrient addition from dog waste would also occur. The effects would be measurable and perceptible, but would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area would occur in a relatively small area compared to the site as a whole. Physically restraining dogs on leash would protect vegetation off trail, and trails in riparian habitat constitute a small area in comparison to the entire site. Therefore, assuming compliance, the overall impacts on riparian vegetation from on-leash dog walking at Muir Beach would be negligible because impacts would result in no measurable or perceptible changes in the plant community.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is not common at Muir Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have negligible impacts on riparian vegetation.

**Cumulative Impacts.** The negligible impacts on riparian vegetation from dogs at Muir Beach under alternative B were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the rehabilitation and improvement projects combined with the negligible impacts from alternative B would result in negligible cumulative impacts on riparian vegetation at this park site.

**MUIR BEACH ALTERNATIVE B CONCLUSION TABLE**

| <b>Riparian Forest and Stream Corridor Impacts</b> | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|--|---|-------------------------------|
| Overall negligible impacts, assuming compliance    | Physically restraining dogs would protect habitat off trail; trails and the LOD area are a small portion of the site; trails in riparian habitat are a small area in comparison to the entire site; trails generally receive low to moderate use | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would have the same dog walking restrictions as alternative B, and impacts would be the same, assuming compliance: long term, minor, and adverse in the LOD area and negligible overall.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Muir Beach is not one of the park sites where permits to walk more than three dogs, with a maximum of six, would be issued. Since commercial dog walking is not common at Muir Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on riparian vegetation.

**Cumulative Impacts.** Under alternative C, the cumulative impacts on riparian vegetation at this park site would be the same as those under alternative B: negligible cumulative impacts.

**MUIR BEACH ALTERNATIVE C CONCLUSION TABLE**

| <b>Riparian Forest and Stream Corridor Impacts</b> | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|--|---|-------------------------------|
| Overall negligible impacts, assuming compliance    | Physically restraining dogs would protect habitat off trail; trails and the LOD area are a small portion of the site; trails in riparian habitat are a small area in comparison to the entire site; trails generally receive low to moderate use | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** In the vicinity of Muir Beach, alternative D would allow on-leash dog walking in the parking area and on the proposed Muir Beach Trail. The bridge and path to beach and the beach itself would be closed to dogs. These on-leash areas are surrounded by riparian forest; therefore, impacts would be expected to be similar to those described for alternative B. Riparian forest vegetation located in the 6-foot area adjacent to the trail and parking lot (LOD area) would receive long-term minor adverse impacts from dogs trampling vegetated areas; nutrient addition from dog waste would also occur. The effects would be measurable and perceptible, but would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area would occur in a relatively small area compared to the site as a whole. Physically restraining dogs on leash would protect vegetation off trail,

## Chapter 4: Environmental Consequences

and trails in riparian habitat constitute a small portion of the site. Therefore, assuming compliance, the overall impact on riparian vegetation from on-leash dog walking at Muir Beach would be negligible because impacts would result in no measurable or perceptible changes in the plant community.

No commercial dog walking would be allowed and no permits to walk more than three dogs would be issued under alternative D; therefore, commercial and permitted dog walking would have no impact on riparian vegetation.

**Cumulative Impacts.** The negligible impacts on riparian vegetation from dogs at Muir Beach under alternative D was considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the rehabilitation and improvement projects combined with the negligible impacts from alternative D would result in negligible cumulative impacts on riparian vegetation at this park site.

**MUIR BEACH ALTERNATIVE D CONCLUSION TABLE**

| Riparian Forest and Stream Corridor Impacts     | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect habitat off trail; trails and the LOD area are a small portion of the site; trails in riparian habitat are a small area in comparison to the entire site; trails generally receive low to moderate use | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Under alternative E at Muir Beach, the parking area, the proposed Muir Beach Trail, and the bridge and path to the beach would be open to on-leash dog walking. The portion of Muir Beach south of the access path would be a designated ROLA, and dogs would be prohibited on the remainder of the beach north of the access path. The ROLA designated as part of this alternative, the proposed Muir Beach Trail, and the parking lot are located immediately adjacent to riparian forest. Riparian forest vegetation located in the 6-foot area adjacent to the trail and parking lot (LOD area) would receive long-term minor adverse impacts from dogs trampling vegetated areas; nutrient addition from dog waste would also occur. The effects would be measurable and perceptible, but would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area would occur in a relatively small area compared to the site as a whole. Physically restraining dogs on leash in areas beyond the ROLA would protect vegetation off trail, and trails in riparian habitat constitute a small area in comparison to the entire site. Therefore, assuming compliance, the overall impacts on riparian vegetation from on-leash dog walking at Muir Beach would be negligible because impacts would result in no measurable or perceptible changes in the plant community.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Muir Beach is not one of the park sites where permits to walk more than three dogs, with a maximum of six, would be issued. Since commercial dog walking is not common at Muir Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on riparian vegetation.

**Cumulative Impacts.** The negligible impacts on riparian vegetation from dogs at Muir Beach under alternative E were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the restoration and improvement projects combined with the negligible impacts from alternative E would result in negligible cumulative impacts on riparian vegetation at this park site.

**MUIR BEACH ALTERNATIVE E CONCLUSION TABLE**

| Riparian Forest and Stream Corridor Impacts     | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect habitat off trail; trails and the LOD area and ROLAs are a small portion of the entire site; trails in riparian habitat are a small area in comparison to the entire site; trails generally receive low to moderate use | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative would allow on-leash dog walking on the beach, bridge and path to the beach, and the proposed Muir Beach Trail. The tidal lagoon and Redwood Creek would remain closed to dogs, and fencing would be installed along the dunes and lagoon as needed. Riparian forest vegetation located in the 6-foot area adjacent to the trail and parking lot (LOD area) would receive long-term minor adverse impacts from dogs trampling vegetated areas; nutrient addition from dog waste would also occur. The effects would be measurable and perceptible, but would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area would occur in a relatively small area compared to the site as a whole. Physically restraining dogs on leash would protect vegetation off trail, and trails in riparian habitat constitute a small area in comparison to the entire site. Therefore, assuming compliance, the overall impacts on riparian vegetation from on-leash dog walking at Muir Beach would be negligible because impacts would result in no measurable or perceptible changes in the plant community.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Muir Beach is not one of the park sites where permits to walk more than three dogs, with a maximum of six, would be issued. Since commercial dog walking is not common at Muir Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have negligible impacts on riparian vegetation.

**Cumulative Impacts.** Projects and actions in and near Muir Beach were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs initiative projects provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils. Ongoing parkwide restoration and enhancement efforts, such as GGNRA natural resource stewardship programs and the *Marin Countywide Plan* (County of Marin 2007), can also beneficially affect riparian forest vegetation at GGNRA park sites such as Muir Beach. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance. Habitat restoration and the implementation of projects funded by the Wildland/Urban Interface Initiative on private lands could also impact Muir Beach. The *Lower Redwood*

## Chapter 4: Environmental Consequences

*Creek Floodplain and Salmonid Habitat Restoration* restored channel function to reduce flooding and reconnect the creek to its floodplain, as well as expanding riparian vegetation at the Banducci site (NPS 2010d, 1). The *Dias Ridge Restoration and Trail Improvement Project* is currently realigning trail segments and restoring degraded areas on Dias Ridge above Muir Beach (NPS 2009i, 1). Additional vegetation benefits would be expected from the *Muir Beach Wetland and Creek Restoration Project*, through restoring and enhancing ecological processes near the mouth of Redwood Creek as well as enhancing habitat and improving erosion and sedimentation conditions (NPS 2009j, 1). The park stewardship programs initiative at Pirates Cove, just south of Muir Beach, included efforts to control invasive non-native plants such as pampas grass to support the dense and relatively undisturbed coastal scrub, prairie, and riparian habitats (GGNPC 2010a, 1).

Generally, construction and development projects that affect the riparian forest and stream corridor communities, such as the GGNRA *Long-range Transportation Plan Update*, require project-specific mitigation measures to address impacts on these communities and their wildlife. Therefore, these projects would not likely contribute to negative cumulative impacts. In addition to construction and development projects, implementation of some of the proposed fire management policies of the GGNRA *Fire Management Plan* may affect riparian areas and stream corridors through vegetation removal, although non-emergency fire management actions would not take place within 100 feet of riparian areas (NPS 2005b). Work in riparian and streamside areas for the GGNRA *Fire Management Plan* would be carefully managed to ensure that impacts are mitigated to an acceptable level and cumulative impacts would be long term and beneficial due to restoration of riparian habitat associated with this project (NPS 2005b). Loss of riparian vegetation can lead to elevated water temperatures, reducing the ability of the water to hold dissolved oxygen (NPS 2005b), which can ultimately affect the fisheries in the stream.

The negligible impacts on riparian vegetation from dogs at Muir Beach under the preferred alternative was considered together with the effects of the projects mentioned above. The beneficial effects from the rehabilitation and improvement projects combined with the negligible impacts from the preferred alternative would result in negligible cumulative impacts on riparian vegetation at this park site.

**MUIR BEACH PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| <b>Riparian Forest and Stream Corridor Impacts</b> | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|--|---|-------------------------------|
| Overall negligible impacts, assuming compliance    | Physically restraining dogs would protect habitat off trail; trails and the LOD area are a small portion of the site; trails in riparian habitat are a small area in comparison to the entire site; trails generally receive low to moderate use | Beneficial, assuming compliance                     | Negligible cumulative impacts |

### Marin Headlands Trails

**Alternative A: No Action.** Under current conditions, on-leash dog walking is allowed along the Coastal Trail from Hill 88 to Muir Beach, the Batteries Loop Trail, North Miwok Trail from Tennessee Valley to Highway 1, County View Trail, and Marin Drive. Dog walking under voice control (or on leash) is allowed along other portions of the Coastal Trail (Golden Gate Bridge to Hill 88, including portions of the Lagoon Loop Trail); the Coastal, Wolf Ridge, and Miwok Trail Loop; and the Old Bunker Fire Road Loop. These trails experience low to moderate use by dog walkers. Dog-related incidents are high at this site with a total of 269 from 2008 through 2011, with the majority of incidents for having dogs within

areas closed to pets (table 16). Within the Marin Headlands Trails, the Rodeo Valley Trail Corridor parallels riparian habitat for its entire length, and the Lagoon Loop Trail both passes through and is adjacent to riparian habitat along both sides of Rodeo Lagoon; portions of both of these trails are currently open to dogs under voice control. Physical disturbance and nutrient addition are currently happening along the trails and in off-trail areas due to unleashed dogs.

Because only a portion of the entire site supports riparian vegetation in areas that would be open to dogs, alternative A would result in continued long-term minor adverse impacts on the riparian community as a result of dogs through trampling, digging, and dog waste; effects would be measurable and perceptible, but would be localized in a relatively small area.

Under alternative A, no permit system exists for dog walking. At the Marin Headlands Trails, commercial dog walking is uncommon; therefore, commercial dog walking would have negligible impacts on riparian vegetation.

**Cumulative Impacts.** Projects and actions in and near the Marin Headlands Trails were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils. Ongoing parkwide restoration and enhancement efforts, such as GGNRA natural resource stewardship programs and the *Marin Countywide Plan* (County of Marin 2007), can also beneficially affect vegetation at GGNRA park sites such as the Marin Headlands Trails. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance. Habitat restoration and the implementation of projects funded by the Wildland/Urban Interface Initiative on private lands could also impact the Marin Headlands Trails.

Generally, construction and development projects that affect the riparian forest and stream corridor communities, such as the GGNRA *Long-range Transportation Plan*, require project-specific mitigation measures to address impacts on these communities and their wildlife. Therefore, these projects would not likely contribute to negative cumulative impacts. In addition to construction and development projects, implementation of some of the proposed fire management policies of the GGNRA *Fire Management Plan* may affect riparian areas and stream corridors through vegetation removal, although non-emergency fire management actions would not take place within 100 feet of riparian areas (NPS 2005b). Work in riparian and streamside areas for the GGNRA *Fire Management Plan* would be carefully managed to ensure that impacts are mitigated to an acceptable level and cumulative impacts would be long term and beneficial due to restoration of riparian habitat associated with this project (NPS 2005b). Loss of riparian vegetation can lead to elevated water temperatures, reducing the ability of the water to hold dissolved oxygen (NPS 2005b), which can ultimately affect the fisheries in the stream.

The long-term minor adverse impacts on riparian vegetation from dogs at the Marin Headlands Trails under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from the rehabilitation and restoration projects should reduce some of the adverse impacts on riparian vegetation from alternative A. Therefore, negligible cumulative impacts on riparian vegetation would result from alternative A.

**Chapter 4: Environmental Consequences**

**MARIN HEADLANDS TRAILS ALTERNATIVE A CONCLUSION TABLE**

| <b>Riparian Forest and Stream Corridor Impacts</b> | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|--|---|-------------------------------|
| Long-term minor adverse impacts                    | Off-leash dogs would affect riparian vegetation along the Lower Rodeo Valley Trail Corridor and along the Lagoon Loop Trail through trampling, digging, and dog waste; nutrient addition would also occur outside the LOD area | N/A   | Negligible cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would prohibit dogs on the trails at the Marin Headlands. Not allowing dog walking on the Marin Headlands Trails would eliminate physical disturbance by dogs and nutrient addition from dog waste. Therefore, assuming compliance, alternative B would result in no impact on riparian vegetation at the site.

Since dogs would not be allowed on the Marin Headlands Trails, there would be no impact from commercial dog walkers on the riparian vegetation community.

**Cumulative Impacts.** The lack of impacts on riparian vegetation from dogs at the Marin Headlands Trails under alternative B was considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the rehabilitation and restoration projects combined with the lack of impacts on riparian vegetation from alternative B would result in beneficial cumulative impacts on riparian vegetation.

**MARIN HEADLANDS TRAILS ALTERNATIVE B CONCLUSION TABLE**

| <b>Riparian Forest and Stream Corridor Impacts</b> | <b>Rationale</b>                     | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|--------------------------------------|---|-------------------------------|
| No impact  | Dogs would be prohibited at the site | Beneficial, assuming compliance                     | Beneficial cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would allow on-leash dog walking along the Lower Rodeo Valley Trail Corridor, which runs from the Rodeo Beach parking lot to the intersection of Bunker and McCullough Roads, via the North Lagoon Loop Trail, Miwok Trail, and Rodeo Valley Trail, and includes the trail connector to the Smith Road Trailhead; the Batteries Loop Trail; and the Old Bunker Fire Road Loop. Within the Marin Headlands Trails, the Rodeo Valley Trail Corridor parallels riparian habitat for its entire length, and the North Lagoon Loop Trail both passes through and is adjacent to riparian habitat along both sides of Rodeo Lagoon. Although only a portion of the Rodeo Valley Trail is currently open to dogs, under alternative C an additional section in riparian habitat would be opened to on-leash dogs on the multi-use trail and bridge at Capehart Housing in upper Rodeo Valley that connects the Rodeo Valley Trail to Bunker Road. The North Lagoon Loop Trail would allow on-leash dog walking. Impacts in the LOD area would be long term, minor, and adverse since the vegetation in these areas would be affected by trampling and dog waste; effects would be measurable and perceptible, but would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area would occur in a fair portion of the site as a whole. However, physically restraining dogs on leash would protect habitat off trail along the Lower

Rodeo Valley Trail Corridor. Therefore, assuming compliance, alternative C would result in overall negligible impacts on riparian vegetation because impacts would result in no measurable or perceptible changes in the plant community.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Marin Headlands Trails is not one of the park sites where permits to walk more than three dogs, with a maximum of six, would be issued. Since commercial dog walking activity is not common at the Marin Headlands Trails, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on riparian vegetation.

**Cumulative Impacts.** The negligible impacts on riparian vegetation from dogs at the Marin Headlands Trails under alternative C were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the rehabilitation and restoration projects combined with the negligible impacts on riparian vegetation from alternative C would result in negligible cumulative impacts on riparian vegetation.

**MARIN HEADLANDS TRAILS ALTERNATIVE C CONCLUSION TABLE**

| <b>Riparian Forest and Stream Corridor Impacts</b> | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|--|---|-------------------------------|
| Overall negligible impacts, assuming compliance    | Physically restraining dogs would protect habitat off trail along the Lower Rodeo Valley Trail Corridor, which supports riparian habitat; LOD area and Lower Rodeo Valley Trail Corridor make up a fair portion of the entire site | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Alternative D would have the same dog walking restrictions as alternative B (dogs would be prohibited on the trails). Therefore, assuming compliance, no impact on riparian vegetation would occur as a result of alternative D.

Since dogs would not be allowed on the Marin Headlands Trails, there would be no impact from commercial dog walkers on the riparian vegetation community.

**Cumulative Impacts.** Under alternative D, the cumulative impacts on riparian vegetation at this park site would be the same as those under alternative B: beneficial cumulative impacts.

**MARIN HEADLANDS TRAILS ALTERNATIVE D CONCLUSION TABLE**

| <b>Riparian Forest and Stream Corridor Impacts</b> | <b>Rationale</b>                     | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|--------------------------------------|---|-------------------------------|
| No impact  | Dogs would be prohibited at the site | Beneficial, assuming compliance                     | Beneficial cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would allow on-leash dog walking on the Conzelman Coastal Trail from Highway 101 to the McCullough intersection and then on the Coastal Trail Bike Route, including Julian Road, to the Rodeo Beach parking lot. On-leash dog walking would also be available on the Old Bunker Fire Road Loop which includes a section of the Coastal trail; the Batteries Loop Trail, North Miwok Trail from Tennessee Valley to Highway 1,

## Chapter 4: Environmental Consequences

County View Trail, Marin Drive, Rodeo Avenue Trail, and Morning Sun Trail. Within the Marin Headlands Trails, the Rodeo Valley Trail Corridor parallels riparian habitat for its entire length, and the Lagoon Loop Trail both passes through and is adjacent to riparian habitat along the sides of Rodeo Lagoon. This alternative would allow dog access only on the perimeter trails in the Marin Headlands, while preserving and maintaining the integrity of interior habitat. Impacts in the LOD area would be long term, minor, and adverse since some of the riparian vegetation along the Lower Rodeo Valley Trail Corridor would be affected by trampling and dog waste. Effects would be measurable and perceptible, but would be localized in a relatively small area. Even though alternative E would allow more dog access at the site, the difference in dog use between alternatives E and C is not considered large enough to cause a change in the intensity of the impacts relative to the area of the site.

The long-term minor adverse impacts from dogs in the LOD area would occur in a relatively small area compared to the site as a whole. However, physically restraining dogs would protect habitat off trail along the Lower Rodeo Valley Trail Corridor and along the Lagoon Loop Trail. Therefore, assuming compliance, alternative E would result in overall negligible impacts on riparian vegetation because impacts would result in no measurable or perceptible changes in the plant community. Although more trails would be available to dogs in comparison to alternative C, the overall impact on vegetation from on-leash dog walking would still be negligible, assuming compliance.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Marin Headlands Trails is not one of the park sites where permits to walk more than three dogs, with a maximum of six, would be issued. Since commercial dog walking is not common at the Marin Headlands Trails, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on riparian vegetation.

**Cumulative Impacts.** The negligible impacts on riparian vegetation from dogs at the Marin Headlands Trails under alternative E were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the rehabilitation and restoration projects combined with the negligible impacts on riparian vegetation from alternative E would result in negligible cumulative impacts on riparian vegetation.

**MARIN HEADLANDS TRAILS ALTERNATIVE E CONCLUSION TABLE**

| <b>Riparian Forest and Stream Corridor Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance    | Physically restraining dogs would protect habitat off trail along the Lower Rodeo Valley Trail Corridor and the Lagoon Trail, which supports riparian habitat; LOD area and Lower Rodeo Valley Trail Corridor make up a fair portion of the entire site | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** On-leash dog walking would be allowed along the Lower Rodeo Valley Trail Corridor, which extends from the Rodeo Beach parking lot to the intersection of Bunker and McCullough Roads via the North Lagoon Loop Trail, Miwok Trail, and the Rodeo Valley Trail, and includes the connector trail from Rodeo Valley Trail to the Smith Road Trailhead. On-leash dog walking would also be available on the Old Bunker Fire Road Loop (including a section of the Coastal Trail), the Batteries Loop Trail, Rodeo Avenue Trail, and Morning Sun Trail. Within the Marin Headlands Trails,

the Rodeo Valley Trail Corridor parallels riparian habitat for its entire length, and the Lagoon Loop Trail both passes through and is adjacent to riparian habitat along both sides of Rodeo Lagoon. Although only a portion of the Rodeo Valley Trail is currently open to dogs, under the preferred alternative, an additional section in riparian habitat would be opened to on-leash dogs on the multi-use trail and bridge at Capehart Housing in upper Rodeo Valley which connects the trail to Bunker Road. Therefore, impacts in the LOD area would be long term, minor, and adverse since the vegetation in these areas will be affected by trampling and dog waste; effects would be measurable and perceptible, but would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area would occur in a fair portion of the site as a whole. However, physically restraining dogs on leash would protect habitat off trail along the Lower Rodeo Valley Trail Corridor. Therefore, assuming compliance, the preferred alternative would result in an overall negligible impact on riparian vegetation because impacts would result in no measurable or perceptible changes in the plant community.

All dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Marin Headlands Trails is not one of the park sites where permits to walk more than three dogs, with a maximum of six, would be issued. Since commercial dog walking activity is not common at the Marin Headlands Trails, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have negligible impacts on riparian vegetation.

**Cumulative Impacts.** Projects and actions in and near the Marin Headlands Trails were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs initiative projects provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils. Ongoing parkwide restoration and enhancement efforts, such as GGNRA natural resource stewardship programs and the *Marin Countywide Plan* (County of Marin 2007), can also beneficially affect vegetation at GGNRA park sites such as the Marin Headlands Trails. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance. Habitat restoration and the implementation of projects funded by the Wildland/Urban Interface Initiative on private lands could also impact the Marin Headlands Trails.

Generally, construction and development projects that affect the riparian forest and stream corridor communities, such as the GGNRA *Long-range Transportation Plan Update*, require project-specific mitigation measures to address impacts on these communities and their wildlife. Therefore, these projects would not likely contribute to negative cumulative impacts. In addition to construction and development projects, implementation of some of the proposed fire management policies of the GGNRA *Fire Management Plan* may affect riparian areas and stream corridors through vegetation removal, although non-emergency fire management actions would not take place within 100 feet of riparian areas (NPS 2005b). Work in riparian and streamside areas for the GGNRA *Fire Management Plan* would be carefully managed to ensure that impacts are mitigated to an acceptable level and cumulative impacts would be long term and beneficial due to restoration of riparian habitat associated with this project (NPS 2005b). Loss of riparian vegetation can lead to elevated water temperatures, reducing the ability of the water to hold dissolved oxygen (NPS 2005b), which can ultimately affect the fisheries in the stream.

The negligible impacts on riparian vegetation from dogs at the Marin Headlands Trails under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from the rehabilitation and restoration projects combined with the negligible impacts on

## Chapter 4: Environmental Consequences

riparian vegetation from the preferred alternative would result in negligible cumulative impacts on riparian vegetation.

**MARIN HEADLANDS TRAILS PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| Riparian Forest and Stream Corridor Impacts     | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect habitat off trail along the Lower Rodeo Valley Trail Corridor, which supports riparian habitat; LOD area and Lower Rodeo Valley Trail Corridor make up a fair portion of the entire site | Beneficial, assuming compliance              | Negligible cumulative impacts |

### Rancho Corral de Tierra

**Alternative A: No Action.** Riparian habitat is found along the creeks, streams, and springs at Rancho Corral de Tierra, and trails cut across riparian forest in some areas. Currently, on-leash dog walking is allowed at Rancho Corral de Tierra. Staff working regularly at Rancho characterize use by dog walkers as low to moderate, and compliance with the leash law is generally low. At Rancho, NPS rangers have observed off-leash dogs running in areas with potentially sensitive habitat.

Under alternative A, dogs could enter the areas containing riparian forest. As a result, continued long-term minor adverse impacts on riparian vegetation would occur under this alternative because the integrity of the plant community could be negatively affected by dogs through trampling, digging, and dog waste; these effects would be measurable and perceptible, but visitor use at the site is generally low to moderate, and impacts from on-leash dogs would be localized in a relatively small area. According to information from the Montara Dog Group and subsequent staff observations, dog walkers, particularly off-leash dog walkers, primarily use the lower elevations of the site at both the Montara and El Granada areas. The terrain at El Granada is particularly steep and challenging, thus dog walking use in that area appears to be concentrated mostly in the lower elevations. Although the Montara area is less steep, visitor use there is similarly concentrated in the lower elevations, but some dog walkers in the Montara area do use trails that connect to the top of the Rancho site. Noncompliant dogs off leash would continue to access riparian and forest and stream corridors.

No permit system exists for dog walking under alternative A. Commercial dog walkers typically use the El Granada area off of Coral Reef Avenue; however, commercial dog walking is considered a low use at the site overall. Therefore, commercial dog walking would have negligible impacts on riparian forest at this site.

**Cumulative Impacts.** Projects and actions in and near Rancho were considered for the cumulative impacts analysis (appendix K). Since the Rancho Corral de Tierra site has been transferred to NPS, general protection of the site and associated natural resources would occur, although some impacts may remain from prior unregulated off-leash dog walking.

The GGNRA Maintenance Division conducts many ongoing functions throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance, which can beneficially affect vegetation at park sites. Additional actions have had, are currently having, or have the potential to have adverse impacts on vegetation at or in the vicinity of Rancho Corral de Tierra, such as development or

construction actions. One example is the CalTrans Devil's Slide Tunnel project, which involves constructing two tunnels beneath San Pedro Mountain to provide a dependable highway between Pacifica and Montara (CADOT 2013, 1). Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts.

The long-term minor adverse impacts on riparian forest from dogs at Rancho Corral de Tierra under alternative A were considered together with the effects of the actions mentioned above. The benefits to vegetation from the park stewardship programs would not be expected to reduce the adverse impacts of this alternative; therefore, the cumulative analysis for these park sites will focus on the results of the impact analysis for this alternative. The beneficial effects from the park stewardship programs combined with the long-term minor adverse impacts from alternative A would result in long-term minor adverse cumulative impacts on the riparian forest.

**RANCHO CORRAL DE TIERRA ALTERNATIVE A CONCLUSION TABLE**

| Riparian Forest and Stream Corridor Impacts | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts                         |
|---|--|--|--|
| Long-term minor adverse impacts             | Creek and waterbodies are closed to dogs by the NPS, but there is no physical barrier and off-leash dogs have been observed at this site; this habitat would continue to be subject to impacts from dogs through trampling, digging, and dog waste | N/A  | Long-term minor adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** On-leash dog walking would be allowed on designated trails in two areas open to dog walking near Montara and El Granada, which were identified by the local dog walking group as key areas for this use. The riparian forest located at Rancho would generally be protected by physically restraining dogs on leash. Riparian forest vegetation located in the 6-foot areas adjacent to the trail (LOD area) would receive long-term minor adverse impacts from dogs trampling vegetated areas; nutrient addition from dog waste would also occur. The effects would be measurable and perceptible, but would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area would occur in a relatively small area compared to the site as a whole. Physically restraining dogs on leash would protect vegetation off trail, and trails in riparian habitat constitute a small area in comparison to the entire site. Therefore, assuming compliance, the overall impacts on riparian vegetation from on-leash dog walking at Rancho would be negligible because impacts would result in no measurable or perceptible changes in the plant community.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking at Rancho is not common, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have negligible impacts on riparian forest.

**Cumulative Impacts.** The negligible impacts on riparian vegetation from dogs at Rancho under alternative B were considered together with the effects of the projects mentioned above under alternative.

## Chapter 4: Environmental Consequences

The beneficial effects from the rehabilitation and improvement projects combined with the negligible impacts from alternative B would result in negligible cumulative impacts on riparian vegetation.

**RANCHO CORRAL DE TIERRA ALTERNATIVE B CONCLUSION TABLE**

| Riparian Forest and Stream Corridor Impacts     | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance              | Beneficial cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Under alternative C, on-leash dog walking would be allowed on designated trails in two areas open to dog walking near Montara and El Granada. Dog walking under voice and site control would be allowed in a ROLA located between Le Conte and Tamarind Street, in a previously (partially) disturbed open area across the street and east of the Farallone View School. The ROLA is not located within riparian forest vegetation. Therefore, impacts to riparian forest under alternative C are the same as alternative B: overall negligible.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Rancho Corral de Tierra is also not one of the areas where permits to walk more than three dogs, with a limit of six, would be issued. Since commercial dog walking is not common at Rancho, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on riparian forest.

**Cumulative Impacts.** Under alternative C, the cumulative impacts on the riparian forest vegetation would be the same as those under alternative B: beneficial cumulative impacts.

**RANCHO CORRAL DE TIERRA ALTERNATIVE C CONCLUSION TABLE**

| Riparian Forest and Stream Corridor Impacts     | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance              | Beneficial cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Under alternative D, on-leash dog walking would be allowed in the Montara area on two existing trails that allow dog walking: Old San Pedro Mountain Road and the Farallon Cutoff. Dogs would be prohibited in other areas of the site, including the entire El Granada area. The riparian forest located at Rancho would generally be protected by physically restraining dogs on leash. Riparian forest vegetation located in the 6-foot areas adjacent to the trail (LOD area) would receive long-term minor adverse impacts from dogs trampling vegetated areas; nutrient addition from dog waste would also occur. The effects would be measurable and perceptible, but would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area would occur in a relatively small area compared to the site as a whole. Physically restraining dogs on leash would protect vegetation off trail, and trails in riparian habitat constitute a small area in comparison to the entire site. Therefore, assuming

compliance, the overall impacts on riparian vegetation from on-leash dog walking at Rancho would be negligible because impacts would result in no measurable or perceptible changes in the plant community.

No commercial dog walking would be allowed and no permits to walk more than three dogs would be issued under alternative D; therefore, no impact would occur as a result of commercial or permitted dog walking.

**Cumulative Impacts.** Under alternative D, the cumulative impacts on riparian forest would be the same as those under alternative B: beneficial cumulative impacts.

**RANCHO CORRAL DE TIERRA ALTERNATIVE D CONCLUSION TABLE**

| <b>Riparian Forest and Stream Corridor Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance    | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance                     | Beneficial cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Dog walking restrictions under alternative E would be the same as under alternative C and impacts on riparian forest vegetation would also be the same: overall, negligible impacts, assuming compliance.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Rancho Corral de Tierra is also not one of the areas where permits to walk more than three dogs, with a limit of six, would be issued. Since commercial dog walking activity is not common at Rancho, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on riparian forest.

**Cumulative Impacts.** Under alternative E, the cumulative impacts on riparian forest would be the same as those under alternative B: beneficial cumulative impacts.

**RANCHO CORRAL DE TIERRA ALTERNATIVE E CONCLUSION TABLE**

| <b>Riparian Forest and Stream Corridor Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance    | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance                     | Beneficial cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative B: on-leash dog walking would be allowed on designated trails in two areas open to dog walking near Montara and El Granada. Physically restraining dogs on leash would protect vegetation off trail. Therefore, assuming compliance, the overall impact on riparian forest from on-leash dog walking at Rancho would be negligible.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Rancho Corral de Tierra is also not one of the areas where permits to walk more than three dogs, with a limit of six, would be issued. Since commercial dog walking activity is not common at Rancho, it is likely that this alternative would not have an impact on

## Chapter 4: Environmental Consequences

the number of dog walkers. Therefore, commercial dog walking under alternative F would have negligible impacts on riparian forest.

**Cumulative Impacts.** Projects and actions in and near Rancho were considered for the cumulative impacts analysis (appendix K). Since the Rancho Corral de Tierra site has been transferred to NPS, general protection of the site and associated natural resources would occur, although some impacts may remain from prior unregulated off-leash dog walking.

The GGNRA Maintenance Division conducts many ongoing functions throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance, which can beneficially affect vegetation at park sites. Additional actions have had, are currently having, or have the potential to have adverse impacts on vegetation at or in the vicinity of Rancho Corral de Tierra, such as development or construction actions. One example is the CalTrans Devil's Slide Tunnel project, which involves constructing two tunnels beneath San Pedro Mountain to provide a dependable highway between Pacifica and Montara (CADOT 2013, 1). Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts.

The negligible impacts on riparian forest from dogs at Rancho Corral de Tierra under the preferred alternative were considered together with the effects of the actions mentioned above. The beneficial effects from the park stewardship programs combined with the negligible impacts under the preferred alternative would result in beneficial cumulative impacts on riparian forest.

**RANCHO CORRAL DE TIERRA PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| <b>Riparian Forest and Stream Corridor Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance    | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance                     | Beneficial cumulative impacts |

### Other Coniferous Communities

Stands of the non-native tree Monterey cypress are found within GGNRA, including at East Fort Miley, Lands End, and in several locations at Rancho Corral de Tierra. Most areas of Monterey cypress at Rancho Corral de Tierra were planted for wind breaks and as timber sources in the 1800s, as well as later for street trees and to provide shade. While these trees provide habitat for some nesting bird species, the creation of a densely shaded canopy and acidic soils disrupt the natural distribution of native species at Rancho Corral de Tierra (POST 2001, 54). In 1933, the City of San Francisco and the federal government's Civilian Works Administration planted thousands of Monterey cypress around Lands End; those cypress were thinned substantially during the initial stages of the Lands End Coastal Trail restoration. East Fort Miley is primarily Monterey cypress with some wetland/riparian vegetation around the fringes; the area is dominated by older stands of cypress, which were densely planted. East and West Fort Miley has low numbers of dog walkers, and low numbers of citations and incident reports related to dog activities at the site (table 9). A large portion of the site is developed with military fortifications and only a small portion of the site supports mature, coniferous vegetation (including primarily Monterey cypress, which is not naturally occurring in San Francisco County) in areas that are open to dogs. The stands of mature Monterey cypress at East Fort Miley, Lands End, and Rancho Corral de Tierra are unlikely to be affected by dogs through trampling, digging, or dog waste due to their previously established nature at the site and/or the development that has previously occurred at Fort Miley and Lands

End. Therefore, impacts from dogs on other coniferous communities (Monterey cypress) at Fort Miley, Lands End, and Rancho Corral de Tierra for all alternatives would be negligible and are not discussed further in this “Vegetation and Soils” section.

## WILDLIFE

As stated in chapter 3, GGNRA supports a rich assemblage of wildlife in grasslands, coastal scrub, wetlands, and forests that compose the coastal ecosystem. Approximately 387 vertebrate species occur within the park boundaries, including 11 amphibians, 20 reptiles, 53 fish, 53 mammals, and 250 birds; terrestrial invertebrates are less well known. The documented species list includes species that are federally or state listed as threatened, endangered, or candidate species as well as species that are of local or management concern. Species that are federally listed and/or candidate species are discussed in the “Special-status Species” section of this chapter. This section addresses all other wildlife species found in the park, including those considered sensitive by agencies such as the Department of Fish and Wildlife, which maintains an informal list of plant and wildlife species of special concern. The NPS makes every reasonable effort to conduct its actions in a manner consistent with relevant state laws and regulations. In this section, impacts on wildlife in general are analyzed by habitat type to be consistent with the wildlife description included in chapter 3. Species are specifically analyzed where applicable and when affected by dog management as part of this draft plan/SEIS. The sites included in the analysis of this section are those where habitat quality and/or quantity may be affected by the various alternatives considered. Urbanized sites with little wildlife habitat or value that support species acclimated to human activity (raccoons, opossums, skunks, etc.) are not analyzed in this draft plan/SEIS. It is presumed that those acclimated species persist currently where dogs are present and will most likely continue to persist under alternatives A through E.

GGNRA is guided by a variety of legal directives, including federal and state laws, regulations, executive orders, NPS management policies, Director’s Orders, other agency and departmental policies, decisions made through other NEPA planning processes, and legal agreements. Foremost among these directives is the NPS *Organic Act of 1916* and its interpretation in the *NPS Management Policies 2006* (NPS 2006a, 10). Following is an overview of the guiding policies and regulations, a description of the study area, a definition of duration, details of the assessment methodology, and a definition of the impact thresholds for wildlife.

## GUIDING POLICIES AND REGULATIONS

### Federal Laws and Regulations

**Code of Federal Regulations.** Disturbances to wildlife are addressed under 36 CFR 2.2(a) and 2.15(a)(4). Under 2.2(a), the following are prohibited:

- The taking of wildlife, except by authorized hunting and trapping activities conducted in accordance with paragraph (b) of this section.
- The feeding, touching, teasing, frightening or intentional disturbing of wildlife nesting, breeding or other activities.

Under 2.15(a)(4), the following is prohibited: allowing a pet to make noise that is unreasonable considering location, time of day or night, impact on park users, and other relevant factors, or that frightens wildlife by barking, howling, or making other noise. Section 2.15(a)(5) requires compliance with pet excrement disposal conditions established by the superintendent.

## Chapter 4: Environmental Consequences

***Migratory Bird Treaty Act of 1918.*** The *Migratory Bird Treaty Act* (16 USC 703–712), which was first enacted in 1918, implements domestically a series of treaties between the United States and Great Britain (on behalf of Canada), Mexico, Japan, and the former Union of Soviet Socialist Republics, which provide for international migratory bird protection and authorize the Secretary of the Interior to regulate the taking of migratory birds. The act makes it unlawful, except as allowed by regulations, “at any time, by any means, or in any manner, to pursue, take, or kill any migratory bird, or any part, nest or egg of any such bird, included in the terms of conventions” with certain other countries (16 USC 703). This includes direct and indirect acts, although harassment and habitat modification are not included unless they result in the direct loss of birds, nests, or eggs. All the bird species at GGNRA discussed in chapters 3 and 4 are protected under the *Migratory Bird Treaty Act*, with the exception of starlings, pigeons, crows, and game birds.

***Marine Mammal Protection Act.*** The *Marine Mammal Protection Act* (16 USC 1361–1423), which was most recently reauthorized in 1994, establishes a moratorium, with certain exceptions, on the taking of marine mammals in U.S. waters. The term “take” is statutorily defined as, “to harass, hunt, capture, or kill, or attempt to harass, hunt, capture, or kill any marine mammal.” Harassment is defined under the 1994 amendments as any act of pursuit, torment, or annoyance that has the potential to injure a marine mammal in the wild, or has the potential to disturb a marine mammal in the wild by causing disruption to behavioral patterns, including, but not limited to, migration, breathing, nursing, breeding, feeding, or sheltering. All the marine mammal species at GGNRA discussed in chapters 3 and 4 are protected under the *Marine Mammal Protection Act* and marine mammals both strand and haul out on GGNRA beaches and other shoreline habitat. The *Marine Mammal Protection Act* defines a stranding as one or more of the following occurrences:

- Any dead marine mammal on the shore or in the water;
- A live marine mammal that is on the shore and unable to return to the water;
- A live marine mammal that is on the shore and in need of medical attention;
- A live marine mammal that is in the water but is unable to return to its natural habitat under its own power or without assistance (e.g., an animal entangled in fishing gear).

***Magnuson-Stevens Fishery Management and Conservation Act.*** The *Magnuson-Stevens Fishery Conservation and Management Act* (PL 94-265), as amended by the *Sustainable Fisheries Act* of 1996 (PL 104-297), requires all federal agencies to consult with NOAA Fisheries (formerly the National Marine Fisheries Service) on all actions, or proposed actions, permitted, funded, or undertaken by the agency, that may adversely affect essential fish habitat. Essential fish habitat is defined as “those waters and substrate necessary to fish for spawning, breeding, feeding, or growth to maturity” (NOAA 2010b, 1) Waters include aquatic areas and their associated physical, chemical, and biological properties. Substrate includes sediment underlying the waters. Necessary means the habitat required to support a sustainable fishery and the managed species’ contribution to a healthy ecosystem.

**Executive Order 13186—Responsibilities of Federal Agencies to Protect Migratory Birds.** This executive order from January 2001 provides a comprehensive strategy for the conservation of migratory birds by the federal government, thereby fulfilling the government’s duty to lead in the protection of migratory birds. The executive order provides a specific framework for the federal government’s compliance with its treaty obligations to Canada, Mexico, Russia, and Japan and serves to enhance coordination and communication among federal agencies regarding their responsibilities under the four bilateral treaties on the conservation of migratory birds (Canada—1916, Mexico—1936, Japan—1972, Russia—1978). The executive order provides broad guidelines on conservation responsibilities and requires the development of more detailed guidance, which is still in draft format. This executive order

aids in incorporating national planning for bird conservation into agency programs and provides the formal presidential guidance necessary for agencies to incorporate migratory bird conservation more fully into their programs.

### **NPS Natural Resource Policies and Guidelines**

The NPS has developed specific guidelines for the management of natural resources as described in NPS Director's Order 77, *Natural Resource Management Guidelines* (NPS 1991). The guidelines provide for the management of native and non-native plant and animal species. The *Natural Resource Reference Manual #77*, offers comprehensive guidance for NPS employees responsible for managing, conserving, and protecting the natural resources found in National park system units. This manual replaces the NPS-77 *The Natural Resource Management Guideline*, issued in 1991 under previous guideline series. To date, 16 of the 42 sections of NPS-77 have been revised.

The *NPS Management Policies 2006* state that the NPS “will maintain as parts of the natural ecosystems of parks all plants and animals native to park ecosystems. The term “plants and animals” refers to all five of the commonly recognized kingdoms of living things and includes such groups as flowering plants, ferns, mosses, lichens, algae, fungi, bacteria, mammals, birds, reptiles, amphibians, fishes, insects, worms, crustaceans, and microscopic plants or animals.” The NPS will achieve this by

- preserving and restoring the natural abundances, diversities, dynamics, distributions, habitats, and behaviors of native plant and animal populations and the communities and ecosystems in which they occur;
- restoring native plant and animal populations in parks when they have been extirpated by past human caused actions; and
- minimizing human impacts on native plants, animals, populations, communities, and ecosystems, and the processes that sustain them (NPS 2006a, Section 4.1).

Additionally, the *Organic Act of 1916* (16 USC 1) directs national parks to conserve wildlife unimpaired for future generations and is interpreted to mean that native animal life is to be protected and perpetuated as part of a park unit's natural ecosystem. Parks rely on natural processes to control populations of native species to the greatest extent possible; otherwise, they are protected from harvest, harassment, or harm by human activities.

### **State Laws and Regulations**

**California Fish and Game Code.** Protection of birds: The California Fish and Game Code states that it is unlawful to take, possess, or needlessly destroy the nest or eggs of any bird (Section 3503). Specifically, it is unlawful to take, possess, or destroy any raptors (i.e., eagles, hawks, owls, and falcons), including their nests or eggs (Section 3503.5). The code adopts the provisions of the *Migratory Bird Treaty Act* and states that it is unlawful to take or possess any designated migratory nongame bird or any part of such migratory nongame bird (Section 3513). The state code offers no statutory or regulatory mechanism for obtaining an incidental take permit for the loss of nongame migratory birds. Typical violations include destruction of active nests resulting from removal of vegetation in which the nests are located. Violation of the code could also include failure of active raptor nests resulting from disturbance of nesting pairs by nearby project construction.

## **Chapter 4: Environmental Consequences**

### **STUDY AREA**

The geographic study area for analysis of wildlife impacts includes the GGNRA sites under consideration for this draft plan/SEIS where wildlife could be impacted by proposed dog management actions. Not all wildlife species that use particular vegetation communities in GGNRA will be affected by this project; therefore, this section only analyzes impacts on the wildlife that could be affected by dog management activities.

### **DURATION OF IMPACT**

Duration describes the length of time an effect would occur, either short term or long term. Long term impacts to wildlife are described as those persisting for the life of the plan/EIS (the next 20 years). After the implementation of the plan, a 1- to 3-month period of public education would occur to implement the proposed action, followed by a 1- to 3-month period testing the monitoring-based management strategy. At the beginning of the education and enforcement period, short-term impacts on all natural resources would occur, regardless of the alternative chosen. During this period, impacts on wildlife would be similar to the current conditions and would be short-term. Following the education period, monitoring for noncompliance and resource impact would begin and it is expected that compliance with the dog walking regulations and associated adverse impacts would improve gradually and the impacts on wildlife would then become long term, as described below for each alternative.

### **ASSESSMENT METHODOLOGY**

This analysis of impacts on wildlife considered the changes and disturbance to wildlife habitat, wildlife species, or the natural processes sustaining them that would occur as a result of the implementation of alternatives A through E.

Overall, impacts on wildlife were analyzed qualitatively. The information in this analysis was obtained through best professional judgment of park staff, experts in the field, and supporting literature (as cited in the text). Data on frequency of disturbance of wildlife in a particular park site, if available, has been incorporated with relevant scientific literature to predict the impact of dog management activities on wildlife. Where data on the frequency of disturbance is not available, information from park staff and visitors on the relative intensity of use by visitors and the relative number of dogs both on and off leash has been used to predict impacts.

At GGNRA, the management of wildlife and wildlife habitat is primarily focused on research, monitoring, and actively protecting and restoring natural processes that sustain native habitat and the wildlife therein. Wildlife species that could be affected by this project primarily include bird species, mammalian species (small and large terrestrial mammals as well as marine mammals), reptiles, and amphibians and are discussed as applicable by site and alternative. With the exception of listed fish species (which are discussed in the “Special-status Species” section), fish and invertebrates are not included in this section because these groups are unlikely to be affected by dogs. Inventorying of wildlife species is currently ongoing at the sites not yet acquired by the park, such as Cattle Hill and Pedro Point Headlands. Therefore, wildlife species with the potential to occur at these sites are identified when applicable.

### **WILDLIFE IMPACT THRESHOLDS**

Wildlife impacts were determined by examining the potential effects of dog walking activities on native wildlife species, their habitats (including quality, quantity, and distribution of habitats), or the natural

processes sustaining them, as well as responses to disturbance by dogs. The intensity of each adverse impact is judged as having a minor, moderate, or major effect. Negligible impacts are neither adverse nor beneficial, nor long-term or short-term. A beneficial impact would be a positive change in the condition or appearance of the resource. “No impact” on wildlife species may also be applicable for some alternatives and sites if dogs are prohibited. The following impact thresholds were established to describe the relative changes in wildlife under the various alternatives being considered:

- Beneficial* A beneficial impact is a beneficial change from the current condition and is a relative indicator of progress compared to the no-action alternative. In general, a beneficial impact would include an increase of the native wildlife species, their habitats (including quality, quantity, and distribution of habitats), or the natural processes sustaining them.
- Negligible* There would be no observable or measurable impacts on native species, their habitats, or the natural processes sustaining them. Impacts would be well within the natural range of variability.
- Adverse* **Minor.** Impacts on native wildlife species, their habitats, or the natural processes sustaining them would be detectable, but would not be outside the natural range of variability. Occasional responses to disturbance from dogs by some individuals could be expected, with some negative impacts on feeding, migration, overwintering, reproduction, resting, or other factors that may affect wildlife at the park. Sufficient habitat in the park would remain functional to support wildlife at GGNRA.
- Moderate.** Impacts on native species, their habitats, or the natural processes sustaining them would be detectable and could be outside the natural range of variability. Frequent responses to disturbance from dogs by some individuals could be expected, with some negative impacts on feeding, migration, overwintering, reproduction, resting, or other factors that may affect wildlife at the park. However, sufficient habitat in the park would remain functional to support wildlife at GGNRA.
- Major.** Impacts on native species, their habitats, or the natural processes sustaining them would be detectable, would be outside the natural range of variability, and would be permanent. Frequent and repeated responses to disturbance from dogs by some individuals could be expected, with negative impacts on feeding, migration, overwintering, reproduction, resting, or other factors that may affect wildlife at the park. Sufficient habitat in the park would not remain functional to support wildlife at GGNRA.

For the action alternatives, on-leash dog walking impacts were based on an allowed 6-foot dog leash. Since dog walkers may walk along the edge of fire roads or trails, dogs would then have access to the adjacent land 6 feet in all directions, resulting in a LOD area for wildlife that would extend 6 feet out from the edges of the fire road or trail. The impacts analysis that follows describes impacts on wildlife by vegetation type for each alternative and applicable site.

## CUMULATIVE WILDLIFE IMPACTS COMMON TO ALL ALTERNATIVES

Influences on vegetation communities in GGNRA could result in alterations to plant communities that provide habitat for wildlife in the park, including amphibians and reptiles, small and large mammals (terrestrial and aquatic), birds, and invertebrates. Alterations to vegetation habitat that result in effects on wildlife at GGNRA include those resulting from fire suppression, urban development and loss of habitat continuity, and the establishment of non-native plant species that exclude wildlife or modify wildlife distribution.

Suppression of wildland fires has allowed the unnatural buildup of both dead and live fuels. The buildup of fuels generally increases the risk of wildfire, which when it occurs can cause wildlife species that are mobile to leave their home area, or can result in direct mortality of wildlife unable to flee the fire. In addition, wildfire can destroy wildlife habitat for some time after a fire. Development of land in the region, extirpation of some species (grizzly bear, tule elk), introduction of exotic species competing for limited habitats, and fragmentation of available habitat have also contributed to changes in occurrence and population sizes of some species. For example, California coastal scrub habitats have declined due to agricultural, industrial, and residential development, directly affecting mammal and bird species that use this habitat. California grassland habitats, which support rodents as well as raptors and other predators, have been declining due to agricultural use or urban development. Regional loss of forests through logging, catastrophic fire events, and urbanization has led to fragmented, isolated forest stands. Recreational trails and their use also fragment habitat and impact habitat quality.

The US North American Bird Conservation Initiative is a forum of government agencies, private organizations, and bird initiatives that work with federal, state, and nongovernmental organizations to meet common bird conservation objectives. The US North American Bird Conservation Initiative fosters collaboration on key issues of concern, including bird monitoring, conservation design, private lands, international objectives, and state and federal agency support for integrated bird conservation. Each year, the US North American Bird Conservation Initiative releases a “state of the birds” report, which provides important scientific data to a broad audience with a call to action to improve the conservation status of birds and the environment. The *State of the Birds 2011 Report* (NABCI, U.S. Committee 2011, 23) identified that:

Major threats to coastal birds include habitat loss and degradation, human disturbance, and predators. Public recreation, development interests, and wildlife compete for beaches. Public ownership of beaches varies among states. In most states, all land below the mean high tide line belongs to the state, and citizens have the right to unrestricted access. Primary threats to birds on beaches include human-caused disturbance, increased predators, sea-level rise, and habitat loss. Many states allow off-road vehicles (ORVs) or unrestricted public access with pets such as dogs and cats. ORVs can be highly disturbing to nesting or feeding shorebirds.

Past, current, and reasonably foreseeable future actions positively affecting wildlife in the park are activities that restore or enhance habitat. These projects include habitat protections and closures, education and outreach, and wetland restoration as well as non-native plant removal and reestablishment of native plant communities, with subsequent direct benefits to wildlife species. Potentially adverse impacts could occur through development both within and adjacent to park boundaries, including the various transportation plans and trails plans. These efforts would involve ground disturbance that could add to or exacerbate existing habitat fragmentation along road and trail corridors. However, efforts to identify mitigation measures such as pre-project coordination with nesting seasons, time of year restrictions, and development and implementation of post-project site plans, would reduce the potential for impacts. Current transportation, trail, and development planning efforts both within and beyond park

boundaries would affect vegetation and wildlife, but mitigation for these projects would reduce the potential for impacts.

Completed, current, and future project activities that will have a beneficial impact on wildlife and wildlife habitat in the GGNRA sites are listed below and discussed under each alternative as applicable:

- GGNRA GMP, which establishes guidelines for resource protection in the park (NPS 1980).
- *The Inventory and Monitoring Program* at GGNRA for natural resources.
- Park improvements of signs and fencing, and initiation of shorebird docent program for the SPPA at Ocean Beach and the WPA at Crissy Field.
- *GGNRA Fire Management Plan* (NPS 2005b), which provides guidance for the protection of natural resources through the use of prescribed burns, fire protection measures, and the reduction of fuel hazards.
- GGNRA Habitat Restoration Programs, parkwide invasive species removal and/or native plant restoration projects to restore and enhance natural terrestrial plant communities in GGNRA.
- Park stewardship programs that have worked with GGNRA since 2003 to control invasive plant species and restore natural plant species throughout the park, resulting in the restoration or enhancement of over 1,000 acres of trailside habitat in sites including Marin Headlands Trails and Lands End.
- *Mori Point Restoration and Trail Plan* (NPS 2006e), which is ongoing and has contributed to the restoration of the ecological integrity of existing habitats and restored native plant communities.
- Restoration of native vegetation as part of the *Lower Easkoot Creek Restoration at Stinson Beach* (NPS n.d.d, 1).
- *Muir Beach Wetland and Creek Restoration Project*, which restores riparian habitat, and proposed fencing will protect wetland plant communities (NPS 2007b, 1).

The proposed GGNRA interim compendium amendment would require that commercial dog walkers in San Francisco and Marin counties obtain a permit to walk more than three dogs, with a maximum of six dogs, at GGNRA sites. This would have beneficial impacts on natural resources at GGNRA sites. The proposed interim compendium amendment would reduce overcrowding, lessening dog disturbance on natural resources. Although the proposed action is directly related to dog management and would have overall beneficial cumulative impacts, these impacts are not expected to be great enough to alter the intensity of the expected impacts from the implementation of the alternatives on natural resources.

In addition to the GGNRA-sponsored projects discussed above, the SNRAMP will also be included in the cumulative impacts analysis, as described in more detail in the “Vegetation and Soils” section of this chapter. Dog management alternatives that prohibit dogs from wildlife habitat, restrict dog walking to on-leash walking, or establish ROLAs in fenced areas are generally most protective of wildlife and wildlife habitat; fencing, however, can preclude movement by larger wildlife species. In general, dog management alternatives that prohibit dogs or restrict dog walking to on-leash walking or in a designated ROLA combined with the benefits to wildlife and wildlife habitat from the restoration and enhancement projects listed above would have beneficial cumulative impacts on wildlife and wildlife habitat at GGNRA. Sites and proposed actions in alternatives that may have different cumulative impacts on wildlife and/or wildlife habitat are discussed below.

### IMPACTS TO WILDLIFE IN COASTAL COMMUNITIES BY SITE AND ALTERNATIVE

This section discusses impacts on wildlife species that use the coastal communities at GGNRA, including dunes, beaches, and adjacent open water. Migrant and overwintering shorebirds use beach and dune habitats along the coastline in GGNRA primarily as stopover and overwintering areas. The highest density of shorebirds on monitored GGNRA beaches generally occurs during the overwintering months of November and December, as well as in April and September during shorebird northbound and southbound migration, respectively (Beach Watch 2009). Collected data for beaches have indicated that willet, marbled godwit, sanderling, and whimbrel are the most common species of shorebirds using beaches in GGNRA and are found to some extent year-round (Beach Watch 2009). The sanderling, long-billed curlew, and marbled godwit are considered watch list species in need of conservation (American Bird Conservancy and National Audubon Society 2007, 2). The recently delisted California brown pelican is relatively abundant in the coastal community habitats at GGNRA, and the NPS has previously provided important roost areas for this species, which may be affected by dogs. The NPS manages protection of the federally threatened western snowy plover from disturbance by off-leash dogs (discussed in detail in the “Special-status Species” section) through the designation of seasonally protected areas in GGNRA (NPS 2008b), which also protects and benefits other shorebirds that use these areas.

The following sites contain coastal beach and/or coastal dune communities and are documented areas where shorebirds, gulls, and terns, as well as marine mammals, may be affected by dog management alternatives, and impacts are discussed in more detail below. Many of the coastal sites in GGNRA have rocky intertidal areas and cliffs, including Muir Beach, Rodeo Beach, Fort Baker, Fort Mason, Baker Beach and Bluffs to the Golden Gate, Lands End, Fort Funston, Mori Point, and Pedro Point, but either these rocky intertidal areas and cliffs are not the dominant habitat type at the site or are generally not accessible to visitors, therefore they are not discussed further in this draft plan/SEIS.

#### MARIN COUNTY SITES

##### Stinson Beach

**Alternative A: No Action.** At Stinson Beach, dogs and dog owners are restricted to having dogs on leash in the parking lots and picnic areas since dogs are not allowed on the beach because it is a swimming beach. Currently, there is low compliance with the no-dog walking restriction on the park’s portion of Stinson Beach; from 2008 through 2011, there were 76 incidents for walking a dog in an area closed to pets (table 6). In addition, there are four recorded incidents of dogs disturbing wildlife at this site (appendix G). Dogs are not allowed near dune communities or on the beach, but noncompliance occurs at a small portion of this site, particularly at the north end of the beach and dunes where dog walkers access the adjacent county beach and dogs disturb shorebirds on the beach.

Under alternative A, even though dogs would be prohibited on Stinson Beach, they could occasionally affect wildlife species that use coastal dunes and beaches through continued dog presence at the site; unleashed dogs could bark at or chase roosting or feeding birds at this site, resulting in disturbance. This type of disturbance could result in loss of preferred habitat as well as energy loss to migrating and wintering birds, potentially reducing their chances of survival along their migratory routes and reducing fitness for successful reproduction. Additionally, marine mammals that haul out or strand at Stinson Beach could occasionally be affected through dogs approaching, biting, barking at, or climbing on/surrounding the mammals or chasing after hauled-out mammals back into the water. Therefore, alternative A would result in negligible to long-term minor adverse impacts on wildlife at Stinson Beach.

Under alternative A, no permit system exists for dog walking. At Stinson Beach, commercial dog walking is uncommon. Therefore, commercial dog walking would have negligible impacts on wildlife.

**Cumulative Impacts.** Projects and actions in and near Stinson Beach were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on wildlife at or in the vicinity of this site.

Park stewardship programs provide indirect benefits to shorebirds by activities such as controlling invasive plant species, supporting coastal habitats, and restoring habitats. The implementation of habitat restoration and projects funded by the Wildland/Urban Interface Initiative on private lands could also impact wildlife at Stinson Beach. The *Lower Easkoot Creek Restoration at Stinson Beach* at Stinson Beach has restored native vegetation (NPS n.d.d, 1). The Gulf of the Farallones National Marine Sanctuary has proposed the *Bolinas Lagoon Ecosystem Restoration Project*, located near Stinson Beach, in partnership with Marin County Open Space District and the U.S. Army Corps of Engineers (GFNMS Working Group 2008), which will restore natural sediment transport and ecological functions of Bolinas Lagoon, and identify and manage introduced species in the Bolinas Lagoon watershed.

Development or construction actions at or in the vicinity of GGNRA sites have had or may have the potential to have adverse impacts on coastal communities, including shorebirds. Generally, adverse impacts on shorebirds may include temporary or permanent loss of habitat and physical disturbance by construction workers or from vehicle and/or boat noise during construction; levels of impacts may include avoidance, underuse, complete abandonment, or reduction in total numbers of shorebirds at construction areas in the coastal community. Even though these efforts both within and beyond park boundaries would affect vegetation and wildlife, mitigation for these projects would reduce the potential for impacts.

In addition to development and restoration projects, oil spills have occurred and will likely occur in the Pacific Ocean and in San Francisco Bay, and will impact coastal community wildlife. Oil spills affect birds, mammals, and fish (MMC 2012b). Marine mammals such as fur seals and sea otters are extremely affected by oil on the water, as are birds that float on the surface of the water (such as scoters and grebes). On November 7, 2007, approximately 58,000 gallons of bunker fuel spilled from a container ship into the bay, resulting in the largest oil spill in the San Francisco Bay since the Cape Mohican incident in 1996. About 1,081 live birds were reported taken for rehabilitation and about 1,803 birds were reported to have been found dead as a result of this incident (USFWS 2007c), although recent estimates show that bird mortality may have been as high as 6,688 individuals; a draft restoration plan is being prepared (USFWS 2009b). The November 7, 2007, oil spill had short-term minor to moderate adverse effects on wildlife such as marine mammals and birds at project sites in GGNRA. For the most part, the impacts on wildlife from this spill lasted only a few weeks, especially on the sandy beaches of the park. In the long term and by the time this dog management plan/EIS is implemented, impacts on wildlife at project sites in GGNRA should be reduced to a negligible level.

The negligible to long-term minor adverse impacts on wildlife from dogs at Stinson Beach under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from the restoration projects provided by the park stewardship programs should reduce some of the adverse impacts on wildlife from alternative A. The impacts resulting from the past oil spill and from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

STINSON BEACH ALTERNATIVE A CONCLUSION TABLE

| Coastal Community Wildlife Impacts            | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Negligible to long-term minor adverse impacts | Dogs would not be allowed near dune communities or on the beach, but noncompliance occurs at this site from the adjacent county beach, where dogs disturb shorebirds on the beach; it is possible that dogs would directly affect wildlife that use coastal dunes and beaches; dog presence and barking at could also indirectly affect wildlife, such as shorebirds | N/A  | Negligible cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would have the same dog walking restrictions as alternative A: dogs would be allowed on leash in the parking lots and picnic areas. Dogs are not allowed on the beach itself, because it is a designated swimming beach. No impact on wildlife at Stinson Beach would occur if visitors are compliant with the current restrictions. Since dogs are restricted from the beach and dune communities, coastal wildlife and marine mammals would not be affected by dog activities.

Since dogs are restricted from the beach and dune communities, no impact to the coastal wildlife and marine mammals would occur; therefore commercial dog walkers would have no impact to the coastal wildlife and marine mammals.

**Cumulative Impacts.** The lack of impacts on wildlife from dogs at Stinson Beach under alternative B was considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the restoration projects provided by the park stewardship programs combined with the negligible impacts from the past oil spill and from any development or construction actions and the lack of impacts on wildlife from alternative B would result in negligible cumulative impacts on wildlife.

STINSON BEACH ALTERNATIVE B CONCLUSION TABLE

| Coastal Community Wildlife Impacts     | Rationale                                    | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|--|--|-------------------------------|
| Overall no impact, assuming compliance | Dogs would be prohibited on trails and beach | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would have the same dog walking restrictions as alternative B, and impacts on wildlife would be the same, assuming compliance: no impact.

Since dogs are restricted from the beach and dune communities, no impact to the coastal wildlife and marine mammals would occur; therefore commercial dog walkers would have no impact to the coastal wildlife and marine mammals.

**Cumulative Impacts.** Under alternative C, the cumulative impacts on wildlife at this park site on wildlife would be the same those under alternative B: negligible cumulative impacts.

**STINSON BEACH ALTERNATIVE C CONCLUSION TABLE**

| <b>Coastal Community Wildlife Impacts</b> | <b>Rationale</b>                             | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--|---|-------------------------------|
| Overall no impact, assuming compliance    | Dogs would be prohibited on trails and beach | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Under alternative D, dogs would not be allowed at Stinson Beach. Therefore, assuming compliance, no impact on wildlife from dogs would occur at this site.

Since dogs would not be allowed at the site, no impact to the coastal wildlife and marine mammals would occur from commercial dog walkers.

**Cumulative Impacts.** There would be no impact on wildlife at this site under alternative D. This lack of impact combined with the beneficial effects from the restoration projects provided by the park stewardship programs and the negligible impacts from the past oil spill and from any development or construction actions would result in negligible cumulative impacts on wildlife.

**STINSON BEACH ALTERNATIVE D CONCLUSION TABLE**

| <b>Coastal Community Wildlife Impacts</b> | <b>Rationale</b>                     | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--------------------------------------|---|-------------------------------|
| Overall no impact, assuming compliance    | Dogs would be prohibited at the site | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would have the same dog walking restrictions as alternative B, and impacts on wildlife would be the same, assuming compliance: no impact.

Since dogs are restricted from the beach and dune communities, no impact to the coastal wildlife and marine mammals would occur; therefore commercial dog walkers would have no impact to the coastal wildlife and marine mammals.

**Cumulative Impacts.** Under alternative E, the cumulative impacts on wildlife at this park site on wildlife would be the same those under alternative B: negligible.

**STINSON BEACH ALTERNATIVE E CONCLUSION TABLE**

| <b>Coastal Community Wildlife Impacts</b> | <b>Rationale</b>                             | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--|---|-------------------------------|
| Overall no impact, assuming compliance    | Dogs would be prohibited on trails and beach | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** Under the preferred alternative, dogs would be allowed on leash in the parking lots and picnic areas and on a path (to be built) allowing access to the adjacent Marin County-managed Upton Beach from the north parking lot. Dogs are not allowed on the NPS beach itself, because it is a designated swimming beach. No impacts on wildlife at Stinson Beach would occur if visitors are compliant with the restrictions. Since dogs are restricted from the beach and dune communities, coastal wildlife and marine mammals would not be affected by dog activities.

## Chapter 4: Environmental Consequences

No impact to the coastal wildlife and marine mammals would occur from commercial dog walkers since dogs are restricted from the beach and dune communities,

**Cumulative Impacts.** Projects and actions in and near Stinson Beach were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on wildlife at or in the vicinity of this site.

Park stewardship programs provide indirect benefits to shorebirds by activities such as controlling invasive plant species, supporting coastal habitats, and restoring habitats. The implementation of habitat restoration and projects funded by the Wildland/Urban Interface Initiative on private lands could also impact wildlife at Stinson Beach. The *Lower Easkoot Creek Restoration Project* at Stinson Beach has restored native vegetation (NPS n.d.d, 1). The Gulf of the Farallones National Marine Sanctuary has proposed the *Bolinas Lagoon Ecosystem Restoration Project*, located near Stinson Beach, in partnership with Marin County Open Space District and the U.S. Army Corps of Engineers (GFNMS Working Group 2008), which will restore natural sediment transport and ecological functions of Bolinas Lagoon, and identify and manage introduced species in the Bolinas Lagoon watershed.

Development or construction actions at or in the vicinity of GGNRA sites have had or may have the potential to have adverse impacts on coastal communities, including shorebirds. Generally, adverse impacts on shorebirds may include temporary or permanent loss of habitat and physical disturbance by construction workers or from vehicle and/or boat noise during construction; levels of impacts may include avoidance, underuse, complete abandonment, or reduction in total numbers of shorebirds at construction areas in the coastal community. Even though these efforts both within and beyond park boundaries would affect vegetation and wildlife, mitigation for these projects would reduce the potential for impacts.

In addition to development and restoration projects, oil spills have occurred and will likely occur in the Pacific Ocean and in San Francisco Bay, and will impact coastal community wildlife. Oil spills affect birds, mammals, and fish (MMC 2012b). Marine mammals such as fur seals and sea otters are extremely affected by oil on the water, as are birds that float on the surface of the water (such as scoters and grebes). On November 7, 2007, approximately 58,000 gallons of bunker fuel spilled from a container ship into the bay, resulting in the largest oil spill in the San Francisco Bay since the Cape Mohican incident in 1996. About 1,081 live birds were reported taken for rehabilitation and about 1,803 birds were reported to have been found dead as a result of this incident (USFWS 2007c, 1), although recent estimates show that bird mortality may have been as high as 6,688 individuals; a draft restoration plan is being prepared (USFWS 2009b, 1). The November 7, 2007, oil spill had short-term minor to moderate adverse effects on wildlife such as marine mammals and birds at project sites in GGNRA. For the most part, the impacts on wildlife from this spill lasted only a few weeks, especially on the sandy beaches of the park. In the long term and by the time this dog management plan/EIS is implemented, impacts on wildlife at project sites in GGNRA should be reduced to a negligible level.

The lack of impacts on wildlife from dogs at Stinson Beach under the preferred alternative was considered together with the effects of the projects mentioned above. The beneficial effects from the restoration projects provided by the park stewardship programs combined with the negligible impacts from the past oil spill and from any development or construction actions and the lack of impacts on wildlife from the preferred alternative would result in negligible cumulative impacts on wildlife.

STINSON BEACH PREFERRED ALTERNATIVE F CONCLUSION TABLE

| Coastal Community Wildlife Impacts     | Rationale                                    | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|--|--|-------------------------------|
| Overall no impact, assuming compliance | Dogs would be prohibited on trails and beach | Beneficial, assuming compliance              | Negligible cumulative impacts |

## Muir Beach

**Alternative A: No Action.** Currently, this site has high visitor use. Twenty-four dog-related violations were reported from 2008 through 2011 (table 14). The most common violations were for having dogs off leash (9 violations) and having dogs within closed areas (4 violations) (table 14). The lagoon is currently closed to people and dogs for overall resource protection. The dune communities at Muir Beach are not well protected. Ineffective post-and-cable fencing at Muir Beach discourages visitors from entering the dune restoration area; other dune areas are unfenced and would not physically exclude dogs.

Although the site has documented low shorebird abundance and diversity compared to other GGNRA coastal beaches, dog presence at the site as well as dogs barking at, chasing after, and being in proximity to roosting or feeding birds would continue to result in disturbance to shorebirds and waterbirds. This type of disturbance by dogs could result in loss of preferred habitat as well as energy loss to migrating and wintering birds, potentially reducing their chances of survival along their migratory routes and reducing fitness for successful reproduction. The presence of leashed and mostly unleashed dogs also results in flushing and displacement of shorebirds in response to presence of a perceived predator. The lagoon at Muir Beach supports river otters, shorebirds, wading birds, and waterbirds in addition to the limited numbers of shorebirds along the beach/ocean shoreline. A fence surrounds the lagoon but does not effectively keep dogs out of the area. The lagoon at Muir Beach was recently restored and may attract more shorebirds and waterbirds and increase visitor use of the site in the future, and the area could be subjected to repeated disturbance by unleashed dogs, including in closed or fenced areas. Additionally, marine mammals that haul out or strand at Muir Beach could occasionally be affected by dogs on the beach through dogs approaching, biting, barking at, or climbing on/surrounding the mammals or chasing after hauled-out mammals back into the water. Alternative A would result in continued long-term minor to moderate adverse impacts on shorebirds, gulls, terns, and marine mammals using beach or dune habitat at Muir Beach because occasional to frequent disturbances to wildlife from dogs would occur.

Under alternative A, no permit system exists for dog walking. At Muir Beach, commercial dog walking is uncommon. Therefore, commercial dog walking would have negligible impacts on wildlife.

**Cumulative Impacts.** Projects and actions in and near Muir Beach were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on wildlife at or in the vicinity of this site.

Park stewardship programs provide indirect benefits to shorebirds by activities such as controlling invasive plant species, supporting coastal habitats, and restoring habitats. Specific projects both in GGNRA and beyond park boundaries will also provide indirect benefits to shorebirds and include the *Muir Beach Wetland and Creek Restoration Project*, designed to bring back natural function to the water bodies and coastal dunes (NPS 2007b).

Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs provide enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils. Ongoing parkwide restoration and enhancement efforts, such as GGNRA natural resource stewardship programs and the *Marin Countywide Plan* (County of Marin 2007),

## Chapter 4: Environmental Consequences

can also beneficially affect vegetation at GGNRA park sites such as Muir Beach. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance. The implementation of habitat restoration and projects funded by the Wildland/Urban Interface Initiative on private lands could also impact Muir Beach. The *Lower Redwood Creek Floodplain and Salmonid Habitat Restoration* restored channel function to reduce flooding and reconnect the creek to its floodplain as well as expanded riparian vegetation at the Banducci site (NPS 2010b, 1). The *Dias Ridge Restoration and Trail Improvement Project* is currently realigning trail segments and restoring degraded areas on Dias Ridge above Muir Beach (NPS 2009i, 1). Additional vegetation benefits would be expected from wetland and creek restoration at the tidal lagoon, which would reduce flooding on Pacific Way. The *Muir Beach Wetland and Creek Restoration Project* is restoring and enhancing ecological processes near the mouth of Redwood Creek, contributing to the quality of habitat, particularly as a result of restoration and enhancement of habitat and improvement of erosion and sedimentation conditions (NPS 2009j). Park stewardship programs at Pirates Cove, just south of Muir Beach, included efforts to control invasive non-native plants such as pampas grass to support the dense and relatively undisturbed coastal scrub, prairie, and riparian habitats in the area (GGNPC 2010a, 1).

Development or construction actions at or in the vicinity of GGNRA sites have had or may have the potential to have adverse impacts on coastal communities, including shorebirds. Generally, adverse impacts on shorebirds may include temporary or permanent loss of habitat and physical disturbance by construction workers or from vehicle and/or boat noise during construction; levels of impacts may include avoidance, underuse, complete abandonment, or reduction in total numbers of shorebirds at construction areas in the coastal community. Even though these efforts both within and beyond park boundaries would affect vegetation and wildlife, mitigation for these projects would reduce the potential for impacts.

In addition to development and restoration projects, oil spills have occurred and will likely occur in the Pacific Ocean and in San Francisco Bay, and will impact coastal community wildlife. Oil spills affect birds, mammals, and fish (MMC 2012b). Marine mammals such as fur seals and sea otters are extremely affected by oil on the water, as are birds that float on the surface of the water (such as scoters and grebes). On November 7, 2007, approximately 58,000 gallons of bunker fuel spilled from a container ship into the bay, resulting in the largest oil spill in the San Francisco Bay since the Cape Mohican incident in 1996. About 1,081 live birds were reported taken for rehabilitation and about 1,803 birds were reported to have been found dead as a result of this incident (USFWS 2007c, 1), although recent estimates show that bird mortality may have been as high as 6,688 individuals; a draft restoration plan is being prepared (USFWS 2009b, 1). The November 7, 2007, oil spill had short-term minor to moderate adverse effects on wildlife such as marine mammals and birds at project sites in GGNRA. For the most part, the impacts on wildlife from this spill lasted only a few weeks, especially on the sandy beaches of the park. In the long term and by the time this dog management plan/EIS is implemented, impacts on wildlife at project sites in GGNRA should be reduced to a negligible level.

The long-term minor to moderate adverse impacts on wildlife from dogs at Muir Beach under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from the restoration projects provided by the park stewardship programs should reduce some of the adverse impacts on wildlife from alternative A. The impacts resulting from the past oil spill and from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to range from negligible to long term, minor, and adverse.

**MUIR BEACH ALTERNATIVE A CONCLUSION TABLE**

| <b>Coastal Community Wildlife Impacts</b>   | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>                                |
|---|--|---|--|
| Long-term minor to moderate adverse impacts | Shorebirds on beach would occasionally to frequently be subjected to impacts by on-leash and voice control dogs through barking at, chasing after, and being in proximity to roosting or feeding birds; although shorebird numbers are low, visitor use is high at this site; marine mammals would occasionally be subjected to impacts from dogs on the beach | N/A   | Negligible to long-term minor adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B proposes on-leash dog walking on the beach, the bridge and path to the beach, and the proposed Muir Beach Trail. On-leash dog walking would not allow dogs to roam freely along the beach. Physically restraining dogs on leash would protect wildlife and reduce chasing after shorebirds and marine mammals on the beach, but on-leash dogs would still be able to disturb wildlife and/or cause a flight response through their presence on the beach and by lunging/barking at roosting, resting, and feeding birds. This could cause birds to flee or relocate, using energy reserves unnecessarily, and could result in the loss of preferred habitat. Muir Beach also has a recently restored lagoon, currently closed to people and dogs, that supports shorebirds, wading birds, and waterbirds in addition to the limited numbers of shorebirds along the beach/ocean shoreline. The combination of on-leash dog walking requirements and the fence that surrounds the lagoon would effectively keep dogs out of this area. Therefore, assuming compliance, overall impacts as a result of alternative B would be long term and would range from negligible to minor adverse impacts on wildlife because shorebirds and waterbirds may not be affected or may occasionally be affected by on-leash dogs. A range is presented to encompass the potential effects, since impacts would depend on the seasonal presence of the birds and the level of activity at the site.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is not common at Muir Beach, it is likely that this alternative would not have an impact on the number of dog walkers at this site. Therefore, commercial dog walking under alternative B would have a negligible impact on wildlife.

**Cumulative Impacts.** The negligible to long-term minor adverse impacts on wildlife from dogs at Muir Beach under alternative B were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the restoration projects provided by the park stewardship programs should reduce some of the adverse impacts on wildlife from alternative B. The impacts resulting from the past oil spill and from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**Chapter 4: Environmental Consequences**

**MUIR BEACH ALTERNATIVE B CONCLUSION TABLE**

| <b>Coastal Community Wildlife Impacts</b>                                  | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect shorebirds and marine mammals on beach, although on-leash dogs could still disturb roosting and feeding birds through barking and by their presence on the beach; impact range is due to changing seasonal presence of the birds and level of activity at the site | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would have the same dog walking restrictions as alternative B, and impacts would be the same: negligible to long term, minor, and adverse.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Muir Beach is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs, with a limit of six. No permits would be allocated at Muir Beach, so individual and commercial dog walkers would only be allowed to walk a maximum of three dogs on leash per person. Since commercial dog walking is not common at Muir Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have a negligible impact on wildlife.

**Cumulative Impacts.** Under alternative C, the cumulative impacts on wildlife at this park would be the same those under alternative B: negligible cumulative impacts.

**MUIR BEACH ALTERNATIVE C CONCLUSION TABLE**

| <b>Coastal Community Wildlife Impacts</b>                                  | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect shorebirds and marine mammals on beach, although on-leash dogs could still disturb roosting and feeding birds through barking and by their presence on the beach; impact range is due to changing seasonal presence of the birds and level of activity at the site | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Under alternative D, on-leash dog walking would only be allowed on proposed Muir Beach Trail and in the parking lot, and would not be allowed on the beach or the boardwalk/path to the beach. Alternative D would provide the most protection to shorebirds, gulls, and terns as well as any stranded marine mammals at Muir Beach by prohibiting dogs in the beach area. The lagoon is currently closed to people and dogs for resource protection. Assuming compliance, alternative D would result in no impact on wildlife, including birds and marine mammals, using beach/dune habitat at Muir Beach.

The coastal community wildlife would not be affected by commercial dog walking as dogs would not be allowed on the beach.

**Cumulative Impacts.** The lack of impacts on wildlife from dogs at Muir Beach under alternative D was considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the restoration projects provided by the park stewardship programs combined with the negligible impacts from the past oil spill and from any development or construction actions and the lack of impacts on wildlife from alternative D would result in negligible cumulative impacts on wildlife.

**MUIR BEACH ALTERNATIVE D CONCLUSION TABLE**

| <b>Coastal Community Wildlife Impacts</b> | <b>Rationale</b>                      | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|---------------------------------------|---|-------------------------------|
| Overall no impact, assuming compliance    | Dogs would be prohibited on the beach | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** At Muir Beach, alternative E would allow on-leash dog walking on the proposed Muir Beach Trail, on the bridge and path to the beach, and would provide a ROLA for dogs on the beach south of the entrance path. The lagoon is currently closed to people and dogs for resource protection. Shorebirds, gulls, and terns roosting or feeding in the ROLA would likely relocate to other areas where dogs are not present when unleashed dogs are in the ROLA, but loss of preferred habitat would have an impact on wildlife. Marine mammals that become stranded on the beach in the ROLA proposed in alternative E could be subjected to disturbance from unleashed dogs, which could bite, bark at, or clamber over stranded or hauled-out animals. Therefore, alternative E would result in long-term moderate adverse impacts on wildlife in the ROLA.

The long-term moderate adverse impacts on wildlife in the ROLA would occur on approximately a quarter of Muir Beach. Also, the ROLA is located away from Redwood Creek and the lagoon, where the greatest numbers of birds have been observed at this site, especially following the lagoon restoration that occurred in 2009. Therefore, assuming compliance, the overall impact on wildlife at Muir Beach under alternative E would be long term, minor, and adverse. Physically restraining dogs would protect shorebirds and marine mammals in on-leash areas, although on-leash dogs could still disturb roosting and feeding birds through barking and by their presence on the beach.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Muir Beach is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs, with a limit of six. Since commercial dog walking is not common at Muir Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have a negligible impact on wildlife.

**Cumulative Impacts.** The long-term minor adverse impacts on wildlife from dogs at Muir Beach under alternative E were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the restoration projects provided by the park stewardship programs should reduce some of the adverse impacts on wildlife from alternative E. The impacts resulting from the past oil spill and from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

MUIR BEACH ALTERNATIVE E CONCLUSION TABLE

| Coastal Community Wildlife Impacts                           | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Overall long-term minor adverse impacts, assuming compliance | Physically restraining dogs would protect shorebirds and marine mammals in on-leash areas, although on-leash dogs could still disturb roosting and feeding birds through barking and by their presence on the beach; ROLA only encompasses a portion of beach habitat at the site and is located away from Redwood Creek and the lagoon (high bird use areas) | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative would allow on-leash dog walking on the beach, the bridge and path to the beach, and the proposed Muir Beach Trail. Fencing would be installed along the dunes and lagoon as needed. The preferred alternative would provide protection to shorebirds, gulls, and terns, as well as any stranded marine mammals at Muir Beach, by requiring a leash on dogs on the beach. The lagoon would remain closed to dogs and people. However, on-leash dogs would still be able to disturb wildlife and/or cause a flight response through their presence on the beach and by lunging/barking at roosting, resting, and feeding birds. This could cause birds to flee or relocate, using energy reserves unnecessarily, and could result in the loss of preferred habitat. Muir Beach also has a recently restored lagoon, closed to people and dogs, that supports river otters, shorebirds, wading birds, and waterbirds. In addition there are small numbers of shorebirds along the beach/ocean shoreline. The combination of on-leash dog walking requirements and the fence that surrounds the lagoon would effectively keep dogs out of this area. Therefore, assuming compliance, overall impacts as a result of alternative B would be long term and would range from negligible to minor adverse impacts on wildlife because shorebirds and waterbirds may occasionally be affected by on-leash dogs. A range is presented to encompass the potential effects, since impacts would depend on the seasonal presence of the birds and the level of activity at the site.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Muir Beach is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs, with a limit of six. Since commercial dog walking is not common at Muir Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have a negligible impact on wildlife.

**Cumulative Impacts.** Projects and actions in and near Muir Beach were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on wildlife at or in the vicinity of this site.

Park stewardship programs provide indirect benefits to shorebirds by activities such as controlling invasive plant species, supporting coastal habitats, and restoring habitats. Specific projects both in GGNRA and beyond park boundaries will also provide indirect benefits to shorebirds and include the *Muir Beach Wetland and Creek Restoration Project*, designed to bring back natural function to the water bodies and coastal dunes at Muir Beach (NPS 2007b).

Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs provide enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils. Ongoing parkwide restoration and enhancement efforts, such as GGNRA natural resource stewardship programs and the *Marin Countywide Plan* (County of Marin 2007), can also beneficially affect vegetation at GGNRA park sites such as Muir Beach. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance. The implementation of habitat restoration and projects funded by the Wildland/Urban Interface Initiative on private lands could also impact Muir Beach. The *Lower Redwood Creek Floodplain and Salmonid Habitat Restoration* restored channel function to reduce flooding and reconnect the creek to its floodplain as well as expanded riparian vegetation at the Banducci site (NPS 2010b, 1). The *Dias Ridge Restoration and Trail Improvement Project* is currently realigning trail segments and restoring degraded areas on Dias Ridge above Muir Beach (NPS 2009i, 1). Additional vegetation benefits would be expected from wetland and creek restoration at the tidal lagoon, which would reduce flooding on Pacific Way. The *Muir Beach Wetland and Creek Restoration Project* is restoring and enhancing ecological processes near the mouth of Redwood Creek, contributing to the quality of habitat, particularly as a result of restoration and enhancement of habitat and improvement of erosion and sedimentation conditions (NPS 2009j). Park stewardship programs at Pirates Cove, just south of Muir Beach, included efforts to control invasive non-native plants such as pampas grass to support the dense and relatively undisturbed coastal scrub, prairie, and riparian habitats in the area (GGNPC 2010a, 1).

Development or construction actions at or in the vicinity of GGNRA sites have had or may have the potential to have adverse impacts on coastal communities, including shorebirds. Generally, adverse impacts on shorebirds may include temporary or permanent loss of habitat and physical disturbance by construction workers or from vehicle and/or boat noise during construction; levels of impacts may include avoidance, underuse, complete abandonment, or reduction in total numbers of shorebirds at construction areas in the coastal community. Even though these efforts both within and beyond park boundaries would affect vegetation and wildlife, mitigation for these projects would reduce the potential for impacts.

In addition to development and restoration projects, oil spills have occurred and will likely occur in the Pacific Ocean and in San Francisco Bay and will impact coastal community wildlife. Oil spills affect birds, mammals, and fish (MMC 2012b). Marine mammals such as fur seals and sea otters are extremely affected by oil on the water, as are birds that float on the surface of the water (such as scoters and grebes). On November 7, 2007, approximately 58,000 gallons of bunker fuel spilled from a container ship into the bay, resulting in the largest oil spill in the San Francisco Bay since the Cape Mohican incident in 1996. About 1,081 live birds were reported taken for rehabilitation and about 1,803 birds were reported to have been found dead as a result of this incident (USFWS 2007c, 1), although recent estimates show that bird mortality may have been as high as 6,688 individuals; a draft restoration plan is being prepared (USFWS 2009b, 1). The November 7, 2007, oil spill had short-term minor to moderate adverse effects on wildlife such as marine mammals and birds at project sites in GGNRA. For the most part, the impacts on wildlife from this spill lasted only a few weeks, especially on the sandy beaches of the park. In the long term and by the time this dog management plan/EIS is implemented, impacts on wildlife at project sites in GGNRA should be reduced to a negligible level.

The negligible to long-term minor adverse impacts on wildlife from dogs at Muir Beach under the preferred alternative was considered together with the effects of the projects mentioned above. The beneficial effects from the restoration projects provided by the park stewardship programs combined with the negligible impacts from the past oil spill and from any development or construction actions and the negligible to long-term minor adverse impacts on wildlife from the preferred alternative would result in negligible cumulative impacts on wildlife.

MUIR BEACH PREFERRED ALTERNATIVE F CONCLUSION TABLE

| Coastal Community Wildlife Impacts   | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Overall negligible to long-term, minor adverse impact, assuming compliance | Physically restraining dogs on leash would protect shorebirds and marine mammals on the beach, although on-leash dogs could still disturb roosting and feeding birds through barking and by their presence on the beach; impact range is due to changing seasonal presence of the birds and level of activity at the site | Beneficial, assuming compliance              | Negligible cumulative impacts |

### Rodeo Beach/South Rodeo Beach

**Alternative A: No Action.** Under current conditions, dogs are allowed under voice control on Rodeo Beach and South Rodeo Beach; on-leash dog walking is allowed on the footbridge and access trail to the beach. Currently, there is low to moderate use of the site for on-leash and voice control dog walking at the beach and other areas. The lagoon and lake are currently closed to people and dogs for overall resource protection. A total of 30 dog-related incidents were reported, with 9 off-leash violations and 7 incidents involving pets within closed areas (table 15). Park staff has estimated that they observe dogs in the lagoon at least once a week, and on a daily basis during good weather. Although the site has documented low shorebird abundance and diversity compared to other GGNRA coastal beaches, dog presence at the site, including unleashed dogs, which could bark at or chase roosting or feeding birds, could result in disturbance. This type of disturbance could result in abandonment of the area, relocation, and/or loss of preferred habitat. This would result in energy loss to migrating and wintering birds, potentially reducing their chances of survival along their migratory routes and reducing fitness for successful reproduction. Rodeo Beach/South Rodeo Beach has a lagoon that supports high bird use by shorebirds, wading birds, and waterbirds in addition to the limited numbers of shorebirds that use the beach/ocean shoreline. Wading birds, as well as pelicans and cormorants, use both the beach and the lagoon shoreline. Several hundred brown pelicans roost on Rodeo Beach on rare occasions and the nearby Bird Island also supports numerous bird species. Visitor use is moderate to high at this site, and even though the beach at Rodeo Beach/South Rodeo Beach is large and dogs are more spread out, birds along the shoreline of Rodeo Beach/South Rodeo Beach, the lake, and the lagoon are regularly disturbed by off-leash dogs and people, and the proposed fence along the western shoreline of the lagoon will deter but not physically exclude dogs from accessing the lagoon from the beach. Additionally, marine mammals that haul out or strand at Rodeo Beach/South Rodeo Beach would be affected by dogs on the beach through dogs approaching, biting, barking at, or climbing on/surrounding the mammals or chasing after hauled-out mammals back into the water. Alternative A would result in continued long-term moderate adverse impacts on shorebirds, gulls, terns, and marine mammals because continued frequent disturbances to wildlife from dogs would occur.

Under alternative A, no permit system exists for dog walking. At Rodeo Beach/South Rodeo Beach, commercial dog walking is uncommon although it has recently begun to increase. Commercial dog walking would have negligible impacts on wildlife.

**Cumulative Impacts.** Projects and actions in and near Rodeo Beach/South Rodeo Beach were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on wildlife at or in the vicinity of this site.

Park stewardship programs provide indirect benefits to shorebirds by activities such as controlling invasive plant species, supporting coastal habitats, and restoring habitats.

Development or construction actions at or in the vicinity of GGNRA sites have had or may have the potential to have adverse impacts on coastal communities, including shorebirds. Generally, adverse impacts on shorebirds may include temporary or permanent loss of habitat and physical disturbance by construction workers or from vehicle and/or boat noise during construction; levels of impacts may include avoidance, underuse, complete abandonment, or reduction in total numbers of shorebirds at construction areas in the coastal community. Even though these efforts both within and beyond park boundaries would affect vegetation and wildlife, mitigation for these projects would reduce the potential for impacts.

In addition to development and restoration projects, oil spills have occurred and will likely occur in the Pacific Ocean and in San Francisco Bay and will impact coastal community wildlife. Oil spills affect birds, mammals, and fish (MMC 2012b). Marine mammals such as fur seals and sea otters are extremely affected by oil on the water, as are birds that float on the surface of the water (such as scoters and grebes). On November 7, 2007, approximately 58,000 gallons of bunker fuel spilled from a container ship into the bay, resulting in the largest oil spill in the San Francisco Bay since the Cape Mohican incident in 1996. About 1,081 live birds were reported taken for rehabilitation and about 1,803 birds were reported to have been found dead as a result of this incident (USFWS 2007c, 1), although recent estimates show that bird mortality may have been as high as 6,688 individuals; a draft restoration plan is being prepared (USFWS 2009b, 1). The November 7, 2007, oil spill had minor to moderate adverse effects on wildlife such as marine mammals and birds at Rodeo Beach/South Rodeo Beach. The impacts on wildlife from this spill at Rodeo Beach/South Rodeo Beach lasted 8 to 9 months. However, by the time this dog management plan/EIS is implemented the adverse impacts on wildlife at Rodeo Beach/South Rodeo Beach should be reduced to a negligible level.

The long-term moderate adverse impacts on wildlife from dogs at Rodeo Beach/South Rodeo Beach under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from the restoration projects provided by the park stewardship programs should reduce some of the adverse impacts on wildlife from alternative A. The impacts resulting from the past oil spill and from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be long term, minor, and adverse.

RODEO BEACH/SOUTH RODEO BEACH ALTERNATIVE A CONCLUSION TABLE

| Coastal Community Wildlife Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts                         |
|------------------------------------|---|--|--|
| Long-term moderate adverse impacts | Shorebirds on beach and wading birds such as pelicans would frequently be subjected to impacts by on-leash and voice control dogs through barking at, chasing after, and being in proximity to roosting or feeding birds; although shorebird numbers are low, visitor use is high and coastal habitat is large at this site; marine mammals would occasionally be subjected to impacts from dogs on the beach | N/A  | Long-term minor adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B proposes on-leash dog walking on Rodeo Beach/South Rodeo Beach, the footbridge, and access trail to the beach. The lagoon and lake are currently closed to people and dogs for resource protection. On-leash dog walking would not allow dogs to roam freely along the beach. Physically restraining dogs on leash would protect wildlife and reduce chasing after shorebirds and marine mammals on the beach, but on-leash dogs would still be able to disturb wildlife and/or cause a flight response through their presence on the beach and lunging/barking at roosting, resting, and feeding birds. This could cause birds to abandon the area or relocate, using energy reserves unnecessarily, and could result in the loss of preferred habitat. Rodeo Beach/South Rodeo Beach has a lagoon and a lake that support high bird use by shorebirds, wading birds, and waterbirds in addition to the limited numbers of shorebirds that use the beach/ocean shoreline. A fence is proposed along the western shoreline of the lagoon to discourage dogs from accessing the lagoon from the beach. The combination of on-leash dog walking requirements and the fence surrounding the lagoon would effectively keep dogs out of the closed area. Therefore, assuming compliance, overall impacts as a result of alternative B would be long term and would range from negligible to minor adverse impacts on wildlife, because shorebirds and waterbirds may not be affected or may occasionally be affected by on-leash dogs. A range is presented to encompass the potential effects, since impacts would depend on the seasonal presence of the birds and the level of activity at the site.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is not common at Rodeo Beach or South Rodeo Beach, but has recently begun to increase, it is likely that this alternative may increase the number of commercial dog walkers at this site in the future. Therefore, commercial dog walking under alternative B would have a negligible to long-term minor adverse impact on wildlife.

**Cumulative Impacts.** The negligible to long-term minor adverse impacts on wildlife from dogs at Rodeo Beach/South Rodeo Beach under alternative B were considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the restoration projects provided by the park stewardship programs along with the negligible impacts from the past oil spill and from any development or construction actions combined with the negligible to long-term minor adverse impacts on wildlife from alternative B would result in negligible cumulative impacts on wildlife.

RODEO BEACH/SOUTH RODEO BEACH ALTERNATIVE B CONCLUSION TABLE

| Coastal Community Wildlife Impacts   | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect shorebirds and marine mammals on beach, although on-leash dogs could still disturb roosting and feeding birds through barking and by their presence on the beach; impact range is due to changing seasonal presence of the birds and level of activity at the site, including the presence of dogs | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would provide a ROLA on Rodeo Beach that would extend the full length of the beach and include the entire width of the beach from the ocean to the bluffs and to the proposed post-and-cable fence to be installed to protect the shoreline habitat at the western end of Rodeo Lagoon. The ROLA would include portions of the sparsely vegetated foredunes that extend from the crest of the beach to the western edge of the lagoon. On-leash dog walking would be allowed on the footbridge to the beach, and South Rodeo Beach would be closed to dogs. Rodeo Lagoon and lake are currently closed to people and dogs for overall resource protection. The installation of the post-and-cable fence along the west end of Rodeo Lagoon would discourage visitors from accessing the lagoon, but would not physically exclude dogs from this area. A fence more impervious to dogs in this area is not feasible because winter storm waves wash over the entire beach, and wind-driven litter and debris would be trapped in the fence. Shorebirds, gulls, and terns roosting or feeding in the ROLA would be disrupted by dogs under voice and sight control on North Rodeo Beach. Marine mammals that become stranded or haul out on the beach in the ROLA could be subjected to disturbance from the presence of unleashed dogs, which could bite, bark at, or clamber over the animals. Therefore, alternative C would result in long-term minor to moderate adverse impacts on marine mammals and shorebirds in the ROLA; impacts would depend on the seasonal presence of the birds and the level of activity at the site.

Birds roosting or feeding in the ROLA may be forced to abandon the area or relocate, but at this site, there is no other habitat nearby, which may cause birds to flush and settle repeatedly, causing energy reserves to be used up. The ROLA encompasses a large portion of beach habitat at the site and off-leash dogs could disturb shorebirds and marine mammals on the beach at this site; there is no on-leash area (non-ROLA) designated for Rodeo Beach as part of alternative C. Therefore, overall impacts on wildlife under alternative C would be long term and would range from minor to moderate and adverse, since impacts would depend on the seasonal presence marine mammals and birds as well as the level of activity at the site.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. At Rodeo Beach, any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. In a ROLA, permit holders may walk one to six dogs off leash and the permit may restrict use by time and area. Impacts on wildlife from permit holders with up to six dogs off leash would be expected to increase under this alternative. Since commercial dog walking is not common at Rodeo Beach/South Rodeo Beach, but has recently begun to increase, and it is likely that this alternative may increase the number of commercial dog walkers at this

## Chapter 4: Environmental Consequences

site in the future. Therefore, commercial dog walking under the alternative C would have a negligible to long-term minor adverse impact on wildlife.

**Cumulative Impacts.** The long-term minor to moderate adverse impacts on wildlife from dogs at Rodeo Beach/South Rodeo Beach under alternative C were considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the restoration projects provided by the park stewardship programs combined with the negligible impacts from the past oil spill and from any development or construction actions and the long-term minor to moderate adverse impacts on wildlife from alternative C would result in negligible to long-term minor adverse cumulative impacts on wildlife.

**RODEO BEACH/SOUTH RODEO BEACH ALTERNATIVE C CONCLUSION TABLE**

| Coastal Community Wildlife Impacts                                       | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts                                       |
|--|--|--|--|
| Overall long-term minor to moderate adverse impacts, assuming compliance | The ROLA encompasses a large portion of beach habitat at the site and off-leash dogs could disturb shorebirds and marine mammals on the beach at this site; impacts would depend on the seasonal presence of the birds and the level of activity at the site, including the presence of dogs | Beneficial to no change, assuming compliance | Negligible to long-term minor adverse cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Under alternative D, on-leash dog walking would be allowed only on the main beach, north of the footbridge and on the footbridge to the beach. Rodeo lagoon and lake are currently closed to people and dogs for resource protection. Alternative D at Rodeo Beach/South Rodeo Beach would provide shorebirds, gulls, and terns with foraging and roosting habitat that is protected from dogs; physically restraining dogs on leash would protect shorebirds and marine mammals on the beach, although on-leash dogs could still disturb roosting and feeding birds through barking and by their presence on the beach. Shorebirds, gulls, and terns roosting or feeding in the on-leash area may relocate to an area of the beach where dogs are prohibited when dogs are present and use the on-leash area only when dogs are absent; this relocation would affect energy reserves in birds. Additionally, marine mammals that become stranded or haul out on the beach in the on-leash area could be subjected to disturbance from dogs. Therefore, assuming compliance, alternative D impacts on shorebirds, gulls, terns, and marine mammals would be negligible to long term, minor, and adverse depending on the seasonal presence of the birds and level of activity at the site. Although birds at the site would have similar habitat in close proximity that is prohibited to dogs, displacement of birds to another location would still have an impact on wildlife. Up to a minor adverse impact is expected because the primary area used by birds would be adjacent to the no-dog area, and dogs would be on leash in the other area, where they could disturb birds along the unfenced portion of the lagoon.

No commercial dog walking would be allowed and no permits to walk more than three dogs would be issued under alternative D; therefore, commercial and permitted dog walking would have no impact on wildlife.

**Cumulative Impacts.** The negligible to long-term minor adverse impacts on wildlife from dogs at Rodeo Beach/South Rodeo Beach under alternative D were considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the restoration projects provided by the park stewardship programs combined with the negligible impacts from the past oil spill and from any

development or construction actions and the negligible to long-term minor adverse impacts on wildlife from alternative D would result in negligible cumulative impacts on wildlife.

**RODEO BEACH/SOUTH RODEO BEACH ALTERNATIVE D CONCLUSION TABLE**

| Coastal Community Wildlife Impacts   | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect shorebirds and marine mammals on beach, although on-leash dogs could still disturb roosting and feeding birds through barking and by their presence on the beach; impact range is due to changing seasonal presence of the birds and level of activity at the site, including the presence of dogs | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Under alternative E, dog walking under voice and sight control would be allowed in a ROLA on Rodeo Beach and South Rodeo Beach. On-leash dog walking would be allowed on the footbridge and access trails to the beach. As in all alternatives, the lagoon would be closed to dogs and people. Alternative E would result in the same impacts on shorebirds, gulls, terns, and marine mammals as previously described in alternative C. The installation of the post-and-cable fence along the west end of Rodeo Lagoon would discourage visitors from accessing the lagoon, which would remain closed to people and dogs, but would not physically exclude dogs from this area. A fence more impervious to dogs in this area is not feasible because winter storm waves wash over the entire beach, and wind-driven litter and debris would be trapped in the fence. Shorebirds, gulls, and terns roosting or feeding in the ROLA would be disrupted by dogs under voice and sight control on North Rodeo Beach. Marine mammals that become stranded or haul out on the beach in the ROLA could be subjected to disturbance from the presence of unleashed dogs, which could bite, bark at, or clamber over the animals. Therefore, alternative E would result in long-term minor to moderate adverse impacts on marine mammals and shorebirds in the ROLA. The majority of birds at Rodeo Beach/South Rodeo Beach occur at the lagoon, but there are also a lesser number of birds that use the unfenced portion of the lagoon near the inlet/outlet.

The ROLA would encompass the entire beach habitat at the site and off-leash dogs could disturb shorebirds and marine mammals on the beach; there is no on-leash area (non-ROLA) designated for Rodeo Beach as part of alternative E. Birds roosting or feeding in the ROLA may be forced to abandon the area or relocate. At this site, however, there is no other habitat nearby, which may cause birds to flush and settle repeatedly, causing energy reserves to be used up. Therefore, overall impacts on wildlife under alternative E would be long term and would range from minor to moderate and adverse, since impacts would depend on the seasonal presence of marine mammals and birds as well as the level of activity at the site.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. At Rodeo Beach, any dog walker, commercial or private, could obtain a permit to walk more than three dogs with a limit of six dogs on leash. In a ROLA, permit holders may walk one to six dogs off leash and the permit may restrict use by time and area. Impacts on wildlife from permit holders with six dogs off leash would be expected to increase under this alternative. Since commercial dog walking is not common at Rodeo Beach/South Rodeo Beach, but has recently begun to increase, it is likely that this alternative may increase the number of commercial dog walkers at this site in

## Chapter 4: Environmental Consequences

the future. Therefore, commercial dog walking under alternative E would have a negligible to long-term minor, adverse impact on wildlife.

**Cumulative Impacts.** The long-term minor to moderate adverse impacts on wildlife from dogs at Rodeo Beach/South Rodeo Beach under alternative E were considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the restoration projects provided by the park stewardship programs combined with the negligible impacts from the past oil spill and from any development or construction actions and the long-term minor to moderate adverse impacts on wildlife from alternative E would result in negligible to long-term, minor, adverse cumulative impacts on wildlife.

**RODEO BEACH/SOUTH RODEO BEACH ALTERNATIVE E CONCLUSION TABLE**

| Coastal Community Wildlife Impacts                                       | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts   |
|--|--|--|--|
| Overall long-term minor to moderate adverse impacts, assuming compliance | The ROLA encompasses the entire beach habitat at the site and off-leash dogs could disturb shorebirds and marine mammals on the beach at this site; impacts would depend on the seasonal presence of the birds and the level of activity at the site, including the presence of dogs | No change, assuming compliance               | Negligible to long-term, minor, adverse cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative would provide a ROLA on the full length of the main beach between the ocean and the proposed post-and-cable fence to be installed to protect the shoreline habitat at the western end of Rodeo Lagoon, and south to the sea stacks that divide the main beach from South Rodeo Beach. The ROLA would include portions of the sparsely vegetated foredunes that extend from the crest of the beach to the lagoon. On-leash dog walking would be allowed on the footbridge to the beach, and South Rodeo Beach would be closed to dogs. Rodeo Lagoon is currently closed to people and dogs for overall resource protection. The installation of the post-and-cable fence along the west end of Rodeo Lagoon would discourage visitors from accessing the lagoon, but would not physically exclude dogs from this area. A fence more impervious to dogs in this area is not feasible because winter storm waves wash over the entire beach, and wind-driven litter and debris would be trapped in the fence. Shorebirds, gulls, and terns roosting or feeding in the ROLA would be disrupted by dogs under voice and sight control on North Rodeo Beach. Marine mammals that become stranded or haul out on the beach in the ROLA could be subjected to disturbance from the presence of unleashed dogs, which could bite, bark at, or clamber over the animals. Therefore, the preferred alternative would result in long-term minor to moderate adverse impacts on marine mammals and shorebirds in the ROLA; impacts would depend on the seasonal presence of the birds and the level of activity at the site.

Birds roosting or feeding in the ROLA may be forced to abandon the area or relocate, but at this site, there is no other habitat nearby, which may cause birds to flush and settle repeatedly, causing energy reserves to be used up. The ROLA encompasses a large portion of beach habitat at the site and off-leash dogs could disturb shorebirds and marine mammals on the beach at this site; there is no on-leash area (non-ROLA) designated for Rodeo Beach as part of alternative C. Therefore, the overall impacts on wildlife under the preferred alternative would be long term and would range from minor to moderate and adverse, since impacts would depend on the seasonal presence marine mammals and birds as well as the level of activity at the site.

All dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. At Rodeo Beach, any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. In a ROLA, permit holders may walk one to six

dogs off leash and the permit may restrict use by time and area. Impacts on wildlife from permit holders with up to six dogs off leash would be expected to increase under this alternative. Since commercial dog walking is not common at Rodeo Beach/South Rodeo Beach, but has recently begun to increase, it is likely that this alternative may increase the number of commercial dog walkers at this site in the future. Therefore, commercial dog walking under the preferred alternative would have a negligible to long-term minor adverse impact on wildlife.

**Cumulative Impacts.** Projects and actions in and near Rodeo Beach/South Rodeo Beach were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on wildlife at or in the vicinity of this site.

Park stewardship programs provide indirect benefits to shorebirds by activities such as controlling invasive plant species, supporting coastal habitats, and restoring habitats.

Development or construction actions at or in the vicinity of GGNRA sites have had or may have the potential to have adverse impacts on coastal communities, including shorebirds. Generally, adverse impacts on shorebirds may include temporary or permanent loss of habitat and physical disturbance by construction workers or from vehicle and/or boat noise during construction; levels of impacts may include avoidance, underuse, complete abandonment, or reduction in total numbers of shorebirds at construction areas in the coastal community. Even though these efforts both within and beyond park boundaries would affect vegetation and wildlife, mitigation for these projects would reduce the potential for impacts.

In addition to development and restoration projects, oil spills have occurred and will likely occur in the Pacific Ocean and in San Francisco Bay and will impact coastal community wildlife. Oil spills affect birds, mammals, and fish (MMC 2012b). Marine mammals such as fur seals and sea otters are extremely affected by oil on the water, as are birds that float on the surface of the water (such as scoters and grebes). On November 7, 2007, approximately 58,000 gallons of bunker fuel spilled from a container ship into the bay, resulting in the largest oil spill in the San Francisco Bay since the Cape Mohican incident in 1996. About 1,081 live birds were reported taken for rehabilitation and about 1,803 birds were reported to have been found dead as a result of this incident (USFWS 2007c, 1), although recent estimates show that bird mortality may have been as high as 6,688 individuals; a draft restoration plan is being prepared (USFWS 2009b, 1). The November 7, 2007, oil spill had minor to moderate adverse effects on wildlife such as marine mammals and birds at Rodeo Beach/South Rodeo Beach. The impacts on wildlife from this spill at Rodeo Beach/South Rodeo Beach lasted for 8 to 9 months. However, by the time this dog management plan/EIS is implemented the adverse impacts on wildlife at Rodeo Beach/South Rodeo Beach should be reduced to a negligible level.

The long-term minor to moderate adverse impacts on wildlife from dogs at Rodeo Beach/South Rodeo Beach under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from the restoration projects provided by the park stewardship programs combined with the negligible impacts from the past oil spill and from any development or construction actions and the long-term minor to moderate adverse impacts on wildlife from the preferred alternative would result in negligible to long-term minor adverse cumulative impacts on wildlife.

RODEO BEACH/SOUTH RODEO BEACH PREFERRED ALTERNATIVE F CONCLUSION TABLE

| Coastal Community Wildlife Impacts                                       | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts                                       |
|--|--|--|--|
| Overall long-term minor to moderate adverse impacts, assuming compliance | ROLA encompasses a large portion of beach habitat at the site and off-leash dogs could disturb shorebirds and marine mammals on the beach at this site; impacts would depend on the seasonal presence of the birds and the level of activity at the site | No change, assuming compliance               | Negligible to long-term minor adverse cumulative impacts |

SAN FRANCISCO COUNTY SITES

Crissy Field

**Common to All Alternatives.** Impacts from dogs as a result of the two different definitions of the Crissy Field WPA (the 36 CFR 7.97(d) definition for alternative A and the Warming Hut to approximately 900 feet east of the former Coast Guard Pier definition for alternatives B–F) would be the same for all alternatives. Even though the WPA would be expanded for alternatives B–F, this change would not influence the overall impacts analysis at this site because it would neither increase nor decrease the impacts at Crissy Field described in the paragraphs that follow. Further explanation of these two definitions can be found in the “Current Regulations and Policies” section of chapter 2.

**Alternative A: No Action.** Currently, Crissy Field is a moderate to high use site for on-leash and voice control dog walking at the beach and other areas of the site and has low compliance with dog walking regulations. Dogs are allowed under voice control throughout Crissy Field except for the picnic and parking area (which require on-leash dog walking) and a seasonal leash restriction in the WPA for protection of the federally threatened western snowy plover. Crissy Marsh is currently closed to people and dogs. The seasonal leash restriction is in effect the majority of the year (July 1 through May 15), but the site has high incidences of dogs in the WPA violating the seasonal leash restriction. From 2008 through 2011, a total of 510 dog-related incidents were reported. Of the 510 incidents, 283 incidents were for having dogs off leash within the Crissy Field WPA when the seasonal leash restriction was in effect (table 19). Other common incidents include violation of a closed area (58 incidents), having dogs off leash (65 incidents), and possession of a pet in a closed area (15). Violations have been issued for having pets in Crissy Field Lagoon, which is closed to humans and pets. In June through July 2006, there were two observed instances of dogs chasing birds within the Crissy Field WPA (Hatch et al. 2007a, 14) and during the September 2006 through April 2007 surveys, there were a total of three observations of dogs chasing shorebirds within the Crissy Field WPA (Hatch et al. 2007b, 5). There were no observations of dogs chasing shorebirds or plovers during the July 2007 through February 2008 surveys within the Crissy Field WPA (Hatch et al. 2008, 3). Dog presence, as well as unleashed dogs barking at or chasing after roosting or feeding birds at this site, could disturb wildlife. This type of disturbance could cause loss of preferred habitat as well as energy loss in migrating and wintering birds, potentially reducing their chances of survival along their migratory routes and reducing fitness for successful reproduction. The park has documented the highest year-round bird densities in the Crissy Marsh (discussed in more detail in the “Wildlife in Wetlands and Aquatic Communities” section), with slightly lower densities in the dune swale and rear dune; bird species richness has been reported at its highest in the wetland, with slightly less richness in the beach and nearshore areas (Ward and Ablog 2006, 25–26 and 92–93). Although bird species richness in the WPA is lower in comparison to other Crissy Field habitats like the marsh (which may be a result of the intense visitor and dog use of the site), there are often relatively large flocks of killdeer in the dunes in the WPA. Additionally, marine mammals that haul out or strand at the beach at

Crissy Field are occasionally affected by dogs on the beach through dogs approaching, biting, barking at, or climbing on/surrounding the mammals or chasing after hauled-out mammals back into the water. Alternative A would result in continued long-term minor to moderate adverse impacts on wildlife using beach/dune habitat, including the WPA, because occasional to frequent disturbances to wildlife from dogs would occur.

Under alternative A, no permit system exists for dog walking. However, commercial dog walking occurs regularly at Crissy Field. Commercial dog walking would continue to contribute to the long-term minor to moderate adverse impacts on wildlife. Commercial dog walkers with multiple dogs under voice control would impact wildlife by continued disturbances to wildlife by dogs.

**Cumulative Impacts.** Projects and actions in and near Crissy Field were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on wildlife at or in the vicinity of this site.

Park stewardship programs provide indirect benefits to shorebirds by activities such as controlling invasive plant species, supporting coastal habitats, and restoring habitats. The PTMP was adopted in 2002 and includes the preservation of the Presidio's cultural, natural, scenic, and recreational resources in Area B, managed by the Presidio Trust. The PTMP focuses on the long-term preservation of the park, including replacing pavement with green space, improving and enlarging the park's trail system, restoring stream corridors and natural habitats, and reusing historic structures (Presidio Trust 2002, 3). Management objectives in the PTMP that are applicable to wildlife include identifying and protecting sensitive wildlife species, and restoring and maintaining their habitats. The PTMP also preserves, enhances, and increases natural habitats managed by the Presidio Trust. For example, historic forests are being rehabilitated, wetlands are being enhanced, and native plant and wildlife species are being protected (Presidio Trust 2002, ii). As a result, the PTMP has beneficial impacts on wildlife at or in the vicinity of Crissy Field.

Development or construction actions at or in the vicinity of GGNRA sites have had or may have the potential to have adverse impacts on coastal communities, including shorebirds. Generally, adverse impacts on shorebirds may include temporary or permanent loss of habitat and physical disturbance by construction workers or from vehicle and/or boat noise during construction; levels of impacts may include avoidance, underuse, complete abandonment, or reduction in total numbers of shorebirds at construction areas in the coastal community. Even though these efforts both within and beyond park boundaries would affect vegetation and wildlife, mitigation for these projects would reduce the potential for impacts.

In addition to development and restoration projects, oil spills have occurred and will likely occur in the Pacific Ocean and in San Francisco Bay and will impact coastal community wildlife. Oil spills affect birds, mammals, and fish (MMC 2012b). Marine mammals such as fur seals and sea otters are extremely affected by oil on the water, as are birds that float on the surface of the water (such as scoters and grebes). On November 7, 2007, approximately 58,000 gallons of bunker fuel spilled from a container ship into the bay, resulting in the largest oil spill in the San Francisco Bay since the Cape Mohican incident in 1996. About 1,081 live birds were reported taken for rehabilitation and about 1,803 birds were reported to have been found dead as a result of this incident (USFWS 2007c, 1), although recent estimates show that bird mortality may have been as high as 6,688 individuals; a draft restoration plan is being prepared (USFWS 2009b, 1). The November 7, 2007, oil spill had short-term minor to moderate adverse effects on wildlife such as marine mammals and birds at project sites in GGNRA. For the most part, the impacts on wildlife from this spill lasted only a few weeks, especially on the sandy beaches of the park. In the long term, and by the time this dog management plan/EIS is implemented, impacts on wildlife at project sites in GGNRA should be reduced to a negligible level.

## Chapter 4: Environmental Consequences

The long-term minor to moderate adverse impacts on wildlife from dogs at Crissy Field under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from the restoration projects provided by the park stewardship programs and the PTMP should reduce some of the adverse impacts on wildlife from alternative A. The impacts resulting from the past oil spill and from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible to long term, minor, and adverse.

**CRISSY FIELD ALTERNATIVE A CONCLUSION TABLE**

| Coastal Community Wildlife Impacts          | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts                                       |
|---|--|--|--|
| Long-term minor to moderate adverse impacts | Shorebirds on beach and in WPA (seasonal leash restriction is often violated in the WPA) would occasionally to frequently be subjected to impacts from on-leash and voice control dogs through dogs barking at, chasing after, and being in proximity to roosting or feeding birds; although shorebird numbers are low at the beach they are high in the marsh; visitor use is high at this site; marine mammals would occasionally be subjected to impacts from dogs on the beach | N/A  | Negligible to long-term minor adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking on the promenade, Crissy Airfield, East and Central beaches, paths leading to Central Beach, trails and grassy areas near East Beach, around the Old Coast Guard Station, and on the Mason Street Bike Path. Dogs would be prohibited in the WPA, and Crissy Marsh and fenced dune areas would remain closed to dogs. On-leash dog walking would not allow dogs to roam freely along the beach. Due to physical restraint, it is highly unlikely that dogs would access the WPA, resulting in protection for resting and feeding shorebirds and waterbirds that may use the area year-round as well as elimination of chasing after, and disturbance and reduction of flushing from preferred areas (the WPA). Physically restraining dogs on leash would protect wildlife and reduce chasing after shorebirds and marine mammals on the beach, but on-leash dogs would still be able to disturb wildlife and/or cause a flight response through their presence on the beach and lunging/barking at roosting, resting, and feeding birds. This could cause birds to flee or relocate, using energy reserves unnecessarily, and could result in the loss of preferred habitat. Crissy Field also has a fenced marsh that supports high bird use by shorebirds, wading birds, and waterbirds in addition to the limited numbers of shorebirds that use the beach/ocean shoreline. The combination of on-leash dog walking requirements and the fence that surrounds the marsh would effectively keep dogs out of the area. Therefore, assuming compliance, overall impacts on wildlife as a result of alternative B would be long term and would range from negligible to minor and adverse, because shorebirds and waterbirds as well as marine mammals may occasionally be affected by on-leash dogs. A range is presented to encompass the potential effects, since impacts would depend on the seasonal presence of the birds and the level of activity at the site, which in turn would affect the presence of birds at the site.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since the percentage of commercial dog walkers is

considered high at Crissy Field, dogs walked by commercial dog walkers would create the majority of the adverse impacts on wildlife from dogs at the site. Overall impacts on wildlife from dogs walked by both commercial dog walkers and private individuals would be negligible to long term minor and adverse.

**Cumulative Impacts.** The negligible to long-term minor adverse impacts on wildlife from dogs at Crissy Field under alternative B were considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the restoration projects provided by the park stewardship programs and the PTMP should reduce some of the adverse impacts on wildlife from alternative B. The impacts resulting from the past oil spill and from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**CRISSY FIELD ALTERNATIVE B CONCLUSION TABLE**

| Coastal Community Wildlife Impacts   | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect shorebirds and marine mammals on beach, although on-leash dogs could still disturb roosting and feeding birds through barking and by their presence on the beach; impact range is due to changing seasonal presence of the birds and level of activity at the site | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Under alternative C, no dogs would be allowed in the WPA or on East Beach; therefore, there would be no impact on wildlife in this area. Crissy Marsh is currently closed to dogs. On-leash dog walking would be allowed on the promenade and the Mason Street Bike Path, as well as in the picnic area and parking area. Two ROLAs would be provided under this alternative: one on Crissy Airfield and one along Central Beach. The addition of the Central Beach ROLA would result in impacts on wildlife using the beach ROLA. Shorebirds use the habitat at the Central Beach ROLA and off-leash dogs could disturb and/or harass the birds, causing them to flush, which would result in the birds fleeing to the WPA, East Beach, or other areas where dogs are not allowed. Therefore, indirect impacts on wildlife in the Central Beach ROLA would occur due to wildlife avoiding the area during periods of activity or altogether. Also, marine mammals that strand or haul out in the beach ROLA could be disturbed by off-leash dogs, which could bite, bark at, or clamber over marine animals. The presence of dogs could preclude establishment of new haul-out sites and/or breeding and pupping sites as marine mammal populations expand. Therefore, alternative C would have long-term moderate adverse impacts on shorebirds, gulls, terns, and marine mammals using the beach inside the designated Central Beach ROLA.

The long-term moderate adverse impacts on wildlife in the Central Beach ROLA would occur in a small portion of the site when compared to the site as a whole (the ROLA encompasses about one-third of the beach habitat at the site). Assuming compliance with proposed regulations, alternative C would result in overall long-term minor adverse impacts on wildlife because occasional disturbances to wildlife from dogs would occur, although shorebirds and marine mammals would be protected through WPA site closure to dogs and by physical restraint of dogs on leash in other areas.

## Chapter 4: Environmental Consequences

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. At Crissy Field, any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. In a ROLA, permit holders may walk one to six dogs off leash, and the permit may restrict use by time and area. Impacts on wildlife from permit holders with up to six dogs off leash would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is common at Crissy Field, impacts on wildlife would be expected from this user group. Impacts on wildlife from commercial dog walkers would be similar to impacts from other dog walkers, as summarized below in overall impacts; therefore, impacts from commercial dog walking would be long term, minor, and adverse.

**Cumulative Impacts.** The long-term minor adverse impacts on wildlife from dogs at Crissy Field under alternative C were considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the restoration projects provided by the park stewardship programs and the PTMP should reduce some of the adverse impacts on wildlife from alternative C. The impacts resulting from the past oil spill and from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**CRISSY FIELD ALTERNATIVE C CONCLUSION TABLE**

| Coastal Community Wildlife Impacts                           | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|--|--|-------------------------------|
| Overall long-term minor adverse impacts, assuming compliance | Shorebirds would be protected through WPA site closure to dogs and by physically restraining dogs on leash in other areas; the Central Beach ROLA encompasses about one-third of the beach habitat at the site | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Alternative D would allow dogs on leash along the promenade and the eastern portion of Crissy Airfield. Dogs would not be allowed in the WPA, East Beach or Central Beach. Crissy Marsh is currently closed to dogs. Dogs would be allowed under voice and sight control only on the western portion of Crissy Airfield (not beach habitat) in a ROLA. There would be no impact on coastal community habitat or wildlife in the airfield ROLA, which supports manicured grass. Assuming compliance, overall impacts on shorebirds, gulls, and terns using beach habitat would be negligible. Prohibiting dogs in beach areas would not allow dogs to access stranded marine mammals.

No commercial dog walking would be allowed and no permits to walk more than three dogs would be issued under alternative D; therefore, commercial and permitted dog walking would have no impact on wildlife.

**Cumulative Impacts.** The negligible impacts on wildlife from dogs at Crissy Field under alternative D were considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the restoration projects provided by the park stewardship programs and the PTMP combined with the negligible impacts from the past oil spill and from any development or construction actions and the negligible impacts on wildlife from alternative D would result in negligible cumulative impacts on wildlife.

CRISSY FIELD ALTERNATIVE D CONCLUSION TABLE

| Coastal Community Wildlife Impacts              | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Prohibiting dogs on all beach areas would protect shorebirds and stranded or hauled-out marine mammals; no coastal community habitat or wildlife exists in airfield ROLA | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would allow on-leash dog walking in the WPA, at East Beach, in the picnic area and parking area, and along the promenade and the Mason Street Bike Path. One ROLA would be established on Crissy Airfield and another ROLA would be established at Central Beach. Crissy Marsh is currently closed to dogs. As a result of the ROLAs, the presence of dogs, as well as their barking and running, in the Central Beach ROLA could disturb shorebirds, gulls, and terns using the beach/dune habitat for roosting or feeding, causing them to flush. This would result in the birds fleeing to the WPA, East Beach, or other areas where dogs are not allowed, resulting in indirect impacts on wildlife in the Central Beach ROLA due to avoidance of the area during periods of activity or altogether. Also, marine mammals that strand or haul out in the Central Beach ROLA could be disturbed by off-leash dogs, which could bite, bark at, or clamber over marine animals. The presence of dogs could preclude establishment of new haul-out sites and/or breeding and pupping sites as marine mammal populations expand. Therefore, alternative E would have long-term moderate adverse impacts on shorebirds, gulls, terns, and marine mammals using the beach inside the designated ROLA.

The long-term moderate adverse impacts on wildlife in the Central Beach ROLA would occur in a small portion of the site when compared to the site as a whole (the Central Beach ROLA encompasses about one-third of the beach habitat at the site). However, dogs would be allowed in the majority of the coastal community at Crissy Field, including the WPA and East Beach (on leash) as well as in the ROLA on Crissy Airfield and the ROLA on Central Beach (off leash). No similar habitat to Crissy Marsh exists at the site where dogs are not allowed, and on-leash dogs could still disturb roosting and feeding birds through barking and by their presence on the beach. Therefore, assuming compliance with the proposed regulations, alternative E would result in overall long-term minor to moderate adverse impacts on wildlife because occasional to frequent disturbances to wildlife from dogs would occur at the site, including at the WPA, which would allow on-leash dogs.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. At Crissy Field, any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. In a ROLA, permit holders may walk one to six dogs off leash and the permit may restrict use by time and area. Impacts on wildlife from permit holders with up to six dogs off leash would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is common at Crissy Field, impacts on wildlife would be expected from this user group. Impacts on wildlife from commercial dog walkers would be similar to impacts from other dog walkers, as summarized above in overall impacts; therefore, impacts from commercial dog walking would be long term, minor, and adverse.

**Cumulative Impacts.** The long-term minor to moderate adverse impacts on wildlife from dogs at Crissy Field under alternative E were considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the restoration projects provided by the park stewardship

## Chapter 4: Environmental Consequences

programs and the PTMP should reduce some of the adverse impacts on wildlife from alternative E. The impacts resulting from the past oil spill and from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible to long term, minor, and adverse.

**CRISSY FIELD ALTERNATIVE E CONCLUSION TABLE**

| Coastal Community Wildlife Impacts                                       | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts                                       |
|--|--|--|--|
| Overall long-term minor to moderate adverse impacts, assuming compliance | Dogs would be allowed in the majority of the coastal community at Crissy Field, including the WPA and East Beach (on leash) as well as one ROLA on Crissy Airfield and one ROLA on Central Beach (off leash); the beach ROLA encompasses about one-third of the beach habitat at the site; no similar habitat to Crissy Marsh exists at the site where dogs are not allowed; on-leash dogs could still disturb roosting and feeding birds through barking and by their presence on the beach | No change, assuming compliance               | Negligible to long-term minor adverse cumulative impacts |

**Alternative F: Preferred Alternative.** Under the preferred alternative, no dogs would be allowed in the WPA or on East Beach; therefore, there would be no impact on wildlife in this area. Crissy Marsh is currently closed to dogs. On-leash dog walking would be allowed on the promenade and the Mason Street Bike Path, as well as in the picnic area and parking area. Two ROLAs would be provided under this alternative: one on the eastern section of Crissy Airfield and one along Central Beach. The addition of the beach ROLA would result in impacts on wildlife using the beach ROLA. Shorebirds use the habitat at the beach ROLA and off-leash dogs could disturb and/or harass the birds, causing them to flush, which would result in the birds fleeing to the WPA, East Beach, or other areas where dogs are not allowed. Therefore, indirect impacts on wildlife in the beach ROLA would occur due to wildlife avoiding the area during periods of activity or altogether. Also, marine mammals that strand or haul out in the beach ROLA could be disturbed by off-leash dogs, which could bite, bark at, or clamber over marine animals. The presence of dogs could preclude establishment of new haul-out sites and/or breeding and pupping sites as marine mammal populations expand. Therefore, the preferred alternative would have long-term moderate adverse impacts on shorebirds, gulls, terns, and marine mammals using the beach inside the designated beach ROLA.

The long-term moderate adverse impacts on wildlife in the beach ROLA would occur in a small portion of the site when compared to the site as a whole (the ROLA encompasses about one-third of beach habitat at the site). Assuming compliance with proposed regulations, the preferred alternative would result in overall long-term minor adverse impacts on wildlife because occasional disturbances to wildlife from dogs would occur, although shorebirds and marine mammals would be protected through WPA site closure to dogs and by physically restraining dogs on leash in other areas.

All dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. At Crissy Field, any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. In a ROLA, permit holders may walk one to six dogs off leash and the permit may restrict use by time and area. Impacts on wildlife from permit holders with up to six dogs off leash would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is common at Crissy Field, impacts on wildlife would be expected from this user group. Impacts on wildlife from commercial dog walkers would be similar to impacts from other dog walkers, as summarized below in overall impacts; therefore, impacts from commercial dog walking would be long term, minor, and adverse.

**Cumulative Impacts.** Projects and actions in and near Crissy Field were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on wildlife at or in the vicinity of this site.

Park stewardship programs provide indirect benefits to shorebirds by activities such as controlling invasive plant species, supporting coastal habitats, and restoring habitats. The PTMP was adopted in 2002 and includes the preservation of the Presidio's cultural, natural, scenic, and recreational resources in Area B, managed by the Presidio Trust. The PTMP focuses on the long-term preservation of the park, including replacing pavement with green space, improving and enlarging the park's trail system, restoring stream corridors and natural habitats, and reusing historic structures (Presidio Trust 2002, 3). Management objectives in the PTMP that are applicable to wildlife include identifying and protecting sensitive wildlife species, and restoring and maintaining their habitats. The PTMP also preserves, enhances, and increases natural habitats managed by the Presidio Trust. For example, historic forests are being rehabilitated, wetlands are being enhanced, and native plant and wildlife species are being protected (Presidio Trust 2002, ii). As a result, the PTMP has beneficial impacts on wildlife at or in the vicinity of Crissy Field.

Development or construction actions at or in the vicinity of GGNRA sites have had or may have the potential to have adverse impacts on coastal communities, including shorebirds. Generally, adverse impacts on shorebirds may include temporary or permanent loss of habitat and physical disturbance by construction workers or from vehicle and/or boat noise during construction; levels of impacts may include avoidance, underuse, complete abandonment, or reduction in total numbers of shorebirds at construction areas in the coastal community. Even though these efforts both within and beyond park boundaries would affect vegetation and wildlife, mitigation for these projects would reduce the potential for impacts.

In addition to development and restoration projects, oil spills have occurred and will likely occur in the Pacific Ocean and in San Francisco Bay, and will impact coastal community wildlife. Oil spills affect birds, mammals, and fish (MMC 2012b). Marine mammals such as fur seals and sea otters are extremely affected by oil on the water, as are birds that float on the surface of the water (such as scoters and grebes). On November 7, 2007, approximately 58,000 gallons of bunker fuel spilled from a container ship into the bay, resulting in the largest oil spill in the San Francisco Bay since the Cape Mohican incident in 1996. About 1,081 live birds were reported taken for rehabilitation and about 1,803 birds were reported to have been found dead as a result of this incident (USFWS 2007c, 1), although recent estimates show that bird mortality may have been as high as 6,688 individuals; a draft restoration plan is being prepared (USFWS 2009b, 1). The November 7, 2007, oil spill had short-term minor to moderate adverse effects on wildlife such as marine mammals and birds at project sites in GGNRA. For the most part, the impacts on wildlife from this spill lasted only a few weeks, especially on the sandy beaches of the park. In the long term and by the time this dog management plan/EIS is implemented, impacts on wildlife at project sites in GGNRA should be reduced to a negligible level.

## Chapter 4: Environmental Consequences

The long-term minor adverse impacts on wildlife from dogs at Crissy Field under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from the restoration projects provided by the park stewardship programs and the PTMP should reduce some of the adverse impacts on wildlife from the preferred alternative. The impacts resulting from the past oil spill and from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**CRISSY FIELD PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| Coastal Community Wildlife Impacts                           | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|--|--|-------------------------------|
| Overall long-term minor adverse impacts, assuming compliance | Shorebirds would be protected through WPA site closure to dogs and by physically restraining dogs on leash in other areas; the Central Beach ROLA encompasses about one-third of the beach habitat at the site | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

### Baker Beach and Bluffs to Golden Gate Bridge

**Alternative A: No Action.** Dog walking under voice control is allowed on the beach (South Beach and North Beach). On-leash dog walking is allowed in the picnic and parking areas, as well as on the other trails at the site except the Batteries to Bluffs Trail, where no dogs are allowed. Baker Beach is a low to moderate use area for on-leash and voice control dog walking at the beach and other areas of the site. A total of 86 dog-related incidents were reported between 2008 and 2011; the majority of incidents were for having dogs off leash or within a closed area (table 21). Baker Beach has fairly high numbers of shorebirds, and coastal beach habitat is extensive at this site. In addition, the water at Lobos Creek is quite attractive to gulls, and this area is in the voice control area for dogs at the southern portion of Baker Beach.

Since alternative A would allow voice control dog walking on the beach, dog presence as well as dogs chasing after, barking at, and coming in close proximity to migrating and wintering shorebirds, gulls, and terns roosting or feeding on the beach would continue. This type of disturbance by dogs could result in loss of preferred habitat as well as energy loss to migrating and wintering birds, potentially reducing their chances of survival along their migratory routes and reducing fitness for successful reproduction. Additionally, marine mammals that haul out or strand at Baker Beach would occasionally be affected by dogs on the beach through dogs approaching, biting, barking at, or climbing on/surrounding the mammals or chasing after hauled-out mammals back into the water. Therefore, alternative A would result in continued long-term moderate adverse impacts on wildlife using beach/dune habitat because continued frequent and repeated disturbances to wildlife from dogs would occur.

Under alternative A, no permit system exists for dog walking. At Baker Beach and Bluffs to Golden Gate Bridge, commercial dog walking is uncommon. Therefore, commercial dog walking would have negligible impacts on wildlife.

**Cumulative Impacts.** Projects and actions in and near Baker Beach and Bluffs to Golden Gate Bridge were considered for the cumulative impacts analysis (appendix K). The following is a discussion of

projects that have had, are currently having, or have the potential to have effects on wildlife at or in the vicinity of this site.

Park stewardship programs provide indirect benefits to shorebirds by activities such as controlling invasive plant species, supporting coastal habitats, and restoring habitats.

Development or construction actions at or in the vicinity of GGNRA sites have had or may have the potential to have adverse impacts on coastal communities, including shorebirds. Generally, adverse impacts on shorebirds may include temporary or permanent loss of habitat and physical disturbance by construction workers or from vehicle and/or boat noise during construction; levels of impacts may include avoidance, underuse, complete abandonment, or reduction in total numbers of shorebirds at construction areas in the coastal community. Even though these efforts both within and beyond park boundaries would affect vegetation and wildlife, mitigation for these projects would reduce the potential for impacts.

In addition to development and restoration projects, oil spills have occurred and will likely occur in the Pacific Ocean and in San Francisco Bay and will impact coastal community wildlife. Oil spills affect birds, mammals, and fish (MMC 2012b). Marine mammals such as fur seals and sea otters are extremely affected by oil on the water, as are birds that float on the surface of the water (such as scoters and grebes). On November 7, 2007, approximately 58,000 gallons of bunker fuel spilled from a container ship into the bay, resulting in the largest oil spill in the San Francisco Bay since the Cape Mohican incident in 1996. About 1,081 live birds were reported taken for rehabilitation and about 1,803 birds were reported to have been found dead as a result of this incident (USFWS 2007c, 1), although recent estimates show that bird mortality may have been as high as 6,688 individuals; a draft restoration plan is being prepared (USFWS 2009b, 1). The November 7, 2007, oil spill had short-term minor to moderate adverse effects on wildlife such as marine mammals and birds at project sites in GGNRA. For the most part, the impacts on wildlife from this spill lasted only a few weeks, especially on the sandy beaches of the park. In the long term and by the time this dog management plan/EIS is implemented, impacts on wildlife at project sites in GGNRA should be reduced to a negligible level.

The long-term moderate adverse impacts on wildlife from dogs at Baker Beach and Bluffs to Golden Gate Bridge under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from the restoration projects provided by the park stewardship programs should reduce some of the adverse impacts on wildlife from alternative A. The impacts resulting from the past oil spill and from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be long term, minor, and adverse.

**BAKER BEACH AND BLUFFS TO GOLDEN GATE BRIDGE ALTERNATIVE A CONCLUSION TABLE**

| Coastal Community Wildlife Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts                         |
|------------------------------------|---|--|--|
| Long-term moderate adverse impacts | Shorebirds on beach would frequently be subjected to impacts from on-leash and voice control dogs through dogs barking at, chasing after, and being in proximity to roosting or feeding birds; shorebird numbers are fairly high, visitor use is low to moderate, and coastal habitat is extensive at this site; marine mammals would occasionally be subjected to impacts from dogs on the beach | N/A  | Long-term minor adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking on North Beach, in the picnic and parking areas, and on all trails leading to the beaches except the Batteries to Bluffs Trail or trails leading to the Batteries to Bluffs Trail, where no dogs would be allowed. Dogs would be allowed on leash on South Beach. On-leash dog walking would not allow dogs to roam freely along the beach. Physically restraining dogs on leash would protect wildlife and reduce chasing after shorebirds and marine mammals on the beach, but on-leash dogs would still be able to disturb wildlife and/or cause a flight response through their presence on the beach and lunging/barking at roosting, resting, and feeding birds. This could cause birds to use energy reserves unnecessarily and could result in the loss of preferred habitat. Therefore, assuming compliance, overall impacts on wildlife as a result of alternative B would be long term and would range from negligible to minor and adverse, because shorebirds and waterbirds as well as marine mammals may not be affected or may occasionally be affected by on-leash dogs. A range is presented to encompass the potential effects, since impacts would depend on the seasonal presence of the birds and the level of activity at the site.

The water at Lobos Creek is quite attractive to gulls and this area is within the on-leash area for dogs. On-leash dog walking, if occurring in proximity to wildlife, would cause shorebirds, gulls, and terns roosting and/or feeding on the beach to flee to nearby areas of less activity (if available) or to relocate entirely; both actions would result in unnecessary energy expenditure by fleeing birds.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is not common at Baker Beach and Bluffs to Golden Gate Bridge, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have a negligible impact on wildlife.

**Cumulative Impacts.** The negligible to long-term minor adverse impacts on wildlife from dogs at Baker Beach and Bluffs to Golden Gate Bridge under alternative B were considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the restoration projects provided by the park stewardship programs should reduce some of the adverse impacts on wildlife from alternative B. The impacts resulting from the past oil spill and from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for

impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**BAKER BEACH AND BLUFFS TO GOLDEN GATE BRIDGE ALTERNATIVE B CONCLUSION TABLE**

| <b>Coastal Community Wildlife Impacts</b>                                  | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect shorebirds and marine mammals on beach, although on-leash dogs could still disturb roosting and feeding birds through barking and by their presence on the beach; impact range is due to changing seasonal presence of the birds and level of activity at the site | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Dog walking restrictions under alternative C would be the same as alternative B, and impacts would be the same, assuming compliance: negligible to long-term minor adverse impacts on marine mammals and shorebirds. Impacts would depend on the seasonal presence of the birds and the level of activity at the site.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. At Baker Beach, any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. Impacts on wildlife from permit holders with up to six dogs off leash would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is not common at Baker Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have a negligible impact on wildlife.

**Cumulative Impacts.** Under alternative C, the cumulative impacts on wildlife at this park site would be the same as those under alternative B: negligible cumulative impacts.

**BAKER BEACH AND BLUFFS TO GOLDEN GATE BRIDGE ALTERNATIVE C CONCLUSION TABLE**

| <b>Coastal Community Wildlife Impacts</b>                                  | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect shorebirds and marine mammals on beach, although on-leash dogs could still disturb roosting and feeding birds through barking and by their presence on the beach; impact range is due to changing seasonal presence of the birds and level of activity at the site | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Under alternative D, Baker Beach and Bluffs to Golden Gate Bridge would be divided into on-leash areas and no-dog areas, and all trails providing access to the on-leash areas would require on-leash dog walking as well. Dogs would be prohibited on the beach north of the north parking lot and on the trails that access that section of beach.

## Chapter 4: Environmental Consequences

Dogs would be allowed on only a portion of the beach, and physically restraining dogs on leash would protect shorebirds and marine mammals on the beach, but on-leash dogs could still disturb roosting and feeding birds through barking and by their presence on the beach. In addition, the water at Lobos Creek is quite attractive to gulls and this area is in the on-leash area for dogs at the southern portion of Baker Beach. Therefore, alternative D impacts on wildlife would be negligible to long term, minor, and adverse; the impact range is due to changing seasonal presence of the birds and level of activity at the site. Beach habitat is available north of the parking lot (which would be prohibited to dogs) and in close proximity to Baker Beach. Shorebirds, gulls, and terns might flee from dogs on leash to other portions of the beach, and displacement of birds to another location would have an impact on wildlife.

No commercial dog walking would be allowed and no permits to walk more than three dogs would be issued under alternative D; therefore, commercial and permitted dog walking would have no impact on wildlife. Private dog walkers would be allowed to walk one to three dogs.

**Cumulative Impacts.** The negligible to long-term minor adverse impacts on wildlife from dogs at Baker Beach and Bluffs to Golden Gate Bridge under alternative D were considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the restoration projects provided by the park stewardship programs should reduce some of the adverse impacts on wildlife from alternative D. The impacts resulting from the past oil spill and from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**BAKER BEACH AND BLUFFS TO GOLDEN GATE BRIDGE ALTERNATIVE D CONCLUSION TABLE**

| Coastal Community Wildlife Impacts   | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect shorebirds and marine mammals on beach, although on-leash dogs could still disturb roosting and feeding birds through barking and by their presence on the beach; impact range is due to changing seasonal presence of the birds and level of activity at the site | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Implementation of alternative E at Baker Beach would provide a ROLA on the beach south of the north parking lot to the draft plan/SEIS boundary (South Beach). On-leash dog walking would be allowed on the remaining beach (North Beach) and on trails, including those through dune habitat, that access the beach. No dogs would be allowed on the Batteries to Bluffs Trail. Because dogs restricted on leash would be allowed along the northern portion of the beach and a ROLA would be designated for the southern portion of Baker Beach, the presence of dogs, as well as their barking and running, in the ROLA would disturb shorebirds, gulls, and terns using the beach/dune habitat for roosting or feeding. In addition, the water at Lobos Creek is quite attractive to gulls and this area is in the off-leash area for dogs at the southern portion of Baker Beach. When dogs and dog walkers are present in the ROLA, birds using the beach in the ROLA could flee from the ROLA to other areas where dogs are not allowed or they may flush and return and be repeatedly disturbed. Because of mobility, wildlife can usually avoid areas where dogs are present during

peak activity or habituate to these activities, but loss of preferred habitat would still indirectly affect wildlife. In addition, marine mammals that strand or haul out in the ROLA could be disturbed by off-leash dogs, which could bite, bark at, or clamber over marine animals. Therefore, alternative E impacts on wildlife in the ROLA would be long term, moderate, and adverse because frequent disturbances from dogs would occur; however, impacts would depend on the seasonal presence of the birds and the level of activity at the site.

The long-term moderate adverse impacts from dogs in the ROLA would occur in about one-third of the beach habitat at the site, and on-leash dog walking would be allowed in the remaining portion of Baker Beach and Bluffs to Golden Gate Bridge. Physically restraining dogs on leash in some areas of the site would protect shorebirds and other wildlife such as marine mammals, but the presence of dogs barking and running (even while on leash) would occasionally to frequently disturb wildlife. Therefore, the overall impacts on wildlife at Baker Beach and Bluffs to Golden Gate Bridge would be long term and would range from minor to moderate and adverse.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. At Baker Beach, any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. In a ROLA, permit holders may walk one to six dogs off leash and the permit may restrict use by time and area. Impacts on wildlife from permit holders with up to six dogs off leash would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is not common at Baker Beach and Bluffs to Golden Gate Bridge, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have a negligible impact on wildlife.

**Cumulative Impacts.** The long-term minor to moderate adverse impacts on wildlife from dogs at Baker Beach and Bluffs to Golden Gate Bridge under alternative E were considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the restoration projects provided by the park stewardship programs should reduce some of the adverse impacts on wildlife from alternative E. The impacts resulting from the past oil spill and from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible to long term, minor, and adverse.

**BAKER BEACH AND BLUFFS TO GOLDEN GATE BRIDGE ALTERNATIVE E CONCLUSION TABLE**

| <b>Coastal Community Wildlife Impacts</b>                                | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>                                |
|--|---|---|--|
| Overall long-term minor to moderate adverse impacts, assuming compliance | Physically restraining dogs on leash in some areas of the site would protect shorebirds and other wildlife but the presence of dogs barking and running (even while on leash) would disturb wildlife; ROLA encompasses about one-third of beach habitat at the site | Beneficial to no change, assuming compliance        | Negligible to long-term minor adverse cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative D: Baker Beach and Bluffs to Golden Gate Bridge would be divided into on-leash areas and no-dog areas, and all trails providing access to the on-leash areas would require on-leash dog walking as well. Dogs would be prohibited on Batteries to Bluffs Trail, the beach north of the north parking lot, and the trails that access

## Chapter 4: Environmental Consequences

that section of beach. Dogs would be allowed on only a portion of the beach, and physically restraining dogs on leash would protect shorebirds and marine mammals on the beach, but on-leash dogs could still disturb roosting and feeding birds through barking and by their presence on the beach. In addition, the water at Lobos Creek is quite attractive to gulls and this area is in the on-leash area for dogs at the southern portion of Baker Beach. Therefore, the preferred alternative impacts on wildlife would be negligible to long term, minor, and adverse; the impact range is due to the changing seasonal presence of the birds and the level of activity at the site. Beach habitat is available north of the parking lot (which is prohibited to dogs) and in close proximity to Baker Beach and Bluffs to Golden Gate Bridge. Shorebirds, gulls, and terns might flee from dogs on leash to other portions of the beach, and displacement of birds to another location would have an impact on wildlife.

All dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. At Baker Beach, any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. Impacts on wildlife from permit holders with up to six dogs off leash would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is not common at Baker Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have a negligible impact on wildlife.

**Cumulative Impacts.** Projects and actions in and near Baker Beach and Bluffs to Golden Gate Bridge were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on wildlife at or in the vicinity of this site.

Park stewardship programs provide indirect benefits to shorebirds by activities such as controlling invasive plant species, supporting coastal habitats, and restoring habitats.

Development or construction actions at or in the vicinity of GGNRA sites have had or may have the potential to have adverse impacts on coastal communities, including shorebirds. Generally, adverse impacts on shorebirds may include temporary or permanent loss of habitat and physical disturbance by construction workers or from vehicle and/or boat noise during construction; levels of impacts may include avoidance, underuse, complete abandonment, or reduction in total numbers of shorebirds at construction areas in the coastal community. Even though these efforts both within and beyond park boundaries would affect vegetation and wildlife, mitigation for these projects would reduce the potential for impacts.

In addition to development and restoration projects, oil spills have occurred and will likely occur in the Pacific Ocean and in San Francisco Bay, and will impact coastal community wildlife. Oil spills affect birds, mammals, and fish (MMC 2012b). Marine mammals such as fur seals and sea otters are extremely affected by oil on the water, as are birds that float on the surface of the water (such as scoters and grebes). On November 7, 2007, approximately 58,000 gallons of bunker fuel spilled from a container ship into the bay, resulting in the largest oil spill in the San Francisco Bay since the Cape Mohican incident in 1996. About 1,081 live birds were reported taken for rehabilitation and about 1,803 birds were reported to have been found dead as a result of this incident (USFWS 2007c, 1), although recent estimates show that bird mortality may have been as high as 6,688 individuals; a draft restoration plan is being prepared (USFWS 2009b, 1). The November 7, 2007, oil spill had short-term minor to moderate adverse effects on wildlife such as marine mammals and birds at project sites in GGNRA. For the most part, the impacts on wildlife from this spill lasted only a few weeks, especially on the sandy beaches of the park. In the long term and by the time this dog management plan/EIS is implemented, impacts on wildlife at project sites in GGNRA should be reduced to a negligible level.

The negligible to long-term minor adverse impacts on wildlife from dogs at Baker Beach and Bluffs to Golden Gate Bridge under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from the restoration projects provided by the park stewardship programs should reduce some of the adverse impacts on wildlife from the preferred alternative. The impacts resulting from the past oil spill and from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

#### BAKER BEACH AND BLUFFS TO GOLDEN GATE BRIDGE PREFERRED ALTERNATIVE F CONCLUSION TABLE

| Coastal Community Wildlife Impacts   | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect shorebirds and marine mammals on beach, although on-leash dogs could still disturb roosting and feeding birds through barking and by their presence on the beach; impact range is due to changing seasonal presence of the birds and level of activity at the site | Beneficial, assuming compliance              | Negligible cumulative impacts |

#### Ocean Beach (Snowy Plover Protection Area)

North of Stairwell 21 and South of Sloat Boulevard has a separate analysis and follows below the SPPA analysis.

**Alternative A: No Action.** Ocean Beach has a designated SPPA that seasonally restricts dog walking to on leash to protect the western snowy plover during its overwintering season (July 1 through May 15); the SPPA also provides protection for other wintering and migrant shorebirds. At the entire Ocean Beach site, there were 969 dog-related incidents reported from 2008 through 2011. The majority of the incidents reported were for having a dog off leash within the Ocean Beach SPPA (729 recorded incidents, table 24) during the period (July 1 through May 15) when dogs must be leashed. Another 166 violations were recorded as off-leash violations (89), violation of a closed area (75), and pet in a closed area (5). Current compliance with the seasonal leash restriction (36 CFR 7.97(d)) is estimated at less than 50 percent by the NPS, and there have been multiple instances where dogs have flushed or chased shorebirds or snowy plovers (table 9) as documented in NPS monitoring reports by Park Natural Resources Division (NPS 2008a; Hatch et al. 2007a, 12; Hatch et al. 2007b, 4-6; Hatch et al. 2008, 2-4). At this site, harassment (flushing) by dogs and people is common during periods of peak use by migratory/wintering shorebirds (August–May) (Hatch 1996, 9; USFWS 2007a, 64). At Ocean Beach, shorebird numbers are high (particularly Central Ocean Beach (Beach Watch 2009)), visitor use is moderate to high, and coastal habitat is represented by a long stretch of beach at this site. Additionally, there are significant areas of concentrations/congregations of roosting gulls and terns that are affected by off-leash dogs at this site.

Under alternative A, the seasonal restriction would continue, with dog walking under voice control allowed the remainder of the year (May 15 through July 1) in the SPPA. Since alternative A would allow voice control dog walking on the beach outside the SPPA, dog presence as well as dogs chasing after, barking at, and coming in close proximity to migrating and wintering shorebirds, gulls, and terns roosting or feeding on the beach would continue. This type of disturbance by dogs could in turn result in energy

## Chapter 4: Environmental Consequences

loss to migrating and wintering birds, potentially reducing their chances of survival along their migratory routes and reducing fitness for successful reproduction. Additionally, marine mammals that haul out or strand at Ocean Beach would be affected by dogs on the beach through dogs approaching, biting, barking at, or climbing on/surrounding the mammals or chasing after hauled-out mammals back into the water. Therefore, alternative A would result in continued long-term moderate to major adverse impacts on wildlife using beach/dune habitat because continued frequent and repeated disturbances to wildlife from dogs would occur, potentially limiting their use of preferred habitat. Disturbance by dogs would cause frequent responses by wildlife because the site has high shorebird abundance and diversity, further supporting the conclusion of a long-term moderate to major adverse impact in the SPPA.

Under alternative A, no permit system exists for dog walking. At Ocean Beach, commercial dog walking is uncommon. Therefore, commercial dog walking would have negligible impacts on wildlife.

**Cumulative Impacts.** Projects and actions in and near Ocean Beach were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on wildlife at or in the vicinity of this site.

Park stewardship programs provide indirect benefits to shorebirds by activities such as controlling invasive plant species, supporting coastal habitats, and restoring habitats.

Development or construction actions at or in the vicinity of GGNRA sites have had or may have the potential to have adverse impacts on coastal communities, including shorebirds. Generally, adverse impacts on shorebirds may include temporary or permanent loss of habitat and physical disturbance by construction workers or from vehicle and/or boat noise during construction; levels of impacts may include avoidance, underuse, complete abandonment, or reduction in total numbers of shorebirds at construction areas in the coastal community. Even though these efforts both within and beyond park boundaries would affect vegetation and wildlife, mitigation for these projects would reduce the potential for impacts.

Projects planned in or near the coastal community that may affect shorebirds include the *Ocean Beach–Great Highway Erosion Control Project*, which is developing long-term solutions to beach and bluff erosion problems at Ocean Beach along Highway 1 (City and County of San Francisco 2008, 3, 7), but could have long-term adverse effects on shorebird habitat.

In addition to development and restoration projects, oil spills have occurred and will likely occur in the Pacific Ocean and in San Francisco Bay, and will impact coastal community wildlife. Oil spills affect birds, mammals, and fish (MMC 2012b). Marine mammals such as fur seals and sea otters are extremely affected by oil on the water, as are birds that float on the surface of the water (such as scoters and grebes). On November 7, 2007, approximately 58,000 gallons of bunker fuel spilled from a container ship into the bay, resulting in the largest oil spill in the San Francisco Bay since the Cape Mohican incident in 1996. About 1,081 live birds were reported taken for rehabilitation and about 1,803 birds were reported to have been found dead as a result of this incident (USFWS 2007c, 1), although recent estimates show that bird mortality may have been as high as 6,688 individuals; a draft restoration plan is being prepared (USFWS 2009b, 1). The November 7, 2007, oil spill had short-term minor to moderate adverse effects on wildlife such as marine mammals and birds at project sites in GGNRA. For the most part, the impacts on wildlife from this spill lasted only a few weeks, especially on the sandy beaches of the park. In the long term and by the time this dog management plan/EIS is implemented, impacts on wildlife at project sites in GGNRA should be reduced to a negligible level. The *Ocean Beach Master Plan* includes plans to restore habitat at Ocean Beach, resulting in beneficial impacts on coastal community wildlife.

The long-term moderate to major adverse impacts on wildlife from dogs at under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from the

restoration projects provided by the park stewardship programs should reduce some of the adverse impacts on wildlife from alternative A; however, the effects from the erosion control project on shorebird habitat would be adverse. These beneficial and adverse effects from projects at Ocean Beach may balance out when combined. In addition, the impacts resulting from the past oil spill and from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, the cumulative analysis for this park site will mainly focus on the results of the impact analysis for each alternative. Cumulative impacts on wildlife under this alternative would be expected to be long term, moderate to major, and adverse.

**OCEAN BEACH SPPA ALTERNATIVE A CONCLUSION TABLE**

| <b>Coastal Community Wildlife Impacts</b>   | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>                              |
|---|---|---|--|
| Long-term moderate to major adverse impacts | The seasonal leash restriction is often violated in the SPPA; dogs would continue to disturb and/or harass the birds, potentially limiting their use of preferred habitat, and to interrupt roosting or foraging behavior, which causes the expenditure of energy and could affect migration and breeding; shorebird numbers are high, visitor use is high, and coastal habitat is extensive at this site | N/A   | Long-term moderate to major adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would prohibit dogs in the SPPA, allowing on-leash dog walking only on the Ocean Beach Trail adjacent to the Great Highway. On-leash dog walking would not allow dogs to roam freely along the beach. Due to physical restraint on leash, it is highly unlikely that off-leash dogs would access the SPPA, resulting in protection for resting and feeding shorebirds and waterbirds that may use the area year-round as well as elimination of chasing after or disturbance and reduction of flushing from preferred areas (the SPPA). Therefore, assuming compliance, there would be no overall impact on wildlife as a result of alternative B in the SPPA because shorebirds and marine mammals may not be affected by disturbance from dogs because dogs would be prohibited on the SPPA beach. Alternative B would result in the protection of a large expanse of beach habitat and shorebirds through year-round closure of the SPPA to dogs and by physically restraining dogs on leash in other areas (along the paved Great Highway).

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. However, no overall impact on wildlife in the SPPA would occur from commercial dog walkers because shorebirds and marine mammals would not be affected by disturbance from dogs since dogs would be prohibited on the SPPA beach.

**Cumulative Impacts.** The lack of impacts on wildlife from dogs at the Ocean Beach SPPA under alternative B were considered together with the effects of the projects mentioned above in alternative A. There would be a combination of beneficial and adverse effects from projects in and around Ocean Beach; when combined, these effects would balance out, resulting in negligible impacts. These negligible impacts combined with the lack of impacts from alternative B would result in negligible cumulative impacts on wildlife.

OCEAN BEACH SPPA ALTERNATIVE B CONCLUSION TABLE

| Coastal Community Wildlife Impacts     | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Overall no impact, assuming compliance | Shorebirds and beach habitat would be protected through SPPA site closure to dogs | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would prohibit dogs in the SPPA, allowing on-leash dog walking only on the Ocean Beach Trail adjacent to the Great Highway. Due to physical restraint of dogs on-leash in other areas of the site, it is highly unlikely that dogs would access the SPPA, resulting in protection for resting and feeding shorebirds and waterbirds that may use the area year-round as well as elimination of chasing after and disturbance and reduction of flushing from preferred areas (the SPPA). Alternative C would result in the protection of habitat and shorebirds through closure of the SPPA to dogs and by physically restraining dogs on leash in nearby areas. Assuming compliance with proposed regulations, alternative C would result in no impact on shorebirds and marine mammals in the SPPA.

No impact on wildlife in the SPPA would occur from commercial dog walkers because shorebirds and marine mammals would not be affected by disturbance from dogs because dogs would be prohibited on the SPPA beach.

**Cumulative Impacts.** The lack of impacts on wildlife from dogs at the Ocean Beach SPPA under alternative C was considered together with the effects of the projects mentioned above in alternative A. There would be a combination of beneficial and adverse effects from projects in and around Ocean Beach; when combined, these effects would balance out, resulting in negligible impacts. These negligible impacts combined with the lack of impacts from alternative C would result in negligible cumulative impacts on wildlife.

OCEAN BEACH SPPA ALTERNATIVE C CONCLUSION TABLE

| Coastal Community Wildlife Impacts     | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|--|--|-------------------------------|
| Overall no impact, assuming compliance | Shorebirds and marine mammals would be protected through SPPA site closure to dogs | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Dog walking restrictions at the Ocean Beach SPPA under alternative D would be the same as alternative B, and impacts would also be the same: no impact on wildlife.

No impact on wildlife in the SPPA would occur from commercial or permitted dog walkers because shorebirds and marine mammals would not be affected by disturbance from dogs because dogs would be prohibited on the SPPA beach.

**Cumulative Impacts.** The cumulative impacts on wildlife at Ocean Beach on wildlife under alternative D would be the same as those under alternative B: negligible.

OCEAN BEACH SPPA ALTERNATIVE D CONCLUSION TABLE

| Coastal Community Wildlife Impacts     | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Overall no impact, assuming compliance | Shorebirds and habitat would be protected through SPPA site closure to dogs | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would allow on-leash dog walking on the beach in the SPPA during all seasons. On-leash dog walking would restrain or prevent dog access to stranded marine mammals; however, activity resulting from walking dogs, such as their barking and lunging in proximity to birds on the beach, could cause birds to flee or relocate, using energy reserves unnecessarily. Impacts would be due to disturbance from on-leash dog walking and dog walkers using the beach habitat where these birds forage and rest during migration and as winter residents; dogs would potentially limit shorebird use of preferred habitat. Therefore, alternative E impacts on wildlife in the SPPA would be long term, minor, and adverse because this section of beach has a high abundance of shorebirds and although dogs would be required to be on leash, occasional disturbances to wildlife from dogs could occur as a result of this alternative.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Ocean Beach is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs, with a limit of six. Since commercial dog walking activity is not common at Ocean Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have a negligible impact on wildlife.

**Cumulative Impacts.** The long-term minor adverse impacts on wildlife from dogs at the SPPA under alternative E were considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the restoration projects provided by the park stewardship programs should reduce some of the adverse impacts on wildlife from alternative E; however, the effects on shorebird habitat from the erosion control project would be adverse. These beneficial and adverse effects from projects at Ocean Beach may balance out when combined. The impacts resulting from the past oil spill and from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, the cumulative analysis for this park site will mainly focus on the results of the impact analysis for this alternative. Cumulative impacts on wildlife under this alternative would be expected to be long term, minor, and adverse.

OCEAN BEACH SPPA ALTERNATIVE E CONCLUSION TABLE

| Coastal Community Wildlife Impacts                           | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts                         |
|--|--|--|--|
| Overall long-term minor adverse impacts, assuming compliance | On-leash dogs would be allowed in the SPPA during all seasons and would disturb shorebirds and affect wildlife; on-leash dogs could still disturb roosting and feeding birds through barking and by their presence on the beach; dogs would potentially limit shorebird use of preferred habitat | Beneficial, assuming compliance              | Long-term minor adverse cumulative impacts |

## Chapter 4: Environmental Consequences

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative B and would prohibit dogs in the SPPA, allowing on-leash dog walking only on the Ocean Beach Trail adjacent to the Great Highway. Due to physical restraint of dogs on a leash, it is highly unlikely that dogs would access the SPPA, resulting in protection for resting and feeding shorebirds and waterbirds that may use the area year-round as well as elimination of chasing after and disturbance and reduction of flushing from preferred areas (the SPPA). The preferred alternative would result in the protection of habitat and shorebirds through closure of the SPPA to dogs, and by physically restraining dogs on leash in nearby areas. Assuming compliance with the proposed regulations, the preferred alternative would result in no impact on shorebirds and marine mammals in the SPPA.

All dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Ocean Beach is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs, with a limit of six. However, no overall impact on wildlife in the SPPA would occur from commercial dog walkers because shorebirds and marine mammals would not be affected by disturbance from dogs since dogs would be prohibited on the SPPA beach.

**Cumulative Impacts.** Projects and actions in and near Ocean Beach were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on wildlife at or in the vicinity of this site.

Park stewardship programs provide indirect benefits to shorebirds by activities such as controlling invasive plant species, supporting coastal habitats, and restoring habitats.

Development or construction actions at or in the vicinity of GGNRA sites have had or may have the potential to have adverse impacts on coastal communities, including shorebirds. Generally, adverse impacts on shorebirds may include temporary or permanent loss of habitat and physical disturbance by construction workers or from vehicle and/or boat noise during construction; levels of impacts may include avoidance, underuse, complete abandonment, or reduction in total numbers of shorebirds at construction areas in the coastal community. Even though these efforts both within and beyond park boundaries would affect vegetation and wildlife, mitigation for these projects would reduce the potential for impacts.

Projects planned in or near the coastal community that may affect shorebirds include the *Ocean Beach–Great Highway Erosion Control Project*, which is developing long-term solutions to beach and bluff erosion problems at Ocean Beach along Highway 1 (City and County of San Francisco 2008, 3, 7), but could have long-term adverse effects on shorebird habitat.

In addition to development and restoration projects, oil spills have occurred and will likely occur in the Pacific Ocean and in San Francisco Bay, and will impact coastal community wildlife. Oil spills affect birds, mammals, and fish (MMC 2012b). Marine mammals such as fur seals and sea otters are extremely affected by oil on the water, as are birds that float on the surface of the water (such as scoters and grebes). On November 7, 2007, approximately 58,000 gallons of bunker fuel spilled from a container ship into the bay, resulting in the largest oil spill in the San Francisco Bay since the Cape Mohican incident in 1996. About 1,081 live birds were reported taken for rehabilitation and about 1,803 birds were reported to have been found dead as a result of this incident (USFWS 2007c, 1), although recent estimates show that bird mortality may have been as high as 6,688 individuals; a draft restoration plan is being prepared (USFWS 2009b, 1). The November 7, 2007, oil spill had short-term minor to moderate adverse effects on wildlife such as marine mammals and birds at project sites in GGNRA. For the most part, the impacts on wildlife from this spill lasted only a few weeks, especially on the sandy beaches of the park. In the long term and by the time this dog management plan/EIS is implemented, impacts on wildlife at project sites in GGNRA should be reduced to a negligible level. The *Ocean Beach Master Plan* includes plans to restore habitat at Ocean Beach, resulting in beneficial impacts on coastal community wildlife.

The lack of impact on wildlife from dogs at the SPPA under the preferred alternative were considered together with the effects of the projects mentioned above in alternative A. There would be a combination of beneficial and adverse effects from projects in and around Ocean Beach; when combined, these projects would balance out, resulting in negligible impacts. These negligible impacts combined with the lack of impact from the preferred alternative would result in negligible cumulative impacts on wildlife.

**OCEAN BEACH SPPA PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| <b>Coastal Community Wildlife Impacts</b> | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--|---|-------------------------------|
| Overall no impact, assuming compliance    | Shorebirds and marine mammals would be protected through SPPA site closure to dogs | Beneficial, assuming compliance                     | Negligible cumulative impacts |

### **Ocean Beach North of Stairwell 21 and South of Sloat Boulevard**

**Alternative A: No Action.** Under current conditions, dogs are allowed under voice control on the beach both north of Stairwell 21 and south of Sloat Boulevard. This site has documented high visitor use and compliance with the current dog policies at Ocean Beach is considered poor; 969 dog-related incidents were reported from 2008 through 2011. The majority of the incidents reported were for having a dog off leash within the Ocean Beach SPPA (729 recorded incidents, table 24) during the period (July 1 through May 15) when dogs must be leashed. Another 166 violations were recorded as off-leash violations (89), violation of a closed area (75), and pet in a closed area (5). Ocean Beach south of Sloat Boulevard has high shorebird use in a very narrow stretch of beach and north of Stairwell 21 has relatively high shorebird use in a large area with high visitor use due to convenient parking. Additionally, there are significant areas of concentrations/congregations of roosting gulls and terns that are affected by off-leash dogs at this site.

Since alternative A would allow voice control dog walking on the beach, dog presence as well as dogs chasing after, barking at, and coming in close proximity to migrating and wintering shorebirds, gulls, and terns roosting or feeding on the beach would continue. This type of disturbance by dogs could result in energy loss to migrating and wintering birds, potentially reducing their chances of survival along their migratory routes and reducing fitness for successful reproduction. Additionally, marine mammals that haul out or strand at Ocean Beach could be affected by dogs on the beach through dogs approaching, biting, barking at, or climbing on/surrounding the mammals or chasing after the mammals back into the water. Therefore, under alternative A, long-term moderate adverse impacts on wildlife would result because frequent wildlife responses to disturbance from dogs would continue to occur at the site, potentially limiting wildlife's use of preferred habitat.

Under alternative A, no permit system exists for dog walking. At Ocean Beach, commercial dog walking is uncommon. Therefore, commercial dog walking would have negligible impacts on wildlife.

**Cumulative Impacts.** The long-term moderate adverse impacts on wildlife from dogs at Ocean Beach under alternative A were considered together with the effects of the projects mentioned above under alternative A for the Ocean Beach SPPA. The beneficial effects from the restoration projects provided by the park stewardship programs should reduce some of the adverse impacts on wildlife from alternative A; however, the effects from the erosion control project on shorebird habitat would be adverse. These beneficial and adverse effects from projects at Ocean Beach may balance out when combined. The *Ocean Beach Master Plan* includes plans to restore habitat at Ocean Beach, resulting in beneficial impacts on coastal community wildlife. These plans would not be great enough to offset other adverse cumulative

## Chapter 4: Environmental Consequences

projects at Ocean Beach. In addition, the impacts resulting from the past oil spill and from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, the cumulative analysis for this park site will mainly focus on the results of the impact analysis for each alternative. Cumulative impacts on wildlife under this alternative would be expected to be long term, moderate, and adverse.

**OCEAN BEACH NORTH OF STAIRWELL 21 AND SOUTH OF SLOAT BOULEVARD ALTERNATIVE A CONCLUSION TABLE**

| <b>Coastal Community Wildlife Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>                     |
|---|---|---|---|
| Long-term moderate adverse impacts        | Off-leash dogs would continue to disturb and/or harass birds and potentially limit their use of preferred habitat and interrupt roosting or foraging behavior, which causes expenditure of energy and could affect migration and breeding; south of Sloat Boulevard has high shorebird use in a very narrow beach and north of Stairwell 21 has relatively high shorebird use in a large area with high visitor use; marine mammals would occasionally be subjected to impacts from dogs on the beach | N/A   | Long-term moderate adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking on the beach north of Stairwell 21 and south of Sloat Boulevard. On-leash dog walking would not allow dogs to roam freely along the beach. Physically restraining dogs on leash would protect wildlife and reduce chasing after shorebirds and marine mammals on the beach, but on-leash dogs would still be able to disturb wildlife and/or cause a flight response through their presence on the beach and lunging/barking at roosting, resting, and feeding birds. On-leash dog walking, if occurring in proximity to wildlife, would cause birds roosting and/or feeding on the beach to flee to nearby areas of less activity (e.g., the adjacent SPPA) or to relocate entirely; both actions would result in loss of preferred habitat and unnecessary energy expenditure by fleeing birds. Ocean Beach south of Sloat Boulevard has high shorebird use in a very narrow stretch of beach and north of Stairwell 21 has relatively high shorebird use in a large area with high visitor use. Therefore, assuming compliance, overall impacts on wildlife as a result of alternative B would be long term, minor, and adverse because shorebirds and waterbirds as well as marine mammals may occasionally be affected by on-leash dogs.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is not common at Ocean Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have a negligible impact on wildlife.

**Cumulative Impacts.** The long-term minor adverse impacts on wildlife from dogs at Ocean Beach north of Stairwell 21 and south of Sloat Boulevard under alternative B were considered together with the effects of the projects mentioned above under alternative A for the Ocean Beach SPPA. The beneficial effects from the restoration projects provided by the park stewardship programs should reduce some of the adverse impacts on wildlife from alternative B; however, the effects from the erosion control project on

shorebird habitat would be adverse. These beneficial and adverse effects from projects at Ocean Beach may balance out when combined. In addition, the impacts resulting from the past oil spill and from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, the cumulative analysis for this park site will mainly focus on the results of the impact analysis for this alternative. Cumulative impacts on wildlife at Ocean Beach north of Stairwell 21 and south of Sloat Boulevard under this alternative would be expected to be long term, minor, and adverse.

**OCEAN BEACH NORTH OF STAIRWELL 21 AND SOUTH OF SLOAT BOULEVARD ALTERNATIVE B CONCLUSION TABLE**

| Coastal Community Wildlife Impacts                           | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts                         |
|--|---|--|--|
| Overall long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect shorebirds and marine mammals on beach, although on-leash dogs could still disturb roosting and feeding birds through barking and by their presence on the beach; south of Sloat Boulevard has high shorebird use on a very narrow beach and north of Stairwell 21 has relatively high shorebird use in a large area with high visitor use | Beneficial, assuming compliance              | Long-term minor adverse cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Implementation of alternative C along these portions of Ocean Beach would establish a ROLA on the length of beach north of Stairwell 21 and would prohibit dogs on the remaining beach, located south of Sloat Boulevard. At Ocean Beach south of Sloat Boulevard, there is a high diversity and abundance of shorebirds, while the beach north of Stairwell 21 has relatively high shorebird use in a large area with high visitor use. The presence of dogs, as well as their barking and running, in the designated ROLA would disturb shorebirds, gulls, and terns using the beach/dune habitat in the ROLA for roosting or feeding. When dogs and dog walkers are present in the ROLA, birds using the beach in the ROLA could flee from the ROLA to other areas where dogs are not allowed, such as the nearby SPPA, or they may flush and return and be repeatedly disturbed. Marine mammals stranding or hauling out on Ocean Beach in the ROLA proposed in alternative C could be subjected to disturbance from unleashed dogs, which could bite, bark at, or clamber over stranded or hauled-out animals. Therefore, alternative C would have long-term moderate adverse impacts on shorebirds, gulls, and terns as well as marine mammals using beach habitat in the ROLA.

The long-term moderate adverse impacts on wildlife in the ROLA would occur only on about a quarter of the entire beach. Shorebirds and marine mammals would be protected at the beach south of Sloat Boulevard where dogs are prohibited, but off-leash dogs could occasionally to frequently disturb shorebirds and marine mammals in the ROLA at this site. Therefore, the overall impact on wildlife at Ocean Beach north of Stairwell 21 and south of Sloat Boulevard would be long term, minor to moderate, and adverse, assuming compliance. A range is included because impacts would depend on the seasonal presence of the birds and the level of activity at the site as well as the presence of marine mammals.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Ocean Beach is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs, with a limit of six. Since

## Chapter 4: Environmental Consequences

commercial dog walking activity is not common at Ocean Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have a negligible impact on wildlife.

**Cumulative Impacts.** The long-term minor to moderate adverse impacts on wildlife from dogs at Ocean Beach north of Stairwell 21 and south of Sloat Boulevard under alternative C were considered together with the effects of the projects mentioned above under alternative A for the Ocean Beach SPPA. The beneficial effects from the restoration projects provided by the park stewardship programs should reduce some of the adverse impacts on wildlife from alternative C; however, the effects from the erosion control project on shorebird habitat would be adverse. These beneficial and adverse effects from projects at Ocean Beach may balance out when combined. The impacts resulting from the past oil spill and from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, the cumulative analysis for this park site will mainly focus on the results of the impact analysis for this alternative. Cumulative impacts on wildlife at Ocean Beach north of Stairwell 21 and south of Sloat Boulevard under this alternative would be expected to be long term, minor to moderate, and adverse.

**OCEAN BEACH NORTH OF STAIRWELL 21 AND SOUTH OF SLOAT BOULEVARD ALTERNATIVE C CONCLUSION TABLE**

| <b>Coastal Community Wildlife Impacts</b>                                | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>                              |
|--|--|---|--|
| Overall long-term minor to moderate adverse impacts, assuming compliance | Shorebirds and marine mammals would be protected at the beach south of Sloat Boulevard where dogs are prohibited, but the ROLA encompasses about a quarter of the beach habitat at the site and off-leash dogs could disturb shorebirds and marine mammals on the beach at this site; impacts would depend on the seasonal presence of the birds and the level of activity at the site | Beneficial to no change, assuming compliance        | Long-term minor to moderate adverse cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Under alternative D, on-leash dog walking would be required north of Stairwell 21 and dogs would be prohibited south of Sloat Boulevard. Overall impacts would be the same as alternative B: long term, minor, and adverse.

No commercial dog walking would be allowed under alternative D; therefore, commercial dog walking would have no impact on wildlife. Private dog walkers would be allowed to walk one to three dogs.

**Cumulative Impacts.** Under alternative D, the cumulative impacts on wildlife at Ocean Beach would be the same as those under alternative B: long-term, minor, and adverse.

**OCEAN BEACH NORTH OF STAIRWELL 21 AND SOUTH OF SLOAT BOULEVARD ALTERNATIVE D CONCLUSION TABLE**

| Coastal Community Wildlife Impacts                           | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts                         |
|--|---|--|--|
| Overall long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect shorebirds and marine mammals on beach, although on-leash dogs could still disturb roosting and feeding birds through barking and by their presence on the beach; south of Sloat Boulevard has high shorebird use in a very narrow beach and north of Stairwell 21 has relatively high shorebird use in a large area with high visitor use | Beneficial, assuming compliance              | Long-term minor adverse cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would provide a ROLA on the beach north of Stairwell 21 and dogs would be allowed on leash south of Sloat Boulevard. The presence of dogs, as well as their barking and running, in the designated ROLA would disturb shorebirds, gulls, and terns using the beach/dune habitat for roosting or feeding. It is possible that shorebirds, gulls, and terns that roost or feed along the beach could be frequently disturbed by dogs in the ROLA through dogs chasing after and barking at them, which would result in the birds fleeing to other areas where dogs are not allowed or flushing and returning and being repeatedly disturbed. Indirect impacts on wildlife in the ROLA would also occur due to wildlife avoidance of the area during periods of activity or altogether. Marine mammals stranding on Ocean Beach in the ROLA would be subjected to disturbance from unleashed dogs, which could bite, bark at, or clamber over stranded animals. Therefore, in the ROLA at Ocean Beach, alternative E would result in long-term moderate adverse impacts on wildlife.

The long-term moderate adverse impacts on wildlife in the ROLA would occur in only a portion of the entire site. Physically restraining dogs on leash at the beach south of Sloat Boulevard would protect shorebirds and marine mammals, although on-leash dogs could still disturb shorebirds and wildlife. Therefore, assuming compliance, overall impacts on wildlife as a result of alternative E would be long term and would range from minor to moderate and adverse, since impacts would depend on the seasonal presence of the birds and the level of activity at the site.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Ocean Beach is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs, with a limit of six. Since commercial dog walking activity is not common at Ocean Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have a negligible impact on wildlife.

**Cumulative Impacts.** The long-term minor to moderate adverse impacts on wildlife from dogs at Ocean Beach north of Stairwell 21 and south of Sloat Boulevard under alternative E were considered together with the effects of the projects mentioned above under alternative A for the Ocean Beach SPPA. The beneficial effects from the restoration projects provided by the park stewardship programs should reduce some of the adverse impacts on wildlife from alternative E; however, the effects on shorebird habitat from the erosion control project would be adverse. These beneficial and adverse effects from projects at Ocean

## Chapter 4: Environmental Consequences

Beach may balance out when combined. The impacts resulting from the past oil spill and from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, the cumulative analysis for this park site will mainly focus on the results of the impact analysis for this alternative. Cumulative impacts on wildlife under this alternative would be expected to be long term, minor to moderate, and adverse.

**OCEAN BEACH NORTH OF STAIRWELL 21 AND SOUTH OF SLOAT BOULEVARD ALTERNATIVE E CONCLUSION TABLE**

| Coastal Community Wildlife Impacts                                       | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts                                     |
|--|--|--|--|
| Overall long-term minor to moderate adverse impacts, assuming compliance | Physically restraining dogs on leash at the beach south of Sloat Boulevard would protect shorebirds and marine mammals, although on-leash dogs could still disturb shorebirds and wildlife; the ROLA encompasses only a portion of the beach habitat at the site; off-leash dogs could disturb shorebirds and marine mammals on the beach at this site; impacts would depend on the seasonal presence of the birds and the level of activity at the site | Beneficial to no change, assuming compliance | Long-term minor to moderate adverse cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative C: a ROLA would be established on the beach north of Stairwell 21 and would prohibit dogs on the remaining beach, located south of Sloat Boulevard. At Ocean Beach south of Sloat Boulevard, there is a high diversity and abundance of shorebirds, while the beach north of Stairwell 21 has relatively high shorebird use in a large area with high visitor use. The presence of dogs, as well as their barking and running, in the designated ROLA would disturb shorebirds, gulls, and terns using the beach/dune habitat in the ROLA for roosting or feeding. When dogs and dog walkers are present in the ROLA, birds using the beach in the ROLA could flee from the ROLA to other areas where dogs are not allowed, such as the nearby SPPA, or they may flush and return and be repeatedly disturbed. Marine mammals stranding or hauling out on Ocean Beach in the ROLA proposed in the preferred alternative could be subjected to disturbance from unleashed dogs, which could bite, bark at, or clamber over stranded animals. Therefore, the preferred alternative would have long-term moderate adverse impacts on shorebirds, gulls, and terns as well as marine mammals using beach habitat in the ROLA.

The long-term moderate adverse impacts on wildlife in the ROLA would occur only on about a quarter of the entire beach. Shorebirds and marine mammals would be protected at the beach south of Sloat Boulevard where dogs would be prohibited, but off-leash dogs could occasionally to frequently disturb shorebirds and marine mammals in the ROLA at this site. Therefore, the overall impact on wildlife at Ocean Beach north of Stairwell 21 and south of Sloat Boulevard would be long term, minor to moderate, and adverse, assuming compliance. A range is included because impacts would depend on the seasonal presence of the birds and the level of activity at the site, as well as the presence of marine mammals.

All dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Ocean Beach is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs, with a limit of six. Since commercial dog walking activity is not common at Ocean Beach, it is likely that this alternative would not have an impact on the

number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have a negligible impact on wildlife.

**Cumulative Impacts.** Projects and actions in and near Ocean Beach were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on wildlife at or in the vicinity of this site.

Park stewardship programs provide indirect benefits to shorebirds by activities such as controlling invasive plant species, supporting coastal habitats, and restoring habitats.

Development or construction actions at or in the vicinity of GGNRA sites have had or may have the potential to have adverse impacts on coastal communities, including shorebirds. Generally, adverse impacts on shorebirds may include temporary or permanent loss of habitat and physical disturbance by construction workers or from vehicle and/or boat noise during construction; levels of impacts may include avoidance, underuse, complete abandonment, or reduction in total numbers of shorebirds at construction areas in the coastal community. Even though these efforts both within and beyond park boundaries would affect vegetation and wildlife, mitigation for these projects would reduce the potential for impacts.

Projects planned in or near the coastal community that may affect shorebirds include the *Ocean Beach–Great Highway Erosion Control Project*, which is developing long-term solutions to beach and bluff erosion problems at Ocean Beach along Highway 1 (City and County of San Francisco 2008, 3, 7), but could have long-term adverse effects on shorebird habitat.

In addition to development and restoration projects, oil spills have occurred and will likely occur in the Pacific Ocean and in San Francisco Bay, and will impact coastal community wildlife. Oil spills affect birds, mammals, and fish (MMC 2012b). Marine mammals such as fur seals and sea otters are extremely affected by oil on the water, as are birds that float on the surface of the water (such as scoters and grebes). On November 7, 2007, approximately 58,000 gallons of bunker fuel spilled from a container ship into the bay, resulting in the largest oil spill in the San Francisco Bay since the Cape Mohican incident in 1996. About 1,081 live birds were reported taken for rehabilitation and about 1,803 birds were reported to have been found dead as a result of this incident (USFWS 2007c, 1), although recent estimates show that bird mortality may have been as high as 6,688 individuals; a draft restoration plan is being prepared (USFWS 2009b, 1). The November 7, 2007, oil spill had short-term minor to moderate adverse effects on wildlife such as marine mammals and birds at project sites in GGNRA. For the most part, the impacts on wildlife from this spill lasted only a few weeks, especially on the sandy beaches of the park. In the long term and by the time this dog management plan/EIS is implemented, impacts on wildlife at project sites in GGNRA should be reduced to a negligible level. The *Ocean Beach Master Plan* includes plans to restore habitat at Ocean Beach, resulting in beneficial impacts on coastal community wildlife. These plans would not be great enough to offset other adverse cumulative projects at Ocean Beach.

The long-term minor to moderate adverse impacts on wildlife from dogs at Ocean Beach north of Stairwell 21 and south of Sloat Boulevard under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from the restoration projects provided by the park stewardship programs should reduce some of the adverse impacts on wildlife from the preferred alternative; however, the effects on shorebird habitat from the erosion control project would be adverse. These beneficial and adverse effects from projects at Ocean Beach may balance out when combined. The impacts resulting from the past oil spill and from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, the cumulative analysis for this park site will mainly focus on the results of the impact analysis

## Chapter 4: Environmental Consequences

for this alternative. Cumulative impacts on wildlife under this alternative would be expected to be long term, minor to moderate, and adverse.

### OCEAN BEACH NORTH OF STAIRWELL 21 AND SOUTH OF SLOAT BOULEVARD PREFERRED ALTERNATIVE F CONCLUSION TABLE

| Coastal Community Wildlife Impacts                                       | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts                                     |
|--|--|--|--|
| Overall long-term minor to moderate adverse impacts, assuming compliance | Shorebirds and marine mammals would be protected at the beach south of Sloat Boulevard, where dogs would be prohibited, but the ROLA encompasses about a quarter of the beach habitat at the site and off-leash dogs could disturb shorebirds and marine mammals on the beach at this site; impacts would depend on the seasonal presence of the birds and the level of activity at the site | Beneficial to no change, assuming compliance | Long-term minor to moderate adverse cumulative impacts |

## Fort Funston

**Alternative A: No Action.** Currently, dogs are allowed on the beach at Fort Funston under voice control. The beach at Fort Funston is a high visitor and dog use area, and is also used by high numbers of shorebirds, gulls, and terns. Beach Watch surveys indicate that the Thornton beach segment (which encompasses Fort Funston) shows high shorebird use (Beach Watch 2009), and park staff often observe large numbers of shorebirds when there are fewer dogs in this area of the site. A voluntary seasonal closure (April 1 through August 15) prohibiting visitors within 50 feet of the cliff face at the north end of the beach is put in place annually to protect a colony of bank swallows nesting in the coastal bluffs. Some dogs have accessed the cliffs from the beach and from the dunes above, resulting in disturbance to the bank swallow colony (table 9); see “Special-status Species” section for more details. At Fort Funston, a total of 172 dog-related incidents were recorded from 2008 through 2011. The majority of incidents recorded were for having a dog off-leash (69 incidents) and for hazardous conditions; of the 72 hazardous conditions reported, 29 were for pet rescues on the cliffs at the site (table 25).

Since voice control dog walking would continue to be allowed on the beach, dog presence as well as dogs chasing after, barking at, and coming in close proximity to migrating and wintering shorebirds, gulls, and terns roosting or feeding on the beach would continue under alternative A. This type of disturbance by dogs could result in energy loss to migrating and wintering birds, potentially reducing their chances of survival along their migratory routes and reducing fitness for successful reproduction. Birds using beach and coastal bluff habitat at Fort Funston would continue to be frequently and repeatedly disturbed by dogs because the site has high visitor and dog use. In addition to birds, marine mammals that haul out or strand at Fort Funston would occasionally be affected by dogs on the beach through dogs approaching, biting, barking at, or climbing on/surrounding the mammals or chasing after hauled-out mammals back into the water.

Additionally, dog walking under voice control would be allowed on the Fort Funston upland vegetation through coastal dune vegetation north and south of the main parking lot. Other impacts on wildlife (besides shorebirds and waterbirds using beach habitat) as a result of dogs at this site would include disturbance, harassment, chasing after, and possible disease transmission; indirect impacts would include physical damage to habitat by dogs digging or trampling. Indirect impacts as a result of dogs include affecting bird habitat and reducing its suitability for songbirds and California quail, which have

historically used habitat at Fort Funston. Dogs and dog walkers have created a myriad of informal pathways through the vegetation, resulting in continued long-term moderate adverse impacts on wildlife through fragmentation of habitat and creation of open areas that could be barriers to the movement of smaller animals.

Overall, alternative A would result in continued long-term moderate to major adverse impacts on wildlife using beach and coastal dune habitat at Fort Funston because frequent and repeated disturbances to wildlife from dogs would continue to occur, potentially limiting wildlife's use of preferred habitat at the site and continuing to degrade this habitat.

Under alternative A, no permit system exists for dog walking. However, commercial dog walking regularly occurs at Fort Funston. Commercial dog walking would continue to contribute to the long-term moderate to major adverse impacts on wildlife. Impacts would include repeated disturbances to wildlife from dogs and the degradation of habitat.

**Cumulative Impacts.** Projects and actions in and near Fort Funston were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on wildlife at or in the vicinity of this site.

Park stewardship programs provide indirect benefits to shorebirds by activities such as controlling invasive plant species, supporting coastal habitats, and restoring habitats.

Development or construction actions at or in the vicinity of GGNRA sites have had or may have the potential to have adverse impacts on coastal communities, including shorebirds. Generally, adverse impacts on shorebirds may include temporary or permanent loss of habitat and physical disturbance by construction workers or from vehicle and/or boat noise during construction; levels of impacts may include avoidance, underuse, complete abandonment, or reduction in total numbers of shorebirds at construction areas in the coastal community. Projects in or near the coastal community that may affect shorebirds include the Vista Grande portion of Daly City's stormwater collection system, which routes storm flows to an outfall structure at the beach below Fort Funston (City of Daly City 2010b, 3). Even though these efforts both within and beyond park boundaries would affect vegetation and wildlife, mitigation for these projects would reduce the potential for impacts.

In addition to development and restoration projects, oil spills have occurred and will likely occur in the Pacific Ocean and in San Francisco Bay, and will impact coastal community wildlife. Oil spills affect birds, mammals, and fish (MMC 2012b). Marine mammals such as fur seals and sea otters are extremely affected by oil on the water, as are birds that float on the surface of the water (such as scoters and grebes). On November 7, 2007, approximately 58,000 gallons of bunker fuel spilled from a container ship into the bay, resulting in the largest oil spill in the San Francisco Bay since the Cape Mohican incident in 1996. About 1,081 live birds were reported taken for rehabilitation and about 1,803 birds were reported to have been found dead as a result of this incident (USFWS 2007c, 1), although recent estimates show that bird mortality may have been as high as 6,688 individuals; a draft restoration plan is being prepared (USFWS 2009b, 1). The November 7, 2007, oil spill had short-term minor to moderate adverse effects on wildlife such as marine mammals and birds at project sites in GGNRA. For the most part, the impacts on wildlife from this spill lasted only a few weeks, especially on the sandy beaches of the park. In the long term and by the time this dog management plan/EIS is implemented, impacts on wildlife at project sites in GGNRA should be reduced to a negligible level.

The long-term moderate to major adverse impacts on wildlife from dogs at Fort Funston under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from the restoration projects provided by the park stewardship programs should reduce some of

## Chapter 4: Environmental Consequences

the adverse impacts on wildlife from alternative A. The impacts resulting from the past oil spill and from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be long term, minor to moderate, and adverse.

**FORT FUNSTON ALTERNATIVE A CONCLUSION TABLE**

| Coastal Community Wildlife Impacts          | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts                                     |
|---|--|--|--|
| Long-term moderate to major adverse impacts | The voluntary seasonal closure would continue to be often violated on the beach and dogs would continue to frequently disturb and/or harass shorebirds and potentially limit their use of preferred habitat and interrupt roosting or foraging behavior, which causes the expenditure of energy and could affect migration and breeding; shorebird numbers are high and visitor use is high at this site; marine mammals would continue to be occasionally subjected to impacts from dogs on the beach | N/A  | Long-term minor to moderate adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Under alternative B, on-leash dog walking would be allowed on the beach and trails that are not closed to dogs. Closed areas include a 12-acre habitat protection area that restricts both visitors and dogs to protect habitat for the California threatened bank swallows (*Riparia riparia*), enhance significant native plant communities, improve public safety and reduce human-induced impacts to the coastal bluffs and dunes, a significant geological feature (NPS 2000b); the bluff area that has a seasonal closure (April 1 – August 15) for the protection of the bank swallow colony; and a section of trail closed for the prevention of erosion. At Fort Funston there are other existing habitat areas (currently not officially closed) where dogs and dog walkers have created social trails that would be closed since dogs would have to remain on designated upland trails or the beach. Dog walking under voice control would not be allowed under this alternative. As a result, on-leash dog walking would not allow dogs to roam freely along the beach. Physically restraining dogs on leash would protect wildlife and reduce chasing after shorebirds and marine mammals on the beach, but on-leash dogs would still be able to disturb wildlife and/or cause a flight response through their presence on the beach and lunging/barking at roosting, resting, and feeding birds. On-leash dog walking, if occurring in proximity to wildlife, would cause birds roosting and/or feeding on the beach to flee to nearby areas of less activity, like the SPPA at Ocean Beach, or to relocate entirely; both actions would result in loss of preferred habitat and unnecessary energy expenditure by fleeing birds. Therefore, assuming compliance, overall impacts as a result of alternative B would be long term, minor, and adverse because shorebirds and waterbirds as well as marine mammals may occasionally be affected by on-leash dogs; upland wildlife such as birds and small mammals would also be disturbed by dogs. The level of disturbance would depend on the seasonal presence of the birds and the level of activity at the site.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since the percentage of commercial dog walkers is considered high at Fort Funston, dogs walked by commercial dog walkers would cause the majority of the adverse impacts on wildlife from dogs at the site. Overall impacts on wildlife from dogs walked by both commercial and private individuals are summarized above.

**Cumulative Impacts.** The long-term minor adverse impacts on wildlife from dogs at Fort Funston under alternative B were considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the restoration projects provided by the park stewardship programs should reduce some of the adverse impacts on wildlife from alternative B. The impacts resulting from the past oil spill and from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**FORT FUNSTON ALTERNATIVE B CONCLUSION TABLE**

| Coastal Community Wildlife Impacts                           | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|--|--|-------------------------------|
| Overall long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect shorebirds and marine mammals on beach, although on-leash dogs could still disturb roosting and feeding birds through barking and by their presence on the beach; other wildlife such as birds and small mammals would also be affected by dogs; seasonal beach closure in place during bank swallow nesting season | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C at Fort Funston would provide two ROLAs: one on the beach south of the Funston Beach Trail North to the southern boundary of the site and one in coastal dune habitat north of the main parking lot. On-leash dog walking would be allowed on all trails north of the parking lot (except the Sunset Trail from the parking lot to the junction with the Chip Trail, and the Funston Horse Trail, which would be closed to dogs), and on the Funston Beach Trail South (sand ladder) and Sunset Trail south of the main parking lot. Dogs would be prohibited on the beach north of the Funston Beach Trail North. The beach ROLA is a high use area and is preferred habitat for shorebirds; the presence of dogs, as well as their barking and running, in the designated ROLA would disturb shorebirds, gulls, and terns using the beach/dune habitat in the ROLA for roosting or feeding. When dogs and dog walkers are present in the ROLA, birds using the beach in the ROLA could flee to other areas where dogs are not allowed, such as the northern portion of the beach or the SPPA at Ocean Beach, or they may flush and return and be repeatedly disturbed. Marine mammals stranding or hauling out on the beach at Fort Funston in the ROLA could be subjected to disturbance from unleashed dogs, which could bite, bark at, or clamber over the animals. The presence of dogs could preclude establishment of new haul-out sites and/or breeding and pupping sites as marine mammal populations expand. Existing wildlife and wildlife habitat in both of the designated ROLAs would be adversely affected by disturbance from dogs. Because of mobility, wildlife can usually avoid these areas during peak activity or habituate to these activities, but indirect impacts on wildlife in the ROLAs due to wildlife avoidance of the area during periods of activity or altogether would still affect wildlife. In addition, restoration at Fort Funston would be partially precluded by dogs in the ROLAs at the site. Therefore, alternative C would have long-term major adverse impacts on wildlife in the ROLAs at Fort Funston

## Chapter 4: Environmental Consequences

because these are high use areas for shorebirds and other wildlife, indicating the presence of preferred habitat despite the level of disturbance by dogs.

The long-term major adverse impacts on wildlife in the ROLAs would occur in only a portion of the entire site. Shorebirds and marine mammals would be protected at the beach north of the Funston Beach Trail North, where dogs would be prohibited, but the beach ROLA encompasses about one-half of the beach habitat at the site and off-leash dogs could disturb shorebirds and marine mammals on the beach at this site. Other wildlife, such as birds and small mammals, use the upland ROLA that supports coastal habitat and would also be disturbed by dogs. Habitat restoration would be partially precluded by dogs at the site. Therefore, assuming compliance, the overall impact on wildlife at Fort Funston would be long term, moderate, and adverse due to frequent disturbances to wildlife as a result of dogs.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. At Fort Funston, any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. In a ROLA, permit holders may walk one to six dogs off leash and the permit may restrict use by time and area. Impacts on wildlife from permit holders with up to six dogs off leash would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is common at Fort Funston, impacts on wildlife would be expected from this user group. Impacts on wildlife from commercial dog walkers would be similar to impacts from other dog walkers, as summarized above in overall impacts; therefore, impacts from commercial dog walking would be long term, moderate, and adverse.

**Cumulative Impacts.** The long-term moderate adverse impacts on wildlife from dogs at Fort Funston under alternative C were considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the restoration projects provided by the park stewardship programs should reduce some of the adverse impacts on wildlife from alternative C. The impacts resulting from the past oil spill and from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be long term, minor, and adverse.

**FORT FUNSTON ALTERNATIVE C CONCLUSION TABLE**

| Coastal Community Wildlife Impacts                              | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts                         |
|---|--|--|--|
| Overall long-term moderate adverse impacts, assuming compliance | Shorebirds and marine mammals would be protected at the beach north of the Funston Beach Trail North, where dogs would be prohibited, but the beach ROLA encompasses about one-half of the beach habitat at the site and off-leash dogs could disturb shorebirds and marine mammals on the beach at this site as well as other wildlife in the upland ROLA; restoration would be precluded by dogs at the site | Beneficial to no change, assuming compliance | Long-term minor adverse cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Alternative D at Fort Funston would allow on-leash dog walking on the beach between the Funston Beach Trail North and the southern boundary of the site. Dogs would be prohibited north of the Funston Beach Trail North. Additionally, alternative D would provide a fenced ROLA in a previously disturbed area of coastal dune habitat north of the water fountain, but would otherwise restrict dogs to on leash on trails except for the Funston Horse Trail, where dogs would be prohibited, and the northern portion of the Sunset Trail, which is closed because of erosion. As a result, impacts on wildlife using coastal dune habitat would be limited and restored areas would be protected. The beach seasonal closure would be in place during bank swallow nesting season, which would protect wildlife, and physically restraining dogs on leash would protect shorebirds and marine mammals on beach, although on-leash dogs could still disturb roosting and feeding birds through barking and by their presence on the beach. This may cause shorebirds, gulls, and terns using the beach habitat for roosting or feeding to relocate to portions of the beach where dogs are not allowed (the northern portion of the beach or the SPPA at Ocean Beach). It is assumed that shorebirds and other wildlife using the beach would not use habitat on the beach during periods of activity or may avoid the area completely or habituate to these activities, but loss of preferred habitat would still have an impact on wildlife. Because of mobility, wildlife can usually avoid areas where dogs are present during peak activity, or they may habituate to these activities, but indirect impacts in the ROLA due to wildlife avoidance of the area during periods of activity or altogether would still affect wildlife. Off-leash dogs could disturb and/or harass the birds and wildlife in the ROLA, causing them to flush and return repeatedly. Therefore, alternative D would have long-term moderate adverse impacts on wildlife in the ROLA at Fort Funston due to the frequent disturbance of wildlife by dogs.

The moderate adverse impacts on wildlife in the upland ROLA would occur only in a portion of the entire site. Physically restraining dogs on leash in areas beyond the ROLA would protect shorebirds and marine mammals on the beach as well as upland wildlife in the coastal dunes, although on-leash dogs could still disturb birds and other wildlife. Additionally, the beach seasonal closure would be in place during bank swallow nesting season, which would protect other wildlife as well as bank swallows. Therefore, assuming compliance, the overall impact on wildlife at Fort Funston would be long term, minor, and adverse due to occasional disturbances to wildlife.

No commercial dog walking would be allowed and no permits to walk more than three dogs would be issued under alternative D; therefore, commercial and permitted dog walking would have no impact on wildlife. Private dog walkers would be allowed to walk one to three dogs.

**Cumulative Impacts.** The long-term minor adverse impacts on wildlife from dogs at Fort Funston under alternative D were considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the restoration projects provided by the park stewardship programs should reduce some of the adverse impacts on wildlife from alternative D. The impacts resulting from the past oil spill and from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

FORT FUNSTON ALTERNATIVE D CONCLUSION TABLE

| Coastal Community Wildlife Impacts                           | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Overall long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect shorebirds and marine mammals on beach, although on-leash dogs could still disturb roosting and feeding birds and other wildlife by their presence; other wildlife use the upland ROLA, which supports coastal habitat; on-leash areas make up a large portion of the site; beach seasonal closure in place during bank swallow nesting season | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would allow on-leash dog walking on all trails outside the upland ROLA except the Funston Horse Trail, which is closed to dogs, and the northern end of the Sunset Trail, which is closed due to erosion. On-leash dog walking would be allowed on the beach north of the Funston Beach Trail North. Dog walking under voice and sight control would be allowed in two ROLAs. One ROLA would be on the beach south of the Funston Beach Trail North to the Fort Funston southern boundary. The second (“upland”) ROLA would extend north from the main parking lot. This ROLA corridor would extend from just north of the new trail to be built along the northern edge of the parking lot to, and including, the Funston Beach Trail North. The ROLA corridor includes the Chip Trail and sections of the Sunset Trail, Funston Road, and Battery Davis Trail, all located north of the parking lot. The ROLA also extends into the disturbed area across from Funston Beach Trail North. The seasonal closure (April 1 through August 15) on the beach that extends 50 feet out from the cliff face to protect the bank swallow colony nesting in the coastal bluffs would be in affect under alternative E.

For shorebirds, gulls, and terns resting and feeding on the beach, the presence of running, barking dogs in the beach ROLA would result in disturbance that could result in relocation. It is possible that shorebirds, gulls, and terns that roost or feed along the beach could be disturbed by dogs in the ROLA chasing after them and barking, which would result in the birds fleeing to other areas where dogs are not allowed or flushing and returning and being repeatedly disturbed. Even on-leash dog walking could disturb birds as a result of barking and lunging, which would force birds to relocate. Because of mobility, wildlife can usually avoid areas where dogs are present during peak activity or habituate to these activities, but loss of preferred habitat would still indirectly affect wildlife. Although a seasonal closure prohibiting dogs would be in place, it is unlikely that shorebirds, gulls, and terns would relocate to the closed portion of the beach because it is located at the base of the cliffs, not at the waterline. For the remainder of the year, shorebirds, gulls, and terns that are present in the ROLA would be forced to relocate farther away since dogs on leash would still be allowed north of the Funston Beach Trail North. In addition, marine mammals on the beach at Fort Funston in the ROLA proposed in alternative E would continue to be subjected to disturbance from unleashed dogs, which can bite, bark at, or clamber over stranded or hauled-out animals. The presence of dogs in the large coastal dune ROLA corridor that would be established under this alternative would result in disturbance to wildlife as well as the continued fragmentation of coastal dune habitat. Existing wildlife and wildlife habitat in both of the designated ROLAs would continue to be disturbed. In addition, restoration at Fort Funston would be partially precluded by dogs in the ROLAs at the site. Because the beach ROLA is a high use area and is preferred habitat for shorebirds, marine mammals can be present in the beach ROLA, and other wildlife use the upland ROLA that supports coastal dune habitat, long-term major adverse impacts on wildlife would

occur in the ROLAs at Fort Funston as a result of alternative E because frequent and repeated disturbances to wildlife from dogs would occur, potentially limiting wildlife use of preferred habitat at the site and continuing to degrade this habitat.

The long-term major adverse impacts on wildlife in the ROLAs would occur in a relatively large portion of the site. Frequent disturbances to wildlife from dogs would occur, potentially limiting wildlife use of preferred habitat and continuing to degrade preferred habitat at the site. Wildlife would be required to move to other locations, resulting in impacts on wildlife due to habitat loss. In addition, restoration at Fort Funston would be partially precluded by dogs in the ROLAs at the site. Therefore, assuming compliance, alternative E would result in overall long-term moderate adverse impacts on wildlife at this site because dogs (both on leash and in ROLAs) would be allowed in a large area that bisects most of the site.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. At Fort Funston, any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. In a ROLA, permit holders may walk one to six dogs off leash and the permit may restrict use by time and area. Impacts on wildlife from permit holders with up to six dogs off leash would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is common at Fort Funston, impacts on wildlife would be expected from this user group. Impacts on wildlife from commercial dog walkers would be similar to impacts from other dog walkers, as summarized above in overall impacts; therefore, impacts from commercial dog walking would be long term, moderate, and adverse.

**Cumulative Impacts.** The long-term moderate adverse impacts on wildlife from dogs at Fort Funston under alternative E were considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the restoration projects provided by the park stewardship programs should reduce some of the adverse impacts on wildlife from alternative E. The impacts resulting from the past oil spill and from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be long term, minor, and adverse.

**FORT FUNSTON ALTERNATIVE E CONCLUSION TABLE**

| <b>Coastal Community Wildlife Impacts</b>                       | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>                  |
|---|--|---|--|
| Overall long-term moderate adverse impacts, assuming compliance | Physically restraining dogs on leash at the beach north of the Funston Beach Trail North (with a seasonal closure) would protect shorebirds and marine mammals, although on-leash dogs could still disturb shorebirds and wildlife; the beach ROLA encompasses about one-half of beach habitat at the site and off-leash dogs could disturb shorebirds and marine mammals on the beach at this site as well as other wildlife in the upland ROLA; restoration would be precluded by dogs at the site | Beneficial to no change, assuming compliance        | Long-term minor adverse cumulative impacts |

## Chapter 4: Environmental Consequences

**Alternative F: Preferred Alternative.** The preferred alternative at Fort Funston would provide two ROLAs: one on the beach south of the Funston Beach Trail North to the southern boundary of the site, and an upland ROLA that would extend north from the main parking lot. This ROLA corridor would extend from just north of the new trail to be built along the northern edge of the parking lot to, and including the Funston Beach Trail North. The ROLA corridor would include the Chip Trail and sections of the Sunset Trail, Funston Road, and Battery Davis Trail, all located north of the parking lot. The ROLA would extend into the disturbed area across from the Funston Beach Trail North. On-leash dog walking would be allowed on all trails north of the parking lot (except the Sunset Trail from the parking lot to the junction with the Chip Trail, and the Funston Horse Trail, which would be closed to dogs), and on the Funston Beach Trail South (sand ladder) and Sunset Trail south of the main parking lot. Dogs would be prohibited on the beach north of the Funston Beach Trail North. The beach ROLA is a high use area and is preferred habitat for shorebirds; the presence of dogs, as well as their barking and running, in the designated ROLA would disturb shorebirds, gulls, and terns using the beach/dune habitat in the ROLA for roosting or feeding. When dogs and dog walkers are present in the ROLA birds using the beach in the ROLA could flee to other areas where dogs are not allowed, such as the northern portion of the beach or the SPPA at Ocean Beach, or they may flush and return and be repeatedly disturbed. Marine mammals stranding or hauling out on the beach ROLA at Fort Funston could be subjected to disturbance from unleashed dogs, which could bite, bark at, or clamber over the animals. The presence of dogs could preclude establishment of new haul-out sites and/or breeding and pupping sites as marine mammal populations expand. Existing wildlife and wildlife habitat in both of the designated ROLAs would be adversely affected by disturbance from dogs. Because of mobility, wildlife can usually avoid areas where dogs are present during peak activity or habituate to these activities, but indirect impacts in the ROLAs due to wildlife avoidance of the areas during periods of activity or altogether would still affect wildlife. In addition, restoration at Fort Funston would be partially precluded by dogs in the ROLAs at the site. Therefore, the preferred alternative would have long-term major adverse impacts on wildlife because these are high use areas for shorebirds and other wildlife, indicating the presence of preferred habitat despite the level of disturbance by dogs.

The long-term major adverse impacts on wildlife in the ROLAs would occur only in a portion of the entire site. Shorebirds and marine mammals would be protected at the beach north of the Funston Beach Trail North, where dogs would be prohibited, but the beach ROLA encompasses about one-half of the beach habitat at the site and off-leash dogs could disturb shorebirds and marine mammals on the beach. Other wildlife, such as birds and small mammals, use the upland ROLA that supports coastal habitat and would also be disturbed by dogs. Habitat restoration would be precluded by dogs at the site. Therefore, assuming compliance, the overall impact on wildlife at Fort Funston would be long term, moderate, and adverse due to frequent disturbances to wildlife as a result of dogs.

All dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. At Fort Funston, any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. In a ROLA, permit holders may walk one to six dogs off leash and the permit may restrict use by time and area. Impacts on wildlife from permit holders with up to six dogs off leash would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is common at Fort Funston, impacts on wildlife would be expected from this user group. Impacts on wildlife from commercial dog walkers would be similar to impacts from other dog walkers, as summarized above in overall impacts; therefore, impacts from commercial dog walking would be long term, moderate, and adverse.

**Cumulative Impacts.** Projects and actions in and near Fort Funston were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on wildlife at or in the vicinity of this site.

Park stewardship programs provide indirect benefits to shorebirds by activities such as controlling invasive plant species, supporting coastal habitats, and restoring habitats.

Development or construction actions at or in the vicinity of GGNRA sites have had or may have the potential to have adverse impacts on coastal communities, including shorebirds. Generally, adverse impacts on shorebirds may include temporary or permanent loss of habitat and physical disturbance by construction workers or from vehicle and/or boat noise during construction; levels of impacts may include avoidance, underuse, complete abandonment, or reduction in total numbers of shorebirds at construction areas in the coastal community. Projects in or near the coastal community that may affect shorebirds include the Vista Grande portion of Daly City's stormwater collection system, which routes storm flows to an outfall structure at the beach below Fort Funston (City of Daly City 2010b, 3). Even though these efforts both within and beyond park boundaries would affect vegetation and wildlife, mitigation for these projects would reduce the potential for impacts.

In addition to development and restoration projects, oil spills have occurred and will likely occur in the Pacific Ocean and in San Francisco Bay, and will impact coastal community wildlife. Oil spills affect birds, mammals, and fish (MMC 2012b). Marine mammals such as fur seals and sea otters are extremely affected by oil on the water, as are birds that float on the surface of the water (such as scoters and grebes). On November 7, 2007, approximately 58,000 gallons of bunker fuel spilled from a container ship into the bay, resulting in the largest oil spill in the San Francisco Bay since the Cape Mohican incident in 1996. About 1,081 live birds were reported taken for rehabilitation and about 1,803 birds were reported to have been found dead as a result of this incident (USFWS 2007c, 1), although recent estimates show that bird mortality may have been as high as 6,688 individuals; a draft restoration plan is being prepared (USFWS 2009b, 1). The November 7, 2007, oil spill had short-term minor to moderate adverse effects on wildlife such as marine mammals and birds at project sites in GGNRA. For the most part, the impacts on wildlife from this spill lasted only a few weeks, especially on the sandy beaches of the park. In the long term and by the time this dog management plan/EIS is implemented, impacts on wildlife at project sites in GGNRA should be reduced to a negligible level.

The long-term moderate adverse impacts on wildlife from dogs at Fort Funston under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from the restoration projects provided by the park stewardship programs should reduce some of the adverse impacts on wildlife from the preferred alternative. The impacts resulting from the past oil spill and from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be long term, minor and adverse.

FORT FUNSTON PREFERRED ALTERNATIVE F CONCLUSION TABLE

| Coastal Community Wildlife Impacts                              | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts                         |
|---|--|--|--|
| Overall long-term moderate adverse impacts, assuming compliance | Shorebirds and marine mammals would be protected at the beach north of the Funston Beach Trail North, where dogs would be prohibited, but the beach ROLA encompasses about one-half of beach habitat at the site and off-leash dogs could disturb shorebirds and marine mammals on the beach at this site as well as other wildlife in the upland ROLA; restoration would be precluded by dogs at the site | Beneficial to no change, assuming compliance | Long-term minor adverse cumulative impacts |

## SAN MATEO SITES

### Mori Point

**Alternative A: No Action.** Currently, access to the small beach area within the NPS boundary is allowed for on-leash dog walking. The site receives moderate use by people walking dogs, but the section of beach in Mori Point is very small. On-leash dog walking is also allowed on the trails at the site. Park staff have observed unleashed dogs at the site; off-leash violations totaled 146 from 2008 through 2011 (table 26).

Under alternative A, shorebirds, gulls, and terns that may roost or feed on the beach would continue to be subjected to disturbance from barking, excited dogs, even though on leash, resulting in shorebirds fleeing from one location to another on the beach or leaving the area entirely. Additionally, marine mammals that haul out or strand at the beach would occasionally be affected by dogs on the beach through dogs approaching, biting, barking at, or climbing on/surrounding the mammals or chasing after hauled-out mammals back into the water. On-leash dog walking at Mori Point would have continued long-term minor adverse impacts on wildlife along the beach within the NPS boundary because occasional disturbances from dogs would occur at this site.

Under alternative A, no permit system exists for dog walking. At Mori Point, commercial dog walking is uncommon. Therefore, commercial dog walking would have negligible impacts on wildlife.

**Cumulative Impacts.** Projects and actions in and near Mori Point were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on wildlife at or in the vicinity of this site.

Park stewardship programs provide indirect benefits to shorebirds by activities such as controlling invasive plant species, supporting coastal habitats, and restoring habitats.

Development or construction actions at or in the vicinity of GGNRA sites have had or may have the potential to have adverse impacts on coastal communities, including shorebirds. Generally, adverse impacts on shorebirds may include temporary or permanent loss of habitat and physical disturbance by construction workers or from vehicle and/or boat noise during construction; levels of impacts may include avoidance, underuse, complete abandonment, or reduction in total numbers of shorebirds at construction

areas in the coastal community. Even though these efforts both within and beyond park boundaries would affect vegetation and wildlife, mitigation for these projects would reduce the potential for impacts.

In addition to development and restoration projects, oil spills have occurred and will likely occur in the Pacific Ocean and in San Francisco Bay, and will impact coastal community wildlife. Oil spills affect birds, mammals, and fish (MMC 2012b). Marine mammals such as fur seals and sea otters are extremely affected by oil on the water, as are birds that float on the surface of the water (such as scoters and grebes). On November 7, 2007, approximately 58,000 gallons of bunker fuel spilled from a container ship into the bay, resulting in the largest oil spill in the San Francisco Bay since the Cape Mohican incident in 1996. About 1,081 live birds were reported taken for rehabilitation and about 1,803 birds were reported to have been found dead as a result of this incident (USFWS 2007c, 1), although recent estimates show that bird mortality may have been as high as 6,688 individuals; a draft restoration plan is being prepared (USFWS 2009b, 1). The November 7, 2007, oil spill had short-term minor to moderate adverse effects on wildlife such as marine mammals and birds at project sites in GGNRA. For the most part, the impacts on wildlife from this spill lasted only a few weeks, especially on the sandy beaches of the park. In the long term and by the time this dog management plan/EIS is implemented, impacts on wildlife at project sites in GGNRA should be reduced to a negligible level.

The long-term minor adverse impacts on wildlife from dogs at Mori Point under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from the restoration projects provided by the park stewardship programs should reduce some of the adverse impacts on wildlife from alternative A. The impacts resulting from the past oil spill and from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**MORI POINT ALTERNATIVE A CONCLUSION TABLE**

| Coastal Community Wildlife Impacts | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|------------------------------------|--|--|-------------------------------|
| Long-term minor adverse impacts    | Shorebirds on beach would occasionally be subjected to impacts from on-leash dogs (and off-leash dogs violating the leash law) through dogs barking at, chasing after, and being in proximity to roosting or feeding birds; shorebird numbers are low, visitor use is moderate, and beach habitat area is small at this site | N/A  | Negligible cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking on the Mori Coastal Trail and the beach (the portion owned by the NPS). On-leash dog walking would not allow dogs to roam freely along the beach. Physically restraining dogs on leash would protect wildlife and reduce chasing after shorebirds and marine mammals on the beach, but on-leash dogs would still be able to disturb wildlife and/or cause a flight response through their presence on the beach and lunging/barking at roosting, resting, and feeding birds. On-leash dog walking, if occurring in proximity to wildlife, would cause birds roosting and/or feeding on the beach to flee to nearby areas of less activity or to relocate entirely; both actions would result in loss of preferred habitat and unnecessary energy expenditure by

## Chapter 4: Environmental Consequences

fleeing birds. Therefore, assuming compliance, overall impacts on wildlife as a result of alternative B would be long term and would range from negligible to minor and adverse because shorebirds and waterbirds as well as marine mammals may not be affected or may occasionally be affected by on-leash dogs. A range is presented to encompass the potential effects, since impacts would depend on the seasonal presence of the birds and the level of activity at the site.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is not common in this area, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have a negligible impact on wildlife.

**Cumulative Impacts.** The negligible to long-term minor adverse impacts on wildlife from dogs at Mori Point under alternative B were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the restoration projects provided by the park stewardship programs should reduce some of the adverse impacts on wildlife from alternative B. The impacts resulting from the past oil spill and from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**MORI POINT ALTERNATIVE B CONCLUSION TABLE**

| Coastal Community Wildlife Impacts   | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect shorebirds and marine mammals on beach, although on-leash dogs could still disturb roosting and feeding birds through barking and by their presence on the beach; impact range is due to changing seasonal presence of the birds and level of activity at the site | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would allow on-leash dog walking on the beach within the NPS boundary, on the Mori Coastal Trail, and on Old Mori Trail and would result in the same impacts as alternative B: negligible to long term, minor, and adverse.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Mori Point is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs, with a limit of six. Since commercial dog walking activity is not common at Mori Point, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have a negligible impact on wildlife.

**Cumulative Impacts.** The negligible to long-term minor adverse impacts on wildlife from dogs at Mori Point under alternative C were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the restoration projects provided by the park stewardship programs should reduce some of the adverse impacts on wildlife from alternative C. The impacts resulting from the past oil spill and from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to

mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**MORI POINT ALTERNATIVE C CONCLUSION TABLE**

| Coastal Community Wildlife Impacts   | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect shorebirds and marine mammals on beach, although on-leash dogs could still disturb roosting and feeding birds through barking and by their presence on the beach; impact range is due to changing seasonal presence of the birds and level of activity at the site | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Alternative D would prohibit dogs throughout Mori Point, including on the NPS-owned portion of beach. Shorebirds, gulls, and terns that may roost or feed on the beach would be protected from disturbance related to having dogs on the beach. As a result, no impacts on shorebirds, gulls, terns, or stranded marine mammals at Mori Point would occur.

Since dogs would be prohibited from Mori Point, there would be no impact from commercial dog walking on wildlife.

**Cumulative Impacts.** The lack of impacts on wildlife from dogs at Mori Point under alternative D was considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the restoration projects provided by the park stewardship programs combined with the negligible impacts from the past oil spill and from any development or construction actions and the lack of impacts on wildlife from alternative D would result in negligible cumulative impacts on wildlife.

**MORI POINT ALTERNATIVE D CONCLUSION TABLE**

| Coastal Community Wildlife Impacts | Rationale                              | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|------------------------------------|--|--|-------------------------------|
| No impact, assuming compliance     | Dogs would be prohibited at Mori Point | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would allow on-leash dog walking on the Mori Coastal Trail, Old Mori Trail, the Pollywog Trail, and the beach within the NPS boundary and would result in the same impacts as alternative B, assuming compliance: negligible to long term, minor, and adverse.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required Mori Point is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs, with a limit of six. Since commercial dog walking activity is not common at Mori Point, it is likely that this alternative would not

## Chapter 4: Environmental Consequences

have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have a negligible impact on wildlife.

**Cumulative Impacts.** The negligible to long-term minor adverse impacts on wildlife from dogs at Mori Point under alternative E were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the restoration projects provided by the park stewardship programs should reduce some of the adverse impacts on wildlife from alternative E. The impacts resulting from the past oil spill and from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**MORI POINT ALTERNATIVE E CONCLUSION TABLE**

| Coastal Community Wildlife Impacts   | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect shorebirds and marine mammals on beach, although on-leash dogs could still disturb roosting and feeding birds through barking and by their presence on the beach; impact range is due to changing seasonal presence of the birds and level of activity at the site | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative E, allowing on-leash dog walking on the beach within the NPS boundary, on the Mori Coastal Trail, on Old Mori Trail, and on the Pollywog Trail. On-leash dog walking would not allow dogs to roam freely along the beach. Physically restraining dogs on leash would protect wildlife and reduce chasing after shorebirds and marine mammals on the beach, but on-leash dogs would still be able to disturb wildlife and/or cause a flight response through their presence on the beach and lunging/barking at roosting, resting, and feeding birds. On-leash dog walking, if occurring in proximity to wildlife, would cause birds roosting and/or feeding on the beach to flee to nearby areas of less activity or to relocate entirely; both actions would result in loss of preferred habitat and unnecessary energy expenditure by fleeing birds. Therefore, assuming compliance, overall impacts on wildlife as a result of the preferred alternative would be long term and would range from negligible to minor and adverse because shorebirds and waterbirds as well as marine mammals may not be affected or may occasionally be affected by on-leash dogs. A range is presented to encompass the potential effects, since impacts would depend on the seasonal presence of the birds and the level of activity at the site.

All dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Mori Point is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs, with a limit of six. Since commercial dog walking activity is not common at Mori Point, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have a negligible impact on wildlife.

**Cumulative Impacts.** Projects and actions in and near Mori Point were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on wildlife at or in the vicinity of this site.

Park stewardship programs provide indirect benefits to shorebirds by activities such as controlling invasive plant species, supporting coastal habitats, and restoring habitats.

Development or construction actions at or in the vicinity of GGNRA sites have had or may have the potential to have adverse impacts on coastal communities, including shorebirds. Generally, adverse impacts on shorebirds may include temporary or permanent loss of habitat and physical disturbance by construction workers or from vehicle and/or boat noise during construction; levels of impacts may include avoidance, underuse, complete abandonment, or reduction in total numbers of shorebirds at construction areas in the coastal community. Even though these efforts both within and beyond park boundaries would affect vegetation and wildlife, mitigation for these projects would reduce the potential for impacts.

In addition to development and restoration projects, oil spills have occurred and will likely occur in the Pacific Ocean and in San Francisco Bay, and will impact coastal community wildlife. Oil spills affect birds, mammals, and fish (MMC 2012). Marine mammals such as fur seals and sea otters are extremely affected by oil on the water, as are birds that float on the surface of the water (such as scoters and grebes). On November 7, 2007, approximately 58,000 gallons of bunker fuel spilled from a container ship into the bay, resulting in the largest oil spill in the San Francisco Bay since the Cape Mohican incident in 1996. About 1,081 live birds were reported taken for rehabilitation and about 1,803 birds were reported to have been found dead as a result of this incident (USFWS 2007c, 1), although recent estimates show that bird mortality may have been as high as 6,688 individuals; a draft restoration plan is being prepared (USFWS 2009b, 1). The November 7, 2007, oil spill had short-term minor to moderate adverse effects on wildlife such as marine mammals and birds at project sites in GGNRA. For the most part, the impacts on wildlife from this spill lasted only a few weeks, especially on the sandy beaches of the park. In the long term and by the time this dog management plan/EIS is implemented, impacts on wildlife at project sites in GGNRA should be reduced to a negligible level.

The negligible to long-term minor adverse impacts on wildlife from dogs at Mori Point under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from the restoration projects provided by the park stewardship programs should reduce some of the adverse impacts on wildlife from the preferred alternative. The impacts resulting from the past oil spill and from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**MORI POINT PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| <b>Coastal Community Wildlife Impacts</b>                                  | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect shorebirds and marine mammals on beach, although on-leash dogs could still disturb roosting and feeding birds through barking and by their presence on the beach; impact range is due to changing seasonal presence of the birds and level of activity at the site | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

### IMPACTS TO WILDLIFE IN COASTAL SCRUB, CHAPARRAL, AND GRASSLAND COMMUNITIES BY SITE AND ALTERNATIVE

Coastal scrub, bluff scrub, chaparral, and grassland plant communities are found to some extent at many of the GGNRA sites considered in this draft plan/SEIS, but at the more developed sites in San Francisco County only small remnants may remain (such as Crissy Field and Fort Point trail areas). As a result, only impacts on largely undeveloped park sites containing intact acreage of coastal scrub/chaparral/grassland are analyzed. These communities form a mosaic that provide habitat for many species of wildlife. Wildlife species that use these habitats and may be affected by dog management are discussed in detail in the sections below.

Sites currently have varying degrees of adverse impacts, as shown by levels of use and numbers of citations and incident reports related to dog activities (appendix G and table 9). A detailed literature review was conducted for this draft plan/SEIS to determine the impacts of dogs on wildlife species such as birds, small mammals, and deer, the results of which are summarized at the beginning of this chapter in the section titled “Summary of Background Information Used to Determine Impacts to Natural Resources.” Unrestrained dogs, because of their innate abilities as hunters, could affect wildlife by disturbing birds (low- and ground-nesting birds would be affected the most), disturbing reptiles using roosting or sunning sites, chasing after fleeing birds and small mammals, and even on occasion capturing individuals. Dogs have a keen sense of smell and can identify burrows of reptiles (e.g., gopher snakes) and small mammals (mice, moles, voles, etc.), destroy the burrows by digging (when off leash), and capture animals living in the burrows. Dogs off leash and unrestrained by voice control could also encounter coyotes in the developed areas of GGNRA (San Francisco sites) and in some of the more undeveloped and expansive areas of GGNRA, such as at Alta Trail, Oakwood Valley, Marin Headlands Trails, and San Mateo sites. These undeveloped sites are frequented by coyotes, which are likely impacted by the continual presence of dogs. In addition, interactions between dogs and coyotes could result in injury and possibly transmission of disease to either species, as well as injury to visitors. Mountain lions are increasingly encountered in more suburban settings and it is possible that mountain lions could interact with humans and dogs at GGNRA sites that have appropriate habitat, although they are not likely to be present when human and dog activity is highest at these sites. As a result of such interaction, injury, death, or potential transfer of disease could occur. The NPS strives to provide a landscape that would benefit coyotes and mountain lions in GGNRA while minimizing the potential for encounters with dogs or humans. Because of the range and extent of these communities and the similarity of potential impacts on wildlife resulting from dog management, the discussion of impacts by alternative will be treated more specifically by site or groups of sites in the paragraphs that follow.

#### MARIN COUNTY SITES

##### Homestead Valley

**Alternative A: No Action.** Currently, dogs are allowed under voice control or on leash throughout the site. This site has low visitor use for dog walkers (table 9). The trails in this site are easily accessible from residential areas and Homestead Valley is adjacent to larger tracts of open land across Panoramic Highway.

Under the no-action alternative at this site, off-leash dog access to wildlife and associated habitat off trails and fire roads would continue. Disturbance as a result of dogs includes physical damage to habitat or nests/burrows from digging or trampling, as well as chasing after and even capturing small mammals, reptiles, and ground-nesting birds. Ground-dwelling and ground-nesting bird species such as California quail are especially vulnerable. Dogs also have the potential to encounter larger mammals such as deer or

coyotes and interact or exchange parasites/diseases. In addition, wildlife may also be displaced from high quality habitat that is degraded by the presence of dogs; trails in this site are easily accessible from residential areas and generally receive heavy use by visitors. Therefore, alternative A would result in continued long-term minor to moderate adverse impacts on wildlife using coastal scrub habitat at Homestead Valley because occasional to frequent disturbances to wildlife from dogs would occur.

Under alternative A, no permit system exists for dog walking. At Homestead Valley, commercial dog walking is uncommon. Therefore, commercial dog walking would have negligible impacts on wildlife.

**Cumulative Impacts.** Projects and actions in and near Homestead Valley were considered for the cumulative impacts analysis (appendix K) and are similar to projects discussed previously. Long-term parkwide projects such as trail rehabilitation can provide enhancements that improve conditions for vegetation and wildlife habitat. Ongoing parkwide restoration and enhancement efforts can also beneficially affect coastal scrub at GGNRA park sites such as Homestead Valley. Additionally, the implementation of habitat restoration and projects funded by the Wildland/Urban Interface Initiative on private lands could impact Homestead Valley.

As stated above, coastal scrub habitat in California is threatened by habitat loss, fragmentation, and degradation (USDA 2005, 613). The implementation of current and future projects both in GGNRA and beyond park boundaries could have a cumulative impact on the wildlife species that inhabit coastal scrub/chaparral/grassland communities. Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would not likely contribute cumulatively to wildlife impacts. Because the mission blue butterfly inhabits coastal scrub/chaparral/grassland communities, projects that would benefit and enhance mission blue butterfly habitat would also benefit wildlife species that inhabit this community type.

The long-term minor to moderate adverse impacts on wildlife from dogs at Homestead Valley under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from the restoration and trail rehabilitation projects should reduce some of the adverse impacts on wildlife from alternative A. The adverse impacts resulting from construction projects at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be expected to be negligible due to mitigation that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible to long term, minor, and adverse.

HOMESTEAD VALLEY ALTERNATIVE A CONCLUSION TABLE

| Coastal Scrub, Chaparral, and Grassland Wildlife Impacts | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts                                       |
|--|--|--|--|
| Long-term minor to moderate adverse impacts              | Off-leash dog access to wildlife and associated habitat off trails and fire roads would continue; disturbance includes physical damage to habitat or nests/ burrows from digging or trampling, as well as chasing after and even capturing wildlife; wildlife may also be displaced from high quality habitat that is degraded by the presence of dogs; trails in this site are easily accessible from residential areas | N/A  | Negligible to long-term minor adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking on Homestead Fire Road and on neighborhood connector trails (Homestead Trail and Homestead Summit Trail) that would be designated in the future. Since dog walkers may walk along the edge of the fire road or trails, dogs would then have access to the adjacent land 6 feet in all directions, resulting in an LOD area that would extend 6 feet out from the edges of the fire road or trails. Leash requirements would reduce the probability that a dog would disturb birds (Lafferty 2001a, 1955, 1961) and chase and/or harass other wildlife, due to physical restraint on leash. However, the habitat in the LOD area would be affected by dogs through trampling, dog waste, and nutrient addition, resulting in long-term minor to moderate adverse impacts on wildlife in the LOD area. Because of mobility, wildlife can usually avoid areas with dogs present during peak activity or habituate to these activities, but the displacement of wildlife from high quality habitat and preferred habitat that is degraded by the presence of dogs would indirectly affect wildlife.

The long-term minor to moderate adverse impacts from dogs in the LOD area would occur in a relatively small area when compared to the entire site. Physically restraining dogs on leash would protect habitat off trail as well as wildlife, and chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior. Wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs. Additionally, trails in this site are easily accessible from residential areas and generally receive heavy use by visitors. Therefore, assuming compliance, alternative B would result in overall long-term minor adverse impacts on wildlife because occasional disturbance to wildlife would result from dogs.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is not common in this area, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have a negligible impact on wildlife.

**Cumulative Impacts.** The long-term minor adverse impacts on wildlife from dogs at Homestead Valley under alternative B were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the restoration and trail rehabilitation projects should reduce some of the adverse impacts on wildlife from alternative B. The adverse impacts resulting from construction projects at or in the vicinity of GGNRA would add little to the cumulative impacts on

wildlife, since those impacts would be expected to be negligible due to mitigation that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**HOMESTEAD VALLEY ALTERNATIVE B CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Wildlife Impacts</b> | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--|---|-------------------------------|
| Overall long-term minor adverse impacts, assuming compliance    | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; trails and the LOD area are a small portion of the entire site; trails in this site are easily accessible from residential areas and receive heavy use by visitors | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would have the same dog walking restrictions as alternative B, and the impacts on wildlife would be the same: long term, minor to moderate, and adverse in the LOD area and long term, minor, and adverse overall.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Homestead Valley is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs, with a limit of six. Since dog walking activity in Homestead Valley is low and commercial dog walking is not common in this area, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have a negligible impact on wildlife.

**Cumulative Impacts.** Under alternative C, the cumulative impacts on wildlife at this park site would be the same as those under alternative B: negligible.

HOMESTEAD VALLEY ALTERNATIVE C CONCLUSION TABLE

| Coastal Scrub, Chaparral, and Grassland Wildlife Impacts     | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|--|--|-------------------------------|
| Overall long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; trails and the LOD area are a small portion of the entire site; trails in this site are easily accessible from residential areas and receive heavy use by visitors | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Under alternative D, on-leash dog walking would be allowed only along Homestead Fire Road; dogs would be prohibited in other areas of the site, providing protection to coastal scrub/chaparral/grassland habitat and wildlife by limiting the number of trails accessible to dogs and by restricting that access to on-leash dog walking. The LOD area would include the fire road and the 6 feet of land adjacent to the edges of the road, as described in alternative B. The habitat in the LOD area would be affected by dogs through trampling, dog waste, and nutrient addition, resulting in long-term minor to moderate adverse impacts on wildlife in the LOD area. Because of mobility, wildlife can usually avoid areas with dogs present during peak activity or habituate to these activities, but the displacement of wildlife from high quality habitat and preferred habitat that is degraded by the presence of dogs would indirectly affect wildlife.

The long-term minor to moderate adverse impacts from dogs in the LOD area would occur in a relatively small area when compared to the site as a whole. Physically restraining dogs on leash would protect habitat off trail as well as wildlife, and chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior. Wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs. Additionally, trails in this site are easily accessible from residential areas and generally receive heavy use by visitors. Therefore, assuming compliance, alternative D would result in overall negligible to long-term minor adverse impacts on wildlife.

No commercial dog walking would be allowed and no permits to walk more than three dogs would be issued under alternative D; therefore, there would be no impacts from commercial and permitted dog walking. Private dog walkers would be allowed to walk one to three dogs.

**Cumulative Impacts.** The negligible to long-term minor adverse impacts on wildlife from dogs at Homestead Valley under alternative D were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the restoration and trail rehabilitation projects should reduce some of the adverse impacts on wildlife from alternative D. The adverse impacts resulting from construction projects at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be expected to be negligible due to mitigation that would reduce the

potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**HOMESTEAD VALLEY ALTERNATIVE D CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Wildlife Impacts</b>            | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; trails and the LOD area are a small portion of the entire site; fewer trails would be available to on-leash dogs compared to all other alternatives; trails receive heavy use by visitors | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would have the same dog walking restrictions as alternative B, and impacts would be the same, assuming compliance: long term, minor to moderate, and adverse in the LOD area and long term, minor, and adverse overall.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Homestead Valley is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs, with a limit of six. Since dog walking activity in Homestead Valley is low and commercial dog walking is not common in this area, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have a negligible impact on wildlife.

**Cumulative Impacts.** Under alternative E, the cumulative impacts on wildlife at this park site would be the same those under alternative B: negligible.

HOMESTEAD VALLEY ALTERNATIVE E CONCLUSION TABLE

| Coastal Scrub, Chaparral, and Grassland Wildlife Impacts     | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|--|--|-------------------------------|
| Overall long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; trails and the LOD area are a small portion of the entire site; trails in this site are easily accessible from residential areas and receive heavy use by visitors | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative B, allowing on-leash dog walking on Homestead Fire Road and on neighborhood connector trails (Homestead Trail and Homestead Summit Trail) that would be designated in the future. Since dog walkers may walk along the edge of the fire road or trails, dogs would then have access to the adjacent land 6 feet in all directions, resulting in an LOD area that would extend 6 feet out from the edges of the fire road or trails. Leash requirements would reduce the probability that a dog would disturb birds (Lafferty 2001a, 1955, 1961) and chase and/or harass other wildlife, due to physical restraint on leash. However, the habitat in the LOD area would be affected by dogs through trampling, dog waste, and nutrient addition, resulting in long-term minor to moderate adverse impacts on wildlife in the LOD area. Because of mobility, wildlife can usually avoid areas with dogs present during peak activity or habituate to these activities, but the displacement of wildlife from high quality habitat and preferred habitat that is degraded by the presence of dogs would indirectly affect wildlife.

The long-term minor to moderate adverse impacts from dogs in the LOD area would occur in a relatively small area when compared to the site as a whole. Physically restraining dogs on leash would protect habitat off trail as well as wildlife, and chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior. Wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs. Additionally, trails in this site are easily accessible from residential areas and generally receive heavy use by visitors. Therefore, assuming compliance, the preferred alternative would result in overall long-term minor adverse impacts on wildlife because occasional disturbance to wildlife would result from dogs.

All dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Homestead Valley is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs, with a limit of six. Since dog walking activity in Homestead Valley is low and commercial dog walking is not common in this area, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have a negligible impact on wildlife.

**Cumulative Impacts.** Projects and actions in and near Homestead Valley were considered for the cumulative impacts analysis (appendix K) and are similar to projects discussed previously. Long-term

parkwide projects such as trail rehabilitation can provide enhancements that improve conditions for vegetation and wildlife habitat. Ongoing parkwide restoration and enhancement efforts can also beneficially affect coastal scrub at GGNRA park sites such as Homestead Valley. Additionally, the implementation of habitat restoration and projects funded by the Wildland/Urban Interface Initiative on private lands could impact Homestead Valley.

As stated above, coastal scrub habitat in California is threatened by habitat loss, fragmentation, and degradation (USDA 2005, 613). The implementation of current and future projects both in GGNRA and beyond park boundaries could have a cumulative impact on the wildlife species that inhabit coastal scrub/chaparral/grassland communities. Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would not likely contribute cumulatively to wildlife impacts. Because the mission blue butterfly inhabits coastal scrub/chaparral/grassland communities, projects that would benefit and enhance mission blue butterfly habitat would also benefit wildlife species that inhabit this community type.

The long-term minor adverse impacts on wildlife from dogs at Homestead Valley under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from the restoration and trail rehabilitation projects should reduce some of the adverse impacts on wildlife from the preferred alternative. The adverse impacts resulting from construction projects at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be expected to be negligible due to mitigation that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**HOMESTEAD VALLEY PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Wildlife Impacts</b> | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--|---|-------------------------------|
| Overall long-term minor adverse impacts, assuming compliance    | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; trails and the LOD area are a small portion of the entire site; trails in this site are easily accessible from residential areas and receive heavy use by visitors | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

**Alta Trail/Orchard Fire Road/Pacheco Fire Road**

**Alternative A: No Action.** Currently, dogs are allowed under voice control or on leash on the trails and roads from Marin City to Oakwood Valley. These areas experience high use by commercial dog walkers (table 9), with typically 5 to 12 dogs under voice control per commercial walker, and the trails in this site are easily accessible from residential areas and generally receive heavy use by visitors. There are large tracts of habitat in the Alta Trail/Orchard Fire Road/Pacheco Fire Road that extend north into Muir Beach.

## Chapter 4: Environmental Consequences

Under the no-action alternative, access to wildlife habitat off trails and fire roads would continue. Disturbance from dogs could include physical damage to habitat from digging or trampling, as well as dogs chasing after and even capturing small mammals, reptiles, and ground-nesting birds. Nests of ground-nesting birds could be trampled, thus eliminating the opportunity for successful reproduction. Ground-dwelling and ground-nesting bird species such as California quail, which uses the scrub/chaparral/grassland habitat, are in decline. Birds foraging in the coastal scrub/chaparral/grassland mosaic can be flushed and forced into flight; relocating to another area uses valuable energy reserves or results in an unprotected nest, providing opportunity for predators. Time and energy that would otherwise be spent feeding (including feeding young) or protecting nests becomes lost when these birds are disturbed or chased by dogs. Small rodents and mammals may also be chased and/or captured by dogs; burrows of these animals may be crushed or dug up by dogs. Dogs also have the potential to encounter larger mammals such as deer or coyotes. Deer could be chased by dogs, resulting in loss of energy reserves and the dispersal of family units. This site is frequented by coyotes, which are likely impacted by the continual presence of dogs. In addition, interactions between dogs and coyotes could lead to altercations and even the exchange of parasites and disease because of the genetic similarities, as previously discussed. Because of mobility, wildlife can usually avoid areas with dogs present during peak activity or habituate to these activities, but the displacement of wildlife from high quality habitat and preferred habitat that is degraded by the presence of dogs would indirectly affect wildlife. Therefore, alternative A would result in continued long-term minor to moderate adverse impacts on wildlife using coastal scrub habitat at this park site because occasional to frequent disturbances to wildlife from dogs would occur.

Under alternative A, no permit system exists for dog walking. However, commercial dog walking at Alta Trail, Orchard Fire Road, and Pacheco Fire Road is common, with commercial dog walkers having 5 to 12 dogs under voice control at one time. Commercial dog walking would continue to create long-term minor to moderate adverse impacts on wildlife. Dogs under voice control would continue to disturb wildlife in the area.

**Cumulative Impacts.** Projects and actions in and near Alta Trail and Orchard and Pacheco fire roads were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs provide enhancements that improve conditions for vegetation and wildlife habitat. Ongoing parkwide restoration and enhancement efforts, such as GGNRA natural resource stewardship programs and the *Marin Countywide Plan* (County of Marin 2007), can also beneficially affect coastal scrub at GGNRA park sites such as Alta Trail, Orchard Fire Road, and Pacheco Fire Road. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance. The implementation of habitat restoration and projects funded by the Wildland/Urban Interface Initiative on private lands could also impact Alta Trail, Orchard Fire Road, and Pacheco Fire Road.

Coastal scrub habitat in California is threatened by habitat loss, fragmentation, and degradation (USDA 2005, 613). Local and statewide declines have been observed in several birds that breed in coastal scrub, most notably the California gnatcatcher, which is a federally threatened species endemic to Southern California, as well as common species such as the white-crowned sparrow (USDA 2005, 613). Any impacts on scrub/chaparral/grassland habitats, whether beneficial or adverse, will also indirectly affect wildlife species that use these habitats. The implementation of current and future projects both in GGNRA and beyond park boundaries could have a cumulative impact on the wildlife species that inhabit coastal scrub/chaparral/grassland communities. Generally, construction projects that affect this community require project-specific mitigation measures to address impacts, such as the *Marin Headlands/Fort Baker Improvement and Transportation Management Plan/EIS* (NPS 2009c, ix, 82), which primarily provides mitigation for impacts on the mission blue butterfly. Therefore, these projects would not likely contribute adversely to the cumulative impacts. Because the mission blue butterfly

inhabits coastal scrub/chaparral/grassland communities, projects that would benefit and enhance mission blue butterfly habitat would also benefit wildlife species that inhabit this community type (e.g., various species of butterflies, small mammals, predators, reptiles, and bird species as described in chapter 3). Such projects include the following: proposed fire management policies of the *Fire Management Plan* (NPS 2005b), the *San Bruno Elfin and Mission Blue Butterflies Recovery Plan* (USFWS 1984), and the Southern Marin Headlands project, which focused on enhancing the Coastal Trail corridor in the southern Marin Headlands (GGNPC n.d.).

The long-term minor to moderate adverse impacts on wildlife from dogs at Alta Trail and Orchard and Pacheco fire roads under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from the restoration and trail rehabilitation projects should reduce some of the adverse impacts on wildlife from alternative A. The adverse impacts resulting from construction and transportation projects at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be expected to be negligible due to mitigation that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible to long term, minor, and adverse.

**ALTA TRAIL/ORCHARD FIRE ROAD/PACHECO FIRE ROAD ALTERNATIVE A CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Wildlife Impacts | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts                                       |
|--|--|--|--|
| Long-term minor to moderate adverse impacts              | Off-leash dog access to wildlife and associated habitat off trails and fire roads would continue; disturbance includes physical damage to habitat or nests/ burrows from digging or trampling, as well as chasing after and even capturing wildlife; wildlife may also be displaced from high quality habitat that is degraded by the presence of dogs; trails in this site are easily accessible from residential areas and receive heavy use by visitors | N/A  | Negligible to long-term minor adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking on the Alta Trail to Orchard Fire Road, on Orchard Fire Road, and on Pacheco Fire Road. Leash requirements would reduce the probability that dogs would disturb birds (Lafferty 2001a, 1955, 1961) and chase and/or harass other wildlife, due to physical restraint on leash. However, the habitat in the LOD area would be affected by dogs through trampling, dog waste, and nutrient addition, resulting in long-term minor to moderate adverse impacts on wildlife in the LOD area. Because of mobility, wildlife can usually avoid areas with dogs present during peak activity or habituate to these activities, but the displacement of wildlife from high quality habitat and preferred habitat that is degraded by the presence of dogs would indirectly affect wildlife.

The long-term minor to moderate adverse impacts that would occur in the LOD area would encompass a reduced portion of the site. Physically restraining dogs on leash would protect habitat off trail as well as wildlife, and chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior. Wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs. Additionally, trails in this site are easily

## Chapter 4: Environmental Consequences

accessible from residential areas and generally receive heavy use by visitors. Therefore, assuming compliance, alternative B would result in overall long-term minor adverse impacts on wildlife because occasional disturbance to wildlife from dogs would result.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since the percentage of commercial dog walkers is considered high at Alta Trail/Orchard Fire Road/Pacheco Fire Road, dogs walked by commercial dog walkers would cause the majority of the adverse impacts on wildlife from dogs at the site. Overall impacts on wildlife from dogs walked by both commercial and private individuals are summarized below.

**Cumulative Impacts.** The long-term minor adverse impacts on wildlife from dogs at Alta Trail and Pacheco and Orchard fire roads under alternative B were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the restoration and trail rehabilitation projects should reduce some of the adverse impacts on wildlife from alternative B. The adverse impacts resulting from construction and transportation projects at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be expected to be negligible due to mitigation that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**ALTA TRAIL/ORCHARD FIRE ROAD/PACHECO FIRE ROAD ALTERNATIVE B CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Wildlife Impacts     | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Overall long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; trails and the LOD area are only a portion of the entire site; trails in this site are easily accessible from residential areas and receive heavy use by visitors | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would have the same dog walking restrictions as alternative B, and impacts would be the same, assuming compliance: long term, minor to moderate, and adverse in the LOD area and long term, minor, and adverse overall.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. At Alta Trail, any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. Impacts on wildlife from permit holders with up six dogs off leash would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is common at Alta Trail/Orchard Fire Road/Pacheco Fire Road, impacts on wildlife would be expected from this user group. Impacts on wildlife from commercial dog walkers would be similar to overall impacts from other dog walkers, as summarized above; therefore, impacts from commercial dog walking would be long term, minor, and adverse.

**Cumulative Impacts.** Under alternative C, the cumulative impacts on wildlife at this park site would be the same those under alternative B: negligible.

**ALTA TRAIL/ORCHARD FIRE ROAD/PACHECO FIRE ROAD ALTERNATIVE C CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Wildlife Impacts</b> | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--|---|-------------------------------|
| Overall long-term minor adverse impacts, assuming compliance    | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; trails and the LOD area are a small portion of the entire site; trails in this site are easily accessible from residential areas and receive heavy use by visitors | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Under alternative D, dogs would not be allowed at this site. Therefore, no impact on wildlife from dogs would occur at this site.

No dog walking would be allowed under alternative D; therefore, commercial dog walking would have no impact on wildlife.

**Cumulative Impacts.** The lack of impacts on wildlife from dogs at Alta Trail and Orchard and Pacheco fire roads under alternative D was considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the restoration and trail rehabilitation projects combined with the negligible impacts from construction and transportation projects and the lack of impacts on wildlife from alternative D would result in negligible cumulative impacts on wildlife.

**ALTA TRAIL/ORCHARD FIRE ROAD/PACHECO FIRE ROAD ALTERNATIVE D CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Wildlife Impacts</b> | <b>Rationale</b>                     | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--------------------------------------|---|-------------------------------|
| No impact, assuming compliance                                  | Dogs would be prohibited at the site | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would allow on-leash dog walking on the Alta Trail to the junction with the Morning Sun Trail, and on Orchard and Pacheco fire roads. While the mileage open to dog walking would be greater than that described for alternative B, the impacts would be similar, assuming compliance: long term, minor to moderate, and adverse in the LOD area and long term, minor, and adverse overall.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. At Alta Trail, any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. Permits would be allowed at this

## Chapter 4: Environmental Consequences

site, but permit holders would be restricted to the section of Alta Trail between Donahue Street and the junction with Orchard Fire Road. Impacts on wildlife from permit holders with up to six dogs off leash would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level, especially with the restriction to a limited portion of the Alta Trail. Since commercial dog walking is common at the site, impacts on wildlife would be expected from this user group. Impacts on wildlife from commercial dog walkers would be similar to overall impacts from other dog walkers; therefore, impacts from commercial dog walking would be long term, minor, and adverse.

**Cumulative Impacts.** The long-term minor adverse impacts on wildlife from dogs at Alta Trail and Pacheco and Orchard fire roads under alternative E were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the restoration and trail rehabilitation projects should reduce some of the adverse impacts on wildlife from alternative E. The adverse impacts resulting from construction and transportation projects at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be expected to be negligible due to mitigation that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**ALTA TRAIL/ORCHARD FIRE ROAD/PACHECO FIRE ROAD ALTERNATIVE E CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Wildlife Impacts     | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|--|--|-------------------------------|
| Overall long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; trails and the LOD area are a small portion of the entire site; trails in this site are easily accessible from residential areas and receive heavy use by visitors | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative E, allowing on-leash dog walking on Alta Trail from Donahue Street to the junction with the Morning Sun Trail and on Orchard and Pacheco fire roads. The LOD would include all areas adjacent to the edges of the trail/roads up to 6 feet. Leash requirements would reduce the probability that dogs would disturb birds (Lafferty 2001a, 1955, 1961) and chase and/or harass other wildlife, due to physical restraint on leash. However, the habitat in the LOD area would be affected by dogs through trampling, dog waste, and nutrient addition, resulting in long-term minor to moderate adverse impacts on wildlife in the LOD area. Because of mobility, wildlife can usually avoid areas with dogs present during peak activity or habituate to these activities, but the displacement of wildlife from high quality habitat and preferred habitat that is degraded by the presence of dogs would indirectly affect wildlife. This site is frequented by coyotes, which would likely continue to be impacted by the presence of dogs.

The long-term minor to moderate adverse impacts that would occur in the LOD area would encompass a reduced portion of the site. Physically restraining dogs on leash would protect habitat off trail as well as wildlife, and chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior. Wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs. Additionally, trails in this site are easily accessible from residential areas and generally receive heavy use by visitors. Therefore, assuming compliance, the preferred alternative would result in long-term minor adverse impacts on wildlife because occasional disturbance to wildlife from dogs would result.

All dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. At Alta Trail, any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. Permits would be allowed at this site, but permit holders would be restricted to the section of Alta Trail between Donahue Street and the junction with Orchard Fire Road. Impacts on wildlife from permit holders with up to six dogs off leash would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level, especially with the restriction to a limited portion of Alta Trail. Since commercial dog walking is common on Alta Trail/Orchard Fire Road/Pacheco Fire Road, impacts on wildlife would be expected from this user group. Impacts on wildlife from commercial dog walkers would be similar to overall impacts from other dog walkers, as summarized above; therefore, impacts from commercial dog walking would be long term, minor, and adverse.

**Cumulative Impacts.** Projects and actions in and near Alta Trail and Orchard and Pacheco fire roads were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs provide enhancements that improve conditions for vegetation and wildlife habitat. Ongoing parkwide restoration and enhancement efforts, such as GGNRA natural resource stewardship programs and the *Marin Countywide Plan* (County of Marin 2007), can also beneficially affect coastal scrub at GGNRA park sites such as Alta Trail and Orchard and Pacheco fire roads. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance. The implementation of habitat restoration and projects funded by the Wildland/Urban Interface Initiative on private lands could also impact Alta Trail, Orchard Fire Road, and Pacheco Fire Road.

Coastal scrub habitat in California is threatened by habitat loss, fragmentation, and degradation (USDA 2005, 613). Local and statewide declines have been observed in several birds that breed in coastal scrub, most notably the California gnatcatcher, which is a federally threatened species endemic to Southern California, as well as common species such as the white-crowned sparrow (USDA 2005, 613). Any impacts on scrub/chaparral/grassland habitats, whether beneficial or adverse, will also indirectly affect wildlife species that use these habitats. The implementation of current and future projects both in GGNRA and beyond park boundaries could have a cumulative impact on the wildlife species that inhabit coastal scrub/chaparral/grassland communities. Generally, construction projects that affect this community require project-specific mitigation measures to address impacts, such as the *Marin Headlands/Fort Baker Improvement and Transportation Management Plan/EIS*, which primarily provides mitigation for impacts on the mission blue butterfly. Therefore, these projects would have negligible cumulative impacts. Because the mission blue butterfly inhabits coastal scrub/chaparral/grassland communities, projects that would benefit and enhance mission blue butterfly habitat would also benefit wildlife species that inhabit this community type (e.g., various species of butterflies, small mammals, predators, reptiles, and bird species as described in chapter 3). Such projects include the following: mitigation for the *Marin Headlands/Fort Baker Improvement and Transportation Management Plan/EIS* (NPS 2009c, ix, 82), proposed fire management policies of the *Fire Management Plan* (NPS 2005b), the *San Bruno Elfin and Mission Blue Butterflies Recovery Plan* (USFWS 1984), and the

## Chapter 4: Environmental Consequences

Southern Marin Headlands project, which focused on enhancing the Coastal Trail corridor in the southern Marin Headlands (GGNPC n.d.)

The long-term minor adverse impacts on wildlife from dogs at Alta Trail and Pacheco and Orchard fire roads under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from the restoration and trail rehabilitation projects should reduce some of the adverse impacts on wildlife from the preferred alternative. The adverse impacts resulting from construction and transportation projects at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be expected to be negligible due to mitigation that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**ALTA TRAIL/ORCHARD FIRE ROAD/PACHECO FIRE ROAD PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Wildlife Impacts     | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Overall long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; trails and the LOD area are only a portion of the entire site; trails in this site are easily accessible from residential areas and receive heavy use by visitors | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

### Oakwood Valley

**Alternative A: No Action.** Currently, dogs are allowed under voice control on Oakwood Valley Fire Road and the Oakwood Valley Trail from the junction with the fire road to the junction with Alta Trail, and on leash on the Oakwood Valley Trail from the trailhead to the junction with the Oakwood Valley Fire Road. These areas experience high use by hikers, runners, bicyclists, and horseback riders and moderate use by dog walkers (table 9). The trails in this site are easily accessible from residential areas and this site has sensitive coastal scrub habitat. Under the no-action alternative at this site, off-leash dog access to wildlife and associated habitat off trails and fire roads would continue and impacts would be similar to those described in detail above at Alta Trail/Orchard Fire Road/Pacheco Fire Road. Disturbance as a result of dogs includes physical damage to habitat or nests/burrows from digging or trampling, as well as chasing after and even capturing small mammals, reptiles, and ground-nesting birds. Ground-dwelling and ground-nesting bird species such as California quail are especially vulnerable. Dogs would also have the potential to encounter larger mammals such as deer or coyotes and interact or exchange parasites/diseases. This site is frequented by coyotes, which are likely impacted by the continual presence of dogs. In addition, wildlife may be displaced from high-quality habitat that is degraded by the presence of dogs; trails in this site are easily accessible from residential areas and generally receive heavy use by visitors. Therefore, alternative A would result in continued long-term minor to moderate adverse impacts on wildlife using coastal scrub habitat at Oakwood Valley because occasional to frequent disturbances to wildlife from dogs would occur.

Under alternative A, no permit system exists for dog walking. At Oakwood Valley, commercial dog walking is uncommon. Therefore, commercial dog walking would have negligible impacts on wildlife.

**Cumulative Impacts.** Projects and actions in and near Oakwood Valley were considered for the cumulative impacts analysis (appendix K) and are similar to projects discussed previously. Long-term parkwide projects such as trail rehabilitation can provide enhancements that improve conditions for vegetation and wildlife habitat. Ongoing parkwide restoration and enhancement efforts can also beneficially affect coastal scrub at GGNRA park sites such as Oakwood Valley. Additionally, the implementation of habitat restoration and projects funded by the Wildland/Urban Interface Initiative on private lands could impact Oakwood Valley.

As stated above, coastal scrub habitat in California is threatened by habitat loss, fragmentation, and degradation (USDA 2005, 613). The implementation of current and future projects both in GGNRA and beyond park boundaries could have a cumulative impact on the wildlife species that inhabit coastal scrub/chaparral/grassland communities. Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts. Because the mission blue butterfly inhabits coastal scrub/chaparral/grassland communities, projects that would benefit and enhance mission blue butterfly habitat would also benefit wildlife species that inhabit this community type.

The long-term minor to moderate adverse impacts on wildlife from dogs at Oakwood Valley under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from trail rehabilitation projects should reduce some of the adverse impacts on wildlife from alternative A. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible to long term, minor, and adverse.

**OAKWOOD VALLEY ALTERNATIVE A CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Wildlife Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts                                       |
|--|---|--|--|
| Long-term minor to moderate adverse impacts              | Off-leash dog access to wildlife and associated habitat off trails and fire roads would continue; disturbance includes physical damage to habitat or nests/burrows from digging or trampling, as well as chasing after and even capturing wildlife; wildlife may also be displaced from high quality habitat that is degraded by the presence of dogs; trails in this site are easily accessible from residential areas and receive heavy use by visitors | N/A  | Negligible to long-term minor adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Under alternative B, on-leash dog walking would be allowed and would be limited to the Oakwood Valley Fire Road and Oakwood Valley Trail to their intersection. No dogs would be allowed above the junction of the fire road and trail. The LOD area would include 6 feet in each direction from the edges of the trail/road. Leash requirements would reduce the probability that dogs

## Chapter 4: Environmental Consequences

would disturb birds (Lafferty 2001a, 1955, 1961) and chase and/or harass other wildlife, due to physical restraint on leash. However, the habitat in the LOD area would be affected by dogs through trampling, dog waste, and nutrient addition, resulting in long-term minor to moderate adverse impacts on wildlife in the LOD area. Because of mobility, wildlife can usually avoid areas with dogs present during peak activity or habituate to these activities, but the displacement of wildlife from high quality habitat and preferred habitat that is degraded by the presence of dogs would indirectly affect wildlife. The long-term minor to moderate adverse impacts that would occur in the LOD area represent only a small portion of the entire site. Physically restraining dogs on leash would protect habitat off trail as well as wildlife, and chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior. Wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs. Additionally, trails in this site are easily accessible from residential areas and generally receive heavy use by visitors. Therefore, assuming compliance, alternative B would result in overall long-term minor adverse impacts on wildlife because occasional disturbance on wildlife would result from dogs.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is not common at Oakwood Valley, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have a negligible impact on wildlife.

**Cumulative Impacts.** The long-term minor adverse impacts on wildlife from dogs at Oakwood Valley under alternative B were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from trail rehabilitation projects should reduce some of the adverse impacts on wildlife from alternative B. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**OAKWOOD VALLEY ALTERNATIVE B CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Wildlife Impacts</b> | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--|---|-------------------------------|
| Overall long-term minor adverse impacts, assuming compliance    | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; trails and the LOD area are a small portion of the entire site; trails in this site are easily accessible from residential areas and receive heavy use by visitors | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** For alternative C, a ROLA is proposed on Oakwood Valley Fire Road to the junction with the Oakwood Valley Trail. The ROLA would include double gates at both ends (to separate this use from other users of the site) and continuous fencing to protect sensitive habitat. On-leash dog walking is proposed on Oakwood Valley Trail from the junction with the Oakwood Valley Fire Road to a new gate at the junction with Alta Trail. The ROLA would be located in a native hardwood forest and Douglas-fir/coast redwood community, and impacts in the ROLA are discussed in more detail in that section of the draft plan/SEIS. Impacts on wildlife in the LOD area along the Oakwood Valley Trail would be long term, minor to moderate, and adverse. Impacts would result from disruption of wildlife habitat through trampling, dog waste, and nutrient addition. Because of mobility, wildlife can usually avoid areas with dogs present during peak activity or habituate to these activities, but the displacement of wildlife from high quality habitat and preferred habitat that is degraded by the presence of dogs would indirectly affect wildlife.

The long-term minor to moderate adverse impacts from dogs in the LOD area would occur in a relatively small area when compared to the site as a whole. Physically restraining dogs on leash would protect habitat off trail as well as wildlife, and chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior. Wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs. Additionally, trails in this site are easily accessible from residential areas and generally receive heavy use by visitors. Therefore, assuming compliance, the overall impact on wildlife at Oakwood Valley would be long term, minor, and adverse.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Oakwood Valley is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs, with a limit of six. Since commercial dog walking activity is not common at Oakwood Valley, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have a negligible impact on wildlife.

**Cumulative Impacts.** The long-term minor adverse impacts on wildlife from dogs at Oakwood Valley under alternative C were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from trail rehabilitation projects should reduce some of the adverse impacts on wildlife from alternative C. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

OAKWOOD VALLEY ALTERNATIVE C CONCLUSION TABLE

| Coastal Scrub, Chaparral, and Grassland Wildlife Impacts    | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Overall long-term minor adverse impacts assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; trails and the LOD area are a small portion of the entire site; trails in this site are easily accessible from residential areas and receive heavy use by visitors | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Under alternative D, on-leash dog walking would be allowed only along the Oakwood Valley Fire Road and Oakwood Valley Trail from Tennessee Valley Road to the junction of the fire road and the trail. The LOD area would include the fire road and trail and the 6 feet of land adjacent to the edges of the road. Impacts on wildlife in the 6-foot LOD area would be long term, minor to moderate, and adverse. Impacts would result from the habitat in the LOD area being affected by dogs through trampling, dog waste, and nutrient addition. Because of mobility, wildlife can usually avoid areas with dogs present during peak activity or habituate to these activities, but the displacement of wildlife from high quality habitat and preferred habitat that is degraded by the presence of dogs would indirectly affect wildlife.

The long-term minor to moderate adverse impacts from dogs in the LOD area would occur in a relatively small area when compared to the site as a whole. Physically restraining dogs on leash would protect habitat off trail as well as wildlife, and chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior. Wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs. Additionally, fewer trails would be available to on-leash dogs compared to all other alternatives, and this site generally receives heavy use by visitors. Therefore, assuming compliance, alternative D would result in overall negligible to long-term minor adverse impacts on wildlife because occasional disturbance to wildlife would result from dogs.

No commercial dog walking would be allowed and no permits to walk more than three dogs would be issued under alternative D; therefore, commercial and permitted dog walking would have no impact on wildlife. Private dog walkers would be allowed to walk one to three dogs.

**Cumulative Impacts.** The negligible to long-term minor adverse impacts on wildlife from dogs at Oakwood Valley under alternative D were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from trail rehabilitation projects should reduce some of the adverse impacts on wildlife from alternative D. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce

the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**OAKWOOD VALLEY ALTERNATIVE D CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Wildlife Impacts                   | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; trails and the LOD area are a small portion of the entire site; fewer trails would be available to on-leash dogs compared to all other alternatives; trails receive heavy use by visitors | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would allow on leash dog walking in the same areas as alternative C. The ROLA would have double gates at both ends (to separate this use from other visitors to the site), but unlike alternative C, would have non-continuous fencing only where needed to protect sensitive habitat. Impacts from alternative E would be the same as alternative C, assuming compliance: long term, minor to moderate, and adverse in the LOD area and long term, minor, and adverse overall.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Oakwood Valley is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs, with a limit of six. Since commercial dog walking activity is not common at Oakwood Valley, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have a negligible impact on wildlife.

**Cumulative Impacts.** Under alternative E, the cumulative impacts on wildlife at this park site would be the same those under alternative C: negligible.

OAKWOOD VALLEY ALTERNATIVE E CONCLUSION TABLE

| Coastal Scrub, Chaparral, and Grassland Wildlife Impacts     | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|--|--|-------------------------------|
| Overall long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; the LOD area and ROLA are a small portion of the entire site; trails in this site are easily accessible from residential areas and receive heavy use by visitors | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative would allow on-leash dog walking on Oakwood Valley Fire Road and on Oakwood Valley Trail from the junction with the fire road to the junction with Alta Trail. Leash requirements would reduce the probability that dogs would disturb birds (Lafferty 2001a, 1955, 1961) and chase and/or harass other wildlife. However, the habitat in the LOD area would be affected by dogs through trampling, dog waste, and nutrient addition, resulting in long-term minor to moderate adverse impacts on wildlife in the LOD area. Because of mobility, wildlife can usually avoid areas with dogs present during peak activity or habituate to these activities, but the displacement of wildlife from high-quality habitat and preferred habitat that is degraded by the presence of dogs would indirectly affect wildlife. This site is frequented by coyotes, which would likely continue to be impacted by the presence of dogs.

The long-term minor to moderate adverse impacts that would occur in the LOD are representative of impacts from only a small portion of the entire site. Physically restraining dogs on leash would protect habitat off trail as well as wildlife, and chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior. Wildlife may avoid trail corridors that allow on-leash dog walking thereby becoming displaced from high quality habitat due to the presence of dogs. Additionally, trails in this site are easily accessible from residential areas and generally receive heavy use by visitors. Therefore, assuming compliance, the preferred alternative would result in overall long-term minor adverse impacts on wildlife because occasional disturbance of wildlife would result from dogs.

All dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Oakwood Valley is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs, with a limit of six. Since commercial dog walking activity is not common at Oakwood Valley, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have a negligible impact on wildlife.

**Cumulative Impacts.** Projects and actions in and near Oakwood Valley were considered for the cumulative impacts analysis (appendix K) and are similar to projects discussed previously. Long-term parkwide projects such as trail rehabilitation can provide enhancements that improve conditions for vegetation and wildlife habitat. Ongoing parkwide restoration and enhancement efforts can also

beneficially affect coastal scrub at GGNRA park sites such as Oakwood Valley. Additionally, the implementation of habitat restoration and projects funded by the Wildland/Urban Interface Initiative on private lands could impact Oakwood Valley.

As stated above, coastal scrub habitat in California is threatened by habitat loss, fragmentation, and degradation (USDA 2005, 613). The implementation of current and future projects both in GGNRA and beyond park boundaries could have a cumulative impact on the wildlife species that inhabit coastal scrub/chaparral/grassland communities. Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts. Because the mission blue butterfly inhabits coastal scrub/chaparral/grassland communities, projects that would benefit and enhance mission blue butterfly habitat would also benefit wildlife species that inhabit this community type.

The long-term minor adverse impacts on wildlife from dogs at Oakwood Valley under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from trail rehabilitation projects should reduce some of the adverse impacts on wildlife from the preferred alternative. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**OAKWOOD VALLEY PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Wildlife Impacts     | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|--|--|-------------------------------|
| Overall long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; trails and the LOD area are a small portion of the entire site; trails in this site are easily accessible from residential areas and receive heavy use by visitors | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

### Marin Headlands Trails

**Alternative A: No Action.** Under current conditions, on-leash dog walking is allowed along the Coastal Trail from Hill 88 to Muir Beach, the Batteries Loop Trail, North Miwok Trail from Tennessee Valley to Highway 1, County View Trail, and Marin Drive. Dog walking under voice control (or on leash) is allowed on the Coastal Trail from the Golden Gate Bridge to Hill 88, including the Lagoon Loop Trail; the Coastal, Wolf Ridge, and Miwok Trail Loop; and the Old Bunker Fire Road Loop (includes a section of the Coastal Trail). These trails experience low to moderate use by dog walkers. Dog-related incidents are high at this site with a total of 269 from 2008 through 2011, with the majority of incidents for having dogs within areas closed to pets (table 16). In general, in the larger tracts such as the Marin Headlands

## Chapter 4: Environmental Consequences

Trails, more dog walkers and their dogs would be concentrated at the trailheads and the ability of dog walkers to disperse provides a dilution that would actually spread impacts to a greater area or throughout the site. There are large tracts of coastal scrub habitat in Marin Headlands Trails that extend north into Muir Beach.

Under the no-action alternative at this site, off-leash dog access to wildlife and associated habitat off trails and fire roads would continue and impacts would be similar to those described in detail above at Alta Trail, Orchard Fire Road, and Pacheco Fire Road. Disturbance as a result of dogs includes physical damage to habitat or nests/burrows from digging or trampling, as well as chasing after and even capturing small mammals, reptiles, and ground-nesting birds. Ground-dwelling and ground-nesting bird species such as California quail are especially vulnerable. Dogs also have the potential to encounter larger mammals such as deer or coyotes and interact or exchange parasites/diseases. This site is frequented by coyotes, which are likely impacted by the continual presence of dogs. In addition, wildlife may be displaced from high-quality habitat that is degraded by the presence of dogs; trails in this site are easily accessible from residential areas and generally receive heavy use by visitors. Therefore, alternative A would result in continued long-term minor to moderate adverse impacts on wildlife using coastal scrub habitat at Marin Headlands Trails, because occasional to frequent disturbances to wildlife from dogs would occur.

Under alternative A, no permit system exists for dog walking. At Marin Headlands Trails, commercial dog walking is uncommon. Therefore, commercial dog walking would have negligible impacts on wildlife.

**Cumulative Impacts.** Projects and actions in and near Marin Headlands Trails were considered for the cumulative impacts analysis (appendix K) and are similar to projects discussed previously. Long-term parkwide projects such as trail rehabilitation can provide enhancements that improve conditions for vegetation and wildlife habitat. Ongoing parkwide restoration and enhancement efforts can also beneficially affect coastal scrub at GGNRA park sites such as Marin Headlands Trails. Additionally, the implementation of habitat restoration and projects funded by the Wildland/Urban Interface Initiative on private lands could impact Marin Headlands Trails.

As stated above, coastal scrub habitat in California is threatened by habitat loss, fragmentation, and degradation (USDA 2005). The implementation of current and future projects both in GGNRA and beyond park boundaries could have a cumulative impact on the wildlife species that inhabit coastal scrub/chaparral/grassland communities. Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts. Because the mission blue butterfly inhabits coastal scrub/chaparral/grassland communities, projects that would benefit and enhance mission blue butterfly habitat would also benefit wildlife species that inhabit this community type.

The long-term minor to moderate adverse impacts on wildlife from dogs at the Marin Headlands Trails under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from trail rehabilitation projects should reduce some of the adverse impacts on wildlife from alternative A. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible to long term, minor, and adverse.

**MARIN HEADLANDS TRAILS ALTERNATIVE A CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Wildlife Impacts</b> | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>                                |
|---|--|---|--|
| Long-term minor to moderate adverse impacts                     | Off-leash dog access to wildlife and associated habitat off trails and fire roads would continue; disturbance includes physical damage to habitat or nests/ burrows from digging or trampling, as well as chasing after and even capturing wildlife; wildlife may also be displaced from high quality habitat that is degraded by the presence of dogs; trails in this site are easily accessible from residential areas and receive heavy use by visitors | N/A   | Negligible to long-term minor adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would be the most protective of the coastal scrub/ chaparral habitat by prohibiting dogs throughout the Marin Headlands Trails site. Coastal scrub/chaparral/ grassland habitat, including habitat adjacent to trails and roads in the headlands, would be protected from impacts from dogs. Assuming compliance, alternative B would result in no impact on wildlife at the Marin Headlands Trails site.

Since dogs would be prohibited from the Marin Headlands Trails there would be no impact on wildlife from commercial dog walking.

**Cumulative Impacts.** The lack of impacts on wildlife under alternative B was considered together with the effects of the projects mentioned above under alternative A “Cumulative Impacts.” The beneficial effects from trail rehabilitation projects combined with the negligible impacts of development or construction actions and the lack of impacts on wildlife from alternative B would result in negligible cumulative impacts on wildlife.

**MARIN HEADLANDS TRAILS ALTERNATIVE B CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Wildlife Impacts</b> | <b>Rationale</b>                 | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|----------------------------------|---|-------------------------------|
| No impacts, assuming compliance                                 | Dogs would be prohibited at site | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would allow on-leash dog walking along the Lower Rodeo Valley Trail Corridor. This corridor extends from the Rodeo Beach parking lot to the intersection of Bunker and McCullough roads via the North Lagoon Loop Trail, North Miwok Trail, and Rodeo Valley Trail and includes the connector trails from the Rodeo Valley Trail to Smith Road Trailhead. On-leash dog walking would also be allowed on the Old Bunker Fire Road Loop, (including a section of the Coastal Trail), and the Batteries Loop Trail. This alternative would allow dog access only on these perimeter trails in the Marin Headlands, while preserving and maintaining the integrity of interior habitat. The LOD area would include 6 feet in each direction from the edges of the trail. Leash requirements would reduce the probability that dogs would disturb birds (Lafferty 2001a,

## Chapter 4: Environmental Consequences

1955, 1961) and chase and/or harass other wildlife, due to physical restraint on leash. However, the habitat in the LOD area would be affected by dogs through trampling, dog waste, and nutrient addition, resulting in long-term minor to moderate adverse impacts on wildlife in the LOD area. Because of mobility, wildlife can usually avoid areas with dogs present during peak activity or habituate to these activities, but the displacement of wildlife from high quality habitat and preferred habitat that is degraded by the presence of dogs would indirectly affect wildlife.

The long-term minor to moderate adverse impacts from dogs in the LOD area would occur in a relatively small area when compared to the site as a whole. Physically restraining dogs on leash would protect habitat off trail as well as wildlife, and chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior. Wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs. Additionally, trails in this site are easily accessible from residential areas and generally receive heavy use by visitors. Therefore, assuming compliance, the overall impact on wildlife from on-leash dog walking would be long term, minor, and adverse.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Marin Headlands Trails is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs, with a limit of six. Since commercial dog walking activity is not common at Marin Headlands Trails, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have a negligible impact on wildlife.

**Cumulative Impacts.** The long-term minor adverse impacts on wildlife from dogs at the Marin Headlands Trails under alternative C were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from trail rehabilitation projects should reduce some of the adverse impacts on wildlife from alternative C. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**MARIN HEADLANDS TRAILS ALTERNATIVE C CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Wildlife Impacts     | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|--|--|-------------------------------|
| Overall long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; trails and the LOD area are a small portion of the entire site; trails in this site are easily accessible from residential areas and receive heavy use by visitors | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Alternative D would have the same dog walking restrictions as alternative B (dogs would be prohibited on the trails); therefore, assuming compliance, no impact on wildlife would occur as a result of alternative D.

No dog walking would be allowed under alternative D; therefore, commercial and permitted dog walking would have no impact on wildlife.

**Cumulative Impacts.** Under alternative D, the cumulative impacts on wildlife in the Marin Headlands Trails would be the same as those under alternative B: negligible.

**MARIN HEADLANDS TRAILS ALTERNATIVE D CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Wildlife Impacts</b> | <b>Rationale</b>                 | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|----------------------------------|---|-------------------------------|
| No impact, assuming compliance                                  | Dogs would be prohibited at site | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would allow on-leash dog walking on the Conzelman Coastal Trail from Highway 101 to the McCullough intersection and then to the Coastal Trail Bike Route, including the fire road, to the Rodeo Beach parking lot. On-leash dog walking would be available on the Old Bunker Fire Road Loop (which includes a section of the Coastal Trail), Batteries Loop Trail, North Miwok Trail from Tennessee Valley to Highway 1, County View Trail, Marin Drive, Rodeo Avenue Trail, and Morning Sun Trail. This alternative would allow dog access only on these perimeter trails in the Marin Headlands, while preserving and maintaining the integrity of interior habitat. The LOD area would include 6 feet in each direction from the edges of the trails. Impacts on wildlife in the LOD area would be long term, moderate, and adverse due to trampling, dog waste, and nutrient addition. Because of mobility, wildlife can usually avoid areas with dogs present during peak activity or habituate to these activities, but the displacement of wildlife from high quality habitat and preferred habitat that is degraded by the presence of dogs would indirectly affect wildlife.

Under alternative E at the Marin Headlands Trails, on-leash dog trails and the LOD area are a greater portion of the entire site compared to alternatives B, C, and D. Trails in this site are easily accessible from residential areas and generally receive heavy use by visitors. Physically restraining dogs on leash would protect habitat off trail as well as wildlife, and chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior. Wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs. Therefore, assuming compliance, alternative E would result in overall long-term minor to moderate adverse impacts on wildlife because occasional to frequent disturbance to wildlife would result.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Marin Headlands Trails is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs, with a limit of six. Since commercial dog walking activity is not common at Marin Headlands Trails, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have a negligible impact on wildlife.

**Cumulative Impacts.** The long-term minor to moderate adverse impacts on wildlife from dogs at the Marin Headlands Trails under alternative E were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from trail rehabilitation projects should reduce some of the adverse impacts on wildlife from alternative E. The impacts resulting from any

## Chapter 4: Environmental Consequences

development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible to long term, minor, and adverse.

**MARIN HEADLANDS TRAILS ALTERNATIVE E CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Wildlife Impacts                 | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts                                       |
|--|---|--|--|
| Overall long-term minor to moderate adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; on-leash dog trails and the LOD area are a greater portion of the entire site; trails in this site are easily accessible from residential areas and receive heavy use by visitors | No change, assuming compliance               | Negligible to long-term minor adverse cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative would allow on-leash dog walking along the Lower Rodeo Valley Trail Corridor, which extends from the Rodeo Beach parking lot to the intersection of Bunker and McCullough Roads via the North Lagoon Loop Trail, Miwok Trail, Rodeo Valley Trail, and includes the connector trail from Rodeo Valley Trail to Smith Road Trailhead. On-leash dog walking would also be available on the Old Bunker Fire Road Loop (including a section of the Coastal Trail), Batteries Loop Trail, Rodeo Avenue Trail, and Morning Sun Trail. This alternative would allow dog access only on these perimeter trails in the Marin Headlands, while preserving and maintaining the integrity of interior habitat. The LOD area would include 6 feet in each direction from the edges of the trails. Leash requirements would reduce the probability that dogs would disturb birds (Lafferty 2001a, 1955, 1961) and chase and/or harass other wildlife, due to physical restraint on leash. However, the habitat in the LOD area would be affected by dogs through trampling, dog waste, and nutrient addition, resulting in long-term minor to moderate adverse impacts on wildlife in the LOD area. Because of mobility, wildlife can usually avoid areas with dogs present during peak activity or habituate to these activities, but the displacement of wildlife from high quality habitat and preferred habitat that is degraded by the presence of dogs would indirectly affect wildlife. This site is frequented by coyotes, which would likely continue to be impacted by the presence of dogs.

The long-term minor to moderate adverse impacts from dogs in the LOD area would occur in a relatively small area when compared to the site as a whole. Physically restraining dogs on leash would protect habitat off trail as well as wildlife, and chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior. Wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs. Additionally, trails in this site are easily accessible from residential areas and generally receive heavy use by visitors. Therefore, assuming compliance, the overall impact on wildlife from on-leash dog walking would be long term, minor, and adverse.

All dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Marin Headlands Trails is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs, with a limit of six. Since commercial dog walking activity is not common at Marin Headlands Trails, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have a negligible impact on wildlife.

**Cumulative Impacts.** Projects and actions in and near the Marin Headlands Trails were considered for the cumulative impacts analysis (appendix K) and are similar to projects discussed previously. Long-term parkwide projects such as trail rehabilitation can provide enhancements that improve conditions for vegetation and wildlife habitat. Ongoing parkwide restoration and enhancement efforts can also beneficially affect coastal scrub at GGNRA park sites such as the Marin Headlands Trails. Additionally, the implementation of habitat restoration and projects funded by the Wildland/Urban Interface Initiative on private lands could impact Marin Headlands Trails.

As stated above, coastal scrub habitat in California is threatened by habitat loss, fragmentation, and degradation (USDA 2005). The implementation of current and future projects both in GGNRA and beyond park boundaries could have a cumulative impact on the wildlife species that inhabit coastal scrub/chaparral/grassland communities. Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts. Because the mission blue butterfly inhabits coastal scrub/chaparral/grassland communities, projects that would benefit and enhance mission blue butterfly habitat would also benefit wildlife species that inhabit this community type.

The long-term minor adverse impacts on wildlife from dogs at the Marin Headlands Trails under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from trail rehabilitation projects should reduce some of the adverse impacts on wildlife from the preferred alternative. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**MARIN HEADLANDS TRAILS PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Wildlife Impacts</b> | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--|---|-------------------------------|
| Overall long-term minor adverse impacts, assuming compliance    | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; trails and the LOD area are a small portion of the entire site; trails in this site are easily accessible from residential areas and receive heavy use by visitors | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

## Chapter 4: Environmental Consequences

### Fort Baker

**Alternative A: No Action.** Alternative A allows dogs on leash throughout Fort Baker, except that dogs are not allowed on the Chapel Trail or the pier. This site experiences moderate visitor use and low dog walking use. Documented leash law violations at this site totaled 52 from 2008 through 2011 (table 17). Dogs have been observed by park staff off leash at the Parade Ground, Drown Fire Road, Battery Yates Trail, and behind the Bay Area Discovery Museum.

Under the no-action alternative at this site, on-leash dogs would have access to areas adjacent to the trails/fire roads, and off-leash dog access to wildlife and associated habitat off trails and fire roads would continue; impacts would be similar to those described in detail above at Alta Trail, Orchard Fire Road, and Pacheco Fire Road. Disturbance as a result of dogs includes physical damage to habitat or nests/burrows from digging or trampling, as well as chasing after and even capturing small mammals, reptiles, and ground-nesting birds. Ground-dwelling and ground-nesting bird species such as California quail are especially vulnerable. Dogs also have the potential to encounter larger mammals such as deer or coyotes and interact or exchange parasites/diseases. In addition, wildlife may be displaced from high-quality habitat that is degraded by the presence of dogs; trails in this site are easily accessible from residential areas. Therefore, alternative A would result in continued long-term minor to moderate adverse impacts on wildlife using coastal scrub habitat at Fort Baker, because occasional to frequent disturbances to wildlife from dogs would occur.

Under alternative A, no permit system exists for dog walking. At Fort Baker, commercial dog walking is uncommon. Therefore, commercial dog walking would have negligible impacts on wildlife.

**Cumulative Impacts.** Projects and actions in and near Fort Baker were considered for the cumulative impacts analysis (appendix K) and are similar to projects discussed previously. Long-term parkwide projects such as trail rehabilitation can provide enhancements that improve conditions for vegetation and wildlife habitat. Ongoing parkwide restoration and enhancement efforts can also beneficially affect coastal scrub at GGNRA park sites such as Fort Baker. Additionally, the implementation of habitat restoration and projects funded by the Wildland/Urban Interface Initiative on private lands could impact Fort Baker.

As stated above, coastal scrub habitat in California is threatened by habitat loss, fragmentation, and degradation (USDA 2005, 613). The implementation of current and future projects both in GGNRA and beyond park boundaries could have a cumulative impact on the wildlife species that inhabit coastal scrub/chaparral/grassland communities. Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts. Because the mission blue butterfly inhabits coastal scrub/chaparral/grassland communities, projects that would benefit and enhance mission blue butterfly habitat would also benefit wildlife species that inhabit this community type.

The long-term minor to moderate adverse impacts on wildlife from dogs at Fort Baker under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from trail rehabilitation projects should reduce some of the adverse impacts on wildlife from alternative A. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible to long term, minor, and adverse.

FORT BAKER ALTERNATIVE A CONCLUSION TABLE

| Coastal Scrub, Chaparral, and Grassland Wildlife Impacts | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts                                       |
|--|--|--|--|
| Long-term minor to moderate adverse impacts              | Off-leash dog access to wildlife and associated habitat off trails and fire roads would continue; disturbance includes physical damage to habitat or nests/ burrows from digging or trampling, as well as chasing after and even capturing wildlife; wildlife may also be displaced from high quality habitat that is degraded by the presence of dogs; trails in this site are easily accessible from residential areas and receive heavy use by visitors | N/A  | Negligible to long-term minor adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking on Drown Fire Road, the Bay Trail (not including Battery Yates Trail), Vista Point Trail (to be built), the Lodge/Conference Center Grounds, and the Parade Ground. Dogs would not be allowed on the Battery Yates Trail as part of this alternative due to the presence of mission blue butterfly habitat. The LOD area would include 6 feet in each direction from the edges of the trail/fire road/grounds. Leash requirements would reduce the probability that a dog would disturb birds (Lafferty 2001a, 1955, 1961) and chase and/or harass other wildlife, due to physical restraint on leash. However, the habitat in the LOD area would be affected by dogs through trampling, dog waste, and nutrient addition, resulting in long-term minor to moderate adverse impacts on wildlife in the LOD area. Because of mobility, wildlife can usually avoid areas with dogs present during peak activity or habituate to these activities, but the displacement of wildlife from high quality habitat and preferred habitat that is degraded by the presence of dogs would indirectly affect wildlife.

The long-term minor to moderate adverse impacts from dogs in the LOD area would occur in a relatively small area when compared to the site as a whole. Physically restraining dogs on leash would protect habitat off trail as well as wildlife, and chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior. Wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs. Additionally, trails in this site are easily accessible from residential areas and generally receive heavy use by visitors. Therefore, assuming compliance, the overall impact on wildlife at Fort Baker would be long term, minor, and adverse because occasional disturbance to wildlife would result.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is not common in this area, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have a negligible impact on wildlife.

**Cumulative Impacts.** The long-term minor adverse impacts on wildlife from dogs at Fort Baker under alternative B were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from trail rehabilitation projects should reduce some of the adverse impacts on wildlife from alternative B. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those

## Chapter 4: Environmental Consequences

impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**FORT BAKER ALTERNATIVE B CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Wildlife Impacts     | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|--|--|-------------------------------|
| Overall long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; trails and the LOD area are a small portion of the entire site; trails in this site are easily accessible from residential areas and receive heavy use by visitors | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would allow on-leash dog walking on Drown Fire Road, the Bay Trail including Battery Yates Trail, the Vista Point Trail (to be built), the Lodge/Conference Center Grounds, and the Parade Ground. The LOD area would include 6 feet in each direction from the edges of the trail/fire road/grounds. Leash requirements would reduce the probability that a dog would disturb birds (Lafferty 2001a, 1955, 1961) and chase and/or harass other wildlife, due to physical restraint on leash. However, the habitat in the LOD area would be affected by dogs through trampling, dog waste, and nutrient addition, resulting in long-term minor to moderate adverse impacts on wildlife in the LOD area. Because of mobility, wildlife can usually avoid areas with dogs present during peak activity or habituate to these activities, but the displacement of wildlife from high quality habitat and preferred habitat that is degraded by the presence of dogs would indirectly affect wildlife. Therefore, assuming compliance, the overall impact on wildlife at Fort Baker would be long term, minor, and adverse because occasional disturbance to wildlife would result.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. At Fort Baker (excluding Drown Fire Road), any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. Impacts on wildlife from permit holders with up to six dogs off leash would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is not common at Fort Baker, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have a negligible impact on wildlife.

**Cumulative Impacts.** The long-term minor adverse impacts on wildlife from dogs at Fort Baker under alternative C were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from trail rehabilitation projects should reduce some of the adverse impacts on wildlife from alternative C. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those

impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**FORT BAKER ALTERNATIVE C CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Wildlife Impacts     | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|--|--|-------------------------------|
| Overall long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; trails and the LOD area are a small portion of the entire site; trails in this site are easily accessible from residential areas and receive heavy use by visitors | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Under alternative D, on-leash dog walking would be allowed on the lodge and conference grounds, the Vista Point Trail (to be built), and on the Bay Trail (excluding the Battery Yates Trail). Impacts on wildlife caused by dogs in the areas adjacent to the trail (LOD area) would be long term, minor to moderate, and adverse due to trampling, dog waste, and nutrient addition. Because of mobility, wildlife can usually avoid areas with dogs present during peak activity or habituate to these activities, but the displacement of wildlife from high quality habitat and preferred habitat that is degraded by the presence of dogs would indirectly affect wildlife.

The minor to moderate adverse impacts from dogs in the LOD area would occur in a relatively small area when compared to the site as a whole. Physically restraining dogs on leash would protect habitat off trail as well as wildlife, and chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior. Wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs. Additionally, fewer trails would be available to on-leash dogs compared to all other alternatives, and this site generally receives heavy use by visitors. Therefore, assuming compliance, alternative D would result in negligible to long-term minor adverse impacts on wildlife because occasional disturbance to wildlife would result from dogs.

No commercial dog walking would be allowed and no permits to walk more than three dogs would be issued under alternative D; therefore, commercial and permitted dog walking would have no impact on wildlife. Private dog walkers would be allowed to walk one to three dogs.

**Cumulative Impacts.** The negligible to long-term minor adverse impacts on wildlife from dogs at Fort Baker under alternative D were considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from trail rehabilitation projects should reduce some of the adverse impacts on wildlife from alternative D. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for

**Chapter 4: Environmental Consequences**

impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**FORT BAKER ALTERNATIVE D CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Wildlife Impacts</b>            | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; trails and the LOD area are a small portion of the entire site; fewer trails would be available to on-leash dogs compared to all other alternatives; trails generally receive heavy use by visitors | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would have the same dog walking restrictions as alternative C, and impacts would be the same, assuming compliance: long term, minor to moderate, and adverse in the LOD area and long term, minor, and adverse overall.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. At Fort Baker (excluding Drown Fire Road), any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. Impacts on wildlife from permit holders with up to six dogs off leash would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is not common at Fort Baker, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have a negligible impact on wildlife.

**Cumulative Impacts.** Under alternative E, the cumulative impacts on wildlife at this park site would be the same those under alternative C: negligible.

FORT BAKER ALTERNATIVE E CONCLUSION TABLE

| Coastal Scrub, Chaparral, and Grassland Wildlife Impacts     | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|--|--|-------------------------------|
| Overall long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; trails and the LOD area are a small portion of the entire site; trails in this site are easily accessible from residential areas and receive heavy use by visitors | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative C, allowing on-leash dog walking on Drown Fire Road, the Vista Point Trail (to be built), the Bay Trail including the Battery Yates Trail, the Lodge/Conference Center Grounds, and the Parade Ground. Leash requirements would reduce the probability that dogs would disturb birds (Lafferty 2001a, 1955, 1961) and chase and/or harass other wildlife, due to physical restraint on leash. However, the habitat in the LOD area would be affected by dogs through trampling, dog waste, and nutrient addition, resulting in long-term minor to moderate adverse impacts on wildlife in the LOD area. Because of mobility, wildlife can usually avoid areas with dogs present during peak activity or habituate to these activities, but the displacement of wildlife from high quality habitat and preferred habitat that is degraded by the presence of dogs would indirectly affect wildlife.

The long-term minor to moderate adverse impacts from dogs in the LOD area would occur in a relatively small area when compared to the site as a whole. Physically restraining dogs on leash would protect habitat off trail as well as wildlife, and chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior. Wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs. Additionally, trails in this site are easily accessible from residential areas and generally receive heavy use by visitors. Therefore, assuming compliance, the overall impact on wildlife at Fort Baker would be long term, minor, and adverse because occasional disturbance to wildlife would result.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. At Fort Baker (excluding Drown Fire Road), any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. Impacts on wildlife from permit holders with up to six dogs off leash would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is not common at Fort Baker, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have a negligible impact on wildlife.

**Cumulative Impacts.** Projects and actions in and near Fort Baker were considered for the cumulative impacts analysis (appendix K) and are similar to projects discussed previously. Long-term parkwide

## Chapter 4: Environmental Consequences

projects such as trail rehabilitation can provide enhancements that improve conditions for vegetation and wildlife habitat. Ongoing parkwide restoration and enhancement efforts can also beneficially affect coastal scrub at GGNRA park sites such as Fort Baker. Additionally, the implementation of habitat restoration and projects funded by the Wildland/Urban Interface Initiative on private lands could impact Fort Baker.

As stated above, coastal scrub habitat in California is threatened by habitat loss, fragmentation, and degradation (USDA 2005, 613). The implementation of current and future projects both in GGNRA and beyond park boundaries could have a cumulative impact on the wildlife species that inhabit coastal scrub/chaparral/grassland communities. Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts. Because the mission blue butterfly inhabits coastal scrub/chaparral/grassland communities, projects that would benefit and enhance mission blue butterfly habitat would also benefit wildlife species that inhabit this community type.

The long-term minor adverse impacts on wildlife from dogs at Fort Baker under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from trail rehabilitation projects should reduce some of the adverse impacts on wildlife from the preferred alternative. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**FORT BAKER PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Wildlife Impacts     | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|--|--|-------------------------------|
| Overall long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; trails and the LOD area are a small portion of the entire site; trails in this site are easily accessible from residential areas and receive heavy use by visitors | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

### SAN FRANCISCO COUNTY SITES

#### Baker Beach and Bluffs to Golden Gate Bridge

**Alternative A: No Action.** Currently, dogs are allowed under voice control on the beach north of the draft plan/SEIS boundary, with on-leash dog walking required for trails leading to the beach; however, social trails exist at the site and traverse sensitive coastal scrub habitat. This site has documented low to

high visitor use (varies due to weather, holidays, and weekend use) and dog walking use is considered low to moderate (table 9).

Under the no-action alternative at this site, off-leash dog access to wildlife and associated habitat off trails and fire roads would continue and impacts would be similar to those described in detail above at Alta Trail, Orchard Fire Road, and Pacheco Fire Road. Disturbance as a result of dogs includes physical damage to habitat or nests/burrows from digging or trampling, as well as chasing after and even capturing small mammals, reptiles, and ground-nesting birds. Ground-dwelling and ground-nesting bird species such as California quail are especially vulnerable. Dogs also have the potential to encounter larger mammals such as deer or coyotes and interact or exchange parasites/diseases. In addition, wildlife may be displaced from high quality habitat that is degraded by the presence of dogs; trails in this site are easily accessible from residential areas. Therefore, alternative A would result in continued long-term minor to moderate adverse impacts on wildlife using coastal scrub habitat at Baker Beach and Bluffs to Golden Gate Bridge because occasional to frequent disturbances to wildlife from dogs would occur.

Under alternative A, no permit system exists for dog walking. At Baker Beach and Bluffs to Golden Gate Bridge, commercial dog walking is uncommon. Therefore, commercial dog walking would have negligible impacts on wildlife.

**Cumulative Impacts.** Projects and actions in and near Baker Beach and Bluffs to Golden Gate Bridge were considered for the cumulative impacts analysis (appendix K) and are similar to projects discussed previously. Long-term parkwide projects such as trail rehabilitation can provide enhancements that improve conditions for vegetation and wildlife habitat. Ongoing parkwide restoration and enhancement efforts can also beneficially affect coastal scrub at GGNRA park sites such as Baker Beach and Bluffs to Golden Gate Bridge. The implementation of habitat restoration and projects funded by the Wildland/Urban Interface Initiative on private lands could impact Baker Beach and Bluffs to Golden Gate Bridge.

The PTMP was adopted in 2002 and includes the preservation of the Presidio's cultural, natural, scenic, and recreational resources in Area B, managed by the Presidio Trust. The PTMP focuses on the long-term preservation of the park, including replacing pavement with green space, improving and enlarging the park's trail system, restoring stream corridors and natural habitats, and reusing historic structures (Presidio Trust 2002, 3). Management objectives in the PTMP that are applicable to wildlife include identifying and protecting sensitive wildlife species, and restoring and maintaining their habitats. The PTMP also preserves, enhances, and increases natural habitats managed by the Presidio Trust. For example, historic forests are being rehabilitated, wetlands are being enhanced, and native plant and wildlife species are being protected (Presidio Trust 2002, ii). As a result, the PTMP has beneficial impacts on wildlife at or in the vicinity of Baker Beach and Bluffs to Golden Gate Bridge.

As stated above, coastal scrub habitat in California is threatened by habitat loss, fragmentation, and degradation (USDA 2005, 613). The implementation of current and future projects both in GGNRA and beyond park boundaries could have a cumulative impact on the wildlife species that inhabit coastal scrub/chaparral/grassland communities. Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts. Because the mission blue butterfly inhabits coastal scrub/chaparral/grassland communities, projects that would benefit and enhance mission blue butterfly habitat would also benefit wildlife species that inhabit this community type.

The long-term minor to moderate adverse impacts on wildlife from dogs at Baker Beach and Bluffs to Golden Gate Bridge under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from trail rehabilitation projects and the PTMP should reduce

## Chapter 4: Environmental Consequences

some of the adverse impacts on wildlife from alternative A. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible to long term, minor, and adverse.

**BAKER BEACH AND BLUFFS TO GOLDEN GATE BRIDGE ALTERNATIVE A CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Wildlife Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts                                       |
|--|---|--|--|
| Long-term minor to moderate adverse impacts              | Off-leash dog access to wildlife and associated habitat off trails and fire roads would continue; disturbance includes physical damage to habitat or nests/burrows from digging or trampling, as well as chasing after and even capturing wildlife; wildlife may also be displaced from high quality habitat that is degraded by the presence of dogs; trails in this site are easily accessible from residential areas and receive heavy use by visitors | N/A  | Negligible to long-term minor adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking on all trails all the way to the Golden Gate Bridge in the vicinity of Baker Beach except the Batteries to Bluffs trail and trails leading to the Batteries to Bluffs trail, as well as on the beach north of the north parking lot. In general, impacts would be limited to the existing trails and the 6-foot corridors immediately adjacent to the trails. Leash requirements would reduce the probability that dogs would disturb birds (Lafferty 2001a, 1955, 1961) and chase and/or harass other wildlife, due to physical restraint on leash. However, the habitat in the LOD area would be affected by dogs through trampling, dog waste, and nutrient addition, resulting in long-term minor to moderate adverse impacts on wildlife in the LOD area. Because of mobility, wildlife can usually avoid areas with dogs present during peak activity or habituate to these activities, but the displacement of wildlife from high quality habitat and preferred habitat that is degraded by the presence of dogs would indirectly affect wildlife.

The long-term minor to moderate adverse impacts from dogs in the LOD area would affect only a portion of the site. Physically restraining dogs on leash would protect habitat off trail as well as wildlife, and chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior. Wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs. Additionally, trails in this site are easily accessible from residential areas and generally receive heavy use by visitors. Assuming compliance, alternative B would result in overall negligible to long-term minor adverse impacts on wildlife because occasional disturbance to wildlife would result.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is not common at Baker Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have a negligible impact on wildlife.

**Cumulative Impacts.** The negligible to long-term minor adverse impacts on wildlife from dogs at Baker Beach and Bluffs to Golden Gate Bridge under alternative B were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from trail rehabilitation projects and the PTMP should reduce some of the adverse impacts on wildlife from alternative B. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**BAKER BEACH AND BLUFFS TO GOLDEN GATE BRIDGE ALTERNATIVE B CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Wildlife Impacts                   | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|--|--|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; trails and the LOD area are a small portion of the entire site | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would have the same dog walking restrictions as alternative B, and impacts would be the same, assuming compliance: long term, minor to moderate, and adverse in the LOD area and negligible to long term, minor, and adverse overall.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. At Baker Beach, any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. Impacts on wildlife from permit holders with up to six dogs off leash would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is not common at Baker Beach and Bluffs to Golden Gate Bridge, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have a negligible impact on wildlife.

**Cumulative Impacts.** Under alternative C, the cumulative impacts on wildlife at this park would be the same as those under alternative B: negligible.

**BAKER BEACH AND BLUFFS TO GOLDEN GATE BRIDGE ALTERNATIVE C CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Wildlife Impacts                   | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|--|--|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; trails and the LOD area are a small portion of the entire site | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Alternative D would allow on-leash dog walking on the section of Baker Beach south of the north parking lot and on all trails leading to that section of beach, as well as the Coastal Trail. Dogs would be prohibited on the section of beach north of the north parking lot, approximately half of the beach, and the trails leading to the northern section of the beach. In general, impacts would be limited to the existing trails and the 6-foot corridors immediately adjacent to the trails. Impacts on wildlife from dogs in areas adjacent to the trail (LOD area) would be long term, minor to moderate, and adverse, due to trampling, dog waste, and nutrient addition. Because of mobility, wildlife can usually avoid areas with dogs present during peak activity or habituate to these activities, but the displacement of wildlife from high quality habitat and preferred habitat that is degraded by the presence of dogs would indirectly affect wildlife.

The long-term minor to moderate adverse impacts from dogs in the LOD area would occur in a relatively small area when compared to the site as a whole. Physically restraining dogs on leash would protect habitat off trail as well as wildlife, and chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior. Wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs. Therefore, assuming compliance, the overall impacts on wildlife at Baker Beach and Bluffs to Golden Gate Bridge would be negligible to long term, minor, and adverse.

No commercial dog walking would be allowed and no permits to walk more than three dogs would be issued under alternative D; therefore, commercial and permitted dog walking would have no impact on wildlife. Private dog walkers would be allowed to walk one to three dogs.

**Cumulative Impacts.** The negligible to long-term minor adverse impacts on wildlife from dogs at Baker Beach and Bluffs to Golden Gate Bridge under alternative D were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from trail rehabilitation projects and the PTMP should reduce some of the adverse impacts on wildlife from alternative D. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**BAKER BEACH AND BLUFFS TO GOLDEN GATE BRIDGE ALTERNATIVE D CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Wildlife Impacts                   | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|--|--|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; trails and the LOD area are a small portion of the entire site | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would allow on-leash dog walking on all trails in the vicinity of Baker Beach except the Batteries to Bluffs Trail and trails leading to the Batteries to Bluffs Trail, as well as on the northern portion of the beach. A ROLA would be established on the southern portion of the beach, south of the north parking lot. In general, impacts would be limited to the existing trails, and the 6-foot corridors immediately adjacent to the trails (LOD area). Impacts on wildlife in the LOD area from dogs would be long term, minor, and adverse due to trampling, dog waste, and nutrient addition. Because of mobility, wildlife can usually avoid areas with dogs present during peak activity or habituate to these activities, but the displacement of wildlife from high quality habitat and preferred habitat that is degraded by the presence of dogs would indirectly affect wildlife. The ROLA at Baker Beach and Bluffs to Golden Gate Bridge does not contain coastal scrub habitat; therefore, dog activity in the ROLA would not create any impacts on coastal scrub wildlife.

The long-term minor adverse impacts from dogs in the LOD area would occur in a relatively small area when compared to the site as a whole, and the beach ROLA is not in coastal scrub habitat. Physically restraining dogs on leash would protect habitat off trail as well as wildlife, and chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior. Wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs. Therefore, assuming compliance, the overall impacts on wildlife at Baker Beach and Bluffs to Golden Gate Bridge would be negligible to long term, minor, and adverse.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. At Baker Beach, any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. In a ROLA, permit holders may walk one to six dogs off leash and the permit may restrict use by time and area. Impacts on wildlife from permit holders with six dogs off leash would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is not common at Baker Beach and Bluffs to Golden Gate Bridge, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have a negligible impact on wildlife.

**Cumulative Impacts.** The negligible to long-term minor adverse impacts on wildlife from dogs at Baker Beach and Bluffs to Golden Gate Bridge under alternative E were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from trail rehabilitation projects

## Chapter 4: Environmental Consequences

and the PTMP should reduce some of the adverse impacts on wildlife from alternative E. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**BAKER BEACH AND BLUFFS TO GOLDEN GATE BRIDGE ALTERNATIVE E CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Wildlife Impacts                   | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|--|--|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; trails and the LOD area are a small portion of the entire site; beach ROLA is not in coastal scrub habitat | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative D, allowing on-leash dog walking on the beach south of the north parking lot, in picnic and parking areas, and on the trails to the southern beach area, as well as the Coastal Trail. Dogs would be prohibited on the section of beach north of the north parking lot, approximately half the beach, and the trails leading to the northern section of the beach. In general, impacts would be limited to the existing trails and the 6-foot corridors immediately adjacent to the trails. Impacts on wildlife caused by dogs in areas adjacent to the trail (LOD area) would be long term, minor to moderate, and adverse, due to trampling, dog waste, and nutrient addition. Because of mobility, wildlife can usually avoid areas with dogs present during peak activity or habituate to these activities, but the displacement of wildlife from high quality habitat and preferred habitat that is degraded by the presence of dogs would indirectly affect wildlife.

The long-term minor to moderate adverse impacts from dogs in the LOD area would occur in a relatively small area when compared to the site as a whole. Physically restraining dogs on leash would protect habitat off trail as well as wildlife, and chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior. Wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs. Therefore, assuming compliance, the overall impacts on wildlife at Baker Beach and Bluffs to Golden Gate Bridge would be negligible to long term, minor, and adverse.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. At Baker Beach, any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. Impacts on wildlife from permit holders with up to six dogs off leash would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is not common at Baker Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have a negligible impact on wildlife.

**Cumulative Impacts.** Projects and actions in and near Baker Beach and Bluffs to Golden Gate Bridge were considered for the cumulative impacts analysis (appendix K) and are similar to projects discussed previously. Long-term parkwide projects such as trail rehabilitation can provide enhancements that improve conditions for vegetation and wildlife habitat. Ongoing parkwide restoration and enhancement efforts can also beneficially affect coastal scrub at GGNRA park sites such as Baker Beach and Bluffs to Golden Gate Bridge. Additionally, the implementation of habitat restoration and projects funded by the Wildland/Urban Interface Initiative on private lands could impact Baker Beach and Bluffs to Golden Gate Bridge. As stated previously, the PTMP identifies and protects sensitive wildlife species, and restoring and maintaining their habitats. The PTMP preserves, enhances, and increases natural habitats managed by the Presidio Trust. For example, historic forests are being rehabilitated, wetlands are being enhanced, and native plant and wildlife species are being protected (Presidio Trust 2002, ii). As a result, the PTMP has beneficial impacts on wildlife at or in the vicinity of Baker Beach and Bluffs to Golden Gate Bridge.

As stated above, coastal scrub habitat in California is threatened by habitat loss, fragmentation, and degradation (USDA 2005, 613). The implementation of current and future projects both in GGNRA and beyond park boundaries could have a cumulative impact on the wildlife species that inhabit coastal scrub/chaparral/grassland communities. Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts. Because the mission blue butterfly inhabits coastal scrub/chaparral/grassland communities, projects that would benefit and enhance mission blue butterfly habitat would also benefit wildlife species that inhabit this community type.

The negligible to long-term minor adverse impacts on wildlife from dogs at Baker Beach and Bluffs to Golden Gate Bridge under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from trail rehabilitation projects and the PTMP should reduce some of the adverse impacts on wildlife from the preferred alternative. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

#### **BAKER BEACH AND BLUFFS TO GOLDEN GATE BRIDGE PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Wildlife Impacts</b>            | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|--|---|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; trails and the LOD area are a small portion of the entire site | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

### Lands End

**Alternative A: No Action.** Currently, dogs are allowed under voice control at the Lands End Site, which includes the Lands End Coastal Trail and the El Camino del Mar Trail. This site has low to moderate visitor use, including visitors with dogs (table 9), and a total of 10 dog-related incidents were recorded from 2008 through 2011 (table 22). Under the no-action alternative at this site, off-leash dog access to wildlife and associated habitat off trails and fire roads would continue and impacts would be similar to those described in detail above at Alta Trail, Orchard Fire Road, and Pacheco Fire Road. Disturbance as a result of dogs includes physical damage to habitat or nests/burrows from digging or trampling, as well as chasing after and even capturing small mammals, reptiles, and ground-nesting birds. Ground-dwelling and ground-nesting bird species such as California quail are especially vulnerable. Dogs also have the potential to encounter larger mammals such as deer or coyotes and interact or exchange parasites/diseases. In addition, wildlife may be displaced from high quality habitat that is degraded by the presence of dogs; trails in this site are easily accessible from residential areas. Therefore, alternative A would result in continued long-term minor to moderate adverse impacts on wildlife using coastal scrub habitat at Lands End because occasional to frequent disturbances to wildlife from dogs would occur.

Under alternative A, no permit system exists for dog walking. At Lands End, commercial dog walking is uncommon. Therefore, commercial dog walking would have negligible impacts on wildlife.

**Cumulative Impacts.** Projects and actions in and near Lands End were considered for the cumulative impacts analysis (appendix K) and are similar to projects discussed previously. Long-term parkwide projects such as trail rehabilitation can provide enhancements that improve conditions for vegetation and wildlife habitat. Ongoing parkwide restoration and enhancement efforts can also beneficially affect coastal scrub at GGNRA park sites such as Lands End. Additionally, the implementation of habitat restoration and projects funded by the Wildland/Urban Interface Initiative on private lands could impact Lands End.

As stated above, coastal scrub habitat in California is threatened by habitat loss, fragmentation, and degradation (USDA 2005, 613). The implementation of current and future projects both in GGNRA and beyond park boundaries could have a cumulative impact on the wildlife species that inhabit coastal scrub/chaparral/grassland communities. Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts. Because the mission blue butterfly inhabits coastal scrub/chaparral/grassland communities, projects that would benefit and enhance mission blue butterfly habitat would also benefit wildlife species that inhabit this community type.

The long-term minor to moderate adverse impacts on wildlife from dogs at Lands End under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from trail rehabilitation projects should reduce some of the adverse impacts on wildlife from alternative A. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible to long term, minor, and adverse.

LANDS END ALTERNATIVE A CONCLUSION TABLE

| Coastal Scrub, Chaparral, and Grassland Wildlife Impacts | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts                                       |
|--|--|--|--|
| Long-term minor to moderate adverse impacts              | Off-leash dog access to wildlife and associated habitat off trails and fire roads would continue; disturbance includes physical damage to habitat or nests/ burrows from digging or trampling, as well as chasing after and even capturing wildlife; wildlife may also be displaced from high quality habitat that is degraded by the presence of dogs; trails in this site are easily accessible from residential areas and receive heavy use by visitors | N/A  | Negligible to long-term minor adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking on the El Camino del Mar Trail, Lands End Coastal Trail, and connecting steps. In general, impacts would be limited to the existing trails and the 6-foot corridors immediately adjacent to the trails. Leash requirements would reduce the probability that dogs would disturb birds (Lafferty 2001a, 1955, 1961) and chase and/or harass other wildlife, due to physical restraint on leash. However, the habitat in the LOD area would be affected by dogs through trampling, dog waste, and nutrient addition, resulting in long-term minor to moderate adverse impacts on wildlife in the LOD area. Because of mobility, wildlife can usually avoid areas with dogs present during peak activity or habituate to these activities, but the displacement of wildlife from high quality habitat and preferred habitat that is degraded by the presence of dogs would indirectly affect wildlife.

The long-term minor to moderate adverse impact on wildlife along the land adjacent to the trails would occur in a relatively small area when compared to the site as a whole, which receives low to moderate use by dog walkers. Physically restraining dogs on leash would protect habitat off trail as well as wildlife, and chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior. Wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs. Additionally, trails in this site receive low to moderate use by dog walkers. Therefore, assuming compliance, alternative B would result in overall negligible to long-term minor adverse impacts on wildlife because occasional disturbance to wildlife would result.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking in this site is uncommon, it is likely that commercial dog walking would have a negligible impact on wildlife.

**Cumulative Impacts.** The negligible to long-term minor adverse impacts on wildlife from dogs at Lands End under alternative B were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from trail rehabilitation projects should reduce some of the adverse impacts on wildlife from alternative B. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for

## Chapter 4: Environmental Consequences

impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**LANDS END ALTERNATIVE B CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Wildlife Impacts                   | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|--|--|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; trails and the LOD area are a small portion of the entire site | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would have the same dog walking restrictions as alternative B, allowing on-leash dog walking on the El Camino del Mar Trail, the Lands End Coastal Trail, including on the steps to the El Camino del Mar Trail, and in the parking areas and on connecting trails. In general, impacts would be limited to the existing trails and the 6-foot corridors immediately adjacent to the trails. Impacts on wildlife would be long term, minor to moderate, and adverse in the LOD area. Impacts would result from disruption of wildlife habitat through trampling, dog waste, and nutrient addition. Because of mobility, wildlife can usually avoid areas with dogs present during peak activity or habituate to these activities, but the displacement of wildlife from high quality habitat and preferred habitat that is degraded by the presence of dogs would indirectly affect wildlife.

The minor to moderate adverse impacts in the LOD area would occur in a relatively small area when compared to the site as a whole. Physically restraining dogs on leash would protect habitat off trail as well as wildlife, and chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior. Wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs. Additionally, trails in this site receive low to moderate use by dog walkers. Therefore, assuming compliance, alternative C would result in overall negligible to long-term minor adverse impacts on wildlife because occasional disturbance to wildlife would result.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Lands End is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking activity is not common at Lands End, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have a negligible impact on wildlife.

**Cumulative Impacts.** The long-term minor adverse impacts on wildlife from dogs at Lands End under alternative C were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from trail rehabilitation projects should reduce some of the adverse impacts on wildlife from alternative C. The impacts resulting from any development or construction

actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**LANDS END ALTERNATIVE C CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Wildlife Impacts</b>            | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|--|---|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; trails and the LOD area are a small portion of the entire site | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Alternative D would allow on-leash dog walking on the El Camino del Mar Trail and on the Lands End Coastal Trail from Merrie Way parking lot to the junction with, and on the connector trail/steps leading to, the El Camino del Mar Trail. In general, impacts would be limited to the existing trails and the 6-foot corridors immediately adjacent to the trails. Impacts from dogs in areas adjacent to the trail (LOD area) would be long term, minor to moderate, and adverse, due to trampling, dog waste, and nutrient addition. Because of mobility, wildlife can usually avoid areas with dogs present during peak activity or habituate to these activities, but the displacement of wildlife from high quality habitat and preferred habitat that is degraded by the presence of dogs would indirectly affect wildlife.

The minor to moderate adverse impacts on wildlife adjacent to the trails in the LOD area would occur in a relatively small area when compared to the site as a whole. Physically restraining dogs on leash would protect habitat off trail as well as wildlife, and chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs. Additionally, Lands End receives low to moderate use by dog walkers. Therefore, assuming compliance, the overall impact on wildlife at Lands End would be negligible to long term, minor, and adverse.

No commercial dog walking would be allowed and no permits to walk more than three dogs would be issued under alternative D; therefore, commercial and permitted dog walking would have no impact on wildlife. Private dog walkers would be allowed to walk one to three dogs.

**Cumulative Impacts.** The negligible to long-term minor adverse impacts on wildlife from dogs at Lands End under alternative D were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from trail rehabilitation projects should reduce some of the adverse impacts on wildlife from alternative D. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for

**Chapter 4: Environmental Consequences**

impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**LANDS END ALTERNATIVE D CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Wildlife Impacts</b>            | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|--|---|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; trails and the LOD area are a small portion of the entire site | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would have the same dog walking restrictions as alternative B, and impacts would be the same, assuming compliance: long term, minor to moderate, and adverse in the LOD area and negligible to long term, minor, and adverse overall.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Lands End is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking activity is not common at Lands End, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have a negligible impact on wildlife.

**Cumulative Impacts.** Under alternative E, the cumulative impacts on wildlife at this park site would be the same those under alternative C: negligible.

LANDS END ALTERNATIVE E CONCLUSION TABLE

| Coastal Scrub, Chaparral, and Grassland Wildlife Impacts                   | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|--|--|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; trails and the LOD area are a small portion of the entire site | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative B. The preferred alternative would allow on-leash dog walking at on the El Camino del Mar Trail, Lands End Coastal Trail, and the connecting steps. In general, impacts would be limited to the existing trails and the 6-foot corridors immediately adjacent to the trails. Leash requirements would reduce the probability that dogs would disturb birds (Lafferty 2001a, 1955, 1961) and chase and/or harass other wildlife, due to physical restraint on leash. However, the habitat in the LOD area would be affected by dogs through trampling, dog waste, and nutrient addition, resulting in long-term minor to moderate adverse impacts on wildlife in the LOD area. Because of mobility, wildlife can usually avoid areas with dogs present during peak activity or habituate to these activities, but the displacement of wildlife from high quality habitat and preferred habitat that is degraded by the presence of dogs would indirectly affect wildlife.

The long-term minor to moderate adverse impacts on wildlife along the land adjacent to the trails would occur in a relatively small area when compared to the site as a whole, which receives low to moderate use by dog walkers. Physically restraining dogs on leash would protect habitat off trail as well as wildlife, and chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior. Wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs. Additionally, trails in this site are easily accessible from residential areas and generally receive heavy use by visitors. Therefore, assuming compliance, the preferred alternative would result in overall negligible to long-term minor adverse impacts on wildlife because occasional disturbance to wildlife would result.

Lands End is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. However, no permits allowing dog walkers to walk four to six dogs would be allocated at Lands End, so individual and commercial dog walkers would only be allowed to walk one to three dogs on leash per person. Since commercial dog walking is not common at Lands End, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have a negligible impact on wildlife.

**Cumulative Impacts.** Projects and actions in and near Lands End were considered for the cumulative impacts analysis (appendix K) and are similar to projects discussed previously. Long-term parkwide projects such as trail rehabilitation can provide enhancements that improve conditions for vegetation and wildlife habitat. Ongoing parkwide restoration and enhancement efforts can also beneficially affect coastal scrub at GGNRA park sites such as Lands End. Additionally, the implementation of habitat

## Chapter 4: Environmental Consequences

restoration and projects funded by the Wildland/Urban Interface Initiative on private lands could impact Lands End.

As stated above, coastal scrub habitat in California is threatened by habitat loss, fragmentation, and degradation (USDA 2005, 613). The implementation of current and future projects both in GGNRA and beyond park boundaries could have a cumulative impact on the wildlife species that inhabit coastal scrub/chaparral/grassland communities. Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts. Because the mission blue butterfly inhabits coastal scrub/chaparral/grassland communities, projects that would benefit and enhance mission blue butterfly habitat would also benefit wildlife species that inhabit this community type.

The negligible to long-term minor adverse impacts on wildlife from dogs at Lands End under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from trail rehabilitation projects should reduce some of the adverse impacts on wildlife from the preferred alternative. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**LANDS END PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Wildlife Impacts                   | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|--|--|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; trails and the LOD area are a small portion of the entire site | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

## SAN MATEO COUNTY SITES

### Mori Point

**Alternative A: No Action.** On-leash dog walking is currently allowed on all trails and the portion of the beach owned by the NPS. Although current GGNRA regulations require dogs to be leashed at Mori Point, unleashed dogs are often observed at the site. This site has moderate visitor use by dog walkers and some visitors do not comply with the leash law; off-leash violations totaled 146 from 2008 through 2011 (table 26).

Under the no-action alternative at this site, off-leash dog access to wildlife and associated habitat off trails and fire roads would continue and impacts would be similar to those described in detail above at Alta Trail, Orchard Fire Road, and Pacheco Fire Road. Disturbance as a result of dogs includes physical damage to habitat or nests/burrows from digging or trampling, as well as chasing after and even capturing

small mammals, reptiles, and ground-nesting birds. Ground-dwelling and ground-nesting bird species such as California quail are especially vulnerable. Dogs also have the potential to encounter larger mammals such as deer or coyotes and interact or exchange parasites/diseases. In addition, wildlife may be displaced from high quality habitat that is degraded by the presence of dogs; trails in this site are easily accessible from residential areas. Some of the trails at this site are long, with excellent coastal scrub habitat directly adjacent to the trails, so there could be an avoidance of these trail corridors by birds and mammals that would actually cover more than small, localized areas. Therefore, alternative A would result in continued long-term minor to moderate adverse impacts on wildlife using coastal scrub habitat at Mori Point because occasional to frequent disturbances to wildlife from dogs would occur.

Under alternative A, no permit system exists for dog walking. At Mori Point, commercial dog walking is uncommon. Therefore, commercial dog walking would have negligible impacts on wildlife.

**Cumulative Impacts.** Projects and actions in and near Mori Point were considered for the cumulative impacts analysis (appendix K) and are similar to projects discussed previously. Long-term parkwide projects such as trail rehabilitation can provide enhancements that improve conditions for vegetation and wildlife habitat. Ongoing parkwide restoration and enhancement efforts can also beneficially affect coastal scrub at GGNRA park sites such as Mori Point. Additionally, the implementation of habitat restoration and projects funded by the Wildland/Urban Interface Initiative on private lands could impact Mori Point.

As stated previously, coastal scrub habitat in California is threatened by habitat loss, fragmentation, and degradation (USDA 2005, 613). The implementation of current and future projects both in GGNRA and beyond park boundaries could have a cumulative impact on the wildlife species that inhabit coastal scrub/chaparral/grassland communities. Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts. Because the mission blue butterfly inhabits coastal scrub/chaparral/grassland communities, projects that would benefit and enhance mission blue butterfly habitat (even though this butterfly is not present at Mori Point currently) would also benefit wildlife species that inhabit this community type (i.e., various species of butterflies, small mammals, predators, reptiles, and bird species as described in chapter 3). Such projects include the following: proposed fire management policies of the *Fire Management Plan* (NPS 2005b); the *San Bruno Elfin and Mission Blue Butterflies Recovery Plan* (USFWS 1984); and the *Mori Point Restoration and Trail Plan* (NPS 2010e).

The long-term minor to moderate adverse impacts on wildlife from dogs at Mori Point under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from trail rehabilitation projects should reduce some of the adverse impacts on wildlife from alternative A. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible to long term, minor, and adverse.

MORI POINT ALTERNATIVE A CONCLUSION TABLE

| Coastal Scrub, Chaparral, and Grassland Wildlife Impacts | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts                                       |
|--|--|--|--|
| Long-term minor to moderate adverse impacts              | Off-leash dog access to wildlife and associated habitat off trails and fire roads would continue; disturbance includes physical damage to habitat or nests/burrows from digging or trampling, as well as chasing after and even capturing wildlife; wildlife may also be displaced from high quality habitat that is degraded by the presence of dogs; trails in this site generally receive low to moderate use | N/A  | Negligible to long-term minor adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would also allow on-leash dog walking on the Mori Coastal Trail and the beach (the portion owned by the NPS), but dogs would not be allowed on other trails or on Old Mori Trail. In general, impacts would be limited to the existing trails, the beach, and the 6-foot corridors immediately adjacent to the trails (LOD area). Leash requirements would reduce the probability that dogs would disturb birds (Lafferty 2001a, 1955, 1961) and chase and/or harass other wildlife, due to physical constraint. Impacts on wildlife in the LOD area would be long term, minor to moderate, and adverse since dogs would be able to disrupt wildlife habitat through trampling, dog waste, and nutrient addition. Because of mobility, wildlife can usually avoid areas with dogs present during peak activity or habituate to these activities, but the displacement of wildlife from high quality habitat and preferred habitat that is degraded by the presence of dogs would indirectly affect wildlife.

The long-term minor to moderate adverse impacts from dogs in the LOD area would occur in a relatively small area when compared to the site as a whole. Physically restraining dogs on leash would protect habitat off trail as well as wildlife, and chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs. Additionally, alternative B would have fewer trails available to on-leash dogs compared to alternative A, and the trails generally receive low to moderate use. Therefore, assuming compliance, alternative B would result in overall negligible to long-term minor adverse impacts on wildlife because occasional disturbance to wildlife would occur.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is not common in this area, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have a negligible impact on wildlife.

**Cumulative Impacts.** The negligible to long-term minor adverse impacts on wildlife from dogs at Mori Point under alternative B were considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from trail rehabilitation projects should reduce some of the adverse impacts on wildlife from alternative B. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for

impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**MORI POINT ALTERNATIVE B CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Wildlife Impacts                   | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|--|--|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; trails and the LOD area are a small portion of the entire site; fewer trails would be available to on-leash dogs compared to alternative A; trails generally receive low to moderate use | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would allow on-leash dog walking on Old Mori Trail, the Mori Coastal Trail, and the portion of beach owned by the NPS. In general, impacts would be limited to the existing trails, the beach, and the 6-foot corridors immediately adjacent to the trails (LOD area). Impacts on wildlife in the LOD area would be long term, minor to moderate, and adverse. Impacts would result from disruption of wildlife habitat through trampling, dog waste, and nutrient addition. Because of mobility, wildlife can usually avoid areas with dogs present during peak activity or habituate to these activities, but the displacement of wildlife from high quality habitat and preferred habitat that is degraded by the presence of dogs would indirectly affect wildlife.

The long-term minor to moderate adverse impacts from dogs in the LOD area would occur in a relatively small area when compared to the site as a whole. Physically restraining dogs on leash would protect habitat off trail as well as wildlife, and chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs. Additionally, there would be fewer trails available to on-leash dogs compared to alternative A and one more trail (Old Mori Trail) compared to alternative B. The trails at this site generally receive moderate use by dog walkers. Therefore, assuming compliance, the overall impact on wildlife at Mori Point would be negligible to long term, minor, and adverse.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Mori Point is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking activity is not common at Mori Point, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have a negligible impact on wildlife.

**Cumulative Impacts.** The negligible to long-term minor adverse impacts on wildlife from dogs at Mori Point under alternative C were considered together with the effects of the projects mentioned above in

## Chapter 4: Environmental Consequences

alternative A. The beneficial effects from trail rehabilitation projects should reduce some of the adverse impacts on wildlife from alternative C. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**MORI POINT ALTERNATIVE C CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Wildlife Impacts</b>            | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|--|---|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; trails and the LOD area are a small portion of the entire site; fewer trails would be available to on-leash dogs compared to alternative A; trails generally receive low to moderate use | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Under alternative D, dogs would not be allowed at this site. Therefore, no impacts on wildlife from dogs would occur at this site.

No dog walking would be allowed under alternative D; therefore, commercial dog walking would have no impact on wildlife.

**Cumulative Impacts.** The lack of impacts on wildlife from dogs at Mori Point under alternative D was considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the trail rehabilitation projects combined with the negligible impacts from any development or construction actions and the lack of impacts on wildlife from alternative D would result in negligible cumulative impacts on wildlife.

**MORI POINT ALTERNATIVE D CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Wildlife Impacts</b> | <b>Rationale</b>                 | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|----------------------------------|---|-------------------------------|
| No impact, assuming compliance                                  | Dogs would be prohibited at site | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would allow on-leash dog walking on the same trails and beach as alternative B, with the addition of Old Mori Trail and the Pollywog Trail. In general, impacts would be limited to the existing trails, the beach, and the 6-

foot corridors immediately adjacent to the trails (LOD area). Impacts from dog walking in the LOD area would be long term, minor to moderate, and adverse, due to trampling, dog waste, and nutrient addition. Because of mobility, wildlife can usually avoid areas with dogs present during peak activity or habituate to these activities, but the displacement of wildlife from high quality habitat and preferred habitat that is degraded by the presence of dogs would indirectly affect wildlife.

Under this alternative, the trails that would allow on-leash dogs and the LOD area are a greater portion of the entire site compared to alternatives B, C, and D. In addition, the trails generally receive moderate use by dog walkers. Physically restraining dogs on leash would protect habitat off trail as well as wildlife, and chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior. Wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs, which would indirectly affect wildlife. Therefore, assuming compliance, the overall impact on wildlife at Mori Point would be long term, minor, and adverse.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Mori Point is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking activity is not common at Mori Point, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have a negligible impact on wildlife.

**Cumulative Impacts.** The long-term minor adverse impacts on wildlife from dogs at Mori Point under alternative E were considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from trail rehabilitation projects should reduce some of the adverse impacts on wildlife from alternative E. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**MORI POINT ALTERNATIVE E CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Wildlife Impacts</b> | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--|---|-------------------------------|
| Overall long-term minor adverse impacts, assuming compliance    | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; trails generally receive low to moderate use | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative E. The preferred alternative would allow on-leash dog walking on Old Mori Trail, the Mori Coastal Trail, the Pollywog Trail and the portion of beach owned by the NPS. In general, impacts would be limited to the

## Chapter 4: Environmental Consequences

existing trails, the beach, and the 6-foot corridors immediately adjacent to the trails (LOD area). Impacts on wildlife in the LOD area would be long term, minor to moderate, and adverse. Impacts would result from disruption of wildlife habitat through trampling, dog waste, and nutrient addition. Because of mobility, wildlife can usually avoid areas with dogs present during peak activity or habituate to these activities, but the displacement of wildlife from high quality habitat and preferred habitat that is degraded by the presence of dogs would indirectly affect wildlife.

The long-term minor to moderate adverse impacts from dogs in the LOD area would occur in a relatively small area when compared to the site as a whole. Physically restraining dogs on leash would protect habitat off trail as well as wildlife, and chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior. Wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs. Additionally, there would be fewer trails available to on-leash dogs compared to alternative A and two more trails (Old Mori Trail and the Pollywog Trail) compared to alternative B. The trails at this site generally receive low to moderate use. Therefore, assuming compliance, the overall impact on wildlife at Mori Point would be negligible to long term, minor, and adverse.

All dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Mori Point is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking activity is not common at Mori Point, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have a negligible impact on wildlife.

**Cumulative Impacts.** Projects and actions in and near Mori Point were considered for the cumulative impacts analysis (appendix K) and are similar to projects discussed previously. Long-term parkwide projects such as trail rehabilitation can provide enhancements that improve conditions for vegetation and wildlife habitat. Ongoing parkwide restoration and enhancement efforts can also beneficially affect coastal scrub at GGNRA park sites such as Mori Point. Additionally, the implementation of habitat restoration and projects funded by the Wildland/Urban Interface Initiative on private lands could impact Mori Point.

As stated previously, coastal scrub habitat in California is threatened by habitat loss, fragmentation, and degradation (USDA 2005, 613). The implementation of current and future projects both in GGNRA and beyond park boundaries could have a cumulative impact on the wildlife species that inhabit coastal scrub/chaparral/grassland communities. Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts. Because the mission blue butterfly inhabits coastal scrub/chaparral/grassland communities, projects that would benefit and enhance mission blue butterfly habitat would also benefit wildlife species that inhabit this community type (i.e., various species of butterflies, small mammals, predators, reptiles, and bird species, as described in chapter 3). Such projects include the following: proposed fire management policies of the *Fire Management Plan* (NPS 2005b); the *San Bruno Elfin and Mission Blue Butterflies Recovery Plan* (USFWS 1984); the *Mori Point Restoration and Trail Plan* (NPS 2010e); and the Martini Creek watershed assessment (San Mateo County) (CCC 2008).

The negligible to long-term minor adverse impacts on wildlife from dogs at Mori Point under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from trail rehabilitation projects should reduce some of the adverse impacts on wildlife from the preferred alternative. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts

would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**MORI POINT PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Wildlife Impacts                   | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|--|--|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; trails and the LOD area are a small portion of the entire site; fewer trails would be available to on-leash dogs compared to alternative A; trails generally receive low to moderate use | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

## Milagra Ridge

**Alternative A: No Action.** On-leash dog walking is currently allowed on all trails and fire roads. This site has documented moderate visitor use by bicyclists, walkers, and hikers, and low to moderate visitor use by dog walkers (table 9). Although current GGNRA regulations require dogs to be leashed at Milagra Ridge, unleashed dogs have been observed at the site; leash law violations totaled 35 from 2008 through 2011 (table 27).

Under the no-action alternative at this site, off-leash dog access to wildlife and associated habitat off trails and fire roads would continue. Disturbance as a result of dogs includes physical damage to habitat or nests/burrows from digging or trampling, as well as chasing after and even capturing small mammals, reptiles, and ground-nesting birds. Ground-dwelling and ground-nesting bird species such as California quail are especially vulnerable. Dogs also have the potential to encounter larger mammals such as deer or coyotes and interact or exchange parasites/diseases. Specifically, dog/coyote interactions have occurred at Milagra Ridge. In addition, wildlife may be displaced from high quality habitat that is degraded by the presence of dogs; trails in this site are easily accessible from residential areas. Some of the trails at this site are long, with excellent coastal scrub habitat directly adjacent to the trails, so there could be an avoidance of these trail corridors by birds and mammals that would actually cover more than small, localized areas. Therefore, alternative A would result in continued long-term minor to moderate adverse impacts on wildlife using coastal scrub habitat at Milagra Ridge because occasional to frequent disturbances to wildlife from dogs would occur.

Under alternative A, no permit system exists for dog walking. At Milagra Ridge, commercial dog walking is uncommon. Therefore, commercial dog walking would have negligible impacts on wildlife.

**Cumulative Impacts.** Projects and actions in and near Milagra Ridge were considered for the cumulative impacts analysis (appendix K) and are similar to projects discussed previously. Long-term parkwide

## Chapter 4: Environmental Consequences

projects such as trail rehabilitation can provide enhancements that improve conditions for vegetation and wildlife habitat. Ongoing parkwide restoration and enhancement efforts can also beneficially affect coastal scrub at GGNRA park sites such as Milagra Ridge. Additionally, the implementation of habitat restoration and projects funded by the Wildland/Urban Interface Initiative on private lands could impact Milagra Ridge. The scope of the SNRAMP analysis includes a natural area managed by the SFRPD in Pacifica (Sharp Park, located near Milagra Ridge) and addresses dog walking (including on-leash dog walking and off-leash DPAs) in this area (SFPD 2011, 261-262). Project activities included in the SNRAMP would protect and improve habitat and provide long-term beneficial impacts to wildlife.

As stated previously, coastal scrub habitat in California is threatened by habitat loss, fragmentation, and degradation (USDA 2005, 613). The implementation of current and future projects both in GGNRA and beyond park boundaries could have a cumulative impact on the wildlife species that inhabit coastal scrub/chaparral/grassland communities. Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts. Because the mission blue butterfly inhabits coastal scrub/chaparral/grassland communities, projects that would benefit and enhance mission blue butterfly habitat would also benefit wildlife species that inhabit this community type. Such projects include the following: proposed fire management policies of the *Fire Management Plan* (NPS 2005b), the *San Bruno Elfín and Mission Blue Butterflies Recovery Plan* (USFWS 1984), site management plans for sites in GGNRA such as Milagra Ridge, and the Martini Creek watershed assessment (San Mateo County) (CCC 2008).

The long-term minor to moderate adverse impacts on wildlife from dogs at Milagra Ridge under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from trail rehabilitation projects and the SNRAMP should reduce some of the adverse impacts on wildlife from alternative A. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible to long term, minor, and adverse.

**MILAGRA RIDGE ALTERNATIVE A CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Wildlife Impacts</b> | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>                                |
|---|--|---|--|
| Long-term minor to moderate adverse impacts                     | Off-leash dog access to wildlife and associated habitat off trails and fire roads would continue; disturbance includes physical damage to habitat or nests/burrows from digging or trampling, as well as chasing after and even capturing wildlife; wildlife may also be displaced from high quality habitat that is degraded by the presence of dogs; trails in this site generally receive low to moderate use | N/A   | Negligible to long-term minor adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B also would allow dog walking on leash on the fire road and the trail to the westernmost overlook and WW II bunker, as well as on the future Milagra Battery

Trail. However, the trail to the top of the hill would not be open for dog walking in this alternative. Since dog walkers may walk along the edge of the fire road or trails, dogs would then have access to the adjacent land 6 feet in all directions, resulting in an LOD area that would extend 6 feet out from the edges of the fire road or trails. In general, impacts on wildlife would be limited to the existing fire road and trails and the 6-foot corridors immediately adjacent to the trails/fire road. Leash requirements would reduce the probability that dogs would disturb birds (Lafferty 2001a, 1955, 1961) and chase and/or harass other wildlife, due to physical constraint. Impacts in wildlife areas adjacent to the trail (6-foot corridor or LOD area) would be long term, minor to moderate, and adverse since dogs would be able to disrupt wildlife habitat through trampling, dog waste, and nutrient addition. Because of mobility, wildlife can usually avoid areas with dogs present during peak activity or habituate to these activities, but the displacement of wildlife from high quality habitat and preferred habitat that is degraded by the presence of dogs would indirectly affect wildlife.

The minor to moderate adverse impacts from dogs in the LOD area would occur in a relatively small area when compared to the site as a whole. Physically restraining dogs on leash would protect habitat off trail as well as wildlife, and chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs. Additionally, alternative B would have fewer trails available to on-leash dogs compared to alternative A, and trails generally receive low to moderate use. Therefore, assuming compliance, alternative B would result in overall negligible to long-term minor adverse impacts on wildlife because occasional disturbance to wildlife would result.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is uncommon at Milagra Ridge, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have a negligible impact on wildlife.

**Cumulative Impacts.** The negligible to long-term minor adverse impacts on wildlife from dogs at Milagra Ridge under alternative B were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from trail rehabilitation projects and the SNRAMP should reduce some of the adverse impacts on wildlife from alternative B. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

MILAGRA RIDGE ALTERNATIVE B CONCLUSION TABLE

| Coastal Scrub, Chaparral, and Grassland Wildlife Impacts                   | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|--|--|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; trails and the LOD area are a small portion of the entire site; fewer trails would be available to on-leash dogs compared to alternative A; trails generally receive low to moderate use | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would allow on-leash dog walking in the same areas as alternative B and impacts would be the same: long term, minor to moderate, and adverse in the LOD area and negligible to long term, minor, and adverse overall.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Milagra Ridge is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking activity is not common at Milagra Ridge, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have a negligible impact on wildlife.

**Cumulative Impacts.** Under alternative C, the cumulative impacts on wildlife at Milagra Ridge would be the same as those under alternative B: negligible.

**MILAGRA RIDGE ALTERNATIVE C CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Wildlife Impacts</b>            | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|--|---|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; trails and the LOD area are a small portion of the entire site; fewer trails would be available to on-leash dogs compared to alternative A; trails generally receive low to moderate use | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Alternative D would prohibit dogs at Milagra Ridge, thus providing long-term protection of coastal scrub/chaparral/grassland habitat throughout the site. This protects not only the habitat, including interior areas, but all wildlife species that use the habitat at Milagra Ridge. Therefore, no impact would occur on wildlife at this site as a result of alternative D.

Since dogs would be prohibited from the site, there would be no impacts from commercial dog walking on wildlife.

**Cumulative Impacts.** The lack of impacts on wildlife from dogs at Milagra Ridge under alternative D was considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from trail rehabilitation projects and the SNRAMP combined with the negligible impacts from any development or construction actions and the lack of impacts on wildlife from alternative D would result in negligible cumulative impacts on wildlife.

**MILAGRA RIDGE ALTERNATIVE D CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Wildlife Impacts</b> | <b>Rationale</b>                 | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|----------------------------------|---|-------------------------------|
| No impact, assuming compliance                                  | Dogs would be prohibited at site | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would allow on-leash dog walking on the same trails as alternative B, with the addition of a trail to the top of the hill. In general, impacts would be limited to the existing trails and fire road and the 6-foot corridors immediately adjacent to the trails/fire road (LOD area). Impacts on wildlife from dogs in the LOD area would be long term, minor to moderate, and adverse, due to trampling, dog waste, and nutrient addition. Because of mobility, wildlife can usually avoid areas with dogs present during peak activity or habituate

## Chapter 4: Environmental Consequences

to these activities, but the displacement of wildlife from high quality habitat and preferred habitat that is degraded by the presence of dogs would indirectly affect wildlife.

Under this alternative, the on-leash dog trails and the LOD area are a greater portion of the site compared to alternatives B, C, and D. In addition, the trails generally receive low to moderate use. Physically restraining dogs on leash would protect habitat off trail as well as wildlife, and chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs, which would indirectly affect wildlife. Therefore, assuming compliance, the overall impact on wildlife at Milagra Ridge would be long term, minor, and adverse.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Milagra Ridge is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking activity is not common at Milagra Ridge, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have a negligible impact on wildlife.

**Cumulative Impacts.** Under alternative E, the cumulative impacts on wildlife at this park site would be the same those under alternative B: negligible.

**MILAGRA RIDGE ALTERNATIVE E CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Wildlife Impacts     | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|--|--|-------------------------------|
| Overall long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; on-leash dog trails and the LOD area are a greater portion of the entire site compared to alternatives B, C, and D; trails generally receive low to moderate use | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative B, allowing dogs on leash on the fire road and the trail to the westernmost overlook and WW II bunker, as well as on the future Milagra Battery Trail. However, the trail to the top of the hill would not be open for dog walking in this alternative. Since dog walkers may walk along the edge of the fire road or trails, dogs would then have access to the adjacent land 6 feet in all directions, resulting in an LOD that would extend 6 feet out from the edges of the fire road or trails. In general, impacts on wildlife would area be limited to the existing fire road and trails and the 6-foot corridors immediately adjacent to the trails/fire road. Leash requirements would reduce the probability that dogs would disturb birds (Lafferty 2001a, 1955, 1961) and chase and/or harass other wildlife, due to physical constraint. Impacts in wildlife areas adjacent to the trail

(6-foot corridor or LOD area) would be long term, minor to moderate, and adverse since dogs would be able to disrupt wildlife habitat through trampling, dog waste, and nutrient addition. Because of mobility, wildlife can usually avoid areas with dogs present during peak activity or habituate to these activities, but the displacement of wildlife from high quality habitat and preferred habitat that is degraded by the presence of dogs would indirectly affect wildlife.

The minor to moderate adverse impacts from dogs in the LOD area would occur in a relatively small area when compared to the site as a whole. Physically restraining dogs on leash would protect habitat off trail as well as wildlife, and chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs. Additionally, the preferred alternative would have fewer trails available to on-leash dogs compared to alternative A, and trails generally receive low to moderate use. Therefore, assuming compliance, the preferred alternative would result in overall negligible to long-term minor adverse impacts on wildlife because occasional disturbance to wildlife would result.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Milagra Ridge is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking activity is not common at Milagra Ridge, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have a negligible impact on wildlife.

**Cumulative Impacts.** Projects and actions in and near Milagra Ridge were considered for the cumulative impacts analysis (appendix K) and are similar to projects discussed previously. Long-term parkwide projects such as trail rehabilitation can provide enhancements that improve conditions for vegetation and wildlife habitat. Ongoing parkwide restoration and enhancement efforts can also beneficially affect coastal scrub at GGNRA park sites such as Milagra Ridge. Additionally, the implementation of habitat restoration and projects funded by the Wildland/Urban Interface Initiative on private lands could impact Milagra Ridge. The scope of the SNRAMP analysis includes a natural area managed by the SFRPD in Pacifica (Sharp Park, located near Milagra Ridge) and addresses dog walking (including on-leash dog walking and off-leash DPAs) in this area (SFPD 2011, 261-262). Project activities included in the SNRAMP would protect and improve habitat and provide long-term beneficial impacts to wildlife.

As stated previously, coastal scrub habitat in California is threatened by habitat loss, fragmentation, and degradation (USDA 2005, 613). The implementation of current and future projects both in GGNRA and beyond park boundaries could have a cumulative impact on the wildlife species that inhabit coastal scrub/chaparral/grassland communities. Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts. Because the mission blue butterfly inhabits coastal scrub/chaparral/grassland communities, projects that would benefit and enhance mission blue butterfly habitat would also benefit wildlife species that inhabit this community type. Such projects include the following: proposed fire management policies of the *Fire Management Plan* (NPS 2005b), the *San Bruno Elfin and Mission Blue Butterflies Recovery Plan* (USFWS 1984), site management plans for sites in GGNRA such as Milagra Ridge, and the Martini Creek watershed assessment (San Mateo County) (CCC 2008).

The negligible to long-term minor adverse impacts on wildlife from dogs at Milagra Ridge under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from trail rehabilitation projects and the SNRAMP should reduce some of the adverse impacts on wildlife from the preferred alternative. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on

## Chapter 4: Environmental Consequences

wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**MILAGRA RIDGE PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Wildlife Impacts                   | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|--|--|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; trails and the LOD area are a small portion of the entire site; trails generally receive low to moderate use | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

### Sweeney Ridge/Cattle Hill

**Alternative A: No Action.** On-leash dog walking is currently allowed on all trails at Sweeney Ridge except the Notch Trail, which is closed to dogs. Cattle Hill is currently not part of GGNRA, but unrestricted dog walking also occurs at this site. These sites have documented low to moderate visitor use by dog walkers and off-leash incidents totaled 115 from 2008 through 2011 (table 28); therefore, off-leash dog walking is occurring along the trails of these sites.

Under the no-action alternative at these sites, off-leash dog access to wildlife and associated habitat off trails would continue. Disturbance as a result of dogs includes physical damage to habitat or nests/burrows from digging or trampling, as well as chasing after and even capturing small mammals, reptiles, and ground-nesting birds. Ground-dwelling and ground-nesting bird species such as California quail are especially vulnerable. Dogs also have the potential to encounter larger mammals such as deer or coyotes and interact or exchange parasites/diseases. In addition, wildlife may be displaced from high quality habitat that is degraded by the presence of dogs; trails in this site are easily accessible from residential areas. Some of the trails at these sites are long, with excellent coastal scrub habitat directly adjacent to the trails, so there could be an avoidance of these trail corridors by birds and mammals that would actually cover more than small, localized areas. Therefore, alternative A would result in continued long-term minor to moderate adverse impacts on wildlife using coastal scrub habitat at Sweeney Ridge/Cattle Hill because occasional to frequent disturbances to wildlife from dogs would occur.

Under alternative A, no permit system exists for dog walking. Commercial dog walking is uncommon at Sweeney Ridge/Cattle Hill. Therefore, commercial dog walking would have negligible impacts on wildlife.

**Cumulative Impacts.** Projects and actions in and near Sweeney Ridge/Cattle Hill were considered for the cumulative impacts analysis (appendix K) and are similar to projects discussed previously. Long-term

parkwide projects such as trail rehabilitation can provide enhancements that improve conditions for vegetation and wildlife habitat. Ongoing parkwide restoration and enhancement efforts can also beneficially affect coastal scrub at GGNRA park sites such as Sweeney Ridge. Additionally, the implementation of habitat restoration and projects funded by the Wildland/Urban Interface Initiative on private lands could impact Sweeney Ridge. The scope of the SNRAMP analysis includes a natural area managed by the SFRPD in Pacifica (Sharp Park, located near Sweeney Ridge) and addresses dog walking (including on-leash dog walking and off-leash DPAs) in this area (SFPD 2011, 261-262). Project activities included in the SNRAMP would protect and improve habitat and provide long-term beneficial impacts to wildlife.

As stated previously, coastal scrub habitat in California is threatened by habitat loss, fragmentation, and degradation (USDA 2005, 613). The implementation of current and future projects both in GGNRA and beyond park boundaries could have a cumulative impact on the wildlife species that inhabit coastal scrub/chaparral/grassland communities. Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts. Because the mission blue butterfly inhabits coastal scrub/chaparral/grassland communities, projects that would benefit and enhance mission blue butterfly habitat would also benefit wildlife species that inhabit this community type. Such projects include the following: proposed fire management policies of the *Fire Management Plan* (NPS 2005b), and the *San Bruno Elfin and Mission Blue Butterflies Recovery Plan* (USFWS 1984).

The long-term minor to moderate adverse impacts on wildlife from dogs at Sweeney Ridge/Cattle Hill under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from trail rehabilitation projects and the SNRAMP should reduce some of the adverse impacts on wildlife from alternative A. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible to long term, minor, and adverse.

**SWEENEY RIDGE/CATTLE HILL ALTERNATIVE A CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Wildlife Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>                                |

| Long-term minor to moderate adverse impacts                     | Off-leash dog access to wildlife and associated habitat off trails would continue; disturbance includes physical damage to habitat or nests/burrows from digging or trampling, as well as chasing after and even capturing wildlife; wildlife may also be displaced from high quality habitat that is degraded by the presence of dogs; trails in this site generally receive low to moderate use | N/A   | Negligible to long-term minor adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would prohibit dogs at Sweeney Ridge/Cattle Hill, thus providing long-term protection of coastal scrub/chaparral/grassland habitat throughout the site. This

## Chapter 4: Environmental Consequences

protects not only the habitat, including interior areas, but all wildlife species that use the habitat at Sweeney Ridge/Cattle Hill. Therefore, no impact would occur on wildlife at these sites as a result of alternative B.

Since dog walking would not be allowed at Sweeney Ridge and Cattle Hill, commercial dog walking under alternative B would have no impact on wildlife.

**Cumulative Impacts.** The lack of impacts on wildlife under alternative B was considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from trail rehabilitation projects and the SNRAMP combined with the negligible impacts from any development or construction actions and the lack of impacts on wildlife from alternative B would result in beneficial cumulative impacts on wildlife.

**SWEENEY RIDGE/CATTLE HILL ALTERNATIVE B CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Wildlife Impacts</b> | <b>Rationale</b>                       | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--|---|-------------------------------|
| No impact, assuming compliance                                  | Dogs would be prohibited at both sites | Beneficial, assuming compliance                     | Beneficial cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Under alternative C, no dog walking would be allowed at Sweeney Ridge. Therefore, assuming compliance, no impact on wildlife from dogs at Sweeney Ridge would occur because dogs would be prohibited at the site. At Cattle Hill, on-leash dog walking would be allowed on the Baquiano Trail from Fassler Avenue up to and including the Farallon View Trail. Since dog walkers may walk along the edge of the trails, dogs would then have access to the adjacent land 6 feet in all directions, resulting in an LOD area that would extend 6 feet out from the edges of the trails. Impacts on wildlife from dogs in areas adjacent to the trail (6-foot corridor or LOD area) would be long term, minor to moderate, and adverse, due to trampling, dog waste, and nutrient addition. Because of mobility, wildlife can usually avoid areas with dogs present during peak activity or habituate to these activities, but the displacement of wildlife from high quality habitat and preferred habitat that is degraded by the presence of dogs would indirectly affect wildlife.

The Cattle Hill trails would allow on-leash dog walking under this alternative and these trails generally receive low to moderate use by dog walkers. Physically restraining dogs on leash would protect habitat off trail as well as wildlife, and chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs, which would indirectly affect wildlife. In addition, the LOD area only makes up a small portion of the entire site. Therefore, when looking at the entire site the overall impact on wildlife at Cattle Hill would be long term, minor, and adverse.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Sweeney Ridge/Cattle Hill is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since dog walking would not be allowed at Sweeney Ridge commercial dog walking under alternative C would have no impact to coastal scrub wildlife. Since commercial dog walking is not common at Cattle Hill, it is likely that this alternative would not have an impact on the number of dog walkers.

**Cumulative Impacts.** The lack of impacts from dogs at Sweeney Ridge under alternative C was considered together with the effects of the projects mentioned above under alternative A. The beneficial

effects from trail rehabilitation projects considered with the lack of impacts under this alternative would result in beneficial cumulative impacts for Sweeney Ridge. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts.

The long-term, minor, adverse impact to the coastal scrub wildlife community from dogs at Cattle Hill under alternative C were considered together with effects of the projects mentioned above under alternative A cumulative impacts. The beneficial effects from trail rehabilitation projects and the SNRAMP should reduce some of the adverse impacts on wildlife from alternative C. Cumulatively, there would be negligible impacts to the coastal scrub, chaparral, and grassland community at Cattle Hill, when added to these projects.

**SWEENEY RIDGE/CATTLE HILL ALTERNATIVE C CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Wildlife Impacts</b>           | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b>       | <b>Cumulative Impacts</b>                    |
|---|---|---|--|
| No impact at Sweeney Ridge  | Dogs prohibited at Sweeney Ridge  | Sweeney Ridge: Beneficial assuming compliance             | Sweeney Ridge: Beneficial cumulative impacts |
| Cattle Hill: Overall long-term minor adverse impacts, assuming compliance | Cattle Hill: Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs | Cattle Hill: Beneficial to no change, assuming compliance | Cattle Hill: Negligible cumulative impacts   |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Under alternative D, dogs would not be allowed at this site. Therefore, no impact on wildlife from dogs would occur at this site.

Since dogs would not be allowed at Sweeney Ridge/Cattle Hill, there would be no impacts from commercial dog walking on wildlife.

**Cumulative Impacts.** Under alternative D, the cumulative impacts on wildlife at this park site would be the same those under alternative B: beneficial.

**SWEENEY RIDGE/CATTLE HILL ALTERNATIVE D CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Wildlife Impacts</b> | <b>Rationale</b>                       | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--|---|-------------------------------|
| No impact, assuming compliance                                  | Dogs would be prohibited at both sites | Beneficial, assuming compliance                     | Beneficial cumulative impacts |

## Chapter 4: Environmental Consequences

**Alternative E: Most Dog Walking Access / Most Management Intensive.** At Sweeney Ridge, alternative E would allow on-leash dog walking along Sweeney Ridge Trail from Portola Discovery Site to the Notch Trail and on to the junction with Mori Ridge Trail. On-leash dog walking would be allowed on Sneath Lane. At Cattle Hill, dogs would be allowed on leash on the Baquiano Trail from Fassler Avenue up to and including the Farallon View Trail. Since dog walkers may walk along the edge of the trails, dogs would then have access to the adjacent land 6 feet in all directions, resulting in an LOD area that would extend 6 feet out from the edges of the trails. Impacts on wildlife from dogs in areas adjacent to the trail (6-foot corridor or LOD area) would be long term, minor to moderate, and adverse, due to trampling, dog waste, and nutrient addition. Because of mobility, wildlife can usually avoid areas with dogs present during peak activity or habituate to these activities, but the displacement of wildlife from high quality habitat and preferred habitat that is degraded by the presence of dogs would indirectly affect wildlife.

The trails at Sweeney Ridge/Cattle Hill are long, with high quality habitat directly adjacent to the trails, and the on-leash dog trails under this alternative are a greater portion of the entire site compared to alternatives B, C, and D. Additionally, Cattle Hill trails would allow on-leash dog walking under this alternative as does alternative C, and these trails generally receive low to moderate use. Physically restraining dogs on leash would protect habitat off trail as well as wildlife, and chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior. Wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs, which would indirectly affect wildlife. However, when considering the entire site of Sweeney Ridge and Cattle Hill, the trails only make up a portion of the entire site. Therefore, assuming compliance, the overall impact on wildlife at Sweeney Ridge and Cattle Hill would be long term, minor, and adverse.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Sweeney Ridge/Cattle Hill is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at Sweeney Ridge and Cattle Hill, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have a negligible impact on wildlife.

**Cumulative Impacts.** The long-term minor adverse impacts on wildlife from dogs at Sweeney Ridge/Cattle Hill under alternative E were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from trail rehabilitation projects and the SNRAMP should reduce some of the adverse impacts on wildlife from alternative E. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**SWEENEY RIDGE/CATTLE HILL ALTERNATIVE E CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Wildlife Impacts     | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|--|--|-------------------------------|
| Overall long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; trails at this site are long with high quality habitat directly adjacent to the trails, trails generally receive low to moderate use | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** On-leash dog walking would be allowed at Sweeney Ridge on Sneath Lane and Sweeney Ridge Trail between the Portola Discovery site and the Nike Missile Site. On-leash dog walking would be allowed at Cattle Hill on the Baquiano Trail from Fassler Avenue up to and including the Farallon View Trail. Since dog walkers may walk along the edge of the trails, dogs would then have access to the adjacent land 6 feet in all directions, resulting in an LOD area that would extend 6 feet out from the edges of the trails. Impacts on wildlife from dogs in areas adjacent to the trail (6-foot corridor or LOD area) would be long term, minor to moderate, and adverse, due to trampling, dog waste, and nutrient addition. Because of mobility, wildlife can usually avoid areas with dogs present during peak activity or habituate to these activities, but the displacement of wildlife from high quality habitat and preferred habitat that is degraded by the presence of dogs would indirectly affect wildlife.

The Sweeney Ridge and Cattle Hill trails would allow on-leash dog walking in this alternative and these trails generally receive low to moderate use. Physically restraining dogs on leash would protect habitat off trail as well as wildlife, and chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior. Wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs, which would indirectly affect wildlife. In addition, the LOD area only makes up a small portion of the entire site. Therefore, when looking at the site in its entirety, the overall impact on wildlife at Sweeney Ridge and Cattle Hill would be long term, minor, and adverse.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Sweeney Ridge/Cattle Hill is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at Sweeney Ridge/Cattle Hill, it is likely that this alternative would not have an impact on the number of dog walkers.

**Cumulative Impacts.** Projects and actions in and near Sweeney Ridge/Cattle Hill were considered for the cumulative impacts analysis (appendix K) and are similar to projects discussed previously. Long-term parkwide projects such as trail rehabilitation can provide enhancements that improve conditions for vegetation and wildlife habitat. Ongoing parkwide restoration and enhancement efforts can also beneficially affect coastal scrub at GGNRA park sites such as Sweeney Ridge/Cattle Hill. Additionally,

## Chapter 4: Environmental Consequences

the implementation of habitat restoration and projects funded by the Wildland/Urban Interface Initiative on private lands could impact Sweeney Ridge/Cattle Hill. The scope of the SNRAMP analysis includes a natural area managed by the SFRPD in Pacifica (Sharp Park, located near Sweeney Ridge/Cattle Hill), and addresses dog walking (including on-leash dog walking and off-leash DPAs) in this area (SFPD 2011, 261-262). Project activities included in the SNRAMP would protect and improve habitat and provide long-term beneficial impacts to wildlife.

As stated previously, coastal scrub habitat in California is threatened by habitat loss, fragmentation, and degradation (USDA 2005, 613). The implementation of current and future projects both in GGNRA and beyond park boundaries could have a cumulative impact on the wildlife species that inhabit coastal scrub/chaparral/grassland communities. Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts. Because the mission blue butterfly inhabits coastal scrub/chaparral/grassland communities, projects that would benefit and enhance mission blue butterfly habitat would also benefit wildlife species that inhabit this community type. Such projects include the following: proposed fire management policies of the *Fire Management Plan* (NPS 2005b) and the *San Bruno Elfin and Mission Blue Butterflies Recovery Plan* (USFWS 1984).

The long-term, minor, adverse impact to the coastal scrub wildlife community from dogs at Sweeney Ridge/Cattle Hill under the preferred alternative were considered together with effects of the projects mentioned above. The beneficial effects from trail rehabilitation projects and the SNRAMP should reduce some of the adverse impacts on wildlife from alternative F. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Cumulatively, there would be negligible impacts to the coastal scrub, chaparral, and grassland community at Sweeney Ridge/Cattle Hill, when added to these projects.

**SWEENEY RIDGE/CATTLE HILL PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Wildlife Impacts     | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|--|--|-------------------------------|
| Overall long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

### Pedro Point Headlands

**Alternative A: No Action.** Although this site is currently not part of GGNRA, unrestricted dog walking occurs at this site. This site has documented low to moderate visitor use, including visitors with dogs, and incidents related to dog activities at the site are not documented since the NPS does not currently own the property and it is not patrolled by NPS rangers (table 9).

Under the no-action alternative at this site, off-leash dog access to wildlife and associated habitat off trails and fire roads would continue. Disturbance as a result of dogs includes physical damage to habitat or nests/burrows from digging or trampling, as well as chasing after and even capturing small mammals, reptiles, and ground-nesting birds. Ground-dwelling and ground-nesting bird species such as California quail are especially vulnerable. Dogs also have the potential to encounter larger mammals such as deer or coyotes and interact or exchange parasites/diseases. In addition, wildlife may be displaced from high quality habitat that is degraded by the presence of dogs; trails in this site are easily accessible from residential areas. Some of the trails at this site are long, with excellent coastal scrub habitat directly adjacent to the trails, so there could be an avoidance of these trail corridors by birds and mammals that would actually cover more than small, localized areas. Therefore, alternative A would result in continued long-term minor to moderate adverse impacts on wildlife using coastal scrub habitat at Pedro Point Headlands because occasional to frequent disturbances to wildlife from dogs would occur.

There are currently no commercial dog walking regulations at Pedro Point Headlands. It is unknown if commercial dog walkers contribute to wildlife impacts.

**Cumulative Impacts.** Projects and actions in and near Pedro Point Headlands were considered for the cumulative impacts analysis (appendix K), although long-term parkwide projects such as trail rehabilitation, which can provide enhancements that improve conditions for vegetation and wildlife habitat, may only occur in the future after the park gains ownership of the property. In the future, ongoing parkwide restoration and enhancement efforts will beneficially affect coastal scrub at GGNRA park sites such as Pedro Point Headlands. Additionally, the implementation of habitat restoration and projects funded by the Wildland/Urban Interface Initiative on private lands could impact Pedro Point Headlands.

As stated previously, coastal scrub habitat in California is threatened by habitat loss, fragmentation, and degradation (USDA 2005, 613). The implementation of current and future projects in GGNRA and beyond park boundaries could have a cumulative impact on the wildlife species that inhabit coastal scrub/chaparral/grassland communities. Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts. Because the mission blue butterfly inhabits coastal scrub/chaparral/grassland communities, projects that would benefit and enhance mission blue butterfly habitat would also benefit wildlife species that inhabit this community type. Such projects include the following: mitigation for the *Marin Headlands/Fort Baker Improvement and Transportation Management Plan/EIS* (NPS 2009c, ix, 82), proposed fire management policies of the *Fire Management Plan* (NPS 2005b), the *San Bruno Elfín and Mission Blue Butterflies Recovery Plan* (USFWS 1984), and the Pedro Point Headlands Stewardship Project (PLT 2008, 1).

The long-term minor to moderate adverse impacts on wildlife from dogs at the Pedro Point Headlands under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from future trail rehabilitation projects should reduce some of the adverse impacts on wildlife from alternative A. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible to long term, minor, and adverse.

PEDRO POINT HEADLANDS ALTERNATIVE A CONCLUSION TABLE

| Coastal Scrub, Chaparral, and Grassland Wildlife Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts                                       |
|--|---|--|--|
| Long-term minor to moderate adverse impacts              | Off-leash dog access to wildlife and associated habitat off trails would continue; disturbance includes physical damage to habitat or nests/ burrows from digging or trampling, as well as chasing after and even capturing wildlife; wildlife may also be displaced from high quality habitat that is degraded by the presence of dogs | N/A  | Negligible to long-term minor adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking on the Coastal Trail (to be built). No dog walking would be allowed on the trails proposed by the Pacifica Land Trust. Since dog walkers may walk along the edge of the trail, dogs would then have access to the adjacent land 6 feet in all directions, resulting in an LOD area that would extend 6 feet out from the edges of the trail. In general, impacts on wildlife would be limited to the existing trail and the 6-foot corridors immediately adjacent to the trail. Leash requirements would reduce the probability that dogs would disturb birds (Lafferty 2001a, 1955, 1961) and chase and/or harass other wildlife, due to physical constraint. Impacts on wildlife in areas adjacent to the trail (6-foot corridor or LOD area) would be long term, minor to moderate, and adverse since dogs would be able to disrupt wildlife habitat through trampling, dog waste, and nutrient addition. Because of mobility, wildlife can usually avoid areas with dogs present during peak activity or habituate to these activities, but the displacement of wildlife from high quality habitat and preferred habitat that is degraded by the presence of dogs would indirectly affect wildlife.

Under this alternative, the long-term minor to moderate adverse impacts from dogs in the LOD area would occur in a relatively small area when compared to the site as a whole. Physically restraining dogs on leash would protect habitat off trail as well as wildlife, and chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior. Wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs. Therefore, assuming compliance, alternative B would result in overall negligible to long-term minor adverse impacts on wildlife because occasional disturbance to wildlife would occur.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is not common at Pedro Point Headlands, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have a negligible impact on wildlife.

**Cumulative Impacts.** The negligible to long-term minor adverse impacts on wildlife from dogs at the Pedro Point Headlands under alternative B were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from future trail rehabilitation projects should reduce some of the adverse impacts on wildlife from alternative B. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that

would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**PEDRO POINT HEADLANDS ALTERNATIVE B CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Wildlife Impacts                   | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|--|--|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; trails and the LOD area are a small portion of the entire site | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Like alternative B, alternative C would allow on-leash dog walking on the Coastal Trail (to be built), and impacts on wildlife would be the same, assuming compliance: long term, minor to moderate, and adverse in the LOD area and negligible to long term, minor, and adverse overall.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Pedro Point Headlands is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking activity is not common at Pedro Point Headlands, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have a negligible impact on wildlife.

**Cumulative Impacts.** Under alternative C, the cumulative impacts on wildlife at this park site would be the same those under alternative B: negligible.

**Chapter 4: Environmental Consequences**

**PEDRO POINT HEADLANDS ALTERNATIVE C CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Wildlife Impacts</b>            | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; trail and the LOD area are a small portion of the entire site; trail generally receives low to moderate use | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Under alternative D, dogs would not be allowed at this site. Therefore, no impact on wildlife from dogs at this site would occur.

Since dogs would not be allowed at this site under alternative D, commercial dog walking would have no impact on wildlife.

**Cumulative Impacts.** The lack of impacts on wildlife from dogs at the Pedro Point Headlands under alternative D was considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from trail rehabilitation projects combined with the negligible impacts from any development or construction actions and the lack of impacts on wildlife from alternative D would result in negligible cumulative impacts on wildlife.

**PEDRO POINT HEADLANDS ALTERNATIVE D CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Wildlife Impacts</b> | <b>Rationale</b>                 | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|----------------------------------|---|-------------------------------|
| No impact, assuming compliance                                  | Dogs would be prohibited at site | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** On-leash dog walking would be allowed on the Coastal Trail (to be built) and trails proposed by the Pacifica Land Trust. Impacts on wildlife in areas adjacent to the trail (6-foot corridor or LOD area) would be long term, minor to moderate, and adverse since dogs would be able to disrupt wildlife habitat through trampling, dog waste, and nutrient addition. Because of mobility, wildlife can usually avoid areas with dogs present during peak activity or habituate to these activities, but the displacement of wildlife from high quality habitat and preferred habitat due to the presence of dogs would indirectly affect wildlife.

Under this alternative, the long-term minor to moderate adverse impacts that would occur from dogs in the LOD represent a relatively small area of impact when compared to the site as a whole. Physically restraining dogs on leash would protect habitat off trail as well as wildlife, and chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior. Wildlife may avoid trail

corridors that allow on-leash dog walking and may be displaced from high-quality habitat that is degraded by the presence of dogs. Therefore, assuming compliance, alternative E would result in overall negligible to long-term minor adverse impacts on wildlife because occasional disturbance to wildlife would occur.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Pedro Point Headlands is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking activity is not common at Pedro Point Headlands, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have a negligible impact on wildlife.

**Cumulative Impacts.** Under alternative E, the cumulative impacts on wildlife at this park site would be the same those under alternative B: negligible cumulative impacts.

**PEDRO POINT HEADLANDS ALTERNATIVE E CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Wildlife Impacts                   | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; trail and the LOD area are a small portion of the entire site | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative B, allowing on-leash dog walking on the Coastal Trail (to be built), but no dog walking would be permitted on the trails proposed by the Pacifica Land Trust. In general, impacts on wildlife would be limited to the existing trail and the 6-foot corridors immediately adjacent to the trail. Leash requirements would reduce the probability that dogs would disturb birds (Lafferty 2001a, 1955, 1961) and chase and/or harass other wildlife, due to physical constraint. Impacts on wildlife in areas adjacent to the trail (6-foot corridor or LOD area) would be long term, minor to moderate, and adverse since dogs would be able to disrupt wildlife habitat through trampling, dog waste, and nutrient addition. Because of mobility, wildlife can usually avoid areas with dogs present during peak activity or habituate to these activities, but the displacement of wildlife from high quality habitat and preferred habitat that is degraded by the presence of dogs would indirectly affect wildlife.

The long-term minor to moderate adverse impacts from dogs in the LOD area would occur in a relatively small area when compared to the site as a whole. Physically restraining dogs on leash would protect habitat off trail as well as wildlife, and chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior. Wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs. Therefore, assuming compliance, the preferred alternative would result in an overall negligible to long-term minor adverse impact on wildlife because occasional disturbance to wildlife would occur.

## Chapter 4: Environmental Consequences

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Pedro Point Headlands is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking activity is not common at Pedro Point Headlands, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have a negligible impact on wildlife.

**Cumulative Impacts.** Projects and actions in and near Pedro Point Headlands were considered for the cumulative impacts analysis (appendix K), although long-term parkwide projects such as trail rehabilitation, which can provide enhancements that improve conditions for vegetation and wildlife habitat, may only occur in the future after the park gains ownership of the property. In the future, ongoing parkwide restoration and enhancement efforts will beneficially affect coastal scrub at GGNRA park sites such as Pedro Point Headlands. Additionally, the implementation of habitat restoration and projects funded by the Wildland/Urban Interface Initiative on private lands could impact Pedro Point Headlands.

As stated previously, coastal scrub habitat in California is threatened by habitat loss, fragmentation, and degradation (USDA 2005, 613). The implementation of current and future projects both in GGNRA and beyond park boundaries could have a cumulative impact on the wildlife species that inhabit coastal scrub/chaparral/grassland communities. Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts. Because the mission blue butterfly inhabits coastal scrub/chaparral/grassland communities, projects that would benefit and enhance mission blue butterfly habitat would also benefit wildlife species that inhabit this community type. Such projects include the following: proposed fire management policies of the *Fire Management Plan* (NPS 2005b), the *San Bruno Elfin and Mission Blue Butterflies Recovery Plan* (USFWS 1984), the *Pedro Point Headland Stewardship Project* (PLT 2008), and the Martini Creek watershed assessment (San Mateo County) (CCC 2008).

The negligible to long-term minor adverse impacts on wildlife from dogs at the Pedro Point Headlands under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from future trail rehabilitation projects should reduce some of the adverse impacts on wildlife from the preferred alternative. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

PEDRO POINT HEADLANDS PREFERRED ALTERNATIVE F CONCLUSION TABLE

| Coastal Scrub, Chaparral, and Grassland Wildlife Impacts                   | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; trail and the LOD area are a small portion of the entire site | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

### Rancho Corral de Tierra

**Alternative A: No Action.** Currently, on-leash dog walking is allowed at Rancho Corral de Tierra. Some areas of Rancho are dominated by coastal scrub, chaparral, and grassland vegetation, including areas along trails at the site. Staff regularly working at Rancho characterize use by dog walkers at the site as low to moderate, and compliance with the leash law is generally low. At Rancho, NPS rangers have observed off-leash dogs running in areas with potentially sensitive habitat.

Under the no-action alternative at this site, off-leash dog access to wildlife and associated habitat off trails would continue. Disturbance as a result of dogs includes physical damage to habitat or nests/burrows from digging or trampling, as well as chasing or capturing small mammals, reptiles, and ground-nesting birds. Ground-dwelling and ground-nesting bird species such as California quail are especially vulnerable. Dogs have the potential to encounter larger mammals such as deer or coyotes and interact with or exchange parasites or diseases. In addition, wildlife may be displaced from high-quality habitat that is degraded by the presence of dogs; trails in this site are easily accessible from residential areas. Some of the trails at this site have coastal scrub habitat directly adjacent to the trails; birds and mammals could avoid these trail corridors, covering more than small, localized areas. Therefore, alternative A would result in continued long-term minor to moderate adverse impacts on wildlife using coastal scrub habitat at Rancho Corral de Tierra because occasional to frequent disturbances to wildlife from dogs would occur. According to information from the Montara Dog Group and subsequent staff observations, dog walkers, particularly off-leash dog walkers, primarily use the lower elevations of the site at both the Montara and El Granada areas. The terrain at El Granada is particularly steep and challenging, thus dog walking use in that area appears to be concentrated mostly in the lower elevations. Although the Montara area is less steep, visitor use there is similarly concentrated in the lower elevations, but some dog walkers in the Montara area do use trails that connect to the top of the Rancho site.

No permit system exists for dog walking under alternative A. Commercial dog walkers typically use the El Granada area off of Coral Reef Avenue; however, commercial dog walking is considered a low use at the site overall. Therefore, commercial dog walking would have negligible impacts on wildlife at this site.

**Cumulative Impacts.** Projects and actions in and near Rancho were considered for the cumulative impacts analysis (appendix K). Since the Rancho Corral de Tierra site has been transferred to NPS,

## Chapter 4: Environmental Consequences

general protection of the site and associated natural resources would occur, although some impacts may remain from prior unregulated off-leash dog walking.

Additional actions have had, are currently having, or will have the potential to have adverse impacts on wildlife at or in the vicinity of Rancho Corral de Tierra, such as development or construction actions. One example is the CalTrans Devil's Slide Tunnel project, which involves constructing two tunnels beneath San Pedro Mountain to provide a dependable highway between Pacifica and Montara (CADOT 2013, 1). Coastal scrub habitat in California is threatened by habitat loss, fragmentation, and degradation (USDA 2005, 613). Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts.

The long-term minor to moderate adverse impacts on wildlife from dogs at Rancho Corral de Tierra under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from future trail rehabilitation projects under park stewardship programs should reduce some of the adverse impacts on wildlife from alternative A. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible to long term, minor, and adverse.

**RANCHO CORRAL DE TIERRA ALTERNATIVE A CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Wildlife Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts                                       |
|--|---|--|--|
| Long-term minor to moderate adverse impacts              | On-leash dog walking is allowed, but off-leash dogs have been observed in areas with potentially sensitive habitat; disturbance includes physical damage to habitat or nests/burrows from digging or trampling, as well as chasing after and even capturing wildlife; wildlife may also be displaced from high quality habitat that is degraded by the presence of dogs | N/A  | Negligible to long-term minor adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** On-leash dog walking would be allowed on designated trails in two areas open to dog walking near Montara and El Granada, which were identified by the local dog walking group as key areas for this use. Since dog walkers may walk along the edge of the trail, dogs would then have access to the adjacent land 6 feet in all directions, resulting in an LOD area that would extend 6 feet out from the edges of the trail. In general, impacts on wildlife would be limited to the existing trail and the 6-foot corridors immediately adjacent to the trail. Leash requirements would reduce the probability that dogs would disturb birds (Lafferty 2001a, 1955, 1961) and chase and/or harass other wildlife, due to physical constraint. Impacts on wildlife in areas adjacent to the trail (6-foot corridor or LOD area) would be long term, minor to moderate, and adverse since dogs would be able to disrupt wildlife habitat through trampling, dog waste, and nutrient addition. Because of mobility, wildlife can usually avoid areas with dogs present during peak activity or some may potentially habituate to these activities, but the displacement of wildlife from high-quality habitat and preferred habitat that is degraded by the presence of dogs would affect wildlife.

Under this alternative, the long-term minor to moderate adverse impacts from dogs in the LOD area would occur in a relatively small area when compared to the site as a whole. Physically restraining dogs on leash would protect habitat off trail as well as wildlife, and chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior. Wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs. Therefore, assuming compliance, alternative B would result in overall negligible to long-term minor adverse impacts on wildlife because there would be occasional disturbance to wildlife.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking at Rancho is not common, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have negligible impacts on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** The negligible to long-term minor adverse impacts on wildlife from dogs at Rancho Corral de Tierra under alternative B were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from future trail rehabilitation projects should reduce some of the adverse impacts on wildlife from alternative B. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation thus reducing the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**RANCHO CORRAL DE TIERRA ALTERNATIVE B CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Wildlife Impacts</b>            | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|--|---|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; trails and the LOD area are a small portion of the entire site | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Under alternative C, dog walking under voice and site control would be allowed in a ROLA located between Le Conte and Tamarind Street, in a previously (partially) disturbed open area across the street and east of the Farallone View School. On-leash dog walking would be allowed on designated trails in two areas open to dog walking near Montara and El Granada.

In general, impacts would be limited to the ROLA, existing trails, and the 6-foot corridors immediately adjacent to the trails (LOD area). Leash requirements would reduce the probability that dogs would disturb birds (Lafferty 2001a, 1955, 1961) and chase and/or harass other wildlife, due to physical restraint on leash. However, the habitat in the LOD area would be affected by dogs through trampling, dog waste,

## Chapter 4: Environmental Consequences

and nutrient addition, resulting in long-term minor to moderate adverse impacts on wildlife in the LOD area. Wildlife in the LOD area and ROLA would be occasionally to frequently affected by dogs and may avoid and/or be displaced from high quality habitat that is degraded by the presence of dogs. The ROLA may lead to avoidance of the surrounding area by wildlife due to the concentration of dogs and noise as well as the elevated amount of dog waste and scent marking. Because of mobility, wildlife can usually avoid areas with dogs present during peak activity or some may potentially habituate to these activities, but the displacement of wildlife from high quality habitat and preferred habitat that is degraded by the presence of dogs would indirectly affect wildlife. Therefore, in the LOD area and ROLA, alternative C would result in long-term minor to moderate adverse impacts on wildlife at Rancho Corral de Tierra.

The long-term minor to moderate adverse impacts from dogs in the LOD area and ROLA would occur in a relatively small area when compared to the site as a whole, and the wildlife and supporting habitat constitute a small portion of the entire site. Physically restraining dogs in on-leash areas would protect habitat off trail as well as wildlife, and chasing after wildlife would be eliminated, but on-leash dogs would still occasionally disturb wildlife; wildlife may avoid trail corridors that allow on-leash dog walking and may be displaced from high quality habitat that is degraded by the presence of dogs. Therefore, assuming compliance, the overall impact on wildlife at Rancho Corral de Tierra would be negligible to long term, minor, and adverse.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Rancho Corral de Tierra is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at Rancho, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** Under alternative C, the cumulative impacts on wildlife would be the same as those under alternative B: negligible.

**RANCHO CORRAL DE TIERRA ALTERNATIVE C CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Wildlife Impacts                   | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; trail and the LOD area are a small portion of the entire site | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Under alternative D, on-leash dog walking would be allowed in the Montara area on two existing trails that allow dog walking: Old San Pedro Mountain Road and the Farallon Cutoff. Dogs would be prohibited in other areas of the site, including the entire El Granada area. Impacts on wildlife in areas adjacent to the trail (6-foot corridor

or LOD area) would be long term, minor to moderate, and adverse since dogs would be able to disrupt wildlife habitat through trampling, dog waste, and nutrient addition. Because of mobility, wildlife can usually avoid areas where dogs are present during peak activity or some wildlife may habituate to these activities, but the displacement of wildlife from high quality habitat and preferred habitat due to the presence of dogs would indirectly affect wildlife.

Under this alternative, the long-term minor to moderate adverse impacts that would occur from dogs in the LOD represent a relatively small area of impact when compared to the site as a whole. Physically restraining dogs on leash would protect habitat off trail as well as wildlife, and chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior. Wildlife may avoid trail corridors that allow on-leash dog walking and may be displaced from high quality habitat that is degraded by the presence of dogs. Therefore, assuming compliance, alternative D would result in overall negligible to long-term minor adverse impacts on wildlife because there would be occasional disturbance to wildlife.

No commercial dog walking would be allowed and no permits to walk more than three dogs would be issued under alternative D; therefore, no impact would occur as a result of commercial or permitted dog walking.

**Cumulative Impacts.** Under alternative D, the cumulative impacts on wildlife would be the same as those under alternative B: negligible.

**RANCHO CORRAL DE TIERRA ALTERNATIVE D CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Wildlife Impacts                   | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; trail and the LOD area are a small portion of the entire site | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Dog walking restrictions under alternative E would be the same as under alternative C and impacts on wildlife would also be the same: overall, negligible to long-term, minor, and adverse, assuming compliance.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Rancho Corral de Tierra is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking activity is not common at Rancho, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on coastal scrub/chaparral/grassland vegetation.

**Chapter 4: Environmental Consequences**

**Cumulative Impacts.** Under alternative E, the cumulative impacts on wildlife would be the same as those under alternative B: negligible.

**RANCHO CORRAL DE TIERRA ALTERNATIVE E CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Wildlife Impacts                   | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; trail and the LOD area are a small portion of the entire site | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative B. On-leash dog walking would be allowed on designated trails in two areas open to dog walking near Montara and El Granada. Since dog walkers may walk along the edge of the trail, dogs would then have access to the adjacent land 6 feet in all directions, resulting in an LOD area that would extend 6 feet out from the edges of the trail. In general, impacts on wildlife would be limited to the existing trail and the 6-foot corridors immediately adjacent to the trail. Leash requirements would reduce the probability that dogs would disturb birds (Lafferty 2001a, 1955, 1961) and chase and/or harass other wildlife, due to physical constraint. Impacts on wildlife in areas adjacent to the trail (6-foot corridor or LOD area) would be long term, minor to moderate, and adverse since dogs would be able to disrupt wildlife habitat through trampling, dog waste, and nutrient addition. Because of mobility, wildlife can usually avoid areas where dogs are present during peak activity or some wildlife may habituate to these activities, but the displacement of wildlife from preferred habitat that is degraded by the presence of dogs would indirectly affect wildlife.

Under the preferred alternative, the long-term minor to moderate adverse impacts from dogs in the LOD area would occur in a relatively small area when compared to the site as a whole. Physically restraining dogs on leash would protect habitat off trail as well as wildlife, and chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior. Wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from preferred habitat that is degraded by the presence of dogs. Therefore, assuming compliance, the preferred alternative would result in overall negligible to long-term minor adverse impacts on wildlife because there would be occasional disturbance to wildlife.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Rancho Corral de Tierra is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking activity is not common at Rancho, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative F would have negligible impacts on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** Projects and actions in and near Rancho were considered for the cumulative impacts analysis (appendix K). Since the Rancho Corral de Tierra site has been transferred to the NPS, general protection of the site and associated natural resources would occur, although some impacts may remain from prior unregulated off-leash dog walking.

Additional actions have had, are currently having, or will have the potential to have adverse impacts on wildlife at or in the vicinity of Rancho Corral de Tierra, such as development or construction actions. One example is the CalTrans Devil's Slide Tunnel project, which involves constructing two tunnels beneath San Pedro Mountain to provide a dependable highway between Pacifica and Montara (CADOT 2013, 1). Coastal scrub habitat in California is threatened by habitat loss, fragmentation, and degradation (USDA 2005, 613). Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts.

The overall negligible to long-term minor adverse impacts on wildlife from dogs at Rancho Corral de Tierra under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from future trail rehabilitation projects under park stewardship programs should reduce some of the adverse impacts on wildlife from the preferred alternative. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation thus reducing the potential for impacts. Therefore, cumulative impacts on wildlife under the preferred alternative would be expected to be negligible.

**RANCHO CORRAL DE TIERRA PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Wildlife Impacts</b>            | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; trail and the LOD area are a small portion of the entire site | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

## **IMPACTS TO WILDLIFE IN WETLANDS AND AQUATIC COMMUNITIES BY SITE AND ALTERNATIVE**

GGNRA contains both freshwater wetlands and coastal (estuarine) wetlands. Vegetation in these wetlands is composed of herbaceous plant species that support wildlife species. Wetlands are located at Rodeo Beach/South Rodeo Beach (Rodeo Lagoon and Rodeo Lake), Muir Beach (lagoon), Crissy Field, and Mori Point. In general, dogs would be prohibited from accessing wetland areas at all locations in GGNRA, but violations of these closures have been documented (table 9).

### MARIN COUNTY SITES

#### Muir Beach (Lagoon)

**Alternative A: No Action.** The lagoon at Muir Beach is a small tidal waterbody fringed by wetland vegetation. A wetland restoration project is currently ongoing at the site, and the lagoon was restored in 2009 to provide enhanced habitat at the lagoon. Dog walking is currently allowed on leash or under voice control at Muir Beach. The lagoon is currently closed to people and dogs, although it has been observed that closures at this site have been violated (appendix G). A total of 24 dog-related violations were reported from 2008 through 2011 at Muir Beach (table 14). The most common violations were for having dogs off-leash (9 violations) and having dogs within closed areas (5 violations) (table 14). An incident report included the following: “I observed the two dogs run into the Muir Beach Lagoon, an area that is closed to pets” (Muir Beach, November 9, 2010, Incident Report # 10-012822). The area is considered moderate to high use even though the lagoon is small in size compared to other lagoons at GGNRA. In addition, there is no physical barrier to prevent dogs from accessing the lagoon, and dogs gain access to the lagoon and surrounding wetland habitat at Muir Beach on an almost daily basis. The voice control area of Muir Beach encompasses the entrance channel of Redwood Creek and is located immediately adjacent to the shoreline of the lagoon. Surveys found bird diversity and use of the lagoon to be low, which could be attributed to dog use of the site; bird numbers are low and visitor use is high at this site.

Alternative A would result in continued long-term minor to moderate adverse impacts on wildlife at this site; specifically, waterbirds that use the restored lagoon are occasionally to frequently subjected to impacts from on-leash and voice control dogs through dogs barking at, chasing after, and being in proximity to roosting or feeding birds, potentially limiting their use of preferred habitat. A few individuals of the species in a small, localized area could be affected and reproductive success could be indirectly affected. A range is presented because the impact would depend on the time of year and intensity of use of the site by dogs and wildlife.

Under alternative A, no permit system exists for dog walking. At Muir Beach, commercial dog walking is uncommon. Therefore, commercial dog walking would have negligible impacts on wildlife.

**Cumulative Impacts.** Projects and actions in and near Muir Beach were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on wildlife at or in the vicinity of this site.

Many wetland restoration and creation projects have been completed or are proposed in GGNRA and beyond the boundaries of the park. Impacts resulting from completed, ongoing, and future restoration/creation projects at Redwood Creek and Muir Beach lagoon and projects beyond the park boundaries will generally provide an overall benefit to wetland and tidal marsh habitats. Specific examples of projects and plans that have cumulatively provided beneficial effects to wetlands include the *Muir Beach Wetland and Creek Restoration Project*; the lagoon was restored in 2009 to provide a functional, resilient ecosystem while also providing habitat for special-status species and reducing flooding on Pacific Way. Similarly, the NPS and the California State Lands Commission formulated the *Giacomini Wetland Restoration Project* (Marin County, near Tomales Bay), which restored 560 acres of pastures to wetlands of increased complexity and diversity of vegetation and aquatic habitats (NPS 2009k; NPS and CSLC 2007). This project also dramatically increased habitat for California black rail as well as other aquatic species such as waterfowl, shorebirds, fish, and seals (NPS 2009k). The Gulf of the Farallones National Marine Sanctuary has proposed the *Bolinas Lagoon Ecosystem Restoration Project* (near Stinson Beach), which will benefit wildlife species that currently use Bolinas Lagoon, including 245 species of birds, such as migratory waterfowl and shorebirds, as well as fish, invertebrates, and harbor seals, which use the site for pupping grounds and as a haul-out site (GFNMS Working Group 2008).

Additional actions have had or have the potential to have adverse effects on wetlands at or in the vicinity of GGNRA sites. Larger, more regional development projects like the GGNRA *Long-range Transportation Plan Update* (NPS 2008g) and the *Doyle Drive Project* (Presidio Parkway 2008) will impact or have the potential to negatively affect wetland resources within and beyond park boundaries. However, wetland impacts from the implementation of these and other proposed projects in the area should be sufficiently offset by mitigation, project by project, such that there should be no net loss of wetland acreage, functions, or values.

The loss of more than 90 percent of California's original wetlands is the largest loss of any state in the nation and is directly related to economic development (NOAA 2010a). The *Clean Water Act* and the state's coastal wetlands statute have succeeded in reducing the rate of wetland loss in California, but development pressures remain a threat (NOAA 2010a, 1). Therefore, projects that protect or degrade wetlands and aquatic habitats will have a cumulative effect, whether beneficial or adverse, on wildlife species that inhabit wetlands.

The long-term minor to moderate adverse impacts on wildlife from dogs at Muir Beach under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from wetland restoration/creation projects should reduce some of the adverse impacts on wildlife from alternative A. However, the impacts resulting from any development projects at or in the vicinity of GGNRA and the loss of more than 90 percent of California's original wetlands may add to the cumulative impacts on wildlife even though wetland mitigation has contributed to reducing impacts on wildlife. Since there would be a combination of beneficial and adverse effects from projects in and around Muir Beach, when combined, these projects would balance out, resulting in negligible impacts. Therefore, the cumulative analysis for this park site will mainly focus on the results of the impact analysis for each alternative. Cumulative impacts on wildlife under this alternative would be expected to be long term, minor to moderate, and adverse.

**MUIR BEACH ALTERNATIVE A CONCLUSION TABLE**

| Wetland and Aquatic Wildlife Impacts        | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts                                     |
|---|--|--|--|
| Long-term minor to moderate adverse impacts | Lagoon closures have been violated; shorebirds, wading birds, and waterbirds that use the restored lagoon would occasionally to frequently be subjected to impacts from on-leash and voice control dogs barking at, chasing after, and being in proximity to roosting or feeding birds; bird numbers are low and visitor use is high at this site; range is presented because the intensity of use (by dogs and wildlife) is dependent on the time of year | N/A  | Long-term minor to moderate adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Under alternative B, the protection of wetland habitat would occur through requiring on-leash dog walking in other areas of the site since the lagoon is currently closed to people and dogs. As part of the restoration plan at this site, post-and-cable fencing would be installed between the tidal lagoon and Muir Beach to discourage visitors from accessing the lagoon, but the fencing would not physically exclude dogs from the area. If dogs are physically restrained on leash and deterred

## Chapter 4: Environmental Consequences

by a fence at this site, they should not gain access to the lagoon or its shorelines. Therefore, assuming compliance, alternative B would result in negligible impacts on wildlife at this site because on-leash dogs could still disturb wildlife through barking and by their presence.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is not common at Muir Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have a negligible impact on wildlife.

**Cumulative Impacts.** The negligible impacts on wildlife from dogs at Muir Beach under alternative B were considered together with the effects of the projects mentioned above under alternative A. There would be a combination of beneficial and adverse effects from projects in and around Muir Beach; when combined, these projects would balance out, resulting in negligible impacts. These negligible impacts combined with the negligible impacts from alternative B would result in negligible cumulative impacts on wildlife.

**MUIR BEACH ALTERNATIVE B CONCLUSION TABLE**

| Wetland and Aquatic Wildlife Impacts            | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance | The lagoon is closed to dogs; physically restraining dogs on leash would not allow access to the lagoon or its shorelines used by shorebirds, wading birds, waterbirds, and other wildlife; on-leash dogs could still infrequently disturb roosting and feeding birds through barking and by their presence | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would have the same dog walking restrictions as alternative B, and impacts would be the same, assuming compliance: negligible.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Muir Beach is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking activity is not common at Muir Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have a negligible impact on wildlife.

**Cumulative Impacts.** Under alternative C, the cumulative impacts on wildlife at this park site would be the same those under alternative B.

**MUIR BEACH ALTERNATIVE C CONCLUSION TABLE**

| <b>Wetland and Aquatic Wildlife Impacts</b>     | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance | The lagoon is closed to dogs; physically restraining dogs on leash would not allow access to the lagoon or its shorelines used by shorebirds, wading birds, waterbirds, and other wildlife; on-leash dogs could still infrequently disturb roosting and feeding birds through barking and by their presence | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Under alternative D, dogs would be prohibited at the Muir Beach site except for on-leash dog walking in the parking lot and on the proposed Muir Beach Trail leading to the parking lot, which supports some adjacent wetland/aquatic habitat. The lagoon is currently closed to people and dogs. Therefore, assuming compliance, alternative D would result in negligible impacts on wildlife at this site; even though dogs would not be allowed in proximity to the lagoon and only along the trail, on-leash dogs could still infrequently disturb roosting and feeding birds and other wildlife through barking and by their presence.

No commercial dog walking would be allowed and no permits to walk more than three dogs would be issued under alternative D; therefore, commercial and permitted dog walking would have no impact on wildlife. Private dog walkers would be allowed to walk one to three dogs.

**Cumulative Impacts.** The negligible impacts on wildlife from dogs at Muir Beach under alternative D were considered together with the effects of the projects mentioned above under alternative A. There would be a combination of beneficial and adverse effects from projects in and around Muir Beach; when combined, these projects would balance out, resulting in negligible impacts. These negligible impacts combined with the negligible impacts from alternative D would result in negligible cumulative impacts on wildlife.

**MUIR BEACH ALTERNATIVE D CONCLUSION TABLE**

| <b>Wetland and Aquatic Wildlife Impacts</b> | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--|---|-------------------------------|
| Negligible impacts, assuming compliance     | Dogs would be prohibited at the Muir Beach site except for the parking lot and the proposed Muir Beach Trail, which supports some adjacent wetland/aquatic habitat | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Under alternative E, on-leash dog walking would be allowed on the proposed Muir Beach Trail, in the parking area, and on the bridge and path to the beach, and dog walking under voice and sight control would be allowed in a ROLA at the south end of the beach (which includes coastal community wildlife habitat, not wetland and aquatic wildlife habitat). The lagoon is currently closed to people and dogs, and physical restraint of dogs on leash and compliance in the ROLA would not allow dog access to the lagoon, its shorelines, or wetland habitat adjacent to trails used by shorebirds, wading birds, waterbirds, and other wildlife. Therefore, assuming compliance, alternative E would result in negligible impacts on wildlife at this site because on-

## Chapter 4: Environmental Consequences

leash dogs could still infrequently disturb roosting and feeding birds and other wildlife through barking and by their presence.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Muir Beach is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at Muir Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have a negligible impact on wildlife.

**Cumulative Impacts.** The negligible impacts on wildlife from dogs at Muir Beach under alternative E were considered together with the effects of the projects mentioned above under alternative A. There would be a combination of beneficial and adverse effects from projects in and around Muir Beach; when combined, these projects would balance out, resulting in negligible impacts. These negligible impacts combined with the negligible impacts from alternative E would result in negligible cumulative impacts on wildlife.

**MUIR BEACH ALTERNATIVE E CONCLUSION TABLE**

| Wetland and Aquatic Wildlife Impacts            | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Overall negligible impacts, assuming compliance | The lagoon is closed to dogs; physical restraint of dogs on leash and compliance in ROLA would not allow dogs access to the lagoon, its shorelines, or wetland habitat adjacent to trails used by shorebirds, wading birds, waterbirds, and other wildlife; on-leash dogs could still infrequently disturb roosting and feeding birds and other wildlife through barking and by their presence | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative would allow on-leash dog walking on the beach, bridge and path to the beach, and the proposed Muir Beach Trail leading to the parking lot, which supports some adjacent wetland/aquatic habitat. The lagoon is currently closed to people and dogs. Therefore, assuming compliance, the preferred alternative would result in negligible impacts on wildlife at this site; even though dogs would not be allowed in proximity to the lagoon and only along the trail, on-leash dogs could still infrequently disturb roosting and feeding birds and other wildlife through barking and by their presence.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Muir Beach is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at Muir Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have a negligible impact on wildlife.

**Cumulative Impacts.** Projects and actions in and near Muir Beach were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on wildlife at or in the vicinity of this site.

Many wetland restoration and creation projects have been completed or are proposed in GGNRA and beyond the boundaries of the park. Impacts resulting from completed, ongoing, and future restoration/creation projects at Redwood Creek and Muir Beach lagoon and projects beyond the park boundaries will generally provide an overall benefit to wetland and tidal marsh habitats. Specific examples of projects and plans that have cumulatively provided beneficial affects to wetlands include the *Muir Beach Wetland and Creek Restoration*; the tidal lagoon was restored in 2009 to provide a functional, resilient ecosystem while also providing habitat for special-status species and reducing flooding on Pacific Way. Similarly, NPS and the California State Lands Commission formulated the *Giacomini Wetland Restoration Project* (Marin County, near Tomales Bay), which restored 560 acres of pastures to wetlands of increased complexity and diversity of vegetation and aquatic habitats (NPS 2009k; NPS and CSLC 2007). This project also dramatically increased habitat for California black rail as well as other aquatic species such as waterfowl, shorebirds, fish, and seals (NPS 2009k). The Gulf of the Farallones National Marine Sanctuary has proposed the *Bolinas Lagoon Ecosystem Restoration Project* (near Stinson Beach), which will benefit wildlife species that currently use Bolinas Lagoon, including 245 species of birds, such as migratory waterfowl and shorebirds, as well as fish, invertebrates, and harbor seals, which use the site for pupping grounds and as a haul-out site (GFNMS Working Group 2008).

Additional actions have had or have the potential to have adverse effects on wetlands at or in the vicinity of GGNRA sites. Larger, more regional development projects like the GGNRA *Long-range Transportation Plan Update* (NPS 2008g) and the *Doyle Drive Project* (Presidio Parkway 2008) will impact or have the potential to negatively affect wetland resources within and beyond park boundaries. However, wetland impacts from the implementation of these and other proposed projects in the area should be sufficiently offset by mitigation, project by project, such that there would be no net loss of wetland acreage, functions, or values.

The loss of more than 90 percent of California's original wetlands is the largest loss of any state in the nation and is directly related to economic development (NOAA 2010a, 1). The *Clean Water Act* and the state's coastal wetlands statute have succeeded in reducing the rate of wetland loss in California, but development pressures remain a threat (NOAA 2010a, 1). Therefore, projects that protect or degrade wetlands and aquatic habitats will have a cumulative effect, whether beneficial or adverse, on wildlife species that inhabit wetlands.

The negligible impacts on wildlife from dogs at Muir Beach under the preferred alternative were considered together with the effects of the projects mentioned above. There would be a combination of beneficial and adverse effects from projects in and around Muir Beach; when combined, these projects would balance out, resulting in negligible impacts. Therefore, these negligible impacts combined with the negligible impacts from the preferred alternative would result in negligible cumulative impacts on wildlife.

**MUIR BEACH PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| <b>Wetland and Aquatic Wildlife Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|---|---|-------------------------------|
| Negligible impacts, assuming compliance     | Dogs would be allowed on-leash in the parking lot, on the beach and path to the beach, and on the proposed Muir Beach Trail, which supports some adjacent wetland/aquatic habitat | Beneficial, assuming compliance                     | Negligible cumulative impacts |

### Rodeo Beach/South Rodeo Beach (Rodeo Lagoon)

**Alternative A: No Action.** Dogs are currently required to be either on leash or under voice control at both Rodeo Beach and South Rodeo Beach. On-leash dog walking is allowed on the footbridge and access trail to the beach. Rodeo Lagoon is currently closed to people and dogs for overall resource protection. The NPS has restricted people and their pets from accessing the lagoon and its shoreline. However, there is no physical barrier to prevent dogs from accessing the lagoon. Shorebird numbers are high at this site and the area receives moderate to high use by dog owners/beachgoers. Park staff members have estimated that they observe dogs in the lagoon at least once a week, and on a daily basis during good weather.

Under the no-action alternative, dogs along the shoreline and in the lagoon could continue to affect water-dependent reptile, amphibian, and fish species. Specifically, egg masses and individual species could be affected directly through trampling or indirectly by increased turbidity (sedimentation) if dogs access the lagoon or its shorelines. Bird species that could be affected include waterbirds (pelicans, grebes, ducks, cormorants, gulls), wading birds (herons and egrets), and shorebirds. River otters also use habitat at the lagoon and could be affected by presence of dogs. Impacts would generally be the result of dog presence, dogs chasing after birds, and noise disruptions from barking; dogs frequently play and run around in the shallow water of the lagoon and inlet. Therefore, alternative A would result in continued long-term moderate adverse impacts on wildlife at Rodeo Lagoon because shorebirds, wading birds, and waterbirds such as pelicans that use the lagoon would frequently be subjected to impacts from on-leash and voice control dogs barking at, chasing after, and being in proximity to roosting or feeding birds, potentially limiting their use of preferred habitat and affecting their reproductive success.

Under alternative A, no permit system exists for dog walking. At Rodeo Beach/South Rodeo Beach, commercial dog walking is uncommon. Therefore, commercial dog walking would have negligible impacts on wildlife.

**Cumulative Impacts.** Projects and actions in and near Rodeo Beach/South Rodeo Beach were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on wildlife at or in the vicinity of this site.

Many wetland restoration and creation projects have been completed or are proposed in GGNRA and beyond the boundaries of the park. Impacts resulting from completed, ongoing, and future restoration/creation projects at Rodeo Lagoon and projects beyond the park boundaries will generally provide an overall benefit to wetland and tidal marsh habitats. Specific examples of projects and plans that will cumulatively provide beneficial affects to wetlands include the *Giacomini Wetland Restoration Project* (Marin County, near Tomales Bay), which restored 560 acres of pastures to wetlands of increased complexity and diversity of vegetation and aquatic habitats (NPS 2009k; NPS and CSLC 2007). This project also dramatically increased habitat for California black rail as well as other aquatic species such as waterfowl, shorebirds, fish, and seals (NPS 2009k). The Gulf of the Farallones National Marine Sanctuary has proposed the *Bolinas Lagoon Ecosystem Restoration Project* (near Stinson Beach), which will benefit wildlife species that currently use Bolinas Lagoon, including 245 species of birds, such as migratory waterfowl and shorebirds, as well as fish, invertebrates, and harbor seals, which use the site for pupping grounds and as a haul-out site (GFNMS Working Group 2008).

Additional actions have had or have the potential to have adverse effects on wetlands at or in the vicinity of GGNRA sites. Larger, more regional development projects like the GGNRA *Long-range Transportation Plan Update* (NPS 2008g) and the *Doyle Drive Project* (Presidio Parkway 2008) will impact or have the potential to negatively affect wetland resources within and beyond park boundaries. However, wetland impacts from the implementation of these and other proposed projects in the area

should be sufficiently offset by mitigation, project by project, such that there would be no net loss of wetland acreage, functions, or values.

The loss of more than 90 percent of California's original wetlands is the largest loss of any state in the nation and is directly related to economic development (NOAA 2010a, 1). The *Clean Water Act* and the state's coastal wetlands statute have succeeded in reducing the rate of wetland loss in California, but development pressures remain a threat (NOAA 2010a, 1). Therefore, projects that protect or degrade wetlands and aquatic habitats will have a cumulative effect, whether beneficial or adverse, on wildlife species that inhabit wetlands.

The long-term moderate adverse impacts on wildlife from dogs at Rodeo Beach/South Rodeo Beach under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from wetland restoration/creation projects should reduce some of the adverse impacts on wildlife from alternative A. However, the impacts resulting from any development projects at or in the vicinity of GGNRA and the loss of more than 90 percent of California's original wetlands may add adversely to the cumulative impacts on wildlife, even though wetland mitigation has contributed to reducing impacts on wildlife. Since there would be a combination of beneficial and adverse effects from projects in and around Rodeo Beach/South Rodeo Beach, when combined, these projects would balance out, resulting in negligible impacts. Therefore, the cumulative analysis for this park site will mainly focus on the results of the impact analysis for each alternative. Cumulative impacts on wildlife under this alternative would be expected to be long term, moderate, and adverse.

**RODEO BEACH/SOUTH RODEO BEACH ALTERNATIVE A CONCLUSION TABLE**

| Wetland and Aquatic Wildlife Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts                            |
|--------------------------------------|---|--|---|
| Long-term moderate adverse impacts   | Historically, dogs have gained access to the closed lagoon at least once a week, and during good weather, on a daily basis; shorebirds, wading birds, and waterbirds such as pelicans that use the lagoon would frequently be subjected to impacts from on-leash and voice control dogs barking at, chasing after, and being in proximity to roosting or feeding birds; shorebird numbers are high and visitor use is moderate to high at this site | N/A  | Long-term moderate adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Under alternative B, on-leash dog walking would be allowed on Rodeo Beach, South Rodeo Beach, and on the footbridge and access trail to the beaches. Rodeo Lagoon and Rodeo Lake would remain closed to people and dogs. Additionally, a concurrent NPS project includes the installation of a post-and-cable fence along the beach side of Rodeo Lagoon to discourage visitors from accessing the lagoon, though it would not physically exclude dogs from this area. If dogs are physically restrained on leash at this site and deterred by a fence, they should not gain access to the lagoon or its shorelines. Therefore, assuming compliance, alternative B would result in negligible impacts on wildlife using the lagoon and lake and surrounding habitat because on-leash dogs could still disturb wildlife through barking and by their presence.

## Chapter 4: Environmental Consequences

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is not common at Rodeo Beach/South Rodeo Beach, but has recently begun to increase, it is likely that this alternative may increase the number of commercial dog walkers at this site in the future. Therefore, commercial dog walking under the preferred alternative would have a negligible to long-term minor adverse impact on wildlife.

**Cumulative Impacts.** The negligible impacts on wildlife from dogs at Rodeo Beach/South Rodeo Beach under alternative B were considered together with the effects of the projects mentioned above under alternative A. There would be a combination of beneficial and adverse effects from projects in and around Rodeo Beach/South Rodeo Beach; when combined, these projects would balance out, resulting in negligible impacts. These negligible impacts combined with the negligible impact from alternative B would result in negligible cumulative impacts on wildlife.

**RODEO BEACH/SOUTH RODEO BEACH ALTERNATIVE B CONCLUSION TABLE**

| Wetland and Aquatic Wildlife Impacts            | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Rodeo Lagoon is closed to dogs; physically restraining dogs on leash would not allow dogs access to Rodeo Lagoon or along shorelines used by shorebirds, wading birds, waterbirds, and other wildlife; on-leash dogs could still disturb roosting and feeding birds through barking and by their presence | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Dogs would be required to be on leash on the footbridge to the beach, but would be allowed under voice and sight control in a ROLA on the main Rodeo Beach (which includes coastal community wildlife habitat, not wetland and aquatic wildlife habitat). Rodeo Lagoon and Rodeo Lake is currently closed to people and dogs. A concurrent NPS project includes the installation of a post-and-cable fence along the beach side of Rodeo Lagoon to discourage visitors from accessing the lagoon, though it would not physically exclude dogs from this area. Therefore, assuming compliance, alternative C would result in negligible impacts on wildlife using the lagoon and lake and surrounding habitat because on-leash dogs could still disturb roosting and feeding birds and other wildlife through barking and by their presence.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. At Rodeo Beach, any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. In a ROLA, permit holders may walk one to six dogs off leash and the permit may restrict use by time and area. Impacts on wildlife from permit holders with up to six dogs off leash would be expected to increase under this alternative. Since commercial dog walking is not common at Rodeo Beach/South Rodeo Beach, but has recently begun to increase, it is likely that this alternative may increase the number of commercial dog walkers at this site in the future. Therefore, commercial dog walking under the preferred alternative would have a negligible to long-term minor adverse impact on wildlife.

**Cumulative Impacts.** The negligible impacts on wildlife from dogs at Rodeo Beach/South Rodeo Beach under alternative C were considered together with the effects of the projects mentioned above under

alternative A. There would be a combination of beneficial and adverse effects from projects in and around Rodeo Beach/South Rodeo Beach; when combined, these projects would balance out, resulting in negligible impacts. These negligible impacts combined with the negligible impacts from alternative C would result in negligible cumulative impacts on wildlife.

**RODEO BEACH/SOUTH RODEO BEACH ALTERNATIVE C CONCLUSION TABLE**

| <b>Wetland and Aquatic Wildlife Impacts</b>     | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance | Rodeo Lagoon is closed to dogs; physical restraint of dogs on leash and compliance in the ROLA would not allow dogs access to Rodeo Lagoon or along shorelines used by shorebirds, wading birds, waterbirds, and other wildlife; on-leash dogs could still disturb roosting and feeding birds through barking and by their presence | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Under alternative D, on-leash dog walking would be allowed on Rodeo Beach north of the footbridge and on the footbridge to the beach. Rodeo Lagoon and Rodeo Lake is currently closed to people and dogs. A concurrent NPS project includes the installation of a post-and-cable fence along the beach side of Rodeo Lagoon to discourage visitors from accessing the lagoon, though it would not physically exclude dogs from this area. If dogs are physically restrained on leash at this site and deterred by a fence, they should not gain access to the lagoon or its shorelines. Therefore, assuming compliance, alternative D would result in negligible impacts on wildlife using the lagoon and lake and surrounding habitat because on-leash dogs could still disturb wildlife through barking and by their presence.

No commercial dog walking would be allowed and no permits to walk more than three dogs would be issued under alternative D; therefore, commercial and permitted dog walking would have no impact on wildlife. Private dog walkers would be allowed to walk one to three dogs.

**Cumulative Impacts.** The negligible impacts on wildlife from dogs at Rodeo Beach/South Rodeo Beach under alternative D were considered together with the effects of the projects mentioned above under alternative A. There would be a combination of beneficial and adverse effects from projects in and around Rodeo Beach/South Rodeo Beach; when combined, these projects would balance out, resulting in negligible impacts. These negligible impacts combined with the negligible impacts from alternative D would result in negligible cumulative impacts on wildlife.

RODEO BEACH/SOUTH RODEO BEACH ALTERNATIVE D CONCLUSION TABLE

| Wetland and Aquatic Wildlife Impacts            | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Rodeo Lagoon is closed to dogs; physically restraining dogs on leash would not allow dogs access to Rodeo Lagoon or along shorelines used by shorebirds, wading birds, waterbirds, and other wildlife; on-leash dogs could still disturb roosting and feeding birds through barking and by their presence | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Under alternative E, dog walking under voice and sight control would be allowed in a ROLA on Rodeo Beach and South Rodeo Beach. The lagoon would remain closed to people and dogs. The installation of the fence along the beach side of Rodeo Lagoon would discourage visitors from accessing the lagoon, but would not physically exclude dogs from this area. Although this alternative includes a ROLA, the addition of a fence as deterrent and compliance with regulations as well as on-leash requirements would result in protection of wildlife using wetland vegetation surrounding Rodeo Lagoon. Therefore, assuming compliance, alternative E would result in negligible impacts on wildlife species because on-leash dogs could still disturb wildlife through barking and by their presence.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. At Rodeo Beach, any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. In a ROLA, permit holders may walk one to six dogs off leash and the permit may restrict use by time and area. Impacts on wildlife from permit holders with up to six dogs off leash would be expected to increase under this alternative. Since commercial dog walking is not common at Rodeo Beach/South Rodeo Beach, but has recently begun to increase, it is likely that this alternative may increase the number of commercial dog walkers at this site in the future. Therefore, commercial dog walking under the preferred alternative would have a negligible to long-term minor adverse impact on wildlife.

**Cumulative Impacts.** The negligible impacts on wildlife from dogs at Rodeo Beach/South Rodeo Beach under alternative E were considered together with the effects of the projects mentioned above under alternative A. There would be a combination of beneficial and adverse effects from projects in and around Rodeo Beach/South Rodeo Beach; when combined, these projects would balance out, resulting in negligible impacts. These negligible impacts combined with the negligible impacts from alternative E would result in negligible cumulative impacts on wildlife.

RODEO BEACH/SOUTH RODEO BEACH ALTERNATIVE E CONCLUSION TABLE

| Wetland and Aquatic Wildlife Impacts            | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Rodeo Lagoon is closed to dogs; physical restraint of dogs on leash and compliance in the ROLA would not allow dogs access to Rodeo Lagoon or along shorelines used by shorebirds, wading birds, waterbirds, and other wildlife; on-leash dogs could still disturb roosting and feeding birds and other wildlife through barking and by their presence | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative would allow dogs on leash on the footbridge to the beach, but then dogs would be allowed under voice and sight control in a ROLA on Rodeo Beach (which is coastal community wildlife habitat, not wetland and aquatic wildlife habitat), to the sea stacks dividing the main beach from South Rodeo Beach. Rodeo Lagoon and Rodeo Lake are currently closed to people and dogs. A concurrent NPS project includes the installation of a post-and-cable fence along the beach side of Rodeo Lagoon to discourage visitors from accessing the lagoon, though it would not physically exclude dogs from this area. Therefore, assuming compliance, the preferred alternative would result in negligible impacts on wildlife using the lagoon and lake and surrounding habitat because on-leash dogs could still disturb roosting and feeding birds and other wildlife through barking and by their presence.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. At Rodeo Beach, any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. In a ROLA, permit holders may walk one to six dogs off leash and the permit may restrict use by time and area. Impacts on wildlife from permit holders with up to six dogs off leash would be expected to increase under this alternative. Since commercial dog walking is not common at Rodeo Beach/South Rodeo Beach, but has recently begun to increase, it is likely that this alternative may increase the number of commercial dog walkers at this site in the future. Therefore, commercial dog walking under the preferred alternative would have a negligible to long-term minor adverse impact on wildlife.

**Cumulative Impacts.** Projects and actions in and near Rodeo Beach/South Rodeo Beach were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on wildlife at or in the vicinity of this site.

Many wetland restoration and creation projects have been completed or are proposed in GGNRA and beyond the boundaries of the park. Impacts resulting from completed, ongoing, and future restoration/creation projects at Rodeo Lagoon and projects beyond the park boundaries will generally provide an overall benefit to wetland and tidal marsh habitats. Specific examples of projects and plans that will cumulatively provide beneficial affects to wetlands include the *Giacomini Wetland Restoration Project* (Marin County, near Tomales Bay), which restored 560 acres of pastures to wetlands of increased complexity and diversity of vegetation and aquatic habitats (NPS 2009k; NPS and CSLC 2007). This project also dramatically increased habitat for California black rail as well as other aquatic species such as waterfowl, shorebirds, fish, and seals (NPS 2009k). The Gulf of the Farallones National Marine Sanctuary has proposed the *Bolinas Lagoon Ecosystem Restoration Project* (near Stinson Beach) which will benefit wildlife species that currently use Bolinas Lagoon, including 245 species of birds, such as migratory

## Chapter 4: Environmental Consequences

waterfowl and shorebirds, as well as fish, invertebrates, and harbor seals, which use the site for pupping grounds and as a haul-out site (GFNMS Working Group 2008).

Additional actions have had or have the potential to have adverse effects on wetlands at or in the vicinity of GGNRA sites. Larger, more regional development projects like the GGNRA *Long-range Transportation Plan Update* (NPS 2008g) and the *Doyle Drive Project* (Presidio Parkway 2008) will impact or have the potential to negatively affect wetland resources within and beyond park boundaries. However, wetland impacts from the implementation of these and other proposed projects in the area should be sufficiently offset by mitigation, project by project, such that there should be no net loss of wetland acreage, functions, or values.

The loss of more than 90 percent of California’s original wetlands is the largest loss of any state in the nation and is directly related to economic development (NOAA 2010a, 1). The *Clean Water Act* and the state’s coastal wetlands statute have succeeded in reducing the rate of wetland loss in California, but development pressures remain a threat (NOAA 2010a, 1). Therefore, projects that protect or degrade wetlands and aquatic habitats will have a cumulative effect, whether beneficial or adverse, on wildlife species that inhabit wetlands.

The negligible impacts on wildlife from dogs at Rodeo Beach/South Rodeo Beach under the preferred alternative were considered together with the effects of the projects mentioned above. There would be a combination of beneficial and adverse effects from projects in and around Rodeo Beach/South Rodeo Beach; when combined, these projects would balance out, resulting in negligible impacts. These negligible impacts combined with the negligible impacts from the preferred alternative would result in negligible cumulative impacts on wildlife.

**RODEO BEACH/SOUTH RODEO BEACH PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| Wetland and Aquatic Wildlife Impacts            | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Rodeo Lagoon is closed to dogs; physical restraint of dogs on leash and compliance in the ROLA would not allow dogs access to Rodeo Lagoon or along shorelines used by shorebirds, wading birds, waterbirds, and other wildlife; on-leash dogs could still disturb roosting and feeding birds through barking and by their presence | Beneficial, assuming compliance              | Negligible cumulative impacts |

### Marin Headlands Trails

**Alternative A: No Action.** Currently, on-leash dog walking is allowed along the Coastal Trail from Hill 88 to Muir Beach, the Batteries Loop Trail, North Miwok Trail from Tennessee Valley to Highway 1, County View Trail, and Marin Drive. Dog walking under voice control (or on leash) is allowed along the Coastal Trail from the Golden Gate Bridge to Hill 88 including the Lagoon Loop Trail, the Coastal, Wolf Ridge and Miwok Loop, and the Old Bunker Fire Road Loop (includes section of the Coastal Trail). These trails experience low to moderate use by dog walkers but dog-related incidents are high at this site with a total of 269 from 2008 through 2011. The majority of dog-related incidents at the Marin Headlands Trails included having dogs within areas closed to pets (table 16). The Marin Headlands Trails area

supports wetland vegetation around Rodeo Lake and extensive areas of wetlands in the valley bottom along Rodeo Valley Trail.

Under the no-action alternative, dogs along the shorelines of the wetlands and in Rodeo Lake could continue to affect water-dependent reptile, amphibian, and fish species. Specifically, egg masses and individual species could be affected directly through trampling or indirectly by increased turbidity (sedimentation) if dogs access the lake or wetland shorelines. Bird species that could be affected by the presence of dogs include aquatic bird species (grebes, ducks, cormorants, gulls, waterfowl), wading birds (herons and egrets), and shorebirds. Impacts would generally be the result of dog presence, dogs chasing after birds, and noise disruptions from barking. Dogs have gained access to Rodeo Lake and affected wildlife through barking and chasing after; wildlife species that use areas of wetlands in the valley bottom along Rodeo Valley Trail should not be affected by dogs since dogs would not be allowed in the vicinity of this trail.

Alternative A would result in continued long-term minor adverse impacts on wildlife at Marin Headlands Trails because shorebirds, wading birds, and waterbirds that use the lake would occasionally be disturbed by on-leash and voice control dogs barking at, chasing after, and being in proximity to roosting or feeding birds, potentially limiting their use of preferred habitat.

Under alternative A, no permit system exists for dog walking. At Marin Headlands Trails, commercial dog walking is uncommon. Therefore, commercial dog walking would have negligible impacts on wildlife species that use wetland vegetation.

**Cumulative Impacts.** Projects and actions in and near Marin Headlands Trails were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on wildlife at or in the vicinity of this site.

Many wetland restoration and creation projects have been completed or are proposed in GGNRA and beyond the boundaries of the park. Impacts resulting from completed, ongoing, and future restoration/creation projects at Rodeo Lagoon and projects beyond the park boundaries will generally provide an overall benefit to wetland and tidal marsh habitats. Specific examples of projects and plans that will cumulatively provide beneficial affects to wetlands include the *Giacomini Wetland Restoration Project* (Marin County, near Tomales Bay) that restored 560 acres of pastures to wetlands of increased complexity and diversity of vegetation and aquatic habitats (NPS 2009k; NPS and CSLC 2007). This project also dramatically increased habitat for California black rail, as well as other aquatic species such as waterfowl, shorebirds, fish, and seals (NPS 2009k). The Gulf of the Farallones National Marine Sanctuary has proposed the *Bolinas Lagoon Ecosystem Restoration Project* (near Stinson Beach), which will benefit wildlife species that currently use Bolinas Lagoon, including 245 species of birds, such as migratory waterfowl and shorebirds, as well as fish, invertebrates, and harbor seals, which use the site for pupping grounds and as a haul-out site (GFNMS Working Group 2008).

Additional actions have had or have the potential to have adverse effects on wetlands at or in the vicinity of GGNRA sites. Larger, more regional development projects like the GGNRA *Long-range Transportation Plan Update* (NPS 2008g) and the *Doyle Drive Project* (Presidio Parkway 2008) will impact or have the potential to negatively affect wetland resources and wildlife within and beyond park boundaries. However, wetland impacts from the implementation of these and other proposed projects in the area should be sufficiently offset by mitigation, project by project, such that there would be no net loss of wetland acreage, functions, or values.

As stated previously, the loss of more than 90 percent of California's original wetlands is the largest loss of any state in the nation and is directly related to economic development (NOAA 2010a, 1). The *Clean*

## Chapter 4: Environmental Consequences

*Water Act* and the state's coastal wetlands statute have succeeded in reducing the rate of wetland loss in California, but development pressures remain a threat (NOAA 2010a, 1). Therefore, projects that protect or degrade wetlands and aquatic habitats will have a cumulative effect, whether beneficial or adverse, on wildlife species that inhabit wetlands.

The long-term minor adverse impacts on wildlife from dogs at Marin Headlands Trails under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from wetland restoration/creation projects should reduce some of the adverse impacts on wildlife from alternative A. However, the impacts resulting from any development projects at or in the vicinity of GGNRA and the loss of more than 90 percent of California's original wetlands may add to the cumulative impacts on wildlife, even though wetland mitigation has contributed to reducing impacts on wildlife. Since there would be a combination of beneficial and adverse effects from projects in and around Marin Headlands Trails, when combined, these projects would balance out, resulting in negligible impacts. Therefore, the cumulative analysis for this park site will mainly focus on the results of the impact analysis for each alternative. Cumulative impacts on wildlife under this alternative would be expected to be long term, minor, and adverse.

**MARIN HEADLANDS TRAILS ALTERNATIVE A CONCLUSION TABLE**

| Wetland and Aquatic Wildlife Impacts | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts                         |
|--------------------------------------|--|--|--|
| Long-term minor adverse impacts      | Dogs would continue to gain access to Rodeo Lake and birds would occasionally be subjected to impacts by dogs through barking and chasing after; wildlife using areas of wetlands in the valley bottom along Rodeo Valley Trail should not be affected by dogs since dogs would not be allowed in the vicinity of this trail | N/A  | Long-term minor adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Under alternative B, dogs would not be allowed at this site. Therefore, assuming compliance, no impact on wildlife from dogs at this site would occur.

Since dogs would not be allowed at the Marin Headlands Trails, no impacts on wildlife species that use wetland vegetation would occur from commercial dog walkers.

**Cumulative Impacts.** The lack of impacts on wildlife from dogs under alternative B was considered together with the effects of the projects mentioned above under alternative A. There would be a combination of beneficial and adverse effects from projects in and around Marin Headlands Trails; when combined, these projects would balance out, resulting in negligible impacts. Cumulatively, alternative B would have negligible impacts on wildlife at this park site when added to other past, present, or foreseeable future actions at and around this park site.

MARIN HEADLANDS TRAILS ALTERNATIVE B CONCLUSION TABLE

| Wetland and Aquatic Wildlife Impacts | Rationale                        | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--------------------------------------|----------------------------------|--|-------------------------------|
| No impact                            | Dogs would be prohibited at site | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Under alternative C, on-leash dog walking would be allowed along the Lower Rodeo Valley Trail Corridor. This corridor extends from the Rodeo Beach parking lot to the intersection of Bunker and McCullough Roads via North Lagoon Loop Trail, Miwok Trail, and Rodeo Valley Trail including the connector trail from the Rodeo Valley Trail to the Smith Road Trailhead. On-leash dog walking would also be allowed on the Old Bunker Fire Road Loop (including a section of the Coastal Trail), and the Batteries Loop Trail. This alternative would allow dog access only on these perimeter trails in the Marin Headlands Trails, while preserving and maintaining the integrity of interior habitat. The valley bottom along Rodeo Valley Trail Corridor is adjacent to extensive areas of freshwater vegetation and the Miwok Trail is adjacent to Rodeo Lake, which supports shoreline wetland vegetation. Rodeo Lake is closed to dogs and is densely vegetated with willows along the shoreline making access difficult. Rodeo Lagoon is closed to dogs and humans for overall resource protection. However, compared to alternative A, this alternative would allow dogs on a much longer section of the Rodeo Valley Trail, which passes through or is directly adjacent to wetland habitat. Alternative C would allow dogs on two new bridges that cross over a creek and wetlands at the site. Therefore, assuming compliance, alternative C would result in negligible to long-term minor adverse impacts on wildlife using the lake and other wetland habitats at the site because a longer section of the Rodeo Valley Trail would be available for dog walking and because on-leash dogs could still disturb roosting and feeding birds and other wildlife by barking and by their presence.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Marin Headlands Trails is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking activity is not common at Marin Headlands Trails, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have a negligible impact on wildlife species that use wetland vegetation.

**Cumulative Impacts.** The negligible to long-term minor adverse impacts on wildlife from dogs at Marin Headlands Trails under alternative C were considered together with the effects of the projects mentioned above under alternative A. There would be a combination of beneficial and adverse effects from projects in and around Marin Headlands Trails; when combined, these projects would balance out, resulting in negligible impacts. These negligible impacts combined with the negligible to long-term minor adverse impacts from alternative C would result in negligible cumulative impacts on wildlife.

MARIN HEADLANDS TRAILS ALTERNATIVE C CONCLUSION TABLE

| Wetland and Aquatic Wildlife Impacts                                       | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Rodeo Lake is closed to dogs; a longer section of the Rodeo Valley Trail would be available for dog walking but physically restraining dogs on leash would not allow access in habitat off trail along the Rodeo Valley Trail Corridor, which supports wetlands and could be used by shorebirds, wading birds, waterbirds, and other wildlife | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Under alternative D, dogs would not be allowed at this site. Therefore, assuming compliance, no impact on wildlife from dogs at this site would occur.

Since dogs would not be allowed at the Marin Headlands Trails, no impacts on wildlife species that use wetland vegetation would occur from commercial dog walkers.

**Cumulative Impacts.** Under alternative D, the cumulative impacts on wildlife at this park site would be the same those under alternative B: negligible.

MARIN HEADLANDS TRAILS ALTERNATIVE D CONCLUSION TABLE

| Wetland and Aquatic Wildlife Impacts | Rationale                        | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--------------------------------------|----------------------------------|--|-------------------------------|
| No impact assuming compliance        | Dogs would be prohibited at site | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would allow on-leash dog walking on the Conzelman Coastal Trail from Highway 101 to the McCullough intersection and then to the Coastal Trail Bike Route, including Julian Road, to Rodeo Beach parking lot. On-leash dog walking would be available on the Old Bunker Fire Road Loop (which includes a section of the Coastal Trail), Batteries Loop Trail, North Miwok Trail from Tennessee Valley to Highway 1, County View Trail, Marin Drive, Rodeo Avenue Trail, and Morning Sun Trail. This alternative would allow dog access only on these perimeter trails in the Marin Headlands Trails, while preserving and maintaining the integrity of interior habitat. The valley bottom along Rodeo Valley Trail Corridor is adjacent to extensive areas of freshwater vegetation and the Miwok Trail is adjacent to Rodeo Lake, which supports shoreline wetland vegetation. Rodeo Lake is closed to dogs and is densely vegetated with willows along the shoreline making access difficult. Rodeo Lagoon is closed to dogs and humans for overall resource protection, including wetland shorelines used by shorebirds, wading birds, waterbirds, and other wildlife. Therefore, assuming compliance, alternative E would result in negligible impacts on wildlife using the lake and surrounding wetland habitat because on-leash dogs could still disturb roosting and feeding birds and other wildlife through barking and by their presence. Even though alternative E would allow more dog access at the site, the difference in dog use between alternatives E and C is not considered large enough to cause a change in the intensity of the impact relative to the area of the site.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Marin Headlands Trails is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking activity is not common at Marin Headlands Trails, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have a negligible impact on wildlife using wetland vegetation.

**Cumulative Impacts.** The negligible impacts on wildlife from dogs under alternative E were considered together with the effects of the projects mentioned above under alternative A. Cumulatively, alternative E would have negligible impacts on wildlife species that use wetland vegetation at this park site when added to other past, present, or foreseeable future actions at and around this park site.

**MARIN HEADLANDS TRAILS ALTERNATIVE E CONCLUSION TABLE**

| Wetland and Aquatic Wildlife Impacts            | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs on leash and closing Rodeo Lake would protect wildlife in wetlands along Rodeo Lake and along the Rodeo Valley Trail Corridor, which also supports wetland habitat | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative would allow on-leash dog walking along the Lower Rodeo Valley Trail Corridor, which extends from the Rodeo Beach parking lot to the intersection of Bunker and McCullough Roads via the North Lagoon Loop Trail, Miwok Trail and the Rodeo Valley Trail, and includes the connector trail from Rodeo Valley Trail to Smith Road trailhead. On-leash dog walking would be available on the Old Bunker Fire Road Loop (including a section of the Coastal Trail), Batteries Loop Trail, Rodeo Avenue Trail, and Morning Sun Trail. This alternative would allow dog access only on these perimeter trails in the Marin Headlands Trails, while preserving and maintaining the integrity of interior habitat. The valley bottom along Rodeo Valley Trail Corridor is adjacent to extensive areas of freshwater vegetation and the Miwok Trail is adjacent to Rodeo Lake, which supports shoreline wetland vegetation. Rodeo Lake is closed to dogs and is densely vegetated with willows along the shoreline making access difficult. Rodeo Lagoon is closed to dogs and humans for overall resource protection, including wetland shorelines used by shorebirds, wading birds, waterbirds, and other wildlife. However, compared to alternative A, this alternative would allow dogs on a much longer section of the Rodeo Valley Trail, which passes through or is directly adjacent to wetland habitat. The preferred alternative would allow dogs on two new bridges that cross over a creek and wetlands at the site. Therefore, assuming compliance, the preferred alternative would result in negligible to long-term, minor, adverse impacts on wildlife using the lake and other wetland habitats at the site because a longer section of the Rodeo Valley Trail would be available for dog walking and because on-leash dogs could still disturb roosting and feeding birds and other wildlife through barking and by their presence.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Marin Headlands Trails is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking activity is not common at Marin Headlands Trails, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have a negligible impact on wildlife species that use wetland vegetation.

## Chapter 4: Environmental Consequences

**Cumulative Impacts.** Projects and actions in and near Marin Headlands Trails were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on wildlife at or in the vicinity of this site.

Many wetland restoration and creation projects have been completed or are proposed in GGNRA and beyond the boundaries of the park. Impacts resulting from completed, ongoing, and future restoration/creation projects at Rodeo Lagoon and projects beyond the park boundaries will generally provide an overall benefit to wetland and tidal marsh habitats. Specific examples of projects and plans that will cumulatively provide beneficial affects to wetlands include the *Giacomini Wetland Restoration Project* (Marin County, near Tomales Bay), which restored 560 acres of pastures to wetlands of increased complexity and diversity of vegetation and aquatic habitats (NPS 2009k; NPS and CSLC 2007). This project also dramatically increased habitat for California black rail, as well as other aquatic species such as waterfowl, shorebirds, fish, and seals (NPS 2009k). The Gulf of the Farallones National Marine Sanctuary has proposed the *Bolinas Lagoon Ecosystem Restoration Project* (near Stinson Beach), which will benefit wildlife species that currently use Bolinas Lagoon, including 245 species of birds, such as migratory waterfowl and shorebirds, as well as fish, invertebrates, and harbor seals, which use the site for pupping grounds and as a haul-out site (GFNMS Working Group 2008).

Additional actions have had or have the potential to have adverse effects on wetlands at or in the vicinity of GGNRA sites. Larger, more regional development projects, like the GGNRA *Long-range Transportation Plan Update* (NPS 2008g) and the *Doyle Drive Project* (Presidio Parkway 2008) will impact or have the potential to negatively affect wetland resources and wildlife within and beyond park boundaries. However, wetland impacts from the implementation of these and other proposed projects in the area should be sufficiently offset by mitigation, project by project, such that there should be no net loss of wetland acreage, functions or values.

As stated previously, the loss of more than 90 percent of California's original wetlands is the largest loss of any state in the nation and is directly related to economic development (NOAA 2010a, 1). The *Clean Water Act* and the state's coastal wetlands statute have succeeded in reducing the rate of wetland loss in California, but development pressures remain a threat (NOAA 2010a, 1). Therefore, projects that protect or degrade wetlands and aquatic habitats will have a cumulative effect, whether beneficial or adverse, on wildlife species that inhabit wetlands.

The negligible to long-term minor adverse impacts on wildlife from dogs at Marin Headlands Trails under the preferred alternative were considered together with the effects of the projects mentioned above. There would be a combination of beneficial and adverse effects from projects in and around Marin Headlands Trails; when combined, these projects would balance out, resulting in negligible impacts. These negligible impacts combined with the negligible to long-term minor adverse impacts from the preferred alternative would result in negligible cumulative impacts on wildlife.

MARIN HEADLANDS TRAILS PREFERRED ALTERNATIVE F CONCLUSION TABLE

| Wetland and Aquatic Wildlife Impacts                                       | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|--|--|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Rodeo Lake is closed to dogs; a longer section of the Rodeo Valley Trail would be available for dog walking but physically restraining dogs on leash would not allow dogs access to habitat off trail along the Rodeo Valley Trail Corridor, which supports wetlands and could be used by shorebirds, wading birds, waterbirds, and other wildlife | Beneficial, assuming compliance              | Negligible cumulative impacts |

## SAN FRANCISCO COUNTY SITES

### Crissy Field

**Common to All Alternatives.** Impacts from dogs as a result of the two different definitions of the Crissy Field WPA (the 36 CFR 7.97(d) definition for alternative A and the Warming Hut to approximately 900 feet east of the former Coast Guard Pier definition for alternatives B–F) will be the same for all alternatives. Even though the WPA would be expanded for alternatives B–F, this change would not influence the overall impacts analysis at this site because it would neither increase nor decrease the impacts at Crissy Field described in the paragraphs that follow. Further explanation of these two definitions can be found in the “Current Regulations and Policies” section of chapter 2.

**Alternative A: No Action.** Both freshwater and tidal wetlands are present at Crissy Field. From 1998 through 2000, a restoration project reestablished an 18-acre tidal marsh with a narrow fringe of salt marsh vegetation that links with San Francisco Bay at Crissy Field. Freshwater wetlands are located in swales created in the dunes at Crissy Field and primarily consist of cattails and willow species. The tidal marsh is a high use area for birds, and the area is fenced and is currently closed to people and dogs. The park has documented the highest (within Crissy Field site) year-round bird densities in the Crissy Marsh, with slightly lower densities in the dune swale and rear dune; bird species richness has been reported at its highest in the wetland, with slightly less richness in the beach and nearshore areas (Ward and Ablog 2006, 25–26 and 92–93). Migrating ducks, shorebirds, California brown pelicans, and diving birds such as cormorants, as well as resident gulls and wading birds, feed or rest in the tidal marsh at Crissy Field. Despite protection of the restored tidal marsh by fencing and prohibiting dogs in the WPA, dogs under voice control can gain access at low tide to the marsh through the tidal inlet that allows exchange of water between the marsh and San Francisco Bay. Generally, birds that use the marsh are not subjected to disturbance from dogs except at the tidal inlet. However, the park has documented that dogs go under the bridge into Crissy Marsh and access the flood shoal areas along the marsh and chase birds; further, a western grebe was killed at the Crissy Field site by a dog that accessed the marsh at this location.

This site has documented moderate to high visitor use and moderate to high numbers of dog walkers (table 9). In general, compliance with dog walking regulations is low, and from 2008 through 2011 a total of 510 incidents were reported. Of the 510 incidents, 283 incidents were for having dogs off leash within the Crissy Field WPA when the seasonal leash restriction was in effect (table 19). Other common incidents include violation of a closed area (58 incidents), having dogs off leash (65 incidents), and possession of a pet in a closed area (15). Other violations were issued for having pets in Crissy Field Lagoon, which is closed to humans and pets. Dogs gaining access to the marsh can disturb birds by

## Chapter 4: Environmental Consequences

chasing after them and generally by their activity level and by barking. Birds can relocate to avoid dogs, but in doing so they expend energy necessary to maintain conditions for migration, reproduction, and general health. Birds on the open water of the marsh are susceptible to impacts from dogs swimming in the marsh (which has been observed by park staff) and are also susceptible to chasing after and harassment by dogs if roosting on land.

Alternative A would result in continued long-term minor adverse impacts on wildlife associated with the restored marsh at Crissy Field because birds would occasionally be subjected to impacts from on-leash and voice control dogs that gain access to the marsh. Impacts would occur from dogs barking at, chasing after, and being in proximity to roosting or feeding birds.

Under alternative A, no permit system exists for dog walking. However, commercial dog walking occurs regularly at Crissy Field. Commercial dog walking would continue to contribute to the long-term minor adverse impacts on wildlife. Commercial dog walkers with multiple dogs under voice control would impact wildlife by barking at, chasing after, and being in close proximity to feeding and roosting birds.

**Cumulative Impacts.** Projects and actions in and near Crissy Field were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on wildlife at or in the vicinity of this site.

Many wetland restoration and creation projects have been completed or are proposed in GGNRA and beyond the boundaries of the park. Impacts resulting from completed, ongoing, and future restoration/creation projects at Crissy Field and projects beyond the park boundaries will generally provide an overall benefit to wetland and tidal marsh habitats. Specific examples of projects and plans that will cumulatively provide beneficial affects to wetlands include the *Giacomini Wetland Restoration Project* (Marin County, near Tomales Bay), which restored 560 acres of pastures to wetlands of increased complexity and diversity of vegetation and aquatic habitats (NPS 2009k; NPS and CSLC 2007). This project also dramatically increased habitat for California black rail, as well as other aquatic species such as waterfowl, shorebirds, fish, and seals (NPS 2009k). The Gulf of the Farallones National Marine Sanctuary has proposed the *Bolinas Lagoon Ecosystem Restoration Project* (near Stinson Beach), which will benefit wildlife species that currently use Bolinas Lagoon, including 245 species of birds, such as migratory waterfowl and shorebirds, as well as fish, invertebrates, and harbor seals, which use the site for pupping grounds and as a haul-out site (GFNMS Working Group 2008). Beginning in 1997, efforts to remediate and restore Crissy Field included the removal of hazardous waste and the re-creation of the 18-acre tidal marsh.

The PTMP (described earlier) was adopted in 2002 and includes the preservation of the Presidio's cultural, natural, scenic, and recreational resources in Area B, managed by the Presidio Trust. Management objectives in the PTMP that are applicable to wildlife include identifying and protecting sensitive wildlife species, and restoring and maintaining their habitats. The PTMP also preserves, enhances, and increases natural habitats managed by the Presidio Trust. For example, historic forests are being rehabilitated, wetlands are being enhanced, and native plant and wildlife species are being protected (Presidio Trust 2002, ii). As a result, the PTMP has beneficial impacts on wildlife in the vicinity of Crissy Field.

Additional actions have had or have the potential to have adverse effects on wetlands at or in the vicinity of GGNRA sites. Larger, more regional development projects, like the GGNRA *Long-range Transportation Plan Update* (NPS 2008g) and the *Doyle Drive Project* (Presidio Parkway 2008) will impact or have the potential to negatively affect wetland resources within and beyond park boundaries. However, wetland impacts from the implementation of these and other proposed projects in the area

should be sufficiently offset by mitigation, project by project, such that there should be no net loss of wetland acreage, functions or values.

The loss of more than 90 percent of California's original wetlands is the largest loss of any state in the nation and is directly related to economic development (NOAA 2010a, 1). The *Clean Water Act* and the state's coastal wetlands statute have succeeded in reducing the rate of wetland loss in California, but development pressures remain a threat (NOAA 2010a, 1). Therefore, projects that protect or degrade wetlands and aquatic habitats will have a cumulative effect, whether beneficial or adverse, on wildlife species that inhabit wetlands.

The long-term minor adverse impacts on wildlife from dogs at Crissy Field under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from wetland restoration/creation projects should reduce some of the adverse impacts on wildlife from alternative A. However, the impacts resulting from any development projects at or in the vicinity of GGNRA and the loss of more than 90 percent of California's original wetlands may add adversely to the cumulative impacts on wildlife, even though wetland mitigation has contributed to reducing impacts on wildlife. Since there would be a combination of beneficial and adverse effects from projects in and around Crissy Field, when combined, these projects would balance out, resulting in negligible impacts. Therefore, the cumulative analysis for this park site will mainly focus on the results of the impact analysis for each alternative. Cumulative impacts on wildlife under this alternative would be expected to be long term, minor, and adverse.

**CRISSY FIELD ALTERNATIVE A CONCLUSION TABLE**

| <b>Wetland and Aquatic Wildlife Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>                  |
|---|---|---|--|
| Long-term minor adverse impacts             | The tidal marsh is a high use area for shorebirds, wading birds, and waterbirds and is fenced and protected from dogs, although dogs have been observed in the marsh; these birds would occasionally be subjected to impacts from on-leash and voice control dogs that gain access to the marsh through barking and chasing after and by proximity to roosting or feeding birds; visitor use is high at this site | N/A   | Long-term minor adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking on the promenade, Crissy Airfield, East and Central beaches, paths leading to Central Beach, trails and grassy areas near East Beach, around the Old Coast Guard Station, and on the Mason Street Bike Path. Dog walking would be prohibited in the WPA and the tidal marsh. Physically restraining dogs on leash would not allow dog access to the marsh or shorelines used by shorebirds, wading birds, waterbirds, and other wildlife. Therefore, alternative B would result in negligible impacts on wildlife using the restored tidal marsh because on-leash dogs could still disturb roosting and feeding birds and other wildlife through barking and by their presence.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since the percentage of commercial dog walkers is

## Chapter 4: Environmental Consequences

considered high at Crissy Field, dogs walked by commercial dog walkers would constitute the majority of the adverse impacts on wildlife from dogs at the site. Overall impacts on wildlife from dogs walked by both commercial and private individuals are summarized in the previous paragraph.

**Cumulative Impacts.** The negligible impacts on wildlife from dogs at Crissy Field under alternative B were considered together with the effects of the projects mentioned above under alternative A. There would be a combination of beneficial and adverse effects from projects in and around Crissy Field; when combined, these projects would balance out, resulting in negligible impacts. These negligible impacts combined with the negligible impacts from alternative B would result in negligible cumulative impacts on wildlife.

**CRISSY FIELD ALTERNATIVE B CONCLUSION TABLE**

| Wetland and Aquatic Wildlife Impacts            | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Dogs would be prohibited in marsh; physically restraining dogs on leash would not allow dogs access to the marsh or shorelines used by shorebirds, wading birds, waterbirds, and other wildlife; on-leash dogs could still disturb roosting and feeding birds through barking and by their presence | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** The addition of a ROLA on Central Beach (which includes coastal community wildlife habitat, not wetland and aquatic wildlife habitat) and another ROLA on Crissy Airfield in alternative C would allow dog walking under voice and sight control. On-leash dog walking would be available along the promenade, the eastern and western sections of Crissy Airfield, the Mason Street Bike Path, trails and grassy areas near East Beach, around the Old Coast Guard Station, paths to Central Beach, and picnic areas. Physically restraining dogs on leash would not allow access to marsh, which is currently closed to people and dogs, or shorelines (including the WPA). Therefore, assuming compliance, alternative C would result in negligible impacts on wildlife species using the tidal marsh because on-leash dogs could still disturb roosting and feeding birds and other wildlife through barking and by their presence.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. At Crissy Field, any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. In a ROLA, permit holders may walk one to six dogs off leash and the permit may restrict use by time and area. Impacts on wildlife from permit holders with up to six dogs off leash would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is common at Crissy Field, impacts on wildlife would be expected from this user group. Impacts on wildlife from commercial dog walkers would be similar to impacts from other dog walkers, as summarized in the above paragraph; therefore, impacts from commercial dog walking would be negligible.

**Cumulative Impacts.** The negligible impacts on wildlife from dogs at Crissy Field under alternative C were considered together with the effects of the projects mentioned above under alternative A. There would be a combination of beneficial and adverse effects from projects in and around Crissy Field; when combined, these projects would balance out, resulting in negligible impacts. These negligible impacts

combined with the negligible impacts from alternative C would result in negligible cumulative impacts on wildlife.

**CRISSY FIELD ALTERNATIVE C CONCLUSION TABLE**

| <b>Wetland and Aquatic Wildlife Impacts</b>     | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--|---|-------------------------------|
| Overall negligible impacts, assuming compliance | Dogs would be prohibited in the marsh; physical restraint of dogs on leash and compliance in the ROLAs would not allow dogs access to the marsh or shorelines used by shorebirds, wading birds, waterbirds, and other wildlife; on-leash dogs could still disturb roosting and feeding birds through barking and by their presence | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Alternative D would prohibit dogs on all beaches, but would establish a ROLA on the western section of Crissy Airfield (which consists of manicured lawn, not wetland and aquatic wildlife habitat). Dogs would be physically restrained on leash in all other areas of Crissy Field and not allowed on beaches (including the WPA). In addition, people and dogs are currently prohibited in the tidal marsh. Therefore, assuming compliance, alternative D would result in negligible impacts on wildlife using the tidal marsh and surrounding habitat because on-leash dogs could still disturb wildlife through barking and by their presence.

No commercial dog walking would be allowed and no permits to walk more than three dogs would be issued under alternative D; therefore, commercial and permitted dog walking would have no impact on wildlife. Private dog walkers would be allowed to walk one to three dogs.

**Cumulative Impacts.** The negligible impacts on wildlife from dogs at Crissy Field under alternative D were considered together with the effects of the projects mentioned above under alternative A. There would be a combination of beneficial and adverse effects from projects in and around Crissy Field; when combined, these projects would balance out, resulting in negligible impacts. These negligible impacts combined with the negligible impacts from alternative D would result in negligible cumulative impacts on wildlife.

**CRISSY FIELD ALTERNATIVE D CONCLUSION TABLE**

| <b>Wetland and Aquatic Wildlife Impacts</b>     | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance | Dogs would be prohibited in the marsh; physical restraint of dogs on leash and compliance in ROLA would not allow dogs access to the marsh or shorelines used by shorebirds, wading birds, waterbirds, and other wildlife; on-leash dogs could still disturb roosting and feeding birds through barking and by their presence | Beneficial, assuming compliance                     | Negligible cumulative impacts |

## Chapter 4: Environmental Consequences

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would allow on-leash dog walking in the WPA, on the promenade, East Beach, paths to Central Beach, trails and grassy areas near East Beach, around the Old Coast Guard Station, and on the Mason Street Bike Path. Dogs would be under voice and sight control in two ROLAs established on Crissy Airfield and Central Beach (ROLAs do not include wetland and aquatic wildlife habitat). The tidal marsh would remain closed to dogs and people. Therefore, assuming compliance, alternative E would result in negligible impacts on wildlife species because on-leash dogs could still disturb wildlife through barking and by their presence.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. At Crissy Field, any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. In a ROLA, permit holders may walk one to six dogs off leash and the permit may restrict use by time and area. Impacts on wildlife from permit holders with up to six dogs off leash would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is common at Crissy Field, impacts on wildlife would be expected from this user group. Impacts on wildlife from commercial dog walkers would be similar to impacts from other dog walkers, as in the previous paragraph; therefore, impacts from commercial dog walking would be negligible.

**Cumulative Impacts.** The negligible impacts on wildlife from dogs at Crissy Field under alternative E were considered together with the effects of the projects mentioned above under alternative A. There would be a combination of beneficial and adverse effects from projects in and around Crissy Field; when combined, these projects would balance out, resulting in negligible impacts. These negligible impacts combined with the negligible impacts from alternative E would result in negligible cumulative impacts on wildlife.

**CRISSY FIELD ALTERNATIVE E CONCLUSION TABLE**

| Wetland and Aquatic Wildlife Impacts            | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Dogs would be prohibited in marsh; physical restraint of dogs on leash and compliance in the ROLAs would not allow dogs access to marsh or shorelines used by shorebirds, wading birds, waterbirds, and other wildlife; on-leash dogs could still infrequently disturb roosting and feeding birds through barking and by their presence | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The addition of one ROLA on Central Beach (which includes coastal community wildlife habitat, not wetland and aquatic wildlife habitat) and one on the eastern portion of Crissy Airfield in the preferred alternative would allow dog walking under voice and sight control. On-leash dog walking would be required for the remainder of the site and physically restraining dogs on leash would not allow access to marsh, which is currently closed to people and dogs, or shorelines (including the WPA). Therefore, assuming compliance, the preferred alternative would result in negligible impacts on wildlife species using the tidal marsh because on-leash dogs could still disturb roosting and feeding birds and other wildlife through barking and by their presence.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. At Crissy Field, any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. In a ROLA, permit holders may walk one to six dogs off leash and the permit may restrict use by time and area. Impacts on wildlife from permit holders with up to six dogs off leash would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is common at Crissy Field, impacts on wildlife would be expected from this user group. Impacts on wildlife from commercial dog walkers would be similar to impacts from other dog walkers, as summarized in the above paragraph; therefore, impacts from commercial dog walking would be negligible.

**Cumulative Impacts.** Projects and actions in and near Crissy Field were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on wildlife at or in the vicinity of this site.

Many wetland restoration and creation projects have been completed or are proposed in GGNRA and beyond the boundaries of the park. Impacts resulting from completed, ongoing, and future restoration/creation projects at Crissy Field and projects beyond the park boundaries will generally provide an overall benefit to wetland and tidal marsh habitats. Specific examples of projects and plans that will cumulatively provide beneficial affects to wetlands include the *Giacomini Wetland Restoration Project* (Marin County, near Tomales Bay), which restored 560 acres of pastures to wetlands of increased complexity and diversity of vegetation and aquatic habitats (NPS 2009k; NPS and CSLC 2007). This project also dramatically increased habitat for California black rail, as well as other aquatic species such as waterfowl, shorebirds, fish, and seals (NPS 2009k). The Gulf of the Farallones National Marine Sanctuary has proposed the *Bolinas Lagoon Ecosystem Restoration Project* (near Stinson Beach), which will benefit wildlife species that currently use Bolinas Lagoon, including 245 species of birds, such as migratory waterfowl and shorebirds, as well as fish, invertebrates, and harbor seals, which use the site for pupping grounds and as a haul-out site (GFNMS Working Group 2008).

The PTMP would have beneficial impacts on wildlife in the vicinity of Crissy Field. Plans under the PTMP include rehabilitating the historic planted forest; preserving, enhancing, and managing other forested areas that provide values such as windbreaks, vistas, screening, and wildlife habitat; identifying, protecting, enhancing, restoring, and expanding the Presidio's ecosystems; protecting, establishing, and managing areas of native vegetation; identifying, monitoring, and protecting sensitive wildlife species, and restoring and maintaining their habitats; rehabilitating and enhancing natural water resources; managing on-site water resources to protect ground and surface water, natural wetland and riparian habitat, and water supplies for the Presidio community; and protecting geologic and soil features and minimizing erosion and unnatural disturbances (Presidio Trust 2002, 20-37).

Additional actions have had or have the potential to have adverse effects on wetlands at or in the vicinity of GGNRA sites. Larger, more regional development projects, like the GGNRA *Long-range Transportation Plan Update* (NPS 2008g) and the *Doyle Drive Project* (Presidio Parkway 2008) will impact or have the potential to negatively affect wetland resources within and beyond park boundaries. However, wetland impacts from the implementation of these and other proposed projects in the area should be sufficiently offset by mitigation, project by project, such that there should be no net loss of wetland acreage, functions or values.

The loss of more than 90 percent of California's original wetlands is the largest loss of any state in the nation and is directly related to economic development (NOAA 2010a, 1). The *Clean Water Act* and the state's coastal wetlands statute have succeeded in reducing the rate of wetland loss in California, but development pressures remain a threat (NOAA 2010a, 1). Therefore, projects that protect or degrade

## Chapter 4: Environmental Consequences

wetlands and aquatic habitats will have a cumulative effect, whether beneficial or adverse, on wildlife species that inhabit wetlands.

The negligible impacts on wildlife from dogs at Crissy Field under the preferred alternative were considered together with the effects of the projects mentioned above. There would be a combination of beneficial and adverse effects from projects in and around Crissy Field; when combined, these projects would balance out, resulting in negligible impacts. These negligible impacts combined with the negligible impacts from the preferred alternative would result in negligible cumulative impacts on wildlife.

**CRISSY FIELD PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| Wetland and Aquatic Wildlife Impacts            | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Dogs would be prohibited in marsh; physical restraint of dogs on leash and compliance in the ROLAs would not allow dogs access to marsh or shorelines used by shorebirds, wading birds, waterbirds, and other wildlife; on-leash dogs could still disturb roosting and feeding birds through barking and by their presence | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

## SAN MATEO COUNTY SITES

### Mori Point

**Alternative A: No Action.** Currently, dogs must be on leash on the trails at Mori Point. Dogs are prohibited at the four freshwater ponds at the site. Because of the presence of the California red-legged frog and the San Francisco garter snake at Mori Point wetlands, an NPS enhancement project has created four ponds to enhance the freshwater wetland habitat and to provide foraging habitat for the San Francisco garter snake. The project included associated wetland vegetation plantings, educational signs, and fences around the ponds and wetland habitat to prevent impacts on the California red-legged frog. Despite the educational signs and fences that have been placed around the ponds and wetland habitat at Mori Point, dogs have occasionally been observed in the ponds. In addition, some visitors are not complying with the leash law; off-leash violations totaled 146 from 2008 through 2011 (table 26).

Alternative A would result in negligible to long-term minor adverse impacts on wildlife species using wetlands at Mori Point because birds and other wildlife species would occasionally be subjected to impacts from off-leash dogs that gain access to the ponds and associated habitat. Impacts would result from dogs barking at, chasing after, and being in proximity to roosting or feeding birds or other wildlife. A range is presented to encompass the potential effects, since impacts would depend on the seasonal presence of the birds and the level of activity at the site.

Under alternative A, no permit system exists for dog walking. At Mori Point, commercial dog walking is uncommon. Therefore, commercial dog walking would have negligible impacts on wildlife.

**Cumulative Impacts.** Projects and actions in and near Mori Point were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on wildlife at or in the vicinity of this site.

Many wetland restoration and creation projects have been completed or are proposed in GGNRA and beyond the boundaries of the park. Impacts resulting from completed, ongoing, and future restoration/creation projects at Mori Point and projects beyond the park boundaries will generally provide an overall benefit to wetland and tidal marsh habitats. The scope of the SNRAMP analysis includes a natural area managed by the SFRPD in Pacifica (Sharp Park, located near Mori Point) and addresses dog walking (including on-leash dog walking and off-leash DPAs) in this area (SFPD 2011, 261-262). Project activities included in the SNRAMP, including the restoration of the Laguna Salada at Sharp Park, would protect and improve habitat and provide long-term beneficial impacts to wildlife that use wetland habitats.

Additional actions have had or have the potential to have adverse effects on wetlands at or in the vicinity of GGNRA sites. Larger, more regional development projects, like the GGNRA *Long-range Transportation Plan Update* (NPS 2008g) could negatively affect wetland resources within and beyond park boundaries. However, wetland impacts from the implementation of these and other proposed projects in the area should be sufficiently offset by mitigation, project by project, such that there should be no net loss of wetland acreage, functions or values.

The loss of more than 90 percent of California's original wetlands is the largest loss of any state in the nation and is directly related to economic development (NOAA 2010a, 1). The *Clean Water Act* and the state's coastal wetlands statute have succeeded in reducing the rate of wetland loss in California, but development pressures remain a threat (NOAA 2010a, 1). Therefore, projects that protect or degrade wetlands and aquatic habitats will have a cumulative effect, whether beneficial or adverse, on wildlife species that inhabit wetlands.

The negligible to long-term minor adverse impacts on wildlife from dogs at Mori Point under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from wetland restoration/creation projects should reduce some of the adverse impacts on wildlife from alternative A. However, the impacts resulting from any development projects at or in the vicinity of GGNRA and the loss of more than 90 percent of California's original wetlands may add to the cumulative impacts on wildlife, even though wetland mitigation has contributed to reducing impacts on wildlife. Since there would be a combination of beneficial and adverse effects from projects in and around Mori Point, when combined, these projects would balance out, resulting in negligible impacts. Therefore, the cumulative analysis for this park site will mainly focus on the results of the impact analysis for each alternative. Cumulative impacts on wildlife under this alternative would be expected to be negligible to long term, minor, and adverse.

**MORI POINT ALTERNATIVE A CONCLUSION TABLE**

| <b>Wetland and Aquatic Wildlife Impacts</b>   | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>                                |
|---|--|---|--|
| Negligible to long-term minor adverse impacts | Dogs have occasionally been observed in fenced ponds; birds and other wildlife using pond habitat would infrequently be subjected to impacts from on-leash dogs (and off-leash dogs violating the leash law) barking at, chasing after, and being in proximity to wildlife; visitor use is moderate at this site | N/A   | Negligible to long-term minor adverse cumulative impacts |

N/A = not applicable.

## Chapter 4: Environmental Consequences

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking on the Mori Coastal Trail and the beach (the portion owned by the NPS), but dogs would not be allowed on Old Mori Trail or the Pollywog Trail, which are located adjacent to the freshwater ponds. Therefore, assuming compliance, alternative B would result in negligible impacts on wildlife because on-leash dogs could still disturb roosting and feeding birds and other wildlife through barking and by their presence.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is not common in this area, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have a negligible impact on wildlife.

**Cumulative Impacts.** The negligible impacts on wildlife from dogs at Mori Point under alternative B were considered together with the effects of the projects mentioned above under alternative A. There would be a combination of beneficial and adverse effects from projects in and around Mori Point; when combined, these projects would balance out, resulting in negligible impacts. These negligible impacts combined with the negligible impacts from alternative B would result in negligible cumulative impacts on wildlife.

**MORI POINT ALTERNATIVE B CONCLUSION TABLE**

| Wetland and Aquatic Wildlife Impacts            | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Dogs would be prohibited in ponds; physically restraining dogs on leash would not allow dogs access to ponds or shorelines used by birds and other wildlife; on-leash dogs could still infrequently disturb roosting and feeding birds through barking and by their presence | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Under alternative C, dog walking restrictions would be the same as alternative B, except dogs would be allowed on leash on Old Mori Trail, which passes by the freshwater ponds that prohibit dogs. Dogs would not be allowed on the Pollywog Trail, which is also adjacent to the ponds. Physically restraining dogs on leash would not allow dog access to the ponds or shorelines used by wading birds, waterbirds, and other wildlife. To protect the ponds and California red-legged frog habitat, an exclusionary fence that effectively keeps visitors and dogs from accessing these wetland areas exists at the site. Therefore, alternative C would result in negligible impacts on wildlife using the ponds at Mori Point because on-leash dogs could still disturb roosting and feeding birds and other wildlife through barking and by their presence.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Mori Point is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking activity is not common at Mori Point, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have a negligible impact on wildlife.

**Cumulative Impacts.** The negligible impacts on wildlife from dogs at Mori Point under alternative C were considered together with the effects of the projects mentioned above under alternative A. There

would be a combination of beneficial and adverse effects from projects in and around Mori Point; when combined, these projects would balance out, resulting in negligible impacts. These negligible impacts combined with the negligible impacts from alternative C would result in negligible cumulative impacts on wildlife.

**MORI POINT ALTERNATIVE C CONCLUSION TABLE**

| <b>Wetland and Aquatic Wildlife Impacts</b>     | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance | Dogs would be prohibited in ponds; physically restraining dogs on leash would not allow dogs access to ponds or shorelines used by birds and other wildlife; on-leash dogs could still disturb roosting and feeding birds through barking and by their presence | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Under alternative D, dogs would not be allowed at this site. Therefore, assuming compliance, no impact on wildlife from dogs would occur at this site.

Since dogs would not be allowed at Mori Point, no impacts on wildlife species that use wetland vegetation would occur from commercial or permitted dog walkers.

**Cumulative Impacts.** The lack of impacts on wildlife from dogs at Mori Point under alternative D was considered together with the effects of the projects mentioned above in alternative A. There would be a combination of beneficial and adverse effects from projects in and around Mori Point; when combined, these projects would balance out, resulting in negligible impacts. These negligible impacts combined with the lack of impacts from alternative D would result in negligible cumulative impacts on wildlife.

**MORI POINT ALTERNATIVE D CONCLUSION TABLE**

| <b>Wetland and Aquatic Wildlife Impacts</b> | <b>Rationale</b>                 | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|----------------------------------|---|-------------------------------|
| No impact, assuming compliance              | Dogs would be prohibited at site | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would allow on-leash dog walking on the Mori Coastal Trail and the portion of beach owned by the NPS, as well as on Old Mori Trail, which is located adjacent to the freshwater ponds, and the Pollywog Trail, which ends near the creek and riparian habitat. Physically restraining dogs on leash would not allow dog access to the ponds or shorelines used by wading birds, waterbirds, and other wildlife. To protect the ponds and California red-legged frog habitat, an exclusionary fence that effectively keeps visitors and dogs from accessing these wetland areas exists at the site. Therefore, alternative E would result in negligible impacts on wildlife using the ponds at Mori Point because on-leash dogs could still disturb roosting and feeding birds and other wildlife through barking and by their presence.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Mori Point is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking

## Chapter 4: Environmental Consequences

activity is not common at Mori Point, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have a negligible impact on wildlife.

**Cumulative Impacts.** The negligible impacts on wildlife from dogs at Mori Point under alternative E were considered together with the effects of the projects mentioned above under alternative A. There would be a combination of beneficial and adverse effects from projects in and around Mori Point; when combined, these projects would balance out, resulting in negligible impacts. These negligible impacts combined with the negligible impacts from alternative E would result in negligible cumulative impacts on wildlife.

**MORI POINT ALTERNATIVE E CONCLUSION TABLE**

| Wetland and Aquatic Wildlife Impacts            | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Dogs would be prohibited in ponds; physically restraining dogs on leash would not allow dogs access to ponds or shorelines used by birds and other wildlife; on-leash dogs could still infrequently disturb roosting and feeding birds through barking and by their presence | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative E. The preferred alternative would allow on-leash dog walking on Old Mori Trail and the Pollywog Trail (which are adjacent to the freshwater ponds that prohibit dogs), the Mori Coastal Trail, and the portion of beach owned by the NPS. Physically restraining dogs on leash would not allow dog access to the ponds or shorelines used by wading birds, waterbirds, and other wildlife. To protect the ponds and California red-legged frog habitat, an exclusionary fence that effectively keeps visitors and dogs from accessing these wetland areas exists at the site. Therefore, the preferred alternative would result in negligible impacts on wildlife using the ponds at Mori Point because on-leash dogs could still disturb roosting and feeding birds and other wildlife through barking and by their presence.

All dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Mori Point is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking activity is not common at Mori Point, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have a negligible impact on wildlife.

**Cumulative Impacts.** Projects and actions in and near Mori Point were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on wildlife at or in the vicinity of this site.

Many wetland restoration and creation projects have been completed or are proposed in GGNRA and beyond the boundaries of the park. Impacts resulting from completed, ongoing, and future restoration/creation projects at Mori Point and projects beyond the park boundaries will generally provide an overall benefit to wetland and tidal marsh habitats. The scope of the SNRAMP analysis includes a natural area managed by the SFRPD in Pacifica (Sharp Park, located near Mori Point) and addresses dog

walking (including on-leash dog walking and off-leash DPAs) in this area (SFPD 2011, 261-262). Project activities included in the SNRAMP, including the restoration of the Laguna Salada at Sharp Park, would protect and improve habitat and provide long-term beneficial impacts to wildlife that use wetland habitats.

Additional actions have had or have the potential to have adverse effects on wetlands at or in the vicinity of GGNRA sites. Larger, more regional development projects, like the GGNRA *Long-range Transportation Plan Update* (NPS 2008g) could negatively affect wetland resources within and beyond park boundaries. However, wetland impacts from the implementation of these and other proposed projects in the area should be sufficiently offset by mitigation, project by project, such that there should be no net loss of wetland acreage, functions, or values.

The loss of more than 90 percent of California's original wetlands is the largest loss of any state in the nation and is directly related to economic development (NOAA 2010a, 1). The *Clean Water Act* and the state's coastal wetlands statute have succeeded in reducing the rate of wetland loss in California, but development pressures remain a threat (NOAA 2010a, 1). Therefore, projects that protect or degrade wetlands and aquatic habitats will have a cumulative effect, whether beneficial or adverse, on wildlife species that inhabit wetlands.

The negligible impacts on wildlife from dogs at Mori Point under the preferred alternative were considered together with the effects of the projects mentioned above. There would be a combination of beneficial and adverse effects from projects in and around Mori Point; when combined, these projects would balance out, resulting in negligible impacts. These negligible impacts combined with the negligible impacts from the preferred alternative would result in negligible cumulative impacts on wildlife.

**MORI POINT PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| <b>Wetland and Aquatic Wildlife Impacts</b>     | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance | Dogs would be prohibited in ponds; physically restraining dogs on leash would not allow dogs access to ponds or shorelines used by birds and other wildlife; on-leash dogs could still disturb roosting and feeding birds through barking and by their presence | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

### **IMPACTS TO WILDLIFE IN THE NATIVE HARDWOOD FOREST AND DOUGLAS-FIR/COAST REDWOOD COMMUNITY BY SITE AND ALTERNATIVE**

In the planning area at GGNRA, native hardwood forest exists at Oakwood Valley, Alta Trail/Orchard Fire Road/Pacheco Fire Road, and Fort Baker. The Douglas-fir/coast redwood community is found sporadically in portions of Homestead Valley and in Oakwood Valley, but outside the area accessed by dogs, and is therefore not discussed further in this section with reference to these sites. The native hardwood forest or Douglas-fir/coast redwood communities exist at Oakwood Valley, Alta Trail/Orchard Fire Road/Pacheco Fire Road, and Fort Baker, and impacts on the wildlife species that inhabit these communities at these sites are discussed in more detail in the paragraphs that follow.

As previously discussed in chapter 3, a variety of wildlife species, such as woodland birds (passerines such as chestnut-backed chickadee, flycatchers, warblers, woodland hawks, and owls) and small mammals (shrews, squirrels, and dusky-footed wood rat), use the woodland habitats at GGNRA. Other

## Chapter 4: Environmental Consequences

animals such as deer, coyote, and bobcat, often found in more open habitat, can use woodlands as protected cover and resting areas. Birds in woodlands primarily use the canopy and middle-level forest but may nest and forage in the herbaceous understory and on the ground. Mammals would be found mainly at ground level in this habitat.

### MARIN COUNTY SITES

#### Alta Trail/Orchard Fire Road/Pacheco Fire Road

**Alternative A: No Action.** Dogs are currently allowed under voice control or on leash on the trails and roads from Marin City to Oakwood Valley. These areas experience high use by dog walkers (table 9), especially commercial dog walkers, with typically 5 to 12 dogs under voice control per commercial walker.

Under the no-action alternative, off-leash dog access to wildlife and associated habitat off trails and fire roads would continue, and occasional disturbance would include physical damage to habitat or nests and burrows from digging or trampling, as well as chasing after and even capturing small mammals, reptiles, and ground-nesting birds. Wildlife may also be displaced from high quality habitat that is degraded by the presence of dogs. These impacts would be considered long term, minor, and adverse because native hardwood forests and the wildlife associated with this habitat constitute only a small portion of the site.

Under alternative A, no permit system exists for dog walking. However, commercial dog walking at Alta Trail, Orchard Fire Road, and Pacheco Fire Road is common, with commercial dog walkers often having 5 to 12 dogs under voice control at one time. Commercial dog walking would continue to create long-term minor adverse impacts on wildlife. Dogs under voice control would continue to disturb the natural habitat of wildlife.

**Cumulative Impacts.** Projects and actions in and near Alta Trail and Orchard and Pacheco fire roads were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs provide enhancements that improve conditions for vegetation and wildlife habitat. Ongoing parkwide restoration and enhancement efforts, such as GGNRA natural resource stewardship programs and the *Marin Countywide Plan* (County of Marin 2007), can also beneficially affect native hardwood forests at GGNRA park sites such as Alta Trail and Orchard and Pacheco fire roads. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance. The implementation of habitat restoration and projects funded by the Wildland/Urban Interface Initiative on private lands could also impact Alta Trail, Orchard Fire Road, and Pacheco Fire Road.

The implementation of current and future projects both in GGNRA and beyond park boundaries could have a cumulative impact on the wildlife species that inhabit native hardwood forest communities. Generally, construction projects that affect this community require project-specific mitigation measures to address impacts. Therefore, these projects would not likely contribute to the cumulative impacts.

The long-term minor adverse impacts on wildlife from dogs at Alta Trail and Orchard and Pacheco fire roads under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from the restoration and trail rehabilitation projects should reduce some of the adverse impacts on wildlife from alternative A. The adverse impacts resulting from construction projects at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be expected to be negligible due to mitigation that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**ALTA TRAIL/ORCHARD FIRE ROAD/PACHECO FIRE ROAD ALTERNATIVE A CONCLUSION TABLE**

| <b>Native Hardwood Forest and Douglas-fir/Coast Redwood Wildlife Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Long-term minor adverse impacts  | Off-leash dog access to wildlife and associated habitat off trails and fire roads would continue; occasional disturbance would include physical damage to habitat or nests/burrows from digging or trampling, as well as chasing after and even capturing wildlife; wildlife may also be displaced from high quality habitat that is degraded by the presence of dogs; this habitat and supporting wildlife constitutes a very small portion of entire site | N/A   | Negligible cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Under alternative B, on-leash dog walking would be allowed on the Alta Trail to Orchard Fire Road, on Orchard Fire Road, and on Pacheco Fire Road. Impacts on wildlife in the LOD area would be long term, minor, and adverse; adjacent habitat used by wildlife would be affected by dogs through trampling, dog waste, and nutrient addition. Chasing after wildlife would be eliminated but on-leash dogs would still occasionally disturb wildlife behavior. Wildlife may avoid and/or be displaced from high quality habitat that is degraded by the presence of dogs, and displacement to another location is an impact on wildlife.

The long-term minor adverse impacts from the high use of dogs in the LOD area would occur in a relatively small area when compared to the site as a whole. Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated, although on-leash dogs could still disturb wildlife through barking and their presence. The overall impact on wildlife from on-leash dog walking at Alta Trail, Orchard Fire Road, and Pacheco Fire Road would be negligible.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since the percentage of commercial dog walkers is considered high at Alta Trail/Orchard Fire Road/Pacheco Fire Road, dogs walked by commercial dog walkers would constitute the majority of the adverse impacts on wildlife from dogs at the site. Overall impacts on wildlife from dogs walked by both commercial and private individuals are summarized above.

**Cumulative Impacts.** The negligible impacts on wildlife from dogs at Alta Trail and Orchard and Pacheco fire roads under alternative B were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the trail rehabilitation projects along with the negligible impacts from any construction actions and the negligible impacts on wildlife from alternative B would result in negligible cumulative impacts on wildlife.

ALTA TRAIL/ORCHARD FIRE ROAD/PACHECO FIRE ROAD ALTERNATIVE B CONCLUSION TABLE

| Native Hardwood Forest and Douglas-fir/Coast Redwood Wildlife Impacts | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Overall negligible impacts, assuming compliance                       | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs would still infrequently disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; this habitat and supporting wildlife constitute a very small portion of entire site | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would have the same dog walking restrictions as alternative B, and overall impacts would be the same, assuming compliance: long term, minor, and adverse in the LOD area and negligible overall.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. At Alta Trail, any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. Impacts on wildlife from permit holders with up to six dogs off leash would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is common at the Alta Trail/Orchard Fire Road/Pacheco Fire Road, impacts on wildlife would be expected from this user group. Impacts on wildlife from commercial dog walkers would be similar to impacts from other dog walkers: negligible.

**Cumulative Impacts.** Under alternative C, the cumulative impacts on wildlife at this park site would be the same those under alternative B: negligible.

**ALTA TRAIL/ORCHARD FIRE ROAD/PACHECO FIRE ROAD ALTERNATIVE C CONCLUSION TABLE**

| <b>Native Hardwood Forest and Douglas-fir/Coast Redwood Wildlife Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance                              | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs would still infrequently disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; this habitat and supporting wildlife constitutes a very small portion of entire site | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Under alternative D, dogs would not be allowed at this site. Therefore, assuming compliance, no impact on wildlife would occur.

Since dogs would not be allowed at this site, no impacts on wildlife species that use native hardwood forests would occur from commercial dog walkers.

**Cumulative Impacts.** The lack of impacts on wildlife from dogs at Alta Trail and Orchard and Pacheco fire roads under alternative D was considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the trail rehabilitation projects along with the negligible impacts from any construction actions and the lack of impacts on wildlife from alternative D would result in negligible cumulative impacts on wildlife.

**ALTA TRAIL/ORCHARD FIRE ROAD/PACHECO FIRE ROAD ALTERNATIVE D CONCLUSION TABLE**

| <b>Native Hardwood Forest and Douglas-fir/Coast Redwood Wildlife Impacts</b> | <b>Rationale</b>                      | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---------------------------------------|---|-------------------------------|
| No impact, assuming compliance   | Dogs would not be allowed at the site | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would allow on-leash dog walking on the Alta Trail to the junction with the Morning Sun Trail, and on Orchard and Pacheco fire roads. While the mileage open to dog walking would be greater than that described for alternative B, the impacts would be similar, assuming compliance: long term, minor, and adverse in the LOD area and negligible overall.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. At Alta Trail, any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. Impacts on wildlife from permit holders with up to six dogs off leash would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is common at Alta Trail/Orchard Fire Road/Pacheco Fire Road, impacts on

**Chapter 4: Environmental Consequences**

wildlife would be expected from this user group. Impacts on wildlife from commercial dog walkers would be similar to impacts from other dog walkers, as summarized above; therefore, impacts from commercial dog walking would be negligible.

**Cumulative Impacts.** The negligible impacts on wildlife from dogs at Alta Trail and Orchard and Pacheco fire roads under alternative E were considered together with the effects of the projects mentioned under alternative A. The beneficial effects from the trail rehabilitation projects along with the negligible impacts from any construction actions and the negligible impacts on wildlife from alternative E would result in negligible cumulative impacts on wildlife.

**ALTA TRAIL/ORCHARD FIRE ROAD/PACHECO FIRE ROAD ALTERNATIVE E CONCLUSION TABLE**

| Native Hardwood Forest and Douglas-fir/Coast Redwood Wildlife Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance                       | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs would still infrequently disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; this habitat and supporting wildlife constitutes a very small portion of entire site | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative E. The preferred alternative would allow on-leash dog walking on the Alta Trail from Donahue Street to the junction with the Morning Sun Trail and on Orchard and Pacheco fire roads. The LOD area would include 6 feet in each direction from the edges of the trail. Impacts on wildlife in the LOD area would be long term, minor, and adverse; adjacent habitat used by wildlife would be affected by dogs through trampling, dog waste, and nutrient addition. Chasing after wildlife would be eliminated but on-leash dogs would still occasionally disturb wildlife behavior. Therefore, wildlife may avoid and/or be displaced from high quality habitat that is degraded by the presence of dogs, and displacement to another location is still considered an impact on wildlife.

The long-term minor adverse impacts from the high use of dog walking in the LOD area would occur in a relatively small area when compared to the site as a whole. Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated, although on-leash dogs could still disturb wildlife through barking and by their presence. The overall impact on wildlife from on-leash dog walking at Alta Trail, Orchard Fire Road, and Pacheco Fire Road would be negligible.

All dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. At Alta Trail, any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. Impacts on wildlife from permit holders with up to six dogs off leash would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is common at Alta Trail, Orchard Fire Road, and Pacheco Fire Road, impacts on wildlife would be expected

from this user group. Impacts on wildlife from commercial dog walkers would be similar to impacts from other dog walkers: negligible.

**Cumulative Impacts.** Projects and actions in and near Alta Trail and Orchard and Pacheco fire roads were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs provide enhancements that improve conditions for vegetation and wildlife habitat. Ongoing parkwide restoration and enhancement efforts, such as GGNRA natural resource stewardship programs and the *Marin Countywide Plan* (County of Marin 2007), can also beneficially affect native hardwood forests at GGNRA park sites such as Alta Trail and Orchard and Pacheco fire roads. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance. The implementation of habitat restoration and projects funded by the Wildland/Urban Interface Initiative on private lands could also impact Alta Trail, Orchard Fire Road, and Pacheco Fire Road.

The implementation of current and future projects both in GGNRA and beyond park boundaries could have a cumulative impact on the wildlife species that inhabit native hardwood forest communities. Generally, construction projects that affect this community require project-specific mitigation measures to address impacts. Therefore, these projects would have negligible cumulative impacts on wildlife.

The negligible impacts on wildlife from dogs at Alta Trail and Orchard and Pacheco fire roads under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from the trail rehabilitation projects combined with the negligible impacts from any construction actions and the negligible impacts on wildlife from the preferred alternative would result in negligible cumulative impacts on wildlife.

#### ALTA TRAIL/ORCHARD FIRE ROAD/PACHECO FIRE ROAD PREFERRED ALTERNATIVE F CONCLUSION TABLE

| Native Hardwood Forest and Douglas-fir/Coast Redwood Wildlife Impacts | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Overall negligible impacts, assuming compliance                       | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs would still infrequently disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; this habitat and supporting wildlife constitute a very small portion of entire site | Beneficial, assuming compliance              | Negligible cumulative impacts |

### Oakwood Valley

**Alternative A: No Action.** Under alternative A under alternative A, dogs are currently allowed under voice control or on leash on the Oakwood Valley Fire Road and Oakwood Valley Trail from junction with Fire Road to junction with Alta Trail, and on leash on the Oakwood Valley Trail from trailhead to

## Chapter 4: Environmental Consequences

junction with Oakwood Valley Fire Road. These areas experience high use by hikers, runners, bicyclists, and horseback riders and moderate use by dog walkers (table 9).

Under the no-action alternative, off-leash dog access to wildlife and associated habitat off trails and fire roads would continue and occasional disturbance would include physical damage to habitat or nests and burrows from digging or trampling, as well as chasing after and even capturing small mammals, reptiles, and ground-nesting birds. Wildlife may also be displaced from high quality habitat that is degraded by the presence of dogs. Impacts on wildlife at Oakwood Valley would be long term, minor, and adverse because native hardwood forests and the wildlife associated with this habitat constitute only a small portion of the site.

Under alternative A, no permit system exists for dog walking. At Oakwood Valley, commercial dog walking is uncommon. Therefore, commercial dog walking would have negligible impacts on wildlife.

**Cumulative Impacts.** Projects and actions in and near Oakwood Valley were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation can provide enhancements that improve conditions for vegetation and wildlife habitat. Ongoing parkwide restoration and enhancement efforts can also beneficially affect native hardwood forests at GGNRA park sites such as Oakwood Valley. Additionally, the implementation of habitat restoration and projects funded by the Wildland/Urban Interface Initiative on private lands could impact Oakwood Valley.

The implementation of current and future projects both in GGNRA and beyond park boundaries could have a cumulative impact on the wildlife species that inhabit native hardwood forest communities. Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would not likely contribute to cumulative impacts.

The long-term minor adverse impacts on wildlife from dogs at Oakwood Valley under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from trail rehabilitation projects should reduce some of the adverse impacts on wildlife from alternative A. The impacts resulting from any construction projects at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

OAKWOOD VALLEY ALTERNATIVE A CONCLUSION TABLE

| Native Hardwood Forest and Douglas-fir/Coast Redwood Wildlife Impacts | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Long-term minor adverse impacts                                       | Off-leash dog access to wildlife and associated habitat off trails and fire roads would continue; occasional disturbance includes physical damage to habitat or nests/ burrows from digging or trampling, as well as chasing after and even capturing wildlife; wildlife may also be displaced from high quality habitat that is degraded by the presence of dogs; this habitat and supporting wildlife constitute a very small portion of entire site | N/A  | Negligible cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Under alternative B, on-leash dog walking would be allowed and would be limited to the Oakwood Valley Fire Road and Oakwood Valley Trail to the junction of the fire road and trail. No dogs would be allowed above the junction of the road and trail. Impacts on wildlife in the LOD area would be long term, minor, and adverse; adjacent habitat used by wildlife would be affected by dogs through trampling, dog waste, and nutrient addition. Physically restraining dogs on leash in the Oakwood Valley site would protect habitat off trail as well as wildlife. Chasing after wildlife would be eliminated but on-leash dogs would still infrequently disturb wildlife behavior. Wildlife would be occasionally affected by dogs and may avoid and/or be displaced from high quality habitat that is degraded by the presence of dogs.

The long-term minor adverse impacts from the high use of dogs in the LOD area would occur in a relatively small area when compared to the site as a whole. Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated, although on-leash dogs could still disturb wildlife through barking and by their presence. Even though this habitat and supporting wildlife constitutes a very small portion of entire site, it is considered important native wildlife habitat. Assuming compliance, the overall impact on wildlife from on-leash dog walking at Oakwood Valley would be negligible to long term, minor, and adverse.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is not common at Oakwood Valley, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have a negligible impact on wildlife.

**Cumulative Impacts.** The negligible to long-term minor adverse impacts on wildlife from dogs at Oakwood Valley under alternative B were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from trail rehabilitation projects should reduce some of the adverse impacts on wildlife from alternative B. The impacts resulting from any construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. The beneficial effects from the trail rehabilitation projects along with the negligible impacts from any

## Chapter 4: Environmental Consequences

construction actions and the negligible to long-term minor adverse impacts on wildlife from alternative B would result in negligible cumulative impacts on wildlife.

**OAKWOOD VALLEY ALTERNATIVE B CONCLUSION TABLE**

| Native Hardwood Forest and Douglas-fir/Coast Redwood Wildlife Impacts      | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|--|--|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs would still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; this habitat constitutes a very small portion of entire site but is considered important native wildlife habitat | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** For alternative C, a ROLA is proposed along Oakwood Valley Fire Road to the junction with the Oakwood Valley Trail. The ROLA would include double gates at both ends (to reduce dog escapes) and continuous fencing to protect sensitive habitat. On-leash dog walking is proposed on the Oakwood Valley Trail from the junction with the Oakwood Valley Fire Road to the junction with Alta Trail. In general, impacts would be limited to the ROLA, existing trails, and the 6-foot corridors immediately adjacent to the trails (LOD area). Leash requirements would reduce the probability that dogs would disturb birds (Lafferty 2001a, 1955, 1961) and chase and/or harass other wildlife, due to physical restraint on leash. However, the habitat in the LOD area would be affected by dogs through trampling, dog waste, and nutrient addition, resulting in long-term minor to moderate adverse impacts on wildlife in the LOD area. Wildlife in the LOD area and ROLA would be occasionally to frequently affected by dogs and may avoid and/or be displaced from high quality habitat that is degraded by the presence of dogs. The ROLA may also lead to avoidance of the surrounding area by wildlife due to the concentration of dogs and noise as well as the elevated amount of dog waste and scent marking. In addition, the ROLA fencing may prevent wildlife from using the trail at night and when dogs are not present. Because of mobility, wildlife can usually avoid areas with dogs present during peak activity or habituate to these activities, but the displacement of wildlife from high quality habitat and preferred habitat that is degraded by the presence of dogs would indirectly affect wildlife. Therefore, in the LOD area and ROLA, alternative C would result in long-term minor to moderate adverse impacts on wildlife using native hardwood forest and Douglas-fir/coast redwood habitat at Oakwood Valley.

The long-term minor to moderate adverse impacts from dogs in the LOD area and ROLA would occur in a relatively small area when compared to the site as a whole, and the wildlife and supporting habitat constitute a small portion of the entire site. Physically restraining dogs in on-leash areas would protect habitat off trail as well as wildlife, and chasing after wildlife would be eliminated, but on-leash dogs would still occasionally disturb wildlife; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs. Therefore,

assuming compliance, the overall impact on wildlife at Oakwood Valley would be negligible to long term, minor, and adverse.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Oakwood Valley is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking activity is not common at Oakwood Valley, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on wildlife.

**Cumulative Impacts.** The negligible to long-term minor adverse impacts on wildlife from dogs at Oakwood Valley under alternative C were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from trail rehabilitation projects should reduce some of the adverse impacts on wildlife from alternative C. The impacts resulting from any construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**OAKWOOD VALLEY ALTERNATIVE C CONCLUSION TABLE**

| Native Hardwood Forest and Douglas-fir/Coast Redwood Wildlife Impacts      | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs in on-leash areas would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs would still infrequently disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; this habitat constitutes a very small portion of entire site; LOD areas and ROLAs are a small portion of the site | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Under alternative D, on-leash dog walking would only be allowed along the Oakwood Valley Fire Road from Tennessee Valley Road to the junction with Oakwood Valley Trail, and on Oakwood Valley Trail to the junction with the fire road. The LOD area would include the fire road and the 6 feet of land adjacent to the road. Impacts on wildlife in the LOD area would be long term, minor, and adverse; adjacent habitat used by wildlife would be affected by dogs through trampling, dog waste, and nutrient addition. Physically restraining dogs on leash in the Oakwood Valley site would protect habitat off trail as well as wildlife. Chasing after wildlife would be eliminated but on-leash dogs would still occasionally disturb wildlife and wildlife may avoid and/or be displaced from high quality habitat that is degraded by the presence of dogs.

The long-term minor adverse impacts in the LOD area would occur in a relatively small area when compared to the site as a whole. Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated, although on-leash dogs could still disturb wildlife

## Chapter 4: Environmental Consequences

through barking and by their presence. Even though this habitat and supporting wildlife constitutes a very small portion of the site, it is considered important native wildlife habitat. Assuming compliance, the overall impact on wildlife from on-leash dog walking at Oakwood Valley would be negligible to long term, minor, and adverse.

No commercial dog walking would be allowed and no permits to walk more than three dogs would be issued under alternative D; therefore, commercial and permitted dog walking would have no impact on wildlife at the site.

**Cumulative Impacts.** The negligible to long-term minor adverse impacts on wildlife from dogs at Oakwood Valley under alternative D were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from trail rehabilitation projects should reduce some of the adverse impacts on wildlife from alternative D. The impacts resulting from any construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. The beneficial effects from the trail rehabilitation projects along with the negligible impacts from any construction actions and the negligible to long-term minor adverse impacts on wildlife from alternative D would result in negligible cumulative impacts on wildlife.

**OAKWOOD VALLEY ALTERNATIVE D CONCLUSION TABLE**

| Native Hardwood Forest and Douglas-fir/Coast Redwood Wildlife Impacts      | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs would still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; this habitat constitutes a very small portion of the site but is considered important native wildlife habitat; the LOD area is a small portion of the entire site | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would have the same dog walking restrictions as alternative C, though unlike alternative C the ROLA would have non-continuous fencing only where needed. Overall impacts from alternative E would be the same as alternative C, assuming compliance: long term, minor to moderate, and adverse in the LOD area and ROLA and negligible to long term, minor, and adverse overall.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Oakwood Valley is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking activity is not common at Oakwood Valley, it is likely that this alternative would not have an

impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have a negligible impact on wildlife.

**Cumulative Impacts.** Under alternative E, the cumulative impacts on wildlife at this park would be the same as those under alternative B: negligible.

**OAKWOOD VALLEY ALTERNATIVE E CONCLUSION TABLE**

| Native Hardwood Forest and Douglas-fir/Coast Redwood Wildlife Impacts      | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash in on-leash areas would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs would still infrequently disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; this habitat constitutes a very small portion of the entire site; LOD areas and ROLAs are a small portion of the entire site | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative would allow on-leash dog walking on the Oakwood Valley Fire Road and on the Oakwood Valley Trail from the junction with the fire road to the junction with the Alta Trail. In general, impacts would be limited to the 6-foot corridors immediately adjacent to the trails (LOD area). Leash requirements would reduce the probability that dogs would disturb birds (Lafferty 2001a, 1955, 1961) and chase and/or harass other wildlife, due to physical restraint on leash. However, the habitat in the LOD would be affected by dogs through trampling, dog waste, and nutrient addition, resulting in long-term minor to moderate adverse impacts on wildlife in the LOD area. Wildlife in the LOD would occasionally be affected by dogs and may avoid and/or be displaced from high quality habitat that is degraded by the presence of dogs. Because of mobility, wildlife can usually avoid areas with dogs present during peak activity or habituate to these activities, but the displacement of wildlife from high quality habitat and preferred habitat that is degraded by the presence of dogs would indirectly affect wildlife. Therefore, in the LOD area, the preferred alternative would result in long-term minor adverse impacts on wildlife using native hardwood forest at Oakwood Valley.

The long-term minor adverse impacts from dogs in the LOD area would occur in a relatively small area when compared to the site as a whole, and the wildlife and supporting habitat constitute a small portion of the site. Physically restraining dogs in on-leash areas would protect habitat off trail as well as wildlife, and chasing after wildlife would be eliminated, but on-leash dogs would still occasionally disturb wildlife. Wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs. Therefore, assuming compliance, the overall impact on wildlife at Oakwood Valley would be negligible to long term, minor, and adverse.

All dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Oakwood Valley is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking activity is not

## Chapter 4: Environmental Consequences

common at Oakwood Valley, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have a negligible impact on wildlife.

**Cumulative Impacts.** Projects and actions in and near Oakwood Valley were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation can provide enhancements that improve conditions for vegetation and wildlife habitat. Ongoing parkwide restoration and enhancement efforts can also beneficially affect native hardwood forest at GGNRA park sites such as Oakwood Valley. Additionally, the implementation of habitat restoration and projects funded by the Wildland/Urban Interface Initiative on private lands could impact Oakwood Valley.

The implementation of current and future projects both in GGNRA and beyond park boundaries could have a cumulative impact on the wildlife species that inhabit native hardwood forest communities. Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts.

The negligible to long-term minor adverse impacts on wildlife from dogs at Oakwood Valley under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from trail rehabilitation projects should reduce some of the adverse impacts on wildlife from the preferred alternative. The impacts resulting from any construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**OAKWOOD VALLEY PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| Native Hardwood Forest and Douglas-fir/Coast Redwood Wildlife Impacts      | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|--|--|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs in on-leash areas would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs would still infrequently disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; this habitat constitutes a very small portion of the site; LOD areas and ROLAs are a small portion of the site | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

### Fort Baker

**Alternative A: No Action.** Currently, on-leash dog walking is allowed throughout Fort Baker, except that dogs are not allowed on the Chapel Trail or the pier. This site experiences moderate visitor use and low dog walking use, and there were 52 documented leash law violations at this site from 2008 through 2011 (table 17). Dogs have been observed off leash at the Parade Ground, Drown Fire Road, Battery Yates, and behind the Bay Area Discovery Museum (NPS 2006g).

Under alternative A, impacts on wildlife would include physical damage to habitat or nests and burrows from digging or trampling, as well as chasing after and even capturing small mammals, reptiles, and ground-nesting birds. Wildlife may also be displaced from high quality habitat that is degraded by the presence of dogs. Because native hardwood forests and the wildlife associated with this habitat constitute only a small portion of the site, the impacts would be considered long term, minor, and adverse under alternative A.

Under alternative A, no permit system exists for dog walking. At Fort Baker, commercial dog walking is uncommon. Therefore, commercial dog walking would have negligible impacts on wildlife.

**Cumulative Impacts.** Projects and actions in and near Fort Baker were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on wildlife at or in the vicinity of this site.

Park stewardship programs provide indirect benefits to wildlife by activities such as controlling invasive plant species and restoring habitats.

Development or construction actions at or in the vicinity of GGNRA sites have had or may have the potential to have adverse impacts on wildlife species that inhabit native hardwood forests. Even though these efforts both within and beyond park boundaries would affect vegetation and wildlife, mitigation for these projects would reduce the potential for impacts.

The long-term minor adverse impacts on wildlife from dogs at Fort Baker under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from the projects provided by the park stewardship programs should reduce some of the adverse impacts on wildlife from alternative A. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**FORT BAKER ALTERNATIVE A CONCLUSION TABLE**

| Native Hardwood Forest and Douglas-fir/Coast Redwood Wildlife Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Long-term minor adverse impacts                                       | Off-leash dog access to wildlife and associated habitat off trails and fire roads would continue; occasional disturbance includes physical damage to habitat or nests/burrows from digging or trampling, as well as chasing after and even capturing wildlife; wildlife may also be displaced from high quality habitat that is degraded by the presence of dogs; this habitat constitutes a very small portion of the site | N/A  | Negligible cumulative impacts |

N/A = not applicable.

## Chapter 4: Environmental Consequences

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking on Drown Fire Road, the Bay Trail (not including Battery Yates Loop), the Vista Point Trail (to be built), the Lodge/Conference Center Grounds, and the Parade Ground. Dogs would not be allowed on the Battery Yates Trail or the Battery Yates Loop as part of this alternative, due to the presence of mission blue butterfly habitat. The LOD area would include 6 feet in each direction from the edges of the trail. Impacts on wildlife in the LOD area would be long term, minor, and adverse; adjacent habitat used by wildlife would be affected by dogs through trampling, dog waste, and nutrient addition. Chasing after wildlife would be eliminated but on-leash dogs would still occasionally disturb wildlife behavior. Wildlife may avoid and/or be displaced from high quality habitat that is degraded by the presence of dogs, and displacement to another location is still an impact on wildlife.

The long-term minor adverse impacts from dogs in the LOD area would occur in a relatively small area when compared to the site as a whole; therefore, the overall impact on wildlife at Fort Baker would be negligible. Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated, although on-leash dogs could still disturb wildlife through barking and by their presence.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is not common in this area, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have a negligible impact on wildlife.

**Cumulative Impacts.** The negligible impacts on wildlife from dogs at Fort Baker under alternative B were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the park stewardship programs along with the negligible impacts from any construction actions and the negligible impacts on wildlife from alternative B would result in negligible cumulative impacts on wildlife.

**FORT BAKER ALTERNATIVE B CONCLUSION TABLE**

| Native Hardwood Forest and Douglas-fir/Coast Redwood Wildlife Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance                       | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs would still infrequently disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; this habitat constitutes a very small portion of the entire site | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would have the same dog walking restrictions as alternative B, except for the addition of on-leash dog walking on the Battery Yates Loop. The LOD area would include 6 feet in each direction from the edges of the trail. Impacts on wildlife in the LOD area would be long term, minor, and adverse; adjacent habitat used by wildlife would be affected by dogs through trampling, dog waste, and nutrient addition. Chasing after wildlife would be

eliminated but on-leash dogs would still occasionally disturb wildlife behavior. Wildlife may avoid and/or be displaced from high quality habitat that is degraded by the presence of dogs, and displacement to another location is still an impact on wildlife. The long-term minor adverse impacts from dogs in the LOD area would occur in a relatively small area when compared to the site as a whole; therefore, the overall impact on wildlife at Fort Baker would be negligible.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. At Fort Baker (excluding Drown Fire Road), any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. Impacts on wildlife from permit holders with up to six dogs off leash would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is not common at Fort Baker, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have a negligible impact on wildlife.

**Cumulative Impacts.** The negligible impacts on wildlife from dogs at Fort Baker under alternative C were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the park stewardship programs along with the negligible impacts from any construction actions and the negligible impacts on wildlife from alternative c would result in negligible cumulative impacts on wildlife.

**FORT BAKER ALTERNATIVE C CONCLUSION TABLE**

| Native Hardwood Forest and Douglas-fir/Coast Redwood Wildlife Impacts | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Overall negligible impacts, assuming compliance                       | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs would still infrequently disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; this habitat constitutes a very small portion of the site | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Under alternative D, on-leash dog walking would be allowed on the Lodge and Conference Center grounds and on the Bay Trail (excluding the Battery Yates Loop), the Vista Point Trail (to be built), but dogs would be prohibited on the Parade Ground. The LOD area would include 6 feet in each direction from the edges of the trail/grounds. Physically restraining dogs on leash would protect habitat and wildlife off trail, and chasing after wildlife would be eliminated, but on-leash dogs would still infrequently disturb wildlife behavior. Impacts in areas adjacent to the trail/ground would be long term, minor, and adverse as adjacent habitat would be occasionally affected by dogs through trampling, dog waste, and nutrient addition. Because of mobility, wildlife may avoid and/or be displaced from high quality habitat that is degraded by the presence of dogs.

## Chapter 4: Environmental Consequences

The long-term minor adverse impacts from dogs in the LOD area would occur in a relatively small area when compared to the site as a whole, and this habitat and supporting wildlife constitutes a very small portion of the site. Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated, although on-leash dogs could still disturb wildlife through barking and by their presence. Assuming compliance, the overall impact on wildlife at Fort Baker would be negligible.

No commercial dog walking would be allowed and no permits to walk more than three dogs would be issued under alternative D; therefore, commercial and permitted dog walking would have no impact on wildlife.

**Cumulative Impacts.** The negligible impacts on wildlife from dogs at Fort Baker under alternative D were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the park stewardship programs combined with the negligible impacts from any construction actions and the negligible impacts on wildlife from alternative D would result in negligible cumulative impacts on wildlife.

**FORT BAKER ALTERNATIVE D CONCLUSION TABLE**

| Native Hardwood Forest and Douglas-fir/Coast Redwood Wildlife Impacts | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Overall negligible impacts, assuming compliance                       | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs would still infrequently disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; this habitat constitutes a very small portion of the site | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would have the same dog walking restrictions as alternative C and impacts would be the same, assuming compliance: long term, minor, and adverse in the LOD area and negligible overall.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. At Fort Baker (excluding Drown Fire Road), any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. Impacts on wildlife from permit holders with six dogs off leash would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is not common at Fort Baker, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have a negligible impact on wildlife.

**Cumulative Impacts.** Under alternative E, the cumulative impacts on wildlife at this park site would be the same those under alternative C: negligible.

FORT BAKER ALTERNATIVE E CONCLUSION TABLE

| Native Hardwood Forest and Douglas-fir/Coast Redwood Wildlife Impacts | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Overall negligible impacts, assuming compliance                       | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs would still infrequently disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; this habitat constitutes a very small portion of the site | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative C. The preferred alternative would allow on-leash dog walking on Drown Fire Road, the Bay Trail including the Battery Yates Loop, the Vista Point Trail (to be built), the Lodge/Conference Center Grounds, and the Parade Ground. Impacts on wildlife in the LOD area would be long term, minor, and adverse; adjacent habitat used by wildlife would be affected by dogs through trampling, dog waste, and nutrient addition. Chasing after wildlife would be eliminated, but on-leash dogs would still occasionally disturb wildlife behavior. Wildlife may avoid and/or be displaced from high quality habitat that is degraded by the presence of dogs, and displacement to another location is still an impact on wildlife.

The long-term minor adverse impacts from dogs in the LOD area would occur in a relatively small area when compared to the site as a whole; therefore, the overall impact on wildlife at Fort Baker would be negligible. Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated, although on-leash dogs could still disturb wildlife through barking and by their presence.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. At Fort Baker (excluding Drown Fire Road), any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. Impacts on wildlife from permit holders with up to six dogs off leash would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is not common at Fort Baker, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have a negligible impact on wildlife.

**Cumulative Impacts.** Projects and actions in and near Fort Baker were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on wildlife at or in the vicinity of this site.

Park stewardship programs provide indirect benefits to wildlife by activities such as controlling invasive plant species and restoring habitats.

Development or construction actions at or in the vicinity of GGNRA sites have had or may have the potential to have adverse impacts on wildlife species that inhabit native hardwood forests. Even though

## Chapter 4: Environmental Consequences

these efforts both within and beyond park boundaries would affect vegetation and wildlife, mitigation for these projects would reduce the potential for impacts.

The negligible impacts on wildlife from dogs at Fort Baker under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from the park stewardship programs along with the negligible impacts from any construction actions and the negligible impacts on wildlife from the preferred alternative would result in negligible cumulative impacts on wildlife.

**FORT BAKER PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| Native Hardwood Forest and Douglas-fir/Coast Redwood Wildlife Impacts | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Overall negligible impacts, assuming compliance                       | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs would still infrequently disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; this habitat constitutes a very small portion of the site | Beneficial, assuming compliance              | Negligible cumulative impacts |

### IMPACTS TO WILDLIFE IN RIPARIAN FOREST AND STREAM CORRIDORS BY SITE AND ALTERNATIVE

Wildlife using riparian habitat along wetlands, streams, and creeks in GGNRA include amphibians, reptiles, birds, and mammals that require the specialized habitat associated with stream corridors for all or part of their life. Riparian habitat often supports a high diversity of wildlife species and can provide movement corridors for these species. The sites in GGNRA that possess riparian habitat that supports wildlife species include: Easkoot Creek at Stinson Beach, Redwood Creek at Muir Beach in Marin County, Marin Headlands Trails along the Rodeo Valley Trail Corridor from Rodeo Beach to Capehart Housing, and Lobos Creek at Baker Beach. The area at the Lobos Creek inlet that supports riparian vegetation is generally not used by visitors with dogs and is not affected by this draft plan/SEIS. At Easkoot Creek, the creek is densely vegetated with riparian plant species and generally difficult to access. Therefore, impacts on riparian vegetation as a result of alternatives A through E at both Lobos Creek at Baker Beach and Easkoot Creek at Stinson Beach would be negligible and are not discussed further in this section. Below and discussed in more detail include the following sites: Muir Beach (Redwood Creek), Marin Headlands Trails (along the Rodeo Valley Trail Corridor from Rodeo Beach to Capehart Housing), and Rancho Corral de Tierra.

#### MARIN COUNTY SITES

##### Muir Beach (Redwood Creek)

**Alternative A: No Action.** Redwood Creek and the trail associated with the creek are currently closed to dogs by the NPS to protect sensitive habitat and wildlife species that occur in the watershed, including

migrating salmonids (see “Special-status Species” section for a detailed discussion of impacts on coho salmon and steelhead trout). The park has closed the Redwood Creek area, including the trail along Redwood Creek and at the creek crossing near Muir Beach, to people and dogs. Off-leash dogs have frequently been observed in Redwood Creek despite these closures (table 6). A post-and-cable fence installed by the NPS between lower Redwood Creek and the lagoon, also currently closed to dogs, is intended to discourage visitors from accessing the water; however, it does not physically exclude dogs or visitors from the area. Water-dependent amphibians and reptiles found in Redwood Creek that may be affected by current conditions include Pacific tree frogs, California newts, and California giant salamanders.

Under the no-action alternative, if dogs gain access to Redwood Creek they could affect amphibians and reptiles by fouling water with dog waste, trampling plants (habitat) along the water/wetland edges, and disturbing sediment and causing turbidity that can smother egg masses, or by injuring or causing direct mortality to egg masses or individual species in the creek. Other wildlife species, such as birds and small mammals, can usually avoid areas where dogs are present during peak activity or habituate to these activities because of their mobility, but loss of preferred habitat would still indirectly affect wildlife. Off-leash dogs could also chase wildlife, and nesting birds on the ground or in low vegetation could have nests destroyed by dogs wandering off the trail. Therefore, alternative A would result in continued long-term minor adverse impacts on wildlife species at Redwood Creek.

Under alternative A, no permit system exists for dog walking. At Muir Beach, commercial dog walking is uncommon. Therefore, commercial dog walking would have negligible impacts on wildlife.

**Cumulative Impacts.** Projects and actions in and near Muir Beach were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on wildlife at or in the vicinity of this site.

Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat. Ongoing parkwide restoration and enhancement efforts, such as GGNRA natural resource stewardship programs and the *Marin Countywide Plan* (County of Marin 2007), can also beneficially affect riparian forest and stream corridors at GGNRA park sites such as Muir Beach. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance. The implementation of habitat restoration and projects funded by the Wildland/Urban Interface Initiative on private lands could also impact Muir Beach.

Additional specific projects that may benefit wildlife in riparian forest and stream corridor habitats include the following: the *Muir Beach Wetland and Creek Restoration Project*, which aims to restore a functional, self-sustaining ecosystem at the tidal lagoon and includes wetland, riparian, and aquatic components to re-create habitat; the *Lower Redwood Creek Interim Flood Reduction Measures and Floodplain/Channel Restoration* project (NPS 2002c, 7), which helped to reduce flooding on Pacific Way in Muir Beach, maintained passage for federally threatened fish in Redwood Creek, and restored riparian habitat and the floodplain at the GGNRA Banducci site; the *Coho and Steelhead Restoration Project* (NPS 2010f, 1), which focuses on Pine Gulch, Redwood, Olema, and Lagunitas creeks and their watersheds and includes assessments of coho salmon and steelhead abundance and distribution, and the development and implementation of a fish and habitat restoration and monitoring plan; and the *Redwood Creek Watershed: Vision for the Future* project (NPS 2003c, 8), which included identification of issues and values in the watershed and desired future conditions for watershed resources.

Generally, construction and development projects that affect the riparian forest and stream corridor communities require project-specific mitigation measures to address impacts on these communities and

## Chapter 4: Environmental Consequences

their wildlife, such as the GGNRA *Long-range Transportation Plan Update* (NPS 2008g). Therefore, these projects would not likely contribute to negative cumulative impacts. In addition to construction and development projects, implementation of some of the proposed fire management policies of the GGNRA *Fire Management Plan* may affect riparian areas and stream corridors through vegetation removal, although non-emergency fire management actions would not take place within 100 feet of riparian areas (NPS 2005b, 342-343). Work in riparian and streamside areas for the GGNRA *Fire Management Plan* would be carefully managed to ensure that impacts are mitigated to an acceptable level, and cumulative impacts would be long term and beneficial due to restoration of riparian habitat associated with this project (NPS 2005b, 94-101). Loss of riparian vegetation could lead to elevated water temperatures, reducing the ability of the water to hold dissolved oxygen (NPS 2005b, 343), which could ultimately affect the fisheries in the stream.

The long-term minor adverse impacts on wildlife from dogs at Muir Beach under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from trail rehabilitation projects should reduce some of the adverse impacts on wildlife from alternative A. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**MUIR BEACH ALTERNATIVE A CONCLUSION TABLE**

| Riparian Forest and Stream Corridor Wildlife Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Long-term minor adverse impacts                      | Redwood Creek closures have been violated by off-leash dogs; wildlife, especially aquatic species, that use the creek and associated riparian habitat along the proposed Muir Beach Trail would occasionally be subjected to impacts from on-leash and voice control dogs through barking and chasing after, wildlife avoidance of areas, and aquatic impacts when dogs gain access to the creek, such as fouling water with dog waste, trampling vegetation, disturbing sediment and causing turbidity, or injuring or causing direct mortality to eggs or individual species in the creek | N/A  | Negligible cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B allows on-leash dog walking on the beach, the bridge, and path to the beach, the parking area, and the proposed Muir Beach Trail. The lagoon and creek are currently closed to dogs and people. Physically restraining dogs on leash would protect habitat and wildlife off trail by eliminating chasing after wildlife. However, dogs could still disturb wildlife behavior. Because of mobility, wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs, which would indirectly affect wildlife.

Therefore, long-term minor adverse impacts on habitat and the associated wildlife located in the 6-foot area adjacent to the trail/path (LOD area) would occur.

Because the trail and the LOD area represent a small portion of the Muir Beach site, the overall impacts would be negligible to long term, minor, and adverse, assuming compliance. The trail generally receives low to high use by dog walkers. Because dogs would be physically restrained and the regulations would be enforced, habitat and wildlife at Redwood Creek would be protected. Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior. Wildlife may avoid the trail and areas that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is not common at Muir Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have a negligible impact on wildlife.

**Cumulative Impacts.** The negligible to long-term minor adverse impacts on wildlife from dogs at Muir Beach under alternative B were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from trail rehabilitation projects should reduce some of the adverse impacts on wildlife from alternative B. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**MUIR BEACH ALTERNATIVE B CONCLUSION TABLE**

| Riparian Forest and Stream Corridor Wildlife Impacts                       | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid the trail and areas that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; the trail and the LOD area are a small portion of the site; site generally receives low to high use | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would have the same dog walking restrictions as alternative B, and impacts would be the same, assuming compliance: long term, minor, and adverse in the LOD area and negligible to long term, minor, and adverse overall.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Muir Beach is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is

**Chapter 4: Environmental Consequences**

not common at Muir Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have a negligible impact on wildlife.

**Cumulative Impacts.** Under alternative C, the cumulative impacts on wildlife at this park site would be the same those under alternative B: negligible.

**MUIR BEACH ALTERNATIVE C CONCLUSION TABLE**

| Riparian Forest and Stream Corridor Wildlife Impacts                      | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible to long-term minor adverse impacts assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid the trail and areas that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; the trail and the LOD area are a small portion of the site; the site generally receives low to high use | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Under alternative D, on-leash dog walking would only be allowed on proposed Muir Beach Trail and the parking area, and not on the beach or paths to the beach. Currently, the entire length of the proposed Muir Beach Trail is adjacent to the riparian forest habitat; restoration of the proposed Muir Beach Trail will move it even closer to the riparian habitat. Currently the lagoon and creek are closed to dogs. Physically restraining dogs on leash would protect habitat and wildlife off trail by eliminating chasing after wildlife. However, dogs could still disturb wildlife behavior. Habitat and the associated wildlife located in the 6-foot area adjacent to the trail/path (LOD area) would receive long-term minor adverse impacts related to the presence of dogs affecting the quality and availability of habitat and causing displacement of wildlife in the vicinity of trails. Because of mobility, wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs.

Assuming compliance, overall negligible to long-term minor adverse impacts on wildlife would occur as a result of alternative D because impacts on wildlife would be limited to a small area when compared to the size of the entire site. Physically restraining dogs on leash would protect habitat off trail as well as wildlife, and chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior. Wildlife may avoid the trail and areas that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs.

No commercial dog walking would be allowed and no permits to walk more than three dogs would be issued under alternative D; therefore, commercial and permitted dog walking would have no impact on wildlife.

**Cumulative Impacts.** The negligible to long-term minor adverse impacts on wildlife from dogs at Muir Beach under alternative D were considered together with the effects of the projects mentioned above

under alternative A. The beneficial effects from trail rehabilitation projects should reduce some of the adverse impacts on wildlife from alternative D. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**MUIR BEACH ALTERNATIVE D CONCLUSION TABLE**

| <b>Riparian Forest and Stream Corridor Wildlife Impacts</b>                | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid the trail and areas that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; the trail and the LOD area are a small portion of the site; the site receives low to high use | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** At Muir Beach, on-leash dog walking would be allowed on the proposed Muir Beach Trail, the bridge and path to the beach, and the parking lot. The portion of the beach south of the access path would be a designated ROLA and would be open to dogs under voice and sight control, but would not be located in riparian habitat. Currently the lagoon and creek are closed to dogs. Currently, the entire length of the proposed Muir Beach Trail is adjacent to the riparian forest habitat; restoration of the proposed Muir Beach Trail will move it even closer to the riparian habitat. Habitat and the associated wildlife located in the 6-foot area adjacent to the trail/path (LOD area) would receive long-term minor adverse impacts related to the presence of dogs affecting the quality and availability of habitat and causing displacement of wildlife in the vicinity of trails. Because of mobility, wildlife may avoid the trail and areas that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs.

Because the trail and the LOD area represent a small portion of the Muir Beach site, the overall impacts would be negligible to long term, minor, and adverse. The trail generally receives low to high use by dog walkers. Because dogs would be physically restrained in riparian habitat and the regulations would be enforced, habitat and wildlife at Redwood Creek would be protected. Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior. Wildlife may avoid the trail and other areas that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Muir Beach is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at Muir Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have a negligible impact on wildlife.

## Chapter 4: Environmental Consequences

**Cumulative Impacts.** The negligible to long-term minor adverse impacts on wildlife from dogs at Muir Beach under alternative E were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from trail rehabilitation projects should reduce some of the adverse impacts on wildlife from alternative E. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**MUIR BEACH ALTERNATIVE E CONCLUSION TABLE**

| Riparian Forest and Stream Corridor Wildlife Impacts                       | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid the trail and areas that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; the trail and the LOD area are a small portion of the site; the site receives low to high use | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative would allow on-leash dog walking on the beach, bridge and path to the beach, and the proposed Muir Beach Trail. Currently, the entire length of the proposed Muir Beach Trail is adjacent to the riparian forest habitat; restoration of the proposed Muir Beach Trail will move it even closer to the riparian habitat. The lagoon and creek are currently closed to dogs. Physically restraining dogs on leash would protect habitat and wildlife off trail by eliminating chasing after wildlife. However, dogs could still disturb wildlife behavior. Habitat and the associated wildlife located in the 6-foot area adjacent to the trail/path (LOD area) would receive long-term minor adverse impacts related to the presence of dogs affecting the quality and availability of habitat and causing displacement of wildlife in the vicinity of the trail. Because of mobility, wildlife may avoid the trail and areas that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs.

Assuming compliance, overall negligible to long-term minor adverse impacts on wildlife would occur as a result of the preferred alternative because impacts on wildlife would be limited to a small area when compared to the size of the entire site. Physically restraining dogs on leash would protect habitat off trail as well as wildlife, and chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior. Wildlife may avoid the trail and areas that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Muir Beach is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at Muir Beach, it is likely that this alternative would not have an impact on

the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have a negligible impact on wildlife.

**Cumulative Impacts.** Projects and actions in and near Muir Beach were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on wildlife at or in the vicinity of this site.

Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat. Ongoing parkwide restoration and enhancement efforts, such as GGNRA natural resource stewardship programs and the *Marin Countywide Plan* (County of Marin 2007), can also beneficially affect riparian forest and stream corridors at GGNRA park sites such as Muir Beach. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance. The implementation of habitat restoration and projects funded by the Wildland/Urban Interface Initiative on private lands could also impact Muir Beach.

Additional specific projects that may benefit wildlife in riparian forest and stream corridor habitats include the following: the *Muir Beach Wetland and Creek Restoration Project*, which aims to restore a functional, self-sustaining ecosystem at the lagoon and includes wetland, riparian and aquatic components to re-create habitat; the *Lower Redwood Creek Interim Flood Reduction Measures and Floodplain/Channel Restoration* project, which helped to reduce flooding on Pacific Way in Muir Beach, maintained passage for federally threatened fish in Redwood Creek, and restored riparian habitat and the floodplain at the GGNRA Banducci site; the *Coho and Steelhead Restoration Project*, which focuses on Pine Gulch, Redwood, Olema, and Lagunitas creeks and their watersheds and includes assessments of coho salmon and steelhead abundance and distribution, as well as the development and implementation of a fish and habitat restoration and monitoring plan; and the *Redwood Creek Watershed: Vision for the Future* project, which included identification of issues and values in the watershed and desired future conditions for watershed resources.

Generally, construction and development projects that affect the riparian forest and stream corridor communities require project-specific mitigation measures to address impacts on these communities and their wildlife, such as the GGNRA *Long-range Transportation Plan Update* (NPS 2008g). Therefore, these projects would not likely contribute to negative cumulative impacts. In addition to construction and development projects, implementation of some of the proposed fire management policies of the GGNRA *Fire Management Plan* may affect riparian areas and stream corridors through vegetation removal, although non-emergency fire management actions would not take place within 100 feet of riparian areas (NPS 2005b). Work in riparian and streamside areas for the GGNRA *Fire Management Plan* would be carefully managed to ensure that impacts are mitigated to an acceptable level and cumulative impacts would be long term and beneficial due to restoration of riparian habitat associated with this project (NPS 2005b). Loss of riparian vegetation could lead to elevated water temperatures, reducing the ability of the water to hold dissolved oxygen (NPS 2005b), which could ultimately affect the fisheries in the stream.

The negligible to long-term minor adverse impacts on wildlife from dogs at Muir Beach under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from trail rehabilitation projects should reduce some of the adverse impacts on wildlife from the preferred alternative. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

MUIR BEACH PREFERRED ALTERNATIVE F CONCLUSION TABLE

| Riparian Forest and Stream Corridor Wildlife Impacts                       | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid the trail and areas that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; the trail and the LOD area are a small portion of the site; the site receives low to high use | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

### Marin Headlands Trails

**Alternative A: No Action.** Currently, on-leash dog walking is allowed along the Coastal Trail from Hill 88 to Muir Beach, the Batteries Loop Trail, North Miwok Trail from Tennessee Valley to Highway 1, County View Road, and Marin Drive. Dog walking under voice control (or on leash) is allowed along other portions of the Coastal Trail (Golden Gate Bridge to Hill 88 and includes portions of the Lagoon Loop Trail), the Coastal, Wolf, and Miwok Loop, and the Old Bunker Fire Road Loop (includes a section of the Coastal Trail). These trails experience low to moderate use by dog walkers. Dog-related incidents are high at this site with a total of 269 from 2008 through 2011, with the majority of incidents for having dogs within areas closed to pets (table 16). Riparian forest occurs along portions of the Lagoon Loop Trail and the Rodeo Valley Trail is adjacent to riparian forest for much of the length of Rodeo Valley; these areas make up a fair portion of the entire site. Voice control dog walking currently occurs along the Lagoon Loop Trail.

Alternative A would result in continued long-term minor to moderate adverse impacts on wildlife using the riparian community. Off-leash dog access to wildlife and associated riparian habitat along the Lagoon Loop Trail would continue and occasional to frequent disturbance would occur, including physical damage to habitat or nests/burrows from digging or trampling, as well as chasing after and even capturing small mammals, reptiles, amphibians, and ground-nesting birds; wildlife may also be displaced from high quality habitat that is degraded by the presence of dogs.

Under alternative A, no permit system exists for dog walking. At Marin Headlands Trails, commercial dog walking is uncommon. Therefore, commercial dog walking would have negligible impacts on wildlife.

**Cumulative Impacts.** Projects and actions in and near the Marin Headlands Trails were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on wildlife at or in the vicinity of this site.

Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat. Ongoing parkwide restoration and enhancement efforts, such as GGNRA natural resource stewardship programs and the *Marin Countywide Plan* (County of Marin 2007), can also beneficially

affect riparian forest and stream corridors at GGNRA park sites such as the Marin Headlands Trails. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance. The implementation of habitat restoration and projects funded by the Wildland/Urban Interface Initiative on private lands could also impact the Marin Headlands Trails.

Generally, construction and development projects that affect the riparian forest and stream corridor communities require project-specific mitigation measures to address impacts on these communities and their wildlife, specifically the *Marin Headlands/Fort Baker Improvement and Transportation Management Plan/EIS* and the *GGNRA Long-range Transportation Plan Update* (NPS 2008g). Therefore, these projects would not likely contribute to negative cumulative impacts. In addition to construction and development projects, implementation of some of the proposed fire management policies of the *GGNRA Fire Management Plan* may affect riparian areas and stream corridors through vegetation removal, although non-emergency fire management actions would not take place within 100 feet of riparian areas (NPS 2005b). Work in riparian and streamside areas for the *GGNRA Fire Management Plan* would be carefully managed to ensure that impacts are mitigated to an acceptable level, and cumulative impacts would be long term and beneficial due to restoration of riparian habitat associated with this project (NPS 2005b). Loss of riparian vegetation could lead to elevated water temperatures, reducing the ability of the water to hold dissolved oxygen (NPS 2005b), which could ultimately affect the fisheries in the stream.

The long-term minor to moderate adverse impacts on wildlife from dogs at the Marin Headlands Trails under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from trail rehabilitation projects should reduce some of the adverse impacts on wildlife from alternative A. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be long-term, minor, and adverse.

**MARIN HEADLANDS TRAILS ALTERNATIVE A CONCLUSION TABLE**

| <b>Riparian Forest and Stream Corridor Wildlife Impacts</b> | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>                  |
|---|--|---|--|
| Long-term minor to moderate adverse impacts                 | Off-leash dog access to wildlife and associated riparian habitat along the Rodeo Valley Trail Corridor and the Lagoon Loop Trail would continue; these areas make up a fair portion of the entire site; disturbance would include physical damage to habitat or nests/burrows from digging or trampling, as well as chasing after and even capturing wildlife; wildlife may also be displaced from high quality habitat that is degraded by the presence of dogs | N/A   | Long-term minor adverse cumulative impacts |

N/A = not applicable.

## Chapter 4: Environmental Consequences

**Alternative B: NPS Leash Regulation.** Alternative B would prohibit dogs at the site, which includes the trails throughout the Marin Headlands. Riparian communities and stream corridors, including habitat adjacent to trails and roads of the headlands, would be protected from dog impacts, resulting in no impact on wildlife using riparian communities at Marin Headlands Trails, assuming compliance.

Since dogs would be prohibited from this site, no impacts on wildlife species that use the riparian community would occur from commercial dog walkers.

**Cumulative Impacts.** Under alternative B, the lack of impacts on wildlife from dogs at the Marin Headlands Trails was considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from trail rehabilitation projects combined with the negligible impacts from any development or construction actions and the lack of impacts on wildlife from alternative B would result in negligible cumulative impacts on wildlife.

**MARIN HEADLANDS TRAILS ALTERNATIVE B CONCLUSION TABLE**

| Riparian Forest and Stream Corridor Wildlife Impacts | Rationale                            | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|--------------------------------------|--|-------------------------------|
| No impact, assuming compliance                       | Dogs would be prohibited at the site | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would allow on-leash dog walking along the Lower Rodeo Valley Trail Corridor. This corridor extends from the Rodeo Beach parking lot to the intersection of Bunker and McCullough Roads via the North Lagoon Loop Trail, Miwok Trail, and Rodeo Valley Trail, and includes the connector trail from the Rodeo Valley Trail to the Smith Road Trailhead. On-leash dog walking would also be allowed on the Old Bunker Fire Road Loop (including a section of the Coastal Trail), and the Batteries Loop Trail. This alternative would allow on-leash dog access only on these perimeter trails in the Marin Headlands, while preserving and maintaining the integrity of interior habitat. The Rodeo Valley Trail Corridor parallels riparian habitat for its entire length. Although only a portion of this trail is currently open to dogs, under alternative C, an additional section in riparian habitat will be opened to on-leash dogs on the multi-use trail and bridge at Capehart Housing in upper Rodeo Valley which will connect the trail corridor to Bunker Road. The habitat and associated wildlife in the LOD area would be affected by dogs through trampling, dog waste, and nutrient addition, resulting in long-term minor adverse impacts. Wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs, which is an indirect impact on wildlife.

Given the amount of riparian habitat and wildlife species that could be impacted along the LOD area and Lower Rodeo Valley Trail Corridor, the overall impacts, assuming compliance, would be expected to be long term, minor, and adverse. Alternative C would actually have more trail length available in this habitat compared to alternative A, but compliance is assumed. Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior. Wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Marin Headlands Trails is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking activity is not common at Marin Headlands Trails, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have a negligible impact on wildlife.

**Cumulative Impacts.** The long-term minor adverse impacts on wildlife from dogs at the Marin Headlands Trails under alternative C were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from trail rehabilitation projects should reduce some of the adverse impacts on wildlife from alternative C. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**MARIN HEADLANDS TRAILS ALTERNATIVE C CONCLUSION TABLE**

| Riparian Forest and Stream Corridor Wildlife Impacts         | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Overall long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; more trail length in this habitat available for dog walking compared to alternative A | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Alternative D would prohibit dogs on trails throughout the Marin Headlands. Riparian communities and stream corridors, including habitat adjacent to trails and roads of the headlands, would be protected from dog impacts, resulting in no impact on wildlife using riparian communities at Marin Headlands Trails, assuming compliance.

Since dogs would be prohibited from this site, no impacts on wildlife species that use the riparian community would occur from commercial or permitted dog walkers.

**Cumulative Impacts.** Under alternative D, the cumulative impacts on wildlife at this park site would be the same those under alternative B: negligible.

**MARIN HEADLANDS TRAILS ALTERNATIVE D CONCLUSION TABLE**

| Riparian Forest and Stream Corridor Wildlife Impacts | Rationale                            | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|--------------------------------------|--|-------------------------------|
| No impacts, assuming compliance                      | Dogs would be prohibited at the site | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would allow on-leash dog walking on the Coastal Hiking Trail from Highway 101 along Conzelman Road to the McCullough intersection and then to the Coastal Trail Bike Route, including Julian Road, to the Rodeo Beach parking lot. On-leash dog walking would also be available on the Old Bunker Fire Road Loop (which includes a section of the Coastal Trail), Batteries Loop Trail, North Miwok Trail from Tennessee

## Chapter 4: Environmental Consequences

Valley to Highway 1, County View Trail, Marin Drive, Rodeo Avenue Trail, and Morning Sun Trail. This alternative would allow on-leash dog access only on these perimeter trails in the Marin Headlands, while preserving and maintaining the integrity of interior habitat. Physically restraining dogs on leash would protect habitat off trail as well as wildlife, and chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior. The Rodeo Lagoon Loop Trail parallels riparian habitat. Only a portion of this trail is currently open to dogs, under alternative E. The habitat and associated wildlife in the LOD area would be affected by dogs through trampling, dog waste, and nutrient addition, resulting in long-term minor adverse impacts.

Given the amount of riparian habitat and wildlife species that could be impacted along the LOD area and Lagoon Loop Trail, the overall impacts, assuming compliance, would be expected to be long term, minor, and adverse. Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior. Wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Marin Headlands Trails is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking activity is not common at Marin Headlands Trails, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have a negligible impact on wildlife.

**Cumulative Impacts.** The long-term minor adverse impacts on wildlife from dogs at the Marin Headlands Trails under alternative E were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from trail rehabilitation projects should reduce some of the adverse impacts on wildlife from alternative E. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**MARIN HEADLANDS TRAILS ALTERNATIVE E CONCLUSION TABLE**

| Riparian Forest and Stream Corridor Wildlife Impacts         | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|--|--|-------------------------------|
| Overall long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative would allow on-leash dog walking along the Lower Rodeo Valley Trail Corridor, which extends from the Rodeo Beach parking lot to the intersection of Bunker and McCullough Roads via the North Lagoon Trail, Miwok Trail, Rodeo Valley Trail, and includes the connector trail from the Rodeo Valley Trail to the Smith Road Trailhead. On-leash

dog walking would also be available on the Old Bunker Fire Road Loop (including a section of the Coastal Trail), Batteries Loop Trail, Rodeo Avenue Trail, and Morning Sun Trail. This alternative would allow on-leash dog access only on these perimeter trails in the Marin Headlands, while preserving and maintaining the integrity of interior habitat. The Rodeo Valley Trail Corridor parallels riparian habitat for its entire length. Although only a portion of this trail is currently open to dogs, under the preferred alternative, an additional section in riparian habitat will be opened to on-leash dogs when the multi-use trail is completed with a bridge at Capehart Housing in upper Rodeo Valley. The habitat and associated wildlife in the LOD area would be affected by dogs through trampling, dog waste, and nutrient addition, resulting in a long-term minor adverse impact in the LOD area and overall. Wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs, which is an indirect impact on wildlife.

Given the amount of riparian habitat and wildlife species that could be impacted along the LOD area and Lower Rodeo Valley Trail Corridor, the overall impacts assuming compliance would be expected to be long term, minor, and adverse. The preferred alternative would actually have more trail length in this habitat available for dog walking compared to alternative A, but compliance is assumed. Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior. Wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Marin Headlands Trails is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking activity is not common at Marin Headlands Trails, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have a negligible impact on wildlife.

**Cumulative Impacts.** Projects and actions in and near the Marin Headlands Trails were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on wildlife at or in the vicinity of this site.

Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat. Ongoing parkwide restoration and enhancement efforts, such as GGNRA natural resource stewardship programs and the *Marin Countywide Plan* (County of Marin 2007), can also beneficially affect riparian forest and stream corridors at GGNRA park sites such as the Marin Headlands Trails. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance. The implementation of habitat restoration and projects funded by the Wildland/Urban Interface Initiative on private lands could also impact the Marin Headlands Trails.

Generally, construction and development projects that affect the riparian forest and stream corridor communities require project-specific mitigation measures to address impacts on these communities and their wildlife, specifically the GGNRA *Long-range Transportation Plan Update* (NPS 2008g) and the *Marin Headlands/Fort Baker Improvement and Transportation Management Plan/EIS* (NPS 2009c). Therefore, these projects would not likely contribute to negative cumulative impacts. In addition to construction and development projects, implementation of some of the proposed fire management policies of the GGNRA *Fire Management Plan* may affect riparian areas and stream corridors through vegetation removal, although non-emergency fire management actions would not take place within 100 feet of riparian areas (NPS 2005b). Work in riparian and streamside areas for the GGNRA *Fire Management*

## Chapter 4: Environmental Consequences

*Plan* would be carefully managed to ensure that impacts are mitigated to an acceptable level and cumulative impacts would be long term and beneficial due to restoration of riparian habitat associated with this project (NPS 2005b). Loss of riparian vegetation could lead to elevated water temperatures, reducing the ability of the water to hold dissolved oxygen (NPS 2005b), which could ultimately affect the fisheries in the stream.

The long-term minor adverse impacts on wildlife from dogs at the Marin Headlands Trails under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from trail rehabilitation projects should reduce some of the adverse impacts on wildlife from the preferred alternative. The impacts resulting from any development or construction actions at or in the vicinity of GGNRA would add little to the cumulative impacts on wildlife, since those impacts would be negligible due to mitigation for these projects that would reduce the potential for impacts. Therefore, cumulative impacts on wildlife under this alternative would be expected to be negligible.

**MARIN HEADLANDS TRAILS PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| Riparian Forest and Stream Corridor Wildlife Impacts         | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Overall long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat that is degraded by the presence of dogs; more trail length in this habitat available for dog walking compared to alternative A | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

### Rancho Corral de Tierra

**Alternative A: No Action.** Riparian habitat is found along the creeks, streams, and springs at Rancho Corral de Tierra, and trails cut across riparian forest in some areas. Currently, on-leash dog walking is allowed at Rancho Corral de Tierra. Staff regularly working at Rancho characterize use by dog walkers as low to moderate, and compliance with the leash law is generally low. At Rancho, NPS rangers have observed off-leash dogs running in areas with potentially sensitive habitat.

Alternative A would result in continued long-term minor to moderate adverse impacts on wildlife using the riparian community. Off-leash dog access to wildlife and associated riparian habitat along the trails would continue and occasional to frequent disturbance would occur, including physical damage to habitat or nests/burrows from digging or trampling, as well as chasing after and even capturing small mammals, reptiles, amphibians, and ground-nesting birds; wildlife may also be displaced from high quality habitat that is degraded by the presence of dogs. According to information from the Montara Dog Group and subsequent staff observations, dog walkers, particularly off-leash dog walkers, primarily use the lower elevations of the site at both the Montara and El Granada areas. The terrain at El Granada is particularly steep and challenging, thus dog walking use in that area appears to be concentrated mostly in the lower elevations. Although the Montara area is less steep, visitor use there is similarly concentrated in the lower

elevations, but some dog walkers in the Montara area do use trails that connect to the top of the Rancho site.

No permit system exists for dog walking under alternative A. Commercial dog walkers typically use the El Granada area off of Coral Reef Avenue; however, commercial dog walking is considered a low use at the site overall. Therefore, commercial dog walking would have negligible impacts on wildlife using riparian forest at Rancho.

**Cumulative Impacts.** Projects and actions in and near Rancho were considered for the cumulative impacts analysis (appendix K). Since the Rancho Corral de Tierra site has been transferred to the NPS, general maintenance and protection of the site and associated natural resources have been occurring, although some impacts may remain from prior unregulated off-leash dog walking.

Additional actions have had, or are currently having, or will have the potential to have adverse impacts on wildlife at or in the vicinity of Rancho Corral de Tierra, such as development or construction actions. One example is the CalTrans Devil's Slide Tunnel project, which involves constructing two tunnels beneath San Pedro Mountain to provide a dependable highway between Pacifica and Montara (CADOT 2013, 1). Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts.

The long-term minor to moderate adverse impacts on riparian forest from dogs at Rancho Corral de Tierra under alternative A were considered together with the effects of the actions mentioned above. The benefits to wildlife from the park stewardship programs would not be expected to completely reduce the adverse impacts of this alternative. Therefore, the beneficial effects from the park stewardship programs combined with the long-term minor to moderate adverse impacts from alternative A would result in long-term minor adverse cumulative impacts on the riparian forest.

**RANCHO CORRAL DE TIERRA ALTERNATIVE A CONCLUSION TABLE**

| Riparian Forest and Stream Corridor Wildlife Impacts | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts                         |
|--|--|--|--|
| Long-term minor to moderate adverse impacts          | Creek and waterbodies are closed to dogs by the NPS, but there is no physical barrier and off-leash dogs have been observed at this site; this habitat would continue to be subject to impacts from dogs through trampling, digging, and dog waste | N/A  | Long-term minor adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** On-leash dog walking would be allowed on designated trails in two areas open to dog walking near Montara and El Granada, which were identified by the local dog walking group as key areas for this use. Creeks and waterbodies at Rancho would remain closed to dogs. Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior. The habitat and associated wildlife in the LOD area would be affected by dogs through trampling, dog waste, and nutrient addition, resulting in a negligible to long-term minor adverse impact in the LOD area and overall. Wildlife may avoid trail corridors that allow on-leash dog walking and may be displaced from high quality habitat that is degraded by the presence of dogs, which is an indirect impact on wildlife.

## Chapter 4: Environmental Consequences

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking at Rancho is not common, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have negligible impacts on wildlife using riparian forest at Rancho.

**Cumulative Impacts.** The negligible to long-term minor adverse impacts on wildlife using riparian vegetation from dogs at Rancho under alternative B were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the rehabilitation and improvement projects combined with the long-term minor adverse impacts from alternative B would result in negligible cumulative impacts on wildlife using riparian forest at Rancho.

**RANCHO CORRAL DE TIERRA ALTERNATIVE B CONCLUSION TABLE**

| Riparian Forest and Stream Corridor Wildlife Impacts                       | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Creeks and waterbodies would remain closed to dogs; physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Under alternative C, on-leash dog walking would be allowed on designated trails in two areas open to dog walking near Montara and El Granada. Dog walking under voice and site control would be allowed in a ROLA located between Le Conte and Tamarind Street, in a previously (partially) disturbed open area across the street and east of the Farallone View School. The ROLA would not be located within riparian forest vegetation; creeks and waterbodies at Rancho would remain closed to dogs. Therefore, impacts to wildlife that use riparian forest under alternative C would be the same as alternative B: overall negligible to long-term, minor, and adverse.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Rancho Corral de Tierra is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at Rancho, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on wildlife using riparian forest at Rancho.

**Cumulative Impacts.** Under alternative C, the cumulative impacts on wildlife using riparian forest at Rancho would be the same as those under alternative B: negligible cumulative impacts.

**RANCHO CORRAL DE TIERRA ALTERNATIVE C CONCLUSION TABLE**

| <b>Riparian Forest and Stream Corridor Wildlife Impacts</b>                | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Creeks and waterbodies would remain closed to dogs; physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Under alternative D, on-leash dog walking would be allowed in the Montara area on two existing trails that allow dog walking: Old San Pedro Mountain Road and the Farallon Cutoff. Dogs would be prohibited in other areas of the site, including the entire El Granada area. Creeks and waterbodies at Rancho would remain closed to dogs. Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior. The habitat and associated wildlife in the LOD area would be affected by dogs through trampling, dog waste, and nutrient addition, resulting in a negligible to long-term minor adverse impact in the LOD area and overall. Wildlife may avoid trail corridors that allow on-leash dog walking and may be displaced from high quality habitat that is degraded by the presence of dogs, which is an indirect impact on wildlife.

No commercial dog walking would be allowed and no permits to walk more than three dogs would be issued under alternative D; therefore, no impact would occur as a result of commercial or permitted dog walking.

**Cumulative Impacts.** Under alternative D, the cumulative impacts on wildlife using riparian forest at Rancho would be the same as those under alternative B: negligible cumulative impacts.

**RANCHO CORRAL DE TIERRA ALTERNATIVE D CONCLUSION TABLE**

| <b>Riparian Forest and Stream Corridor Wildlife Impacts</b>                | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Creeks and waterbodies would remain closed to dogs; physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

## Chapter 4: Environmental Consequences

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Dog walking restrictions under alternative E would be the same as under alternative C and impacts on wildlife using riparian forest would be the same: overall negligible to long-term minor adverse impacts, assuming compliance.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Rancho Corral de Tierra is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking activity is not common at Rancho, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on wildlife using riparian forest at Rancho.

**Cumulative Impacts.** Under alternative E, the cumulative impacts on wildlife using riparian forest at Rancho would be the same as those under alternative B: negligible cumulative impacts.

**RANCHO CORRAL DE TIERRA ALTERNATIVE E CONCLUSION TABLE**

| Riparian Forest and Stream Corridor Wildlife Impacts                       | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Creeks and waterbodies would remain closed to dogs; physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative B: on-leash dog walking would be allowed on designated trails in two areas open to dog walking near Montara and El Granada. Creeks and waterbodies at Rancho would remain closed to dogs. Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated, but on-leash dogs could still disturb wildlife behavior. The habitat and associated wildlife in the LOD area would be affected by dogs through trampling, dog waste, and nutrient addition, resulting in a negligible to long-term minor adverse impact in the LOD area and overall. Wildlife may avoid trail corridors that allow on-leash dog walking and may be displaced from high-quality habitat that is degraded by the presence of dogs, which is an indirect impact on wildlife.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Rancho Corral de Tierra is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking activity is not common at Rancho, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative F would have negligible impacts on wildlife using riparian forest at Rancho.

**Cumulative Impacts.** Projects and actions in and near Rancho were considered for the cumulative impacts analysis (appendix K). Since the Rancho Corral de Tierra site has been transferred to the NPS, general maintenance and protection of the site and associated natural resources have been occurring, although some impacts may remain from prior unregulated off-leash dog walking.

The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance, which can beneficially affect vegetation at park sites. Additional actions have had, are currently having, or will have the potential to have adverse impacts on vegetation at or in the vicinity of Rancho Corral de Tierra, such as development or construction actions. One example is the CalTrans Devil’s Slide Tunnel project, which involves constructing two tunnels beneath San Pedro Mountain to provide a dependable highway between Pacifica and Montara (CADOT 2013, 1). Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts.

The negligible to long-term minor adverse impacts on wildlife using riparian forest from dogs at Rancho Corral de Tierra under the preferred alternative were considered together with the effects of the actions mentioned above. The beneficial effects from the park stewardship programs combined with the long-term, minor, adverse impacts under the preferred alternative would result in negligible cumulative impacts on wildlife using riparian forest at Rancho.

**RANCHO CORRAL DE TIERRA PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| <b>Riparian Forest and Stream Corridor Wildlife Impacts</b>                | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Creeks and waterbodies would remain closed to dogs; physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs could still disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from high quality habitat | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

## **IMPACTS TO WILDLIFE IN OTHER CONIFEROUS COMMUNITIES BY SITE AND ALTERNATIVE**

As stated previously, stands of the non-native tree Monterey cypress are found within GGNRA, including at East Fort Miley, Lands End, and several locations at Rancho Corral de Tierra. East Fort Miley is primarily Monterey cypress with some wetland/riparian vegetation around the fringes; the area is dominated by older stands of cypress, which were densely planted and impacts are discussed further in the paragraphs that follow. Lands End and Rancho Corral de Tierra both have smaller stands of Monterey cypress that are not considered the dominant habitat at these sites. Therefore, impacts from dogs on other coniferous communities (Monterey cypress) at Lands End and Rancho Corral de Tierra for all alternatives would be negligible and are not discussed further in this “Wildlife” section.

### **Fort Miley**

**Alternative A: No Action.** Dogs under voice control are currently allowed in both East and West Fort Miley; much of the West Fort Miley site is paved and the primary dog-accessible location at East Fort Miley is the open area north of NPS maintenance and picnic areas. East Fort Miley is primarily Monterey cypress with some wetland/riparian vegetation around the fringes; the area is dominated by older stands

## Chapter 4: Environmental Consequences

of cypress, which were densely planted. Dark-eyed juncos, California towhees, song sparrows, white-crowned sparrows, and spotted towhees may use the forested habitat at Fort Miley for nesting and foraging. Raccoons, red foxes, and skunks are probably present and feral cats are common in the vicinity of the Navy Memorial parking lot and Fort Miley; coyotes may be establishing a den in the Fort Miley area. This site has documented moderate to high visitor use (mostly picnickers) and low numbers of dog walkers. This site is mostly used by local residents and no dog-related incidents were reported from 2008 through 2011.

Under alternative A, since dogs would continue to be allowed off leash, it is likely that dogs would enter areas off the trail and picnic areas that support the growth of existing vegetation. A large portion of the site is developed and only a small portion of the entire site supports coniferous vegetation in areas that are open to dogs. However, alternative A would result in continued long-term minor adverse impacts on wildlife using the coniferous community. Off-leash dog access to wildlife and associated coniferous habitat would continue and occasional disturbance to upland wildlife species would occur, including physical damage to habitat or nests/burrows from digging or trampling, as well as chasing after and even capturing small mammals, reptiles, amphibians, and ground-nesting birds.

Under alternative A, no permit system exists for dog walking. At Fort Miley, commercial dog walking is uncommon. Therefore, commercial dog walking would have negligible impacts on wildlife.

**Cumulative Impacts.** Projects and actions in and near Fort Miley were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs provide enhancements that improve conditions for vegetation and wildlife habitat. Ongoing parkwide restoration and enhancement efforts can also beneficially affect vegetation at GGNRA park sites such as Fort Miley. As part of a U.S. Department of Veterans Affairs project, a new parking structure for the San Francisco Veterans Administration (VA) Medical Center patient and visitor parking would be constructed immediately to the west of East Fort Miley (USVA 2010, 10). However, the environmental assessment (EA) for the project determined that due to the disturbed nature of the site and its relatively small size, no long-term impacts to vegetation or wildlife were anticipated. Therefore, the long-term minor adverse impacts on wildlife from dogs at Fort Miley under alternative A were considered together with the beneficial effects of the projects mentioned above. Cumulatively, there would be negligible impacts on wildlife from alternative A when added to other past, present, or foreseeable future actions at and around this park site.

**FORT MILEY ALTERNATIVE A CONCLUSION TABLE**

| Other Coniferous Community Wildlife Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Long-term minor adverse impacts             | Off-leash dog access to wildlife would continue; these areas make up a small portion of the entire site; occasional disturbance would include physical damage to habitat or nests/burrows from digging or trampling, as well as chasing after and even capturing wildlife | N/A  | Negligible cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would prohibit dogs at the site, which includes the trails throughout the Marin Headlands. Therefore, no impacts on wildlife from dogs at this site would occur because dog use would be eliminated. Wildlife disturbance would no longer occur at Fort Miley.

Since dogs would be prohibited from this site, no impacts on wildlife species that use the coniferous community would occur from commercial dog walkers.

**Cumulative Impacts.** Under alternative B, the lack of impacts on wildlife from dogs at the Fort Miley was considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from projects described above combined with the negligible impacts from any development or construction actions and the lack of impacts on wildlife from alternative B would result in negligible cumulative impacts on wildlife.

**FORT MILEY ALTERNATIVE B CONCLUSION TABLE**

| <b>Other Coniferous Community Wildlife Impacts</b> | <b>Rationale</b>                     | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|--------------------------------------|---|-------------------------------|
| No impact, assuming compliance                     | Dogs would be prohibited at the site | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Under alternative C, on-leash dog walking would be allowed in a trail corridor created on the east side of East Fort Miley. In general, impacts would be limited to the existing trails and the 6-foot corridors immediately adjacent to both sides of the trail. The LOD area would include 6 feet in each direction from the edges of the trail. Impacts on wildlife in the LOD area would be long term, minor, and adverse; adjacent habitat used by wildlife would be affected by dogs through trampling, dog waste, and nutrient addition. Chasing after wildlife would be eliminated but on-leash dogs would still occasionally disturb wildlife behavior. Wildlife may avoid habitat that is degraded by the presence of dogs, and displacement to another location is an impact on wildlife. At Fort Miley, the long-term minor adverse impacts from the use of dogs in the LOD area would occur in a relatively small area when compared to the site as a whole. Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated, although on-leash dogs could still disturb wildlife through barking and their presence. The overall impact on wildlife from on-leash dog walking at Fort Miley would be negligible.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed up to three dogs with no permit required. Fort Miley is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking activity is not common at Fort Miley, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have a negligible impact on wildlife.

**Cumulative Impacts.** The negligible impacts on wildlife from dogs at Fort Miley under alternative C were considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from projects described above combined with the negligible impacts from any development or construction actions and the negligible impacts on wildlife from alternative C would result in negligible cumulative impacts on wildlife.

**FORT MILEY ALTERNATIVE C CONCLUSION TABLE**

| Other Coniferous Community Wildlife Impacts     | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs would still infrequently disturb wildlife behavior; wildlife may avoid areas that allow on-leash dog walking and be displaced from habitat that is degraded by the presence of dogs; this habitat and supporting wildlife constitutes a very small portion of entire site | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Under alternative D, dogs would not be allowed at this site. Therefore, no impacts on wildlife from dogs at this site would occur, because dog use would be eliminated. Wildlife disturbance would no longer occur at Fort Miley.

Since dogs would not be allowed on the trails at Fort Miley, there would be no impact from commercial dog walkers to wildlife.

Overall, no impact on wildlife would result from the new dog regulations under alternative D.

**Cumulative Impacts.** Under alternative D, the lack of impacts on wildlife from dogs at the Fort Miley was considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from projects described above combined with the negligible impacts from any development or construction actions and the lack of impacts on wildlife from alternative D would result in negligible cumulative impacts on wildlife.

**FORT MILEY ALTERNATIVE D CONCLUSION TABLE**

| Other Coniferous Community Wildlife Impacts | Rationale                            | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--------------------------------------|--|-------------------------------|
| No impact, assuming compliance              | Dogs would be prohibited at the site | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Under alternative E, on-leash dog walking would be allowed on the road in West Fort Miley. On-leash dog walking would also be allowed in the eastside trail corridor in East Fort Miley, adjacent to the coniferous community. In general, impacts would be limited to the 6-foot corridors immediately adjacent to the trails (LOD area). Leash requirements would reduce the probability that dogs would disturb birds (Lafferty 2001a, 1955, 1961) and chase and/or harass other wildlife, due to physical restraint on leash. However, the habitat in the LOD area would be affected by dogs through trampling, dog waste, and nutrient addition, resulting in long-term minor adverse impacts on wildlife in the LOD area. Wildlife in the LOD area would occasionally be affected by dogs. Wildlife may avoid and/or be displaced from high-quality habitat that is degraded by the presence of dogs. Because of mobility, wildlife can usually avoid areas with dogs present during peak activity or habituate to these activities, but the displacement of wildlife from habitat that is degraded by

the presence of dogs would indirectly affect wildlife. Therefore, in the LOD area, alternative E would result in long-term minor adverse impacts on wildlife using the coniferous community at Fort Miley.

At Fort Miley, the long-term minor adverse impacts from the use of dogs in the LOD area represents a relatively small area when compared to the site as a whole. Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated, although on-leash dogs could still disturb wildlife through barking and their presence. The overall impact on wildlife from on-leash dog walking at Fort Miley would be negligible.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed up to three dogs with no permit required. Fort Miley is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking activity is not common at Fort Miley, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have a negligible impact on wildlife.

**Cumulative Impacts.** The negligible impacts on wildlife from dogs at Fort Miley under alternative E were considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from projects described above combined with the negligible impacts from any development or construction actions and the impacts on wildlife from alternative E would result in negligible cumulative impacts on wildlife.

**FORT MILEY ALTERNATIVE E CONCLUSION TABLE**

| Other Coniferous Community Wildlife Impacts     | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs in on-leash areas would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs would still infrequently disturb wildlife behavior; wildlife may avoid trail corridors that allow on-leash dog walking and be displaced from habitat that is degraded by the presence of dogs; this habitat constitutes a very small portion of entire site; LOD area and ROLA areas are a small portion of the site | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative C: on-leash dog walking would be allowed in a trail corridor created on the east side of East Fort Miley. In general, impacts would be limited to the existing trails and the 6-foot corridors immediately adjacent to both sides of the trail. The LOD area would include 6 feet in each direction from the edges of the trail. Impacts on wildlife in the LOD area would be long term, minor, and adverse; adjacent habitat used by wildlife would be affected by dogs through trampling, dog waste, and nutrient addition. Chasing after wildlife would be eliminated but on-leash dogs would still occasionally disturb wildlife behavior. Wildlife may avoid habitat that is degraded by the presence of dogs, and displacement to another location is an impact on wildlife.

## Chapter 4: Environmental Consequences

All dog walkers, including commercial dog walkers, would be allowed up to three dogs with no permit required. Fort Miley is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking activity is not common at Fort Miley, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have a negligible impact on wildlife.

At Fort Miley, the long-term minor adverse impacts from the use of dogs in the LOD area would occur in a relatively small area when compared to the site as a whole. Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated, although on-leash dogs could still disturb wildlife through barking and their presence. The overall impact on wildlife from on-leash dog walking at Fort Miley would be negligible.

**Cumulative Impacts.** The negligible impacts on wildlife from dogs at Fort Miley under the preferred alternative were considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from projects described above combined with the negligible impacts from any development or construction actions and the negligible impacts on wildlife from the preferred alternative would result in negligible cumulative impacts on wildlife.

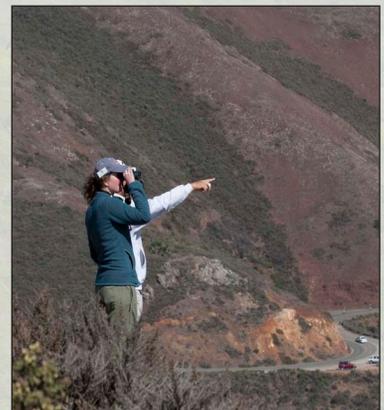

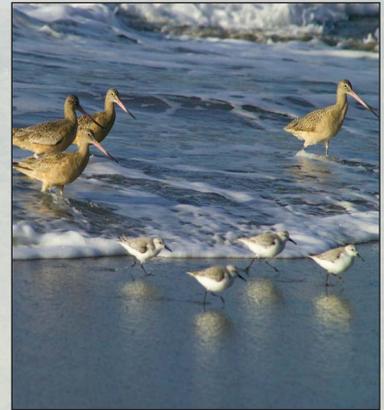

**FORT MILEY PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| Other Coniferous Community Wildlife Impacts     | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs on leash would protect habitat off trail as well as wildlife; chasing after wildlife would be eliminated but on-leash dogs would still infrequently disturb wildlife behavior; wildlife may avoid areas that allow on-leash dog walking and be displaced from habitat that is degraded by the presence of dogs; this habitat and supporting wildlife constitutes a very small portion of entire site | Beneficial, assuming compliance              | Negligible cumulative impacts |

# Golden Gate National Recreation Area California

Draft Dog Management Plan /  
Supplemental Environmental Impact Statement

## SPECIAL-STATUS SPECIES

As stated previously in chapter 3, special-status species are plants and animals that are legally protected under the state and federal ESA of 1973 or other regulations, and species that are considered sufficiently rare by the scientific community to qualify for such status. Additional federal regulations protect endangered and threatened wildlife species, including the *Fish and Wildlife Coordination Act* of 1934 (as amended), the *Bald and Golden Eagle Protection Act*, the *Marine Mammal Protection Act*, and the *Migratory Bird Treaty Act*. These acts are discussed in more detail in the paragraphs that follow. The California ESA (administered by the Department of Fish and Wildlife) does not supersede the federal ESA, but operates in conjunction with it to provide additional protection to threatened and endangered species in California, as well as species that are not protected through federal regulations. In addition to threatened and endangered state-listed species, the Department of Fish and Wildlife maintains an informal list of plant and wildlife species of special concern because of population declines and restricted distributions, and/or because they are associated with habitats that are declining in California. The CNPS has also developed lists of plants of special concern in California. Although federal agencies are not required to comply with the California Fish and Game Code, the NPS makes every reasonable effort to conduct its actions in a manner consistent with relevant state laws and regulations. In this section, impacts on federally and state-listed threatened and endangered species as well as candidate species are analyzed. Due to the extensive numbers of additional plant and wildlife species included on lists produced by the CNPS and the California Department of Fish and Wildlife, impacts on these species are analyzed in the “Vegetation” and “Wildlife” sections. However, these species are still given equal consideration for analysis in this draft plan/SEIS compared to federally and state-listed species discussed in this section. Federally and state-listed plant species are discussed in the following sections when the listed species or potential habitat exists at specific GGNRA sites in areas that allow dogs. Although habitats at GGNRA support many special-status species, only those species potentially affected by this draft plan/SEIS are discussed in this section. Additionally, any impacts on designated critical habitat are also evaluated in this section.

This section provides an overview of the guiding policies and regulations, describes the study area, includes a definition of duration, details the assessment methodology, and defines the impact thresholds for special-status species. This section then provides a detailed, species-specific impact analysis for each alternative and each site in the alternative. It is important to note that only those federally and state-listed species that are present and affected by this project are included in the discussions of this section.

## GUIDING POLICIES AND REGULATIONS

### Federal Laws and Regulations

***Endangered Species Act.*** The USFWS and National Oceanic and Atmospheric Association (NOAA) Fisheries have jurisdiction over species formally listed as threatened or endangered under the ESA (16 USC 1531–1544). The USFWS has interpreted the definition of “harm” to include significant habitat modification. An activity may be defined as a take even if it is unintentional or accidental. An endangered species is one that is considered in danger of becoming extinct throughout all or a significant portion of its range. A threatened species is one that is likely to become endangered in the foreseeable future. In addition to endangered and threatened species, which are legally protected under the ESA, there are lists of candidate species for which the USFWS currently has enough information to support a proposal for listing as threatened or endangered species.

Section 7 of the ESA outlines procedures for federal interagency cooperation to conserve federally listed species and designated critical habitat. The NPS is required to consult with USFWS or NOAA Fisheries

## Chapter 4: Environmental Consequences

to ensure that they are not undertaking, funding, permitting, or authorizing actions likely to jeopardize the continued existence of listed species. This consultation may be either informal or formal consultation. Under a formal consultation, either USFWS or NOAA Fisheries issues a biological opinion. The biological opinion generally authorizes some level of incidental take and details the reasonable and prudent measures that the action agency needs to implement to ensure that critical habitat is not destroyed or degraded and that a listed species is not jeopardized by the federal action. Section 9 of the ESA prohibits the “take” of federally listed species, which is broadly defined as “to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or attempt to engage in any such conduct.”

***Migratory Bird Treaty Act.*** The *Migratory Bird Treaty Act*, which was first enacted in 1918, implements a series of treaties between the United States and Great Britain (on behalf of Canada), Mexico, Japan, and Russia, which provide for international migratory bird protection and authorize the Secretary of the Interior to regulate the take of migratory birds. There is a list of bird species that are protected by the *Migratory Bird Treaty Act*. The act makes it unlawful, except as allowed by regulations, “at any time, by any means, or in any manner, to pursue, take, or kill any migratory bird, or any part, nest, or egg of any such bird, included in the terms of conventions” with certain other countries (16 USC 703). This includes direct and indirect acts, although harassment and habitat modification are not included unless they result in the direct loss of birds, nests, or eggs. All the bird species at GGNRA discussed in chapter 3 are protected under the *Migratory Bird Treaty Act*, with the exception of starlings, pigeons, crows, and game birds.

**Executive Order 13186—Responsibilities of Federal Agencies to Protect Migratory Birds.** This executive order directs executive departments and agencies to take certain actions to further implement the *Migratory Bird Treaty Act*. This executive order creates a more comprehensive strategy for the conservation of migratory birds by the federal government, and fulfills the government’s duty to lead in the protection of this international resource. This executive order also provides a specific framework for the federal government’s compliance with its treaty obligations to Canada, Mexico, Russia, and Japan and provides broad guidelines on conservation responsibilities and requires the development of more detailed guidance in memoranda of understanding. For example, the executive order aids in incorporating national planning for bird conservation into agency programs and provides the formal presidential guidance necessary for agencies to incorporate migratory bird conservation more fully into their programs.

***Marine Mammal Protection Act.*** The *Marine Mammal Protection Act*, which was most recently reauthorized in 1994 (16 USC 1361 et seq.), establishes a moratorium, with certain exceptions, on the take of marine mammals in U.S. waters. The term “take” is statutorily defined as “to harass, hunt, capture, or kill, or attempt to harass, hunt, capture, or kill any marine mammal.” “Harassment” is defined under the 1994 amendments as any act of pursuit, torment, or annoyance that has the potential to injure a marine mammal in the wild, or has the potential to disturb a marine mammal in the wild by causing disruption to behavioral patterns, including but not limited to migration, breathing, nursing, breeding, feeding, or sheltering. All the marine mammal species at GGNRA discussed in chapter 3 are protected under the *Marine Mammal Protection Act*.

***Magnuson-Stevens Fishery Management and Conservation Act.*** The *Magnuson-Stevens Fishery Conservation and Management Act*, as amended by the Sustainable Fisheries Act of 1996 (Public Law 104-267), requires all federal agencies to consult with NOAA Fisheries on all actions or proposed actions allowed, funded, or undertaken by the agency that may adversely affect essential fish habitat. Essential fish habitat is defined as “those waters and substrate necessary to fish for spawning, breeding, feeding, or growth to maturity.” Waters include aquatic areas and their associated physical, chemical, and biological properties. Substrate includes sediment underlying the waters. Necessary means the habitat required to support a sustainable fishery and the managed species’ contribution to a healthy ecosystem.

## NPS Natural Resource Policies and Guidelines

The NPS has developed specific guidelines for the management of natural resources (NPS 1991). The guidelines provide for the management of native and non-native plant and animal species. The *Natural Resource Reference Manual #77*, offers comprehensive guidance for NPS employees responsible for managing, conserving, and protecting the natural resources found in national park system units. This manual replaces the NPS-77 *The Natural Resource Management Guideline*, issued in 1991 under previous guideline series. To date, 16 of the 42 sections of NPS-77 have been revised.

The NPS *Management Policies 2006* direct park managers to preserve natural resources, processes, systems, and values of park units in an unimpaired condition to perpetuate their inherent integrity and to provide present and future generations with the opportunity to enjoy them (NPS 2006a, Section 4.1). Additionally, the *Organic Act* of 1916 (16 USC 1) commits the NPS to making informed decisions that perpetuate the conservation and protection of park resources unimpaired for the benefit and enjoyment of future generations, as described in detail in chapter 1.

## State Laws and Regulations

**California Endangered Species Act.** Pursuant to the California ESA, which is administered by the California Department of Fish and Wildlife, state-listed threatened or endangered species are protected from any take (California Code of Regulations, title 14, Sections 670.2 and 670.5; California ESA, Section 2080). The state ESA is similar to the federal ESA both in process and substance; it is intended to provide additional protection to threatened and endangered species in California. The California ESA does not supersede the federal ESA, but operates in conjunction with it. Species may be listed as threatened or endangered under both acts (in which case the provisions of both state and federal laws apply) or under only one act (Mueller 1994). The take of state-listed species incidental to otherwise lawful activities requires an incidental take permit.

**California Native Plant Protection Act.** In addition to the California ESA, the *California Native Plant Protection Act* provides protection to endangered and rare plant species, subspecies, and varieties of wild native plants in California. The definitions of “endangered” and “rare” closely parallel the definitions of “endangered” and “threatened” plant species in the California ESA. The *California Native Plant Protection Act* lists are used by both the California Department of Fish and Wildlife and the USFWS when considering formal species protection under the ESA and the California ESA. The CNPS has created five lists in an effort to categorize degrees of concern: List 1A (Plants Presumed Extinct in California), List 1B (Plants Rare, Threatened, or Endangered in California and Elsewhere), List 2 (Plants Rare, Threatened, or Endangered in California, But More Common Elsewhere), List 3 (Plants about Which We Need More Information: A Review List), and List 4 (Plants of Limited Distribution: A Watch List). The California Department of Fish and Wildlife considers all plants listed by the CNPS as “special plants” and recommends that impacts on plants on lists 1 and 2 be considered during project analysis.

**California Fish and Game Code, Protection of Birds.** The California Fish and Game Code states that it is unlawful to take, possess, or needlessly destroy the nest or eggs of any bird (Section 3503). Specifically, it is unlawful to take, possess, or destroy any raptors (i.e., eagles, hawks, owls, and falcons), including their nests or eggs (Section 3503.5). The code adopts the provisions of the *Migratory Bird Treaty Act* and states that it is unlawful to take or possess any designated migratory nongame bird or any part of such migratory nongame bird (Section 3513). The state code offers no statutory or regulatory mechanism for obtaining an incidental take permit for the loss of nongame migratory birds. Typical violations include destruction of active nests resulting from removal of vegetation in which the nests are located. Violation of the code could also include failure of active raptor nests resulting from disturbance of nesting pairs by nearby project construction.

## **Chapter 4: Environmental Consequences**

### **Informal Species Designations**

Both the federal and state governments maintain lists of species that are not legally protected but are species that may be rare enough to qualify for listing under the respective ESAs. In addition, the CNPS maintains a list of species in California that are considered rare or endangered according to their criteria and the California Department of Fish and Wildlife maintains an informal list of plant and wildlife species of special concern because of population declines and restricted distributions, and/or because they are associated with habitats that are declining in California. The species listed by these agencies are defined as other species of interest and require consideration by the NPS when management actions are taken to ensure that actions do not harm the species or their habitats. Impacts associated with other species of interest at GGNRA are described in the “Vegetation” and “Wildlife” sections of chapter 4.

### **STUDY AREA**

The geographic study area for special-status species includes the individual sites of GGNRA under consideration for this draft plan/SEIS that could be impacted by dog management activities. There are 22 individual sites relevant to this project, which have been previously described in detail in chapter 3.

### **DURATION OF IMPACT**

Duration describes the length of time an effect would occur, either short term or long term. Long term impacts to special-status species are described as those persisting for the life of the plan/EIS (the next 20 years). After the implementation of the plan, a 1- to 3-month period of public education would occur to implement the proposed action followed by a 1- to 3-month period testing the monitoring-based management strategy. At the beginning of the education and enforcement period, short-term impacts on all natural resources would occur, regardless of the alternative chosen. During this period, impacts on special-status species would be similar to the current conditions and would be short-term. Following the education period, monitoring for compliance would begin and it is expected that compliance with the dog walking regulations and associated adverse impacts would improve gradually and the impacts on special-status species would then become long term, as described below for each alternative.

### **ASSESSMENT METHODOLOGY**

The impact analysis for special-status species includes qualifying habitat types that would be lost or restored, and discussing other potential direct and indirect effects. For the purposes of this document, special-status species addressed in this section include federally and state-listed threatened and endangered species and candidate species as described in the following paragraphs. Impacts on designated critical habitat are also evaluated. Habitat loss or restoration is based on an analysis of vegetation changes. Potential impacts that could occur beyond the limit of direct project disturbance, including those that may not be related to habitat loss, are discussed on a qualitative basis.

The information in this analysis is obtained through best professional judgment of park staff, experts in the field, recovery plans and actions for listed species, ongoing data collection for other projects, and other supporting literature (as cited in the text). NPS observations and anecdotal evidence at GGNRA are also included and described by site, when available. Impacts on special-status species were assessed in terms of changes in the amount and connectivity of special-status species habitat, integrity of the habitat (including past disturbance) and populations, and the potential for increased/decreased disturbance and number of individuals. The park would adhere to any additional measures required by a biological opinion issued by the USFWS (if applicable and in accordance with Section 7 of the ESA) beyond those described in this document. For all listed species, proposed actions would be conducted under the terms and conditions of the biological opinion issued by the USFWS and NOAA Fisheries.

## SPECIAL-STATUS SPECIES IMPACT THRESHOLDS

The following impact thresholds were established to determine the magnitude of effects on special-status species and their associated habitat (including designated critical habitat) that would result from implementation of the various alternatives being considered. Primary steps in assessing impacts on special-status species were taken to determine:

- which species and supporting habitat are found in areas likely to be affected by dog management described in the alternatives;
- any habitat loss or alteration caused by the alternatives; and
- the displacement and/or disturbance potential of the actions, as well as the potential for the species and suitable or supporting habitat to be affected by the alternatives.

### Intensity of Impact

Intensity describes the degree of the effect on special-status species; federally and state-listed threatened and endangered species are addressed together in this section. The intensity of impact is species-specific and related to population size and distribution in the park and regionally. The environmental consequences for federal threatened and endangered species are described in a way that meets the requirements of the NEPA and the ESA. Definitions for impact conclusions required for Section 7 ESA consultation are presented below:

|  |  |
|--|--|
| <i>No effect:</i>  | A proposed action would not affect a federally listed species, candidate species, or designated critical habitat.  |
| <i>May affect, not likely to adversely affect:</i>   | Effects on federally listed or candidate species would be discountable (i.e., extremely unlikely to occur and not able to be meaningfully measured, detected, or evaluated) or would be beneficial.  |
| <i>May affect, likely to adversely affect:</i>   | Adverse effects on a federally listed or candidate species may occur as a direct or indirect result of proposed actions and the effects would be either not discountable or not beneficial.  |
| <i>Likely to jeopardize proposed species or adversely modify proposed critical habitat (impairment):</i> | The appropriate conclusion when the NPS or the USFWS identifies situations in which the proposal could jeopardize the continued existence of a federally listed or candidate species or adversely modify critical habitat for a species within or outside park boundaries. |

Impacts were determined by examining the potential effects of dog walking activities on special-status species, their habitats, or the natural processes sustaining them as well as responses to disturbance by dogs. For the action alternatives, on-leash dog walking impacts were based on an allowed 6-foot dog leash. Since dog walkers may walk along the edge of the fire road or trails, dogs would then have access to the adjacent land 6 feet in all directions, resulting in a LOD area for special-status species and their habitat that would extend 6 feet out from the edges of the fire road or trails. The intensity of each adverse impact is judged as having a minor, moderate, or major effect. A beneficial impact would be a positive change for special-status species. Negligible impacts are neither adverse nor beneficial, nor long term or short term. No impact on special-status species may also be applicable for some alternatives and sites if dogs are prohibited; for federally listed species, this impact intensity would equate to a determination of “no effect.” The following impact threshold definitions are used to describe the severity and magnitude of

## Chapter 4: Environmental Consequences

changes to federally and state-listed species under each of the alternatives. Each threshold definition references the ESA determinations described above, where applicable.

- Beneficial* A beneficial impact is a beneficial change from the current conditions and is a relative indicator of progress compared to the no-action alternative. In general, a beneficial impact would be an increase in the viability of the species if species-limiting factors (e.g., habitat loss, competition, and mortality) are reduced and if species resilience is enhanced through improving habitat integrity. For federally listed species, this impact intensity would equate to a determination of “may affect, not likely to adversely affect.”
- Negligible* Impacts would result in no measurable or perceptible changes in individuals of a species or its habitat (including critical habitat as designated under the ESA). For federally listed species, this impact intensity would equate to a determination of “may affect, not likely to adversely affect.”
- Adverse* **Minor.** Impacts would result in measurable or perceptible changes in individuals of a species or its habitat, but would be localized in a relatively small area. The reproductive success of individuals of a species would not be affected. Adverse impacts may include occasional disturbance to individuals or avoidance of certain areas, although essential features of critical habitat would not be impacted. For federally listed species, this impact intensity would equate to a determination of “may affect, likely to adversely affect.”
- Moderate.** Impacts would result in measurable and/or consequential changes in individuals of a species or its habitat; however, the impact would remain relatively localized. The reproductive success of individuals of a species would be affected, but the species itself would not be permanently lost. Adverse impacts may include frequent disturbance or avoidance of certain areas or injury or mortality of individuals, but the long-term viability of the species would be maintained. Essential features of critical habitat may be impacted. For federally listed species, this impact intensity would equate to a determination of “may affect, likely to adversely affect.”
- Major.** Impacts would result in measurable and/or consequential changes to a large number of individuals of a species or a large area of its habitat. These changes would be substantial, highly noticeable, and permanent, occurring over a widespread geographic area, resulting in a loss of species viability. Adverse impacts may include frequent and repeated disturbance or injury or mortality of individuals to the point that the long-term viability of the species would be compromised. Essential features of critical habitat would be impacted. In extreme adverse cases, effects would be irreversible and the species may be extirpated from the park. For federally listed species, this impact intensity would equate to a determination of “likely to jeopardize proposed species or adversely modify proposed critical habitat (impairment).”

It is important to note that dogs are viewed as a contributing factor to impacts associated with special-status species and the total elimination of dogs in the park would still leave disturbance effects on special-status species by other factors, such as visitors without dogs who would continue to visit the park and use the trails/roads. Disturbance by visitors and their activities (including associated equipment) as well as by dogs has been occurring and currently occurs in GGNRA as an existing condition. However, on a relative

scale, visitors with dogs could impact special-status species to a greater extent than visitors without dogs. The impacts analysis describes species-specific impacts on special-status species by alternative and site.

### **CUMULATIVE SPECIAL-STATUS SPECIES IMPACTS COMMON TO ALL ALTERNATIVES**

The impacts analysis, which describes species-specific impacts on special-status species by alternative and site, is followed by a discussion of cumulative impacts as a result of each alternative and site. Generally, past actions that have influenced special-status species at GGNRA are urban development and loss of habitat continuity, the establishment of and overall dominance by non-native plant species, and fire suppression. Other ongoing programs being completed both in the park and on private lands and lands managed by other agencies adjacent to GGNRA-managed lands in the park are considered in the cumulative impacts discussion for each species.

### **FEDERALLY AND STATE-LISTED WILDLIFE SPECIES**

At GGNRA, for new and/or pending properties recently acquired by the park (Cattle Hill and Pedro Point Headlands), inventorying of listed and unique wildlife species is currently ongoing. Therefore, potential habitat is identified at these sites because site-specific information concerning listed plant species at these locations was relatively unknown at the time of this document's publication.

### **IMPACTS TO SAN BRUNO ELFIN BUTTERFLY (FEDERALLY ENDANGERED) BY SITE AND ALTERNATIVE**

The larval host plant for the San Bruno elfin butterfly is sedum, a succulent plant that grows on rocky north-facing slopes along the coast (coastal scrub) (Newby 2000). San Bruno elfin butterflies are closely tied to sedum host plants, where they lay their eggs and where larvae develop; the adults emerge for only a short period. Existing San Bruno elfin butterfly populations occur in known colonies of sedum only at Milagra Ridge, on rocky outcrops that are relatively inaccessible to people and dogs (NPS 2005c).

#### **Milagra Ridge**

**Alternative A: No Action.** Dogs are currently allowed on leash on all trails and the fire road at Milagra Ridge. Both the road and the trails traverse habitat that could support the host sedum species of the San Bruno elfin butterfly at rocky outcrops in coastal scrub habitat at this site. This site has documented moderate visitor use and leash law violations totaled 35 from 2008 through 2011 (table 27). Because the population of the San Bruno elfin butterfly is small and isolated, it is potentially susceptible to threats and stochastic events (random or rare), but such events are unlikely due to the relative inaccessibility of the habitat that supports this species in relation to trails at Milagra Ridge. Historical use of this area shows no indication that either the host plant or the butterfly is being affected by dogs on the trails and roads.

Therefore, alternative A would result in negligible impacts on the San Bruno elfin butterfly because no measurable or perceptible change in the population or habitat of the San Bruno elfin butterfly would be expected from this alternative. Impacts would be localized and could constitute a permanent loss if San Bruno elfin butterfly eggs or larvae are present on vegetation in or along a trail that is disturbed by dogs. However, it is unlikely that direct impacts on individuals of this butterfly would occur from dogs as a result of this alternative because of the relative inaccessibility of the habitat in relation to trails and because dogs are required to be on leash for alternative A.

Under alternative A, no permit system exists for dog walking. At Milagra Ridge, commercial dog walking is uncommon; therefore, commercial dog walking would have negligible impacts on the San Bruno elfin butterfly.

## Chapter 4: Environmental Consequences

**Cumulative Impacts.** Projects and actions in and near Milagra Ridge were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs would have the potential to affect the San Bruno elfin butterfly and its habitat in San Mateo County. Since San Bruno elfin butterfly habitat in the park is mapped and monitored on a regular basis, the habitat would be considered and avoided during in-park projects and operations, particularly since it occurs primarily in relatively inaccessible patches on rocky outcrops at Milagra Ridge. Other ongoing programs, including non-native plant removal projects in the park as well as Wildland/Urban Interface Initiative projects on adjacent parklands, may result in beneficial effects by preventing non-native vegetation from displacing San Bruno elfin butterfly habitat. The objective of the *San Bruno Elfin and Mission Blue Butterflies Recovery Plan* (USFWS 1984) is to protect, maintain, and enhance existing populations of the two endangered butterfly species; therefore, this plan should provide beneficial effects to the San Bruno elfin butterfly. Additionally, the site management plan for Milagra Ridge includes a statement to protect and enhance the habitat of the mission blue butterfly in coordination with GGNRA (NPS) and USFWS. Although habitat restoration as a result of the plans mentioned above has focused on the mission blue butterfly, the plans should both provide beneficial effects to the San Bruno elfin butterfly as well, through protection of existing butterfly habitat.

The negligible impacts on the San Bruno elfin butterfly under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from the habitat restoration projects combined with the negligible impacts from alternative A would result in negligible cumulative impacts on the San Bruno elfin butterfly.

**MILAGRA RIDGE ALTERNATIVE A CONCLUSION TABLE**

| San Bruno Elfin Butterfly Impacts | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|-----------------------------------|--|--|-------------------------------|
| Negligible impacts                | It is unlikely that direct impacts on individuals of this butterfly species would occur from dogs because of the relative inaccessibility of the habitat in relation to trails and because dogs would be required to be on leash | N/A  | Negligible cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking on the fire road and the trail to the westernmost overlook and WW II bunker, as well as on the future Milagra Battery Trail, similar to alternative A. However, the trail to the top of the hill would not be open for dog walking in this alternative. In general, impacts on the San Bruno elfin butterfly would be limited to the existing fire road and trails and the 6-foot corridor immediately adjacent to the trails/fire roads. Because the host plants are not located along the trails and due to the relative inaccessibility of the sedum host plants in relation to trails, negligible impacts on the butterfly in areas adjacent to the trail (6-foot corridor or LOD area) would occur, but impacts on the habitat would not be detectable or measurable.

Overall, assuming compliance with the leash regulation, negligible impacts on the San Bruno elfin butterfly would occur in the Milagra Ridge site. Impacts would be localized and could constitute a permanent loss if San Bruno elfin butterfly eggs or larvae are present on vegetation in or along a trail that is disturbed by dogs. However, it is unlikely that direct impacts on individuals of this butterfly species would occur from dogs as a result of any of the alternatives because of the relative inaccessibility of the habitat in relation to trails and because dogs would be required to be on leash for alternative B.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is uncommon at Milagra Ridge, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have a negligible impact on the San Bruno elfin butterfly.

**Cumulative Impacts.** The negligible impacts on the San Bruno elfin butterfly under alternative B were considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the habitat restoration projects combined with the negligible impacts from alternative B would result in negligible cumulative impacts on the San Bruno elfin butterfly.

**MILAGRA RIDGE ALTERNATIVE B CONCLUSION TABLE**

| San Bruno Elfin Butterfly Impacts               | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Overall negligible impacts, assuming compliance | It is unlikely that direct impacts on individuals of this butterfly species would occur from dogs because of the relative inaccessibility of the habitat in relation to trails and because dogs would be required to be on leash | No change, assuming compliance               | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would allow on-leash dog walking in the same areas as alternative B, and impacts would be the same, assuming compliance: negligible in the LOD area and overall.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Milagra Ridge is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at Milagra Ridge, it is likely that commercial dog walkers would have no impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on the San Bruno elfin butterfly.

**Cumulative Impacts.** The negligible impacts on the San Bruno elfin butterfly under alternative C were considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the habitat restoration projects combined with the negligible impacts from alternative C would result in negligible cumulative impacts on the San Bruno elfin butterfly.

**MILAGRA RIDGE ALTERNATIVE C CONCLUSION TABLE**

| San Bruno Elfin Butterfly Impacts               | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Overall negligible impacts, assuming compliance | It is unlikely that direct impacts on individuals of this butterfly species would occur from dogs because of the relative inaccessibility of the habitat in relation to trails and because dogs would be required to be on leash | No change, assuming compliance               | Negligible cumulative impacts |

## Chapter 4: Environmental Consequences

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Alternative D would not allow dogs at this site, thereby protecting any preferred habitat along the fire road and trails; therefore, this alternative would result in no impact on the San Bruno elfin butterfly.

Since dogs would not be allowed at Milagra Ridge, there would be no impact from commercial dog walkers on the San Bruno elfin butterfly.

**Cumulative Impacts.** The lack of impacts on the San Bruno elfin butterfly under alternative D was considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the habitat restoration projects combined with the lack of impacts from alternative D would result in negligible cumulative impacts on the San Bruno elfin butterfly.

**MILAGRA RIDGE ALTERNATIVE D CONCLUSION TABLE**

| San Bruno Elfin Butterfly Impacts | Rationale                            | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|-----------------------------------|--------------------------------------|--|-------------------------------|
| No impact, assuming compliance    | Dogs would be prohibited at the site | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would allow on-leash dog walking on the same trails as alternative B, with the addition of a trail to the top of the hill; even with that addition, impacts would be the same as alternative B, assuming compliance: negligible in the LOD area and overall.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Milagra Ridge is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at Milagra Ridge, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on the San Bruno elfin butterfly.

**Cumulative Impacts.** The negligible impacts on the San Bruno elfin butterfly under alternative E were considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the habitat restoration projects combined with the negligible impacts from alternative E would result in negligible cumulative impacts on the San Bruno elfin butterfly.

**MILAGRA RIDGE ALTERNATIVE E CONCLUSION TABLE**

| San Bruno Elfin Butterfly Impacts               | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Overall negligible impacts, assuming compliance | It is unlikely that direct impacts on individuals of this butterfly species would occur from dogs because of the relative inaccessibility of the habitat in relation to trails and because dogs would be required to be on leash | No change, assuming compliance               | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative B, allowing on-leash dog walking on the fire road and the trail to the westernmost overlook and WW II bunker, as well as on the future Milagra Battery Trail. However, the trail to the top of the hill would not be open to

dog walking in this alternative. In general, impacts on the San Bruno elfin butterfly would be limited to the existing fire road and trails and the 6-foot corridor immediately adjacent to the trails/fire roads. Because the host plants are not located along the trails and due to the relative inaccessibility of the sedum host plants in relation to trails, negligible impacts on the butterfly in areas adjacent to the trail (6-foot corridor or LOD area) would occur, but impacts on the habitat would not be detectable or measurable.

Overall, assuming compliance with the leash regulation, negligible impacts on the San Bruno elfin butterfly would occur in the Milagra Ridge site. Impacts would be localized and could constitute a permanent loss if San Bruno elfin butterfly eggs or larvae are present on vegetation in or along a trail that is disturbed by dogs. However, it is unlikely that direct impacts on individuals of this butterfly species would occur from dogs as a result of any of the alternatives because of the relative inaccessibility of the habitat in relation to trails and because dogs would be required to be on leash for the preferred alternative.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Milagra Ridge is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at Milagra Ridge, it is likely that commercial dog walkers would have no impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have negligible impacts on the San Bruno elfin butterfly.

**Cumulative Impacts.** Projects and actions in and near Milagra Ridge were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs would have the potential to affect the San Bruno elfin butterfly and its habitat in San Mateo County. Since San Bruno elfin butterfly habitat in the park is mapped and monitored on a regular basis, the habitat would be considered and avoided during in-park projects and operations, particularly since it occurs primarily in relatively inaccessible patches on rocky outcrops at Milagra Ridge. Other ongoing programs, including non-native plant removal projects in the park as well as Wildland/Urban Interface Initiative projects on adjacent parklands, may result in beneficial effects by preventing non-native vegetation from displacing San Bruno elfin butterfly habitat. The objective of the *San Bruno Elfin and Mission Blue Butterflies Recovery Plan* (USFWS 1984) is to protect, maintain, and enhance existing populations of the two endangered butterfly species; therefore, this plan should provide beneficial effects to the San Bruno elfin butterfly. Additionally, the site management plan for Milagra Ridge includes a statement to protect and enhance the habitat of the mission blue butterfly in coordination with GGNRA (NPS) and USFWS. Although habitat restoration as a result of the plans mentioned above has focused on the mission blue butterfly, the plans should both provide beneficial effects to the San Bruno elfin butterfly as well, through protection of existing butterfly habitat.

The negligible impacts on the San Bruno elfin butterfly under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from the habitat restoration projects combined with the negligible impacts from the preferred alternative would result in negligible cumulative impacts on the San Bruno elfin butterfly.

MILAGRA RIDGE PREFERRED ALTERNATIVE F CONCLUSION TABLE

| San Bruno Elfin Butterfly Impacts               | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Overall negligible impacts, assuming compliance | It is unlikely that direct impacts on individuals of this butterfly species would occur from dogs because of the relative inaccessibility of the habitat in relation to trails and because dogs would be required to be on leash | No change, assuming compliance               | Negligible cumulative impacts |

### Rancho Corral de Tierra

**Alternative A: No Action.** Dogs are currently allowed on leash at Rancho Corral de Tierra. Staff regularly working at Rancho characterize use by dog walkers as low to moderate, and compliance with the leash law is generally low. Although occurrences of the species have been noted at the site, these occurrences have not been confirmed. Suitable habitat for the San Bruno elfin butterfly is found in areas that either support or could support the host sedum species of the San Bruno elfin butterfly at rocky outcrops in coastal scrub habitat at this site near the Alta Vista Trail. Suitable breeding habitat has been identified at all known stonecrop locations, including sites near Montara Mountain in rocky outcrops (URS Corporation 2010, 34 and figure 8).

As noted above, Rancho has documented low to moderate visitor use and a low level of leash law compliance. According to information from the Montara Dog Group and subsequent staff observations, dog walkers, particularly off-leash dog walkers, primarily use the lower elevations of the site at both the Montara and El Granada areas. The terrain at El Granada is particularly steep and challenging, thus dog walking use in that area appears to be concentrated mostly in the lower elevations. Although the Montara area is less steep, visitor use there is similarly concentrated in the lower elevations, but some dog walkers in the Montara area do use trails that connect to the top of the Rancho site. Because the suitable habitat for San Bruno elfin butterfly is isolated and remote in the uplands portion of the site, it is unlikely that dogs or visitors would access suitable habitat or butterflies, if present. Additionally, much of the dog walking currently occurs in the Montara portion of the site, which does not contain habitat for the San Bruno elfin butterfly. Therefore, alternative A would result in negligible impacts on the San Bruno elfin butterfly because no measurable or perceptible change in the population or habitat of the San Bruno elfin butterfly would be expected from this alternative. Impacts would be localized and could constitute a permanent loss if San Bruno elfin butterfly eggs or larvae are present on vegetation in areas that are disturbed by dogs. However, it is unlikely that direct impacts on individuals of this butterfly or suitable habitat would occur from dogs as a result of this alternative because of the relative remoteness of the habitat at the site.

No permit system exists for dog walking under alternative A. Commercial dog walkers have begun to use the El Granada area off of Coral Reef Avenue; however, commercial dog walking is considered a low use at the site overall. Therefore, commercial dog walking would have negligible impacts on the San Bruno elfin butterfly at this site.

**Cumulative Impacts.** Projects and actions in and near Rancho Corral de Tierra were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the San Bruno elfin butterfly at or in the vicinity of this site. Since the Rancho Corral de Tierra site has been transferred to the NPS, general protection of the site and associated natural resources has occurred and will continue, although some impacts may remain from prior unregulated off-leash dog walking.

The primary objective of the *San Bruno Elfin and Mission Blue Butterflies Recovery Plan* (USFWS 1984) is to protect, maintain, and enhance existing populations of the two endangered butterfly species. Management activities described in the plan that will benefit the San Bruno elfin butterfly include protecting essential habitat outside targeted park locations through cooperative agreements with adjacent landowners and negotiating conservation easements or similar land conservation agreements (USFWS 1984). Other ongoing programs, including non-native plant removal projects in the park as well as Wildland/Urban Interface Initiative projects on adjacent parklands, may result in beneficial effects by preventing non-native vegetation from displacing San Bruno elfin butterfly habitat.

Since the Rancho Corral de Tierra site has been transferred to NPS, general maintenance and protection of the site and associated natural resources has occurred and will continue, but there are currently no plans to restore host plants for the San Bruno elfin butterfly at Rancho. . The effects from future construction projects, maintenance operations, and other agency projects on San Bruno elfin butterfly habitat may be adverse, but these actions have not yet been identified and are currently unknown and would likely require mitigation.

The negligible impacts on the San Bruno elfin butterfly from dogs at Rancho Corral de Tierra under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from the habitat restoration and protection projects combined with the negligible impacts on the San Bruno elfin butterfly would result in negligible cumulative impacts on this butterfly species.

**RANCHO CORRAL DE TIERRA ALTERNATIVE A CONCLUSION TABLE**

| San Bruno Elfin Butterfly Impacts | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|-----------------------------------|--|--|-------------------------------|
| Negligible impacts                | It is unlikely that impacts on individuals of this butterfly species or habitat would occur from dogs because of the relative inaccessibility of the habitat at the site | N/A  | Negligible cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** On-leash dog walking would be allowed on designated trails in two areas open to dog walking near Montara and El Granada, which were identified by the local dog walking group as key areas for this use. The mapped occurrences and host plants for the San Bruno elfin butterfly are not found within the vicinity of designated trails under alternative B. Because habitat is located away from dog walking trails and is relatively remote, there would be no impacts on the San Bruno elfin butterfly from on-leash dog walking, assuming compliance.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Currently, commercial dog walking use is low at Rancho Corral de Tierra and dog walking trails are located away from San Bruno elfin butterfly habitat; therefore, commercial dog walking would have no impacts on the San Bruno elfin butterfly.

**Cumulative Impacts.** The lack of impacts on the San Bruno elfin butterfly habitat from dogs at Rancho Corral de Tierra under alternative B was considered together with the effects of the projects mentioned under alternative A. The anticipated beneficial effects from habitat restoration projects combined with the lack of impacts on the San Bruno elfin butterfly would result in beneficial cumulative impacts.

**Chapter 4: Environmental Consequences**

**RANCHO CORRAL DE TIERRA ALTERNATIVE B CONCLUSION TABLE**

| <b>San Bruno Elfin Butterfly Impacts</b> | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|--|---|-------------------------------|
| No impact, assuming compliance           | Butterfly habitat is remote, and located away from dog walking trails. | Beneficial, assuming compliance                     | Beneficial cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Under alternative C, on-leash dog walking would be allowed on the same trails as alternative B within two areas currently open to dog walking at Rancho Corral de Tierra in the Montara and El Granada areas. A ROLA is also proposed under alternative C in the Montara area between Le Conte Street and Tamarind Street, in an open grassy area near the Farallone View School. The proposed trails and ROLA are not located within the vicinity of San Bruno elfin butterfly habitat or host plants. Therefore, alternative C would have the same impact as alternative B: no impact, assuming compliance.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Rancho Corral de Tierra is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs, with a limit of six. Currently, commercial dog walking use is low at Rancho Corral de Tierra and habitat for the San Bruno elfin butterfly is located away from trails and the ROLA; therefore, commercial dog walking under this alternative would have no impact on the San Bruno elfin butterfly.

**Cumulative Impacts.** Under alternative C, the cumulative impacts on the San Bruno elfin butterfly at this park site would be the same as those under alternative B: beneficial.

**RANCHO CORRAL DE TIERRA ALTERNATIVE C CONCLUSION TABLE**

| <b>San Bruno Elfin Butterfly Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| No impact, assuming compliance           | Butterfly habitat is remote, and located away from dog walking trails and the ROLA. | Beneficial, assuming compliance                     | Beneficial cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Under alternative D, on-leash dog walking would be allowed in the Montara area on two existing trails: Old San Pedro Mountain Road and the Farallon Cutoff. Dogs would be prohibited in other areas of the site, including the entire El Granada area. There is no suitable habitat for the San Bruno elfin butterfly in the Montara area of the Rancho site. Therefore, the impacts to the butterfly under alternative D would be the same as alternative B: no impact, assuming compliance.

Since no commercial dog walking would be allowed and no permits for walking more than three dogs would be issued under alternative D, no impact on the San Bruno elfin butterfly from commercial and permitted dog walking would occur.

**Cumulative Impacts.** Under alternative D, the cumulative impacts on the San Bruno elfin butterfly at this park site would be the same as those under alternative B: beneficial.

RANCHO CORRAL DE TIERRA ALTERNATIVE D CONCLUSION TABLE

| San Bruno Elfin Butterfly Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|-----------------------------------|---|--|-------------------------------|
| No impact, assuming compliance    | Butterfly habitat is not located within the Montara area. | Beneficial, assuming compliance              | Beneficial cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would have the same dog walking restrictions as alternative C, and impacts would be the same: no impact, assuming compliance.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Currently, Rancho Corral de Tierra is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs, with a limit of six. Commercial dog walking use is low at Rancho Corral de Tierra and habitat for the San Bruno elfin butterfly is located away from dog walking trails; therefore, commercial dog walking would have no impact on the San Bruno elfin butterfly.

**Cumulative Impacts.** Under alternative E, the cumulative impacts on the San Bruno elfin butterfly at this park site would be the same as those under alternative B: beneficial.

RANCHO CORRAL DE TIERRA ALTERNATIVE E CONCLUSION TABLE

| San Bruno Elfin Butterfly Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|-----------------------------------|---|--|-------------------------------|
| No impact, assuming compliance    | Butterfly habitat is remote, and located away from dog walking trails and the ROLA. | Beneficial, assuming compliance              | Beneficial cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative B, allowing on-leash dog walking on some trails at Rancho Corral de Tierra in the Montara and El Granada areas. Although occurrences of the San Bruno elfin butterfly have been recorded at Rancho, these occurrences are unconfirmed, and are located away from dog walking trails under alternative F. Additionally, suitable habitat for the butterfly is located in a remote and isolated area of the site in rocky outcroppings. Therefore there would be no impact on the San Bruno elfin butterfly from on-leash dog walking at Rancho Corral de Tierra, assuming compliance.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Rancho Corral de Tierra is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs, with a limit of six. Currently, commercial dog walking use is low at Rancho Corral de Tierra, and suitable habitat is located well away from dog walking trails; therefore, commercial dog walking would have no impact on the San Bruno elfin butterfly.

**Cumulative Impacts.** Projects and actions in and near Rancho Corral de Tierra were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the San Bruno elfin butterfly at or in the vicinity of this site. Since the Rancho Corral de Tierra site has been transferred to the NPS, general protection of the site and associated natural resources would occur, although some impacts may remain from prior unregulated off-leash dog walking.

## Chapter 4: Environmental Consequences

The primary objective of the *San Bruno Elfin and Mission Blue Butterflies Recovery Plan* (USFWS 1984) is to protect, maintain, and enhance existing populations of the two endangered butterfly species. Management activities described in the plan that will benefit the San Bruno elfin butterfly include protecting essential habitat outside targeted park locations through cooperative agreements with adjacent landowners and negotiating conservation easements or similar land conservation agreements (USFWS 1984). Other ongoing programs, including non-native plant removal projects in the park as well as Wildland/Urban Interface Initiative projects on adjacent parklands, may result in beneficial effects by preventing non-native vegetation from displacing San Bruno elfin butterfly habitat.

Since the Rancho Corral de Tierra site has been transferred to the NPS, general maintenance and protection of the site and associated natural resources would occur, but currently the park has no site-specific plans to restore host plants for the San Bruno elfin butterfly. The effects from future construction projects, maintenance operations, and other agency projects on San Bruno elfin butterfly habitat may be adverse, but these actions have not yet been identified and are currently unknown and would likely require mitigation.

The lack of impacts on the San Bruno elfin butterfly from dogs at Rancho Corral de Tierra under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from the habitat restoration and protection projects combined with the lack of impacts on the San Bruno elfin butterfly would result in beneficial cumulative impacts on this butterfly species.

**RANCHO CORRAL DE TIERRA PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| <b>San Bruno Elfin Butterfly Impacts</b> | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|--|---|-------------------------------|
| No impact, assuming compliance           | Butterfly habitat is remote, and located away from dog walking trails. | Beneficial, assuming compliance                     | Beneficial cumulative impacts |

### **IMPACTS TO MISSION BLUE BUTTERFLY (FEDERALLY ENDANGERED) BY SITE AND ALTERNATIVE**

Mission blue butterfly populations use lupine host plants (*Lupinus albifrons*, *L. formosus*, and *L. variicolor*) that inhabit coastal scrub habitat and grassland habitat at GGNRA. The mission blue butterfly is very closely tied to the lupine host plants that support them, and adult butterflies lay their eggs on these plants. For purposes of this analysis, existing habitat is defined as areas where the mission blue butterfly host plants have been mapped. Additionally, other suitable habitat for the mission blue butterfly has been identified by modeling areas that have similar characteristics to existing mission blue butterfly habitat. In the study area, the mission blue butterfly has been documented at Alta Trail/Orchard Fire Road/Pacheco Fire Road, Oakwood Valley, the Marin Headlands Trails, Fort Baker, Milagra Ridge, and Sweeney Ridge/Cattle Hill; Tennessee Valley, in the Marin Headlands Trails, also has mission blue butterfly habitat and documented occurrences of mission blue butterfly (Bennett 2008, 8). In the Montara area of Rancho Corral de Tierra, patches of mission blue butterfly host plants (*Lupinus variicolor*) exist above Old San Pedro Road, near where on-leash dog walking is allowed. Of the three lupine host plant species, *Lupinus variicolor* is the least favored but is still important to the life cycle of the mission blue butterfly. Suitable habitat for the mission blue butterfly can be found in the Montara and El Granada areas of Rancho Corral de Tierra.

As previously discussed, vegetation can be affected by trampling indirectly and dog waste contains nutrients and can increase the amount of nitrogen and phosphorus in the soil (CRCCD 2009, 1). Trailheads are known as areas of disturbance by visitors and their activities as well as by “marking” dogs.

The lupine host plants grow in the trail beds and directly adjacent to the trail in some locations as well as off trail at GGNRA. Therefore, mission blue butterfly host plants (mission blue butterfly habitat) could be affected by both on- and off-leash dog walking due to the plants' presence in and adjacent to the trail beds. The permanent loss of individuals of the species could occur if mission blue butterfly eggs or larvae are present on vegetation along a trail/road that is disturbed by dogs. Potential adverse impacts from dogs include trampling host plants, dislodging eggs from host plants, crushing larvae, adding nutrients to soils from dog waste, and spreading invasive plants, all of which could affect the lupine host plants that support the mission blue butterfly. A more detailed mission blue butterfly discussion regarding individual sites and by alternative is included below.

### **Alta Trail/Orchard Fire Road/Pacheco Fire Road**

**Alternative A: No Action.** Under current conditions, dogs are allowed under voice control or on leash on the trails and roads from Marin City to Oakwood Valley. These areas experience low to moderate use by runners, bicyclists, and hikers (table 9) and the site is a high use individual and commercial dog walking area, with typically 5 to 12 dogs under voice control per commercial walker. There is mapped mission blue butterfly habitat in the grassy hillsides between the Alta Trail and Oakwood Valley Fire Road, where social trails have connected the fire roads; these social trails are closed, but still experience use by both visitors and dogs. These grassy hillsides adjacent to Alta Trail (mapped mission blue butterfly habitat) are a favorite use area for commercial dog walkers, and fencing has been erected to exclude dogs from mission blue butterfly habitat. Therefore, the social trails in mission blue butterfly habitat that are used by dog walkers, particularly commercial dog walkers with voice controlled dogs, are potentially susceptible to physical disturbance by dogs.

Alternative A would continue to result in long-term minor to moderate adverse impacts on the mission blue butterfly at Alta Trail/Orchard Fire Road/Pacheco Fire Road through localized, perceptible damage to mission blue butterfly habitat in the trail beds, roads, and adjacent areas as a result of damage to the vegetation from dogs. Even though impacts would be localized in a relatively small area, the reproductive success of individuals may also be affected as an indirect result of impacts on mission blue butterfly habitat.

Under alternative A, no permit system exists for dog walking. However, commercial dog walking at Alta Trail, Orchard Fire Road, and Pacheco Fire Road is common, with commercial dog walkers often having 5 to 12 dogs under voice control at one time. Commercial dog walking would continue to create long-term minor to moderate adverse impacts on the mission blue butterfly. Dogs under voice control would continue to disturb the mission blue butterfly and associated habitat.

**Cumulative Impacts.** Projects and actions in and near Alta Trail/Orchard Fire Road/Pacheco Fire Road were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the mission blue butterfly at or in the vicinity of this site.

The *San Bruno Elfin and Mission Blue Butterflies Recovery Plan* (USFWS 1984), Wildland/Urban Interface Initiative projects, habitat restoration programs, ongoing monitoring, and volunteer opportunities sponsored by the park—such as efforts with the Golden Gate National Parks Conservancy to restore mission blue butterfly habitat in Marin County—all have the potential to beneficially affect the mission blue butterfly and its habitat in Alta Trail/Orchard Fire Road/Pacheco Fire Road. Additionally, controlled burns will be conducted to help restore mission blue butterfly habitat through beneficial ecological disturbance effects (GGNPC 2010d, 1–2). The primary objective of the *San Bruno Elfin and Mission Blue Butterflies Recovery Plan* (USFWS 1984) is to protect, maintain, and enhance existing populations of the two endangered butterfly species. Management activities described in the plan that will

## Chapter 4: Environmental Consequences

benefit the mission blue butterfly include protecting essential habitat outside targeted park locations through cooperative agreements with adjacent landowners and negotiating conservation easements or similar land conservation agreements (USFWS 1984). Additional acreage of mission blue butterfly habitat will be restored under an agreement with USFWS.

Additional actions have had, are currently having, or have the potential to have adverse impacts on the mission blue butterfly and its habitat at or in the vicinity of GGNRA sites such as Alta Trail/Orchard Fire Road/Pacheco Fire Road. The park stewardship programs, Marin County fire management activities, maintenance operations, and other agency projects may have moderate short- and/or long-term adverse impacts associated with them that would require mitigation to minimize effects on mission blue butterfly habitat.

The long-term minor to moderate adverse impacts on the mission blue butterfly from dogs at Alta Trail, Orchard Fire Road, and Pacheco Fire Road under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from the habitat restoration and protection projects should reduce some of the adverse impacts on the mission blue butterfly from alternative A; however, the effects from the fire management activities, maintenance operations, and other agency projects on mission blue butterfly habitat would be adverse. When combined, the beneficial and adverse effects from these projects may balance out. Therefore, the cumulative analysis for this park site will mainly focus on the results of the impact analysis for each alternative. Cumulative impacts on the mission blue butterfly under this alternative would be expected to be long term, minor to moderate, and adverse.

**ALTA TRAIL/ORCHARD FIRE ROAD/PACHECO FIRE ROAD ALTERNATIVE A CONCLUSION TABLE**

| <b>Mission Blue Butterfly Impacts</b>       | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>                               |
|---|---|---|---|
| Long-term minor to moderate adverse impacts | Dogs could damage mission blue butterfly habitat in the trail beds and adjacent to the trails and roads; protective fencing for habitat would not exclude noncompliant dogs and social trails would degrade habitat | N/A   | Long-term minor to moderate, adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking on the Alta Trail to Orchard Fire Road and on Orchard Fire Road and Pacheco Fire Road. On-leash dog walking would be based on an allowed 6-foot dog leash. The LOD area would include Alta Trail, Orchard Fire Road, Pacheco Fire Road, and all areas adjacent to the trails/roads up to 6 feet. Existing mission blue butterfly habitat at Alta Trail/Orchard Fire Road/Pacheco Fire Road is located away from the trails (beyond the 6-foot LOD corridors) and dogs on leash on the trails would not be in proximity to mission blue butterfly habitat; thus, they would not likely impact mission blue butterfly habitat in the LOD area. Therefore, impacts in the LOD area would be negligible.

Overall, alternative B would result in negligible impacts on the mission blue butterfly, assuming compliance. Under alternative B, dogs would no longer be allowed on the social trails at Alta Trail/Orchard Fire Road/Pacheco Fire Road (which meander through mission blue butterfly habitat), so this alternative would keep dogs out of mission blue butterfly habitat. The loss of these trails would reduce the opportunity for dogs to be in proximity to mission blue butterfly habitat, and although this would protect adjacent trail habitat, it would not result in a measurable or perceptible change for the mission blue butterfly; therefore, impacts would remain negligible.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since the percentage of commercial dog walkers is considered high at Alta Trail/Orchard Fire Road/Pacheco Fire Road, dogs walked by commercial dog walkers would cause the majority of the adverse impacts on the mission blue butterfly from dogs at the site. Overall impacts on the mission blue butterfly from dogs walked by both commercial and private individuals are summarized above.

**Cumulative Impacts.** The negligible impacts on the mission blue butterfly from dogs at Alta Trail, Orchard Fire Road, and Pacheco Fire Road under alternative B were considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the habitat restoration and protection projects combined with the adverse effects from the fire management activities, maintenance operations, and other agency projects and the negligible impacts from alternative B would result in negligible cumulative impacts on the mission blue butterfly.

**ALTA TRAIL/ORCHARD FIRE ROAD/PACHECO FIRE ROAD ALTERNATIVE B CONCLUSION TABLE**

| Mission Blue Butterfly Impacts                  | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Existing habitat is located away from trails and dogs on leash on the trails would not be in proximity to mission blue butterfly habitat; use of social trails would be eliminated | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would have the same dog walking restrictions as alternative B, and impacts would be the same, assuming compliance: negligible in the LOD area and overall.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs, and the permit may restrict use by time and area. Permits would be allowed for Alta Trail/Orchard Fire Road/Pacheco Fire Road. Impacts on the mission blue butterfly from permit holders with four to six dogs would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is common at Alta Trail/Orchard Fire Road/Pacheco Fire Road, impacts on the mission blue butterfly would be expected from this user group. Impacts on the mission blue butterfly from commercial dog walkers would be similar to impacts from other dog walkers as summarized in the preceding paragraph; therefore, impacts from commercial dog walking would be negligible.

**Cumulative Impacts.** Under alternative C, the cumulative impacts on the mission blue butterfly at this park site would be the same as those under alternative B: negligible.

**ALTA TRAIL/ORCHARD FIRE ROAD/PACHECO FIRE ROAD ALTERNATIVE C CONCLUSION TABLE**

| Mission Blue Butterfly Impacts                  | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Existing habitat is located away from trails and use of the social trails at the site would be eliminated | Beneficial, assuming compliance              | Negligible cumulative impacts |

## Chapter 4: Environmental Consequences

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Under alternative D, dogs would not be allowed at this site. Therefore, assuming compliance, no impacts on the mission blue butterfly from dogs would occur at this site.

Since no commercial dog walking would be allowed under alternative D, no impact on the mission blue butterfly from commercial dog walking would occur.

**Cumulative Impacts.** The lack of impacts on the mission blue butterfly at Alta Trail, Orchard Fire Road, and Pacheco Fire Road under alternative D was considered together with the effects of the projects mentioned above under alternative A. There would be a combination of adverse and beneficial effects from actions in and around this park site; when combined, these effects would balance out, resulting in negligible impacts. These negligible impacts combined with the lack of impacts on the mission blue butterfly from dogs under alternative D would result in negligible cumulative impacts.

**ALTA TRAIL/ORCHARD FIRE ROAD/PACHECO FIRE ROAD ALTERNATIVE D CONCLUSION TABLE**

| <b>Mission Blue Butterfly Impacts</b> | <b>Rationale</b>                     | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---------------------------------------|--------------------------------------|---|-------------------------------|
| No impact, assuming compliance        | Dogs would be prohibited at the site | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would allow on-leash dog walking on the Alta Trail from Donahue Street to the junction with the Morning Sun Trail and on Orchard and Pacheco fire roads. While the mileage open to dog walking would be greater than that described for alternative B, the impacts would be similar, assuming compliance: negligible both in the LOD area and overall.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. Permits would be allowed for Alta Trail/Orchard Fire Road/Pacheco Fire Road, however, permits could restrict dog walkers to the section of Alta Trail between Donahue Street and the junction with the Orchard Fire Road. Impacts on the mission blue butterfly from permit holders with four to six dogs would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is common at Alta Trail/Orchard Fire Road/Pacheco Fire Road, impacts on the mission blue butterfly would be expected from this user group. Impacts on the mission blue butterfly from commercial dog walkers would be similar to impacts from other dog walkers, as summarized in the preceding paragraph.

**Cumulative Impacts.** The negligible impacts on the mission blue butterfly from dogs at Alta Trail, Orchard Fire Road, and Pacheco Fire Road under alternative E were considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the habitat restoration and protection projects combined with the adverse effects from the fire management activities, maintenance operations, and other agency projects and the negligible impacts from alternative E would result in negligible cumulative impacts on the mission blue butterfly.

**ALTA TRAIL/ORCHARD FIRE ROAD/PACHECO FIRE ROAD ALTERNATIVE E CONCLUSION TABLE**

| Mission Blue Butterfly Impacts                  | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Existing habitat at is located away from trails and dogs on leash on the trails would not be in proximity to mission blue butterfly habitat; use of social trails would be eliminated | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative E. The preferred alternative would allow on-leash dog walking on Alta Trail from Donahue Street to the junction with the Morning Sun Trail and on Orchard and Pacheco fire roads. The LOD area would include Alta Trail, Orchard Fire Road, Pacheco Fire Road, and all areas adjacent to the trail/roads up to 6 feet. Existing mission blue butterfly habitat at Alta Trail/Orchard Fire Road/Pacheco Fire Road is located away from the trails (beyond the 6-foot LOD corridors) and dogs on leash on the trails would not be in proximity to mission blue butterfly habitat; thus, on-leash dogs would not likely impact mission blue butterfly habitat in the LOD area. Therefore, impacts in the LOD area would be negligible.

Assuming compliance, the preferred alternative would result in overall negligible impacts on the mission blue butterfly. Under the preferred alternative, dogs would no longer be allowed on the social trails at Alta Trail/Orchard Fire Road/Pacheco Fire Road (which meander through mission blue butterfly habitat), so this alternative would keep dogs out of mission blue butterfly habitat. The loss of these trails would reduce the opportunity for dogs to be in proximity to mission blue butterfly habitat, and although this would protect adjacent trail habitat, it would not result in a measurable or perceptible change for the mission blue butterfly, resulting in negligible impacts.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs, and the permit may restrict use by time and area. Permits would be allowed for Alta Trail/Orchard Fire Road/Pacheco Fire Road, however, permits could restrict dog walkers to the section of Alta Trail between Donahue Street and the junction with the Orchard Fire Road. Impacts on the mission blue butterfly from permit holders with four to six dogs would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level given the restriction of permit holders to a limited section of the Alta Trail. Since commercial dog walking is common at Alta Trail/Orchard Fire Road/Pacheco Fire Road, impacts on the mission blue butterfly would be expected from this user group. Impacts on the mission blue butterfly from commercial dog walkers would be similar to impacts from other dog walkers, as summarized in the preceding paragraph.

**Cumulative Impacts.** Projects and actions in and near Alta Trail/Orchard Fire Road/Pacheco Fire Road were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the mission blue butterfly at or in the vicinity of this site.

The *San Bruno Elfin and Mission Blue Butterflies Recovery Plan* (USFWS 1984), Wildland/Urban Interface Initiative projects, habitat restoration programs, ongoing monitoring, and volunteer opportunities sponsored by the park—such as efforts with the Golden Gate National Parks Conservancy to restore mission blue butterfly habitat in Marin County—all have the potential to beneficially affect the mission blue butterfly and its habitat in Alta Trail/Orchard Fire Road/Pacheco Fire Road. Additionally, controlled burns will be conducted to help restore mission blue butterfly habitat through beneficial

## Chapter 4: Environmental Consequences

ecological disturbance effects (GGNPC 2010d, 1–2). The primary objective of the *San Bruno Elfin and Mission Blue Butterflies Recovery Plan* (USFWS 1984) is to protect, maintain, and enhance existing populations of the two endangered butterfly species. Management activities described in the plan that will benefit the mission blue butterfly include protecting essential habitat outside targeted park locations through cooperative agreements with adjacent landowners and negotiating conservation easements or similar land conservation agreements (USFWS 1984). Additional acreage of mission blue butterfly habitat will be restored under an agreement with USFWS.

Additional actions have had, are currently having, or have the potential to have adverse impacts on the mission blue butterfly and its habitat at or in the vicinity of GGNRA sites such as Alta Trail/Orchard Fire Road/Pacheco Fire Road. The park stewardship programs, Marin County fire management activities, maintenance operations, and other agency projects may have moderate short- and/or long-term adverse impacts associated with them that would require mitigation to minimize effects on mission blue butterfly habitat.

The negligible impacts on the mission blue butterfly from dogs at Alta Trail, Orchard Fire Road, and Pacheco Fire Road under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from the habitat restoration and protection projects combined with the adverse effects from the fire management activities, maintenance operations, and other agency projects and the negligible impacts from the preferred alternative would result in negligible cumulative impacts on the mission blue butterfly.

### ALTA TRAIL/ORCHARD FIRE ROAD/PACHECO FIRE ROAD PREFERRED ALTERNATIVE F CONCLUSION TABLE

| Mission Blue Butterfly Impacts                  | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Existing habitat is located away from trails and use of the social trails at this site would be eliminated | Beneficial, assuming compliance              | Negligible cumulative impacts |

## Oakwood Valley

**Alternative A: No Action.** Dogs are currently allowed on leash or under voice control on the Oakwood Valley Fire Road and on the Oakwood Valley Trail from the junction with the fire road to Alta Trail. On-leash dog walking is allowed on the Oakwood Valley Trail from the trailhead to the junction with Oakwood Valley Fire Road. These areas experience moderate use by dog walkers (table 9). There is no mission blue butterfly habitat directly along Oakwood Valley Fire Road. However, there is mapped mission blue butterfly habitat in the grassy hillsides between this fire road and the Alta Trail, where social trails have connected the fire roads; these social trails are closed but experience use by both visitors and dogs. These grassy hillsides adjacent to Oakwood Valley Fire Road (mapped mission blue butterfly habitat) are a favorite use area for commercial dog walkers, and fencing has been erected to exclude dogs from mission blue butterfly habitat. Therefore, the social trails in mission blue butterfly habitat that are used by dog walkers, particularly commercial dog walkers with voice controlled dogs, are potentially susceptible to physical disturbance by dogs.

Therefore, alternative A would continue to result in long-term minor to moderate adverse impacts on the mission blue butterfly at Oakwood Valley through localized, perceptible damage to mission blue butterfly habitat in the trail beds, roads, and adjacent areas as a result of damage to the vegetation from dogs. Even though impacts would be localized in a relatively small area, the reproductive success of individuals may also be affected as an indirect result of impacts on mission blue butterfly habitat.

Under alternative A, no permit system exists for dog walking. At Oakwood Valley, commercial dog walking is uncommon. Therefore, commercial dog walking would have negligible impacts on the mission blue butterfly.

**Cumulative Impacts.** Projects and actions in and near Oakwood Valley were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the mission blue butterfly at or in the vicinity of this site.

The *San Bruno Elfin and Mission Blue Butterflies Recovery Plan* (USFWS 1984), Wildland/Urban Interface Initiative projects, habitat restoration programs, ongoing monitoring, and volunteer opportunities sponsored by the park—such as efforts with the Golden Gate National Parks Conservancy to restore mission blue butterfly habitat in Marin County—all have the potential to beneficially affect the mission blue butterfly and its habitat in Oakwood Valley. Additionally, controlled burns will be conducted to help restore mission blue butterfly habitat through beneficial ecological disturbance effects (GGNPC 2010d, 1–2). The primary objective of the *San Bruno Elfin and Mission Blue Butterflies Recovery Plan* (USFWS 1984) is to protect, maintain, and enhance existing populations of the two endangered butterfly species. Management activities described in the plan that will benefit the mission blue butterfly include protecting essential habitat outside targeted park locations through cooperative agreements with adjacent landowners and negotiating conservation easements or similar land conservation agreements (USFWS 1984). Additional acreage of mission blue butterfly habitat will be restored under an agreement with USFWS.

Additional actions have had, are currently having, or have the potential to have adverse impacts on the mission blue butterfly and its habitat at or in the vicinity of GGNRA sites such as Oakwood Valley. The park stewardship programs, Marin County fire management activities, maintenance operations, and other agency projects may have moderate short- and/or long-term adverse impacts associated with them that would require mitigation to minimize effects on mission blue butterfly habitat.

The long-term minor to moderate adverse impacts on the mission blue butterfly from dogs at Oakwood Valley under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from the habitat restoration and protection projects should reduce some of the adverse impacts on the mission blue butterfly from alternative A; however, the effects from the fire management activities, maintenance operations, and other agency projects on mission blue butterfly habitat would be adverse. When combined, the beneficial and adverse effects from these projects may balance out. Therefore, the cumulative analysis for this park site will mainly focus on the results of the impact analysis for each alternative. Cumulative impacts on the mission blue butterfly under this alternative would be expected to be long term, minor to moderate, and adverse.

**OAKWOOD VALLEY ALTERNATIVE A CONCLUSION TABLE**

| Mission Blue Butterfly Impacts              | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts                                     |
|---|---|--|--|
| Long-term minor to moderate adverse impacts | Dogs could damage mission blue butterfly habitat in the trail beds and adjacent to the trails and roads; protective fencing for habitat would not exclude noncompliant dogs and social trails would degrade habitat | N/A  | Long-term minor to moderate adverse cumulative impacts |

N/A = not applicable.

## Chapter 4: Environmental Consequences

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking on the Oakwood Valley Fire Road and Oakwood Valley Trail to its junction with the fire road. On-leash dog walking would be based on an allowed 6-foot dog leash. The LOD area would include Oakwood Valley Fire Road and Oakwood Valley Trail and all areas adjacent to the trail/road up to 6 feet. Existing mission blue butterfly habitat at Oakwood Valley is located away from the trails/roads (beyond the 6-foot LOD corridors) and dogs on leash on the trails would not be in proximity to mission blue butterfly habitat; thus, dogs would not likely impact mission blue butterfly habitat in the LOD area. Therefore, impacts in the LOD area would be negligible.

Overall, alternative B would result in negligible impacts on the mission blue butterfly at Oakwood Valley. Under alternative B, dogs would no longer be allowed on the social trails near Oakwood Valley Fire Road (which meander through mission blue butterfly habitat), so this alternative would keep dogs out of mission blue butterfly habitat. The loss of these trails would reduce the opportunity for dogs to be in proximity to mission blue butterfly habitat, and although this would protect adjacent trail habitat, it would not result in a measurable or perceptible change for the mission blue butterfly; therefore, impacts would remain negligible.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is not common at Oakwood Valley, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have negligible impacts on the mission blue butterfly.

**Cumulative Impacts.** The negligible impacts on the mission blue butterfly from dogs at Oakwood Valley under alternative B were considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the habitat restoration and protection projects combined with the adverse effects from the fire management activities, maintenance operations, and other agency projects and the negligible impacts from alternative B would result in negligible cumulative impacts on the mission blue butterfly.

**OAKWOOD VALLEY ALTERNATIVE B CONCLUSION TABLE**

| <b>Mission Blue Butterfly Impacts</b>           | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--|---|-------------------------------|
| Overall negligible impacts, assuming compliance | Existing habitat is located away from trails and dogs on leash on the trails would not be in proximity to mission blue butterfly habitat; use of social trails would be eliminated | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C proposes a ROLA on the Oakwood Valley Fire Road to the junction with Oakwood Valley Trail. Double gates would be located at both ends, with continuous fencing to protect sensitive habitat. Oakwood Valley Trail would allow on-leash dog walking from the junction with Oakwood Valley Fire Road to the junction with Alta Trail. Dogs under voice and sight control in the ROLA would have access to the land between the edge of the trail and fence (LOD area). Impacts on the mission blue butterfly in the LOD area (in the ROLA and in the 6-foot corridors adjacent to the trail) would be negligible because existing mission blue butterfly habitat is located away from the trails (beyond the 6-foot LOD corridors) and not in the area proposed as a ROLA. Dogs on leash on the fire road would not be in proximity to mission blue butterfly habitat; thus,

dogs would not likely impact mission blue butterfly habitat in the LOD area. Therefore, impacts in the LOD area would be negligible.

Overall, alternative C would result in negligible impacts on the mission blue butterfly at Oakwood Valley. Under alternative C, dogs would no longer be allowed on the social trails near Oakwood Valley Fire Road (which meander through mission blue butterfly habitat), so this alternative would keep dogs out of mission blue butterfly habitat. The loss of these trails would reduce the opportunity for dogs to be in proximity to mission blue butterfly habitat, and although this would protect adjacent trail habitat, it would not result in a measurable or perceptible change for the mission blue butterfly; therefore, impacts would remain negligible.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Oakwood Valley is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at Oakwood Valley, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have a negligible impact on the mission blue butterfly.

**Cumulative Impacts.** The negligible impacts on the mission blue butterfly from dogs at Oakwood Valley under alternative C were considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the habitat restoration and protection projects combined with the adverse effects from the fire management activities, maintenance operations, and other agency projects and the negligible impacts from alternative C would result in negligible cumulative impacts on the mission blue butterfly.

**OAKWOOD VALLEY ALTERNATIVE C CONCLUSION TABLE**

| Mission Blue Butterfly Impacts                  | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Existing habitat is located away from trails and use of the social trails near the fire road would be eliminated | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Alternative D would have the same dog walking restrictions as alternative B, and impacts would be the same, assuming compliance: negligible in the LOD area and overall.

No commercial dog walking or permits to walk more than three dogs would be allowed under alternative D; therefore, commercial dog walking would have no impact on the mission blue butterfly.

**Cumulative Impacts.** The negligible impacts on the mission blue butterfly from dogs at Oakwood Valley under alternative D were considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the habitat restoration and protection projects combined with the adverse effects from the fire management activities, maintenance operations, and other agency projects and the negligible impacts from alternative D would result in negligible cumulative impacts on the mission blue butterfly.

OAKWOOD VALLEY ALTERNATIVE D CONCLUSION TABLE

| Mission Blue Butterfly Impacts                  | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Existing habitat is located away from trails and dogs on leash on the trails would not be in proximity to mission blue butterfly habitat; use of social trails would be eliminated | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E proposes a ROLA on the Oakwood Valley Fire Road to the junction with Oakwood Valley Trail. Double gates would be located at both ends, with noncontinuous fencing where needed to protect sensitive habitat. Oakwood Valley Trail would allow on-leash dog walking from the junction with Oakwood Valley Fire Road to a new gate at Alta Trail. Dogs under voice control in the ROLA would have access to the land between the edge of the trail and fence (LOD area). Impacts on the mission blue butterfly in the LOD area (in the ROLA and in the 6-foot corridors adjacent to trails) would be negligible because existing mission blue butterfly habitat is located away from the trails (beyond the 6-foot LOD corridors) and not in the area proposed as a ROLA. Dogs on leash on the trails would not be in proximity to mission blue butterfly habitat and thus would not likely impact mission blue butterfly habitat in the LOD area. Therefore, impacts in the LOD area would be negligible.

Assuming compliance, alternative E would result in overall negligible impacts on the mission blue butterfly at Oakwood Valley. Under alternative E, dogs would no longer be allowed on the social trails near Oakwood Valley Fire Road (which meander through mission blue butterfly habitat), so this alternative would keep dogs out of mission blue butterfly habitat. The loss of these trails would reduce the opportunity for dogs to be in proximity to mission blue butterfly habitat, and although this would protect adjacent trail habitat, it would not result in a measurable or perceptible change for the mission blue butterfly; therefore, impacts would remain negligible.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Oakwood Valley is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking activity is not common at Oakwood Valley, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on the mission blue butterfly.

**Cumulative Impacts.** Under alternative E, the cumulative impacts on the mission blue butterfly at this park site would be the same as those under alternative C: negligible.

OAKWOOD VALLEY ALTERNATIVE E CONCLUSION TABLE

| Mission Blue Butterfly Impacts                  | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Existing habitat is located away from trails and use of the social trails near the fire road would be eliminated | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative would allow on-leash dog walking on the Oakwood Valley Fire Road and on the Oakwood Valley Trail from the junction with the fire road to

the junction with the Alta Trail. Impacts on the mission blue butterfly in the LOD area (in the 6-foot corridors adjacent to trails) would be negligible because existing mission blue butterfly habitat is located away from the trails (beyond the 6-foot LOD corridors). Dogs on leash on the trails would not be in proximity to mission blue butterfly habitat and thus would not likely impact mission blue butterfly habitat in the LOD; therefore, impacts in the LOD area would be negligible.

Overall, the preferred alternative would result in negligible impacts on the mission blue butterfly at Oakwood Valley. Dogs would no longer be allowed on the social trails near Oakwood Valley Fire Road (which meander through mission blue butterfly habitat), so this alternative would keep dogs out of mission blue butterfly habitat. The loss of these trails would reduce the opportunity for dogs to be in proximity to mission blue butterfly habitat, and although this would protect adjacent trail habitat, it would not result in a measurable or perceptible change for the mission blue butterfly; therefore, impacts would remain negligible.

All dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Oakwood Valley is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking activity is not common at Oakwood Valley, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have negligible impacts on the mission blue butterfly.

**Cumulative Impacts.** Projects and actions in and near Oakwood Valley were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the mission blue butterfly at or in the vicinity of this site.

The *San Bruno Elfin and Mission Blue Butterflies Recovery Plan* (USFWS 1984), Wildland/Urban Interface Initiative projects, habitat restoration programs, ongoing monitoring, and volunteer opportunities sponsored by the park—such as efforts with the Golden Gate National Parks Conservancy to restore mission blue butterfly habitat in Marin County—all have the potential to beneficially affect the mission blue butterfly and its habitat in Oakwood Valley. Additionally, controlled burns will be conducted to help restore mission blue butterfly habitat through beneficial ecological disturbance effects (GGNPC 2010d, 1–2). The primary objective of the *San Bruno Elfin and Mission Blue Butterflies Recovery Plan* (USFWS 1984) is to protect, maintain, and enhance existing populations of the two endangered butterfly species. Management activities described in the plan that will benefit the mission blue butterfly include protecting essential habitat outside targeted park locations through cooperative agreements with adjacent landowners and negotiating conservation easements or similar land conservation agreements (USFWS 1984). Additional acreage of mission blue butterfly habitat will be restored under an agreement with USFWS.

Additional actions have had, are currently having, or have the potential to have adverse impacts on the mission blue butterfly and its habitat at or in the vicinity of GGNRA sites such as Oakwood Valley. The park stewardship programs, Marin County fire management activities, maintenance operations, and other agency projects may have moderate short- and/or long-term adverse impacts associated with them that would require mitigation to minimize effects on mission blue butterfly habitat.

The negligible impacts on the mission blue butterfly from dogs at Oakwood Valley under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from the habitat restoration and protection projects combined with the adverse effects from the fire management activities, maintenance operations, and other agency projects and the negligible impacts from the preferred alternative would result in negligible cumulative impacts on the mission blue butterfly.

OAKWOOD VALLEY PREFERRED ALTERNATIVE F CONCLUSION TABLE

| Mission Blue Butterfly Impacts                  | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Existing habitat is located away from trails and use of the social trails near the fire road would be eliminated | Beneficial, assuming compliance              | Negligible cumulative impacts |

### Marin Headlands Trails

**Alternative A: No Action.** Under current conditions, on-leash dog walking is allowed along the Coastal Trail from Hill 88 to Muir Beach, Batteries Loop Trail, North Miwok Trail from Tennessee Valley to Highway 1, County View Trail, and Marin Drive. As a result of the 2005 federal court order affirming the 2004 *U.S. v. Barley* decision, dog walking under voice control (or on leash) is allowed along other portions of the Coastal Trail (Golden Gate Bridge to Hill 88, including portions of the Lagoon Loop Trail); the Coastal, Wolf Ridge, and Miwok Trail Loop; and the Old Bunker Fire Road Loop (includes a section of the Coastal Trail). These trails experience low to moderate use by dog walkers. Dog-related incidents are high at this site with a total of 269 from 2008 through 2011, with the majority of incidents for having dogs within areas closed to pets (table 16). Mission blue butterflies and habitat exist along the North Miwok trail corridor, where dogs are allowed on leash, and along a section of the Coastal Trail (Julian Road) where voice control dog walking is allowed. The park practice is to close trails through mission blue butterfly habitat to bicycles, dogs, and horses, but allow dogs on leash on fire roads through mission blue butterfly habitat.

The Barley decision reinstated voice control dog walking along the Coastal Trail between the Golden Gate Bridge and Hill 88 even though the park had a biological opinion from USFWS (1995) restricting dogs to protect mission blue butterfly habitat along the section of the Coastal Trail from Slacker Ridge to the Rifle Range. The reinstatement of voice control potentially allows dogs to roam off trail in these areas. Fencing was placed in the mid-1990s to protect mission blue butterfly habitat along sections of the Coastal Trail to protect lupine host plants, although the fencing is post and cable and would not necessarily exclude dogs.

The Tennessee Valley portion of the Marin Headlands Trails contains mission blue butterfly habitat and mission blue butterflies have been observed along the North Miwok Trail (Bennett 2008, 8). Tennessee Valley is closed to dogs, but the Coastal Trail (where dogs are allowed on leash) crosses lower Tennessee Valley, and the North Miwok Trail (which allows on-leash dog walking) meets the upper Tennessee Valley Trail. Therefore, alternative A would continue to result in long-term minor to moderate adverse impacts on the mission blue butterfly at the Marin Headlands Trails through localized, perceptible damage to mission blue butterfly habitat in the trail beds, roads, and adjacent areas as a result of damage to the vegetation from dogs. Even though impacts would be localized in a relatively small area, the reproductive success of individuals may also be affected as an indirect result of impacts on mission blue butterfly habitat.

Under alternative A, no permit system exists for commercial dog walking. At the Marin Headlands Trails, commercial dog walking is uncommon; therefore, commercial dog walking would have negligible impacts on the mission blue butterfly.

**Cumulative Impacts.** Projects and actions in and near the Marin Headlands Trails were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are

currently having, or have the potential to have effects on the mission blue butterfly at or in the vicinity of the Marin Headlands Trails.

The *San Bruno Elfin and Mission Blue Butterflies Recovery Plan* (USFWS 1984), the Southern Marin Headlands Project, Wildland/Urban Interface Initiative projects, habitat restoration programs, ongoing monitoring, and volunteer opportunities sponsored by the park—such as efforts with the Golden Gate National Parks Conservancy to restore mission blue butterfly habitat in Marin County—all have the potential to beneficially affect the mission blue butterfly and its habitat in the Marin Headlands Trails. Additionally, controlled burns will be conducted to help restore mission blue butterfly habitat through beneficial ecological disturbance effects (GGNPC 2010d, 1–2). The primary objective of the *San Bruno Elfin and Mission Blue Butterflies Recovery Plan* (USFWS 1984) is to protect, maintain, and enhance existing populations of the two endangered butterfly species, and the plan is focused on the Marin Headlands Trails and Fort Baker. Management activities described in the plan that will benefit the mission blue butterfly include protecting essential habitat outside these locations through cooperative agreements with adjacent landowners and negotiating conservation easements or similar land conservation agreements; restoring historic coastal scrub habitats by controlling non-native plants (e.g., gorse, French broom, pampas grass) that threaten the associated host and nectar plants used by the mission blue butterfly species, including silver-leaf lupine; and preventing further habitat degradation due to herbicides, pesticides, other toxicants, and off-road vehicle use (USFWS 1984). The Southern Marin Headlands Project initiated in the summer/fall of 2007 focused on enhancing the Coastal Trail corridor in the southern Marin Headlands and included removal of selected non-native trees that compromise the health of habitat used by the mission blue butterfly (GGNPC n.d., 1). Additional acreage of mission blue butterfly habitat will be restored under an agreement with USFWS.

Additional actions have had, are currently having, or have the potential to have adverse impacts on the mission blue butterfly and its habitat at or in the vicinity of GGNRA sites such as the Marin Headlands Trails. The park stewardship programs, the *Marin Headlands/Fort Baker Improvement and Transportation Management Plan/EIS* (NPS 2009c, ix, 82), Marin County fire management activities, maintenance operations, and other agency projects may have moderate short- and/or long-term adverse impacts associated with them that would require mitigation to minimize effects on mission blue butterfly habitat. Approximately 93 acres of habitat for the mission blue butterfly will be restored in the southern Marin Headlands to mitigate for impacts from road and trail construction that are a part of the *Marin Headlands/Fort Baker Improvement and Transportation Management Plan/EIS* (GGNPC 2010e, 1).

The long-term minor to moderate adverse impacts on the mission blue butterfly from dogs at the Marin Headlands Trails under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from the habitat restoration and protection projects should reduce some of the adverse impacts on the mission blue butterfly from alternative A; however, the effects from the fire management activities, maintenance operations, and other agency projects on mission blue butterfly habitat would be adverse. When combined, the beneficial and adverse effects from these projects may balance out. Therefore, the cumulative analysis for this park site will mainly focus on the results of the impact analysis for each alternative. Cumulative impacts on the mission blue butterfly under this alternative would be expected to be long term, minor to moderate, and adverse.

**Chapter 4: Environmental Consequences**

**MARIN HEADLANDS TRAILS ALTERNATIVE A CONCLUSION TABLE**

| <b>Mission Blue Butterfly Impacts</b>       | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>                              |
|---|---|---|--|
| Long-term minor to moderate adverse impacts | Dogs could damage mission blue butterfly habitat in the trail beds and adjacent to the trails and roads; protective fencing for habitat would not exclude noncompliant dogs | N/A   | Long-term minor to moderate adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would prohibit dogs on the trails. This alternative would be most protective of the coastal scrub habitat and the mission blue butterfly lupine host plants, and would maintain the integrity of the entire Marin Headlands Trails site. Assuming compliance, alternative B would result in no impact on the mission blue butterfly.

Since dogs would not be allowed in the Marin Headlands Trails, there would be no impact from commercial dog walkers on the mission blue butterfly.

**Cumulative Impacts.** The lack of impacts on the mission blue butterfly from dogs at the Marin Headlands Trails under alternative B was considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the habitat restoration and protection projects combined with the adverse effects from the fire management activities, maintenance operations, and other agency projects and the lack of impacts from alternative B would result in negligible cumulative impacts on the mission blue butterfly.

**MARIN HEADLANDS TRAILS ALTERNATIVE B CONCLUSION TABLE**

| <b>Mission Blue Butterfly Impacts</b> | <b>Rationale</b>                     | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---------------------------------------|--------------------------------------|---|-------------------------------|
| No impact, assuming compliance        | Dogs would be prohibited at the site | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would allow on-leash dog walking along the Lower Rodeo Valley Trail Corridor. This corridor extends from the Rodeo Beach parking lot to the intersection of Bunker and McCullough Roads via the North Lagoon Loop Trail, North Miwok Trail, and Rodeo Valley Trail, including the connector trail from the Rodeo Valley Trail to the Smith Road Trailhead. On-leash dog walking would also be allowed on the Old Bunker Fire Road Loop (including a section of the Coastal Trail), and the Batteries Loop Trail. This alternative would allow on-leash dog access only on these perimeter trails in the Marin Headlands, while preserving and maintaining the integrity of interior habitat. Because dogs would not be allowed on the North Miwok Trail and the hiking-only section of the Coastal Trail (Julian Road, where mission blue butterfly habitat exists) under alternative C, negligible impacts on the mission blue butterfly would occur in the LOD area because existing vegetation that supports the mission blue butterfly is not located along the trails/roads.

Because dogs would not be allowed on the North Miwok Trail and the Coastal Trail bicycle route (which includes Julian Road, where mission blue butterfly habitat exists), overall negligible impacts on the mission blue butterfly would occur because of protection of habitat along the trails and roads of the Marin Headlands. This alternative would not result in a measurable or perceptible change in mission blue butterfly habitat; therefore, impacts in the site as a whole would remain negligible.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Marin Headlands Trails is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking activity is not common at the Marin Headlands Trails, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on the mission blue butterfly.

**Cumulative Impacts.** The negligible impacts on the mission blue butterfly from dogs at the Marin Headlands Trails under alternative C were considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the habitat restoration and protection projects combined with the adverse effects from the fire management activities, maintenance operations, and other agency projects and the negligible impacts from alternative C would result in negligible cumulative impacts on the mission blue butterfly.

**MARIN HEADLANDS TRAILS ALTERNATIVE C CONCLUSION TABLE**

| <b>Mission Blue Butterfly Impacts</b>           | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance | On-leash dog access would be allowed only on the perimeter trails, preserving the integrity of interior habitat; prohibiting dogs on the North Miwok Trail and the hiking-only section of the Coastal Trail would protect habitat | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Alternative D would have the same dog walking restrictions as alternative B (no dogs on site), and impacts would be the same, assuming compliance: no impact.

Since dogs would not be allowed at Marin Headlands Trails, there would be no impact from commercial dog walkers on the mission blue butterfly under this alternative.

**Cumulative Impacts.** The lack of impacts on the mission blue butterfly from dogs at the Marin Headlands Trails under alternative D was considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the habitat restoration and protection projects combined with the adverse effects from the fire management activities, maintenance operations, and other agency projects and the lack of impacts from alternative D would result in negligible cumulative impacts on the mission blue butterfly.

**MARIN HEADLANDS TRAILS ALTERNATIVE D CONCLUSION TABLE**

| <b>Mission Blue Butterfly Impacts</b> | <b>Rationale</b>                     | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---------------------------------------|--------------------------------------|---|-------------------------------|
| No impact, assuming compliance        | Dogs would be prohibited at the site | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would allow on-leash dog walking on the Conzelman Coastal Trail, from Highway 1/101 to the McCullough intersection and then to the Coastal Trail Bike Route, including Julian Road to Rodeo Beach parking lot.

## Chapter 4: Environmental Consequences

On-leash dog walking would also be available on the Old Bunker Fire Road Loop (which includes a section of the Coastal trail), Batteries Loop Trail, North Miwok Trail from Tennessee Valley to Highway 1, County View Trail, Marin Drive, Rodeo Avenue Trail, and Morning Sun Trail. Dogs would not be allowed on the section of North Miwok Trail where mission blue butterfly habitat exists, but on-leash dog walking would be allowed on these perimeter trails in the Marin Headlands Trails and along the Coastal Trail (Julian Road), which supports mission blue butterfly habitat in some areas. Therefore, alternative E would result in long-term minor adverse impacts on the mission blue butterfly in the LOD area at the Marin Headlands Trails through perceptible damage to mission blue butterfly habitat along the trail bed as a result of damage to the vegetation from dogs.

The long-term minor adverse impacts from dogs in the LOD area under alternative E would occur in a relatively small area when compared to the site as a whole. However, more trails would be available to dogs in comparison to alternative C, including portions of the Coastal Trail in the easternmost area of Marin Headlands Trails that support mission blue butterfly habitat. Therefore, assuming compliance, the overall impacts on the mission blue butterfly from on-leash dog walking would be long term, minor, and adverse because a measurable or perceptible change in mission blue butterfly habitat could occur as a result of dog disturbance. These impacts on mission blue butterfly habitat would be considered perceptible changes, but localized at the site and therefore minor.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Marin Headlands Trails is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at the Marin Headlands Trails, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on the mission blue butterfly.

**Cumulative Impacts.** The long-term minor adverse impacts on the mission blue butterfly from dogs at the Marin Headlands Trails under alternative E were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the habitat restoration and protection projects should reduce some of the adverse impacts on the mission blue butterfly from alternative E; however, the effects from the fire management activities, maintenance operations, and other agency projects on mission blue butterfly habitat would be adverse. When combined, the beneficial and adverse effects from these projects may balance out. Therefore, the cumulative analysis for this park site will mainly focus on the results of the impact analysis for each alternative. Cumulative impacts on the mission blue butterfly under this alternative would be expected to be long term, minor, and adverse.

**MARIN HEADLANDS TRAILS ALTERNATIVE E CONCLUSION TABLE**

| Mission Blue Butterfly Impacts                               | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts                         |
|--|---|--|--|
| Overall long-term minor adverse impacts, assuming compliance | On-leash dogs would be allowed only on the perimeter trails, which would maintain the integrity of interior habitat; no dogs would be allowed on the North Miwok Trail but dogs would be allowed on leash on the sections of the Coastal Trail, which supports mission blue butterfly habitat | No change, assuming compliance               | Long-term minor adverse cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative would allow on-leash dog walking along the Lower Rodeo Valley Trail Corridor, which extends from the Rodeo Beach parking lot to the intersection of Bunker and McCullough roads via the North Lagoon Loop Trail, Miwok Trail, Rodeo Valley Trail, and the connector trail from Rodeo Valley Trail to the Smith Road trailhead. On-leash dog walking would be allowed on the Old Bunker Fire Road Loop (including a section of the Coastal Trail), Batteries Loop Trail, Rodeo Avenue Trail, and Morning Sun Trail. This alternative would allow on-leash dog access only on these perimeter trails in the Marin Headlands, while preserving and maintaining the integrity of interior habitat. The LOD would include areas adjacent to the trails/roads up to 6 feet. Under the preferred alternative, dogs would not be allowed on the North Miwok Trail and the Coastal Trail bicycle route (which includes Julian Road, where mission blue butterfly habitat exists), and existing vegetation that supports the mission blue butterfly is not located along the trails/roads; therefore, there would be negligible impacts on the mission blue butterfly in the LOD area.

Because dogs would not be allowed on the North Miwok Trail and the hiking-only section of the Coastal Trail (Julian Road, where mission blue butterfly habitat exists), assuming compliance, overall negligible impacts on the mission blue butterfly would occur because of protection of habitat along the trails and roads of the Marin Headlands Trails. This alternative would not result in a measurable or perceptible change in mission blue butterfly habitat; therefore, impacts would remain negligible.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Marin Headlands Trails is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at the Marin Headlands Trails, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have negligible impacts on the mission blue butterfly.

**Cumulative Impacts.** Projects and actions in and near the Marin Headlands Trails were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the mission blue butterfly at or in the vicinity of the Marin Headlands Trails.

The *San Bruno Elfin and Mission Blue Butterflies Recovery Plan* (USFWS 1984), the Southern Marin Headlands Project, Wildland/Urban Interface Initiative projects, habitat restoration programs, ongoing monitoring, and volunteer opportunities sponsored by the park—such as efforts with the Golden Gate National Parks Conservancy to restore mission blue butterfly habitat in Marin County—all have the potential to beneficially affect the mission blue butterfly and its habitat in the Marin Headlands Trails. Additionally, controlled burns will be conducted to help restore mission blue butterfly habitat through beneficial ecological disturbance effects (GGNPC 2010d, 1–2). The primary objective of the *San Bruno Elfin and Mission Blue Butterflies Recovery Plan* (USFWS 1984) is to protect, maintain, and enhance existing populations of the two endangered butterfly species, and the plan is focused on the Marin Headlands Trails and Fort Baker. Management activities described in the plan that will benefit the mission blue butterfly include protecting essential habitat outside these locations through cooperative agreements with adjacent landowners and negotiating conservation easements or similar land conservation agreements; restoring historic coastal scrub habitats by controlling non-native plants (e.g., gorse, French broom, pampas grass) that threaten the associated host and nectar plants used by the mission blue butterfly species, including silver-leaf lupine; and preventing further habitat degradation due to herbicides, pesticides, other toxicants, and off-road vehicle use (USFWS 1984). The Southern Marin Headlands Project initiated in the summer/fall of 2007 focused on enhancing the Coastal Trail corridor in the southern Marin Headlands and included removal of selected non-native trees that compromise the health of habitat used by the mission blue butterfly (GGNPC n.d., 1). Additional acreage of mission blue butterfly habitat will be restored under an agreement with USFWS.

## Chapter 4: Environmental Consequences

Additional actions have had, are currently having, or have the potential to have adverse impacts on the mission blue butterfly and its habitat at or in the vicinity of GGNRA sites such as the Marin Headlands Trails. The park stewardship programs, the *Marin Headlands/Fort Baker Improvement and Transportation Management Plan/EIS* (NPS 2009c, ix, 82), Marin County fire management activities, maintenance operations, and other agency projects may have moderate short- and/or long-term adverse impacts associated with them that would require mitigation to minimize effects on mission blue butterfly habitat. Approximately 93 acres of habitat for the mission blue butterfly will be restored in the southern Marin Headlands to mitigate for impacts from road and trail construction that are a part of the *Marin Headlands/Fort Baker Improvement and Transportation Management Plan/EIS* (GGNPC 2010e, 1).

The negligible impacts on the mission blue butterfly from dogs at the Marin Headlands Trails under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from the habitat restoration and protection projects combined with the adverse effects from the fire management activities, maintenance operations, and other agency projects and the negligible impacts from the preferred alternative would result in negligible cumulative impacts on the mission blue butterfly.

**MARIN HEADLANDS TRAILS PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| <b>Mission Blue Butterfly Impacts</b>           | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance | On-leash dogs would be allowed only on the perimeter trails, which would maintain the integrity of interior habitat; prohibiting dogs on the North Miwok Trail and the hiking-only section of the Coastal Trail would protect habitat | Beneficial, assuming compliance                     | Negligible cumulative impacts |

### Fort Baker

**Alternative A: No Action.** The mission blue butterfly is known to occur at Fort Baker. Restoration of habitat for mission blue butterfly was initiated in 1990 (55 acres have been restored as of publication) and is still ongoing at the site. Dogs are currently required to be on leash throughout Fort Baker, except that dogs are not allowed on Chapel Trail (adjacent to mission blue butterfly habitat) or the pier. Drown Fire Road traverses natural habitat where extensive mission blue butterfly habitat restoration has occurred. Battery Yates has mission blue butterfly habitat that is partially fenced (post and cable), but this fencing would not physically exclude dogs. Dogs have been observed off leash at Battery Yates and behind the Bay Area Discovery Museum. It has been predicted that a marked increase in visitor use along the waterfront portion of this site is likely to occur as a result of upgrades to the waterfront along with the recently opened lodge and conference center. Documented leash law violations at this site totaled 52 from 2008 through 2011 (table 17).

Alternative A would continue to result in long term, minor, adverse impacts on the mission blue butterfly at Fort Baker through damage to habitat in the trail beds, roads, and adjacent areas as a result of dogs. These impacts on mission blue butterfly habitat would be considered perceptible changes, but localized at the site and therefore minor.

Under alternative A, no permit system exists for commercial dog walking. At Fort Baker, commercial dog walking is uncommon; therefore, commercial dog walking would have negligible impacts on the mission blue butterfly.

**Cumulative Impacts.** Projects and actions in and near Fort Baker were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the mission blue butterfly at or in the vicinity of this site.

The *San Bruno Elfin and Mission Blue Butterflies Recovery Plan* (USFWS 1984), Wildland/Urban Interface Initiative projects, habitat restoration programs, ongoing monitoring, and volunteer opportunities sponsored by the park—such as efforts with the Golden Gate National Parks Conservancy to restore mission blue butterfly habitat in Marin County—all have the potential to beneficially affect the mission blue butterfly and its habitat at Fort Baker. Additionally, controlled burns will be conducted to help restore mission blue butterfly habitat through beneficial ecological disturbance effects (GGNPC 2010d, 1–2). The primary objective of the *San Bruno Elfin and Mission Blue Butterflies Recovery Plan* (USFWS 1984) is to protect, maintain, and enhance existing populations of the two endangered butterfly species, and the plan is focused on the Marin Headlands Trails and Fort Baker. Management activities described in the plan that will benefit the mission blue butterfly include protecting essential habitat outside these locations through cooperative agreements with adjacent landowners and negotiating conservation easements or similar land conservation agreements; restoring historic coastal scrub habitats by controlling non-native plants (e.g., gorse, French broom, pampas grass) that threaten the associated host and nectar plants used by the mission blue butterfly species, including silver-leaf lupine; and preventing further habitat degradation due to herbicides, pesticides, other toxicants, and off-road vehicle use (USFWS 1984). The Fort Baker EIS (NPS 2008h) and habitat restoration programs will have beneficial effects through restoration and expansion of mission blue butterfly habitat and control of non-native vegetation. Additional acreage of mission blue butterfly habitat will be restored under an agreement with USFWS; planned restoration of mission blue butterfly habitat as mitigation for the Golden Gate Bridge seismic retrofit work would continue to be implemented at Fort Baker (NPS 2008h, 4-28). These future restoration efforts would expand on this project, completing up to 23 acres of additional mission blue butterfly habitat restoration at Fort Baker (NPS 2008h, 4-28).

Additional actions have had, are currently having, or have the potential to have adverse impacts on the mission blue butterfly and its habitat at or in the vicinity of GGNRA sites such as Fort Baker. The park stewardship programs, the *Marin Headlands/Fort Baker Improvement and Transportation Management Plan/EIS*, Marin County fire management activities, maintenance operations, and other agency projects may have moderate short- and/or long-term adverse impacts associated with them that would require mitigation to minimize effects on mission blue butterfly habitat.

The long-term minor adverse impacts on the mission blue butterfly from dogs at Fort Baker under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from the habitat restoration and protection projects should reduce some of the adverse impacts on the mission blue butterfly from alternative A. Even though the effects from the fire management activities, maintenance operations, and other agency projects on mission blue butterfly habitat would be adverse, the benefits from restoration actions at Fort Baker should mitigate these adverse impacts. Therefore, the cumulative impacts on the mission blue butterfly under this alternative would be expected to be negligible.

**Chapter 4: Environmental Consequences**

**FORT BAKER ALTERNATIVE A CONCLUSION TABLE**

| <b>Mission Blue Butterfly Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---------------------------------------|---|---|-------------------------------|
| Long-term minor adverse impacts       | Dogs could damage mission blue butterfly habitat in the trail beds and adjacent to the trails and roads; fencing for habitat protection would not exclude noncompliant dogs | N/A   | Negligible cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking on Drown Fire Road (which traverses mission blue butterfly habitat), the Vista Point Trail (to be built), the Bay Trail (not including Battery Yates Loop), the Lodge/Conference Center Grounds, and the Parade Ground. The LOD would include all areas adjacent to the trails/roads up to 6 feet. Dogs would no longer be allowed on the Battery Yates Loop under this alternative due to the presence of mission blue butterfly habitat, but dog walking would be allowed along Drown Fire Road, which traverses restored mission blue butterfly habitat. Therefore, long-term minor adverse impacts on the mission blue butterfly in areas adjacent to the trail (6-foot corridor or LOD area) would occur as a result of this alternative.

Not allowing dogs on the Battery Yates Loop would protect existing mission blue butterfly habitat. However, alternative B would allow on-leash dog walking along Drown Fire Road, which supports mission blue butterfly habitat. Therefore, assuming compliance, alternative B would result in overall negligible to long-term minor adverse impacts on the mission blue butterfly. Prohibiting dogs at the Battery Yates Loop would reduce the opportunity for dogs to be in proximity to mission blue butterfly habitat, but allowing dogs on Drown Fire Road would result in perceptible changes, but localized at the site and therefore minor. Although much of the trail is fenced with post and cable fencing, host plants do grow along the shoulder of the fire road outside the fenced area along the edge of the trail.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is not common in this area, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have negligible impacts on the mission blue butterfly.

**Cumulative Impacts.** The negligible impacts on the mission blue butterfly from dogs at Fort Baker under alternative B were considered together with the effects of the projects mentioned above under alternative A. Even though the effects from the fire management activities, maintenance operations, and other agency projects on mission blue butterfly habitat would be adverse, the benefits from restoration actions at Fort Baker should mitigate these adverse impacts. Therefore, the cumulative impacts on the mission blue butterfly under this alternative would be expected to be negligible.

**FORT BAKER ALTERNATIVE B CONCLUSION TABLE**

| <b>Mission Blue Butterfly Impacts</b>                                      | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|--|---|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Allowing dogs along Drown Fire Road would affect butterfly habitat, but impacts would be localized at the site | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would allow on-leash dog walking on Drown Fire Road (which traverses mission blue butterfly habitat), the Bay Trail (including Battery Yates Loop), the Vista Point Trail (to be built), the Lodge/Conference Center Grounds, and the Parade Ground. On-leash dog walking would be based on an allowed 6-foot dog leash. The LOD would include all areas adjacent to the trails/roads up to 6 feet. Under this alternative, dogs would be allowed along Drown Fire Road, which supports mission blue butterfly habitat. Therefore, long-term minor adverse impacts on the mission blue butterfly in areas adjacent to the trail (6-foot corridor or LOD area) would occur as a result of this alternative because mission blue butterfly habitat would be affected by on-leash dogs and would result in perceptible changes in the habitat.

Alternative C allows on-leash dog walking along Drown Fire Road, which supports mission blue butterfly habitat. Therefore, assuming compliance, alternative C would result in overall negligible to long-term minor adverse impacts on the mission blue butterfly; allowing dogs on the Drown Fire Road would result in perceptible changes to mission blue butterfly habitat, but these impacts would be localized at the site and would therefore be considered minor, at most.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs, and the permit may restrict use by time and area. Permits would be allowed at Fort Baker, excluding Drown Fire Road. Impacts on the mission blue butterfly from permit holders with four to six dogs would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is not common at Fort Baker, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on the mission blue butterfly.

**Cumulative Impacts.** Under alternative C, the cumulative impacts on the mission blue butterfly at this park site would be the same as those under alternative B: negligible.

**FORT BAKER ALTERNATIVE C CONCLUSION TABLE**

| Mission Blue Butterfly Impacts   | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|--|--|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Allowing dogs along Drown Fire Road would affect butterfly habitat, but impacts would be localized at the site | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Alternative D would allow on-leash dog walking on the Lodge/Conference Center Grounds, the Vista Point Trail (to be built), and on the Bay Trail. Dogs would not be allowed on the Battery Yates Loop or along Drown Fire Road under this alternative, due to the presence of mission blue butterfly habitat. The LOD would include all areas adjacent to the trail up to 6 feet. No impact on the mission blue butterfly in areas adjacent to the trail (6-foot corridor or LOD area) would occur as a result of this alternative.

Not allowing dogs on the Battery Yates Trail or along Drown Fire Road would protect mission blue butterfly habitat in the site as a whole. Therefore, assuming compliance, alternative D would result in no overall impacts on the mission blue butterfly. Prohibiting dogs at the Battery Yates Trail and Drown Fire Road would eliminate the opportunity for dogs to be in proximity to mission blue butterfly habitat, resulting in no measurable or perceptible change in mission blue butterfly habitat; therefore, no impact would occur.

## Chapter 4: Environmental Consequences

No commercial dog walking or permits to walk more than three dogs would be allowed under alternative D; therefore, commercial or permitted dog walking would have no impact on the mission blue butterfly.

**Cumulative Impacts.** The negligible impacts on the mission blue butterfly from dogs at Fort Baker under alternative D were considered together with the effects of the projects mentioned above under alternative A. Even though the effects from the fire management activities, maintenance operations, and other agency projects on mission blue butterfly habitat would be adverse, the benefits from restoration actions at Fort Baker should mitigate these adverse impacts. Therefore, the cumulative impacts on the mission blue butterfly under this alternative would be expected to be negligible.

**FORT BAKER ALTERNATIVE D CONCLUSION TABLE**

| <b>Mission Blue Butterfly Impacts</b>   | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|---|---|-------------------------------|
| No overall impacts, assuming compliance | Prohibiting dogs on the Battery Yates Trail and Drown Fire Road would provide additional protection of mission blue butterfly habitat | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would have the same dog walking restrictions as alternative C, and impacts would be the same: long term, minor, and adverse in the LOD area and negligible to long term, minor, and adverse overall.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs, and the permit may restrict use by time and area. Permits would be allowed at Fort Baker, excluding Drown Fire Road. Impacts on the mission blue butterfly from permit holders with four to six dogs would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is not common at Fort Baker, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on the mission blue butterfly.

**Cumulative Impacts.** Under alternative E, the cumulative impacts on the mission blue butterfly at this park site would be the same as those under alternative C: negligible.

**FORT BAKER ALTERNATIVE E CONCLUSION TABLE**

| <b>Mission Blue Butterfly Impacts</b>                                      | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|--|---|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Allowing dogs along Drown Fire Road would affect butterfly habitat, but impacts would be localized at the site | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative C. The preferred alternative would allow on-leash dog walking on Drown Fire Road (which traverses mission blue butterfly habitat), the Bay Trail (including Battery Yates Trail), the Vista Point Trail (to be built), the Lodge/Conference Center Grounds, and the Parade Ground. On-leash dog walking would be based on an allowed 6-foot dog leash. The LOD would include all areas adjacent to the trails/roads up to 6 feet. Dogs would be allowed on leash along Drown Fire Road, which supports mission blue butterfly habitat.

Therefore, long-term minor adverse impacts on the mission blue butterfly in areas adjacent to the trail (6-foot corridor or LOD area) would occur as a result of this alternative.

The preferred alternative allows on-leash dog walking along Drown Fire Road, which supports mission blue butterfly habitat. Therefore, assuming compliance, this alternative would result in overall negligible to long-term minor adverse impacts on the mission blue butterfly. Allowing dogs on Drown Fire Road would result in perceptible changes, but these impacts would be localized at the site and would therefore be considered minor, at most.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs, and the permit may restrict use by time and area. Permits would be allowed at Fort Baker (excluding Drown Fire Road). Impacts on the mission blue butterfly from permit holders with four to six dogs would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is not common at Fort Baker, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have negligible impacts on the mission blue butterfly.

**Cumulative Impacts.** Projects and actions in and near Fort Baker were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the mission blue butterfly at or in the vicinity of this site.

The *San Bruno Elfin and Mission Blue Butterflies Recovery Plan* (USFWS 1984), Wildland/Urban Interface Initiative projects, habitat restoration programs, ongoing monitoring, and volunteer opportunities sponsored by the park—such as efforts with the Golden Gate National Parks Conservancy to restore mission blue butterfly habitat in Marin County—all have the potential to beneficially affect the mission blue butterfly and its habitat at Fort Baker. Additionally, controlled burns will be conducted to help restore mission blue butterfly habitat through beneficial ecological disturbance effects (GGNPC 2010d, 1–2). The primary objective of the *San Bruno Elfin and Mission Blue Butterflies Recovery Plan* (USFWS 1984) is to protect, maintain, and enhance existing populations of the two endangered butterfly species, and the plan is focused on the Marin Headlands Trails and Fort Baker. Management activities described in the plan that will benefit the mission blue butterfly include protecting essential habitat outside these locations through cooperative agreements with adjacent landowners and purchase of conservation easements or similar land conservation agreements; restoring historic coastal scrub habitats by controlling non-native plants (e.g., gorse, French broom, pampas grass) that threaten the associated host and nectar plants used by the mission blue butterfly species, including silver-leaf lupine; and preventing further habitat degradation from herbicides, pesticides, other toxicants, and off-road vehicle use (USFWS 1984).

The *Marin Headlands and Fort Baker Transportation Infrastructure and Management Plan* (NPS 2009c) will have beneficial impacts on the mission blue butterfly. Plans include removing non-native trees within areas directly adjacent to mission blue butterfly habitat and within predicted habitat, closing and restoring areas containing known habitat, installing fencing and signage to make visitors aware of mission blue butterfly habitat, and removing target non-native plants within mission blue butterfly habitat (NPS 2009c, 229-242).

Additional actions have had, are currently having, or have the potential to have adverse impacts on the mission blue butterfly and its habitat at or in the vicinity of GGNRA sites such as Fort Baker. The park stewardship programs, Marin County fire management activities, maintenance operations, and other

## Chapter 4: Environmental Consequences

agency projects may have moderate short- and/or long-term adverse impacts associated with them that would require mitigation to minimize effects on mission blue butterfly habitat.

The negligible to long-term minor adverse impacts on the mission blue butterfly from dogs at Fort Baker under the preferred alternative were considered together with the effects of the projects mentioned above. Even though the effects from the fire management activities, maintenance operations, and other agency projects on mission blue butterfly habitat would be adverse, the benefits from restoration actions at Fort Baker should mitigate these adverse impacts. Therefore, the cumulative impacts on the mission blue butterfly under this alternative would be expected to be negligible.

**FORT BAKER PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| Mission Blue Butterfly Impacts   | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|--|--|-------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Allowing dogs along Drown Fire Road would affect butterfly habitat, but impacts would be localized at the site | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

### Milagra Ridge

**Alternative A: No Action.** The mission blue butterfly is known to at Milagra Ridge; an area referred to as the “Mission Blue Butterfly Corridor” is located in portions of this site (NPS 2005c), including a portion of the fire road and the trail to the overlook and the WW II bunker. Under current conditions, dogs are allowed on leash on the fire road and the trails, including the trail to access the overlook and WW II bunker and would be allowed on the future Milagra Battery Trail. This site has documented moderate visitor use and leash law violations totaled 35 from 2008 through 2011 (table 27).

Alternative A would continue to result in long-term minor adverse impacts on the mission blue butterfly through damage to habitat in the trail beds and adjacent areas as a result of dogs. These impacts on mission blue butterfly habitat would be considered perceptible changes, but localized at the site and therefore minor.

Under alternative A, no permit system exists for commercial dog walking. At Milagra Ridge, commercial dog walking is uncommon; therefore, commercial dog walking would have negligible impacts on the mission blue butterfly.

**Cumulative Impacts.** Projects and actions in and near Milagra Ridge were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the mission blue butterfly at or in the vicinity of this site.

The *San Bruno Elfin and Mission Blue Butterflies Recovery Plan* (USFWS 1984), Wildland/Urban Interface Initiative projects, habitat restoration programs, ongoing monitoring, and volunteer opportunities sponsored by the park—such as efforts with the Golden Gate National Parks Conservancy to restore mission blue butterfly habitat in San Mateo County—all have the potential to beneficially affect the mission blue butterfly and its habitat at Milagra Ridge. Additionally, controlled burns will be conducted to help restore mission blue butterfly habitat through beneficial ecological disturbance effects (GGNPC 2010d, 1–2). The primary objective of the *San Bruno Elfin and Mission Blue Butterflies Recovery Plan* (USFWS 1984) is to protect, maintain, and enhance existing populations of the two endangered butterfly species. Management activities described in the plan that will benefit the mission blue butterfly include protecting essential habitat outside targeted park locations through cooperative

agreements with adjacent landowners and negotiating conservation easements or similar land conservation agreements (USFWS 1984). Additionally, the site management plan for Milagra Ridge includes a statement to protect and enhance the habitat of the mission blue butterfly in coordination with GGNRA (NPS) and USFWS.

Fragments of unique plant and animal habitats within Pacifica, known as Significant Natural Resource Areas (natural areas), have been preserved within the parks that are managed by the San Francisco Recreation and Park Department (SFRPD). The SNRAMP is intended to guide natural resource protection, habitat restoration, trail and access improvements, other capital projects, and maintenance activities over the next 20 years (SFPD 2011, 1). The scope of the SNRAMP analysis includes a natural area managed by the SFRPD in Pacifica and addresses dog walking (including on-leash dog walking and off-leash DPAs) in these areas (SFPD 2011, 261-262). The mission blue butterfly has been recorded at Sharp Park (SFPD 2011, 278), which is a natural area located near Milagra Ridge and managed under the SNRAMP. Project activities included in the SNRAMP will protect this listed species and provide long-term beneficial impacts to the mission blue butterfly.

Additional actions have had, are currently having, or have the potential to have adverse impacts on the mission blue butterfly and its habitat at or in the vicinity of GGNRA sites such as Milagra Ridge. The park stewardship programs, maintenance operations, and other agency projects may have moderate short- and/or long-term adverse impacts associated with them that would require mitigation to minimize effects on mission blue butterfly habitat.

The long-term minor adverse impacts on the mission blue butterfly from dogs at Milagra Ridge under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from the habitat restoration and protection projects as well as the SNRAMP should reduce some of the adverse impacts on the mission blue butterfly from alternative A; however, the effects on mission blue butterfly habitat from the fire management activities, maintenance operations, and other agency projects would be adverse. When combined, the beneficial and adverse effects from these projects may balance out. Therefore, the cumulative analysis for this park site will mainly focus on the results of the impact analysis for each alternative. Cumulative impacts on the mission blue butterfly under this alternative would be expected to be long term, minor, and adverse.

**MILAGRA RIDGE ALTERNATIVE A CONCLUSION TABLE**

| Mission Blue Butterfly Impacts  | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts                         |
|---------------------------------|---|--|--|
| Long-term minor adverse impacts | Dogs could damage mission blue butterfly habitat in the trail beds and adjacent to the trails and roads | N/A  | Long-term minor adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking on the fire road and the trails to the overlook and WW II bunker, as well as the future Milagra Battery Trail. However, the trail to the top of the hill would not be open for dog walking in this alternative. On-leash dog walking would be based on an allowed 6-foot dog leash. The LOD would include areas adjacent to the trails/roads up to 6 feet, including the Milagra Ridge Road and trails where mission blue butterfly is known to occur. Impacts on areas adjacent to the trail (6-foot corridor or LOD area) would be long term, minor, and adverse since existing vegetation that supports the mission blue butterfly is located along the trail.

## Chapter 4: Environmental Consequences

The long-term minor adverse impacts from dogs in the LOD area would occur in a relatively small area when compared to the site as a whole; therefore, assuming compliance, the overall impact on the mission blue butterfly from on-leash dog walking at Milagra Ridge would be negligible.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is not common at Milagra Ridge, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have negligible impacts on the mission blue butterfly.

**Cumulative Impacts.** The negligible impacts on the mission blue butterfly from dogs at Milagra Ridge under alternative B were considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the habitat restoration and protection projects as well as the SNRAMP combined with the adverse effects from the fire management activities, maintenance operations, and other agency projects and the negligible impacts from alternative B would result in negligible cumulative impacts on the mission blue butterfly.

**MILAGRA RIDGE ALTERNATIVE B CONCLUSION TABLE**

| <b>Mission Blue Butterfly Impacts</b>           | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect mission blue butterfly habitat off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would allow on-leash dog walking in the same areas as alternative B, and impacts would be the same, assuming compliance: long term, minor, and adverse in the LOD area and negligible overall.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Milagra Ridge is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at Milagra Ridge, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on the mission blue butterfly.

**Cumulative Impacts.** Under alternative C, the cumulative impacts on the mission blue butterfly at Milagra ridge would be the same as those under alternative B: negligible.

**MILAGRA RIDGE ALTERNATIVE C CONCLUSION TABLE**

| <b>Mission Blue Butterfly Impacts</b>           | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect mission blue butterfly habitat off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Alternative D would not allow dogs at this site and would therefore result in no impact on the mission blue butterfly, assuming compliance.

Since dogs would not be allowed at Milagra Ridge, there would be no impact from commercial dog walkers on the mission blue butterfly.

**Cumulative Impacts.** The lack of impacts on the mission blue butterfly from dogs at Milagra Ridge under alternative D was considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the habitat restoration and protection projects as well as the SNRAMP combined with the adverse effects from the fire management activities, maintenance operations, and other agency projects and the lack of impacts from alternative D would result in negligible cumulative impacts on the mission blue butterfly.

**MILAGRA RIDGE ALTERNATIVE D CONCLUSION TABLE**

| <b>Mission Blue Butterfly Impacts</b> | <b>Rationale</b>                     | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---------------------------------------|--------------------------------------|---|-------------------------------|
| No impact, assuming compliance        | Dogs would be prohibited at the site | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would allow on-leash dog walking on the same trails as alternative B, with the addition of a trail to the top of the hill, and impacts would be the same, assuming compliance: long term, minor, and adverse in the LOD area and negligible overall.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Milagra Ridge is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at Milagra Ridge, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on the mission blue butterfly.

**Cumulative Impacts.** Under alternative E, the cumulative impacts on the mission blue butterfly would be the same as those under alternative B: negligible.

**MILAGRA RIDGE ALTERNATIVE E CONCLUSION TABLE**

| <b>Mission Blue Butterfly Impacts</b>           | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative B, allowing on-leash dog walking on the fire road and the trails to the overlook and WW II bunker, as well as on the future Milagra Battery Trail. However, the trail to the top of the hill would not be open for dog walking in this alternative. The LOD would include areas adjacent to the trails/roads up to 6 feet, including the Milagra Ridge Road and other trails where the mission blue butterfly is known to occur. Impacts on areas

## Chapter 4: Environmental Consequences

adjacent to the trails (6-foot corridor or LOD area) would be long term, minor, and adverse since existing vegetation that supports the mission blue butterfly is located along the trails.

The long-term minor adverse impacts from dogs in the LOD would occur in a relatively small area when compared to the site as a whole; therefore, the overall impacts on the mission blue butterfly from on-leash dog walking at Milagra Ridge would be negligible, assuming compliance.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Milagra Ridge is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at Milagra Ridge, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have negligible impacts on the mission blue butterfly.

**Cumulative Impacts.** Projects and actions in and near Milagra Ridge were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the mission blue butterfly at or in the vicinity of this site.

The *San Bruno Elfin and Mission Blue Butterflies Recovery Plan* (USFWS 1984), Wildland/Urban Interface Initiative projects, habitat restoration programs, ongoing monitoring, and volunteer opportunities sponsored by the park—such as efforts with the Golden Gate National Parks Conservancy to restore mission blue butterfly habitat in San Mateo County—all have the potential to beneficially affect the mission blue butterfly and its habitat at Milagra Ridge. Additionally, controlled burns will be conducted to help restore mission blue butterfly habitat through beneficial ecological disturbance effects (GGNPC 2010d, 1–2). The primary objective of the *San Bruno Elfin and Mission Blue Butterflies Recovery Plan* (USFWS 1984) is to protect, maintain, and enhance existing populations of the two endangered butterfly species. Management activities described in the plan that will benefit the mission blue butterfly include protecting essential habitat outside targeted park locations through cooperative agreements with adjacent landowners and negotiating conservation easements or similar land conservation agreements (USFWS 1984). Additionally, the site management plan for Milagra Ridge includes a statement to protect and enhance the habitat of the mission blue butterfly in coordination with the GGNRA and USFWS.

Fragments of unique plant and animal habitats within Pacifica, or natural areas, have been preserved within the parks that are managed by the San Francisco Recreation and Park Department (SFRPD). The SNRAMP is intended to guide natural resource protection, habitat restoration, trail and access improvements, other capital projects, and maintenance activities over the next 20 years (SFPD 2011, 1). The scope of the SNRAMP analysis includes a natural area managed by the SFRPD in Pacifica and addresses dog walking (including on-leash dog walking and off-leash DPAs) in these areas (SFPD 2011, 261–262). The mission blue butterfly has been recorded at Sharp Park (SFPD 2011, 278), which is a natural area located near Milagra Ridge and managed under the SNRAMP. Project activities included in the SNRAMP will protect this listed species and provide long-term beneficial impacts to the mission blue butterfly.

Additional actions have had, are currently having, or have the potential to have adverse impacts on the mission blue butterfly and its habitat at or in the vicinity of GGNRA sites such as Milagra Ridge. The park stewardship programs, maintenance operations, and other agency projects may have moderate short- and/or long-term adverse impacts associated with them that would require mitigation to minimize effects on mission blue butterfly habitat.

The negligible impacts on the mission blue butterfly from dogs at Milagra Ridge under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from the habitat restoration and protection projects as well as the SNRAMP combined with the adverse effects from the fire management activities, maintenance operations, and other agency projects and the negligible impacts from the preferred alternative would result in negligible cumulative impacts on the mission blue butterfly.

**MILAGRA RIDGE PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| Mission Blue Butterfly Impacts                  | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance              | Negligible cumulative impacts |

### Sweeney Ridge/Cattle Hill

**Alternative A: No Action.** The mission blue butterfly is known to occur along the Notch Trail at Sweeney Ridge and the host plants are known to occur in other areas at Sweeney Ridge (USFWS 1995, 3), including along Sweeney Ridge Trail, Baquiano Trail, Sweeney Horse Trail, and Meadow Loop Trail (May & Associates, Inc. 2006). Under current conditions, the Notch Trail is closed to dogs but on-leash dog walking is allowed on all other trails at Sweeney Ridge, including Sweeney Ridge Trail, Sneath Lane, and Baquiano Trail. With the exception of Sneath Lane, mission blue butterfly host plants have been mapped along all trails open to dog walking in Sweeney Ridge. Sweeney Ridge has documented low to moderate use by dog walkers, and off-leash incidents totaled 115 from 2008 through 2011 (table 28).

Alternative A would continue to result in long-term minor adverse impacts on the mission blue butterfly at Sweeney Ridge through damage to host plants and habitat in the trail beds and adjacent areas as a result of dogs. These impacts on mission blue butterfly habitat would be considered perceptible changes, but localized at the site and therefore minor.

No mission blue butterfly habitat exists at Cattle Hill; the host plants were not identified at the site (NRM Environmental Consulting, 2; URS Corporation 2010, Figure 6). Therefore, at Cattle Hill there would be no impacts to the mission blue butterfly.

Under alternative A, no permit system for commercial dog walking exists. Commercial dog walking is uncommon at Sweeney Ridge; therefore, commercial dog walking would have negligible impacts on the mission blue butterfly at this site.

**Cumulative Impacts.** Projects and actions in and near Sweeney Ridge were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the mission blue butterfly at or in the vicinity of this site.

The *San Bruno Elfin and Mission Blue Butterflies Recovery Plan* (USFWS 1984), Wildland/Urban Interface Initiative projects, habitat restoration programs, ongoing monitoring, and volunteer opportunities sponsored by the park—such as efforts with the Golden Gate National Parks Conservancy to restore mission blue butterfly habitat in San Mateo County—all have the potential to beneficially affect the mission blue butterfly and its habitat at Sweeney Ridge. Additionally, controlled burns will be conducted to help restore mission blue butterfly habitat through beneficial ecological disturbance effects

## Chapter 4: Environmental Consequences

(GGNPC 2010d, 1–2). The primary objective of the *San Bruno Elfin and Mission Blue Butterflies Recovery Plan* (USFWS 1984) is to protect, maintain, and enhance existing populations of the two endangered butterfly species. Management activities described in the plan that will benefit the mission blue butterfly include protecting essential habitat outside targeted park locations through cooperative agreements with adjacent landowners and negotiating conservation easements or similar land conservation agreements (USFWS 1984). Additional acreage of mission blue butterfly habitat will be restored under an agreement with USFWS.

Fragments of unique plant and animal habitats within Pacifica, or natural areas, have been preserved within the parks that are managed by the San Francisco Recreation and Park Department (SFRPD). The SNRAMP is intended to guide natural resource protection, habitat restoration, trail and access improvements, other capital projects, and maintenance activities over the next 20 years (SFPD 2011, 1). The scope of the SNRAMP analysis includes a natural area managed by the SFRPD in Pacifica and addresses dog walking (including on-leash dog walking and off-leash DPAs) in these areas (SFPD 2011, 261-262). The mission blue butterfly has been recorded at Sharp Park (SFPD 2011, 278), which is a natural area located adjacent to Sweeney Ridge and managed under the SNRAMP. Project activities included in the SNRAMP will protect this listed species and provide long-term beneficial impacts to the mission blue butterfly.

Additional actions have had, are currently having, or have the potential to have adverse impacts on the mission blue butterfly and its habitat at or in the vicinity of GGNRA sites such as Sweeney Ridge. The park stewardship programs, maintenance operations, and other agency projects may have moderate short- and/or long-term adverse impacts associated with them that would require mitigation to minimize effects on mission blue butterfly habitat.

The long-term minor adverse impacts at Sweeney Ridge on the mission blue butterfly from dogs under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from the habitat restoration and protection projects as well as the SNRAMP should reduce some of the adverse impacts on the mission blue butterfly from alternative A. However, the effects from the fire management activities, maintenance operations, and other agency projects on mission blue butterfly habitat would be adverse. When combined, the beneficial and adverse effects from these projects may balance out. Therefore, the cumulative analysis for this park site will mainly focus on the results of the impact analysis for each alternative. Cumulative impacts on the mission blue butterfly under this alternative at Sweeney Ridge would be expected to be long term, minor, and adverse. The lack of impacts to the mission blue butterfly at Cattle Hill was considered with the above cumulative effects, resulting in overall negligible cumulative impacts at Cattle Hill.

**SWEENEY RIDGE/CATTLE HILL ALTERNATIVE A CONCLUSION TABLE**

| <b>Mission Blue Butterfly Impacts</b>            | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>                                   |
|--|---|---|---|
| Long-term minor adverse impacts at Sweeney Ridge | Dogs could damage mission blue butterfly habitat in the trail beds and adjacent to the trails and roads | N/A   | Long-term minor adverse cumulative impacts at Sweeney Ridge |
| No impact at Cattle Hill                         | Mission blue butterfly host plants are not present at Cattle Hill                                       | N/A   | Negligible cumulative impacts at Cattle Hill                |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would prohibit dogs at both sites, which would provide a large area of relatively undisturbed contiguous habitat that supports the listed mission blue butterfly. Therefore, assuming compliance, alternative B would result in no impact on the mission blue butterfly because of protection of mission blue butterfly habitat at Sweeney Ridge. Alternative B would also result in no impacts to the mission blue butterfly at Cattle Hill because suitable habitat has not been documented at this site to date (NRM Environmental Consulting 2007, 2; URS Corporation 2010, Figure 6).

Since dogs would not be allowed at Sweeney Ridge/Cattle Hill, there would be no impact from commercial dog walkers on the mission blue butterfly at this site.

**Cumulative Impacts.** The lack of impacts on the mission blue butterfly from dogs at Sweeney Ridge/Cattle Hill under alternative B were considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the habitat restoration and protection projects as well as the SNRAMP combined with the adverse effects from the fire management activities, maintenance operations, and other agency projects and the lack of impacts from alternative B would result in negligible cumulative impacts on the mission blue butterfly.

**SWEENEY RIDGE/CATTLE HILL ALTERNATIVE B CONCLUSION TABLE**

| <b>Mission Blue Butterfly Impacts</b>          | <b>Rationale</b>                       | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|--|---|-------------------------------|
| No impact, assuming compliance (at both sites) | Dogs would be prohibited at both sites | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Under alternative C, no dog walking would be allowed at Sweeney Ridge. At Cattle Hill, on-leash dog walking would be allowed on the Baquiano Trail from Fassler Avenue up to and including the Farallon View Trail. However, recent habitat surveys indicate that mission blue butterfly host plants are not present at Cattle Hill (NRM Environmental Consulting 2007, 2; URS Corporation 2010, Figure 6). Therefore, there would be no impact on the mission blue butterfly since there is no mission blue butterfly habitat at Cattle Hill and no dogs would be allowed at Sweeney Ridge, which supports mission blue butterfly habitat along the majority of trails at the site (May & Associates, Inc. 2006).

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Sweeney Ridge/Cattle Hill is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since dog walking would not be allowed at Sweeney Ridge, commercial dog walking under alternative C would have no impact on the mission blue butterfly. Since there is no mission blue butterfly habitat at Cattle Hill there would be no impact on the mission blue butterfly from commercial dog walkers.

**Cumulative Impacts.** Under alternative C, the cumulative impacts on the mission blue butterfly would be the same as those under alternative B: negligible.

## Chapter 4: Environmental Consequences

**SWEENEY RIDGE/CATTLE HILL ALTERNATIVE C CONCLUSION TABLE**

| <b>Mission Blue Butterfly Impacts</b>          | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|--|---|-------------------------------|
| No impact, assuming compliance (at both sites) | Dogs would be prohibited at Sweeney Ridge; no mission blue butterfly habitat exists at Cattle Hill | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** This alternative would have the same dog walking restrictions as described for alternative B, and impacts would be the same: no impact.

Since dogs would not be allowed at Sweeney Ridge/Cattle Hill, there would be no impact from commercial dog walkers on the mission blue butterfly.

**Cumulative Impacts.** The lack of impacts on the mission blue butterfly from dogs at Sweeney Ridge/Cattle Hill under alternative D was considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the habitat restoration and protection projects as well as the SNRAMP combined with the adverse effects from the fire management activities, maintenance operations, and other agency projects and the lack of impacts from alternative D would result in negligible cumulative impacts on the mission blue butterfly.

**SWEENEY RIDGE/CATTLE HILL ALTERNATIVE D CONCLUSION TABLE**

| <b>Mission Blue Butterfly Impacts</b>          | <b>Rationale</b>                       | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|--|---|-------------------------------|
| No impact, assuming compliance (at both sites) | Dogs would be prohibited at both sites | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would allow on-leash dog walking at Sweeney Ridge on Sneath Lane, on the Sweeney Ridge Trail from the Portola Discovery site to Notch Trail, and on to the junction with Mori Ridge Trail; the Notch Trail would remain closed to dogs. At Cattle Hill, dogs would be allowed on leash on the Baquiano Trail from Fassler Avenue up to and including the Farallon View Trail; recent habitat surveys indicate that mission blue butterfly host plants are not present at Cattle Hill (NRM Environmental Consulting 2007, 2; URS Corporation 2010, Figure 6). However, the mission blue butterfly is known to occur along the Notch Trail at Sweeney Ridge and the host plants are known to occur in other areas at Sweeney Ridge (USFWS 1995, 3) that would be open to dog walking under alternative E, including along Sweeney Ridge Trail (May & Associates, Inc. 2006). The LOD would include areas adjacent to the trails/roads up to 6 feet. Impacts on areas adjacent to the trail (6-foot corridor or LOD area) would be long term, minor, and adverse at Sweeney Ridge since existing vegetation that supports the mission blue butterfly is located along the trail and could be damaged as a result of dogs.

The long-term minor adverse impacts from dogs in the LOD would occur in a relatively small area when compared to the site as a whole; therefore, the overall impact on the mission blue butterfly from on-leash dog walking at Sweeney Ridge would be negligible, assuming compliance. There would be no impact on the mission blue butterfly at Cattle Hill since there is no mission blue butterfly habitat at this site.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Sweeney Ridge/Cattle Hill is not one of the park sites where permits

would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at Sweeney Ridge, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on the mission blue butterfly at Sweeney Ridge. There would be no impact on the mission blue butterfly at Cattle Hill from commercial dog walkers since there is no mission blue butterfly habitat at this site.

**Cumulative Impacts.** The negligible impacts on the mission blue butterfly from dogs at Sweeney Ridge under alternative E were considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the habitat restoration and protection projects as well as the SNRAMP combined with the adverse effects from the fire management activities, maintenance operations, and other agency projects and the negligible impacts from alternative E at Sweeney Ridge would result in negligible cumulative impacts on the mission blue butterfly.

The lack of impacts on the mission blue butterfly from dogs at Cattle Hill under alternative E was considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the habitat restoration and protection projects combined with the adverse effects from the fire management activities, maintenance operations, and other agency projects and the lack of impacts from alternative E at Cattle Hill would result in negligible cumulative impacts on the mission blue butterfly.

**SWEENEY RIDGE/CATTLE HILL ALTERNATIVE E CONCLUSION TABLE**

| <b>Mission Blue Butterfly Impacts</b>                            | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|--|---|-------------------------------|
| Overall negligible impacts at Sweeney Ridge, assuming compliance | Physically restraining dogs would protect mission blue habitat off trail; trails and the LOD area are a small portion of the site at Sweeney Ridge | Beneficial, assuming compliance                     | Negligible cumulative impacts |
| No impact at Cattle Hill, assuming compliance                    | No mission blue butterfly habitat exists at Cattle Hill  | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** On-leash dog walking would be allowed at Sweeney Ridge on Sneath Lane and Sweeney Ridge Trail between the Portola Discovery site and the Nike Missile Site. On-leash dog walking would be allowed at Cattle Hill on Baquiano Trail from Fassler Avenue up to and including Farallon View Trail. Recent habitat surveys indicate that mission blue butterfly host plants are not present at Cattle Hill (NRM Environmental Consulting 2007, 2; URS Corporation 2010, Figure 6). Therefore, there would be no impact on the mission blue butterfly at Cattle Hill since there is no mission blue butterfly habitat at this site. The mission blue butterfly is known to occur along the Sweeney Ridge Trail (May & Associates, Inc. 2006), which would be open to dog walking under the preferred alternative. The LOD would include areas adjacent to the trails/roads up to 6 feet. Impacts on areas adjacent to the trail (6-foot corridor or LOD area) would be long term, minor, and adverse at Sweeney Ridge since existing vegetation that supports the mission blue butterfly is located along the trail and could be damaged as a result of dogs.

The long-term minor adverse impacts from dogs in the LOD would occur in a relatively small area when compared to the site as a whole; therefore, the overall impact on the mission blue butterfly from on-leash dog walking at Sweeney Ridge would be negligible, assuming compliance. There would be no impact on the mission blue butterfly at Cattle Hill since there is no mission blue butterfly habitat at this site.

## Chapter 4: Environmental Consequences

All dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Sweeney Ridge/Cattle Hill is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since dog walking would not be allowed at Sweeney Ridge, commercial dog walking under alternative C would have no impact on the mission blue butterfly. Since there is no mission blue butterfly habitat at Cattle Hill there would be no impact on the mission blue butterfly from commercial dog walkers.

**Cumulative Impacts.** Projects and actions in and near Sweeney Ridge/Cattle Hill were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the mission blue butterfly at or in the vicinity of this site.

The *San Bruno Elfin and Mission Blue Butterflies Recovery Plan* (USFWS 1984), Wildland/Urban Interface Initiative projects, habitat restoration programs, ongoing monitoring, and volunteer opportunities sponsored by the park—such as efforts with the Golden Gate National Parks Conservancy to restore mission blue butterfly habitat in San Mateo County—all have the potential to beneficially affect the mission blue butterfly and its habitat at Sweeney Ridge. Additionally, controlled burns will be conducted to help restore mission blue butterfly habitat through beneficial ecological disturbance effects (GGNPC 2010d, 1–2). The primary objective of the *San Bruno Elfin and Mission Blue Butterflies Recovery Plan* (USFWS 1984) is to protect, maintain, and enhance existing populations of the two endangered butterfly species. Management activities described in the plan that will benefit the mission blue butterfly include protecting essential habitat outside targeted park locations through cooperative agreements with adjacent landowners and negotiating conservation easements or similar land conservation agreements (USFWS 1984). Additional acreage of mission blue butterfly habitat will be restored under an agreement with USFWS.

Fragments of unique plant and animal habitats within Pacifica, or natural areas, have been preserved within the parks that are managed by the SFRPD. The SNRAMP is intended to guide natural resource protection, habitat restoration, trail and access improvements, other capital projects, and maintenance activities over the next 20 years (SFPD 2011, 1). The scope of the SNRAMP analysis includes a natural area managed by the SFRPD in Pacifica and addresses dog walking (including on-leash dog walking and off-leash DPAs) in these areas (SFPD 2011, 261-262). The mission blue butterfly has been recorded at Sharp Park (SFPD 2011, 278), which is a natural area located adjacent to Sweeney Ridge and managed under the SNRAMP. Project activities included in the SNRAMP will protect this listed species and provide long-term beneficial impacts to the mission blue butterfly.

Additional actions have had, are currently having, or have the potential to have adverse impacts on the mission blue butterfly and its habitat at or in the vicinity of GGNRA sites such as Sweeney Ridge/Cattle Hill. The park stewardship programs, maintenance operations, and other agency projects may have moderate short- and/or long-term adverse impacts associated with them that would require mitigation to minimize effects on mission blue butterfly habitat.

The negligible impacts from dogs on the mission blue butterfly at Sweeney Ridge were considered together with the above projects. The beneficial effects from the habitat restoration and protection projects combined with the adverse effects from the fire management activities, maintenance operations, and other agency projects and the negligible impacts from the preferred alternative at Sweeney Ridge would result in negligible cumulative impacts on the mission blue butterfly.

The lack of impacts on the mission blue butterfly from dogs at Cattle Hill under the preferred alternative was considered together with the effects of the projects mentioned above. The beneficial effects from the habitat restoration and protection projects as well as the SNRAMP combined with the adverse effects

from the fire management activities, maintenance operations, and other agency projects and the lack of impacts from the preferred alternative would result in negligible cumulative impacts on the mission blue butterfly at Cattle Hill.

**SWEENEY RIDGE/CATTLE HILL PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| <b>Mission Blue Butterfly Impacts</b>                            | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|--|---|-------------------------------|
| Overall negligible impacts at Sweeney Ridge, assuming compliance | Physically restraining dogs would protect mission blue habitat off trail; trails and the LOD area are a small portion of the site at Sweeney Ridge | Beneficial, assuming compliance                     | Negligible cumulative impacts |
| No impact at Cattle Hill, assuming compliance                    | No mission blue butterfly habitat exists at Cattle Hill  | Beneficial, assuming compliance                     | Negligible cumulative impacts |

### **Rancho Corral de Tierra**

**Alternative A: No Action.** Currently, on-leash dog walking is allowed at Rancho Corral de Tierra. Some areas of the Rancho site are dominated by coastal scrub, chaparral, and grassland vegetation along the trails that allow on-leash dog walking. In the Montara area, patches of mission blue butterfly host plants (*Lupinus variicolor*) exist above Old San Pedro Road. Of the three lupine host plant species, *Lupinus variicolor* is the least favored, but is still important to the life cycle of the mission blue butterfly. Suitable breeding habitat for the mission blue butterfly also occurs in parts of the El Granada area at Rancho, including near Denniston Ridge Trail and near Montara Mountain (URS 2010, Figure 6). Staff regularly working at Rancho characterize use by dog walkers as low to moderate, and compliance with the leash law is generally low. At Rancho, NPS rangers have observed off-leash dogs running in areas with unmarked, potentially sensitive habitat, including within areas that support mission blue butterfly host plants in the Montara area.

Alternative A would continue to result in long-term minor adverse impacts on the mission blue butterfly at Rancho Corral de Tierra through damage to host plants and habitat, particularly areas along roads and adjacent areas, as a result of dogs. These impacts on mission blue butterfly habitat would be considered perceptible changes, but localized at the site and therefore minor. According to information from the Montara Dog Group and subsequent staff observations, dog walkers, particularly off-leash dog walkers, primarily use the lower elevations of the site at both the Montara and El Granada areas. The terrain at El Granada is particularly steep and challenging, thus dog walking use in that area appears to be concentrated mostly in the lower elevations. Although the Montara area is less steep, visitor use there is similarly concentrated in the lower elevations, but some dog walkers in the Montara area do use trails that connect to the top of the Rancho site.

No permit system exists for dog walking under alternative A. Commercial dog walkers typically use the El Granada area off of Coral Reef Avenue; however, commercial dog walking is considered a low use at the site overall. Therefore, commercial dog walking would have negligible impacts on the mission blue butterfly at this site.

**Cumulative Impacts.** Projects and actions in and near Rancho Corral de Tierra were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the mission blue butterfly at or in the vicinity of this site. Since the Rancho Corral de Tierra site has been transferred to the NPS, general protection of the site and associated natural resources would occur, although some impacts may remain from prior unregulated off-leash dog walking.

## Chapter 4: Environmental Consequences

The primary objective of the *San Bruno Elfin and Mission Blue Butterflies Recovery Plan* (USFWS 1984) is to protect, maintain, and enhance existing populations of the two endangered butterfly species. Management activities described in the plan that will benefit the mission blue butterfly include protecting essential habitat outside targeted park locations through cooperative agreements with adjacent landowners and negotiating conservation easements or similar land conservation agreements (USFWS 1984). Additional acreage of mission blue butterfly habitat will be restored under an agreement with USFWS. Since the mid-1980's, restoration work has been ongoing at San Bruno Mountain, which has habitat that supports the mission blue butterfly and is located just north of Rancho Corral de Tierra. The San Bruno Mountain Habitat Conservation Plan (HCP) requires restoration of graded or disturbed lands to meet the primary goal of establishing high quality habitat for the mission blue butterfly as well as the Callippe silverspot (*Speyeria callippe callippe*) (San Mateo County Department of Public Works and Parks 2013, 16). Most recently, the restoration of the Northeast Ridge at San Bruno Mountain for the mission blue butterfly was initiated in 2012 (San Mateo County Department of Public Works and Parks 2013, 15). Since the Rancho Corral de Tierra site has been transferred to NPS, general maintenance and protection of the site and associated natural resources would occur, but currently the park has no site-specific plans to restore host plants for the mission blue butterfly. The effects from future construction projects, maintenance operations, and other agency projects on mission blue butterfly habitat may be adverse, but these actions have not yet been identified and are currently unknown and would likely require mitigation.

The long-term minor adverse impacts on the mission blue butterfly from dogs at Rancho Corral de Tierra under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from the habitat restoration and protection projects should reduce some of the adverse impacts on the mission blue butterfly from alternative A. Even though the effects from other construction projects, maintenance operations, and other agency projects on mission blue butterfly habitat may be adverse they are relatively unknown at the time, and the benefits from restoration actions at San Bruno Mountain should mitigate these adverse impacts. Therefore, the cumulative impacts on the mission blue butterfly under this alternative would be expected to be negligible.

**RANCHO CORRAL DE TIERRA ALTERNATIVE A CONCLUSION TABLE**

| <b>Mission Blue Butterfly Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---------------------------------------|---|---|-------------------------------|
| Long-term minor adverse impacts       | Dogs could damage mission blue butterfly habitat located adjacent to roads; off-leash dogs have been observed in areas that support host plants | N/A   | Negligible cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** On-leash dog walking would be allowed on designated trails in two areas open to dog walking near Montara and El Granada, which were identified by the local dog walking group as key areas for this use. Mission blue butterfly host plants are known to near the Old San Pedro Road that would be open to dog walking under alternative B. The LOD would include areas adjacent to the trails/roads up to 6 feet. Impacts on areas adjacent to the trail (6-foot corridor or LOD area) would be negligible since existing vegetation that supports the mission blue butterfly is located beyond the road. The negligible impacts from dogs in the LOD would occur in a relatively small area when compared to the site as a whole. Under alternative B, physically restraining dogs would protect mission blue butterfly host plants in areas near Old San Pedro Road. The overall impact on the mission blue butterfly from on-leash dog walking at Rancho Corral de Tierra would be negligible, assuming compliance.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Currently, commercial dog walking use is low at Rancho Corral de Tierra; therefore, commercial dog walking would have negligible impacts on the mission blue butterfly.

**Cumulative Impacts.** The negligible impacts on the mission blue butterfly habitat from dogs at Rancho Corral de Tierra under alternative B were considered together with the effects of the projects mentioned under alternative A. The anticipated beneficial effects from other restoration plans combined with other construction projects, maintenance operations, and other agency projects on mission blue butterfly habitat which may be adverse are relatively unknown at the time. Therefore, the negligible impacts on the mission blue butterfly habitat from alternative B would result in negligible cumulative impacts.

**RANCHO CORRAL DE TIERRA ALTERNATIVE B CONCLUSION TABLE**

| Mission Blue Butterfly Impacts                  | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect mission blue butterfly habitat off the road; trails/road and the LOD area are a small portion of the site | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Under alternative C, on-leash dog walking would be allowed on the same trails as alternative B within two areas open to dog walking at Rancho Corral de Tierra in the Montara and El Granada areas. A ROLA is also proposed under alternative C in the Montara area between Le Conte Street and Tamarind Street, in an open grassy area near the Farallone View School. The proposed ROLA is not located within habitat that supports mission blue butterfly host plants. Therefore, alternative C would have the same impacts as alternative B: overall negligible, assuming compliance.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Rancho Corral de Tierra is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs, with a limit of six. Currently, commercial dog walking use is low at Rancho Corral de Tierra; therefore, commercial dog walking under this alternative would have negligible impacts on the mission blue butterfly.

**Cumulative Impacts.** Under alternative C, the cumulative impacts on the mission blue butterfly at this park site would be the same as those under alternative B: negligible.

**RANCHO CORRAL DE TIERRA ALTERNATIVE C CONCLUSION TABLE**

| Mission Blue Butterfly Impacts                  | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect mission blue butterfly habitat off the road; trails/road are a small portion of the site; host plants do not occur within or near ROLA | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Under alternative D, on-leash dog walking would be allowed in the Montara area on two trails that allow dog walking: Old San

## Chapter 4: Environmental Consequences

Pedro Mountain Road and the Farallon Cutoff. Dogs would be prohibited in other areas of the site, including the entire El Granada area. If dogs are physically restrained on leash at Montara on two trails open to dog walking under alternative D, they should not gain access to mission blue butterfly host plants. Impacts on areas adjacent to the trail (6-foot corridor or LOD area) would be negligible since existing vegetation that supports the mission blue butterfly is located beyond the Old San Pedro Mountain Road. The negligible impacts from dogs in the LOD would occur in a relatively small area when compared to the site as a whole. Under alternative D, physically restraining dogs would protect mission blue butterfly host plants in areas near Old San Pedro Road. The overall impact on the mission blue butterfly from on-leash dog walking at Rancho Corral de Tierra would be negligible, assuming compliance.

Since no commercial dog walking would be allowed and no permits for walking more than three dogs would be issued under alternative D, no impact on the mission blue butterfly from commercial and permitted dog walking would occur.

**Cumulative Impacts.** Under alternative D, the cumulative impacts on the mission blue butterfly at this park site would be the same as those under alternative B: negligible.

**RANCHO CORRAL DE TIERRA ALTERNATIVE D CONCLUSION TABLE**

| <b>Mission Blue Butterfly Impacts</b>           | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect mission blue butterfly habitat off the road; trails/road and the LOD area are a small portion of the site | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would have the same dog walking restrictions as alternative C, and impacts would be the same: overall negligible, assuming compliance.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Currently, Rancho Corral de Tierra is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs, with a limit of six. Commercial dog walking use is low at Rancho Corral de Tierra; therefore, commercial dog walking would have negligible impacts on the mission blue butterfly.

**Cumulative Impacts.** Under alternative E, the cumulative impacts on the mission blue butterfly at this park site would be the same as those under alternative B: negligible.

**RANCHO CORRAL DE TIERRA ALTERNATIVE E CONCLUSION TABLE**

| <b>Mission Blue Butterfly Impacts</b>           | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--|---|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect mission blue butterfly habitat off the road; trails/road are a small portion of the site; host plants do not occur within or near ROLA | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative B, allowing on-leash dog walking on some trails at Rancho Corral de Tierra in the Montara and El Granada areas. Mission blue butterfly host plants are known to near the Old San Pedro Road that would be open to dog walking under the preferred alternative. The LOD would include areas adjacent to the trails/roads up to 6 feet. Impacts on areas adjacent to the trail (6-foot corridor or LOD area) would be negligible since existing vegetation that supports the mission blue butterfly is located beyond the road. The negligible impacts from dogs in the LOD would occur in a relatively small area when compared to the site as a whole. Under the preferred alternative, physically restraining dogs would protect mission blue butterfly host plants in areas near Old San Pedro Road. The overall impact on the mission blue butterfly from on-leash dog walking at Rancho Corral de Tierra would be negligible, assuming compliance.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Rancho Corral de Tierra is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs, with a limit of six. Currently, commercial dog walking use is low at Rancho Corral de Tierra; therefore, commercial dog walking would have negligible impacts on the mission blue butterfly.

**Cumulative Impacts.** Projects and actions in and near Rancho Corral de Tierra were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the mission blue butterfly at or in the vicinity of this site. Since the Rancho Corral de Tierra site has been transferred to the NPS, general protection of the site and associated natural resources would occur, although some impacts may remain from prior unregulated off-leash dog walking.

The primary objective of the *San Bruno Elfin and Mission Blue Butterflies Recovery Plan* (USFWS 1984) is to protect, maintain, and enhance existing populations of the two endangered butterfly species. Management activities described in the plan that will benefit the mission blue butterfly include protecting essential habitat outside targeted park locations through cooperative agreements with adjacent landowners and negotiating conservation easements or similar land conservation agreements (USFWS 1984). Additional acreage of mission blue butterfly habitat will be restored under an agreement with USFWS. Since the mid-1980's, restoration work has been ongoing at San Bruno Mountain, which has habitat that supports the mission blue butterfly and is located just north of Rancho Corral de Tierra. The San Bruno Mountain Habitat Conservation Plan (HCP) requires restoration of graded or disturbed lands to meet the primary goal of establishing high quality habitat for the mission blue butterfly as well as the Callippe silverspot (San Mateo County Department of Public Works and Parks 2013, 16). Most recently, the restoration of the Northeast Ridge at San Bruno Mountain for the mission blue butterfly was initiated in 2012 (San Mateo County Department of Public Works and Parks 2013, 15). Since the Rancho Corral de Tierra site has been transferred to NPS, general maintenance and protection of the site and associated natural resources would occur, but the park currently has no site-specific plans to restore host plants for this species at Rancho. The effects from future construction projects, maintenance operations, and other agency projects on mission blue butterfly habitat may be adverse, but these actions have not yet been identified and are currently unknown and would likely require mitigation.

The negligible impacts on the mission blue butterfly habitat from dogs at Rancho Corral de Tierra under the preferred alternative were considered together with the effects of the projects mentioned above. The anticipated beneficial effects from other restoration plans combined with other construction projects, maintenance operations, and other agency projects on mission blue butterfly habitat which may be adverse are relatively unknown at the time. Therefore, the negligible impacts on the mission blue butterfly habitat from the preferred alternative would result in negligible cumulative impacts.

RANCHO CORRAL DE TIERRA PREFERRED ALTERNATIVE F CONCLUSION TABLE

| Mission Blue Butterfly Impacts                  | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect mission blue butterfly habitat off the road; trails/road and the LOD area are a small portion of the site | Beneficial, assuming compliance              | Negligible cumulative impacts |

**IMPACTS TO TIDEWATER GOBY (FEDERALLY ENDANGERED) BY SITE AND ALTERNATIVE**

The tidewater goby is known to occur in high densities in Rodeo Lagoon in the Marin Headlands. In January 2008, the USFWS published a final rule re-designating critical habitat for the tidewater goby that included Rodeo Lagoon, described as critical habitat unit MAR-4 in the final rule (USFWS 2008, 5936, 5941). The *Recovery Plan for the Tidewater Goby* calls for protection and enhancement of currently occupied habitat, including managing freshwater inflow, non-native species, channelization, water quality, and human impacts; developing strategies to prevent further loss of habitat; and conducting research and monitoring (USFWS 2005a).

**Rodeo Beach/South Rodeo Beach (Rodeo Lagoon)**

**Alternative A: No Action.** In the vicinity of Rodeo Lagoon, dog walking is currently allowed under voice control or on leash at both Rodeo Beach and South Rodeo Beach. On-leash dog walking is allowed on the footbridge and access trail to the beach. Rodeo Lake is closed to dogs and is densely vegetated with willows along the shoreline, making access difficult. Rodeo Lagoon is currently closed to dogs and humans for overall resource protection. The NPS has restricted people and dogs from accessing the lagoon. However, there is no physical barrier to prevent dogs or visitors from accessing the lagoon, specifically at the beach–lagoon shoreline. A fence is proposed along the western shoreline of the lagoon that will deter but not physically exclude dogs from accessing the lagoon from the beach. A fence more impervious to dogs in this area is not feasible because winter storm waves wash over the entire beach, and wind-driven litter and debris would be trapped in the fence. The area receives low to moderate use by dog walkers. A total of 30 dog-related incidents were reported with 9 off-leash violations and 7 incidents involving pets within closed areas (table 15). Additionally, park staff members have estimated that they observe dogs in the lagoon at least once a week, and on a daily basis during good weather. Additionally, the voice control areas are located immediately adjacent to the shoreline of the lagoon and the lagoon is not screened and is highly visible and accessible. Because tidewater gobies are resident fish and complete their entire life cycle in Rodeo Lagoon, all life history stages could be affected by dogs that gain access to the lagoon. Specifically, the tidewater goby adults and embryos inhabit breeding burrows in shoreline areas of the lagoon. The park has observed that dogs frequently play and run around in the shallow water of the lagoon and inlet. Dogs along the shoreline of the lagoon could crush goby burrows or goby eggs. Frequent use of the shoreline areas may result in loss of emergent and/or submergent vegetation due to trampling. Loss of cover may increase the risk of predation on the goby. The population of tidewater gobies in Rodeo Lagoon is isolated from other populations and is genetically distinct (Dawson et al. 2001, 4). Even so, impacts on the goby would be localized along the western edge of the lagoon, where dogs sometimes come off the beach into the lagoon; therefore, individuals of the species would be affected but the overall population would not be affected. NPS staff members have issued citations and verbal warnings for dogs accessing Rodeo Lagoon; even one animal stepping into goby habitat could possibly crush the eggs, resulting in a take under the ESA. Although dogs are currently accessing the lagoon, there is no published documentation that dogs have either directly or indirectly affected the goby in Rodeo Lagoon.

Therefore, to encompass possible effects, alternative A impacts on the tidewater goby and its critical habitat would be long term and would range from negligible to moderate and adverse. Generally, impacts would be localized along the western edge of the lagoon. Dogs could gain access to the lagoon and could crush goby burrows or goby eggs; the reproductive success of individuals of the species in a small, localized area (Rodeo Lagoon) could be affected and essential features of designated critical habitat may be impacted. Impacts would be localized but could constitute a permanent loss if tidewater goby individuals or eggs are crushed as a result of disturbance by dogs.

Under alternative A, no permit system exists for commercial dog walking. At Rodeo Beach/South Rodeo Beach, commercial dog walking is uncommon; therefore, commercial dog walking would have negligible impacts on the tidewater goby.

**Cumulative Impacts.** Projects and actions in and near Rodeo Beach/South Rodeo Beach were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the tidewater goby at or in the vicinity of this site.

The recovery plan for the tidewater goby calls for protection and enhancement of currently occupied habitat, including managing freshwater inflow, non-native species, channelization, water quality, and human impacts; developing strategies to prevent further loss of habitat; and conducting research and monitoring (USFWS 2005a). The loss and modification of habitat as well as degradation of water quality are among the principal threats to the tidewater goby as determined by the USFWS (2008a, 5922). The *Marin Headlands/Fort Baker Improvement and Transportation Management Plan/EIS*, the park stewardship programs, maintenance activities, and structural fire operations have the potential to affect the tidewater goby and its habitat. The *Marin Headlands/Fort Baker Improvement and Transportation Management Plan/EIS* (NPS 2009c) may beneficially affect the tidewater goby through slight habitat improvements and substantially reduced sediment and contaminant input into Rodeo Lagoon. Habitat restoration programs are restoring riparian and wetland vegetation along the shoreline. Implementation of best management practices for park maintenance operations and improved facilities for vehicle washing at the fire station at Rodeo Beach/South Rodeo Beach will also reduce sedimentation and improve water quality in the lagoon. The tidewater goby was identified at the Giacomini Ranch in areas proposed for tidal wetland restoration. The NPS and the California State Lands Commission formulated the *Giacomini Wetland Restoration Project* (Marin County, near Tomales Bay), which restored 560 acres of pastures to wetlands of increased complexity and diversity of vegetation and aquatic habitats (NPS 2009k; NPS and CSLC 2007). Therefore, this project could increase habitat for the tidewater goby in the Tomales Bay watershed ecosystem.

The negligible to long-term moderate adverse impacts on the tidewater goby from dogs at Rodeo Beach/South Rodeo Beach under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from the habitat enhancement and protection projects should reduce some of the adverse impacts on the tidewater goby from alternative A. Therefore, the cumulative impacts on the tidewater goby under this alternative would be expected to range from negligible to long term, minor, and adverse.

**RODEO BEACH/SOUTH RODEO BEACH ALTERNATIVE A CONCLUSION TABLE**

| Tidewater Goby and Critical Habitat Impacts      | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts                                       |
|--|---|--|--|
| Negligible to long-term moderate adverse impacts | Dogs gain access to closed lagoon and could crush goby burrows or cause increased turbidity by trampling shoreline areas and re-suspending sediment; impacts would be localized along the western edge of the lagoon; a range of impacts is presented to encompass possible effects | N/A  | Negligible to long-term minor adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** In the vicinity of Rodeo Lagoon, alternative B would allow on-leash dog walking on Rodeo Beach, South Rodeo Beach, and on the footbridge and access trail to the beach. Rodeo Lagoon and Rodeo Lake would remain closed to dogs. Although the goby currently persists at the site under current conditions, limiting dog walking to on leash would avoid impacts on the existing population at Rodeo Lagoon. Additionally, a concurrent NPS project includes the installation of a post-and-cable fence along the beach side of Rodeo Lagoon to discourage visitors from accessing the lagoon, though it would not physically exclude dogs from this area. As stated above, tidewater gobies are resident fish with an isolated gene pool that complete their entire life cycle in Rodeo Lagoon. If dogs are physically restrained on leash at this site and deterred by fencing, they should not gain access to the lagoon or its shorelines. Assuming compliance with proposed regulations, alternative B would result in negligible impacts on the tidewater goby and its critical habitat; no measurable or perceptible changes to individual gobies, the population, or designated critical habitat would occur.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is not common at Rodeo Beach/South Rodeo Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have negligible impacts on the tidewater goby.

**Cumulative Impacts.** The negligible impacts on the tidewater goby from dogs at Rodeo Beach/South Rodeo Beach under alternative B were considered together with the beneficial effects of the projects mentioned above under alternative A. The beneficial effects from the habitat enhancement and protection projects combined with the negligible impacts from alternative B would result in beneficial cumulative impacts.

**RODEO BEACH/SOUTH RODEO BEACH ALTERNATIVE B CONCLUSION TABLE**

| Tidewater Goby and Critical Habitat Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Negligible impacts, assuming compliance     | Rodeo Lagoon would continue to be closed to dogs; physically restraining dogs on leash would prevent dog access to Rodeo Lagoon | Beneficial to no change, assuming compliance | Beneficial cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** In the vicinity of Rodeo Lagoon, alternative C would allow on-leash dog walking on the wooden footbridge over the lagoon. Rodeo Lagoon and Rodeo Lake are currently closed to dogs. Dogs would be allowed under voice and sight control in a ROLA on Rodeo Beach, and a post-and-cable fence is proposed as part of a concurrent project. This fence along the beach side of Rodeo Lagoon would discourage visitors from accessing the lagoon, but would not physically exclude dogs or visitors from this area. The ROLA would include portions of the sparsely vegetated foredunes that extend from the crest of the beach east to the lagoon and south to the ridge on the beach north of South Rodeo Beach. This alternative would not require dog walkers to physically restrain their dogs on leash on Rodeo Beach, which is located immediately adjacent to the gobies and their federally designated critical habitat. Assuming compliance with proposed regulations, alternative C would result in negligible impacts on the tidewater goby and its critical habitat; no measurable or perceptible changes to individual gobies, the population, or designated critical habitat would occur.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. In a ROLA, permit holders may have up to six dogs off leash and the permit may restrict use by time and area. Permits would be allowed at Rodeo Beach/South Rodeo Beach. Impacts on the tidewater goby from permit holders with four to six dogs off leash would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is not common at Rodeo Beach/South Rodeo Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on the tidewater goby.

**Cumulative Impacts.** The negligible impacts on the tidewater goby from dogs at Rodeo Beach/South Rodeo Beach under alternative C were considered together with the beneficial effects of the projects mentioned above under alternative A. The beneficial effects from the habitat enhancement and protection projects combined with the negligible impacts from alternative C would result in beneficial cumulative impacts.

**RODEO BEACH/SOUTH RODEO BEACH ALTERNATIVE C CONCLUSION TABLE**

| Tidewater Goby and Critical Habitat Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Negligible impacts, assuming compliance     | Rodeo Lagoon would continue to be closed to dogs; physically restraining dogs on leash would prevent dog access to Rodeo Lagoon; compliant dogs in the ROLA would not affect the goby; the proposed fence would also deter dogs from gaining access to the lagoon | Beneficial to no change, assuming compliance | Beneficial cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** In the vicinity of Rodeo Lagoon, under alternative D on-leash dog walking would be allowed on Rodeo Beach north of the footbridge to the lagoon and on the footbridge. Impacts would be the same as those for alternative B, assuming compliance: negligible.

## Chapter 4: Environmental Consequences

No commercial dog walking would be allowed and no permits to walk more than three dogs would be issued under alternative D; therefore, commercial and permitted dog walking would have no impact on the tidewater goby.

**Cumulative Impacts.** The negligible impacts on the tidewater goby from dogs at Rodeo Beach/South Rodeo Beach under alternative D were considered together with the beneficial effects of the projects mentioned above under alternative A. The beneficial effects from the habitat enhancement and protection projects combined with the negligible impacts from alternative D would result in beneficial cumulative impacts.

**RODEO BEACH/SOUTH RODEO BEACH ALTERNATIVE D CONCLUSION TABLE**

| Tidewater Goby and Critical Habitat Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Negligible impacts, assuming compliance     | Rodeo Lagoon would continue to be closed to dogs; physically restraining dogs on leash would prevent dog access to the lagoon | Beneficial to no change, assuming compliance | Beneficial cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** This alternative would establish ROLAs on both Rodeo Beach and South Rodeo Beach; on-leash dog walking would be allowed on the footbridge and trail that access the beach. Rodeo Lagoon would remain closed to dogs and people, and the proposed fence along the beach side of Rodeo Lagoon would discourage visitors from accessing the lagoon but would not physically exclude dogs from this area. Although this alternative includes a ROLA, with the addition of the fence as a deterrent, compliance with regulations in this alternative would result in protection of individual gobies and critical habitat. Therefore, assuming compliance, alternative E would result in negligible impacts on the tidewater goby and its critical habitat; no measurable or perceptible changes to individual gobies, the population, or designated critical habitat would occur.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. In a ROLA, permit holders may have up to six dogs off leash and the permit may restrict use by time and area. Permits would be allowed at Rodeo Beach/South Rodeo Beach. Impacts on the tidewater goby from permit holders with four to six dogs off leash would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is not common at Rodeo Beach/South Rodeo Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on the tidewater goby.

**Cumulative Impacts.** The negligible impacts on the tidewater goby from dogs at Rodeo Beach/South Rodeo Beach under alternative E were considered together with the beneficial effects of the projects mentioned above under alternative A. The beneficial effects from the habitat enhancement and protection projects combined with the negligible impacts from alternative E would result in beneficial cumulative impacts.

RODEO BEACH/SOUTH RODEO BEACH ALTERNATIVE E CONCLUSION TABLE

| Tidewater Goby and Critical Habitat Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Negligible impacts, assuming compliance     | Rodeo Lagoon would continued to be closed to dogs; physically restraining dogs on leash would prevent dog access to Rodeo Lagoon; compliant dogs in the ROLA would not affect the goby; the proposed fence would deter dogs from gaining access to the lagoon | Beneficial to no change, assuming compliance | Beneficial cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative would allow on-leash dog walking on the wooden footbridge over the lagoon. Rodeo Lagoon and Rodeo Lake would remain closed to dogs and people. Dogs would be allowed under voice and sight control in a ROLA on Rodeo Beach south to the sea stacks that divide the main beach from South Rodeo Beach, and a post-and-cable fence along the west end of the lagoon is proposed as part of a concurrent project. This fence would discourage visitors from accessing the lagoon, but would not physically exclude dogs or visitors from this area. The ROLA would include portions of the sparsely vegetated foredunes that extend from the crest of the beach east to the lagoon and south to the ridge on the beach just north of South Rodeo Beach. This alternative would not require dog walkers to physically restrain their dogs on leash on Rodeo Beach, which is located immediately adjacent to the gobies and their federally designated critical habitat. Assuming compliance with proposed regulations, the preferred alternative would result in negligible impacts on the tidewater goby and its critical habitat; no measurable or perceptible changes to individual gobies, the population, or designated critical habitat would occur.

All dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. In a ROLA, permit holders may have up to six dogs off leash and the permit may restrict use by time and area. Permits would be allowed at Rodeo Beach/South Rodeo Beach. Impacts on the tidewater goby from permit holders with four to six dogs off leash would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is not common at Rodeo Beach/South Rodeo Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have negligible impacts on the tidewater goby.

**Cumulative Impacts.** Projects and actions in and near Rodeo Beach/South Rodeo Beach were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the tidewater goby at or in the vicinity of this site.

The recovery plan for the tidewater goby calls for protection and enhancement of currently occupied habitat, including managing freshwater inflow, non-native species, channelization, water quality, and human impacts; developing strategies to prevent further loss of habitat; and conducting research and monitoring (USFWS 2005a). The loss and modification of habitat as well as degradation of water quality are among the principal threats to the tidewater goby as determined by the USFWS (2008a, 5922). The *Marin Headlands/Fort Baker Improvement and Transportation Management Plan/EIS*, the park stewardship programs, maintenance activities, and structural fire operations have the potential to affect the tidewater goby and its habitat. The *Marin Headlands/Fort Baker Improvement and Transportation*

## Chapter 4: Environmental Consequences

*Management Plan/EIS* may beneficially affect the tidewater goby through slight habitat improvements and substantially reduced sediment and contaminant input into Rodeo Lagoon. Habitat restoration programs are restoring riparian and wetland vegetation along the shoreline. Implementation of best management practices for park maintenance operations and improved facilities for vehicle washing at the fire station at Rodeo Beach will also reduce sedimentation and improve water quality in the lagoon. The tidewater goby was identified at the Giacomini Ranch in areas proposed for tidal wetland restoration. The *Giacomini Wetland Restoration Project* (near Tomales Bay), which is restoring wetlands at the Giacomini Ranch, could increase habitat for the tidewater goby in the Tomales Bay watershed ecosystem.

The negligible impacts on the tidewater goby from dogs at Rodeo Beach/South Rodeo Beach under the preferred alternative were considered together with the beneficial effects of the projects mentioned above. The beneficial effects from the habitat enhancement and protection projects combined with the negligible impacts from the preferred alternative would result in beneficial cumulative impacts.

**RODEO BEACH/SOUTH RODEO BEACH PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| Tidewater Goby and Critical Habitat Impacts | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Negligible impacts, assuming compliance     | Rodeo Lagoon would continue to be closed to dogs; physically restraining dogs on leash would prevent dog access to Rodeo Lagoon; compliant dogs in the ROLA would not affect the goby; the proposed fence would deter dogs from gaining access to the lagoon | Beneficial to no change, assuming compliance | Beneficial cumulative impacts |

### **IMPACTS TO THE COHO SALMON (FEDERALLY AND STATE ENDANGERED) AND STEELHEAD TROUT (FEDERALLY THREATENED) BY SITE AND ALTERNATIVE**

The central California coast coho salmon evolutionarily significant unit is listed as federally endangered as well as state endangered. In GGNRA, a genetically distinct run of coho salmon is found in the Marin Headlands, specifically in Redwood Creek at Muir Beach. Designated critical habitat for coho includes the majority of accessible estuarine and stream areas in the coastal watersheds of Marin County, including Redwood Creek in GGNRA.

The central California coast steelhead trout distinct population segment is listed as federally threatened. In the study area, this species occurs in Stinson Beach (Easkoot Creek), Muir Beach (Redwood Creek), Rodeo Beach (Rodeo Lagoon), and the Marin Headlands Trails (Rodeo Creek and Gerbode Creek) and potentially at Rancho Corral de Tierra (Martini Creek, Denniston Creek, and San Vicente Creek). Designated critical habitat for central California coast steelhead trout is mapped in Denniston Creek downstream of Denniston Reservoir, which is mostly off GGNRA property at Rancho Corral de Tierra. Designated critical habitat also includes most of the coastal streams of Marin County, including Redwood Creek in GGNRA (NOAA 2005, 76).

Designated critical habitat for central California coast steelhead trout includes most of the coastal streams of Marin County, including Redwood Creek in GGNRA (NOAA 2005, 76). At the Rodeo Beach site, it is likely that the steelhead trout is only found in Rodeo Lagoon for very limited periods and only during migration due to existing poor water quality at the lagoon. Because of the limited use of Rodeo Lagoon by the steelhead trout, all impacts on the steelhead trout at this site would be considered negligible; therefore, impacts on the steelhead in Rodeo Lagoon at Rodeo Beach are not discussed further in this

section. Similarly, the steelhead trout has infrequent access to Easkoot Creek at the Stinson Beach site. However, Easkoot Creek is densely vegetated with riparian plant species and generally difficult for leashed dogs to access. Because of the difficulty of access to Easkoot Creek, all impacts on the steelhead trout at this site would be considered negligible; therefore, impacts on the steelhead in Easkoot Creek at Stinson Beach are not discussed further in this section. The following sections analyze impacts to steelhead trout at Muir Beach (Redwood Creek) and the Marin Headlands Trails (Rodeo Creek and Gerbode Creek).

### **Muir Beach (Coho Salmon and Steelhead Trout, Redwood Creek)**

**Alternative A: No Action.** In the vicinity of Muir Beach, the Muir Beach Trail, boardwalk/path to the beach that crosses Redwood Creek, and the parking area are currently open to dogs on-leash, and the beach is open to dogs under voice control. The park has closed the lagoon and Redwood Creek, although it has been observed that these closures have been violated and dogs have accessed Redwood Creek. A total of 24 dog-related violations were reported from 2008 through 2011 (table 14). The most common violations were for having dogs off-leash (9 violations) and having dogs within closed areas (4 violations) (table 14). The fence along the beach side of lower Redwood Creek and the lagoon discourages visitors from accessing the water, but does not physically exclude dogs or visitors from this area. The Muir Beach Community is located adjacent to this area, which results in high visitation on the weekends at Muir Beach. Park staff has observed that some local residents' dogs run free and leave dog waste without proper disposal at Muir Beach. The voice control area of Muir Beach encompasses the entrance channel of Redwood Creek and is located immediately adjacent to the shoreline of the lagoon, which has recently been restored. There is no physical barrier to prevent dogs from accessing portions of Redwood Creek that support coho salmon. Coho salmon and steelhead trout both use Redwood Creek throughout their life cycle, from migrating and laying eggs as adults to living in the stream as juveniles (NPS 2008c). Salmonids in general are sensitive to water quality issues; coho salmon are heavily dependent on stream flow and very sensitive to water temperature (NPS 2008c). Because these salmonids complete sensitive portions of their life cycle in Redwood Creek, adult and juvenile life history stages could be affected by dogs that gain access to the creek. Eggs would not be affected, because salmonids require gravel areas of substrate for laying eggs; these areas are located farther upstream from the area where dogs can access Redwood Creek. Dogs along the shoreline of Redwood Creek could alter the normal behavior of coho salmon and steelhead trout directly if they frequently access the creek or its shoreline, or indirectly by causing increased turbidity by trampling shoreline areas and re-suspending sediment so that feeding is impaired. Potential impacts would be localized to the small area where dogs can access Redwood Creek. There is no documentation that dogs have either directly or indirectly affected either coho salmon or steelhead trout in Redwood Creek. Although these salmonids persist at the site under current conditions, a recent salmon decline has been observed in Redwood Creek. While a portion of this decline can be attributed to regional oceanic phenomena, local conditions that have not yet been determined may also have been a factor (NPS 2008c).

Therefore, alternative A impacts on the coho salmon and steelhead trout as well as associated critical habitat would be long term and would range from negligible to minor and adverse. A few individuals of the species in a small, localized area (Redwood Creek) could be occasionally affected by disturbance from dogs but essential features of critical habitat would not be impacted.

Under alternative A, no permit system exists for commercial dog walking. At Muir Beach, commercial dog walking is uncommon; therefore, commercial dog walking would have negligible impacts on the salmonids.

**Cumulative Impacts.** Projects and actions in and near Muir Beach were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently

## Chapter 4: Environmental Consequences

having, or have the potential to have effects on coho salmon and steelhead trout at or in the vicinity of this site.

The park monitors coho salmon and steelhead trout annually in Redwood Creek and is conducting habitat restoration and protection activities, particularly in Redwood Creek. There were no spawning coho salmon observed during the 2007–2008 winter monitoring period, although a small number of coho fry were observed the next spring. While a portion of this decline can be attributed to regional oceanic phenomena, local conditions that have not yet been identified may also have been a factor (NPS 2008c, 2). The degradation of spawning (gravel) habitat, habitat alteration, and water diversions are among the primary threats to steelhead trout. Numerous creek and wetland restoration projects currently underway or proposed, the *Marin Headlands/Fort Baker Improvement and Transportation Management Plan/EIS*, park stewardship programs, implementation of the GGNRA *Fire Management Plan* (NPS 2005b), Wildland/Urban Interface Initiative projects, habitat restoration programs, and maintenance operations all have the potential to affect coho salmon and steelhead trout as well as associated critical habitat.

Overall, many of the projects that have been completed, or are currently being implemented, or are planned for future implementation or are long term in GGNRA will benefit coho salmon and steelhead trout. Examples of projects and plans that will provide some benefit to these salmonids and critical habitat are described in this paragraph. The *Coho and Steelhead Restoration Project* has been initiated by the NPS, and focuses on Pine Gulch, Redwood, Olema, and Lagunitas creeks and their watersheds. This project includes assessing current coho salmon and steelhead trout abundance and distribution and developing and implementing a plan for restoring and monitoring the fish and their habitat. The *Muir Beach Wetland and Creek Restoration Project* aimed to restore a functional, self-sustaining ecosystem at the lagoon and included wetland, riparian, and aquatic components to re-create habitat for sustainable populations of special-status species, including habitat for federally and state-listed endangered coho salmon and federally threatened steelhead trout. The *Lower Redwood Creek Interim Flood Reduction Measures and Floodplain/Channel Restoration* project helped to reduce flooding on Pacific Way in Muir Beach, maintained passage for federally threatened fish in Redwood Creek, and restored habitat and the floodplain at the GGNRA Banducci site. Specifically, this project reconnected Redwood Creek to its floodplain, expanded riparian vegetation, increased in-channel habitat complexity, and reestablished geomorphic processes, thus improving habitat for coho salmon and steelhead trout. The *Redwood Creek Watershed: Vision for the Future* project included efforts by public agencies in the watershed, who worked with the public and the vision team to identify issues and values in the watershed and define desired future conditions for watershed resources to create a Redwood Creek watershed that exists as an intact natural ecosystem and offers opportunities to learn, experience, and protect nature, rural character, and cultural history in an urbanized area.

The negligible to long-term minor adverse impacts on coho salmon and steelhead trout from dogs at Muir Beach under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from the habitat restoration projects should reduce some of the adverse impacts on coho salmon and steelhead trout from alternative A. Therefore, cumulative impacts on coho salmon under this alternative would be expected to be negligible.

**MUIR BEACH ALTERNATIVE A CONCLUSION TABLE**

| Coho Salmon, Steelhead Trout and Critical Habitat Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Negligible to long-term minor adverse impacts             | Lagoon and Redwood Creek closures have been violated; adult and juvenile life stages could be affected by dogs gaining access to the creek and indirectly causing increased turbidity by trampling shoreline areas and re-suspending sediment | N/A  | Negligible cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** In the vicinity of Muir Beach, alternative B would require on-leash dog walking on the beach, the bridge and path to the beach, the parking area, and the proposed Muir Beach Trail. The lagoon and Redwood Creek would remain closed to dogs. The fence along the beach side of lower Redwood Creek and lagoon discourages visitors from accessing the water, but does not physically exclude dogs or visitors from this area. As stated above, coho salmon and steelhead trout complete sensitive portions of their life cycle in Redwood Creek. If dogs are physically restrained on leash at this site and deterred by fencing, they should not gain access to the creek or its shorelines and should not affect the salmonids during juvenile and adult life stages. Therefore, assuming compliance, alternative B would result in negligible impacts on the coho salmon and steelhead trout as well as associated critical habitat; no measurable or perceptible changes to individual salmonids, the population, or designated critical habitat would occur.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is not common at Muir Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have negligible impacts on the salmonids.

**Cumulative Impacts.** The negligible impacts on coho salmon and steelhead trout from dogs at Muir Beach under alternative B were considered together with the beneficial effects of the projects mentioned above under alternative A. The beneficial effects from the habitat restoration projects combined with the negligible impacts from alternative B would result in beneficial cumulative impacts on the salmonids.

**MUIR BEACH ALTERNATIVE B CONCLUSION TABLE**

| Coho Salmon, Steelhead Trout, and Critical Habitat Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Negligible impacts, assuming compliance                    | The lagoon and Redwood Creek would continue to be closed to dogs; physically restraining dogs on leash would prevent dog access to the creek and its shorelines | Beneficial to no change, assuming compliance | Beneficial cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would have the same dog walking restrictions as alternative B, and impacts would be the same, assuming compliance: negligible.

## Chapter 4: Environmental Consequences

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Muir Beach is not one of the sites where permits would be issued allowing individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at Muir Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on coho salmon and steelhead trout.

**Cumulative Impacts.** Under alternative C, the cumulative impacts on the salmonids at this park site would be the same as those under alternative B: beneficial.

**MUIR BEACH ALTERNATIVE C CONCLUSION TABLE**

| <b>Coho Salmon, Steelhead Trout, and Critical Habitat Impacts</b> | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--|---|-------------------------------|
| Negligible impacts, assuming compliance                           | The lagoon and Redwood Creek would continue to be closed to dogs; physically restraining dogs on leash would prevent dog access to the creek or its shorelines | Beneficial to no change, assuming compliance        | Beneficial cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** In the vicinity of Muir Beach, alternative D would allow on-leash dog walking in the parking area and on the proposed Muir Beach Trail. The beach and the boardwalk/path to the beach would be closed to dogs. The lagoon and Redwood Creek are currently closed to dogs. The fence along the beach side of lower Redwood Creek and lagoon discourages visitors from accessing the water, but does not physically exclude dogs or visitors from this area. This alternative would provide maximum protection of Redwood Creek for coho salmon and steelhead trout. If dogs are physically restrained on leash at this site and deterred by fencing, they should not gain access to the creek or its shorelines and should not affect the salmonids during juvenile and adult life stages. Therefore, assuming compliance, alternative D would result in negligible impacts on the coho salmon and steelhead trout as well as associated critical habitat; no measurable or perceptible changes to individual salmonids, the population, or designated critical habitat would occur.

No commercial dog walking would be allowed and no permits to walk more than three dogs would be issued under alternative D; therefore, commercial and permitted dog walking would have no impact on the salmonids.

**Cumulative Impacts.** The negligible impacts on coho salmon and steelhead trout from dogs at Muir Beach under alternative D were considered together with the beneficial effects of the projects mentioned above under alternative A. The beneficial effects from the habitat restoration projects combined with the negligible impacts from alternative D would result in beneficial cumulative impacts on the salmonids.

**MUIR BEACH ALTERNATIVE D CONCLUSION TABLE**

| <b>Coho Salmon, Steelhead Trout, and Critical Habitat Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|---|---|-------------------------------|
| Negligible impacts, assuming compliance                           | The lagoon and Redwood Creek would continue to be closed to dogs; physically restraining dogs on leash would prevent dog access to the creek and its shorelines | Beneficial to no change, assuming compliance        | Beneficial cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** At Muir Beach, on-leash dog walking would be allowed on the proposed Muir Beach Trail, the bridge and path to the beach, and the parking lot. The portion of Muir Beach south of the boardwalk/path to the beach (not encompassing the entrance channel to Redwood Creek) would be a designated ROLA open to dogs under voice and sight control. Although a ROLA has been designated under this alternative, it would not be sited near Redwood Creek. The lagoon and Redwood Creek area are currently closed to dogs. The fence along the beach side of lower Redwood Creek and lagoon discourages visitors from accessing the water, but does not physically exclude dogs or visitors from this area. If dogs are physically restrained on leash at this site and deterred by a fence, they should not gain access to the creek or its shorelines and should not affect the salmonids during juvenile and adult life stages. Therefore, assuming compliance, alternative E would result in negligible impacts on the coho salmon and steelhead trout as well as associated its critical habitat; no measurable or perceptible changes to individual salmonids, the population, or designated critical habitat would occur.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Muir Beach is not one of the sites where permits would be issued allowing individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at Muir Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on the salmonids.

**Cumulative Impacts.** The negligible impacts on coho salmon and steelhead trout from dogs at Muir Beach under alternative E were considered together with the beneficial effects of the projects mentioned above under alternative A. The beneficial effects from the habitat restoration projects combined with the negligible impacts from alternative E would result in beneficial cumulative impacts on the salmonids.

**MUIR BEACH ALTERNATIVE E CONCLUSION TABLE**

| <b>Coho Salmon, Steelhead Trout, and Critical Habitat Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|---|---|-------------------------------|
| Negligible impacts, assuming compliance                           | The lagoon and Redwood Creek would continue to be closed to dogs; physically restraining dogs on leash would prevent access to the creek and its shorelines; the ROLA would not be sited near Redwood Creek | Beneficial to no change, assuming compliance        | Beneficial cumulative impacts |

## Chapter 4: Environmental Consequences

**Alternative F: Preferred Alternative.** The preferred alternative would allow on-leash dog walking on the beach, bridge and path to the beach, and the proposed Muir Beach Trail. The lagoon and Redwood Creek would remain closed to dogs. The fence along the beach side of lower Redwood Creek and lagoon discourages visitors from accessing the water, but does not physically exclude dogs or visitors from this area. This alternative would provide protection of Redwood Creek and the coho salmon as well as steelhead trout. If dogs are physically restrained on leash at this site and deterred by fencing, they should not gain access to the creek or its shorelines and should not affect the salmonids during juvenile and adult life stages. Therefore, assuming compliance, the preferred alternative would result in negligible impacts on the coho salmon and steelhead trout as well as associated critical habitat; no measurable or perceptible changes to individual salmonids, the population, or designated critical habitat would occur.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Muir Beach is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at Muir Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have negligible impacts on the salmonids.

**Cumulative Impacts.** Projects and actions in and near Muir Beach were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on coho salmon and steelhead trout at or in the vicinity of this site.

The park monitors coho salmon and steelhead trout annually in Redwood Creek and is conducting habitat restoration and protection activities, particularly in Redwood Creek. There were no spawning coho salmon observed during the 2007–2008 winter monitoring period, although a small number of coho fry were observed the next spring. While a portion of this decline can be attributed to regional oceanic phenomena, local conditions that have not yet been identified may also have been a factor (NPS 2008c, 2). The degradation of spawning (gravel) habitat, habitat alteration, and water diversions are among the primary threats to steelhead trout. Numerous creek and wetland restoration projects currently underway or proposed, the *Marin Headlands/Fort Baker Improvement and Transportation Management Plan/EIS*, park stewardship programs, implementation of the *GGNRA Fire Management Plan* (NPS 2005b), Wildland/Urban Interface Initiative projects, habitat restoration programs, and maintenance operations all have the potential to affect coho salmon and steelhead trout as well as associated critical habitat.

Overall, many of the projects that have been completed, are currently being implemented, or are planned for future implementation or that are long term in GGNRA will benefit coho salmon. Examples of projects and plans that will provide some benefit to coho salmon and steelhead trout as well as associated critical habitat are described in this paragraph. The *Coho and Steelhead Restoration Project* has been initiated by the NPS, and focuses on Pine Gulch, Redwood, Olema, and Lagunitas creeks and their watersheds. This project includes assessing current coho salmon and steelhead trout abundance and distribution and developing and implementing a plan for restoring and monitoring the fish and their habitat. The *Muir Beach Wetland and Creek Restoration Project* aimed to restore a functional, self-sustaining ecosystem at the lagoon and included wetland, riparian and aquatic components to re-create habitat for sustainable populations of special-status species, including habitat for federally and state-listed endangered coho salmon and federally threatened steelhead trout. The *Lower Redwood Creek Interim Flood Reduction Measures and Floodplain/Channel Restoration* project helped to reduce flooding on Pacific Way in Muir Beach, maintained passage for federally threatened fish in Redwood Creek, and restored habitat and the floodplain at the GGNRA Banducci site. Specifically, this project reconnected Redwood Creek to its floodplain, expanded riparian vegetation, increased in-channel habitat complexity,

and reestablished geomorphic processes, thus improving habitat for coho salmon and steelhead trout. The *Redwood Creek Watershed: Vision for the Future* project included efforts by public agencies in the watershed, who worked with the public and the vision team to identify issues and values in the watershed and define desired future conditions for watershed resources to create a Redwood Creek watershed that exists as an intact natural ecosystem and offers opportunities to learn, experience, and protect nature, rural character, and cultural history in an urbanized area.

The negligible impacts on coho salmon and steelhead trout from dogs at Muir Beach under the preferred alternative were considered together with the beneficial effects of the projects mentioned above. The beneficial effects from the habitat restoration projects combined with the negligible impacts from the preferred alternative would result in beneficial cumulative impacts on the salmonids under this alternative.

**MUIR BEACH PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| Coho Salmon, Steelhead Trout, and Critical Habitat Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Negligible impacts, assuming compliance                    | The lagoon and Redwood Creek would continue to be closed to dogs; physically restraining dogs on leash would prevent dog access to the creek and its shorelines | Beneficial to no change, assuming compliance | Beneficial cumulative impacts |

### **Marin Headlands Trails (Steelhead Trout, Rodeo Creek and Gerbode Creek)**

**Alternative A: No Action.** Currently, Tennessee Valley is closed to dogs with the exception of the section of the Coastal Trail that crosses Tennessee Valley and the North Miwok Trail from the junction with the Tennessee Valley Trail, where dogs are allowed on leash. This site has documented low to high visitor use, including low to moderate use by dog walkers. Dog-related incidents are high at this site with a total of 269 from 2008 through 2011, with the majority of incidents for having dogs within closed areas (195 incidents) (table 16). A total of 31 off-leash violations were reported at the site (table 16). Similar to coho salmon, steelhead trout use Rodeo Creek and Gerbode Creek (both of which flow into Rodeo Lake) during their life cycle, from migrating as adults to living in the stream or lagoon as juveniles (NPS 2008c, 1). Eggs would not be affected, because salmonids require gravel areas of substrate for laying eggs. Dogs could alter the normal behavior of steelhead trout directly if they frequently access the creek or shorelines, or indirectly by causing increased turbidity by trampling shoreline areas and re-suspending sediment so that feeding is impaired. However, potential impacts would be localized to the area where dogs can access these creeks. There is no documentation that dogs have either directly or indirectly affected the trout in either Rodeo Creek or Gerbode Creek. Therefore, alternative A impacts on the steelhead trout would range from negligible to long term, minor, and adverse. A few individuals of the species in a small, localized area (Rodeo Creek and Gerbode Creek) could occasionally be affected by disturbance from dogs but essential features of critical habitat would not be impacted.

Under alternative A, no permit system exists for commercial dog walking. At the Marin Headlands Trails, commercial dog walking is uncommon; therefore, commercial dog walking would have negligible impacts on the steelhead trout.

**Cumulative Impacts.** Projects and actions in and near the Marin Headlands Trails were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on steelhead trout at or in the vicinity of this site.

## Chapter 4: Environmental Consequences

In general, the park monitors steelhead trout (although not in the Marin Headlands) and is conducting habitat restoration and protection activities. The degradation of spawning (gravel) habitat, habitat alteration, and water diversions are among the primary threats to steelhead trout. Numerous creek and wetland restoration projects currently underway or proposed, the *Marin Headlands/Fort Baker Improvement and Transportation Management Plan/EIS*, the park stewardship programs, implementation of the *Fire Management Plan* (NPS 2005b), Wildland/Urban Interface Initiative projects, habitat restoration programs, and maintenance operations all have the potential to affect steelhead trout. Overall, many of the projects that have been completed, are currently being implemented, or are planned for future implementation will benefit steelhead trout.

The negligible to long-term minor adverse impacts on steelhead trout from dogs at the Marin Headlands Trails under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from the habitat restoration and protection activities should reduce some of the adverse impacts on steelhead trout from alternative A. Therefore, the cumulative impacts on the steelhead trout under this alternative would be expected to be negligible.

**MARIN HEADLANDS TRAILS ALTERNATIVE A CONCLUSION TABLE**

| Steelhead Trout Impacts                       | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Negligible to long-term minor adverse impacts | In Rodeo Creek and Gerbode Creek, adults and juveniles could be affected by dogs gaining access to the creek and causing increased turbidity by trampling shoreline areas and re-suspending sediment | N/A  | Negligible cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would prohibit dogs at the Marin Headlands site and Rodeo Lake as well as Rodeo Creek and Gerbode Creek would be closed to dogs. This alternative would be most protective of the steelhead trout and the creeks would maintain the integrity of the entire Marin Headlands Trails site. Assuming compliance, alternative B would result in no impact on the steelhead trout.

Since dogs would not be allowed at the Marin Headlands Trails, there would be no impact from commercial dog walkers on the steelhead trout.

**Cumulative Impacts.** The lack of impacts on steelhead trout from dogs at the Marin Headlands Trails under alternative B were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the habitat restoration and protection activities combined with the lack of impacts from alternative B would result in beneficial cumulative impacts.

**MARIN HEADLANDS TRAILS ALTERNATIVE B CONCLUSION TABLE**

| Steelhead Trout Impacts        | Rationale                            | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--------------------------------|--------------------------------------|--|-------------------------------|
| No impact, assuming compliance | Dogs would be prohibited at the site | Beneficial, assuming compliance              | Beneficial cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would allow on-leash dog walking along the Lower Rodeo Valley Trail Corridor. This corridor would extend from the Rodeo Beach parking lot to the intersection of Bunker and McCullough Roads via the North Lagoon Loop Trail, Miwok Trail, and Rodeo Valley Trail, including the connector trail from the Rodeo Valley Trail to Smith Road Trailhead. On-leash dog walking would also be allowed on the Old Bunker Fire Road Loop (including a section of the Coastal Trail), and the Batteries Loop Trail. Dogs would be physically restrained on a leash and would be allowed on fewer trails altogether compared to alternative A. Assuming compliance with proposed regulations, alternative C would result in negligible impacts on the steelhead trout; no measurable or perceptible changes to individual trout, the population, or designated critical habitat would occur.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Marin Headlands Trails is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking activity is not common at the Marin Headlands Trails, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on the steelhead trout.

**Cumulative Impacts.** The negligible impacts on steelhead trout from dogs at the Marin Headlands Trails under alternative C were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the habitat restoration and protection activities combined with the negligible impacts from alternative C would result in beneficial cumulative impacts.

**MARIN HEADLANDS TRAILS ALTERNATIVE C CONCLUSION TABLE**

| Steelhead Trout Impacts                 | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Negligible impacts, assuming compliance | Physically restraining dogs on leash would prevent dog access to the both Rodeo Creek and Gerbode Creek | Beneficial to no change, assuming compliance | Beneficial cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Alternative D would have the same dog walking restrictions as alternative B (no dogs on site), and impacts would be the same, assuming compliance: no impact.

Since dogs would not be allowed at the Marin Headlands Trails, there would be no impact from commercial dog walkers on the steelhead trout.

**Cumulative Impacts.** The lack of impacts on steelhead trout from dogs at the Marin Headlands Trails under alternative D were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the habitat restoration and protection activities combined with the lack of impacts from alternative D would result in beneficial cumulative impacts.

**MARIN HEADLANDS TRAILS ALTERNATIVE D CONCLUSION TABLE**

| Steelhead Trout Impacts        | Rationale                            | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--------------------------------|--------------------------------------|--|-------------------------------|
| No impact, assuming compliance | Dogs would be prohibited at the site | Beneficial, assuming compliance              | Beneficial cumulative impacts |

## Chapter 4: Environmental Consequences

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would allow on-leash dog walking on the Conzelman Coastal Trail from Highway 101 to the McCullough intersection and then to the Coastal Trail Bike Route, including Julian Road, to Rodeo Beach parking lot. On-leash dog walking would be available on the Old Bunker Fire Road Loop (which includes a section of the Coastal Trail), Batteries Loop Trail, North Miwok Trail from Tennessee Valley to Highway 1, County View Trail, Marin Drive, Rodeo Avenue Trail, and Morning Sun Trail. Impacts would be the same as those under alternative C, assuming compliance: negligible.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Marin Headlands Trails is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at the Marin Headlands Trails, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on the steelhead trout.

**Cumulative Impacts.** The negligible impacts on steelhead trout from dogs at Marin Headlands Trails under alternative E were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the habitat restoration and protection activities combined with the negligible impacts from alternative E would result in beneficial cumulative impacts.

**MARIN HEADLANDS TRAILS ALTERNATIVE E CONCLUSION TABLE**

| <b>Steelhead Trout Impacts</b>          | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|---|---|-------------------------------|
| Negligible impacts, assuming compliance | Physically restraining dogs on leash would prevent dog access to the both Rodeo Creek and Gerbode Creek | Beneficial to no change, assuming compliance        | Beneficial cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative would allow on-leash dog walking along the Lower Rodeo Valley Trail Corridor, which extends from the Rodeo Beach parking lot to the intersection of Bunker and McCullough Roads via the North Lagoon Loop Trail, and the Miwok and Rodeo Valley trails, and includes the connector trail from Rodeo Valley Trail to the Smith Road trailhead. On-leash dog walking would be available on the Old Bunker Fire Road Loop (including a section of the Coastal Trail), Batteries Loop Trail, Rodeo Avenue Trail, and Morning Sun Trail. Dogs would be physically restrained on a leash and would be allowed on fewer trails altogether compared to alternative A. Assuming compliance with proposed regulations, the preferred alternative would result in negligible impacts on the steelhead trout; no measurable or perceptible changes to individual trout, the population, or designated critical habitat would occur.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Marin Headlands Trails is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at Marin Headlands Trails, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have negligible impacts on the steelhead trout.

**Cumulative Impacts.** Projects and actions in and near the Marin Headlands Trails were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on steelhead trout at or in the vicinity of this site.

The park monitors steelhead trout and is conducting habitat restoration and protection activities. The degradation of spawning (gravel) habitat, habitat alteration, and water diversions are among the primary threats to steelhead trout. Numerous creek and wetland restoration projects currently underway or proposed, the *Marin Headlands/Fort Baker Improvement and Transportation Management Plan/EIS*, park stewardship programs, implementation of the *Fire Management Plan* (NPS 2005b), Wildland/Urban Interface Initiative projects, habitat restoration programs, and maintenance operations all have the potential to affect steelhead trout. Overall, many of the projects that have been completed, are currently being implemented, or are planned for future implementation will benefit steelhead trout.

The negligible impacts on steelhead trout from dogs at the Marin Headlands Trails under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from the habitat restoration and protection activities combined with the negligible impacts from the preferred alternative would result in beneficial cumulative impacts.

**MARIN HEADLANDS TRAILS PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| <b>Steelhead Trout Impacts</b>          | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|---|---|-------------------------------|
| Negligible impacts, assuming compliance | Physically restraining dogs on leash would prevent dog access to the both Rodeo Creek and Gerbode Creek | Beneficial to no change, assuming compliance        | Beneficial cumulative impacts |

### **Rancho Corral de Tierra (Steelhead Trout, Denniston and Martini Creeks)**

**Alternative A: No Action.** Under current conditions, on-leash dog walking is allowed at Rancho. Staff regularly working at Rancho characterize use by dog walkers as low to moderate, and compliance with the leash law is generally low. Because Rancho Corral de Tierra was just transferred to NPS in December 2011, law enforcement statistics are not available for this site. Rancho Corral de Tierra has low compliance with the leash law. At Rancho Corral de Tierra, steelhead trout potentially occur in Denniston Creek in the El Granada area and in Martini Creek in the Montara area; the current presence and distribution in these creeks is unclear. A historic occurrence of steelhead trout has been noted in San Vicente Creek at Rancho Corral de Tierra, but the population is believed to be extant, even though there are current physical blockages to fish entry along this creek (POST 2001, 14).

Martini Creek enters the Pacific Ocean at Montara State Beach near the Montara area of Rancho. A 1995 DFG memo indicates that Martini Creek is "...now inhabited by steelhead/resident rainbow trout" (DFG 1995 in Becker and Reining 2008, 14-15) but additional sources document that "The Highway 1 culvert, which has a four foot drop at both ends, represents an impassable barrier to any migratory fish. Additionally, an instream impoundment blocks the flow approximately 100 yards upstream from highway 1" (DFG ca 1994). One of the current trails at the site, Old San Pedro Mountain Road, includes a small bridge over Martini Creek. However, where Old San Pedro Mountain Road crosses Martini Creek via a bridge, there are steep, incised stream banks and dense vegetation that would likely preclude access by both humans and dogs, including off-leash dogs. Therefore, even if steelhead do still inhabit Martini Creek, the area is not accessible by humans and dogs.

Denniston Creek enters the Pacific Ocean at Half Moon Bay and a reservoir exists in Denniston Creek about 1 mile upstream from the ocean. Upstream of the reservoir, the majority of Denniston Creek is located within the El Granada area of Rancho. Critical habitat for steelhead trout is mapped in Denniston Creek downstream of Denniston Reservoir, which is mostly off GGNRA property. Upstream of the reservoir, according to a DFG memo, a ten foot high instream impoundment is a total barrier to fish

## Chapter 4: Environmental Consequences

passage (DFG ca 1994 in Becker and Reining 2008, 14-15) and fish above this barrier are not considered listed. The 1994 DFG memo also states that the final mile is usually dewatered in the summer due to agricultural diversions and withdrawal by the Coastside Water District (Becker and Reining 2008, 14-15). An undated DFG creek inventory summarizes conditions in Denniston Creek and states, “The creek and its tributaries provide a good potential habitat for steelhead trout if the barriers to migration were removed (Becker and Reining 2008, 14-15). During a 1992 survey, steelhead trout were observed “throughout the drainage” of Denniston Creek (DFG 1992a in Becker and Reining 2008, 14-15). A survey of Denniston Creek downstream from the dam in 2006 included observations of steelhead fry and individuals to about six inches in length (Becker and Reining 2008, 14-15). Dog walking currently occurs on the Denniston Ridge Trail, located approximately 850 ft from Denniston Creek, which is buffered by riparian vegetation and does not allow access by humans or dogs.

As noted above, Rancho Corral de Tierra has low compliance with the leash law, although educational efforts by staff, particularly by law enforcement staff, are ongoing. NPS staff have observed off-leash dogs running in areas with potentially sensitive habitat. Park staff observed a dog swimming in a waterbody at Rancho, but no observations of dogs accessing Denniston or Martini Creeks have been reported. Also, there is no documentation that dogs have either directly or indirectly affected steelhead trout at Rancho Corral de Tierra. The current presence and distribution of steelhead trout at Martini Creek is unclear, a potential barrier to fish exists, and access to this creek is difficult for both humans and dogs, including off-leash dogs that may be present at the site. Similarly there is a barrier to fish passage in the stream above Denniston Reservoir and along San Vicente Creek as well. Also, the Denniston Ridge Trail is located a distance from Denniston Creek and existing riparian vegetation would make access to the creek unlikely. Therefore, impacts on the steelhead trout at Rancho Corral de Tierra would be considered negligible under alternative A. Impacts would result in no measurable or perceptible changes in individuals of a species or its habitat (including critical habitat as designated under the ESA).

Under alternative A, no permit system exists for commercial dog walking. Currently, commercial dog walking use is low at Rancho Corral de Tierra; therefore, commercial dog walking would have negligible impacts on the frog.

**Cumulative Impacts.** Projects and actions in and near Rancho Corral de Tierra were considered for the cumulative impacts analysis (appendix K). Since the Rancho Corral de Tierra site has been transferred to NPS, general protection of the site and associated natural resources would occur, although some impacts may remain from prior unregulated off-leash dog walking. Additionally, the park currently has no site-specific plans for steelhead trout restoration in the vicinity of this site exist. The following is a discussion of projects that have had, are currently having, or have the potential to have effects on steelhead trout at or in the vicinity of this site.

In general, the park monitors steelhead trout (although not at Rancho) and is conducting habitat restoration and protection activities. The degradation of spawning (gravel) habitat, habitat alteration, and water diversions are among the primary threats to steelhead trout. Numerous creek and wetland restoration projects currently underway or proposed, the park stewardship programs, implementation of the Fire Management Plan (NPS 2005b), Wildland/Urban Interface Initiative projects, habitat restoration programs, and maintenance operations all have the potential to affect steelhead trout. Overall, many of the projects that have been completed, are currently being implemented, or are planned for future implementation will benefit steelhead trout. However, the majority of restoration projects mentioned previously aimed to benefit steelhead trout are located in Marin County. In San Mateo County, the CalTrans Devil Slide project involves construction of two tunnels beneath San Pedro Mountain to take Highway 1 off of Devils Slide and will be completed in early 2013 (CADOT 2013, 1). Because the Tunnel alternative was chosen over the Martini Creek alternative, no impacts to steelhead trout are expected as a result of the CalTrans Devil Slide project (CADOT 2013). The effects from future

construction projects, maintenance operations, and other agency projects on steelhead may be adverse, but these actions have not yet been identified, are currently unknown, and would likely require mitigation. Therefore, these projects would have negligible cumulative impacts.

The negligible impacts on the steelhead trout from dogs at Rancho Corral de Tierra under alternative A were considered together with the effects of the projects mentioned above. The negligible cumulative effects from other actions combined with the negligible impacts on the steelhead trout from alternative A would result in negligible cumulative impacts.

**RANCHO CORRAL DE TIERRA ALTERNATIVE A CONCLUSION TABLE**

| Steelhead Trout Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|-------------------------|---|--|-------------------------------|
| Negligible impacts      | Although off-leash dogs have been observed at the site, both Martini and Denniston Creeks where steelhead occur are difficult to access by humans/dogs and have existing barriers to fish which currently block migration | N/A  | Negligible cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** On-leash dog walking would be allowed on designated trails in two areas open to dog walking near Montara and El Granada, which were identified by the local dog walking group as key areas for this use. All waterbodies, including Martini and Denniston Creeks, that potentially support steelhead trout would continue to be closed to humans and dogs. Physically restraining dogs on leash would also prevent dog access to the creek and its shorelines but both creeks are difficult to access by humans and dogs and have existing barriers to fish which currently block migration. Therefore, assuming compliance, alternative B would result in negligible impacts on steelhead trout as well as associated critical habitat; no measurable or perceptible changes to individuals, the population, or designated critical habitat would occur.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking at Rancho is not common, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have negligible impacts on steelhead trout.

**Cumulative Impacts.** The negligible impacts on steelhead trout from dogs at Rancho Corral de Tierra under alternative B were considered together with the negligible effects of the projects mentioned above under alternative A. The negligible effects from projects combined with the negligible impacts from alternative B would result in negligible cumulative impacts on steelhead trout under this alternative.

**Chapter 4: Environmental Consequences**

**RANCHO CORRAL DE TIERRA ALTERNATIVE B CONCLUSION TABLE**

| <b>Steelhead Trout Impacts</b>                  | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--|---|-------------------------------|
| Overall negligible impacts, assuming compliance | Martini and Denniston Creeks would continue to be closed to humans and dogs; physically restraining dogs on leash would also prevent dog access to the creek and its shorelines but both creeks are difficult to access by humans/dogs | No change, assuming compliance                      | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Under alternative C, on-leash dog walking would be allowed on some trails within two areas at Rancho Corral de Tierra in the Montara and El Granada areas. A ROLA is also proposed under alternative C in the Montara area between Le Conte Street and Tamarind Street, in an open grassy area near the Farallone View School. The proposed ROLA is not located near Martini Creek and all waterbodies, including Martini and Denniston Creeks, that potentially support steelhead trout would continue to be closed to humans and dogs. Physically restraining dogs on leash in all other areas would also prevent dog access to the creek and its shorelines but both creeks are difficult to access by humans and dogs and have existing barriers to fish which currently block migration. Therefore, assuming compliance, alternative C would result in negligible impacts on steelhead trout as well as associated critical habitat; no measurable or perceptible changes to individuals, the population, or designated critical habitat would occur.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Rancho Corral de Tierra is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs, with a limit of six. Currently, commercial dog walking use is low at Rancho Corral de Tierra; therefore, commercial dog walking under this alternative would have negligible impacts steelhead trout.

**Cumulative Impacts.** Under alternative C, the cumulative impacts on steelhead trout at this park site would be the same as those under alternative B: negligible.

**RANCHO CORRAL DE TIERRA ALTERNATIVE C CONCLUSION TABLE**

| <b>Steelhead Trout Impacts</b>                  | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--|---|-------------------------------|
| Overall negligible impacts, assuming compliance | Martini and Denniston Creeks would continue to be closed to humans and dogs; physically restraining dogs on leash would also prevent dog access to the creek and its shorelines but both creeks are difficult to access by humans/dogs; ROLA is not located near Martini Creek | No change, assuming compliance                      | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Under alternative D, on-leash dog walking would be allowed in the Montara area on two trails: Old San Pedro Mountain Road and the Farallon Cutoff. Dogs would be prohibited in other areas of the site, including the entire El Granada area. Martini Creek in the Montara area, which potentially supports steelhead trout would continue to be

closed to humans and dogs. Physically restraining dogs on leash along the two trails in the Montara area would also prevent dog access to the creek and its shorelines but the creeks is difficult to access by humans and dogs and has an existing barrier to fish which currently blocks migration. Therefore, assuming compliance, alternative D would result in negligible impacts on steelhead trout; no measurable or perceptible changes to individuals, the population, or designated critical habitat would occur.

No commercial dog walking would be allowed and no permits to walk more than three dogs would be issued under alternative D; therefore, commercial and permitted dog walking would have no impact on steelhead trout.

**Cumulative Impacts.** Under alternative D, the cumulative impacts on steelhead trout at this park site would be the same as those under alternative B: negligible.

**RANCHO CORRAL DE TIERRA ALTERNATIVE D CONCLUSION TABLE**

| Steelhead Trout Impacts                         | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Martini and Denniston Creeks would continue to be closed to humans and dogs; physically restraining dogs on leash would also prevent dog access to the creek and its shorelines but both creeks are difficult to access by humans/dogs | No change, assuming compliance               | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would have the same dog walking restrictions as alternative C, and impacts would be the same: negligible.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Currently, Rancho Corral de Tierra is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs, with a limit of six. Commercial dog walking use is low at Rancho Corral de Tierra; therefore, commercial dog walking would have negligible impacts on steelhead trout.

**Cumulative Impacts.** Under alternative E, the cumulative impacts on steelhead trout at this park site would be the same as those under alternative B: negligible.

**RANCHO CORRAL DE TIERRA ALTERNATIVE E CONCLUSION TABLE**

| Steelhead Trout Impacts                         | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Martini and Denniston Creeks would continue to be closed to humans and dogs; physically restraining dogs on leash would also prevent dog access to the creek and its shorelines but both creeks are difficult to access by humans/dogs; ROLA is not located near Martini Creek | No change, assuming compliance               | Negligible cumulative impacts |

## Chapter 4: Environmental Consequences

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative B, allowing on-leash dog walking on certain trails at Rancho Corral de Tierra in the Montara and El Granada areas. At Rancho Corral de Tierra, steelhead trout potentially occur in Denniston Creek in the El Granada area and in Martini Creek in the Montara area; the current presence and distribution in these creeks is unclear. A historic occurrence of steelhead trout has also been noted in San Vicente Creek at Rancho Corral de Tierra, but the population is believed to be extant, even though there are current physical blockages to fish entry along this creek (POST 2001, 14).

In the Montara area, dog walking would be allowed along Old San Pedro Mountain Road, including a small bridge over Martini Creek. However, where Old San Pedro Mountain Road crosses Martini Creek via a bridge, there are steep, incised stream banks and dense vegetation that would likely preclude access by both humans and dogs. The current presence and distribution of steelhead trout at Martini Creek is unclear, a potential barrier to fish exists, and access to this creek is difficult for both humans and dogs. In the El Granada area of Rancho, on-leash dog walking would be allowed along Denniston Ridge Trail, located approximately 850 ft from Denniston Creek, which is buffered by riparian vegetation. Critical habitat is mapped in Denniston Creek downstream of Denniston Reservoir and off GGNRA property; upstream, according to a DFG memo, a ten foot high instream impoundment is a total barrier to fish passage (DFG ca 1994 in Becker and Reining 2008, 14-15) and fish above this barrier are not considered listed. As a result of the barrier to fish passage in the stream above the reservoir at Rancho, the distance from the Denniston Ridge Trail to the creek and existing riparian vegetation, it is unlikely that dogs would gain access to the creek and impact steelhead trout.

All waterbodies, including Martini and Denniston Creeks, that potentially support steelhead trout would continue to be closed to humans and dogs. Physically restraining dogs on leash would also prevent dog access to the creek and its shorelines but both creeks are difficult to access by humans and dogs and have existing barriers to fish which currently block migration. Therefore, impacts on the steelhead trout at both areas of Rancho Corral de Tierra would be considered negligible under the preferred alternative. Impacts would result in no measurable or perceptible changes in individuals of a species or its habitat (including critical habitat as designated under the ESA).

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Rancho Corral de Tierra is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs, with a limit of six. Currently, commercial dog walking use is low at Rancho Corral de Tierra; therefore, commercial dog walking would have negligible impacts on the frog.

**Cumulative Impacts.** Projects and actions in and near Rancho Corral de Tierra were considered for the cumulative impacts analysis (appendix K). Since the Rancho Corral de Tierra site has been transferred to NPS, general protection of the site and associated natural resources would occur, although some impacts may remain from prior unregulated off-leash dog walking. Additionally, the park currently has no site-specific plans for steelhead trout restoration at Rancho. The following is a discussion of projects that have had, are currently having, or have the potential to have effects on steelhead trout at or in the vicinity of this site.

In general, the park monitors steelhead trout (although not at Rancho) and is conducting habitat restoration and protection activities. The degradation of spawning (gravel) habitat, habitat alteration, and water diversions are among the primary threats to steelhead trout. Numerous creek and wetland restoration projects currently underway or proposed, the park stewardship programs, implementation of the Fire Management Plan (NPS 2005b), Wildland/Urban Interface Initiative projects, habitat restoration programs, and maintenance operations all have the potential to affect steelhead trout. Overall, many of the projects that have been completed, are currently being implemented, or are planned for future

implementation will benefit steelhead trout. However, the majority of restoration projects mentioned previously aimed to benefit steelhead trout are located in Marin County. In San Mateo County, the CalTrans Devil Slide project involves construction of two tunnels beneath San Pedro Mountain to take Highway 1 off of Devils Slide and will be completed in early 2013 (CADOT 2013, 1). Because the Tunnel alternative was chosen over the Martini Creek alternative, no impacts to steelhead trout are expected as a result of the CalTrans Devil Slide project (CADOT 2013). The effects from future construction projects, maintenance operations, and other agency projects on steelhead trout may be adverse, but these actions have not yet been identified and are currently unknown and would likely require mitigation. Therefore, these projects would have negligible cumulative impacts.

The negligible impacts on the steelhead trout from dogs at Rancho Corral de Tierra under the preferred alternative were considered together with the effects of the projects mentioned above. The negligible cumulative effects from other actions combined with the negligible impacts on the steelhead trout from the preferred alternative would result in negligible cumulative impacts.

**RANCHO CORRAL DE TIERRA PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| <b>Steelhead Trout Impacts</b>                  | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--|---|-------------------------------|
| Overall negligible impacts, assuming compliance | Martini and Denniston Creeks would continue to be closed to humans and dogs; physically restraining dogs on leash would also prevent dog access to the creek and its shorelines but both creeks are difficult to access by humans/dogs | No change, assuming compliance                      | Negligible cumulative impacts |

### **IMPACTS TO THE CALIFORNIA RED-LEGGED FROG (FEDERALLY THREATENED) BY SITE AND ALTERNATIVE**

In the study area, this species occurs in Marin County at Muir Beach (water bodies at the site provide habitat but no known breeding occurs) and the Marin Headlands Trails (Rodeo Lake provides both nonbreeding and breeding habitat, Rodeo Lagoon provides nonbreeding habitat, and Tennessee Valley Pond provides nonbreeding and breeding habitat), as well as at Mori Point (the ponds provide nonbreeding and breeding habitat), Milagra Ridge (the ponds provide nonbreeding and breeding habitat), Sweeney Ridge/Cattle Hill, Pedro Point (provides nonbreeding habitat), and Rancho Corral de Tierra (provides nonbreeding and breeding habitat) in San Mateo County. Cattle Hill has mapped occurrences of the California red-legged frog at the site, but neither Sweeney Ridge nor Cattle Hill has known breeding that has been documented to date (URS Corporation 2010, Figure 3). However, both Sweeney Ridge and Cattle Hill provide potential breeding and nonbreeding habitat for the California red-legged frog based upon modeling efforts (URS Corporation 2010, Figure 3). At Rancho Corral de Tierra, several occurrences of the California red-legged frog have been observed (URS Corporation 2010, Figure 3), including along Denniston Creek in the El Granada area and a mapped occurrence and a breeding pond near existing trails in the Montara area. The El Granada area also provides breeding habitat for the frog. In addition, some trails at Rancho Corral de Tierra cross upland aestivation habitat and dispersal habitat for this species (URS Corporation 2010, Figure 3). At Milagra Ridge, the fire road where dog walking is allowed is located more than 800 feet from the pond and more than 1,200 feet from the creek. Therefore, because of the inability for dogs to access both the pond and the creek that support California red-legged frog breeding habitat, all impacts on the California red-legged frog at this site would be considered negligible; therefore, impacts on the California red-legged frog at Milagra Ridge are not discussed further.

## Chapter 4: Environmental Consequences

in this section. All other sites listed above will therefore be included in the paragraphs that follow for a detailed impacts analysis.

Although the California red-legged frog is normally associated with wetland areas and water bodies, this species can also use upland and riparian habitat. The USFWS designated critical habitat units for the California red-legged frog in 2001 and revised the units in 2006, 2008, and 2010 (USFWS 2010). Most of Sweeney Ridge is part of critical habitat unit SNM-1 for the California red-legged frog (USFWS 2010). Designated critical habitat for the frog occurs in portions of Cattle Hill and at Pedro Point Headlands (USFWS 2010). There is also a portion of critical habitat located within the El Granada area of Rancho Corral de Tierra along the trails near Denniston Creek (USFWS 2010) and designated critical habitat for the frog occurs throughout Rancho Corral de Tierra (USFWS 2010). In this section, the California red-legged frog is hereafter often referred to as “the frog.”

### Muir Beach (Lagoon)

**Alternative A: No Action.** In the vicinity of Muir Beach, the beach is open to dogs under voice control, and the parking lot, Muir Beach Trail, and the boardwalk/path to the beach that crosses Redwood Creek are currently open to dogs on leash. The park has closed the lagoon and Redwood Creek, although it has been observed that these closures have been violated and dogs have accessed Redwood Creek. A total of 24 dog-related violations were reported from 2008 through 2011 (table 14). The most common violations were for having dogs off-leash (9 violations) and having dogs within closed areas (4 violations) (table 14). The fence along the beach side of lower Redwood Creek and the lagoon discourages visitors from accessing the water, but does not physically exclude dogs or visitors from accessing portions of Redwood Creek. The Muir Beach Community is located adjacent to this area, which results in high visitation at Muir Beach on the weekends. The voice control area of Muir Beach encompasses the entrance channel of Redwood Creek and is located immediately adjacent to the shoreline of the lagoon, which has recently been restored. Although there is currently no documented California red-legged frog breeding at Muir Beach, juvenile frogs were recently found moving from an upstream breeding pond (near Green Gulch) that is located away from the Muir Beach site down the creek corridor towards Muir Beach. It is expected that breeding may occur at newly constructed ponds or backwater habitats in the future. Currently, frog life stages that could be affected at the site by dogs include juveniles and adults, since juveniles have recently been found at the site. Even though frog breeding habitat occurs off-site from Muir Beach, near Green Gulch (off the Coastal Fire Road and Kaasi Road), noncompliant dogs under voice control could gain access to this area and affect frog eggs. Eggs could be affected by trampling from off leash dogs, as has been documented at a pond in Pacifica, California by the City of San Francisco in San Mateo County. Dogs could affect adult/juvenile frogs at these sites through impacts to habitat, such as trampling vegetation along the water/wetland edges, or through behavioral disturbance by injuring or causing mortality to individuals of the species in these water bodies. However, there is no published documentation that dogs have either directly or indirectly affected the frog at this location. Therefore, to encompass possible effects, alternative A impacts on the frog would be long term and would range from negligible to minor and adverse; frog eggs, juveniles, and adults could be affected by dogs through occasional behavioral disturbance, such as trampling vegetation along the water/wetland edges, or by injuring or causing mortality to individuals of the species in these water bodies. Impacts would be localized but could constitute a permanent loss if frog eggs are crushed as a result of disturbance by dogs.

Under alternative A, no permit system exists for commercial dog walking. At Muir Beach, commercial dog walking is uncommon; therefore, commercial dog walking would have negligible impacts on the California red-legged frog.

**Cumulative Impacts.** Projects and actions in and near Muir Beach were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently

having, or have the potential to have effects on the California red-legged frog at or in the vicinity of this site.

The fragmentation of existing habitat and the continued colonization of existing habitat by non-native species may represent the most important current threats to California red-legged frogs. The *Muir Beach Wetland and Creek Restoration Project*, the *Lower Redwood Creek Interim Flood Reduction Measures and Floodplain/Channel Restoration* at Muir Beach, the park stewardship programs, implementation of the *Fire Management Plan* (NPS 2005b), Wildland/Urban Interface Initiative projects, habitat restoration programs, and maintenance operations all have the potential to affect the frog and its habitat. Interim flood control actions at Muir Beach resulted in unauthorized take of California red-legged frogs; formal Section 7 consultation and mitigation measures were initiated to address this take and prevent future occurrences. Habitat restoration and maintenance operations aim to prevent impacts on the frog. Some examples of projects and plans that will specifically provide some benefit to the frog include the *Muir Beach Wetland and Creek Restoration Project* and the park stewardship programs, which both include provisions for the creation of additional frog habitat. Additionally, the NPS and the California State Lands Commission formulated the *Giacomini Wetland Restoration Project* (Marin County, near Tomales Bay), which restored 560 acres of pastures to wetlands of increased complexity and diversity of vegetation and aquatic habitats (NPS 2009k; NPS and CSLC 2007).

The negligible to long-term minor adverse impacts on the California red-legged frog from dogs at Muir Beach under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from the restoration activities should reduce some of the adverse impacts on the California red-legged frog from alternative A. Therefore, the cumulative impacts on the California red-legged frog under this alternative would be expected to be negligible.

**MUIR BEACH ALTERNATIVE A CONCLUSION TABLE**

| California Red-legged Frog Impacts            | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Negligible to long-term minor adverse impacts | Although Lagoon closures are violated frequently, there is no frog breeding at the Muir Beach site, but the site provides nonbreeding habitat; breeding occurs at a pond off site and noncompliant dogs could access this area; frog eggs, juveniles, and adults could be affected by dogs through habitat or behavioral disturbance | N/A  | Negligible cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** In the vicinity of Muir Beach, alternative B would allow on-leash dog walking on the beach, the bridge and path to the beach, the parking area, and the proposed Muir Beach Trail. The lagoon and Redwood Creek would remain closed to dogs. If dogs are physically restrained on leash at this site and deterred by the existing fence, they should not gain access to the creek or its shorelines or other water bodies and should not affect the frog during juvenile and adult life stages. Therefore, assuming compliance, alternative B would result in negligible impacts on the frog; no measurable or perceptible changes to the frog or breeding/nonbreeding habitat would occur.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is not common at Muir

## Chapter 4: Environmental Consequences

Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have negligible impacts on the frog.

**Cumulative Impacts.** The negligible impacts on the California red-legged frog from dogs at Muir Beach under alternative B were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the restoration activities combined with the negligible impacts on the California red-legged frog under alternative B would result in beneficial cumulative impacts at this park site.

**MUIR BEACH ALTERNATIVE B CONCLUSION TABLE**

| California Red-legged Frog Impacts      | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Negligible impacts, assuming compliance | Water bodies would continue to be closed to dogs and the fence would discourage access; physically restraining dogs on leash would prevent dog access to water bodies that may provide habitat to juvenile or adult frogs | Beneficial to no change, assuming compliance | Beneficial cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would have the same dog walking restrictions as alternative B, and impacts would be the same, assuming compliance: negligible.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Muir Beach is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at Muir Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on the frog.

**Cumulative Impacts.** Under alternative C, the cumulative impacts on the frog at this park site would be the same as those under alternative B: beneficial.

**MUIR BEACH ALTERNATIVE C CONCLUSION TABLE**

| California Red-legged Frog Impacts      | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Negligible impacts, assuming compliance | The lagoon and Redwood Creek would continue to be closed to dogs; physically restraining dogs on leash would prevent dog access to water bodies that may provide habitat to juvenile or adult frogs | Beneficial to no change, assuming compliance | Beneficial cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Alternative D would allow on-leash dog walking in the parking area and on the proposed Muir Beach Trail. The beach and the boardwalk/path to the beach would be closed to dogs. The lagoon and Redwood Creek are currently closed to dogs. If dogs are physically restrained on leash at this site and deterred by the existing fence, they should not gain access to the creek or its shorelines or other water bodies and should not affect the

frog during egg, juvenile, or adult life stages. Additionally, portions of the creek, the lagoon, and the shoreline are in areas where dogs are prohibited under alternative D. Therefore, assuming compliance, alternative D would result in negligible impacts on the frog; no measurable or perceptible changes to the frog or breeding/nonbreeding habitat would occur.

No commercial dog walking would be allowed and no permits to walk more than three dogs would be issued under alternative D; therefore, commercial or permitted dog walking would have no impact on the frog.

**Cumulative Impacts.** The negligible impacts on the California red-legged frog from dogs at Muir Beach under alternative D were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the restoration activities combined with the negligible impacts on the California red-legged frog under alternative D would result in beneficial cumulative impacts at this park site.

**MUIR BEACH ALTERNATIVE D CONCLUSION TABLE**

| California Red-legged Frog Impacts      | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Negligible impacts, assuming compliance | The lagoon and Redwood Creek would continue to be closed to dogs; physically restraining dogs on leash would prevent dog access water bodies and part of the creek, the lagoon, and the shoreline are in areas where dogs are prohibited under alternative D | Beneficial to no change, assuming compliance | Beneficial cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** On-leash dog walking would be allowed on the proposed Muir Beach Trail, the bridge and path to the beach, and the parking lot. The portion of Muir Beach south of the boardwalk/path to the beach (not encompassing the entrance channel to Redwood Creek) would be a designated ROLA open to dogs under voice and sight control. The lagoon and Redwood Creek would remain closed to dogs. Although a ROLA has been designated under this alternative, it would not be sited near the habitat in the tidal lagoon and Redwood Creek that supports the frog. Therefore, assuming compliance, alternative E would result in negligible impacts on the frog; no measurable or perceptible changes to frogs or breeding/nonbreeding habitat would occur.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Muir Beach is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at Muir Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on the frog.

**Cumulative Impacts.** The negligible impacts on the California red-legged frog from dogs at Muir Beach under alternative E were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the restoration activities combined with the negligible impacts on the California red-legged frog under alternative E would result in beneficial cumulative impacts at this park site.

MUIR BEACH ALTERNATIVE E CONCLUSION TABLE

| California Red-legged Frog Impacts      | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Negligible impacts, assuming compliance | The lagoon and Redwood Creek would continue to be closed to dogs; physically restraining dogs on leash would prevent dog access to the creek and its shorelines; the ROLA would not be sited near Redwood Creek | Beneficial to no change, assuming compliance | Beneficial cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative would allow on-leash dog walking on the beach, bridge and path to the beach, and the proposed Muir Beach Trail. The lagoon and Redwood Creek would remain closed to dogs. This alternative would provide protection of the habitat at the tidal lagoon and Redwood Creek that support nonbreeding frog habitat. It is expected that breeding may occur at constructed ponds or backwater habitats in the future. If dogs are physically restrained on leash at this site and deterred by the existing fence, they should not gain access to the creek or its shorelines or other water bodies and should not affect the frog during egg, juvenile, or adult life stages. Additionally, portions of the creek, the lagoon, and the shoreline are in areas where dogs are prohibited under the preferred alternative. Therefore, assuming compliance, the preferred alternative would result in negligible impacts on the frog; no measurable or perceptible changes to the frog or breeding/nonbreeding habitat would occur.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Muir Beach is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at Muir Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have negligible impacts on the frog.

**Cumulative Impacts.** Projects and actions in and near Muir Beach were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the California red-legged frog at or in the vicinity of this site.

The fragmentation of existing habitat and the continued colonization of existing habitat by non-native species may represent the most important current threats to California red-legged frogs. The *Muir Beach Wetland and Creek Restoration Project*, the *Lower Redwood Creek Interim Flood Reduction Measures and Floodplain/Channel Restoration* at Muir Beach, the park stewardship programs, implementation of the *Fire Management Plan* (NPS 2005b), Wildland/Urban Interface Initiative projects, habitat restoration programs, and maintenance operations all have the potential to affect the frog and its habitat. Interim flood control actions at Muir Beach resulted in unauthorized take of California red-legged frogs; formal Section 7 consultation and mitigation measures were initiated to address this take and prevent future occurrences. Habitat restoration and maintenance operations aim to prevent impacts on the frog. Some examples of projects and plans that will specifically provide some benefit to the frog include the *Muir Beach Wetland and Creek Restoration Project* and the park stewardship programs, which both include provisions for the creation of additional frog habitat.

The negligible impacts on the California red-legged frog from dogs at Muir Beach under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial

effects from the restoration activities combined with the negligible impacts on the California red-legged frog from the preferred alternative would result in beneficial cumulative impacts at this park site.

**MUIR BEACH PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| California Red-legged Frog Impacts      | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Negligible impacts, assuming compliance | The lagoon and Redwood Creek would continue to be closed to dogs; physically restraining dogs on leash would prevent dog access water bodies and part of the creek, the lagoon, and the shoreline are in areas where dogs a prohibited under the preferred alternative | Beneficial to no change, assuming compliance | Beneficial cumulative impacts |

**Marin Headlands Trails (Tennessee Valley, Rodeo Lake, Rodeo Lagoon)**

**Alternative A: No Action.** Currently, Tennessee Valley is closed to dogs with the exception of the section of the Coastal Trail that crosses Tennessee Valley and the North Miwok Trail from the junction with the Tennessee Valley Trail, where dogs are allowed on leash. This site has documented low to high visitor use, including low to moderate use by dog walkers. From 2008 through 2011, a total of 269 incidents were reported. The majority of the incidents (195) were for having a dog within a closed area and a total of 31 off-leash violations were also reported at the site (table 16). The Tennessee Valley pond, which provides breeding habitat for the frog, is difficult to access due to the surrounding dense willow vegetation and as stated above, the majority of Tennessee Valley is closed to dogs. However, the freshwater Rodeo Lake (supports breeding frog populations) and Rodeo Lagoon (which provides nonbreeding frog habitat) are also located within the Marin Headlands Trails site. Rodeo Lake is closed to dogs and is densely vegetated with willows along the shoreline, making access difficult. Rodeo Lagoon is closed to dogs and humans for overall resource protection. Current NPS management to protect frogs at GGNRA has included closing areas to visitors and dogs where frog populations have been observed. There is no physical barrier to prevent dogs or visitors from accessing Rodeo Lake. A fence is proposed along the western shoreline of the lagoon that will deter but not physically exclude dogs from accessing the lagoon from the beach. Additionally, park staff members have estimated that they observe dogs in the lagoon at least once a week, and on a daily basis during good weather. The voice control areas for dogs are located immediately adjacent to the shoreline of the lagoon, which is not screened and is highly visible and accessible. Frog life stages that could be affected at the site by dogs include eggs, juveniles and adults, Eggs could be affected by trampling from off leash dogs, as has been documented at a pond in Pacifica, California by the City of San Francisco in San Mateo County. However, there is no published documentation that dogs have either directly or indirectly affected the frog at this location. Therefore, to encompass possible effects, alternative A impacts on the frog would be long term and would range from negligible to minor and adverse; frog eggs, juveniles, and adults could be affected by dogs through occasional habitat disturbance, such as trampling vegetation along the water/wetland edges, or by behavioral disturbance, such as injuring or causing mortality to individuals of the species in these water bodies. Impacts would be localized but could constitute a permanent loss if frog eggs are crushed as a result of disturbance by dogs.

Under alternative A, no permit system exists for commercial dog walking. At the Marin Headlands Trails, commercial dog walking is uncommon; therefore, commercial dog walking would have negligible impacts on the frog.

## Chapter 4: Environmental Consequences

**Cumulative Impacts.** Projects and actions in and near the Marin Headlands Trails were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the California red-legged frog at or in the vicinity of this site.

The fragmentation of existing habitat and the continued colonization of existing habitat by non-native species may represent the most important current threats to California red-legged frogs. The park stewardship programs, implementation of the *Fire Management Plan* (NPS 2005b), Wildland/Urban Interface Initiative projects, habitat restoration programs, and maintenance operations all have the potential to affect the frog and its habitat. Habitat restoration and maintenance operations aim to prevent impacts on the frogs. An example of the programs that will specifically provide some benefit to the frog is the park stewardship programs, which include provisions for the creation of additional frog habitat.

The negligible to long-term minor adverse impacts on the California red-legged frog from dogs at the Marin Headlands Trails under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from the creation of additional frog habitat and the actions from the park stewardship programs should reduce some of the adverse effects of alternative A. Therefore, negligible cumulative impacts would be expected on the California red-legged frog under this alternative.

**MARIN HEADLANDS TRAILS ALTERNATIVE A CONCLUSION TABLE**

| California Red-legged Frog Impacts            | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Negligible to long-term minor adverse impacts | The site provides both breeding (Rodeo Lake) and nonbreeding (Rodeo Lagoon) areas that are accessed by noncompliant dogs; eggs, juveniles, and adults could be affected by dogs through habitat disturbance as well as behavioral disturbance | N/A  | Negligible cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would prohibit dogs at the Marin Headlands site and Rodeo Lagoon and Rodeo Lake would still be closed to dogs. This alternative would be most protective of the frog and the breeding ponds at Tennessee Valley and Rodeo Lake as well as the nonbreeding habitat at Rodeo Lagoon and would maintain the integrity of the entire Marin Headlands Trails site. Assuming compliance, alternative B would result in no impact on the frog.

Since dogs would not be allowed at the Marin Headlands Trails, there would be no impact from commercial dog walkers on the frog.

**Cumulative Impacts.** The lack of impacts on the California red-legged frog from dogs at the Marin Headlands Trails under alternative B was considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the creation of additional frog habitat and the park stewardship programs and other actions combined with the lack of impacts from alternative B should result in beneficial cumulative impacts on the California red-legged frog under this alternative.

**MARIN HEADLANDS TRAILS ALTERNATIVE B CONCLUSION TABLE**

| <b>California Red-legged Frog Impacts</b> | <b>Rationale</b>                     | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--------------------------------------|---|-------------------------------|
| No impacts, assuming compliance           | Dogs would be prohibited at the site | Beneficial to no change, assuming compliance        | Beneficial cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would allow on-leash dog walking along the Lower Rodeo Valley Trail Corridor. This corridor extends from the Rodeo Beach parking lot to the intersection of Bunker and McCullough roads via the North Lagoon Loop Trail, Miwok Trail, and Rodeo Valley Trail including the connector trails from the Rodeo Valley Trail to the Smith Road trailhead. On-leash dog walking would be allowed on the Old Bunker Fire Road Loop (including a section of the Coastal Trail), and the Batteries Loop Trail. Dogs would be physically restrained on a leash and would be allowed on fewer trails altogether compared to alternative A. Therefore, assuming compliance, alternative C would result in negligible impacts on the frog; no measurable or perceptible changes in frogs or breeding/nonbreeding habitat would occur.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Marin Headlands Trails is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking activity is not common at the Marin Headlands Trails, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on the frog.

**Cumulative Impacts.** The negligible impacts on the California red-legged frog from dogs at the Marin Headlands Trails under alternative C were considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the creation of additional frog habitat and the park stewardship programs and other actions combined with the negligible impacts from alternative C should result in beneficial cumulative impacts on the California red-legged frog under this alternative.

**MARIN HEADLANDS TRAILS ALTERNATIVE C CONCLUSION TABLE**

| <b>California Red-legged Frog Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|---|---|-------------------------------|
| Negligible impacts, assuming compliance   | Physically restraining dogs on leash would prevent dog access to the Tennessee Valley pond, Rodeo Lake, or Rodeo Lagoon | Beneficial to no change, assuming compliance        | Beneficial cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Alternative D would have the same dog walking restrictions as alternative B (no dogs on site), and impacts would be the same, assuming compliance: no impact.

Since dogs would not be allowed at the Marin Headlands Trails, there would be no impact from commercial dog walkers on the frog.

**Cumulative Impacts.** Under alternative D, the cumulative impacts on the frog at this park would be the same as those under alternative B: beneficial.

MARIN HEADLANDS TRAILS ALTERNATIVE D CONCLUSION TABLE

| California Red-legged Frog Impacts | Rationale                            | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|------------------------------------|--------------------------------------|--|-------------------------------|
| No impact, assuming compliance     | Dogs would be prohibited at the site | Beneficial, assuming compliance              | Beneficial cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would allow on-leash dog walking on the Conzelman Coastal Trail from Highway 101 to the McCullough intersection and then to the Coastal Trail Bike Route, including Julian Road, to Rodeo Beach parking lot. On-leash dog walking would be available on the Old Bunker Fire Road Loop (which includes a section of the Coastal Trail), Batteries Loop Trail, North Miwok Trail from Tennessee Valley to Highway 1, County View Trail, Marin Drive, Rodeo Avenue Trail, and Morning Sun Trail. Impacts would be the same as those under alternative C, assuming compliance: negligible.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Marin Headlands Trails is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at the Marin Headlands Trails, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on the frog.

**Cumulative Impacts.** The negligible impacts on the California red-legged frog from dogs at the Marin Headlands Trails under alternative E were considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the creation of additional frog habitat and the park stewardship programs and other actions combined with the negligible impacts from alternative E should result in beneficial cumulative impacts on the California red-legged frog under this alternative.

MARIN HEADLANDS TRAILS ALTERNATIVE E CONCLUSION TABLE

| California Red-legged Frog Impacts      | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Negligible impacts, assuming compliance | Physically restraining dogs would prevent dog access to the Tennessee Valley pond, Rodeo Lagoon, and Rodeo Lake | Beneficial to no change, assuming compliance | Beneficial cumulative impacts |

**Alternative F: Preferred Alternative.** On-leash dog walking would be allowed along the Lower Rodeo Valley Trail Corridor, which extends from the Rodeo Beach parking lot to the intersection of Bunker and McCullough roads via the North Lagoon Loop Trail, Miwok and Rodeo Valley trails, and the connector trail from Rodeo Valley Trail to the Smith Road trailhead. On-leash dog walking would be available on the Old Bunker Fire Road Loop (including a section of the Coastal Trail), Batteries Loop Trail, Rodeo Avenue Trail, and Morning Sun Trail. Dogs would be physically restrained on leash and would be allowed on fewer trails altogether. Therefore, assuming compliance, the preferred alternative would result in negligible impacts on the frog; no measurable or perceptible changes in frogs or breeding/nonbreeding habitat would occur.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Marin Headlands Trails is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since

commercial dog walking is not common at Marin Headlands Trails, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have negligible impacts on the frog.

**Cumulative Impacts.** Projects and actions in and near the Marin Headlands Trails were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the California red-legged frog at or in the vicinity of this site.

The fragmentation of existing habitat and the continued colonization of existing habitat by non-native species may represent the most important current threats to California red-legged frogs. The park stewardship programs, implementation of the *Fire Management Plan* (NPS 2005b), Wildland/Urban Interface Initiative projects, habitat restoration programs, and maintenance operations all have the potential to affect the frog and its habitat. Habitat restoration and maintenance operations aim to prevent impacts on the frog. An example of the programs that will specifically provide some benefit to the frog is the park stewardship programs, which include provisions for the creation of additional frog habitat.

The negligible impacts on the California red-legged frog from dogs at the Marin Headlands Trails under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from the creation of additional frog habitat and the actions from the park stewardship programs combined with the negligible impacts from the preferred alternative should result in beneficial cumulative impacts on the California red-legged frog.

**MARIN HEADLANDS TRAILS PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| California Red-legged Frog Impacts      | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Negligible impacts, assuming compliance | Physically restraining dogs on leash would prevent dog access to the Tennessee Valley pond, Rodeo Lake, or Rodeo Lagoon | Beneficial to no change, assuming compliance | Beneficial cumulative impacts |

### Mori Point

**Alternative A: No Action.** Under current conditions, dogs are allowed on leash on all trails at Mori Point. Although current GGNRA regulations require dogs to be leashed at Mori Point, unleashed dogs are often observed at the site. This site has moderate visitor use by dog walkers, and off-leash violations totaled 146 from 2008 through 2011 (table 26). The NPS created four ponds at Mori Point to enhance the freshwater wetland habitat and to provide foraging habitat for the San Francisco garter snake, which also provides breeding and rearing habitat for the California red-legged frog. Educational signs and fences have been placed around the ponds and wetland habitat at Mori Point to prevent direct impacts on frogs and frog habitat; however, dogs have occasionally been observed in the ponds. In addition, the Pollywog Trail at Mori Point is adjacent to the ponds, which is near the unnamed (and unfenced) creek where frogs are frequently found at this site and occasional breeding has occurred at this site (Fong et al. 2010). Frog life stages that could be affected by dogs include eggs, juveniles, and adults. Eggs could be affected by trampling from off leash dogs, as has been documented at a pond in Pacifica, California by the City of San Francisco in San Mateo County. However, there is no documentation that dogs have either directly or indirectly affected the frog at Mori Point. Therefore, to encompass possible effects, alternative A impacts on the frog would range from negligible to minor and adverse; frog eggs, juveniles, and adults could be affected by dogs through occasional habitat disturbance, such as trampling vegetation along the water/wetland edges, or by behavioral disturbance, such as injuring or causing mortality to individuals of the

## Chapter 4: Environmental Consequences

species in these water bodies. Impacts would be localized but could constitute a permanent loss if frog eggs are crushed as a result of disturbance by dogs.

Under alternative A, no permit system exists for commercial dog walking. At Mori Point, commercial dog walking is uncommon; therefore, commercial dog walking would have negligible impacts on the frog.

**Cumulative Impacts.** Projects and actions in and near Mori Point were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the California red-legged frog at or in the vicinity of this site.

The fragmentation of existing habitat and the continued colonization of existing habitat by non-native species may represent the most important current threats to California red-legged frogs. The park stewardship programs, implementation of the *Fire Management Plan* (NPS 2005b), Wildland/Urban Interface Initiative projects, habitat restoration programs, and maintenance operations all have the potential to affect the frog and its habitat. Habitat restoration and maintenance operations aim to prevent impacts on the frog. An example of the programs that will specifically provide some benefit to the frog is the park stewardship programs, which include provisions for the creation of additional frog habitat. The *Mori Point Restoration and Trail Plan* project will protect and enhance habitat for the frog at Mori Point by guiding visitor use away from restoration areas and potential habitat.

Fragments of unique plant and animal habitats within Pacifica, known as Significant Natural Resource Areas (natural areas), have been preserved within the parks that are managed by the San Francisco Recreation and Park Department (SFRPD). The SNRAMP is intended to guide natural resource protection, habitat restoration, trail and access improvements, other capital projects, and maintenance activities over the next 20 years (SFPD 2011, 1). The scope of the SNRAMP analysis includes a natural area managed by the SFRPD in Pacifica and addresses dog walking (including on-leash dog walking and off-leash DPAs) in these areas (SFPD 2011, 261-262). The California red-legged frog has been recorded at Sharp Park (SFPD 2011, 278), which is a natural area located in Pacifica adjacent to Mori Point and managed under the SNRAMP. Implementation of the Sharp Park restoration activities under the SNRAMP would have a short-term adverse effect on special-status species such as the California red-legged frog, although numerous mitigation measures would be employed to reduce adverse impacts (SFPD 2011, 40). Sharp Park has an existing extensive wetland complex (known as Laguna Salada) located between the golf course and the earthen seawall separating it from the sand beach. Mitigation plans that are part of the Sharp Park restoration under the SNRAMP include creating, restoring, and enhancing California red-legged frog and San Francisco garter snake habitat at the Laguna Salada wetland complex in the marsh area and associated uplands (SFPD 2011, 47; 97-98). This restoration could provide long-term protection at Laguna Salada for the California red-legged frog as well as the San Francisco garter snake. Therefore, project activities included in the SNRAMP will protect this listed species and provide long-term beneficial impacts to the California red-legged frog.

The negligible to long-term minor adverse impacts on the California red-legged frog from dogs at Mori Point under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from the park stewardship programs and other restoration projects such as the *Mori Point Restoration and Trail Plan* project at this park site and the SNRAMP should reduce some of the adverse impacts on the California red-legged frog from alternative A. Therefore, cumulative impacts on the California red-legged frog would be expected to be negligible.

**MORI POINT ALTERNATIVE A CONCLUSION TABLE**

| California Red-legged Frog Impacts            | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Negligible to long-term minor adverse impacts | Dogs have occasionally been observed in fenced ponds that support frog breeding habitat; eggs, juveniles, and adults could be affected by dogs through habitat and behavioral disturbance | N/A  | Negligible cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking on the Mori Coastal Trail and on the portion of the beach owned by the NPS, but dogs would not be allowed on the Pollywog Trail adjacent to the ponds and the unnamed creek. Educational signs and fences have been placed around the ponds and wetland habitat at Mori Point to prevent direct impacts on frogs and frog habitat. If dogs are physically restrained on leash at this site and deterred by fences, they should not gain access to the ponds and should not affect the frog during egg, juvenile, and adult life stages. In addition, reducing the number of trails available for dog walking compared to alternative A would result in some benefits to the adjacent upland habitats used by both San Francisco garter snakes and California red-legged frogs. Therefore, assuming compliance, alternative B would result in negligible impacts on the frog; no measurable or perceptible changes in the frog or breeding/nonbreeding habitat would occur.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is not common in this area, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have negligible impacts on the frog.

**Cumulative Impacts.** The negligible impacts on the California red-legged frog from dogs at Mori Point under alternative B were considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the park stewardship programs and other restoration projects such as the *Mori Point Restoration and Trail Plan* project at this park site and the SNRAMP combined with the negligible impacts on the California red-legged frog from alternative B would result in beneficial cumulative impacts.

**MORI POINT ALTERNATIVE B CONCLUSION TABLE**

| California Red-legged Frog Impacts      | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Negligible impacts, assuming compliance | Physically restraining dogs on leash would prevent dog access to ponds and dogs would not be allowed on the Pollywog Trail adjacent to the ponds | Beneficial to no change, assuming compliance | Beneficial cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would allow on-leash dog walking on the Mori Coastal Trail, Old Mori Trail, and the portion of the beach owned by the NPS, but dogs would not be allowed on the Pollywog Trail adjacent to the ponds of the unnamed creek. In addition, reducing the number of trails available for dog walking compared to alternative A would result in some benefits to the adjacent upland habitats used by San Francisco garter snakes and California red-

## Chapter 4: Environmental Consequences

legged frogs. Therefore, assuming compliance, alternative C would result in negligible impacts on the frog; no measurable or perceptible changes in frogs or breeding/nonbreeding habitat would occur.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Mori Point is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at Mori Point, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on the frog.

**Cumulative Impacts.** The negligible impacts on the California red-legged frog from dogs at Mori Point under alternative C were considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the park stewardship programs and other restoration projects such as the *Mori Point Restoration and Trail Plan* project at this park site and the SNRAMP combined with the negligible impacts on the California red-legged frog from alternative C would result in beneficial cumulative impacts.

**MORI POINT ALTERNATIVE C CONCLUSION TABLE**

| California Red-legged Frog Impacts      | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Negligible impacts, assuming compliance | Physically restraining dogs on leash would prevent dog access to ponds and dogs would not be allowed on the Pollywog Trail adjacent to the ponds | Beneficial to no change, assuming compliance | Beneficial cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Alternative D would not allow dogs at the site and therefore would result in no impact on the frog.

Since dogs would not be allowed at Mori Point, there would be no impact from commercial dog walkers on the frog.

**Cumulative Impacts.** The lack of impacts on the California red-legged frog from dogs at Mori Point under alternative D was considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the park stewardship programs and other restoration projects such as the *Mori Point Restoration and Trail Plan* project at this park site and SNRAMP combined with the lack of impacts on the California red-legged frog from alternative D would result in beneficial cumulative impacts.

**MORI POINT ALTERNATIVE D CONCLUSION TABLE**

| California Red-legged Frog Impacts | Rationale                            | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|------------------------------------|--------------------------------------|--|-------------------------------|
| No impact, assuming compliance     | Dogs would be prohibited at the site | Beneficial, assuming compliance              | Beneficial cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would allow on-leash dog walking on the same trails as alternative C, but with the addition of the Pollywog Trail, which leads past the ponds that provide habitat for the frog. The Pollywog Trail is also adjacent to the unnamed (and unfenced) creek where frogs are frequently found at this site. Dogs would be physically

restrained on leash and the leash policy would be enforced, but dogs could directly affect frog habitat even while on leash and being on the Pollywog Trail. However, reducing the number of trails available for dog walking compared to alternative A would result in some benefits to the adjacent upland habitats used by San Francisco garter snakes and California red-legged frogs. Therefore, assuming compliance, alternative E would result in a negligible to long-term minor adverse impacts on the frog because perceptible changes in frogs or breeding/nonbreeding habitat could occur in a small, localized area.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Mori Point is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at Mori Point, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on the frog.

**Cumulative Impacts.** The negligible to long-term minor adverse impacts on the California red-legged frog from dogs at Mori Point under alternative E were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the park stewardship programs and other restoration projects such as the *Mori Point Restoration and Trail Plan* project at this park site and the SNRAMP should reduce some of the adverse impacts on the California red-legged frog from alternative E. Therefore, cumulative impacts on the California red-legged frog would be expected to be negligible.

**MORI POINT ALTERNATIVE E CONCLUSION TABLE**

| California Red-legged Frog Impacts                                 | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|--|--|-------------------------------|
| Negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would prevent dog access to ponds, although on-leash dogs would be allowed on the Pollywog Trail adjacent to the ponds, which is close to the unfenced creek where frogs are frequently found | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative E, allowing dogs on the Mori Coastal Trail, Old Mori Trail, the Pollywog Trail, and the portion of the beach owned by the NPS. The Pollywog Trail is located adjacent to the unnamed (and unfenced) creek where frogs are frequently found at this site. Dogs would be physically restrained on leash and the leash policy would be enforced, but dogs could directly affect frog habitat even while on leash along the Pollywog Trail. However, reducing the number of trails available for dog walking compared to alternative A would result in some benefits to the adjacent upland habitats used by both San Francisco garter snakes and California red-legged frogs. Therefore, assuming compliance, the preferred alternative would result in a negligible to long-term minor adverse impacts on the frog because perceptible changes in frogs or breeding/nonbreeding habitat could occur in a small, localized area.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Mori Point is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at Mori Point, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have negligible impacts on the frog.

## Chapter 4: Environmental Consequences

**Cumulative Impacts.** Projects and actions in and near Mori Point were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the California red-legged frog at or in the vicinity of this site.

The fragmentation of existing habitat and the continued colonization of existing habitat by non-native species may represent the most important current threats to California red-legged frogs. The park stewardship programs, implementation of the *Fire Management Plan* (NPS 2005b), Wildland/Urban Interface Initiative projects, habitat restoration programs, and maintenance operations all have the potential to affect the frog and its habitat. Habitat restoration and maintenance operations aim to prevent impacts on the frogs. An example of the programs that will specifically provide some benefit to the frog is the park stewardship programs, which include provisions for the creation of additional frog habitat. The *Mori Point Restoration and Trail Plan* project will protect and enhance habitat for the frog at Mori Point by guiding visitor use away from restoration areas and potential habitat.

Fragments of unique plant and animal habitats within Pacifica, or natural areas, have been preserved within the parks that are managed by the San Francisco Recreation and Park Department (SFRPD). The SNRAMP is intended to guide natural resource protection, habitat restoration, trail and access improvements, other capital projects, and maintenance activities over the next 20 years (SFPD 2011, 1). The scope of the SNRAMP analysis includes a natural area managed by the SFRPD in Pacifica and addresses dog walking (including on-leash dog walking and off-leash DPAs) in these areas (SFPD 2011, 261-262). The California red-legged frog has been recorded at Sharp Park (SFPD 2011, 278), which is a natural area located adjacent to Mori Point and managed under the SNRAMP. Implementation of the Sharp Park restoration activities under the SNRAMP would have a short-term adverse effect on special-status species such as the California red-legged frog, although numerous mitigation measures would be employed to reduce adverse impacts (SFPD 2011, 40). Sharp Park has an existing extensive wetland complex (known as Laguna Salada) located between the golf course and the earthen seawall separating it from the sand beach. Mitigation plans that are part of the Sharp Park restoration under the SNRAMP include creating, restoring, and enhancing California red-legged frog and San Francisco garter snake habitat at the Laguna Salada wetland complex in the marsh area and associated uplands (SFPD 2011, 47; 97-98). This restoration could provide long-term protection at Laguna Salada for the California red-legged frog as well as the San Francisco garter snake. Therefore, project activities included in the SNRAMP will protect this listed species and provide long-term beneficial impacts to the California red-legged frog.

The negligible to long-term minor adverse impacts on the California red-legged frog from dogs at Mori Point under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from the park stewardship programs and other restoration projects such as the *Mori Point Restoration and Trail Plan* project at this park site and the SNRAMP combined with the negligible to long-term minor adverse impacts on the California red-legged frog from the preferred alternative would result in negligible cumulative impacts.

**MORI POINT PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| California Red-legged Frog Impacts                                 | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|--|--|-------------------------------|
| Negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would prevent dog access to ponds, although on-leash dogs would be allowed on the Pollywog Trail adjacent to the ponds, which is close to the unfenced creek where frogs are frequently found | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

### Sweeney Ridge/Cattle Hill

**Alternative A: No Action.** Under current conditions, on-leash dog walking is allowed on all trails at Sweeney Ridge except the Notch Trail, which is closed to dogs. This site has documented low to moderate visitor use by dog walkers, and off-leash dog walking occurs along the trails of Sweeney Ridge; off-leash incidents totaled 115 from 2008 through 2011 (table 28). Cattle Hill is currently not part of GGNRA, but unrestricted dog walking occurs at this site. At Cattle Hill, there are mapped occurrences of the California red-legged frog, but no known breeding has been documented to date (URS Corporation 2010, Figure 3). However, Cattle Hill provides potential breeding and nonbreeding habitat for the California red-legged frog based upon modeling efforts for these sites (URS Corporation 2010, Figure 3). Also, designated critical habitat for the frog occurs throughout some areas of Cattle Hill (USFWS 2009c). Sweeney Ridge has no known breeding that has been documented to date (URS Corporation 2010, Figure 3). However, Sweeney Ridge provides potential breeding and nonbreeding habitat for the California red-legged frog based upon modeling efforts for these sites (URS Corporation 2010, Figure 3). There is also a small portion of critical habitat unit SNM-1 that is located in the southern corner of Sweeney Ridge (USFWS 2006). Therefore, this section analyzes impacts to both nonbreeding and critical habitat for juvenile and adult life stages of the frog because no known breeding occurs at this site to date. Dogs could affect adult/juvenile frogs at these sites through habitat disturbance, such as trampling vegetation along the water/wetland edges, or by behavioral disturbance such as injuring or causing mortality to individuals of the species at this site. Even so, there is no documentation that dogs have either directly or indirectly affected the frog at Sweeney Ridge or Cattle Hill.

Therefore, to encompass possible effects, alternative A impacts at Sweeney Ridge/Cattle Hill on the frog would be long term and would range from negligible to minor and adverse. A few individuals (juveniles and adults) of the species in a small, localized area could be occasionally affected by disturbance from dogs but essential features of critical habitat would not be impacted and reproductive success of individuals of the species would not be affected.

Under alternative A, no permit system exists for commercial dog walking. Commercial dog walking is uncommon at Sweeney Ridge/Cattle Hill; therefore, commercial dog walking would have negligible impacts on the frog.

**Cumulative Impacts.** Projects and actions in and near Sweeney Ridge/Cattle Hill were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the California red-legged frog at or in the vicinity of this site.

## Chapter 4: Environmental Consequences

The fragmentation of existing habitat and the continued colonization of existing habitat by non-native species may represent the most important current threats to California red-legged frogs. The park stewardship programs, implementation of the *Fire Management Plan* (NPS 2005b), Wildland/Urban Interface Initiative projects, habitat restoration programs, and maintenance operations all have the potential to affect the frog and its habitat. Habitat restoration and maintenance operations aim to prevent impacts on the frog. An example of the programs that will specifically provide some benefit to the frog is the park stewardship programs, which include provisions for the creation of additional frog habitat. As discussed under Mori Point, mitigation plans that are part of the Sharp Park (located adjacent to Sweeney Ridge) restoration under the SNRAMP include creating, restoring, and enhancing California red-legged frog and San Francisco garter snake habitat at the Laguna Salada wetland complex in the marsh area and associated uplands (SFPD 2011, 47; 97-98). This restoration could provide long-term protection at Laguna Salada for the California red-legged frog as well as the San Francisco garter snake.

The negligible to long-term minor adverse impacts on the California red-legged frog from dogs at Sweeney Ridge under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from the park stewardship programs and other actions such as the SNRAMP should reduce some of the adverse impacts on the California red-legged frog from alternative A. Therefore, cumulative impacts on the California red-legged frog under this alternative would be expected to be negligible.

**SWEENEY RIDGE/CATTLE HILL ALTERNATIVE A CONCLUSION TABLE**

| California Red-legged Frog Impacts            | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Negligible to long-term minor adverse impacts | Sites have no known breeding habitat but have mapped critical habitat; juveniles and adults could be affected by dogs through habitat disturbance as well as behavioral disturbance or causing injury or mortality to individuals | N/A  | Negligible cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would not allow dogs at either site and would provide protection for a large area of relatively undisturbed contiguous habitat. Assuming compliance, alternative B would result in no impact on the frog.

Since dogs would not be allowed at Sweeney Ridge/Cattle Hill, there would be no impact from commercial dog walkers on the frog.

**Cumulative Impacts.** The lack of impacts on the California red-legged frog from dogs at Sweeney Ridge/Cattle Hill under alternative B was considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the park stewardship programs as well as the SNRAMP combined with the lack of impacts on the California red-legged frog from alternative B would result in beneficial cumulative impacts.

**SWEENEY RIDGE/CATTLE HILL ALTERNATIVE B CONCLUSION TABLE**

| <b>California Red-legged Frog Impacts</b> | <b>Rationale</b>                     | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--------------------------------------|---|-------------------------------|
| No impact, assuming compliance            | Dogs would be prohibited at the site | Beneficial, assuming compliance                     | Beneficial cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Under alternative C, no dogs would be allowed at Sweeney Ridge. Therefore, assuming compliance, this alternative would result in no impact on the frog at Sweeney Ridge. At Cattle Hill, dogs would be allowed on leash on the Baquiano Trail from Fassler Avenue up to and including the Farallon View Trail. Cattle Hill has mapped occurrences of the California red-legged frog at the site, but no known breeding has been documented to date (URS Corporation 2010, Figure 3). However, Cattle Hill provides potential breeding and nonbreeding habitat for the California red-legged frog based upon modeling efforts for these sites (URS Corporation 2010, Figure 3). Also, designated critical habitat for the frog occurs throughout some areas of Cattle Hill (USFWS 2009c). Physically restraining dogs on leash would not allow dog access to any water bodies that support the frogs or nonbreeding or critical habitat. Therefore, assuming compliance, alternative C would result in negligible impacts on the frog at Cattle Hill because no measurable or perceptible changes in frogs or critical habitat or nonbreeding habitat would occur.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Sweeney Ridge/Cattle Hill is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since dog walking would not be allowed at Sweeney Ridge, commercial dog walking under alternative C would have no impact on the frog. Since commercial dog walking is not common at Cattle Hill, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on the frog.

**Cumulative Impacts.** The negligible impacts on the California red-legged frog from dogs at Cattle Hill under alternative C were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the park stewardship programs as well as the SNRAMP combined with the negligible impacts on the California red-legged frog from alternative C would result in negligible cumulative impacts at Cattle Hill. At Sweeney Ridge, the lack of impacts combined with the beneficial effects from the park stewardship programs would result in beneficial cumulative impacts.

**SWEENEY RIDGE/CATTLE HILL ALTERNATIVE C CONCLUSION TABLE**

| <b>California Red-legged Frog Impacts</b>               | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--|---|-------------------------------|
| No impact at Sweeney Ridge, assuming compliance         | Dogs would be prohibited at Sweeney Ridge  | Beneficial, assuming compliance                     | Beneficial cumulative impacts |
| Negligible impacts, assuming compliance, at Cattle Hill | At Cattle Hill, physically restraining dogs would prevent dog access to any water bodies that support the frog | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Alternative D would have the same dog walking restrictions as alternative B (no dogs on Sweeney Ridge or Cattle Hill sites), and impacts on the frog would be the same, assuming compliance: no impact.

## Chapter 4: Environmental Consequences

Since dogs would not be allowed at Sweeney Ridge/Cattle Hill, there would be no impact from commercial dog walkers on the frog.

**Cumulative Impacts.** Under alternative D, the cumulative impacts on the frog at this park site would be the same as those under alternative B: beneficial.

**SWEENEY RIDGE/CATTLE HILL ALTERNATIVE D CONCLUSION TABLE**

| <b>California Red-legged Frog Impacts</b> | <b>Rationale</b>                     | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--------------------------------------|---|-------------------------------|
| No impact, assuming compliance            | Dogs would be prohibited at the site | Beneficial, assuming compliance                     | Beneficial cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** At Sweeney Ridge, alternative E would allow on-leash dog walking along Sweeney Ridge Trail from Portola Discovery Site to the Notch Trail and on to the junction with the Mori Ridge Trail. On-leash dog walking would also be allowed on Sneath Lane. At Cattle Hill, dogs would be allowed on leash on the Baquiano Trail from Fassler Avenue up to and including the Farallon View Trail. Cattle Hill has mapped occurrences of the California red-legged frog at the site, but neither Sweeney Ridge nor Cattle Hill has known breeding that has been documented to date (URS Corporation 2010, Figure 3). However, both Sweeney Ridge and Cattle Hill provide potential breeding and nonbreeding habitat for the California red-legged frog based upon modeling efforts for these sites (URS Corporation 2010, Figure 3). There is also a small portion of critical habitat unit SNM-1 that is located in the southern corner of Sweeney Ridge (USFWS 2006) and designated critical habitat for the frog occurs throughout some areas of Cattle Hill (USFWS 2009c).

The trails at Sweeney Ridge/Cattle Hill are long, with high quality habitat directly adjacent to the trails, and the on-leash dog trails under this alternative are a greater portion of the entire site compared to alternatives B, C, and D. Additionally, Cattle Hill trails would allow on-leash dog walking under this alternative, and these trails generally receive low to moderate use. However, because the frog is generally found in and around the ponds at this site, the on-leash requirements would prevent dog access to any water bodies that support the frog. Therefore, assuming compliance, alternative E would result in negligible impacts on the frog; no measurable or perceptible changes in frogs, critical habitat, or nonbreeding habitat would occur at Sweeney Ridge/Cattle Hill.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Sweeney Ridge/Cattle Hill is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking activity is not common at Sweeney Ridge or Cattle Hill, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on the frog.

**Cumulative Impacts.** The negligible impacts on the California red-legged frog from dogs at Sweeney Ridge/Cattle Hill under alternative E were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the park stewardship programs as well as the SNRAMP and other actions combined with the negligible impacts on the California red-legged frog from alternative E would result in negligible cumulative impacts.

## SWEENEY RIDGE/CATTLE HILL ALTERNATIVE E CONCLUSION TABLE

| California Red-legged Frog Impacts      | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Negligible impacts, assuming compliance | Physically restraining dogs on leash would prevent dog access to any water bodies that support the frog | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** On-leash dog walking would be allowed at Sweeney Ridge on Sneath Lane and the Sweeney Ridge Trail between the Portola Discovery site and the Nike Missile Site. On-leash dog walking would be allowed at Cattle Hill on the Baquiano Trail from Fassler Avenue up to and including the Farallon View Trail. Physically restraining dogs on leash would not allow dog access to any water bodies that support the frogs or nonbreeding or critical habitat. Therefore, assuming compliance, the preferred alternative would result in negligible impacts on the frog at Sweeney Ridge/Cattle Hill because no measurable or perceptible changes in frogs or critical habitat or nonbreeding habitat would occur.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Sweeney Ridge/Cattle Hill is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at Sweeney Ridge/Cattle Hill, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on the frog.

**Cumulative Impacts.** Projects and actions in and near Sweeney Ridge/Cattle Hill were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the California red-legged frog at or in the vicinity of this site.

As discussed under Mori Point, mitigation plans that are part of the Sharp Park (located adjacent to Sweeney Ridge) restoration under the SNRAMP include creating, restoring, and enhancing California red-legged frog and San Francisco garter snake habitat at the Laguna Salada wetland complex in the marsh area and associated uplands (SFPD 2011, 47; 97-98). This restoration could provide long-term protection at Laguna Salada for the California red-legged frog as well as the San Francisco garter snake.

The fragmentation of existing habitat and the continued colonization of existing habitat by non-native species may represent the most important current threats to California red-legged frogs. The park stewardship programs, implementation of the *Fire Management Plan* (NPS 2005b), Wildland/Urban Interface Initiative projects, habitat restoration programs, and maintenance operations all have the potential to affect the frog and its habitat. Habitat restoration and maintenance operations aim to prevent impacts on the frog. An example of the programs that will specifically provide some benefit to the frog is the park stewardship programs, which include provisions for the creation of additional frog habitat.

The negligible impacts at Sweeney Ridge combined with the beneficial impacts from the projects mentioned above would result in negligible cumulative impacts. The negligible impacts on the California red-legged frog from dogs at Cattle Hill under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from the park stewardship programs, the SNRAMP and other actions combined with the negligible impacts on the California red-legged frog at Cattle Hill from the preferred alternative would also result in negligible cumulative impacts.

SWEENEY RIDGE/CATTLE HILL PREFERRED ALTERNATIVE F CONCLUSION TABLE

| California Red-legged Frog Impacts                     | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|--|--|-------------------------------|
| Negligible impacts, assuming compliance, at both sites | Physically restraining dogs would prevent dog access to any water bodies that support the frog | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

### Pedro Point Headlands

**Alternative A: No Action.** Although this site is currently not part of GGNRA, unrestricted dog walking occurs at this site. This site has documented low to moderate visitor use and the numbers of dog-related incidents at the site are unknown since the NPS does not currently own the property and it is not patrolled by NPS rangers (table 9). Designated critical habitat for the frog occurs throughout a portion of the Pedro Point Headlands (USFWS 2010), although no known breeding habitat occurs at the site. Potential frog breeding sites are separated from Pedro Point Headlands by Interstate Highway 1. Therefore, dogs could affect adult or juvenile frogs at these sites through habitat disturbance, such as trampling vegetation along the water/wetland edges, or by behavioral disturbance such as injuring or causing mortality to individuals of the species at this site. Even so, there is no documentation that dogs have either directly or indirectly affected the frog at the Pedro Point Headlands. Therefore, to encompass possible effects, alternative A impacts on the frog would be long term and would range from negligible to minor and adverse. A few individuals of the species in a small, localized area could be occasionally affected by disturbance from dogs but essential features of designated critical habitat would not be impacted and reproductive success of individuals of the species would not be affected.

There are currently no commercial dog walking regulations at Pedro Point Headlands. It is unknown whether commercial dog walkers contribute to impacts on the frog.

**Cumulative Impacts.** Projects and actions in and near Pedro Point Headlands were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the California red-legged frog at or in the vicinity of this site.

The fragmentation of existing habitat and the continued colonization of existing habitat by non-native species may represent the most important current threats to California red-legged frogs. The park stewardship programs, implementation of the *Fire Management Plan* (NPS 2005b), Wildland/Urban Interface Initiative projects, habitat restoration programs, and maintenance operations all have the potential to affect the frog and its habitat. Habitat restoration and maintenance operations aim to prevent impacts on the frog. An example of the programs that will specifically provide some benefit to the frog is the park stewardship programs, including the Pedro Point Headlands Stewardship Project, which is aiming to protect endangered and native species at the site (City College of San Francisco, Center for Habitat Restoration 2008).

The negligible to long-term minor adverse impacts on the California red-legged frog from dogs at the Pedro Point Headlands under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from the park stewardship programs and other actions should reduce some of the adverse impacts on the California red-legged frog from alternative A. Therefore, cumulative impacts on the California red-legged frog under this alternative would be expected to be negligible.

**PEDRO POINT HEADLANDS ALTERNATIVE A CONCLUSION TABLE**

| California Red-legged Frog Impacts            | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Negligible to long-term minor adverse impacts | Site has no known breeding habitat but has designated critical habitat; juveniles and adults could be affected by dogs through habitat disturbance and causing behavioral disturbance, injury, or mortality to individuals | N/A  | Negligible cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking on the Coastal Trail at the Pedro Point Headlands. No dog walking would be allowed on the trails proposed by the Pacifica Land Trust. If dogs are physically restrained on leash at this site, they should not gain access to frog habitat and should not affect juvenile or adult frogs. Therefore, assuming compliance, alternative B would result in negligible impacts on the frog; no measurable or perceptible changes to frogs, nonbreeding habitat, or critical habitat would occur.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is not common at the Pedro Point Headlands, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have negligible impacts on the frog.

**Cumulative Impacts.** The negligible impacts on the California red-legged frog from dogs at the Pedro Point Headlands under alternative B were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the park stewardship programs and other actions combined with the negligible impacts on the California red-legged frog from alternative B would result in negligible cumulative impacts.

**PEDRO POINT HEADLANDS ALTERNATIVE B CONCLUSION TABLE**

| California Red-legged Frog Impacts      | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Negligible impacts, assuming compliance | Physically restraining dogs on leash would prevent dog access to frog habitat | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Similar to alternative B, alternative C would allow on-leash dog walking on the Coastal Trail, and impacts would be the same, assuming compliance: negligible.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Pedro Point Headlands is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at the Pedro Point Headlands, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on the frog.

## Chapter 4: Environmental Consequences

**Cumulative Impacts.** Under alternative C, the cumulative impacts on the frog at this park site would be the same as those under alternative B: negligible.

**PEDRO POINT HEADLANDS ALTERNATIVE C CONCLUSION TABLE**

| California Red-legged Frog Impacts      | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Negligible impacts, assuming compliance | Physically restraining dogs would prevent dog access to potential habitat for the frog | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Alternative D would not allow dogs at the site and therefore would result in no impact on the frog.

Since dogs would not be allowed at the Pedro Point Headlands, there would be no impact from commercial dog walkers on the frog.

**Cumulative Impacts.** The lack of impacts on the California red-legged frog from dogs at the Pedro Point Headlands under alternative D was considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the park stewardship programs and other actions combined with the lack of impacts on the California red-legged frog from alternative D would result in beneficial cumulative impacts.

**PEDRO POINT HEADLANDS ALTERNATIVE D CONCLUSION TABLE**

| California Red-legged Frog Impacts | Rationale                            | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|------------------------------------|--------------------------------------|--|-------------------------------|
| No impact, assuming compliance     | Dogs would be prohibited at the site | Beneficial, assuming compliance              | Beneficial cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** On-leash dog walking would be allowed on the Coastal Trail and trails proposed by the Pacifica Land Trust. If dogs are physically restrained on leash at this site, they should not gain access to frog habitat and should not affect juvenile or adult frogs. Therefore, assuming compliance, alternative E would result in negligible impacts on the frog; no measurable or perceptible changes to frogs, nonbreeding habitat, or critical habitat would occur.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Pedro Point Headlands is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at the Pedro Point Headlands, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on the frog.

**Cumulative Impacts.** Under alternative E, the cumulative impacts on the frog at this park site would be the same as those under alternative B: negligible.

**PEDRO POINT HEADLANDS ALTERNATIVE E CONCLUSION TABLE**

| California Red-legged Frog Impacts      | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Negligible impacts, assuming compliance | Physically restraining dogs on leash would prevent dog access to any water bodies that support habitat for the frog | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative B, allowing on-leash dog walking on the Coastal Trail, but no dog walking would be permitted on the trails proposed by the Pacifica Land Trust. If dogs are physically restrained on leash at this site, they should not gain access to frog habitat and should not affect the frog during juvenile or adult life stages. Therefore, assuming compliance, the preferred alternative would result in negligible impacts on the frog; no measurable or perceptible changes to frogs, nonbreeding habitat, or critical habitat would occur.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Pedro Point Headlands is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at the Pedro Point Headlands, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have negligible impacts on the frog.

**Cumulative Impacts.** Projects and actions in and near Pedro Point Headlands were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the California red-legged frog at or in the vicinity of this site.

The fragmentation of existing habitat and the continued colonization of existing habitat by non-native species may represent the most important current threats to California red-legged frogs. The park stewardship programs, implementation of the *Fire Management Plan* (NPS 2005b), Wildland/Urban Interface Initiative projects, habitat restoration programs, and maintenance operations all have the potential to affect the frog and its habitat. Habitat restoration and maintenance operations aim to prevent impacts on the frog. An example of the programs that will specifically provide some benefit to the frog is the park stewardship programs, which include provisions for the creation of additional frog habitat.

The negligible impacts on the California red-legged frog from dogs at the Pedro Point Headlands under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from the park stewardship programs and other actions combined with the negligible impacts on the California red-legged frog from the preferred alternative would result in negligible cumulative impacts.

**PEDRO POINT HEADLANDS PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| California Red-legged Frog Impacts      | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Negligible impacts, assuming compliance | Physically restraining dogs on leash would prevent dog access to frog habitat | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

### Rancho Corral de Tierra

**Alternative A: No Action.** Under current conditions, on-leash dog walking is allowed at Rancho Corral de Tierra. Staff regularly working at Rancho characterize use by dog walkers as low to moderate, and compliance with the leash law is generally low. Because Rancho Corral de Tierra was transferred to NPS in December 2011, law enforcement statistics are not available for this site. At Rancho Corral de Tierra, several occurrences of the California red-legged frog have been observed (URS Corporation 2010, Figure 3), including a mapped occurrence and a breeding pond near existing dog walking trails at the Montara area, and occurrences along Denniston Creek in the El Granada area. One area of the El Granada area also provides breeding habitat for the frog in a waterbody located approximately 800 feet from an existing trail. In addition, existing trails at Rancho Corral de Tierra cross upland aestivation habitat and dispersal habitat for this species (URS Corporation 2010, Figure 3). Critical habitat for California red-legged frogs encompasses most of the Rancho Corral de Tierra site (USFWS 2010; USFWS 2009c). There is also a portion of critical habitat unit SNM-1 that is located within the El Granada area along the trails and habitat near Denniston Creek (USFWS 2006; USFWS 2010). Therefore, this section analyzes impacts to nonbreeding and critical habitat for juvenile and adult life stages of the frog.

Rancho has low compliance with the leash law and NPS rangers have observed off-leash dogs running in areas with potentially sensitive habitat. Under alternative A, dogs could affect adult/juvenile frogs at Rancho through habitat disturbance, such as trampling vegetation along the water/wetland edges, or by behavioral disturbance such as injuring or causing mortality to individuals of the species at this site by jumping into unfenced waterbodies that provide breeding habitat. Park staff observed a dog swimming in a waterbody that had previously supported frogs on multiple occasions. Even so, there is no documentation that dogs have either directly or indirectly affected the frog at Rancho Corral de Tierra. Therefore, to encompass possible effects, alternative A impacts on the frog would be long term and would range from negligible to minor and adverse. A few individuals (juveniles and adults) of the species in a small, localized area (Rancho Corral de Tierra) could be occasionally affected by disturbance from dogs but essential features of critical habitat would not be impacted and reproductive success of individuals of the species would not be affected.

Under alternative A, no permit system exists for commercial dog walking. Currently, commercial dog walking use is low at Rancho Corral de Tierra; therefore, commercial dog walking would have negligible impacts on the frog.

**Cumulative Impacts.** Projects and actions in and near Rancho Corral de Tierra were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the California red-legged frog at or in the vicinity of this site. Since the Rancho Corral de Tierra site has been transferred to NPS, general protection of the site and associated natural resources would occur, although some impacts may remain from prior unregulated off-leash dog walking.

Additional actions have had, are currently having, or have the potential to have adverse impacts on wildlife and wildlife habitat at or in the vicinity of Rancho Corral de Tierra, such as development or construction actions. One example is the CalTrans Devil's Slide Tunnel project, which involves constructing two tunnels beneath San Pedro Mountain to provide a dependable highway between Pacifica and Montara (CADOT 2013, 1). The Devil's Slide Bypass highway project will result in a temporary loss of California red-legged frog foraging and potential breeding habitat (FHA and CADOT 2002, 71). Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts.

The fragmentation of existing habitat and the continued colonization of existing habitat by non-native species may represent the most important current threats to California red-legged frogs. Since the Rancho Corral de Tierra site has been transferred to the NPS, general protection of the site and associated natural resources would occur. Additionally, implementation of the *Fire Management Plan* (NPS 2005b), Wildland/Urban Interface Initiative projects, habitat restoration programs, and maintenance operations all have the potential to affect the frog and its habitat. Habitat restoration and maintenance operations aim to prevent impacts on the frog.

The negligible to long-term minor adverse impacts on the California red-legged frog from dogs at Rancho Corral de Tierra under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from the park stewardship programs and other actions should reduce some of the adverse impacts on the California red-legged frog from alternative A. Therefore, cumulative impacts on the California red-legged frog under this alternative would be expected to be negligible.

**RANCHO CORRAL DE TIERRA ALTERNATIVE A CONCLUSION TABLE**

| California Red-legged Frog Impacts            | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Negligible to long-term minor adverse impacts | Site has upland aestivation habitat, dispersal habitat, wetland breeding site, and streams provide potential breeding habitat; critical habitat is throughout the site; juveniles and adults could be affected by dogs through habitat disturbance trampling as well as behavioral disturbance or causing injury or mortality to individuals | N/A  | Negligible cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking on certain trails at Rancho Corral de Tierra in the Montara and El Granada areas, which were identified by the local dog walking group as key areas for this use. The dog walking trails at Rancho Corral de Tierra cross upland aestivation habitat, dispersal habitat, and streams that provide potential breeding habitat. There is critical habitat throughout the property, including areas along dog walking trails near Denniston Creek (USFWS 2010). However, if dogs are physically restrained on leash at this site, they should not gain access to frog habitat and should not affect juvenile or adult frogs. Therefore, assuming compliance, alternative B would result in negligible impacts on the frog; no measurable or perceptible changes to frogs, nonbreeding habitat, or critical habitat would occur.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Currently, commercial dog walking use is low at Rancho Corral de Tierra; therefore, commercial dog walking would have negligible impacts on the frog.

**Cumulative Impacts.** The negligible impacts on the California red-legged frog from dogs at Rancho Corral de Tierra under alternative B were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the park stewardship programs combined with the negligible impacts on the California red-legged frog from alternative B would result in negligible cumulative impacts.

**Chapter 4: Environmental Consequences**

**RANCHO CORRAL DE TIERRA ALTERNATIVE B CONCLUSION TABLE**

| <b>California Red-legged Frog Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|---|---|-------------------------------|
| Negligible impacts, assuming compliance   | Physically restraining dogs on leash would prevent dog access to frog habitat | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Under alternative C, on-leash dog walking would be allowed on certain trails within two areas open to dog walking at Rancho Corral de Tierra in the Montara and El Granada areas. The dog walking trails at cross upland aestivation habitat, dispersal habitat, and streams that provide potential breeding habitat. A ROLA is proposed under alternative C in the Montara area between Le Conte Street and Tamarind Street, in an open grassy area near the Farallone View School. The proposed ROLA is not located within critical habitat for the frog, but in upland and dispersal habitat for the frog (URS Corporation 2010, Figure 3) and within 0.4 miles of an existing breeding site in a wetland area. Vegetation in the ROLA is not comprised of sensitive vegetation, but mostly annual, non-native grasses in a wet area. This vegetation within upland and dispersal habitat for the frog in the ROLA would become trampled and would likely turn to mud. As stated previously, critical habitat is located within the majority of the entire Rancho Corral de Tierra site, including both the Montara and El Granada areas (USFWS 2010). To encompass possible effects of the ROLA, alternative C impacts on the frog would be long term and would range from negligible to minor and adverse. A few individuals (juveniles and adults) of the species in a small, localized area (Rancho Corral de Tierra) could be occasionally affected by disturbance from dogs at the wetland area near the ROLA. Essential features of critical habitat would not likely be impacted and reproductive success of individuals of the species would not be affected, but the level of impact would be dependent on use of the site by visitors and dogs.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Rancho Corral de Tierra is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Currently, commercial dog walking use is low at Rancho Corral de Tierra; therefore, commercial dog walking under this alternative would have negligible impacts on the frog.

**Cumulative Impacts.** The negligible to long-term minor adverse impacts on the California red-legged frog from dogs at Rancho Corral de Tierra under alternative C were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the park stewardship programs combined with the negligible to long-term minor adverse impacts on the California red-legged frog from alternative C would result in negligible cumulative impacts at Rancho Corral de Tierra.

**RANCHO CORRAL DE TIERRA ALTERNATIVE C CONCLUSION TABLE**

| <b>California Red-legged Frog Impacts</b>     | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|---|---|-------------------------------|
| Negligible to long-term minor adverse impacts | Physically restraining dogs on leash would prevent dog access to frog habitat, but ROLA is located within upland and dispersal habitat and near a wetland breeding site | No change, assuming compliance                      | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Under alternative D, on-leash dog walking would be allowed in the Montara area on two trails: Old San Pedro Mountain Road and the Farallon Cutoff. Dogs would be prohibited in other areas of the site, including the entire El Granada area. If dogs are not allowed in the El Granada area (which supports critical habitat for the frog) and are physically restrained on leash at Montara on two existing trails, they should not gain access to frog habitat and should not affect juvenile or adult frogs. Therefore, assuming compliance, alternative D would result in negligible impacts on the frog. No measurable or perceptible changes to frogs, nonbreeding habitat, or critical habitat would occur.

Since no commercial dog walking would be allowed and no permits for walking more than three dogs would be issued under alternative D, no impact on the frog from commercial and permitted dog walking would occur.

**Cumulative Impacts.** Under alternative D, the cumulative impacts on the frog at this park site would be the same as those under alternative B: beneficial.

**RANCHO CORRAL DE TIERRA ALTERNATIVE D CONCLUSION TABLE**

| California Red-legged Frog Impacts      | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Negligible impacts, assuming compliance | Physically restraining dogs on leash would prevent dog access to frog habitat | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would have the same dog walking restrictions as alternative C, and impacts would be the same: ranging from negligible to long-term minor and adverse.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Currently, Rancho Corral de Tierra is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Commercial dog walking use is low at Rancho Corral de Tierra; therefore, commercial dog walking would have negligible impacts on the frog.

**Cumulative Impacts.** The negligible impacts on the California red-legged frog from dogs at Rancho Corral de Tierra under alternative E were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the park stewardship programs and other actions combined with the negligible impacts on the California red-legged frog from alternative E would result in negligible cumulative impacts.

**RANCHO CORRAL DE TIERRA ALTERNATIVE E CONCLUSION TABLE**

| California Red-legged Frog Impacts            | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Negligible to long-term minor adverse impacts | Physically restraining dogs on leash would prevent dog access to frog habitat, but ROLA is located within upland and dispersal habitat and a wetland breeding site | No change, assuming compliance               | Negligible cumulative impacts |

## Chapter 4: Environmental Consequences

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative B, allowing on-leash dog walking on some trails at Rancho Corral de Tierra in the Montara and El Granada areas. The dog walking trails cross upland aestivation habitat, dispersal habitat, and streams that provide potential breeding habitat. Critical habitat is located throughout the site, including in the El Granada area along dog walking trails near Denniston Creek (USFWS 2010). However, if dogs are physically restrained on leash at this site, they should not gain access to frog habitat and should not affect juvenile or adult frogs. Therefore, assuming compliance, the preferred alternative would result in negligible impacts on the frog. No measurable or perceptible changes to frogs, nonbreeding habitat, or critical habitat would occur.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Rancho Corral de Tierra is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Currently, commercial dog walking use is low at Rancho Corral de Tierra; therefore, commercial dog walking would have negligible impacts on the frog.

**Cumulative Impacts.** Projects and actions in and near Rancho Corral de Tierra were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the California red-legged frog at or in the vicinity of this site. Since the Rancho Corral de Tierra site has been transferred to NPS, general protection of the site and associated natural resources would occur, although some impacts may remain from prior unregulated off-leash dog walking.

Additional actions have had, are currently having, or have the potential to have adverse impacts on wildlife and wildlife habitat at or in the vicinity of Rancho Corral de Tierra, such as development or construction actions. One example is the CalTrans Devil's Slide Tunnel project, which involves constructing two tunnels beneath San Pedro Mountain to provide a dependable highway between Pacifica and Montara (CADOT 2013, 1). The Devil's Slide Bypass highway project will result in a temporary loss of California red-legged frog foraging and potential breeding habitat (FHA and CADOT 2002, 71). Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts.

The fragmentation of existing habitat and the continued colonization of existing habitat by non-native species may represent the most important current threats to California red-legged frogs. Since the Rancho Corral de Tierra site has been transferred to the NPS, there would be general protection of the site and associated natural resources. Additionally, implementation of the *Fire Management Plan* (NPS 2005b), Wildland/Urban Interface Initiative projects, habitat restoration programs, and maintenance operations all have the potential to affect the frog and its habitat. Habitat restoration and maintenance operations aim to prevent impacts on the frog.

The negligible impacts on the California red-legged frog from dogs at Rancho Corral de Tierra under the preferred alternative were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the other actions combined with the negligible impacts on the California red-legged frog from the preferred alternative would result in negligible cumulative impacts.

**RANCHO CORRAL DE TIERRA PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| California Red-legged Frog Impacts      | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Negligible impacts, assuming compliance | Physically restraining dogs on leash would prevent dog access to frog habitat | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

## **IMPACTS TO THE SAN FRANCISCO GARTER SNAKE (FEDERALLY AND STATE ENDANGERED) BY SITE AND ALTERNATIVE**

In addition to federal and state listing, the San Francisco garter snake is a fully protected animal in California. In GGNRA, the San Francisco garter snake (hereafter often referred to as “the snake”) has been documented as occurring at Mori Point; the freshwater ponds at this site were created to provide foraging habitat for this species. Milagra Ridge has suitable aquatic, adjacent upland, and dispersal habitats for the snake and Sweeney Ridge/Cattle Hill and Pedro Point Headlands may serve as dispersal habitat for the snake. There is a mapped occurrence of the San Francisco garter snake at Denniston Creek in the El Granada area of the Rancho Corral de Tierra, near an existing trail (URS Corporation 2010, Figure 11). In addition, suitable aquatic habitat and adjacent upland dispersal habitat would be crossed by trails at Rancho Corral de Tierra (URS Corporation 2010, Figure 11).

It is important to note that the primary food source of the San Francisco garter snake is the federally threatened California red-legged frog (discussed above). Therefore, described impacts on the frog could also affect the San Francisco garter snake. The snake is normally associated with wetland areas and water bodies, but also uses upland habitat for basking and/or burrowing (USFWS 1985, 9).

### **Mori Point**

**Alternative A: No Action.** Under current conditions, dogs are allowed on leash on all trails and on the beach within the GGNRA boundary. The San Francisco garter snake is present in areas that are open for visitor and dog use at this site, which has documented high visitor use, including moderate use by dog walkers. Some visitors are not complying with the leash law; off-leash violations totaled 146 from 2008 through 2011 (table 26).

Educational signs and fences have been placed around the ponds and wetland habitat at Mori Point to prevent direct impacts on frogs and frog habitat; however, dogs have occasionally been observed in the ponds (Fong et al. 2010). The signs and fence also benefit the snake since the frog is its main food source. There is no documentation that dogs have either directly or indirectly affected the San Francisco garter snake at this site.

However, under alternative A, the behavior of the San Francisco garter snake could be directly affected by dogs through capture or digging if snakes are basking on warm surfaces, such as trails, or burrowing in upland areas. The snake could be indirectly affected if avoidance of preferred habitat occurs due to dog presence at the site or if changes to the California red-legged frog population occur. Therefore, impacts on the San Francisco garter snake as a result of alternative A would range from negligible to long-term, minor, and adverse. A few individuals of the species in a small, localized area could be affected by occasional disturbance from dogs but the reproductive success of individuals of the species would not be affected.

Under alternative A, no permit system exists for commercial dog walking. At Mori Point, commercial dog walking is uncommon; therefore, commercial dog walking would have negligible impacts on the snake.

**Cumulative Impacts.** Projects and actions in and near Mori Point were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the San Francisco garter snake at or in the vicinity of this site.

## Chapter 4: Environmental Consequences

Park stewardship programs, the *Mori Point Restoration and Trail Plan* project, maintenance operations, illegal poaching by collectors, interim planning for new GGNRA lands in San Mateo County, and proposed plans for the Sharp Park golf course by the San Francisco Recreation and Park Department all have the potential to affect San Francisco garter snake habitat. Park stewardship programs and interim planning for new lands in San Mateo County are actively working to protect and enhance San Francisco garter snake habitat in cooperation with the USFWS as part of the recovery plan. Specifically, the *Mori Point Restoration and Trail Plan* project will protect and enhance habitat for the federally and state-listed threatened San Francisco garter snake at Mori Point by guiding visitor use away from restoration areas.

Fragments of unique plant and animal habitats within Pacifica, known as Significant Natural Resource Areas (natural areas), have been preserved within the parks that are managed by the San Francisco Recreation and Park Department (SFRPD). The SNRAMP is intended to guide natural resource protection, habitat restoration, trail and access improvements, other capital projects, and maintenance activities over the next 20 years (SFPD 2011, 1). The scope of the SNRAMP analysis includes a natural area managed by the SFRPD in Pacifica and addresses dog walking (including on-leash dog walking and off-leash DPAs) in these areas (SFPD 2011, 261-262). The San Francisco garter snake was reported near Horse Stable Pond in Sharp Park in 2008 (SFPD 2011, 279), which is a natural area located adjacent to Mori Point and managed under the SNRAMP. Implementation of the Sharp Park restoration activities under the SNRAMP would have a short-term adverse effect on special-status species such as the San Francisco garter snake, although numerous mitigation measures would be employed to reduce adverse impacts (SFPD 2011, 40). Sharp Park has an existing extensive wetland complex (known as Laguna Salada) located between the golf course and the earthen seawall separating it from the sand beach. Mitigation plans that are part of the Sharp Park restoration under the SNRAMP include creating, restoring, and enhancing California red-legged frog and San Francisco garter snake habitat at the Laguna Salada wetland complex in the marsh area and associated uplands (SFPD 2011, 47; 97-98). This restoration could provide long-term protection at Laguna Salada for the California red-legged frog as well as the San Francisco garter snake. Therefore, project activities included in the SNRAMP will protect this listed species and provide long-term beneficial impacts to the San Francisco garter snake.

The negligible to long-term minor adverse impacts on the San Francisco garter snake from dogs at Mori Point under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from park stewardship programs, the SNRAMP, and the *Mori Point Restoration and Trail Plan* project should reduce some of the adverse impacts on the San Francisco garter snake from alternative A. Therefore, cumulative impacts on the San Francisco garter snake under this alternative would be expected to be negligible.

**MORI POINT ALTERNATIVE A CONCLUSION TABLE**

| <b>San Francisco Garter Snake Impacts</b>     | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--|---|-------------------------------|
| Negligible to long-term minor adverse impacts | Dogs have occasionally been observed in the ponds and snake behavior could be affected by dogs directly (through capture or digging) or indirectly (if preferred habitat is limited or changes in the California red-legged frog population occur) | N/A   | Negligible cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking on the Mori Coastal Trail and on the beach within the GGNRA boundary, but dogs would not be allowed on the Pollywog Trail adjacent to the ponds, which provide snake habitat. Educational signs and fences have been placed around the ponds and wetland habitat at Mori Point. If dogs are physically restrained on leash at this site and deterred by fencing, they should not gain access to the ponds and should not affect the snake in wetland areas or in dispersal habitat. In addition, by reducing the number of trails available for dog walking compared to alternative A, there would be some benefits to the adjacent upland habitats used by San Francisco garter snakes and California red-legged frogs. Therefore, assuming compliance, alternative B would result in negligible impacts on the snake; there would be no measurable or perceptible changes to the snake or its habitat.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is not common in this area, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have negligible impacts on the snake.

**Cumulative Impacts.** The negligible impacts on the San Francisco garter snake from dogs at Mori Point under alternative A were considered together with the effects of the projects mentioned above under alternative B. The beneficial effects from park stewardship programs, the SNRAMP, and the *Mori Point Restoration and Trail Plan* project at this site combined with the negligible impacts on the San Francisco garter snake from alternative B would result in beneficial cumulative impacts.

**MORI POINT ALTERNATIVE B CONCLUSION TABLE**

| San Francisco Garter Snake Impacts      | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Negligible impacts, assuming compliance | Physically restraining dogs on leash would reduce direct impacts on snakes through capture or trampling; dogs would be prohibited on the trail adjacent to the ponds that provide snake habitat | Beneficial to no change, assuming compliance | Beneficial cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would allow dogs on leash on Old Mori Trail, the Mori Coastal Trail, and the beach within the GGNRA boundary, but dogs would not be allowed on the Pollywog Trail adjacent to the ponds. If dogs are physically restrained on leash at this site and not allowed on the trail adjacent to the ponds (which are also fenced), they should not gain access to the ponds and should not affect the snake in wetland areas or in dispersal habitat. In addition, by reducing the number of trails available for dog walking compared to alternative A, there would be some benefits to the adjacent upland habitats used by San Francisco garter snakes and California red-legged frogs.

Therefore, assuming compliance, alternative C would result in negligible impacts on the snake; no measurable or perceptible changes to the snake or its habitat would occur.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Mori Point is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at Mori Point, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on the snake.

## Chapter 4: Environmental Consequences

**Cumulative Impacts.** The negligible impacts on the San Francisco garter snake from dogs at Mori Point under alternative C were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from park stewardship programs, the SNRAMP, and the *Mori Point Restoration and Trail Plan* project at this site combined with the negligible impacts on the San Francisco garter snake from alternative C would result in beneficial cumulative impacts.

**MORI POINT ALTERNATIVE C CONCLUSION TABLE**

| San Francisco Garter Snake Impacts      | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Negligible impacts, assuming compliance | Physically restraining dogs on leash would reduce direct impacts on snakes through capture or trampling; dogs would be prohibited on the trail adjacent to the ponds that provide snake habitat | Beneficial to no change, assuming compliance | Beneficial cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Alternative D would not allow dogs at the site. Therefore, this alternative would result in no impact on the San Francisco garter snake, assuming compliance.

Since dogs would not be allowed at Mori Point, there would be no impact from commercial dog walkers on the snake.

**Cumulative Impacts.** The lack of impacts on the San Francisco garter snake from dogs at Mori Point under alternative D was considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from park stewardship programs, the SNRAMP, and the *Mori Point Restoration and Trail Plan* project at this site combined with the lack of impacts on the San Francisco garter snake from alternative D would result in beneficial cumulative impacts.

**MORI POINT ALTERNATIVE D CONCLUSION TABLE**

| San Francisco Garter Snake Impacts | Rationale                            | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|------------------------------------|--------------------------------------|--|-------------------------------|
| No impact, assuming compliance     | Dogs would be prohibited at the site | Beneficial, assuming compliance              | Beneficial cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would allow on-leash dog walking on the Mori Coastal Trail, Old Mori Trail, the Pollywog Trail (adjacent to the ponds), and the section of beach within the GGNRA boundary. If dogs are physically restrained on leash at this site, they should not gain access to the ponds and should not affect the snake in wetland areas or in dispersal habitat. In addition, by reducing the number of trails available for dog walking compared to alternative A, there would be some benefits to the adjacent upland habitats used by San Francisco garter snakes and California red-legged frogs. Therefore, assuming compliance, alternative E would result in negligible impacts on the snake; no measurable or perceptible changes to the snake or its habitat would occur.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Mori Point is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at Mori Point, it is likely that this alternative would not have an impact on the number of dog

walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on the snake.

**Cumulative Impacts.** The negligible impacts on the San Francisco garter snake from dogs at Mori Point under alternative E were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from park stewardship programs, the SNRAMP, and the *Mori Point Restoration and Trail Plan* project at this site combined with the negligible impacts on the San Francisco garter snake from alternative E would result in beneficial cumulative impacts.

**MORI POINT ALTERNATIVE E CONCLUSION TABLE**

| San Francisco Garter Snake Impacts      | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Negligible impacts, assuming compliance | Physically restraining dogs on leash would reduce direct impacts on snakes through capture or trampling, although on-leash dogs would be allowed on the trail adjacent to some of the ponds (Pollywog Trail) | Beneficial to no change, assuming compliance | Beneficial cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative E. The preferred alternative would allow on-leash dog walking on Old Mori Trail and the Pollywog Trail (which are adjacent to the freshwater ponds that prohibit dogs), the Mori Coastal Trail, and the portion of beach owned by the NPS. If dogs are physically restrained on leash at this site, they should not gain access to the fenced ponds and should not affect the snake in wetland areas or in dispersal habitat. In addition, reducing the number of trails available for dog walking compared to alternative A, there would be some benefits to the adjacent upland habitats used by San Francisco garter snakes and California red-legged frogs. Therefore, assuming compliance, the preferred alternative would result in negligible impacts on the snake; no measurable or perceptible changes to the snake or its habitat would occur.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Mori Point is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at Mori Point, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have negligible impacts on the snake.

**Cumulative Impacts.** Projects and actions in and near Mori Point were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the San Francisco garter snake at or in the vicinity of this site.

Fragments of unique plant and animal habitats within Pacifica, known as Significant Natural Resource Areas (natural areas), have been preserved within the parks that are managed by the San Francisco Recreation and Park Department (SFRPD). The SNRAMP is intended to guide natural resource protection, habitat restoration, trail and access improvements, other capital projects, and maintenance activities over the next 20 years (SFPD 2011, 1). The scope of the SNRAMP analysis includes a natural area managed by the SFRPD in Pacifica and addresses dog walking (including on-leash dog walking and off-leash DPAs) in these areas (SFPD 2011, 261-262). The San Francisco garter snake was reported near the Horse Stable Pond in Sharp Park in 2008 (SFPD 2011, 279), which is a natural area located adjacent

## Chapter 4: Environmental Consequences

to Mori Point and managed under the SNRAMP. Implementation of the Sharp Park restoration activities under the SNRAMP would have a short-term adverse effect on special-status species such as the San Francisco garter snake, although numerous mitigation measures would be employed to reduce adverse impacts (SFPD 2011, 40). Sharp Park has an existing extensive wetland complex (known as Laguna Salada) located between the golf course and the earthen seawall separating it from the sand beach. Mitigation plans that are part of the Sharp Park restoration under the SNRAMP include creating, restoring, and enhancing California red-legged frog and San Francisco garter snake habitat at the Laguna Salada wetland complex in the marsh area and associated uplands (SFPD 2011, 47; 97-98). This restoration could provide long-term protection at Laguna Salada for the California red-legged frog and the San Francisco garter snake. Therefore, project activities included in the SNRAMP will protect this listed species and provide long-term beneficial impacts to the San Francisco garter snake.

Park stewardship programs, the *Mori Point Restoration and Trail Plan* project, maintenance operations, illegal poaching by collectors, interim planning for new GGNRA lands in San Mateo County, and proposed plans for the Sharp Park golf course by the San Francisco Recreation and Park Department all have the potential to affect San Francisco garter snake habitat. Park stewardship programs and interim planning for new lands in San Mateo County are actively working to protect and enhance San Francisco garter snake habitat in cooperation with the USFWS as part of the recovery plan. Specifically, the *Mori Point Restoration and Trail Plan* project will protect and enhance habitat for the federally and state-listed threatened San Francisco garter snake at Mori Point by guiding visitor use away from restoration areas. The Sharp Park Golf Course, located in Pacifica (adjacent to Mori Point), supports the San Francisco garter snake. Plans at the golf course range from restoration to entirely natural habitat, to minor modifications that would improve habitat connectivity for frogs and snakes.

The negligible impacts on the San Francisco garter snake from dogs at Mori Point under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from park stewardship programs, the SNRAMP, and the *Mori Point Restoration and Trail Plan* project at this site combined with the negligible impacts on the San Francisco garter snake from the preferred alternative would result in beneficial cumulative impacts.

**MORI POINT PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| <b>San Francisco Garter Snake Impacts</b> | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--|---|-------------------------------|
| Negligible impacts, assuming compliance   | Physically restraining dogs on leash would reduce direct impacts on snakes through capture or trampling, although on-leash dogs would be allowed on the trail adjacent to some of the ponds (Pollywog Trail) | Beneficial to no change, assuming compliance        | Beneficial cumulative impacts |

### Milagra Ridge

**Alternative A: No Action.** Dogs are currently allowed on leash on all trails at Milagra Ridge. This site has documented moderate visitor use by bicyclists, walkers, and hikers, and high visitor use by dog walkers (table 9). There were 35 leash law violations from 2008 through 2011 (table 27). There is no documentation that dogs have either directly or indirectly affected the San Francisco garter snake at this site.

However, under alternative A, the behavior of the San Francisco garter snake could be directly affected by dogs (through capture or digging) if snakes are basking on warm surfaces, such as trails, or burrowing

in upland areas. The San Francisco garter snake could be indirectly affected if avoidance of preferred habitat occurs due to dog presence at the site or if changes in the California red-legged frog population occur. Therefore, impacts on the snake as a result of alternative A would range from negligible to long term, minor, and adverse. A few individuals of the species in a small, localized area could be affected by occasional disturbance from dogs but the reproductive success of individuals of the species would not be affected.

Under alternative A, no permit system exists for commercial dog walking. At Milagra Ridge, commercial dog walking is uncommon; therefore, commercial dog walking would have negligible impacts on the snake.

**Cumulative Impacts.** Projects and actions in and near Milagra Ridge were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the San Francisco garter snake at or in the vicinity of this site.

As discussed under Mori Point, mitigation plans that are part of the Sharp Park (located near Milagra Ridge) restoration under the SNRAMP include creating, restoring, and enhancing California red-legged frog and San Francisco garter snake habitat at the Laguna Salada wetland complex in the marsh area and associated uplands (SFPD 2011, 47; 97-98). This restoration could provide long-term protection at Laguna Salada for the California red-legged frog and the San Francisco garter snake.

Park stewardship programs, maintenance operations, illegal poaching by collectors, and interim planning for new GGNRA lands in San Mateo County all have potential to affect San Francisco garter snake habitat. Park stewardship programs and interim planning for new lands in San Mateo County are actively working to protect and enhance San Francisco garter snake habitat in cooperation with the USFWS as part of the recovery plan.

The negligible to long-term minor adverse impacts on the San Francisco garter snake from dogs at Milagra Ridge under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from park stewardship programs as well as the SNRAMP should reduce some of the adverse impacts on the San Francisco garter snake from alternative A. Therefore, cumulative impacts on the San Francisco garter snake under this alternative would be expected to be negligible.

**MILAGRA RIDGE ALTERNATIVE A CONCLUSION TABLE**

| San Francisco Garter Snake Impacts            | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Negligible to long-term minor adverse impacts | Snake behavior could be affected by off-leash dogs directly (through capture or digging) or indirectly (if changes in the California red-legged frog population occur) | N/A  | Negligible cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow dogs on leash on the fire road and the trails to the overlook and WW II bunker as well as on the future Milagra Battery Trail. However, the trail to the top of the hill would not be available to dogs under this alternative. If dogs are physically restrained on leash, they should not gain access to the aquatic habitat or dispersal habitat used by snakes at this site.

## Chapter 4: Environmental Consequences

Therefore, assuming compliance, alternative B would result in negligible impacts on the snake; no measurable or perceptible changes to the snake or its habitat would occur.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is uncommon at Milagra Ridge, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have negligible impacts on the snake.

**Cumulative Impacts.** The negligible impacts on the San Francisco garter snake from dogs at Milagra Ridge under alternative B were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from park stewardship programs, the SNRAMP, and other actions combined with the negligible impacts on the San Francisco garter snake from alternative B would result in negligible cumulative impacts.

**MILAGRA RIDGE ALTERNATIVE B CONCLUSION TABLE**

| <b>San Francisco Garter Snake Impacts</b> | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--|---|-------------------------------|
| Negligible impacts, assuming compliance   | Physically restraining dogs on leash would reduce direct impacts on snakes through capture and trampling | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would have the same dog walking restrictions as alternative B, and impacts would be the same, assuming compliance: negligible.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Milagra Ridge is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at Milagra Ridge, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on the snake.

**Cumulative Impacts.** Under alternative C, the cumulative impacts on the snake at this park site would be the same as those under alternative B: negligible.

**MILAGRA RIDGE ALTERNATIVE C CONCLUSION TABLE**

| <b>San Francisco Garter Snake Impacts</b> | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--|---|-------------------------------|
| Negligible impacts, assuming compliance   | Physically restraining dogs would reduce direct impacts on snakes through capture and trampling (due to mobility of species) | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Alternative D would not allow dogs at the site. Therefore, this alternative would result in no impact on the San Francisco garter snake, assuming compliance.

Since dogs would not be allowed at Milagra Ridge, there would be no impact from commercial dog walkers on the snake.

**Cumulative Impacts.** The lack of impacts on the San Francisco garter snake from dogs at Milagra Ridge under alternative D was considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from park stewardship programs, the SNRAMP, and other actions combined with the lack of impacts on the San Francisco garter snake from alternative D would result in beneficial cumulative impacts.

**MILAGRA RIDGE ALTERNATIVE D CONCLUSION TABLE**

| <b>San Francisco Garter Snake Impacts</b> | <b>Rationale</b>                     | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--------------------------------------|---|-------------------------------|
| No impact, assuming compliance            | Dogs would be prohibited at the site | Beneficial, assuming compliance                     | Beneficial cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would allow on-leash dog walking on the same trails as alternative B, with the addition of a trail to the top of the hill, and impacts would be the same, assuming compliance: negligible.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Milagra Ridge is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at Milagra Ridge, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on the snake.

**Cumulative Impacts.** Under alternative E, the cumulative impacts on the San Francisco garter snake at Milagra Ridge would be the same as those under alternative B: negligible.

**MILAGRA RIDGE ALTERNATIVE E CONCLUSION TABLE**

| <b>San Francisco Garter Snake Impacts</b> | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--|---|-------------------------------|
| Negligible impacts, assuming compliance   | Physically restraining dogs on leash would reduce direct impacts on snakes through capture and trampling | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative B, allowing dogs on leash on the fire road and the trails to the overlook and WW II bunker as well as the future Milagra Battery Trail. The trail to the top of the hill would not be available to dogs under this alternative. If dogs are physically restrained on leash at this site, they should not gain access to and should not affect the snake in aquatic areas or in dispersal habitat. Therefore, assuming compliance, the preferred alternative would result in negligible impacts on the snake; no measurable or perceptible changes to the snake or its habitat would occur.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Milagra Ridge is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at Milagra Ridge, it is likely that this alternative would not have an impact on

## Chapter 4: Environmental Consequences

the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have negligible impacts on the snake.

**Cumulative Impacts.** Projects and actions in and near Milagra Ridge were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the San Francisco garter snake at or in the vicinity of this site.

As discussed under Mori Point, mitigation plans that are part of the Sharp Park (located near Milagra Ridge) restoration under the SNRAMP include creating, restoring, and enhancing California red-legged frog and San Francisco garter snake habitat at the Laguna Salada wetland complex in the marsh area and associated uplands (SFPD 2011, 47; 97-98). This restoration could provide long-term protection at Laguna Salada for the California red-legged frog and the San Francisco garter snake.

Park stewardship programs, maintenance operations, illegal poaching by collectors, and interim planning for new GGNRA lands in San Mateo County all have the potential to affect San Francisco garter snake habitat. Park stewardship programs and interim planning for new lands in San Mateo County are actively working to protect and enhance San Francisco garter snake habitat in cooperation with the USFWS as part of the recovery plan.

The negligible impacts on the San Francisco garter snake from dogs at Milagra Ridge under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from park stewardship programs and the SNRAMP combined with the negligible impacts on the San Francisco garter snake from the preferred alternative would result in negligible cumulative impacts.

**MILAGRA RIDGE PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| <b>San Francisco Garter Snake Impacts</b> | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--|---|-------------------------------|
| Negligible impacts, assuming compliance   | Physically restraining dogs on leash would reduce direct impacts on snakes through capture and trampling | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

### Sweeney Ridge/Cattle Hill

**Alternative A: No Action.** Under current conditions, dogs are allowed on leash on all trails except the Notch Trail, where dog walking is not allowed. This site has documented low to moderate visitor use by dog walkers and low use by hikers and bicyclists. Off-leash dog walking has been observed along the trails of Sweeney Ridge; off-leash incidents totaled 115 from 2008 through 2011 (table 28). Cattle Hill is currently not part of GGNRA, but unrestricted dog walking occurs at this site. There is no documentation that dogs have either directly or indirectly affected the San Francisco garter snake at this site.

However, under alternative A, the behavior of the San Francisco garter snake could be directly affected by dogs (through capture or digging) if snakes are basking on warm surfaces, such as trails, or burrowing in upland areas. The snake could be indirectly affected if avoidance of preferred habitat occurs due to dog presence at the site or if changes in the California red-legged frog population occur. Therefore, impacts on the San Francisco garter snake as a result of alternative A would range from negligible to long-term, minor, and adverse. A few individuals of the species in a small, localized area could be affected by occasional disturbance from dogs but the reproductive success of individuals of the species would not be affected.

Under alternative A, no permit system exists for commercial dog walking. Commercial dog walking is uncommon at Sweeney Ridge and Cattle Hill; therefore, commercial dog walking would have negligible impacts on the snake.

**Cumulative Impacts.** Projects and actions in and near Sweeney Ridge/Cattle Hill were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the San Francisco garter snake at or in the vicinity of these sites.

As discussed under Mori Point, mitigation plans that are part of the Sharp Park (located adjacent to Sweeney Ridge) restoration under the SNRAMP include creating, restoring, and enhancing California red-legged frog and San Francisco garter snake habitat at the Laguna Salada wetland complex in the marsh area and associated uplands (SFPD 2011, 47; 97-98). This restoration could provide long-term protection at Laguna Salada for the California red-legged frog and the San Francisco garter snake.

Park stewardship programs, maintenance operations, illegal poaching by collectors, and interim planning for new GGNRA lands in San Mateo County all have the potential to affect San Francisco garter snake habitat. Park stewardship programs and interim planning for new lands in San Mateo County are actively working to protect and enhance San Francisco garter snake habitat in cooperation with the USFWS as part of the recovery plan.

The negligible to long-term minor adverse impacts on the San Francisco garter snake from dogs at Sweeney Ridge/Cattle Hill under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from park stewardship programs, the SNRAMP, and other actions should reduce some of the adverse impacts on the San Francisco garter snake from alternative A. Therefore, cumulative impacts on the San Francisco garter snake under this alternative would be expected to be negligible.

**SWEENEY RIDGE/CATTLE HILL ALTERNATIVE A CONCLUSION TABLE**

| San Francisco Garter Snake Impacts            | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Negligible to long-term minor adverse impacts | Snake behavior could be affected by off-leash dogs directly (through capture or digging) or indirectly (if changes in the California red-legged frog population occur) | N/A  | Negligible cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would not allow dogs at either site and would provide protection for a large area of relatively undisturbed contiguous habitat. Therefore, this alternative would result in no impact on the San Francisco garter snake, assuming compliance.

Since dogs would not be allowed at Sweeney Ridge/Cattle Hill, there would be no impact from commercial dog walkers on the snake.

**Cumulative Impacts.** The lack of impacts on the San Francisco garter snake from dogs at Sweeney Ridge/Cattle Hill under alternative B were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from park stewardship programs, the SNRAMP, and

## Chapter 4: Environmental Consequences

other actions combined with the lack of impacts on the San Francisco garter snake from alternative B would result in beneficial cumulative impacts.

**SWEENEY RIDGE/CATTLE HILL ALTERNATIVE B CONCLUSION TABLE**

| San Francisco Garter Snake Impacts | Rationale                              | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|------------------------------------|--|--|-------------------------------|
| No impact, assuming compliance     | Dogs would be prohibited at both sites | Beneficial, assuming compliance              | Beneficial cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Under alternative C no dog walking would be allowed at Sweeney Ridge. Assuming compliance, there would be no impact on the snake from dog walking at Sweeney Ridge. At Cattle Hill, on-leash dog walking would be allowed on the Baquiano Trail from Fassler Avenue up to and including the Farallon View Trail. Although dogs would be allowed on the Cattle Hill trails, dogs would be physically restrained on leash and the leash policy would be enforced. If dogs are physically restrained on leash at this site, they should not gain access to dispersal habitat and should not affect the snake. Therefore, assuming compliance, alternative C would result in negligible impacts on the snake at Cattle Hill; no measurable or perceptible changes to individual snakes, the population, or designated critical habitat would occur.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Sweeney Ridge/Cattle Hill is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since dog walking would not be allowed at Sweeney Ridge, commercial dog walking under alternative C would have no impact on the snake. Since commercial dog walking is not common at Cattle Hill, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on the snake at Cattle Hill.

**Cumulative Impacts.** The negligible impacts on the snake from dogs at Cattle Hill under alternative C were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from park stewardship programs and the SNRAMP combined with the negligible impacts on the snake from alternative C would result in negligible cumulative impacts at Cattle Hill. At Sweeney Ridge, the lack of impacts combined with the beneficial effects from park stewardship programs would result in beneficial cumulative impacts.

**SWEENEY RIDGE/CATTLE HILL ALTERNATIVE C CONCLUSION TABLE**

| San Francisco Garter Snake Impacts                      | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| No impact at Sweeney Ridge, assuming compliance         | Dogs would be prohibited at Sweeney Ridge   | Beneficial, assuming compliance              | Beneficial cumulative impacts |
| Negligible impacts, assuming compliance, at Cattle Hill | At Cattle Hill, physically restraining dogs would reduce direct impacts on snakes through capture and trampling, although on-leash dogs would be allowed on numerous trails | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Alternative D would not allow dogs at either site and would provide protection for a large area of relatively undisturbed contiguous

habitat. Therefore, this alternative would result in no impact on the San Francisco garter snake, assuming compliance.

Since dogs would not be allowed at Sweeney Ridge/Cattle Hill, there would be no impact from commercial dog walkers on the snake.

**Cumulative Impacts.** Under alternative D, the cumulative impacts on the snake at this park site would be the same as those under alternative B: beneficial.

**SWEENEY RIDGE/CATTLE HILL ALTERNATIVE D CONCLUSION TABLE**

| San Francisco Garter Snake Impacts | Rationale                              | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|------------------------------------|--|--|-------------------------------|
| No impact, assuming compliance     | Dogs would be prohibited at both sites | Beneficial, assuming compliance              | Beneficial cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would allow on-leash dog walking at Sweeney Ridge along on the Sweeney Ridge Trail from the Portola Discovery site to the Notch Trail, on to the junction with Mori Ridge Trail, and on Sneath Lane. The Notch Trail would remain closed to dogs. At Cattle Hill, on-leash dog walking would be allowed on the Baquiano Trail from Fassler Avenue up to and including the Farallon View Trail. The trails at Sweeney Ridge/Cattle Hill are long, with high quality habitat directly adjacent to the trails, and the on-leash dog trails under this alternative are a greater portion of the entire site compared to alternatives B, C, and D. Similar to alternative C, Cattle Hill trails would allow on-leash dog walking under this alternative, and these trails generally receive low to moderate use. Physically restraining dogs on leash would protect habitat off trail, but on-leash dogs could still disturb snake behavior at this site due to the numerous trails open to dogs in high quality snake dispersal habitat. Therefore, assuming compliance, alternative E would result in negligible to long-term, minor, adverse impacts on the snake. A few individuals of the species in a small, localized area could be affected by occasional disturbance from dogs but the reproductive success of individuals of the species would not be affected.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Sweeney Ridge/Cattle Hill is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at Sweeney Ridge or Cattle Hill, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on the snake.

**Cumulative Impacts.** The negligible to long-term, minor, adverse impacts on the San Francisco garter snake from dogs at Sweeney Ridge/Cattle Hill under alternative E were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from park stewardship programs, the SNRAMP, and other actions combined with the negligible impacts on the San Francisco garter snake from alternative E would result in negligible cumulative impacts.

SWEENEY RIDGE/CATTLE HILL ALTERNATIVE E CONCLUSION TABLE

| San Francisco Garter Snake Impacts                                 | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would reduce direct impacts on snakes through capture and trampling, but on-leash dogs would be allowed on numerous trails that support snake dispersal habitat and could occasionally affect the snake or its habitat | No change, assuming compliance               | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** On-leash dog walking would be allowed at Sweeney Ridge on Sneath Lane and the Sweeney Ridge Trail between the Portola Discovery site and the Nike Missile Site. On-leash dog walking would be allowed at Cattle Hill on the Baquiano Trail from Fassler Avenue up to and including the Farallon View Trail. If dogs are physically restrained on leash at this site, they should not gain access to dispersal habitat and should not affect the snake. Therefore, assuming compliance, the preferred alternative would result in negligible impacts on the snake at both sites; no measurable or perceptible changes to individual snakes, the population, or designated critical habitat would occur.

All dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Sweeney Ridge/Cattle Hill is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at Cattle Hill or Sweeney Ridge, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have negligible impacts on the snake at Sweeney Ridge/Cattle Hill.

**Cumulative Impacts.** Projects and actions in and near Sweeney Ridge/Cattle Hill were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the San Francisco garter snake at or in the vicinity of this site.

As discussed under Mori Point, mitigation plans that are part of the Sharp Park (located adjacent to Sweeney Ridge) restoration under the SNRAMP include creating, restoring, and enhancing California red-legged frog and San Francisco garter snake habitat at the Laguna Salada wetland complex in the marsh area and associated uplands(SFPD 2011, 47; 97-98). This restoration could provide long-term protection at Laguna Salada for the California red-legged frog and the San Francisco garter snake.

Park stewardship programs, maintenance operations, illegal poaching by collectors, and interim planning for new GGNRA lands in San Mateo County all have the potential to affect San Francisco garter snake habitat. Park stewardship programs and interim planning for new lands in San Mateo County are actively working to protect and enhance San Francisco garter snake habitat in cooperation with the USFWS as part of the recovery plan.

The negligible impacts on the snake from dogs at Sweeney Ridge and Cattle Hill under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from park stewardship programs, the SNRAMP, and other actions combined with the negligible impacts from dogs at Sweeney Ridge/Cattle Hill under the preferred alternative would result in negligible cumulative impacts.

**SWEENEY RIDGE/CATTLE HILL PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| <b>San Francisco Garter Snake Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|---|---|-------------------------------|
| Negligible impacts, assuming compliance   | Physically restraining dogs would reduce direct impacts on snakes through capture and trampling, although on-leash dogs would be allowed on numerous trails | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Pedro Point Headlands**

**Alternative A: No Action.** Although this site is currently not part of GGNRA, unrestricted dog walking occurs at this site. This site has documented low to moderate visitor use; however, the number of incidents related to dog walking activities at the site is unknown since the NPS does not currently own the property (table 9). There is no documentation that dogs have either directly or indirectly affected the San Francisco garter snake at this site.

Under alternative A, the behavior of the San Francisco garter snake could be directly affected by dogs through capture or digging if snakes are basking on warm surfaces, such as trails, or burrowing in upland areas. The snake could be indirectly affected if avoidance of preferred habitat occurs due to dog presence at the site or if changes in the California red-legged frog population occur. Therefore, impacts on the San Francisco garter snake as a result of alternative A would range from negligible to long term, minor, and adverse. A few individuals of the species in a small, localized area could be affected by occasional disturbance from dogs but the reproductive success of individuals of the species would not be affected.

There are currently no commercial dog walking regulations at Pedro Point Headlands. It is unknown whether commercial dog walkers contribute to impacts on the snake.

**Cumulative Impacts.** Projects and actions in and near the Pedro Point Headlands were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the San Francisco garter snake at or in the vicinity of this site.

Park stewardship programs, maintenance operations, illegal poaching by collectors, and interim planning for new GGNRA lands in San Mateo County all have the potential to affect San Francisco garter snake habitat. Park stewardship programs and interim planning for new lands in San Mateo County are actively working to protect and enhance San Francisco garter snake habitat in cooperation with the USFWS as part of the recovery plan.

The negligible to long-term minor adverse impacts on the San Francisco garter snake from dogs at Pedro Point Headlands under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from park stewardship programs and other actions should reduce some of the adverse impacts on the San Francisco garter snake from alternative A. Therefore, cumulative impacts on the San Francisco garter snake under this alternative would be expected to be negligible.

**Chapter 4: Environmental Consequences**

**PEDRO POINT HEADLANDS ALTERNATIVE A CONCLUSION TABLE**

| <b>San Francisco Garter Snake Impacts</b>     | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--|---|-------------------------------|
| Negligible to long-term minor adverse impacts | Snake behavior could be affected by off-leash dogs directly (through capture or digging) or indirectly (if changes in the California red-legged frog population occur) | N/A   | Negligible cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking on the Coastal Trail. No dog walking would be allowed on the trails proposed by the Pacifica Land Trust. If dogs are physically restrained on leash at this site, they should not gain access to the dispersal habitat used by the snake. Therefore, assuming compliance, alternative B would result in negligible impacts on the snake; no measurable or perceptible changes to the snake or its habitat would occur.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is not common at the Pedro Point Headlands, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have negligible impacts on the snake.

**Cumulative Impacts.** The negligible impacts on the San Francisco garter snake from dogs at Pedro Point Headlands under alternative B were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from park stewardship programs and other actions combined with the negligible impacts on the San Francisco garter snake from alternative B would result in negligible cumulative impacts.

**PEDRO POINT HEADLANDS ALTERNATIVE B CONCLUSION TABLE**

| <b>San Francisco Garter Snake Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|---|---|-------------------------------|
| Negligible impacts, assuming compliance   | Physically restraining dogs on leash would reduce direct impacts on snakes through capture and trampling; dogs would be prohibited on all trails except the Coastal Trail | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would have the same dog walking restrictions as alternative B (on-leash dog walking on the Coastal Trail), and impacts would be the same, assuming compliance: negligible.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Pedro Point Headlands is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at the Pedro Point Headlands, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on the snake.

**Cumulative Impacts.** Under alternative C, the cumulative impacts on the San Francisco garter snake at this park site would be the same as those under alternative B: negligible.

**PEDRO POINT HEADLANDS ALTERNATIVE C CONCLUSION TABLE**

| San Francisco Garter Snake Impacts      | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Negligible impacts, assuming compliance | Physically restraining dogs on leash would reduce direct impacts on snakes through capture and trampling; dogs would be prohibited on all trails except the Coastal Trail | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Alternative D would not allow dogs at the site. Therefore, this alternative would result in no impact on the San Francisco garter snake, assuming compliance.

Since dogs would not be allowed at the Pedro Point Headlands, there would be no impact from commercial dog walkers on the snake.

**Cumulative Impacts.** The lack of impacts on the San Francisco garter snake from dogs at Pedro Point Headlands under alternative D was considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from park stewardship programs and other actions combined with the lack of impacts on the San Francisco garter snake from alternative D would result in beneficial cumulative impacts.

**PEDRO POINT HEADLANDS ALTERNATIVE D CONCLUSION TABLE**

| San Francisco Garter Snake Impacts | Rationale                            | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|------------------------------------|--------------------------------------|--|-------------------------------|
| No impact, assuming compliance     | Dogs would be prohibited at the site | Beneficial, assuming compliance              | Beneficial cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** On-leash dog walking would be allowed on the Coastal Trail and trails proposed by the Pacifica Land Trust. If dogs are physically restrained on leash at this site, they should not gain access to the dispersal habitat used by the snake. Therefore, assuming compliance, alternative B would result in negligible impacts on the snake; no measurable or perceptible changes to the snake or its habitat would occur.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Pedro Point Headlands is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at the Pedro Point Headlands, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on the snake.

**Cumulative Impacts.** Under alternative E, the cumulative impacts on the snake at this park site would be the same as those under alternative B: negligible.

PEDRO POINT HEADLANDS ALTERNATIVE E CONCLUSION TABLE

| San Francisco Garter Snake Impacts      | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Negligible impacts, assuming compliance | Physically restraining dogs on leash would reduce direct impacts on snakes through capture and trampling | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative B, allowing on-leash dog walking on the Coastal Trail, but no dog walking would be permitted on the trails proposed by the Pacifica Land Trust. If dogs are physically restrained on leash, they should not gain access to and should not affect the snake in dispersal habitat at this site. Therefore, assuming compliance, the preferred alternative would result in negligible impacts on the snake; no measurable or perceptible changes to the snake or its habitat would occur.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Pedro Point Headlands is also not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at the Pedro Point Headlands, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have negligible impacts on the snake.

**Cumulative Impacts.** Projects and actions in and near Pedro Point Headlands were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the San Francisco garter snake at or in the vicinity of this site.

Park stewardship programs, maintenance operations, illegal poaching by collectors, and interim planning for new GGNRA lands in San Mateo County all have the potential to affect San Francisco garter snake habitat. Park stewardship programs and interim planning for new lands in San Mateo County are actively working to protect and enhance San Francisco garter snake habitat in cooperation with the USFWS as part of the recovery plan.

The negligible impacts on the San Francisco garter snake from dogs at the Pedro Point Headlands under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from park stewardship programs and other actions combined with the negligible impacts on the San Francisco garter snake from the preferred alternative would result in negligible cumulative impacts.

PEDRO POINT HEADLANDS PREFERRED ALTERNATIVE F CONCLUSION TABLE

| San Francisco Garter Snake Impacts      | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Negligible impacts, assuming compliance | Physically restraining dogs on leash would reduce direct impacts on snakes through capture and trampling; dogs would be prohibited on all trails except the Coastal Trail | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

## Rancho Corral de Tierra

**Alternative A: No Action.** Under current conditions, on-leash dog walking is allowed at Rancho Corral de Tierra. Staff regularly working at Rancho characterize use by dog walkers as low to moderate, and compliance with the leash law is generally low. Because Rancho Corral de Tierra was transferred to the NPS in December 2011, law enforcement data and statistics are not available for this site. At Rancho Corral de Tierra, there is a mapped occurrence of the San Francisco garter snake at Denniston Creek in the El Granada area near an existing trail (URS Corporation 2010, Figure 11). In addition, suitable aquatic habitat and adjacent upland dispersal habitat exists throughout the site, and is crossed by trails at the site (URS Corporation 2010, Figure 11).

As noted above, compliance with the leash law is low at Rancho Corral de Tierra and NPS rangers have observed off-leash dogs running in areas with potentially sensitive habitat. Under alternative A, the San Francisco garter snake could be directly affected by dogs through capture or digging if snakes are basking on warm surfaces such as trails, or burrowing in upland areas. The snake could be indirectly affected if avoidance of preferred habitat occurs due to dog presence at the site or if there are changes to the California red-legged frog population. Therefore, impacts on the San Francisco garter snake as a result of alternative A would range from negligible to long-term, minor, and adverse. A few individuals of the species in a small localized area (Rancho Corral de Tierra) could be affected by occasional disturbance from dogs but the reproductive success of individuals of the species would not be affected.

Under alternative A, no permit system exists for commercial dog walking. Currently, commercial dog walking use is low at Rancho Corral de Tierra; therefore, commercial dog walking would have negligible impacts on the San Francisco garter snake.

**Cumulative Impacts.** Projects and actions in and near Rancho Corral de Tierra were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the San Francisco garter snake at or in the vicinity of this site. Since the Rancho Corral de Tierra site has been transferred to the NPS, general protection of the site and associated natural resources would occur, although some impacts may remain from prior unregulated off-leash dog walking.

Additional actions have had, are currently having, or have the potential to have adverse impacts on wildlife and wildlife habitat at or in the vicinity of Rancho Corral de Tierra, such as development or construction actions. One example is the CalTrans Devil's Slide Tunnel project, which involves constructing two tunnels beneath San Pedro Mountain to provide a dependable highway between Pacifica and Montara (CADOT 2013, 1). Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts.

Since the Rancho Corral de Tierra site has been transferred to the NPS, general maintenance and protection of the site and associated natural resources have been occurring. Specifically, park stewardship programs and interim planning for the new lands in San Mateo County are actively working to protect and enhance San Francisco garter snake habitat in cooperation with the USFWS as part of the recovery plan. The *Mori Point Restoration and Trail Plan* project will protect and enhance habitat for the federally and state-listed threatened San Francisco garter snake at Mori Point (located near Rancho Corral de Tierra) by guiding visitor use away from restoration areas. Additionally, maintenance operations, illegal poaching by collectors, interim planning for new GGNRA lands in San Mateo County, and proposed plans for the Sharp Park golf course by the San Francisco Recreation and Park Department all have the potential to affect San Francisco garter snake habitat.

## Chapter 4: Environmental Consequences

The negligible to long-term minor adverse impacts on the San Francisco garter snake from dogs at Rancho Corral de Tierra under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from park stewardship programs and the *Mori Point Restoration and Trail Plan* project should reduce some of the adverse impacts on the San Francisco garter snake from alternative A. Therefore, cumulative impacts on the San Francisco garter snake under this alternative would be expected to be negligible.

**RANCHO CORRAL DE TIERRA ALTERNATIVE A CONCLUSION TABLE**

| San Francisco Garter Snake Impacts            | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Negligible to long-term minor adverse impacts | Snakes could be affected by dogs directly (through capture or digging) or indirectly (if preferred habitat is limited or changes in the California red-legged frog population occur) | N/A  | Negligible cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking on some trails in the Montara and El Granada areas of Rancho, which were identified by the local dog walking group as key areas for this use. There is a mapped occurrence of the San Francisco garter snake at Denniston Creek in the El Granada area near a trail that would allow on-leash dog walking (URS Corporation 2010, Figure 11). In addition, suitable aquatic habitat and adjacent upland dispersal habitat would be crossed by the trails that would allow on-leash dog walking in Montara and El Granada at Rancho Corral de Tierra (URS Corporation 2010, Figure 11). However, if dogs are physically restrained on-leash at this site, they should not gain access to the creek and should not affect the snake in aquatic areas or in dispersal habitat. Therefore, assuming compliance, alternative B would result in negligible impacts on the snake; there would be no measurable or perceptible changes to the snake or its habitat.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Currently, commercial dog walking use is low at Rancho Corral de Tierra; therefore, commercial dog walking would have negligible impacts on the San Francisco garter snake.

**Cumulative Impacts.** The negligible impact on the San Francisco garter snake from dogs at Rancho Corral de Tierra under alternative B was considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from park stewardship programs and the *Mori Point Restoration and Trail Plan* project combined with the negligible impacts on the San Francisco garter snake from alternative B would result in negligible cumulative impacts.

**RANCHO CORRAL DE TIERRA ALTERNATIVE B CONCLUSION TABLE**

| San Francisco Garter Snake Impacts      | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Negligible impacts, assuming compliance | Physically restraining dogs on-leash would prevent dog access to snake habitat | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Under alternative C, on-leash dog walking would be allowed on the same trails as under alternative B. In addition, a ROLA is proposed

under alternative C in the Montara area between Le Conte Street and Tamarind Street, in an open grassy area near the Farallone View School. The proposed ROLA is located in adjacent upland and dispersal habitat for the San Francisco garter snake (URS Corporation 2010, Figure 11). To encompass possible effects of the ROLA, impacts of alternative C on the snake would be long term and would range from negligible to minor and adverse. A few individuals of the species in a small, localized area (Rancho Corral de Tierra) could be occasionally affected by disturbance from dogs within the ROLA but reproductive success of individuals of the species would not be affected.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Rancho Corral de Tierra is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Currently, commercial dog walking use is low at Rancho Corral de Tierra; therefore, commercial dog walking would have negligible impacts on the San Francisco garter snake.

**Cumulative Impacts.** The negligible to long-term minor adverse impacts on the San Francisco garter snake from dogs at Rancho Corral de Tierra under alternative C were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from park stewardship programs and the *Mori Point Restoration and Trail Plan* project combined with the negligible to long-term minor adverse impacts on the San Francisco garter snake from alternative C would result in negligible cumulative impacts at Rancho Corral de Tierra.

**RANCHO CORRAL DE TIERRA ALTERNATIVE C CONCLUSION TABLE**

| San Francisco Garter Snake Impacts            | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Negligible to long-term minor adverse impacts | Physically restraining dogs on leash would prevent dog access to snake habitat, but ROLA is located within adjacent upland dispersal habitat | No change, assuming compliance               | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Under alternative D, on-leash dog walking would be allowed only in the Montara area on two trails: Old San Pedro Mountain Road and the Farallon Cutoff. Dogs would be prohibited in other areas of the site, including the entire El Granada area. If dogs are physically restrained on leash at Montara on two existing trails, they should not gain access to snake habitat. Therefore, assuming compliance, alternative D would result in negligible impacts on the San Francisco garter snake; no measurable or perceptible changes to the snake would occur.

Since no commercial dog walking would be allowed and no permits to walk more than three dogs would be issued under alternative D, no impact on the San Francisco garter snake from commercial or permitted dog walking would occur.

**Cumulative Impacts.** Under alternative D, the cumulative impacts on the San Francisco garter snake would be the same as those under alternative B: negligible.

**Chapter 4: Environmental Consequences**

**RANCHO CORRAL DE TIERRA ALTERNATIVE D CONCLUSION TABLE**

| <b>San Francisco Garter Snake Impacts</b> | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--|---|-------------------------------|
| Negligible impacts, assuming compliance   | Limiting dog walking to on-leash dog walking on two trails in the Montara area would prevent dog access to snake habitat | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would have the same dog walking restrictions as alternative C, and impacts would be the same: range from negligible to long-term, minor, and adverse.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Rancho Corral de Tierra is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Currently, commercial dog walking use is low at Rancho Corral de Tierra; therefore, commercial dog walking would have negligible impacts on the San Francisco garter snake.

**Cumulative Impacts.** The negligible to long-term minor adverse impacts on the San Francisco garter snake from dogs at Rancho Corral de Tierra under alternative E were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from park stewardship programs, the *Mori Point Restoration and Trail Plan* project, and other actions combined with the negligible to long-term, minor adverse impacts on the San Francisco garter snake from alternative E would result in negligible cumulative impacts.

**RANCHO CORRAL DE TIERRA ALTERNATIVE E CONCLUSION TABLE**

| <b>San Francisco Garter Snake Impacts</b>     | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--|---|-------------------------------|
| Negligible to long-term minor adverse impacts | Physically restraining dogs on leash would prevent dog access to snake habitat, but ROLA is located within adjacent upland dispersal habitat | No change, assuming compliance                      | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative B, allowing on-leash dog walking on some trails in the Montara and El Granada areas. There is a mapped occurrence of the San Francisco garter snake at Denniston Creek in the El Granada Area near a trail that would allow on-leash dog walking (URS Corporation 2010, Figure 11). In addition, suitable aquatic habitat and adjacent upland dispersal habitat would be crossed by the trails where on-leash dog walking would be allowed in both areas (Montara and El Granada) of Rancho Corral de Tierra under the preferred alternative (URS Corporation 2010, Figure 11). However, if dogs are physically restrained on leash at this site, they should not gain access to the creek and should not affect the snake in aquatic areas or in dispersal habitat. Therefore, assuming compliance, the preferred alternative would result in negligible impacts on the snake; no measurable or perceptible changes to the San Francisco garter snake or its habitat would occur.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Rancho Corral de Tierra is also not one of the park sites

where permits would be issued to individual or commercial dog walkers to walk more than three dogs, with a limit of six. Currently, commercial dog walking use is low at Rancho Corral de Tierra; therefore, commercial dog walking would have negligible impacts on the San Francisco garter snake.

**Cumulative Impacts.** Projects and actions in and near Rancho Corral de Tierra were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the San Francisco garter snake at or in the vicinity of this site. Since the Rancho Corral de Tierra site has been transferred to the NPS, general protection of the site and associated natural resources would occur, although some impacts may remain from prior unregulated off-leash dog walking.

Additional actions have had, are currently having, or have the potential to have adverse impacts on wildlife and wildlife habitat at or in the vicinity of Rancho Corral de Tierra, such as development or construction actions. One example is the CalTrans Devil’s Slide Tunnel project, which involves constructing two tunnels beneath San Pedro Mountain to provide a dependable highway between Pacifica and Montara (CADOT 2013, 1). Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts.

Since the Rancho Corral de Tierra site has been transferred to the NPS, general maintenance and protection of the site and associated natural resources have been occurring. Specifically, park stewardship programs and interim planning for the new lands in San Mateo County are actively working to protect and enhance San Francisco garter snake habitat in cooperation with the USFWS as part of the recovery plan. Also, the *Mori Point Restoration and Trail Plan* project will protect and enhance habitat for the federally and state-listed threatened San Francisco garter snake at Mori Point (located near Rancho Corral de Tierra) by guiding visitor use away from restoration areas. Additionally, maintenance operations, illegal poaching by collectors, interim planning for new GGNRA lands in San Mateo County, and proposed plans for the Sharp Park golf course by the San Francisco Recreation and Park Department all have the potential to affect San Francisco garter snake habitat.

The negligible impacts on the San Francisco garter snake from dogs at Rancho Corral de Tierra under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from park stewardship programs and the *Mori Point Restoration and Trail Plan* project combined with the negligible impacts on the San Francisco garter snake from the preferred alternative would result in negligible cumulative impacts.

**RANCHO CORRAL DE TIERRA PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| <b>San Francisco Garter Snake Impacts</b> | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--|---|-------------------------------|
| Negligible impacts, assuming compliance   | Physically restraining dogs on leash would prevent dog access to snake habitat | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

**IMPACTS TO THE WESTERN SNOWY PLOVER (FEDERALLY THREATENED) BY SITE AND ALTERNATIVE**

In GGNRA, the western snowy plover uses areas with wide, sandy, dune-backed beaches (or sections of beaches) for roosting and foraging during their nonbreeding season. There is no documentation of this species nesting in GGNRA, but they overwinter at the Ocean Beach SPPA and at the Crissy Field WPA.

## Chapter 4: Environmental Consequences

The *Recovery Plan for Pacific Coast Population of the Western Snowy Plover* indicates that monitoring and management of western snowy plover breeding, wintering, and migrating habitat in order to maximize survival and productivity and reduce disturbance to this species are important for this species' recovery (USFWS 2007a, 140–141).

The NPS monitors snowy plovers at Ocean Beach and Crissy Field through a monitoring program. Western snowy plover monitoring has been conducted at Ocean Beach using the same monitoring protocol since December 1994. This monitoring protocol was peer reviewed by an external panel through the NPS Inventory and Monitoring Program peer review process (Merkle et al. 2011, ii). The NPS has been monitoring shorebirds at Crissy Field WPA since 2000, and records of western snowy plover pre-date the focused monitoring program there, which began in 2004 (NPS 2008a, 1). The western snowy plover monitoring protocol at Crissy Field was peer reviewed by an external panel through the NPS Inventory and Monitoring Program peer review process. Monitoring under this protocol started in 2006 using the same methods used at Ocean Beach.

The primary objectives of the snowy plover monitoring program are to determine trends in population size and spatial distribution of snowy plovers at the Crissy Field WPA and the Ocean Beach SPPA (Merkle et al. 2011). However, the monitoring program also has management objectives to reduce human-caused disturbance to wintering plovers. In support of these objectives, data on the number and distribution of people and dogs, compliance rates with seasonal restrictions requiring pets to be on leash, and instances of dogs chasing snowy plovers and shorebirds is collected at Ocean Beach and Crissy Field. Because the monitoring program is designed to census snowy plovers and determine where they are on the beach, there are data limitations and limits to analyses of these surveys that may result in underestimating rates of dogs disturbing western snowy plovers. One limitation of the survey is that low numbers of observational hours were used to draw conclusions. Also, using encounter rates (number of dogs encountered per hour) to measure the rate of disturbance may be unsuitable because it is a challenge to obtain encounter rates from observations made along a transect moving in one direction. The low numbers of observational hours and the use of encounter rates in western snowy plover monitoring may underestimate instances of dogs disturbing western snowy plovers. Also, using median or average values to describe disturbance rates may not be useful in assessing disturbance at the sites. For example, an average masks the fact that some observations include no disturbances and other observations show a high number of disturbances (Hatch et al. 2007a, 10). Because of the sensitive nature of western snowy plovers, even small numbers of disturbances can greatly affect this shorebird and this fact may be further obscured by averaging the data.

At GGNRA, disturbances to snowy plovers have been observed and documented by park staff. For example, multiple observations where dogs have flushed or chased shorebirds or snowy plovers at Ocean Beach and Crissy Field have been documented in NPS monitoring reports by the Park Natural Resources Division (NPS 2008a; Hatch et al. 2007a, 12; Hatch et al. 2007b, 4-6; Hatch et al. 2008, 2-4). Park law enforcement staff have recorded snowy plover disturbances from dogs, in violation of park regulations established to protect the plover. Two park regulations are applicable to snowy plovers: 36 CFR 2.2 and 36 CFR 7.97. Specifically, 36 CFR 2.2 covers the protection of wildlife, including western snowy plovers. Wildlife disturbance is described in 36 CFR 2.2 (a) (2) and the following are prohibited: feeding, touching, teasing, frightening or intentional disturbing of wildlife nesting, breeding or other activities. In addition, 36 CFR 7.97(d) describes the seasonal dog walking restrictions for western snowy plovers in the Ocean Beach SPPA and the Crissy Field WPA.

The threatened status of the snowy plover affords it protection from harassment, defined under the ESA as “an intentional or negligent act or omission which creates the likelihood of injury to wildlife by annoying it to such an extent as to significantly disrupt normal behavioral patterns which include, but are not limited to, breeding, feeding, or sheltering.” The USFWS notes:

Dogs on beaches can pose a serious threat to snowy plovers during both the breeding and nonbreeding seasons. Unleashed pets, primarily dogs, sometimes chase snowy plovers and destroy nests. Repeated disturbances by dogs can interrupt brooding, incubating, and foraging behavior of adult plovers and cause chicks to become separated from their parents (USFWS 2007a, 63).

The USFWS further states that dog disturbance at wintering and staging sites may adversely affect individual survivorship and fecundity, thereby affecting the species at a population level (USFWS 2007a, 65). Even though western snowy plovers do not nest at GGNRA, general impacts on western snowy plovers from dogs at GGNRA sites include chasing roosting or feeding shorebirds, which causes shorebirds to expend energy, resulting in disturbance or harassment. Frequent disturbance of this type can affect fat reserves needed for migration and breeding. This type of disturbance could result in loss of preferred habitat as well as energy loss by migrating and wintering shorebirds, potentially reducing their chances of survival along migratory routes and reducing fitness for successful reproduction. The paragraphs that follow describe impacts as a result of the alternatives at Crissy Field and Ocean Beach.

As stated previously, beach nesting bird species are presumed to be the most sensitive species to disturbance. Several of these species, particularly coastal plovers in the genus *Charadrius*, are endangered or threatened (Lafferty 2001b, 315) and are very likely to leave an area altogether if disturbed (Kirby et al. 1993, 56-57). In a study conducted by Lafferty (2001b), western snowy plovers and activities that might disturb them were observed at a beach near Santa Barbara, California. Humans, dogs, crows, and other birds were the main sources of disturbance on the public beach (Lafferty 2001b, 315). However, this study showed that there was clear evidence of a disproportionate effect of dogs on plovers and some evidence that plover feeding was affected by activity on the beach (Lafferty 2001b, 322). Results of this study also showed that plovers were more likely to fly from dogs, horses, and crows than from humans and other shorebirds (Lafferty 2001b, 315).

Lafferty et al. (2006) presents results from a second study on the western snowy plover. This study was conducted at a public beach (Sands Beach, Coal Oil Point Reserve) in Santa Barbara, California, in which a portion of the beach was roped off to protect western snowy plover nests (Lafferty et al. 2006, 2219). The barrier reduced disturbance rates to the western snowy plover by more than half, including disturbances by dogs. Recreational disturbances that remained after the barrier was in place were mostly by humans (92 percent), followed by dogs (8 percent); most of the disturbances by dogs were caused by unleashed dogs (64 percent) (Lafferty et al. 2006, 2222). Protection from humans and off-leash dogs resulted in successful nesting and fledging of western snowy plovers (Lafferty et al. 2006, 2217). Western snowy plovers that were outside the protected area in the morning moved inside the protected area as people began using the beach (Lafferty et al. 2006, 2217). These results demonstrate how recreational disturbance can influence habitat use by shorebirds, including plovers, and that protecting quality habitat may have large benefits to wildlife and small impacts to recreation (Lafferty et al. 2006, 2217). Although disturbances are generally nonlethal and temporary, the cumulative effects of disturbance may be significant, particularly to sensitive species such as the western snowy plover (Lafferty et al. 2006, 2217).

### **Crissy Field (and the Crissy Field WPA)**

**Common to All Alternatives.** Impacts from dogs as a result of the two different definitions of the Crissy Field WPA (the 36 CFR 7.97(d) definition for alternative A, approximately 700 feet east of the former Coast Guard Pier) and the definition for alternatives B–F (Warming Hut to approximately 900 feet east of the former Coast Guard Pier) would be the same for all alternatives. Even though the WPA would be expanded for alternatives B–F, this change would not influence the overall impacts analysis at this site because it would neither increase nor decrease the impacts at Crissy Field, described in the paragraphs

## Chapter 4: Environmental Consequences

that follow. Further explanation of these definitions can be found in the “Current Regulations and Policies” section of chapter 2.

**Alternative A: No Action.** Currently, dogs are allowed under voice control at Crissy Airfield, along the promenade, and at Central and East Beaches. Dogs are allowed on leash in the West Bluff Picnic Area and parking lot. Dogs are allowed in the WPA under voice control except during the seasonal leash restriction from July 1 through May 15 (to protect the western snowy plover). Crissy Field is a low to high use area for dog walking. Compliance with the current dog walking regulation is low at Crissy Field. Of the 510 incidents, 283 incidents were for having dogs off leash within the Crissy Field WPA when the seasonal leash restriction was in effect (table 19). Other common incidents include violation of a closed area (58 incidents), having dogs off leash (65 incidents), and possession of a pet in a closed area (15). Other violations were issued for having pets in Crissy Field Lagoon, which is closed to both humans and pets. In written incident reports, NPS staff have documented detailed disturbances of western snowy plovers by dogs. These incident reports document violations of both 36 CFR 2.2 (protection of wildlife) and 36 CFR 7.97(d)(i) (dog walking restrictions at the Crissy Field WPA).

As stated previously, the primary objectives of the snowy plover monitoring program are to determine trends in population size and spatial distribution of plovers at the WPA. Also included are management objectives to reduce human-caused disturbance to wintering plovers (Merkle et al. 2011). Although the objectives of these surveys include reducing disturbance to western snowy plovers, there are data limitations and limits to analyses of these surveys that may result in underestimating these disturbances. Monitoring data at the site have demonstrated that disturbance of western snowy plovers due to off-leash dogs has increased in the Crissy Field WPA following the *U.S. v. Barley* decision (NPS 2006b; NPS 2008a, 2). Dogs have specifically been documented as chasing western snowy plovers at the Crissy Field WPA. In June through July 2006, there were two recorded instances of dogs chasing birds within the Crissy Field WPA (Hatch et al. 2007a, 14) and during the September 2006 through April 2007 surveys, there were three observations of dogs chasing shorebirds within the Crissy Field WPA (Hatch et al. 2007b, 5). There were no observations of dogs chasing shorebirds or plovers during the July 2007 through February 2008 surveys within the Crissy Field WPA (Hatch et al. 2008, 3). In addition, western snowy plovers infrequently use the habitat at Central Beach (including the tidal inlet from Crissy Marsh), where there are no leash restrictions, although this area is not as wide and the beach characteristics may not provide the same quality of habitat as the WPA.

Studies that were previously discussed have shown that dogs may disproportionately affect plovers (Lafferty 2001b, 322) and may adversely affect plovers in many ways, including individual survivorship and fecundity (USFWS 2007a, 65), feeding and migration behavior (Kersten and Piersma 1987, 182, 185), as well as reducing energy reserves and causing movement to an alternative site (Davidson and Rothwell 1993, 97). These shorebirds may not adapt to the presence of people by habituation (Burger et al. 2004, 286). Therefore, alternative A would result in long-term moderate adverse impacts on the western snowy plover because dogs would continue to frequently disturb and/or harass the birds and potentially limit use of preferred habitat. Dogs could interrupt roosting or foraging, which causes plovers to expend energy; frequent disturbance of this type affects fat reserves needed for migration and breeding. Although this species does not nest in GGNRA, chronic disturbance during the nonbreeding season could indirectly affect breeding behavior. Therefore, impacts would result in measurable and/or consequential changes to individuals of a species through frequent disturbance, but the impact would remain relatively localized and therefore moderate.

Under alternative A, no permit system exists for commercial dog walking. However, commercial dog walking at Crissy Field occurs regularly. Commercial dog walking would continue to contribute to the long-term moderate adverse impacts on the western snowy plover. Commercial dog walkers with multiple

dogs under voice control would impact the western snowy plover as a result of frequent disturbance or harassment of the birds by dogs.

**Cumulative Impacts.** Projects and actions in and near Crissy Field were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the western snowy plover at or in the vicinity of this site.

Along the California coast, western snowy plovers have been extirpated from 33 of 53 nesting sites since 1970, and now number approximately 1,400 birds (USFWS 2007a). Although the western snowy plover does not nest at the Crissy Field WPA, this area is still important for foraging, resting, and overwintering; chronic disturbance during the nonbreeding season could affect breeding behavior.

Oil spills have occurred and will likely occur in the Pacific Ocean and in San Francisco Bay; oil spills have historically affected plovers in GGNRA (USFWS 2007a). Western snowy plovers forage along the shoreline and in beach wrack (seaweed and other natural wave-cast organic debris) at the high-tide line and are thus at risk of direct exposure to oil during spills (USFWS 2007a). However, because snowy plovers do not forage in the water, they are less susceptible to oiling than other species. On November 7, 2007, approximately 58,000 gallons of bunker fuel spilled from a container ship into the bay, resulting in the largest oil spill in the San Francisco Bay since the Cape Mohican incident in 1996. As a result, the Natural Resource Damage Assessment process was initiated and a study estimated that of 52 snowy plovers (included 45 banded snowy plovers) potentially affected by the Cosco Busan oil spill, nearly all the snowy plovers survived the immediate effects from the spill and were still alive 2 years later. The Marine Mammal Center, which works with the Oiled Wildlife Care Network, captured a total of 951 birds affected by the spill and found a total of 884 dead as a result of this incident (MMC 2009).

Proposed restoration projects and plans, maintenance operations, and continued expansion of European beachgrass, have the potential to affect the western snowy plover and its habitat at Crissy Field. Additionally, the shorebird docent program and education and outreach efforts at the park will benefit the western snowy plover. An example of the regional projects and plans that will specifically benefit the western snowy plover is the Abbotts Lagoon Area Dune Restoration Plan, a project in the Point Reyes National Seashore that proposes to restore 300 acres of coastal dune habitat south of Abbotts Lagoon to benefit the western snowy plover. Habitat would be restored by removing highly invasive non-native plant species, which have greatly altered sand movement, dune structure, and habitat function for native plants and animals adapted to a coastal environment. Restoring dune habitat to a more natural condition and removing beachgrass would provide area-wide and regional benefits for the western snowy plover population at the park. The proposed Bolinas Lagoon Ecosystem Restoration Project should benefit the western snowy plover, as Bolinas Lagoon boasts a healthy, though fragile, ecosystem that provides habitat for the western snowy plover. Additionally, to protect the western snowy plover, the park closes the WPA to people and dogs during high use events, such as Fleet Week or the America's Cup yacht races, and the park does not permit special events in the WPA.

The long-term moderate adverse impacts on the western snowy plover from dogs at Crissy Field under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from the restoration projects should reduce some of the adverse impacts on the western snowy plover from alternative A; however, impacts resulting from the past oil spill, maintenance operations, and continued expansion of European beachgrass would adversely affect the western snowy plover. When combined, these beneficial and adverse effects may balance out. Therefore, the cumulative analysis for the western snowy plover will mainly focus on the results of the impact analysis for this alternative. Cumulative impacts on the western snowy plover under this alternative would be expected to be long term, moderate, and adverse.

CRISSY FIELD ALTERNATIVE A CONCLUSION TABLE

| Western Snowy Plover Impacts       | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts                            |
|------------------------------------|--|--|---|
| Long-term moderate adverse impacts | The seasonal leash restriction is frequently violated in the WPA; dogs would continue to disturb and/or harass the birds and potentially limit their use of preferred habitat and interrupt roosting or foraging behavior, which causes birds to expend energy; frequent disturbance of this type affects fat reserves needed for migration and breeding | N/A  | Long-term moderate adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking on the promenade, Airfield, East and Central beaches, paths leading to Central Beach, trails and grassy areas near East Beach, around the former Coast Guard Station, and on the Mason Street Bike Path. Dogs would be prohibited from the WPA and the tidal marsh. Although western snowy plovers infrequently use the habitat at Central Beach, enforcing or requiring leash laws have been suggested to reduce impacts to wildlife as a result of domestic dogs (Burger et al. 2004, 287; Lenth et al. 2008, 223; Miller et al. 2001, 131; Thomas et al. 2003, 71). Studies have shown that impacts on foraging shorebirds can be reduced when people maintain a minimum distance where shorebirds concentrate and leash laws are strictly enforced (Thomas et al. 2003, 71).

In addition to prohibiting unleashed dogs at Crissy Field, closing the WPA to dogs would protect the western snowy plover, and restricting pets on-leash on beaches will benefit the entire shorebird guild (Lafferty 2001b, 324). Under alternative B, the use of preferred habitat in the WPA by the plover would be protected.

Alternative B would result in the protection of western snowy plover habitat and individuals of the species by closing the WPA site to dogs and physically restraining dogs on leash on other beaches, which would improve habitat quality and reduce disturbance to western snowy plovers. Assuming compliance with proposed regulations, alternative B would result in negligible impacts on the western snowy plover. This alternative would provide consistency with the *Recovery Plan for the Western Snowy Plover* (USFWS 2007a); western snowy plover habitat and individuals of the species would be protected by closing the WPA site to dogs and physically restraining dogs on other beaches. The use of preferred habitat in the WPA by the plover would be protected.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Even though the percentage of commercial dog walkers is considered high at Crissy Field, dogs walked by commercial dog walkers would add only negligible impacts on the western snowy plover since the western snowy plover habitat and individuals of the species would be protected by closing the WPA site to dogs and physically restraining dogs in other areas.

**Cumulative Impacts.** The negligible impacts on the western snowy plover from dogs at Crissy Field under alternative B were considered together with the effects of the projects mentioned above in alternative A. When combined, the beneficial effects from the restoration projects and the adverse impacts

resulting from the past oil spill, maintenance operations, and continued expansion of European beachgrass may balance out. Therefore, the cumulative analysis for the western snowy plover will mainly focus on the results of the impact analysis for this alternative. Cumulative impacts on the western snowy plover under this alternative would be expected to be negligible.

**CRISSY FIELD ALTERNATIVE B CONCLUSION TABLE**

| Western Snowy Plover Impacts            | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Negligible impacts, assuming compliance | Western snowy plover habitat and individuals would be protected by closing the WPA site to dogs and physically restraining dogs on leash in other areas; use of preferred habitat in the WPA by the plover would be protected; this alternative is consistent with the recovery plan for the western snowy plover | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would have similar dog walking restrictions as alternative B, except dogs would not be allowed on East Beach and would be allowed under voice and sight control in ROLAs established on Crissy Airfield and Central Beach; dogs would not be allowed in the WPA or the Crissy Marsh. Western snowy plovers infrequently use the habitat at Central Beach (including the tidal inlet from Crissy Marsh) where the ROLA would be established, and the beach characteristics at this site may not provide the same quality of habitat as the WPA. However, off-leash dogs could disturb and/or harass the birds and interrupt roosting or foraging behavior. Therefore, in the beach ROLA, long-term minor adverse impacts on the western snowy plover would occur.

The long-term minor adverse impacts on the plover in the beach ROLA would occur in a relatively small area when compared to the site as a whole. Assuming compliance with proposed regulations, alternative C would result in overall negligible impacts on the western snowy plover because dogs would be prohibited in the WPA, which is preferred habitat. Additionally, the Central Beach ROLA (situated away from the WPA) is infrequently used by plovers and makes up only a portion of the entire Crissy Field site. Western snowy plover habitat and individuals of the species would be protected by closing the WPA site to dogs. The use of preferred habitat in the WPA by the plover would be protected. Alternative C is consistent with the *Recovery Plan for the Western Snowy Plover*.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Permits would be allowed at Crissy Field for private or commercial dog walkers to walk more than three dogs, with a maximum of six dogs. Impacts on the western snowy plover from permit holders with up to six dogs off leash would be expected to increase under this alternative since commercial dog walking is common at Crissy Field. Therefore, impacts on western snowy plover from commercial dog walkers would be greater than impacts from other dog walkers and would be long term, minor, and adverse.

**Cumulative Impacts.** The negligible impacts on the western snowy plover from dogs at Crissy Field under alternative C were considered together with the effects of the projects mentioned above in alternative A. When combined, the beneficial effects from the restoration projects and the adverse impacts resulting from the past oil spill, maintenance operations, and continued expansion of European beachgrass

## Chapter 4: Environmental Consequences

may balance out. Therefore, the cumulative analysis for the western snowy plover will mainly focus on the results of the impact analysis for this alternative. Cumulative impacts on the western snowy plover under this alternative would be expected to be negligible.

**CRISSY FIELD ALTERNATIVE C CONCLUSION TABLE**

| Western Snowy Plover Impacts                    | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Western snowy plover habitat and individuals would be protected by closing the WPA site to dogs and physically restraining dogs on leash in other areas; use of preferred habitat in the WPA by the plover would be protected; this alternative is consistent with the recovery plan for the western snowy plover | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Alternative D would allow on-leash dog walking along the promenade, the eastern and western sections of Crissy Airfield, the Mason Street Bike Path, trails and grassy areas near East Beach, around the former Coast Guard Station, and in picnic and parking areas, except the West Bluff picnic area would be closed to dogs. All fenced areas, including the tidal marsh, would remain closed to dogs, and the WPA and East and Central beaches would be closed under this alternative. Dogs would be allowed under voice and sight control in a ROLA on the western portion of Crissy Airfield. Assuming compliance, negligible impacts on the western snowy plover would occur as a result of this alternative. Western snowy plover habitat and individuals of the species would be protected by closing the WPA site to dogs and physically restraining dogs in most areas. In addition, the ROLA would not be located adjacent to the WPA. The use of preferred habitat in the WPA by the plover would be protected. The alternative is consistent with the *Recovery Plan for the Western Snowy Plover*.

No commercial dog walking would be allowed and no permits to walk more than three dogs would be issued under alternative D; therefore, commercial and permitted dog walking would have no impact on the western snowy plover.

**Cumulative Impacts.** The negligible impacts on the western snowy plover from dogs at Crissy Field under alternative D were considered together with the effects of the projects mentioned above in alternative A. When combined, the beneficial effects from the restoration projects and the adverse impacts resulting from the past oil spill, maintenance operations, and continued expansion of European beachgrass may balance out. Therefore, the cumulative analysis for the western snowy plover will mainly focus on the results of the impact analysis for this alternative. Cumulative impacts on the western snowy plover under this alternative would be expected to be negligible.

CRISSY FIELD ALTERNATIVE D CONCLUSION TABLE

| Western Snowy Plover Impacts            | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Negligible impacts, assuming compliance | Western snowy plover habitat and individuals would be protected by closing the WPA site to dogs and physically restraining dogs on leash in most areas; the ROLA would not be located adjacent to the WPA; use of preferred habitat in the WPA by the plover would be protected; this alternative is consistent with the recovery plan for the western snowy plover | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would allow on-leash dog walking in the WPA, on the promenade, East Beach, paths to Central Beach, trails and grassy areas near East Beach, around the Old Coast Guard Station, and on the Mason Street Bike Path. Dogs would be allowed under voice and sight control in ROLAs established on Crissy Airfield and Central Beach. Crissy Marsh would remain closed to dogs. This alternative would provide protection for western snowy plovers when the leash law is followed. However, even though dogs would be on leash in the WPA, it is preferred habitat for the western snowy plover and dogs walked on leash still disturb birds (Lafferty 2001a, 1955). The USFWS has stated that “dogs on beaches can pose a serious threat to snowy plovers during both the breeding and nonbreeding season” (USFWS 2007a). Assuming compliance, alternative E would result in long-term minor adverse impacts on the western snowy plover because physically restraining dogs on leash in the WPA would reduce chasing, but even leashed dogs in the WPA could bark and/or lunge at feeding and roosting western snowy plovers, resulting in disturbance and/or harassment in a relatively small area; the reproductive success of individuals of the species would not be affected, but the use of preferred habitat in the WPA by the western snowy plover may be limited. Also, the Central Beach ROLA would be located adjacent to the WPA and this alternative is not consistent with the *Recovery Plan for the Western Snowy Plover*.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Permits would be allowed at Crissy Field to walk a maximum of six dogs. Since commercial dog walking is common at Crissy Field, impacts on the western snowy plover would be expected from this user group. Impacts on the western snowy plover from commercial dog walkers would be similar to impacts from other dog walkers, as summarized above in overall impacts; therefore, impacts from commercial dog walking would be long term, minor, and adverse.

**Cumulative Impacts.** The long-term minor adverse impacts on the western snowy plover from dogs at Crissy Field under alternative E were considered together with the effects of the projects mentioned above in alternative A. When combined, the beneficial effects from the restoration projects and the adverse impacts resulting from the past oil spill, maintenance operations, and continued expansion of European beachgrass may balance out. Therefore, the cumulative analysis for the western snowy plover will mainly focus on the results of the impact analysis for this alternative. Cumulative impacts on the western snowy plover under this alternative would be expected to be long term, minor, and adverse.

CRISSY FIELD ALTERNATIVE E CONCLUSION TABLE

| Western Snowy Plover Impacts                         | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts                         |
|--|---|--|--|
| Long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash in the WPA would reduce chasing, but even leashed dogs could bark and/or lunge at feeding and roosting western snowy plovers, causing disturbance and/or harassment in a relatively small area; the beach ROLA is located adjacent to the WPA; plovers' use of preferred habitat in the WPA may be limited; this alternative is not consistent with the recovery plan for the western snowy plover | Beneficial, assuming compliance              | Long-term minor adverse cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative would allow on-leash dog walking throughout Crissy Field, except dogs would not be allowed in the WPA or on East Beach. Dogs would be allowed under voice and sight control in ROLAs established on the eastern portion of Crissy Airfield and on Central Beach. Crissy Marsh would remain closed to dogs. Western snowy plovers infrequently use the habitat at Central Beach (including the tidal inlet from Crissy Marsh) where the ROLA would be established, and the beach characteristics at this site may not provide the same quality of habitat as the WPA. However, off-leash dogs could disturb and/or harass the birds and interrupt roosting or foraging behavior. Therefore, in the beach ROLA, long-term minor adverse impacts on the western snowy plover would occur.

Also, even though a leash makes it difficult for dogs to chase birds and reduces the probability and the number of disturbances to birds, dogs walked on leash still disturb birds (Lafferty 2001a, 1955). Enforcing or requiring leash laws have been suggested to reduce impacts of domestic dogs on wildlife (Burger et al. 2004, 287; Lenth et al. 2008, 223; Miller et al. 2001, 131; Thomas et al. 2003, 71). Specifically, impacts on foraging shorebirds can be reduced by having people maintain a minimum distance where shorebirds concentrate and where leash laws are strictly enforced (Thomas et al. 2003, 71). Therefore, prohibiting dogs in the WPA would provide protection to the western snowy plover under the preferred alternative. Restricting pets on beaches in order to protect snowy plovers will benefit the entire shorebird guild (Lafferty 2001b, 324). In a study conducted by Lafferty et al. (2006) at a public beach (Sands Beach, Coal Oil Point Reserve) in Santa Barbara, CA, protection from humans and off-leash dogs resulted in successful nesting and fledging of western snowy plovers (Lafferty et al. 2006, 2217). Under the preferred alternative, the use of preferred habitat in the WPA by the plover would be protected.

The preferred alternative would result in the protection of western snowy plover habitat and individuals of the species by closing the WPA site to dogs and physically restraining dogs on leash in most other areas, which would improve habitat quality and reduce disturbance to western snowy plovers. The long-term minor adverse impacts on the western snowy plover in the beach ROLA would occur in a relatively small area when compared to the site as a whole. Assuming compliance with proposed regulations, the preferred alternative would result in negligible impacts on the western snowy plover because dogs would be prohibited from the WPA. Additionally, the Central Beach ROLA (which is separated from the WPA by a fence) is infrequently used by plovers and makes up only a portion of the entire Crissy Field site. Western snowy plover habitat and individuals of the species would be protected by closing the WPA site

to dogs. The use of preferred habitat in the WPA by the plover would be protected. This alternative would provide consistency with the *Recovery Plan for the Western Snowy Plover* (USFWS 2007a).

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Permits would be allowed at Crissy Field to walk more than three dogs, with a maximum of six. Impacts on the western snowy plover from permit holders with up to six dogs off leash would be similar to impacts described above for the ROLA, since commercial dog walking is common at Crissy Field. Therefore, impacts on western snowy plover from commercial dog walkers would be long term, minor, and adverse.

**Cumulative Impacts.** Projects and actions in and near Crissy Field were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the western snowy plover at or in the vicinity of this site.

Along the California coast, western snowy plovers have been extirpated from 33 of 53 nesting sites since 1970, and now number approximately 1,400 birds (USFWS 2007a). Although the western snowy plover does not nest at the Crissy Field WPA, this area is still important for foraging, resting, and overwintering; chronic disturbance during the nonbreeding season could affect breeding behavior.

Oil spills have occurred and will likely occur in the Pacific Ocean and in San Francisco Bay; oil spills have historically affected plovers in GGNRA (USFWS 2007a). Western snowy plovers forage along the shoreline and in beach wrack (seaweed and other natural wave-cast organic debris) at the high-tide line and are thus at risk of direct exposure to oil during spills (USFWS 2007a). However, because snowy plovers do not forage in the water, they are less susceptible to oiling than other species. On November 7, 2007, approximately 58,000 gallons of bunker fuel spilled from a container ship into the bay, resulting in the largest oil spill in the San Francisco Bay since the Cape Mohican incident in 1996. As a result, the Natural Resource Damage Assessment process was initiated and a study estimated that of 52 snowy plovers (included 45 banded snowy plovers) potentially affected by the Cosco Busan oil spill, nearly all the snowy plovers survived the initial effects from the spill and were still alive 2 years later. The Marine Mammal Center, which works with the Oiled Wildlife Care Network, captured a total of 951 birds affected by the spill and found a total of 884 dead as a result of this incident (MMC 2009).

Proposed restoration projects and plans, maintenance operations, and continued expansion of European beachgrass have the potential to affect the western snowy plover and its habitat at Crissy Field. Additionally, the shorebird docent program and education and outreach efforts at the park will benefit the western snowy plover. An example of the regional projects and plans that will specifically benefit the western snowy plover is the *Abbotts Lagoon Area Dune Restoration Plan*, a project in the Point Reyes National Seashore that proposes to restore 300 acres of coastal dune habitat south of Abbotts Lagoon to benefit the western snowy plover. Habitat would be restored by removing highly invasive non-native plant species, which have greatly altered sand movement, dune structure, and habitat function for native plants and animals adapted to a coastal environment. Restoring dune habitat to a more natural condition and removing beachgrass would provide area-wide and regional benefits for the western snowy plover population at the park. Additionally, the proposed *Bolinas Lagoon Ecosystem Restoration Project* should benefit the western snowy plover, as Bolinas Lagoon boasts a healthy, though fragile, ecosystem that provides habitat for the western snowy plover.

The overall negligible impacts on the western snowy plover from dogs at Crissy Field under the preferred alternative were considered together with the effects of the projects mentioned above. When combined, the beneficial effects from the restoration projects and the adverse impacts resulting from the past oil spill, maintenance operations, and continued expansion of European beachgrass may balance out. Therefore, the cumulative analysis for the western snowy plover will mainly focus on the results of the

## Chapter 4: Environmental Consequences

impact analysis for this alternative. Cumulative impacts on the western snowy plover under this alternative would be expected to be negligible.

**CRISSY FIELD PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| Western Snowy Plover Impacts                    | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Western snowy plover habitat and individuals would be protected by closing the WPA site to dogs and physically restraining dogs on leash in other areas; use of preferred habitat in the WPA by the plover would be protected; this alternative is consistent with the recovery plan for the western snowy plover | Beneficial, assuming compliance              | Negligible cumulative impacts |

### Ocean Beach SPPA (Stairwell 21 South to Sloat Boulevard)

**Alternative A: No Action.** Under current conditions, the SPPA is open to dogs under voice control from May 15 through July 1, but seasonal leash restrictions require dogs to be on leash from July 1 through May 15. The Ocean Beach SPPA is a moderate use area for dog walking. This site has documented high visitor use and compliance with the current dog policies at Ocean Beach is considered poor. NPS staff have documented detailed disturbances to western snowy plovers as a result of dogs in written incident reports that violate both 36 CFR 2.2 (protection of wildlife) and 36 CFR 7.97(d)(ii) (dog walking restrictions at the Ocean Beach SPPA).

The law enforcement incident reports from 2008 through 2011 showed that there were 729 incidents reported for having a dog off leash within the Ocean Beach SPPA during the period (July 1 through May 15) when dogs must be leashed. As described in the collected law enforcement data and through the plover monitoring program, the seasonal leash restrictions designed to protect western snowy plovers at Ocean Beach are frequently violated and disturbance of shorebirds (including western snowy plovers) by dogs and people has occurred (Hatch 1996; Hatch et al. 2007a, 2008; USFWS 2007a). During western snowy plover monitoring surveys conducted at Ocean Beach from December 1994 to May 1996, 362 dogs were observed chasing birds; 19 dogs were observed chasing at least 62 western snowy plovers; and roaming dogs inadvertently disturbed at least 100 additional western snowy plovers (Hatch 1996). During a long-term monitoring survey conducted from 1994 to 2006, 48 off-leash dogs were observed chasing western snowy plovers (Ward and Ablog 2006). Western snowy plover monitoring data have demonstrated that disturbance of western snowy plovers due to off-leash dogs increased in the SPPA immediately following the *U.S. v. Barley* decision (NPS 2006b; NPS 2008, 2).

Studies that were previously described have shown that dogs may disproportionately affect plovers (Lafferty 2001b, 322) and may adversely affect plovers in many ways, including individual survivorship and fecundity (USFWS 2007a, 65), feeding and migration behavior (Kersten and Piersma 1987, 182, 185), as well as reducing energy reserves and causing movement to an alternative site (Davidson and Rothwell 1993, 97). These shorebirds may not adapt to the presence of people by habituation (Burger et al. 2004, 286). Therefore, alternative A would result in long-term moderate adverse impacts on the western snowy plover because dogs would continue to frequently disturb and/or harass the birds and potentially limit their use of preferred habitat. Dogs could interrupt roosting or foraging, which causes the birds to expend energy; frequent disturbance of this type affects fat reserves needed for migration and breeding. Although this species does not nest in GGNRA, chronic disturbance during the nonbreeding

season could indirectly affect breeding behavior. Therefore, impacts would result in measurable and/or consequential changes in individuals of a species through frequent disturbance, but the impact would remain relatively localized and therefore moderate.

Under alternative A, no permit system exists for commercial dog walking. At Ocean Beach, commercial dog walking is uncommon; therefore, commercial dog walking would have negligible impacts on the western snowy plover.

**Cumulative Impacts.** Projects and actions in and near the Ocean Beach SPPA were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the western snowy plover at or in the vicinity of this site.

Along the California coast, western snowy plovers have been extirpated from 33 of 53 nesting sites since 1970, and now number approximately 1,400 birds (USFWS 2007a). Although the western snowy plover does not nest at the Ocean Beach SPPA, this area is still important for foraging, resting, and overwintering; chronic disturbance during the nonbreeding season could affect breeding behavior.

Oil spills have occurred and will likely occur in the Pacific Ocean and in San Francisco Bay; oil spills have historically affected plovers in GGNRA (USFWS 2007a). Western snowy plovers forage along the shoreline and in beach wrack (seaweed and other natural wave-cast organic debris) at the high-tide line and are thus at risk of direct exposure to oil during spills (USFWS 2007a). However, because snowy plovers do not forage in the water, they are less susceptible to oiling than other species. On November 7, 2007, approximately 58,000 gallons of bunker fuel spilled from a container ship into the bay, resulting in the largest oil spill in the San Francisco Bay since the Cape Mohican incident in 1996. As a result, the Natural Resource Damage Assessment process was initiated and a study estimated that of 52 snowy plovers (included 45 banded snowy plovers) potentially affected by the Cosco Busan oil spill, nearly all the snowy plovers survived the initial effects from the spill and were still alive 2 years later. The Marine Mammal Center, which works with the Oiled Wildlife Care Network, captured a total of 951 birds affected by the spill and found a total of 884 dead as a result of this incident (MMC 2009).

Proposed restoration projects and plans, maintenance operations, continued expansion of European beachgrass, and the *Ocean Beach Erosion Control Project* have the potential to affect the western snowy plover and its habitat at Ocean Beach. The *Ocean Beach Erosion Control Project* is developing long-term solutions to beach and bluff erosion problems at Ocean Beach along the Great Highway consistent with the enhancement of natural processes. An example of the regional projects and plans that will specifically benefit the western snowy plover is the *Abbotts Lagoon Area Dune Restoration Plan*, a project in the Point Reyes National Seashore that proposes to restore 300 acres of coastal dune habitat south of Abbotts Lagoon to benefit the western snowy plover. Habitat would be restored by removing highly invasive non-native plant species, which have greatly altered sand movement, dune structure, and habitat function for native plants and animals adapted to a coastal environment. Restoring dune habitat to a more natural condition and removing beachgrass would provide area-wide and regional benefits for the western snowy plover population at the park. Additionally, the proposed *Bolinas Lagoon Ecosystem Restoration Project* should benefit the western snowy plover, as Bolinas Lagoon boasts a healthy, though fragile, ecosystem that provides habitat for the western snowy plover. The *Ocean Beach Master Plan* includes plans to restore habitat at Ocean Beach including native dune restoration and beach nourishment, which may result in beneficial impacts on the Western snowy plover.

The long-term moderate adverse impacts on the western snowy plover from dogs at the Ocean Beach SPPA under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from the restoration projects should reduce some of the adverse impacts on the western

## Chapter 4: Environmental Consequences

snowy plover from alternative A; however, impacts resulting from the past oil spill, maintenance operations, erosion control projects, and continued expansion of European beachgrass would adversely affect the western snowy plover. When combined, the beneficial and adverse effects from these actions may balance out. Therefore, the cumulative analysis for the western snowy plover will mainly focus on the results of the impact analysis for this alternative. Cumulative impacts on the western snowy plover under this alternative would be expected to be long term, moderate, and adverse.

**OCEAN BEACH SPPA ALTERNATIVE A CONCLUSION TABLE**

| Western Snowy Plover Impacts       | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts                            |
|------------------------------------|---|--|---|
| Long-term moderate adverse impacts | The seasonal leash restriction is frequently violated in the SPPA; dogs would continue to disturb and/or harass the birds and potentially limit their use of preferred habitat and interrupt roosting or foraging behavior, which causes birds to expend energy; frequent disturbance of this type affects fat reserves needed for migration and breeding | N/A  | Long-term moderate adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking on the adjacent Ocean Beach Trail along Great Highway, but not on the beach in the SPPA. Because an approximately 2-mile length of beach (the SPPA, which is preferred habitat for the plover) would not be available to dogs, this alternative would provide protection of the western snowy plover. Alternative B would result in the protection of western snowy plover habitat and individuals of the species by closing the SPPA site to dogs and physically restraining dogs on leash in other areas, which would improve habitat quality and reduce disturbance to western snowy plovers. Also, the use of preferred habitat in the SPPA by the plover would be protected. Assuming compliance with proposed regulations, alternative B would result in no impact on the western snowy plover; western snowy plover habitat and individuals of the species would be protected by closing the SPPA site to dogs and physically restraining dogs on leash in other areas. Finally, this alternative would provide consistency with the *Recovery Plan for the Western Snowy Plover* (USFWS 2007a).

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. However, commercial dog walkers would have no impact on the western snowy plover since the SPPA site would be closed to dogs and dogs would be physically restrained on leash in other areas of the site.

**Cumulative Impacts.** The lack of impacts on the western snowy plover from dogs at the Ocean Beach SPPA under alternative B were considered together with the effects of the projects mentioned above under alternative A. When combined, the beneficial effects from the restoration projects and the adverse impacts resulting from the past oil spill, maintenance operations, and continued expansion of European beachgrass may balance out. Therefore, the cumulative impacts on the western snowy plover would be expected to be negligible.

**OCEAN BEACH SPPA ALTERNATIVE B CONCLUSION TABLE**

| Western Snowy Plover Impacts   | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--------------------------------|--|--|-------------------------------|
| No impact, assuming compliance | Western snowy plover habitat and individuals would be protected by closing the SPPA site to dogs and physically restraining dogs on leash in other areas; use of preferred habitat in the SPPA by the plover would be protected; the alternative is consistent with the recovery plan for the western snowy plover | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would have the same dog walking restrictions as alternative B, and impacts on the western snowy plover would be the same, assuming compliance: no impact.

Under alternative C, commercial dog walkers would have no impact on the western snowy plover since the SPPA site would be closed to dogs and dogs would be physically restrained in other areas of the site.

**Cumulative Impacts.** Under alternative C, the cumulative impacts on the western snowy plover at the Ocean Beach SPPA would be the same as those under alternative B: negligible.

**OCEAN BEACH SPPA ALTERNATIVE C CONCLUSION TABLE**

| Western Snowy Plover Impacts   | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--------------------------------|--|--|-------------------------------|
| No impact, assuming compliance | Western snowy plover habitat and individuals would be protected by closing the SPPA site to dogs and physically restraining dogs on leash in other areas; use of preferred habitat in the SPPA by the plover would be protected; the alternative is consistent with the recovery plan for the western snowy plover | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Alternative D would have the same dog walking restrictions as alternative B, and impacts on the western snowy plover would be the same, assuming compliance: no impact.

No commercial dog walking would be allowed and no permits to walk more than three dogs would be issued under alternative D; therefore, commercial and permitted dog walking would have no impact on the western snowy plover.

**Cumulative Impacts.** Under alternative D, the cumulative impacts on the western snowy plover at the Ocean Beach SPPA would be the same as those under alternative B: negligible.

OCEAN BEACH SPPA ALTERNATIVE D CONCLUSION TABLE

| Western Snowy Plover Impacts   | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--------------------------------|--|--|-------------------------------|
| No impact, assuming compliance | Western snowy plover habitat and individuals would be protected by closing the SPPA site to dogs and physically restraining dogs on leash in other areas; use of preferred habitat in the SPPA by the plover would be protected; the alternative is consistent with the recovery plan for the western snowy plover | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would allow on-leash dog walking on the beach in the SPPA during all seasons, as well as on the Ocean Beach Trail along Great Highway. This alternative would provide protection for western snowy plovers when the leash law is followed. The current protections would be in place for western snowy plovers, but would be extended throughout the year to eliminate the current confusion with the seasonal leash restrictions. However, even though dogs would be on leash in the SPPA, it is preferred habitat for the western snowy plover and dogs walked on leash still disturb birds (Lafferty 2001a, 1955). The USFWS has stated that “dogs on beaches can pose a serious threat to snowy plovers during both the breeding and nonbreeding season” (USFWS 2007a). Assuming compliance, alternative E would result in long-term minor adverse impacts on the western snowy plover because physically restraining dogs on leash in the SPPA would reduce chasing, but even leashed dogs in could bark and/or lunge at feeding and roosting western snowy plovers, causing occasional disturbance and/or harassment in a relatively small area; the reproductive success of individuals of the species would not be affected, but the plovers’ use of preferred habitat in the SPPA may be limited. This alternative is not consistent with the *Recovery Plan for Pacific Coast Population of the Western Snowy Plover* (USFWS 2007a).

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Ocean Beach is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at Ocean Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on the western snowy plover.

**Cumulative Impacts.** The long-term minor adverse impacts on the western snowy plover from dogs at the Ocean Beach SPPA under alternative E were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the restoration projects should reduce some of the adverse impacts on the western snowy plover from alternative E; however, impacts resulting from the past oil spill, maintenance operations, erosion control projects, and continued expansion of European beachgrass would adversely affect the western snowy plover. When combined, the beneficial and adverse effects from these actions may balance out. Therefore, the cumulative analysis for the western snowy plover will mainly focus on the results of the impact analysis for this alternative. Cumulative impacts on the western snowy plover under this alternative would be expected to be long term, minor, and adverse.

**OCEAN BEACH SPPA ALTERNATIVE E CONCLUSION TABLE**

| Western Snowy Plover Impacts                         | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts                         |
|--|--|--|--|
| Long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash in the SPPA would reduce chasing, but even leashed dogs could bark and/or lunge at feeding and roosting western snowy plovers, causing disturbance and/or harassment in a relatively small area; plovers' use of preferred habitat in SPPA may be limited; this alternative is not consistent with the recovery plan for the western snowy plover | Beneficial, assuming compliance              | Long-term minor adverse cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative B, prohibiting dogs on the beach in the SPPA, although dog walking on leash would be allowed on the Ocean Beach Trail adjacent to the Great Highway. Because an approximately 2-mile length of beach (the SPPA, which is preferred habitat for the plover) would not be available to dogs, this alternative would provide for protection of the western snowy plover from dogs and consistency with the *Recovery Plan for the Western Snowy Plover* (USFWS 2007a). Therefore, the preferred alternative would result in no impact on the western snowy plover because individual plovers and habitat would be protected by closing the SPPA site to dogs and physically restraining dogs on leash in other areas. The use of preferred habitat in the SPPA by the plover would be protected. To further support this conclusion, this alternative would prevent disturbance/harassment by dogs to western snowy plovers and would be consistent with the recovery plan.

All dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Ocean Beach is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Regardless, commercial dog walkers would have no impact on the western snowy plover since the SPPA site would be closed to dogs and dogs would be physically restrained on leash or in a ROLA in other areas of the site.

**Cumulative Impacts.** Projects and actions in and near the Ocean Beach SPPA were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the western snowy plover at or in the vicinity of this site.

Along the California coast, western snowy plovers have been extirpated from 33 of 53 nesting sites since 1970, and now number approximately 1,400 birds (USFWS 2007a). Although the western snowy plover does not nest at the Ocean Beach SPPA, this area is still important for foraging, resting, and overwintering; chronic disturbance during the nonbreeding season could affect breeding behavior.

Oil spills have occurred and will likely occur in the Pacific Ocean and in San Francisco Bay; oil spills have historically affected plovers in GGNRA (USFWS 2007a). Western snowy plovers forage along the shoreline and in beach wrack (seaweed and other natural wave-cast organic debris) at the high-tide line and are thus at risk of direct exposure to oil during spills (USFWS 2007a). However, because western snowy plovers do not forage in the water, they are less susceptible to oiling than other species. On November 7, 2007, approximately 58,000 gallons of bunker fuel spilled from a container ship into the bay, resulting in the largest oil spill in the San Francisco Bay since the Cape Mohican incident in 1996.

## Chapter 4: Environmental Consequences

As a result, the Natural Resource Damage Assessment process was initiated and a study estimated that of 52 snowy plovers (included 45 banded snowy plovers) potentially affected by the Cosco Busan oil spill, nearly all the snowy plovers survived the initial effects from the spill and were still alive 2 years later. The Marine Mammal Center, which works with the Oiled Wildlife Care Network, captured a total of 951 birds affected by the spill and found a total of 884 dead as a result of this incident (MMC 2009).

Proposed restoration projects and plans, maintenance operations, continued expansion of European beachgrass, and the *Ocean Beach Erosion Control Project* have the potential to affect the western snowy plover and its habitat at Ocean Beach. The *Ocean Beach Erosion Control Project* is developing long-term solutions to beach and bluff erosion problems at Ocean Beach along the Great Highway consistent with the enhancement of natural processes. An example of the regional projects and plans that will specifically benefit the western snowy plover is the *Abbotts Lagoon Area Dune Restoration Plan*, a project in the Point Reyes National Seashore that proposes to restore 300 acres of coastal dune habitat south of Abbotts Lagoon to benefit the western snowy plover. Habitat would be restored by removing highly invasive non-native plant species, which have greatly altered sand movement, dune structure, and habitat function for native plants and animals adapted to a coastal environment. Restoring dune habitat to a more natural condition and removing beachgrass would provide area-wide and regional benefits for the western snowy plover population at the park. Additionally, the proposed *Bolinas Lagoon Ecosystem Restoration Project* should benefit the western snowy plover, as Bolinas Lagoon boasts a healthy, though fragile, ecosystem that provides habitat for the western snowy plover. The *Ocean Beach Master Plan* includes plans to restore habitat at Ocean Beach including native dune restoration and beach nourishment, which may result in beneficial impacts on the Western snowy plover.

The lack of impacts on the western snowy plover from dogs at the Ocean Beach SPPA under the preferred alternative was considered together with the effects of the projects mentioned above. When combined, the beneficial effects from the restoration projects and the adverse impacts resulting from the past oil spill, maintenance operations, and continued expansion of European beachgrass may balance out. Therefore, the cumulative impacts on the western snowy plover would be expected to be negligible.

**OCEAN BEACH SPPA PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| Western Snowy Plover Impacts   | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--------------------------------|--|--|-------------------------------|
| No impact, assuming compliance | Western snowy plover habitat and individuals would be protected by closing the SPPA site to dogs and physically restraining dogs on leash in other areas; use of preferred habitat in the SPPA by the plover would be protected; the alternative is consistent with the recovery plan for the western snowy plover | Beneficial, assuming compliance              | Negligible cumulative impacts |

### Ocean Beach (North of Stairwell 21 and South of Sloat Boulevard)

**Alternative A: No Action.** At Ocean Beach, the areas located north of Stairwell 21 and south of Sloat Boulevard are currently open to dogs under voice control. However, this area is located adjacent to the SPPA (which is preferred habitat for the plover and where seasonal leash restrictions are in effect) and may cause visitor confusion regarding leash laws, possibly resulting in off-leash dogs inadvertently

entering the SPPA. Only small numbers of western snowy plovers have been observed in areas outside the SPPA, including at this location.

Therefore, alternative A would result in long-term minor to moderate adverse impacts on the western snowy plover because dogs would continue to occasionally to frequently disturb and/or harass the birds at the adjacent SPPA and potentially limit their use of preferred habitat; a few individuals of the species in a small, localized area could be affected and reproductive success could be indirectly affected.

Under alternative A, no permit system exists for commercial dog walking. At Ocean Beach, commercial dog walking is uncommon; therefore, commercial dog walking would have negligible impacts on the western snowy plover.

**Cumulative Impacts.** The long-term minor to moderate adverse impacts on the western snowy plover from dogs at Ocean Beach under alternative A were considered together with the effects of the projects mentioned above under alternative A for the Ocean Beach SPPA. The beneficial effects from the restoration projects should reduce some of the adverse impacts on the western snowy plover from alternative A; however, impacts resulting from the past oil spill, maintenance operations, erosion control projects, and continued expansion of European beachgrass would adversely affect the western snowy plover. When combined, the beneficial and adverse effects from these actions may balance out. Therefore, the cumulative analysis for the western snowy plover will mainly focus on the results of the impact analysis for this alternative. Cumulative impacts on the western snowy plover under this alternative would be expected to be long term, minor to moderate, and adverse.

**OCEAN BEACH ALTERNATIVE A CONCLUSION TABLE**

| Western Snowy Plover Impacts                | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts                                     |
|---|---|--|--|
| Long-term minor to moderate adverse impacts | Only small numbers of western snowy plovers have been observed in this area, but disturbance and harassment could occur; also, dogs can access the SPPA from this beach | N/A  | Long-term minor to moderate adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking on the beach north of Stairwell 21 and south of Sloat Boulevard. This alternative would provide protection for western snowy plovers when the leash law is followed, but dogs walked on leash still disturb birds (Lafferty 2001a, 1955). The USFWS states that “dogs on beaches can pose a serious threat to snowy plovers during both the breeding and nonbreeding season” (USFWS 2007a). However, only small numbers of western snowy plovers have been observed in areas outside the SPPA, including this location. Assuming compliance with proposed regulations, alternative B would result in negligible impacts on the western snowy plover because plover habitat and individuals of the species would be protected by closing the SPPA (which is preferred habitat for the plover) site to dogs and physically restraining dogs on leash on the beach, which would reduce chasing of the western snowy plover.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is not common at Ocean Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have negligible impacts on the western snowy plover.

## Chapter 4: Environmental Consequences

**Cumulative Impacts.** The negligible impacts on the western snowy plover from dogs at Ocean Beach under alternative B were considered together with the effects of the projects mentioned above under the Ocean Beach SPPA alternative A. When combined, the beneficial effects from the restoration projects and the adverse impacts resulting from the past oil spill, maintenance operations, and continued expansion of European beachgrass may balance out. Therefore, the cumulative impacts on the western snowy plover would be expected to be negligible.

**OCEAN BEACH ALTERNATIVE B CONCLUSION TABLE**

| <b>Western Snowy Plover Impacts</b>     | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|---|---|-------------------------------|
| Negligible impacts, assuming compliance | Only small numbers of western snowy plovers have been observed in this area (outside the SPPA); plover habitat and individuals would be protected by physically restraining dogs on leash on the beach, but even leashed dogs may affect the behavior of the plover | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would allow dogs under voice and sight control in a ROLA on the beach north of Stairwell 21; dogs would be prohibited south of Sloat Boulevard. This alternative would provide protection for the western snowy plover from dogs and consistency with the recovery plan (USFWS 2007a), but the ROLA would be sited immediately adjacent to the SPPA. Only small numbers of western snowy plovers have been observed in this area (outside the SPPA). Assuming compliance, alternative C would result in negligible to long-term minor adverse impacts on the western snowy plover. Although only small numbers of western snowy plovers have been observed, off-leash dogs would be allowed in part of this area. Dogs could occasionally disturb western snowy plovers in the ROLA adjacent to the SPPA on the beach. The reproductive success of individuals of the species would not be affected but plovers’ use of preferred habitat (the SPPA) may be partially limited.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. However, Ocean Beach is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Commercial dog walking is not common at Ocean Beach, and it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on the western snowy plover.

**Cumulative Impacts.** The negligible to long-term, minor, adverse impacts on the western snowy plover from dogs at Ocean Beach under alternative C were considered together with the effects of the projects mentioned above under the Ocean Beach SPPA alternative A. When combined, the beneficial effects from the restoration projects and the adverse impacts resulting from the past oil spill, maintenance operations, and continued expansion of European beachgrass may balance out. Therefore, the cumulative impacts on the western snowy plover would be expected to be negligible to long term, minor and adverse.

**OCEAN BEACH ALTERNATIVE C CONCLUSION TABLE**

| Western Snowy Plover Impacts                                       | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts                                       |
|--|--|--|--|
| Negligible to long-term minor adverse impacts, assuming compliance | Only small numbers of western snowy plovers have been observed in this area (outside the SPPA), but the ROLA would be sited immediately adjacent to the SPPA | Beneficial to no change, assuming compliance | Negligible to long-term minor adverse cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Alternative D would have the same dog walking restrictions as alternative B, except dogs would not be allowed on the beach south of Sloat Boulevard. Dogs would be allowed on leash on the beach north of Stairwell 21, where only small numbers of western snowy plovers have been observed. Due to physical restraint on leash, it is highly unlikely that dogs would access the SPPA. Even though dogs walked on leash still disturb birds (Lafferty 2001a, 1955), very few plovers use the beach north of Stairwell 21. This alternative would provide protection for the western snowy plover from dogs and consistency with the recovery plan (USFWS 2007a). Assuming compliance, this alternative would result in negligible impacts on the western snowy plover. Individual plovers and preferred habitat would be protected by closing the SPPA site to dogs and prohibiting dogs or physically restraining dogs on leash in other areas.

No commercial dog walking would be allowed and no permits to walk more than three dogs would be issued under alternative D; therefore, commercial and permitted dog walking would have no impact on the western snowy plover.

**Cumulative Impacts.** The negligible impacts on the western snowy plover from dogs at Ocean Beach under alternative D were considered together with the effects of the projects mentioned above under the Ocean Beach SPPA alternative A. When combined, the beneficial effects from the restoration projects and the adverse impacts resulting from the past oil spill, maintenance operations, and continued expansion of European beachgrass may balance out. Therefore, the cumulative impacts on the western snowy plover would be expected to be negligible.

**OCEAN BEACH ALTERNATIVE D CONCLUSION TABLE**

| Western Snowy Plover Impacts            | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Negligible impacts, assuming compliance | Only small numbers of western snowy plovers have been observed in this area; plover habitat and individuals would be protected by physically restraining dogs on leash on the beach, but even leashed dogs may affect the small numbers of plovers on the beach where dogs would be allowed | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would allow on-leash dog walking on the beach south of Sloat Boulevard and under voice and sight control in a ROLA

## Chapter 4: Environmental Consequences

on the beach north of Stairwell 21. Assuming compliance, alternative E would result in negligible to long-term minor adverse impacts on the western snowy plover, because small numbers of western snowy plovers have been observed at this location and off-leash dogs would be allowed in part of this area. Dogs could occasionally disturb western snowy plovers in the ROLA located adjacent to the SPPA on the beach. The reproductive success of individuals of the species would not be affected but plovers' use of preferred habitat (the SPPA) may be partially limited.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. However, Ocean Beach is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at Ocean Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on the western snowy plover.

**Cumulative Impacts.** The negligible to long-term minor adverse impacts on the western snowy plover from dogs at Ocean Beach under alternative E were considered together with the effects of the projects mentioned above under the Ocean Beach SPPA alternative A. When combined, the beneficial effects from the restoration projects and the adverse impacts resulting from the past oil spill, maintenance operations, and continued expansion of European beachgrass may balance out. Therefore, the cumulative impacts on the western snowy plover would be expected to be negligible to long-term, minor and adverse.

**OCEAN BEACH ALTERNATIVE E CONCLUSION TABLE**

| <b>Western Snowy Plover Impacts</b>                                | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>                                |
|--|--|---|--|
| Negligible to long-term minor adverse impacts, assuming compliance | Only small numbers of western snowy plovers have been observed in this area (outside the SPPA), but the ROLA would be sited immediately adjacent to the SPPA | Beneficial to no change, assuming compliance        | Negligible to long-term minor adverse cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative C, allowing dogs under voice and sight control in a ROLA on the beach north of Stairwell 21; dogs would be prohibited south of Sloat Boulevard. This alternative would provide protection for the western snowy plover from dogs and consistency with the recovery plan (USFWS 2007a). Only small numbers of western snowy plovers have been observed in the area outside the SPPA, but the ROLA would be sited immediately adjacent to the SPPA. Therefore, assuming compliance, the preferred alternative would result in negligible to long-term minor adverse impacts on the western snowy plover, because only small numbers of western snowy plovers have ever been observed at this location and off-leash dogs would be allowed in part of this area. Dogs could occasionally disturb western snowy plovers in the ROLA adjacent to the SPPA on the beach. The reproductive success of individuals of the species would not be affected but use of preferred habitat (the SPPA) by plovers may be partially limited.

All dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. However, Ocean Beach is not one of the park sites where permits would be issued to individual or commercial dog walkers to walk more than three dogs. Since commercial dog walking is not common at Ocean Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have negligible impacts on the western snowy plover.

**Cumulative Impacts.** Projects and actions in and near Ocean Beach were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the western snowy plover at or in the vicinity of this site.

Along the California coast, western snowy plovers have been extirpated from 33 of 53 nesting sites since 1970, and now number approximately 1,400 birds (USFWS 2007a). Although the western snowy plover does not nest at Ocean Beach, this area is still important for foraging, resting, and overwintering; chronic disturbance during the nonbreeding season could affect breeding behavior.

Oil spills have occurred and will likely occur in the Pacific Ocean and in San Francisco Bay; oil spills have historically affected plovers in GGNRA (USFWS 2007a). Western snowy plovers forage along the shoreline and in beach wrack (seaweed and other natural wave-cast organic debris) at the high-tide line and are thus at risk of direct exposure to oil during spills (USFWS 2007a). However, because western snowy plovers do not forage in the water, they are less susceptible to oiling than other species. On November 7, 2007, approximately 58,000 gallons of bunker fuel spilled from a container ship into the bay, resulting in the largest oil spill in the San Francisco Bay since the Cape Mohican incident in 1996. As a result, the Natural Resource Damage Assessment process was initiated and a study estimated that of 52 snowy plovers (included 45 banded snowy plovers) potentially affected by the Cosco Busan oil spill, nearly all the snowy plovers survived the initial effects from the spill and were still alive 2 years later. The Marine Mammal Center, which works with the Oiled Wildlife Care Network, captured a total of 951 birds affected by the spill and found a total of 884 dead as a result of this incident (MMC 2009).

Proposed restoration projects and plans, maintenance operations, continued expansion of European beachgrass, and the *Ocean Beach Erosion Control Project* have the potential to affect the western snowy plover and its habitat at Ocean Beach. The *Ocean Beach Erosion Control Project* is developing long-term solutions to beach and bluff erosion problems at Ocean Beach along the Great Highway consistent with the enhancement of natural processes. An example of the regional projects and plans that will specifically benefit the western snowy plover is the *Abbotts Lagoon Area Dune Restoration Plan*, a project in the Point Reyes National Seashore that proposes to restore 300 acres of coastal dune habitat south of Abbotts Lagoon to benefit the western snowy plover. Habitat would be restored by removing highly invasive non-native plant species, which have greatly altered sand movement, dune structure, and habitat function for native plants and animals adapted to a coastal environment. Restoring dune habitat to a more natural condition and removing beachgrass would provide area-wide and regional benefits for the western snowy plover population at the park. Additionally, the proposed *Bolinas Lagoon Ecosystem Restoration Project* should benefit the western snowy plover, as Bolinas Lagoon boasts a healthy, though fragile, ecosystem that provides habitat for the western snowy plover. The *Ocean Beach Master Plan* includes plans to restore habitat at Ocean Beach including native dune restoration and beach nourishment, which may result in beneficial impacts on the Western snowy plover.

The negligible to long-term, minor, adverse impacts on the western snowy plover from dogs at Ocean Beach under the preferred alternative were considered together with the effects of the projects mentioned above. When combined, the beneficial effects from the restoration projects may be balanced by the adverse impacts resulting from the past oil spill, maintenance operations, and continued expansion of European beachgrass. Therefore, the cumulative impacts on the western snowy plover would be expected to be negligible to long term, minor and adverse.

OCEAN BEACH PREFERRED ALTERNATIVE F CONCLUSION TABLE

| Western Snowy Plover Impacts                                       | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts                                       |
|--|--|--|--|
| Negligible to long-term minor adverse impacts, assuming compliance | Only small numbers of western snowy plovers have been observed in this area (outside the SPPA), but the ROLA would be sited immediately adjacent to the SPPA | Beneficial to no change, assuming compliance | Negligible to long-term minor adverse cumulative impacts |

**IMPACTS TO BANK SWALLOW (STATE THREATENED) BY SITE AND ALTERNATIVE**

A nesting colony of the bank swallow occupies burrows in the coastal bluff habitat at Fort Funston, one of only a few remaining coastal breeding sites for the species along the outer coast in California. The bank swallows are present at the Fort Funston bluffs during their breeding season (April to early August) and spend the nonbreeding season in South America. These bluffs consist of layers of sandstone, mudstones, and conglomerates and are known as the Merced and Colma formations. These formations are described as soft, easily erodible, sedimentary rocks and are very susceptible to disturbance. This section describes impacts to both the bank swallow and the sensitive bluff habitat.

**Fort Funston**

**Alternative A: No Action.** Dogs are currently allowed under voice control on the beach and throughout the site, including on all trails at Fort Funston, with the exception of a 12-acre fenced Habitat Protection Area closure in upper Fort Funston, the voluntary seasonal closure for bank swallow protection (April 1–August 15) on a section of beach extending 50 feet from the base of the coastal bluff below the bank swallow habitat areas, and the north end of the Sunset Trail due to erosion. Visitors can access areas surrounding the coastal bluffs from above the beach at the Funston Beach Trail North. Signs and fencing (currently partially buried) along the bluff edge and along the beach below the colony have been installed to restrict access to these areas by visitors. The bank swallow colony is actively managed by the NPS due to the vulnerability of these bluff-nesting birds, the regional uniqueness of the colony, and the high human/dog use in the Fort Funston area. It has been documented by park personnel that people and dogs access the bluff tops and even gain access to the beach from the trails above the bluff area; this access is more frequent at the north end of the site and occurs even with the seasonal area closures (NPS 2007c, 5–6). The Fort Funston site experiences high visitor use, with the majority of use by private and commercial dog walkers (table 9). Current heavy use by recreationists affects the coastal bluff top at Fort Funston. The bank swallow colony at Fort Funston is monitored weekly by park personnel to document the number of burrows, bank swallow activity, and disturbance to the burrows and/or species during the breeding season (NPS 2007c, 3). Park personnel have observed both people and dogs climbing on the bluffs in the closed areas. A total of 172 dog-related incidents at Fort Funston were recorded from 2008 through 2011. The majority of incidents recorded were for having a dog off-leash and for hazardous conditions. Of the 72 hazardous conditions reported, 29 were for pet rescues on the cliffs (table 25). However, effects from human/dog presence on the nesting success of the bank swallow at Fort Funston have not been adequately studied. It is possible but would be rare that dogs could dig at or collapse the burrows, and possible but rare that climbers (following after their dogs or on their own) could collapse the burrows. Currently, some dogs access the bluff from the beach, resulting in some local disturbances to the bank swallow colony, and there have been numerous recent instances where hazardous conditions/pet rescues have occurred at Fort Funston, which result in further disturbance to the colony during the breeding season (table 9).

Common ravens are nest predators of the bank swallow at Fort Funston and are abundant at the site. Portions of Fort Funston have been heavily impacted by intense dog use, particularly where there is accelerated erosion from natural forces of the geologic resources (Merced and Colma formations). Closing the area through fencing and sign installation has not been successful in preventing recreational disturbance to the bank swallow colony, particularly given current conditions where sand movement has largely buried the signs and fences around the area. However, the colony has persisted despite increased human/dog use in the area (NPS n.d.e, 7–8). Historical evidence has shown that the colony has shifted locations periodically. The most recent colony shift occurred from further south to the north end of the site; this shift caused the bank swallows to move from fairly high bluffs (where access from the beach was not an issue) to lower bluffs that are more likely to be disturbed from the beach and through the dunes from above the coastal bluffs.

Therefore, alternative A would result in continued long-term minor adverse impacts on the bank swallow colony because impacts on the bluff habitat would be infrequent and unlikely to affect the nesting success and population of bank swallows at Fort Funston. The bluff habitat is known to be sensitive but is influenced by many other factors, including rapid erosion from storm events outside the breeding season (NPS 2007c, 1). Park staff have observed that during years when big storm events erode the cliffs, most or all of the burrows may erode away but the bank swallows respond by digging new burrows in the soft cliffs. Additional observations of the colony show that it fluctuates in numbers and locations along the cliffs at Fort Funston over time and is therefore somewhat resilient to disturbance (NPS 2007c, 3; Etchell 2010, 2-3).

Under alternative A, no permit system exists for commercial dog walking. However, commercial dog walking regularly occurs at Fort Funston. Commercial dog walking would continue to contribute to the long-term minor adverse impacts on the bank swallow.

**Cumulative Impacts.** Projects and actions in and near Fort Funston were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the bank swallow at or in the vicinity of this site.

Fort Funston supports one of only a few remaining coastal breeding sites for the bank swallow in California; the closest other breeding site is at Año Nuevo State Reserve in Santa Cruz County, approximately 55 miles south of San Francisco and GGNRA. The bank swallow is protected at both Fort Funston in GGNRA and at Año Nuevo State Reserve. Park stewardship programs, which incorporate trail rehabilitation, including the Sunset Trail at GGNRA, may also provide a benefit to the bank swallows at Fort Funston through habitat protection for the species. Also, the San Francisco Public Utilities Commission is currently developing a *Lake Merced Watershed Plan*, which seeks to provide a comprehensive set of strategies to sustain the health of the Lake Merced Watershed while also providing recreational and educational opportunities. Located immediately to the east of Fort Funston (across Skyline Boulevard), Lake Merced is the largest freshwater wetland between Point Reyes in Marin County and Pescadero Marsh in southern San Mateo County. The 509-acre lake is an emergency source of water for the City of San Francisco and is used for firefighting or sanitation purposes if no other sources of water are available. The resource management portion of the plan, which focuses on flora and fauna preservation as well as restoration and enhancement of the watershed's natural areas, habitat values, and ecological function, should benefit the bank swallow, which forages at Lake Merced. In addition, Lake Merced is a natural area managed under the SNRAMP. Project activities included in the SNRAMP will also protect this listed species and provide long-term beneficial impacts to the bank swallow.

The long-term minor adverse impacts on the bank swallow and bluff habitat from dogs and dog walkers at Fort Funston under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from the habitat protection at the site, the SNRAMP, and from the *Lake*

## Chapter 4: Environmental Consequences

*Merced Watershed Plan* should reduce some of the adverse impacts on the bank swallow from alternative A. Therefore, the cumulative impacts on the bank swallow and bluff habitat under this alternative would be expected to be negligible.

**FORT FUNSTON ALTERNATIVE A CONCLUSION TABLE**

| Bank Swallow Impacts            | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---------------------------------|--|--|-------------------------------|
| Long-term minor adverse impacts | Dogs have accessed the bluff from the beach and hazardous conditions/pet rescues have occurred, but is infrequent and unlikely to affect the nesting success and population; the bluff habitat is known to be sensitive but is influenced by many other factors, including natural erosion or slides and nest predators such as the common raven | N/A  | Negligible cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking on Fort Funston trails that are not closed to dogs, as well as on the full length of the beach, with a seasonal closure extending 50 feet from the foot of the bluffs during the bank swallow nesting season (April 1 through August 15). Closed sections of the upland area include a 12-acre habitat protection area that restricts visitors and dogs for the protection of native plant communities, geologic resources, and the bank swallow colony. There would be a seasonal closure (April 1 – August 15) on the beach at the base of the bluffs to limit disturbance near the active bank swallow colony and a section of trail at the north end of the site would be closed for the prevention of erosion. Dog walking under voice control would no longer be allowed under this alternative. Therefore, assuming compliance, alternative B would result in negligible impacts on the bank swallow because the bank swallow population and bluff habitat would be protected by eliminating access to the breeding sites in the bluff face, and direct disturbance to the colony by dogs would essentially be eliminated.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since the percentage of commercial dog walkers is considered high at Fort Funston, dogs walked by commercial dog walkers would cause the majority of the adverse impacts on the bank swallow from dogs at the site. Overall impacts on the bank swallow from dogs walked by both commercial and private individuals are presented above; these impacts would be negligible.

**Cumulative Impacts.** The negligible impacts on the bank swallow from dogs at Fort Funston under alternative B were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the habitat protection at the site, the SNRAMP, and from the *Lake Merced Watershed Plan* combined with the negligible impacts on the bank swallow from alternative B would result in beneficial cumulative impacts on the bank swallow.

**FORT FUNSTON ALTERNATIVE B CONCLUSION TABLE**

| <b>Bank Swallow Impacts</b>             | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--|---|-------------------------------|
| Negligible impacts, assuming compliance | The beach seasonal closure would be in place during nesting season and the population/habitat would be protected by eliminating access to the breeding sites in the bluff face | Beneficial, assuming compliance                     | Beneficial cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would allow on-leash dog walking on all trails north of the parking lot (except the Sunset Trail from the parking lot to the junction with the Chip Trail and the Funston Horse Trail, which would be closed to dogs), on the Funston Beach Trail South (sand ladder), and on Sunset Trail south of the main parking lot. Dog walking under voice and sight control would be allowed in a ROLA on the beach south of the Funston Beach Trail North and in another ROLA north of the main parking lot. No dogs would be allowed on the beach north of the Funston Beach Trail North, where the bank swallows nest in the bluff face. A seasonal closure for all visitors, extending 50 feet from the foot of the bluffs during the bank swallow nesting season (April 1 through August 15), would continue on the beach at the site. Assuming compliance, alternative C would result in no impact on the bank swallow because the bank swallow population and habitat would be protected by requiring on-leash dog walking on upland trails, and the ROLAs would be situated away from the breeding site. The bank swallow population and bluff habitat would be protected by eliminating access to the breeding sites in the bluff face, and direct disturbance to the colony by dogs would essentially be eliminated.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. In a ROLA, permit holders may have up to six dogs off leash and the permit may restrict use by time and area. Permits would be allowed at Fort Funston. Impacts on the bank swallow from commercial dog walkers would be similar to impacts from other dog walkers, as summarized in the preceding paragraph; therefore, there would be no impact from commercial dog walking.

**Cumulative Impacts.** The lack of impacts on the bank swallow from dogs at Fort Funston under alternative C was considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the habitat protection at the site, the SNRAMP, and from the *Lake Merced Watershed Plan* combined with the lack of impacts on the bank swallow from alternative C would result in beneficial cumulative impacts on the bank swallow.

FORT FUNSTON ALTERNATIVE C CONCLUSION TABLE

| Bank Swallow Impacts           | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--------------------------------|---|--|-------------------------------|
| No impact, assuming compliance | No dogs would be allowed north of the Funston Beach Trail North, where the bank swallows nest in the bluff face; the population/habitat would thus be protected by eliminating access to the breeding sites in the bluff face; the ROLA would be situated away from the breeding site | Beneficial, assuming compliance              | Beneficial cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Alternative D would allow on-leash dog walking on the Sunset Trail and other trails not closed to dogs in the upland area, and on the beach south of the Funston Beach Trail North; dog walking under voice and sight control would be allowed in a ROLA east of the Sunset Trail and west of the Funston Horse Trail, north of the drinking fountain. No dogs would be allowed on the beach north of the Funston Beach Trail North, where the bank swallow colony is located in the bluff face. A seasonal closure extending 50 feet from the foot of the bluffs during the bank swallow nesting season (April 1 through August 15) currently exists on the site. Assuming compliance, alternative D would result in no impact on the bank swallow because the bank swallow population and habitat at Fort Funston would be protected by requiring on-leash dog walking, restricting voice and sight control dog walking to an upland ROLA away from bank swallow habitat, and prohibiting dogs in the vicinity of the bluff area. The bank swallow population and habitat would be protected by eliminating dog and human access to the breeding sites in the bluff face, and direct disturbance to the colony by dogs would essentially be eliminated.

No commercial dog walking would be allowed and no permits to walk more than three dogs would be issued under alternative D; therefore, commercial and permitted dog walking would have no impact on the bank swallow.

**Cumulative Impacts.** The lack of impacts on the bank swallow from dogs at Fort Funston under alternative D was considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the habitat protection at the site, the SNRAMP, and from the *Lake Merced Watershed Plan* combined with the lack of impacts on the bank swallow from alternative D would result in beneficial cumulative impacts on the bank swallow.

FORT FUNSTON ALTERNATIVE D CONCLUSION TABLE

| Bank Swallow Impacts           | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--------------------------------|--|--|-------------------------------|
| No impact, assuming compliance | No dogs would be allowed north of Funston Beach Trail North, where the bank swallows nest in the bluff face, and dogs would be physically restrained on leash south of the Funston Beach Trail North; population/habitat would thus be protected by eliminating access to the breeding sites in the bluff face | Beneficial, assuming compliance              | Beneficial cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would allow on-leash dog walking on all trails outside of the upland ROLA except the Funston Horse Trail, which is closed to dogs, and the northern end of the Sunset Trail, which is closed to all visitors due to erosion. On-leash dog walking would be allowed on the beach north of the Funston Beach Trail North. Dog walking under voice and sight control would be allowed in two ROLAs. One would be on the beach, extending south from the Funston Beach Trail North to Fort Funston’s southern boundary. The second (“upland”) ROLA would be a corridor extending north from the new trail to be built along the north edge of the main parking lot to, and including, the Funston Beach Trail North. The ROLA corridor would extend into the disturbed area across from the Funston Beach Trail North, and would include the Chip Trail and sections of the Sunset Trail, Funston Road, and Battery Davis Trail, all north of the parking lot. The northern section of beach would be closed to visitors and dogs (April 1 through August 15), extending 50 feet from the foot of the northernmost bluffs for protection of the bank swallow colony. Assuming compliance, alternative E would result in negligible impacts on the bank swallow. The bank swallow population and habitat would be protected by the closure and by requiring on-leash dog walking. The ROLAs would be located away from the breeding site. The bank swallow population and habitat would be protected by eliminating dog and human access to the breeding sites in the bluff face, and direct disturbance to the colony by dogs would essentially be eliminated.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. In a ROLA, permit holders may have up to six dogs off leash and the permit may restrict use by time and area. Impacts on the bank swallow from permit holders with four to six dogs off leash would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is common at Fort Funston, impacts on the bank swallow would be expected from this user group. Impacts on the bank swallow from commercial dog walkers would be similar to impacts from other dog walkers, as summarized in the above paragraph; therefore, impacts from commercial dog walking would be negligible.

**Cumulative Impacts.** The negligible impacts on the bank swallow from dogs at Fort Funston under alternative E were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the habitat protection at the site, the SNRAMP, and from the *Lake Merced Watershed Plan* combined with the negligible impacts on the bank swallow from alternative E would result in beneficial cumulative impacts on the bank swallow.

**FORT FUNSTON ALTERNATIVE E CONCLUSION TABLE**

| Bank Swallow Impacts                    | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Negligible impacts, assuming compliance | On-leash dog walking would be allowed north of the Funston Beach Trail North, with a seasonal closure in place during nesting season; the population/habitat would be protected by eliminating access to the breeding sites in the bluff face; the ROLAs would be situated away from the breeding site | Beneficial, assuming compliance              | Beneficial cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative would allow on-leash dog walking on all the trails north of the main parking lot that are outside the ROLA corridor, except that no dogs would be

## Chapter 4: Environmental Consequences

allowed on the Funston Horse Trail or the north end of the Sunset Trail which is closed to all visitors due to erosion. On-leash dog walking would be allowed on the Funston Beach Trail South (sand ladder) and the Sunset Trail south of the main parking lot. Dog walking under voice and sight control would be allowed in two ROLAs. One would be on the beach, extending south from the Funston Beach Trail North to Fort Funston's southern boundary. The second ("upland") ROLA would be a corridor extending north from the new trail to be built along the north edge of the main parking lot to, and including, the Funston Beach Trail North. The ROLA corridor would extend into the disturbed area across from the Funston Beach Trail North, and would include the Chip Trail and sections of the Sunset Trail, Funston Road, and Battery Davis Trail, all north of the parking lot. No dogs would be allowed on the beach north of the Funston Beach Trail North, where the bank swallow nest in the bluff face. Although the northern beach would be closed to dog walking, a closure to all visitors would still be established on the beach during the bank swallow nesting season (April 1 through August 15), extending 50 feet from the foot of the northern bluffs. Assuming compliance, the preferred alternative would result in no impact on the bank swallow because the bank swallow population and habitat would be protected by requiring on-leash dog walking and the ROLAs would be situated away from the breeding site. The bank swallow population and habitat would be protected by eliminating dog and human access to the breeding sites in the bluff face, and direct disturbance to the colony by dogs would essentially be eliminated.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. In a ROLA, permit holders may have up to six dogs off leash and the permit may restrict use by time and area. Permits would be allowed at Fort Funston. Impacts on the bank swallow from commercial dog walkers would be similar to impacts from other dog walkers, as summarized in the preceding paragraph; therefore, there would be no impact on the bank swallow from commercial dog walking.

**Cumulative Impacts.** Projects and actions in and near Fort Funston were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the bank swallow at or in the vicinity of this site.

Fort Funston supports one of only a few remaining coastal breeding sites for the bank swallow in California; the closest other breeding site is at Año Nuevo State Reserve in Santa Cruz County, approximately 55 miles south of San Francisco and GGNRA. The bank swallow is protected at both Fort Funston in GGNRA and at Año Nuevo State Reserve. Park stewardship programs, which incorporate trail rehabilitation, including the Sunset Trail at GGNRA, may also provide a benefit to the bank swallows at Fort Funston through habitat protection for the species. Also, the San Francisco Public Utilities Commission is currently developing a *Lake Merced Watershed Plan* that seeks to provide a comprehensive set of strategies to sustain the health of the Lake Merced Watershed while also providing recreational and educational opportunities. Located immediately to the east of Fort Funston (across Skyline Boulevard), Lake Merced is the largest freshwater wetland between Point Reyes in Marin County and Pescadero Marsh in southern San Mateo County. The 509-acre lake is an emergency source of water for the City of San Francisco and is used for firefighting or sanitation purposes if no other sources of water are available. The resource management portion of the plan, which focuses on flora and fauna preservation as well as restoration and enhancement of the watershed's natural areas, habitat values, and ecological function, should benefit the bank swallow, which forages at Lake Merced. In addition, Lake Merced is a natural area managed under the SNRAMP. Project activities included in the SNRAMP will also protect this listed species and provide long-term beneficial impacts to the bank swallow.

The lack of impacts on the bank swallow from dogs at Fort Funston under the preferred alternative was considered together with the effects of the projects mentioned above. The beneficial effects from the habitat protection at the site, the SNRAMP, and from the *Lake Merced Watershed Plan* combined with

the lack of impacts on the bank swallow from the preferred alternative would result in beneficial cumulative impacts on the bank swallow.

**FORT FUNSTON PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| <b>Bank Swallow Impacts</b>    | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--------------------------------|--|---|-------------------------------|
| No impact, assuming compliance | No dogs would be allowed north of the Funston Beach Trail North, where the bank swallows nest in the bluff face; the population/habitat would thus be protected by eliminating access to the breeding sites in the bluff face; the ROLAs would be situated away from the breeding site | Beneficial, assuming compliance                     | Beneficial cumulative impacts |

### **IMPACTS TO NORTHERN SPOTTED OWL (FEDERALLY THREATENED) BY SITE AND ALTERNATIVE**

In the study area, northern spotted owls have been documented at Homestead Valley, Oakwood Valley, and the Marin Headlands (Coyote Creek Drainage).

#### **Homestead Valley**

**Alternative A: No Action.** Under current conditions, dogs are allowed under voice control throughout the site. Northern spotted owls have been documented at Homestead Valley, where the trails and roads traverse coastal scrub and grassland habitat used as foraging habitat by the northern spotted owl. This northern spotted owl habitat has been mapped adjacent to NPS designated trails in areas that connect with neighborhoods in the eastern part of the site, which is used by local residents walking their dogs. Therefore, well-defined trails (that have not been designated by NPS) exist that go directly through spotted owl habitat, and the NPS recently discovered northern spotted owls nesting within 20 feet of a trail at Homestead Valley. The presence of dogs and disturbance by dogs could indirectly impact the owl by temporarily affecting the abundance and/or distribution of the dusky-footed woodrat, the primary prey item for northern spotted owls (Lenth et al. 2008, 220). Northern spotted owls may also respond to barking dogs, as some dog barking can sound like the territorial calls of the northern spotted owl. However, a northern spotted owl vocalizing in response to a barking dog would not cause a perceptible or measurable risk to the owl. Northern spotted owl fledglings are often found on the ground near the nest after their first flight attempt. There have been a few cases reported of dogs discovering young northern spotted owls on the ground or alerting owners to the presence of owls on the ground. Though the likelihood of an occurrence is small, it is possible that young owls on the ground could be disturbed or injured by dogs if they are found on or near trails. Additionally, adult owls may be stressed or physically challenged when trying to protect fledglings on the ground in the presence of dogs.

Therefore, alternative A would result in continued negligible to long-term minor adverse impacts on the northern spotted owl because individual fledglings could occasionally be affected by dogs if found on a trail or immediately adjacent to a trail used by dogs. Impacts on the northern spotted owl would be considered perceptible changes in individuals of the species, but localized at the site and therefore minor because suitable owl habitat at this site is very limited.

## Chapter 4: Environmental Consequences

Under alternative A, no permit system exists for commercial dog walking. At Homestead Valley, commercial dog walking is uncommon; therefore, commercial dog walking would have negligible impacts on the northern spotted owl.

**Cumulative Impacts.** Projects and actions in and near Homestead Valley were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the northern spotted owl at or in the vicinity of this site.

The *Final Recovery Plan for the Northern Spotted Owl* was developed in 2008 by the USFWS that stated that competition from the barred owl poses a complex threat to the spotted owl (USFWS 2011a). Recently at GGNRA, there have been increased barred owl detections at the park. Barred owls present a much greater long-term threat to the northern spotted owl at GGNRA than dogs. The recovery plan recommends barred owl removal experiments to determine the best path to help the spotted owl recover (USFWS 2011a, Recovery Action 29). A plan/EIS was recently initiated that will propose experimental removals of the barred owl, which could provide a cumulative benefit to the northern spotted owl. In addition to the barred owl, recent monitoring at GGNRA has documented several pairs of great horned owls in the vicinity of Oakwood Valley and Alta Trail/Orchard Fire Road/Pacheco Fire Road area. Great horned owls can prey on northern spotted owls and often displace them from nesting sites. The presence of great horned owls in these areas reduces the chance that northern spotted owls would be present. Besides competition from other owls, corvids (ravens, crows, and jays) or other nest predators may depredate spotted owl nests, thus also having a long-term negative effect on the northern spotted owl (NPS 2005b). However, there are many plans, projects, and activities that consider northern spotted owls in their planning and implementation, thus minimizing impacts, particularly during breeding season. Such activities include the *Marin Headlands/Fort Baker Improvement and Transportation Management Plan/EIS*, park stewardship programs, implementation of the *Fire Management Plan* (NPS 2005b), Wildland/Urban Interface Initiative projects, and maintenance operations. Catastrophic wildfire and sudden oak death (caused by an introduced pathogen) could negatively affect the habitat of the northern spotted owl.

The negligible to long-term minor adverse impacts on the northern spotted owl from dogs at Homestead Valley under alternative A were considered together with the effects of the projects mentioned above. There would be a combination of adverse and beneficial effects on the northern spotted owl from actions in and around Homestead Valley; when combined, these effects would balance out, resulting in negligible impacts. These negligible impacts combined with the negligible to long-term minor adverse impacts from dogs under alternative A would result in negligible to long-term minor adverse cumulative impacts.

**HOMESTEAD VALLEY ALTERNATIVE A CONCLUSION TABLE**

| Northern Spotted Owl Impacts                  | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts                                       |
|---|---|--|--|
| Negligible to long-term minor adverse impacts | Young owls on the ground could be disturbed or injured by dogs if found on or near trails since all trails at the site would allow dogs under voice control; adult owls could be stressed or physically challenged when trying to protect fledglings on the ground in the presence of dogs, but suitable owl habitat at this site is very limited | N/A  | Negligible to long-term minor adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking on Homestead Fire Road and on neighborhood connector trails (Homestead Trail and Homestead Summit Trail) that would be designated in the future. Because dogs would be physically restrained on leash on all roads and trails at this site, it is unlikely that dogs would gain access to fledglings on the trails, assuming compliance. As a result, this alternative would provide protection for the northern spotted owl. The mere presence of dogs at the site could still affect the northern spotted owl (e.g., by disturbance from barking), but this effect cannot be quantified. Therefore, alternative B would result in negligible impacts on the owl because no measurable or perceptible changes in individuals of a species or suitable habitat would occur.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is not common in this area, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have negligible impacts on the northern spotted owl.

**Cumulative Impacts.** The negligible impacts on the northern spotted owl from dogs at Homestead Valley under alternative B were considered together with the effects of the projects mentioned above under alternative A. There would be a combination of adverse and beneficial effects on the northern spotted owl from actions in and around Homestead Valley; when combined, these effects would balance out, resulting in negligible impacts. These negligible impacts combined with the negligible impacts from dogs under alternative B would result in negligible cumulative impacts.

**HOMESTEAD VALLEY ALTERNATIVE B CONCLUSION TABLE**

| Northern Spotted Owl Impacts            | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Negligible impacts, assuming compliance | Dogs would be physically restrained on leash and it would be unlikely that dogs would gain access to fledglings on/along the trails/roads | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** This alternative would have the same dog walking restrictions as alternative B, and impacts on the northern spotted owl would be the same, assuming compliance: negligible.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. However, Homestead Valley is not one of the sites where permits would be issued to walk more than three dogs. Since commercial dog walking is not common in this area, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on the northern spotted owl.

**Cumulative Impacts.** Under alternative C, the cumulative impacts on the northern spotted owl at Homestead Valley would be the same as those under alternative B: negligible.

**Chapter 4: Environmental Consequences**

**HOMESTEAD VALLEY ALTERNATIVE C CONCLUSION TABLE**

| <b>Northern Spotted Owl Impacts</b>     | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|---|---|-------------------------------|
| Negligible impacts, assuming compliance | Dogs would be physically restrained on leash and it would be unlikely that dogs would gain access to fledglings on/along the trails/roads | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Alternative D would allow on-leash dog walking on the Homestead Fire Road only. Although dogs would not be allowed on the neighborhood connector trails, the impacts would be the same as described above for alternative B, assuming compliance: negligible.

No commercial dog walking or permits to walk more than three dogs by private or commercial dog walkers would be allowed under alternative D; therefore, commercial and permitted dog walking would have no impact on the northern spotted owl.

**Cumulative Impacts.** The negligible impacts on the northern spotted owl from dogs at Homestead Valley under alternative D were considered together with the effects of the projects mentioned above under alternative A. There would be a combination of adverse and beneficial effects on the northern spotted owl from actions in and around Homestead Valley; when combined, these effects would balance out, resulting in negligible impacts. These negligible impacts combined with the negligible impacts from dogs under alternative D would result in negligible cumulative impacts.

**HOMESTEAD VALLEY ALTERNATIVE D CONCLUSION TABLE**

| <b>Northern Spotted Owl Impacts</b>     | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|---|---|-------------------------------|
| Negligible impacts, assuming compliance | Dogs would be physically restrained on leash and it would be unlikely that dogs would gain access to fledglings on/along the trails/roads | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** This alternative would have the same dog walking restrictions as alternative B, and impacts on the northern spotted owl would be the same, assuming compliance: negligible.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. However, Homestead Valley is not one of the sites where permits would be issued to walk more than three dogs. Since commercial dog walking is not common in this area, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on the northern spotted owl.

**Cumulative Impacts.** Under alternative E, the cumulative impacts on the northern spotted owl at Homestead Valley would be the same as those under alternative B: negligible.

**HOMESTEAD VALLEY ALTERNATIVE E CONCLUSION TABLE**

| <b>Northern Spotted Owl Impacts</b>     | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|---|---|-------------------------------|
| Negligible impacts, assuming compliance | Dogs would be physically restrained on leash and it would be unlikely that dogs would gain access to fledglings on/along the trails/roads | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative B, allowing on-leash dog walking on Homestead Fire Road and on neighborhood connector trails (Homestead Trail and Homestead Summit Trail) that would be designated in the future. Because dogs would be physically restrained on leash on all roads and trails at this site, it is unlikely that dogs would gain access to fledglings on the trail, assuming compliance. As a result, this alternative would provide protection for the northern spotted owl. However, the mere presence of dogs at the site could still affect the northern spotted owl (e.g., by disturbance from barking), but this affect cannot be quantified. Therefore, the preferred alternative would result in negligible impacts on the owl because no measurable or perceptible changes in individuals of a species or suitable habitat would occur.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. However, Homestead Valley is not one of the sites where permits would be issued to walk more than three dogs. Since commercial dog walking is not common in this area, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have negligible impacts on the northern spotted owl.

**Cumulative Impacts.** Projects and actions in and near Homestead Valley were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the northern spotted owl at or in the vicinity of this site.

The *Final Recovery Plan for the Northern Spotted Owl* was developed in 2008 by the USFWS that stated that competition from the barred owl poses a complex threat to the spotted owl (USFWS 2011a). Recently at GGNRA, there have been increased barred owl detections at the park. Barred owls present a much greater long-term threat to the northern spotted owl at GGNRA than dogs. The recovery plan recommends barred owl removal experiments to determine the best path to help the spotted owl recover (USFWS 2011a, Recovery Action 29). A plan/EIS was recently initiated that will propose experimental removals of the barred owl, which could provide a cumulative benefit to the northern spotted owl. In addition to the barred owl, recent monitoring at GGNRA has documented several pairs of great horned owls in the vicinity of Oakwood Valley and Alta Trail/Orchard Fire Road/Pacheco Fire Road area. Great horned owls can prey on northern spotted owls and often displace them from nesting sites. The presence of great horned owls in these areas reduces the chance that northern spotted owls would be present. Besides competition from other owls, corvids (ravens, crows, and jays) or other nest predators may depredate spotted owl nests, thus also having a long-term negative effect on the northern spotted owl (NPS 2005b). However, there are many plans, projects, and activities that consider northern spotted owls in their planning and implementation, thus minimizing impacts, particularly during breeding season. Such activities include the *Marin Headlands/Fort Baker Improvement and Transportation Management Plan/EIS*, park stewardship programs, implementation of the *Fire Management Plan* (NPS 2005b), Wildland/Urban Interface Initiative projects, and maintenance operations. Catastrophic wildfire and

## Chapter 4: Environmental Consequences

sudden oak death (caused by an introduced pathogen) could negatively affect the habitat of the northern spotted owl.

The negligible impacts on the northern spotted owl from dogs at Homestead Valley under the preferred alternative were considered together with the effects of the projects mentioned above. There would be a combination of adverse and beneficial effects on the northern spotted owl from actions in and around Homestead Valley; when combined, these would balance out, resulting in negligible impacts. These negligible impacts combined with the negligible impacts from dogs under the preferred alternative would result in negligible cumulative impacts.

**HOMESTEAD VALLEY PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| Northern Spotted Owl Impacts            | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Negligible impacts, assuming compliance | Dogs would be physically restrained on leash and it would be unlikely that dogs would gain access to fledglings on/along the trails/roads | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

### Oakwood Valley

**Alternative A: No Action.** Under current conditions, dogs are allowed on leash or under voice control on Oakwood Valley Fire Road and Oakwood Valley Trail from the junction with the fire road to the junction with Alta Trail. On-leash dog walking is allowed on Oakwood Valley Trail from the trailhead to the junction with Oakwood Valley Fire Road. Northern spotted owls have been documented at Oakwood Valley, and portions of the trails and roads are suitable habitat for the owl, especially in the south along Oakwood Valley Trail. Oakwood Valley has a moderate level of use by dog walkers (table 9). The presence of dogs and disturbance by dogs could indirectly impact the owl by temporarily affecting the abundance and/or distribution of the dusky-footed woodrat, the primary prey item for northern spotted owls (Lenth et al. 2008). Northern spotted owls may also respond to barking dogs, as some dog barking can sound like the territorial calls of the northern spotted owl calls, but a northern spotted owl vocalizing in response to a barking dog would not cause a perceptible or measurable risk to the owl.

Therefore, alternative A would result in continued negligible to long-term minor adverse impacts on the northern spotted owl because suitable owl habitat could be limited as a result of dog presence, and young or adult owls on the ground could be occasionally disturbed or injured by dogs if found on or near trails since some trails at the site would allow dogs under voice control.

Under alternative A, no permit system exists for commercial dog walking. At Oakwood Valley, commercial dog walking is uncommon. Therefore, commercial dog walking would have negligible impacts on the northern spotted owl.

**Cumulative Impacts.** Projects and actions in and near Oakwood Valley were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the northern spotted owl at or in the vicinity of this site.

The *Final Recovery Plan for the Northern Spotted Owl* was developed in 2008 by the USFWS that stated that competition from the barred owl poses a complex threat to the spotted owl (USFWS 2011a). Recently at GGNRA, there have been increased barred owl detections at the park. Barred owls present a much

greater long-term threat to the northern spotted owl at GGNRA than dogs. The recovery plan recommends barred owl removal experiments to determine the best path to help the spotted owl recover (USFWS 2011a, Recovery Action 29). A plan/EIS was recently initiated that will propose experimental removals of the barred owl, which could provide a cumulative benefit to the northern spotted owl. In addition to the barred owl, recent monitoring at GGNRA has documented several pairs of great horned owls in the vicinity of Oakwood Valley and Alta Trail/Orchard Fire Road/Pacheco Fire Road. Great horned owls can prey on northern spotted owls and often displace them from nesting sites. The presence of great horned owls in these areas reduces the chance that northern spotted owls would be present. Besides competition from other owls, corvids (ravens, crows, and jays) or other nest predators may depredate spotted owl nests, thus also having a long-term negative effect on the northern spotted owl (NPS 2005b). However, there are many plans, projects, and activities that consider northern spotted owls in their planning and implementation, thus minimizing impacts, particularly during breeding season. Such activities include the *Marin Headlands/Fort Baker Improvement and Transportation Management Plan/EIS*, park stewardship programs, implementation of the *Fire Management Plan* (NPS 2005b), Wildland/Urban Interface Initiative projects, and maintenance operations. Catastrophic wildfire and sudden oak death (caused by an introduced pathogen) could negatively affect the habitat of the northern spotted owl.

The negligible to long-term minor adverse impacts on the northern spotted owl from dogs at Oakwood Valley under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects on the northern spotted owl from actions in and around Oakwood Valley should reduce some of the adverse impacts from alternative A. Therefore cumulative impacts would be negligible.

**OAKWOOD VALLEY ALTERNATIVE A CONCLUSION TABLE**

| Northern Spotted Owl Impacts                  | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Negligible to long-term minor adverse impacts | Portions of the trails/roads that would allow dogs under voice control would be in suitable habitat for the owl | N/A  | Negligible cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking on the Oakwood Valley Fire Road and on the Oakwood Valley Trail from the trailhead to the junction with the fire road. Dogs would be physically restrained on leash on all roads and trails at this site, and it is unlikely that dogs would gain access to fledglings on the trail or disturb or harm adults should northern spotted owls establish a territory or nest in the vicinity of the trails considered in this alternative. Therefore, assuming compliance, alternative B would result in negligible impacts on the owl. This alternative would provide protection for the northern spotted owl at this site, but no measurable or perceptible changes to individuals of a species or suitable habitat would occur.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is not common at Oakwood Valley, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have negligible impacts on the northern spotted owl.

**Cumulative Impacts.** The negligible impacts on the northern spotted owl from dogs at Oakwood Valley under alternative B were considered together with the effects of the projects mentioned above under alternative A. There would be a combination of adverse and beneficial effects on the northern spotted owl from actions in and around Oakwood Valley; when combined, these effects would balance out, resulting

## Chapter 4: Environmental Consequences

in negligible impacts. These negligible impacts combined with the negligible impacts from dogs under alternative B would result in negligible cumulative impacts.

**OAKWOOD VALLEY ALTERNATIVE B CONCLUSION TABLE**

| Northern Spotted Owl Impacts            | Rationale                                    | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Negligible impacts, assuming compliance | Dogs would be physically restrained on leash | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would establish a ROLA on the Oakwood Valley Fire Road to the junction with Oakwood Valley Trail. Double gates would be located at both ends, with continuous fencing to protect sensitive habitat. Oakwood Valley Trail would allow on-leash dog walking from the junction with Oakwood Valley Fire Road to the junction with Alta Trail. Assuming compliance, alternative C would result in negligible impacts on the owl. This alternative would provide protection for the northern spotted owl through continuous fencing at the ROLA and on-leash dog walking in other areas, but no measurable or perceptible changes in individuals of a species or suitable habitat would occur.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. However, Oakwood Valley is not one of the sites where permits would be issued to walk more than three dogs. Since commercial dog walking is not common at Oakwood Valley, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on the northern spotted owl.

**Cumulative Impacts.** The negligible impacts on the northern spotted owl from dogs at Oakwood Valley under alternative C were considered together with the effects of the projects mentioned above under alternative A. There would be a combination of adverse and beneficial effects on the northern spotted owl from actions in and around Oakwood Valley; when combined, these effects would balance out, resulting in negligible impacts. These negligible impacts combined with the negligible impacts from dogs under alternative C would result in negligible cumulative impacts.

**OAKWOOD VALLEY ALTERNATIVE C CONCLUSION TABLE**

| Northern Spotted Owl Impacts            | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Negligible impacts, assuming compliance | Dogs would be physically restrained on leash or in a continuously fenced ROLA | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Alternative D would have the same restrictions as alternative B, allowing on-leash dog walking only on the Oakwood Valley Fire Road and the Oakwood Valley Trail from the trailhead to the junction with the fire road. Dogs would not be allowed on the Oakwood Valley Trail above the junction of the trail and fire road. Dogs would be physically restrained on leash or prohibited on all roads and trails at this site, and it is unlikely that dogs would gain access to fledglings on the trail or disturb or harm adults should northern spotted owls establish a territory or nest in the vicinity of the road considered in this alternative. Therefore, alternative D would result in negligible impacts on the owl. This alternative would provide protection for the northern spotted owl, but no measurable or perceptible changes in individuals of a species or suitable habitat would occur.

No commercial dog walking would be allowed and no permits to walk more than three dogs would be issued under alternative D; therefore, commercial and permitted dog walking would have no impact on the northern spotted owl.

**Cumulative Impacts.** Under alternative D, the cumulative impacts on the northern spotted owl at Oakwood Valley would be the same as those under alternative B: negligible.

**OAKWOOD VALLEY ALTERNATIVE D CONCLUSION TABLE**

| Northern Spotted Owl Impacts            | Rationale                                    | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Negligible impacts, assuming compliance | Dogs would be physically restrained on leash | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would establish a ROLA on the Oakwood Valley Fire Road to the junction with Oakwood Valley Trail. Double gates would be located at both ends, with noncontinuous fencing where needed to protect sensitive habitat. Oakwood Valley Trail would allow on-leash dog walking from the junction with Oakwood Valley Fire Road to a new gate at Alta Trail. Impacts under this alternative would be the same as those under alternative C, assuming compliance: negligible.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. However, Oakwood Valley is not one of the sites where permits would be issued to walk more than three dogs. Since commercial dog walking is not common in this area, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on the northern spotted owl.

**Cumulative Impacts.** Under alternative E, the cumulative impacts on the northern spotted owl at Oakwood Valley would be the same as those under alternative C: negligible.

**OAKWOOD VALLEY ALTERNATIVE E CONCLUSION TABLE**

| Northern Spotted Owl Impacts            | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Negligible impacts, assuming compliance | Dogs would be physically restrained on leash or in a noncontinuously fenced ROLA | Beneficial to no change, assuming compliance | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative would allow on-leash dog walking on the Oakwood Valley Fire Road and on the Oakwood Valley Trail from the junction with the fire road to the junction with the Alta Trail. Assuming compliance, the preferred alternative would result in negligible impacts on the owl. This alternative would provide protection for the northern spotted owl through on-leash dog walking, but no measurable or perceptible changes to individuals of a species or suitable habitat would occur.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. However, Oakwood Valley is not one of the sites where permits would be issued to walk more than three dogs. Since commercial dog walking is not common at Oakwood Valley, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have negligible impacts on the northern spotted owl.

## Chapter 4: Environmental Consequences

**Cumulative Impacts.** Projects and actions in and near Oakwood Valley were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the northern spotted owl at or in the vicinity of this site.

The *Final Recovery Plan for the Northern Spotted Owl* was developed in 2008 by the USFWS that stated that competition from the barred owl poses a complex threat to the spotted owl (USFWS 2011a). Recently, there have been increased barred owl detections at GGNRA. Barred owls present a much greater long-term threat to the northern spotted owl at GGNRA than dogs. The recovery plan recommends barred owl removal experiments to determine the best path to help the spotted owl recover (USFWS 2011a, Recovery Action 29). A plan/EIS was recently initiated that will propose experimental removals of the barred owl, which could provide a cumulative benefit to the northern spotted owl. In addition to the barred owl, recent monitoring at GGNRA has documented several pairs of great horned owls in the vicinity of the Oakwood Valley and Alta Trail/Orchard Fire Road/Pacheco Fire Road. Great horned owls can prey on northern spotted owls and often displace them from nesting sites. The presence of great horned owls in these areas reduces the chance that northern spotted owls would be present. Besides competition from other owls, corvids (ravens, crows, and jays) or other nest predators may depredate spotted owl nests, thus also having a long-term negative effect on the northern spotted owl (NPS 2005b). However, there are many plans, projects, and activities that consider northern spotted owls in their planning and implementation, thus minimizing impacts, particularly during breeding season. Such activities include the *Marin Headlands/Fort Baker Improvement and Transportation Management Plan/EIS*, park stewardship programs, implementation of the *Fire Management Plan* (NPS 2005b), Wildland/Urban Interface Initiative projects, and maintenance operations. Catastrophic wildfire and sudden oak death (caused by an introduced pathogen) could negatively affect the habitat of the northern spotted owl.

The negligible impacts on the northern spotted owl from dogs at Oakwood Valley under the preferred alternative were considered together with the effects of the projects mentioned above. There would be a combination of adverse and beneficial effects on the northern spotted owl from actions in and around Oakwood Valley; when combined, these effects would balance out, resulting in negligible impacts. These negligible impacts combined with the negligible impacts from dogs under the preferred alternative would result in negligible cumulative impacts.

**OAKWOOD VALLEY PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| <b>Northern Spotted Owl Impacts</b>     | <b>Rationale</b>                             | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--|---|-------------------------------|
| Negligible impacts, assuming compliance | Dogs would be physically restrained on leash | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

### Marin Headlands Trails

**Alternative A: No Action.** Under current conditions, on-leash dog walking is allowed along portions of the Coastal Trail (Hill 88 to Muir Beach), the Batteries Loop Trail, North Miwok Trail, County View Trail, and Marin Drive. Dog walking under voice control (or on leash) is allowed along other portions of the Coastal Trail (Golden Gate Bridge to Hill 88, including the Lagoon Loop Trail); the Coastal, Wolf Ridge, and Miwok Trail Loop; and the Old Bunker Fire Road Loop (includes a section of the Coastal Trail). Northern spotted owls have been documented at the Marin Headlands, and portions of the trails and roads are suitable habitat for the owl, especially in the north in the Coyote Creek Drainage. These trails experience low to moderate use by dog walkers. Dog-related incidents are high at this site with a total of 269 from 2008 through 2011. The majority of incidents were for having dogs within areas closed

to pets (table 16). The presence of dogs and disturbance by dogs could indirectly impact the owl by temporarily affecting the abundance and/or distribution of the dusky-footed woodrat, the primary prey item for northern spotted owls (Lenth et al. 2008). Northern spotted owls may respond to barking dogs because some dog barking can sound like the territorial calls of the northern spotted owl calls, but a northern spotted owl vocalizing in response to a barking dog would not cause a perceptible or measurable risk to the owl.

Therefore, alternative A would result in continued negligible to long-term minor adverse impacts on the northern spotted owl because suitable owl habitat could be limited as a result of dog presence, and young or adult owls on the ground could be occasionally disturbed or injured by dogs if found on or near trails since some trails at the site would allow dogs under voice control.

Under alternative A, no permit system exists for dog walking. At the Marin Headlands Trails, commercial dog walking is uncommon; therefore, commercial dog walking would have negligible impacts on vegetation.

**Cumulative Impacts.** Projects and actions in and near Marin Headlands Trails were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the northern spotted owl at or in the vicinity of this site.

As stated for Oakwood Valley, the barred owl poses a complex threat to the spotted owl (USFWS 2011a). Recently at GGNRA, there have been increased barred owl detections at the park. Barred owls present a much greater long-term threat to the northern spotted owl at GGNRA than dogs. A plan/EIS was recently initiated that will propose experimental removals of the barred owl, which could provide a cumulative benefit to the northern spotted owl. In addition to the barred owl, recent monitoring at GGNRA has documented several pairs of great horned owls in the vicinity of the Marin Headlands. The presence of great horned owls in these areas reduces the chance that northern spotted owls would be present. Besides competition from other owls, corvids (ravens, crows, and jays) or other nest predators may depredate spotted owl nests, thus having a long-term negative effect on the northern spotted owl (NPS 2005b). However, many plans, projects, and activities consider northern spotted owls in planning and implementation, thus minimizing impacts, particularly during breeding season. Such activities include the *Marin Headlands/Fort Baker Improvement and Transportation Management Plan/EIS*, park stewardship programs, implementation of the *Fire Management Plan* (NPS 2005b), Wildland/Urban Interface Initiative projects, and maintenance operations. Catastrophic wildfire and sudden oak death (caused by an introduced pathogen) could negatively affect the habitat of the northern spotted owl.

The negligible to long-term minor adverse impacts on the northern spotted owl from dogs at Marin Headlands Trails under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects on the northern spotted owl from actions in and around the Marin Headlands should reduce some of the adverse impacts from alternative A. Therefore cumulative impacts would be negligible.

#### MARIN HEADLANDS TRAILS ALTERNATIVE A CONCLUSION TABLE

| Northern Spotted Owl Impacts                  | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Negligible to long-term minor adverse impacts | Portions of the trails/roads that would allow dogs under voice control would be in suitable habitat for the owl | N/A  | Negligible cumulative impacts |

N/A = not applicable.

## Chapter 4: Environmental Consequences

**Alternative B: NPS Leash Regulation.** Alternative B would prohibit dogs on the trails at the Marin Headlands Trails. Therefore, assuming compliance, no impact on the northern spotted owl from dogs at the Marin Headlands would occur.

Since no dog walking would be permitted under alternative B at the Marin Headlands, commercial dog walking under alternative B would have no impacts on the northern spotted owl.

**Cumulative Impacts.** The lack of impacts on the northern spotted owl from dogs at the Marin Headlands Trails under alternative B was considered together with the effects of the projects mentioned above under alternative A. There would be a combination of adverse and beneficial effects on the northern spotted owl from actions in and around the Marin Headlands; when combined, these effects would balance out, resulting in negligible impacts. These negligible impacts combined with the lack of impacts from dogs under alternative B would result in negligible cumulative impacts.

**MARIN HEADLANDS TRAILS ALTERNATIVE B CONCLUSION TABLE**

| <b>Northern Spotted Owl Impacts</b> | <b>Rationale</b>                     | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|-------------------------------------|--------------------------------------|---|-------------------------------|
| No impact, assuming compliance      | Dogs would be prohibited at the site | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would allow on-leash dog walking along the Lower Rodeo Valley Trail Corridor. This corridor extends from the Rodeo Beach parking lot to the intersection of Bunker and McCullough roads via the North Lagoon Loop Trail, a section of the Miwok Trail, and the Rodeo Valley Trail, and includes the connector trail from the Rodeo Valley Trail to the Smith Road Trailhead. On-leash dog walking would be allowed on the Old Bunker Fire Road Loop (which includes a section of the Coastal Trail), and the Batteries Loop Trail. This alternative would allow dog access only on these perimeter trails in the Marin Headlands Trails, while preserving and maintaining the integrity of interior habitat.

Dogs would be physically restrained on leash on all roads and trails at this site, and it is unlikely that dogs would gain access to fledglings on the trail or disturb or harm adults should northern spotted owls establish a territory or nest in the vicinity of the trails considered in this alternative. Therefore, assuming compliance, alternative C would result in negligible impacts on the owl. This alternative would provide protection for the northern spotted owl at this site, but no measurable or perceptible changes to individuals of a species or suitable habitat would occur.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. However, Marin Headlands Trails is not one of the sites where permits would be issued to walk more than three dogs. Since commercial dog walking is not common at the Marin Headlands, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on the northern spotted owl.

**Cumulative Impacts.** The negligible impacts on the northern spotted owl from dogs at Marin Headlands Trails under alternative C were considered together with the effects of the projects mentioned under alternative A. There would be a combination of adverse and beneficial effects on the northern spotted owl from actions in and around the Marin Headlands; when combined, these effects would balance out, resulting in negligible impacts. These negligible impacts combined with the negligible impacts from dogs under alternative C would result in negligible cumulative impacts.

**MARIN HEADLANDS TRAILS ALTERNATIVE C CONCLUSION TABLE**

| <b>Northern Spotted Owl Impacts</b>     | <b>Rationale</b>                             | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--|---|-------------------------------|
| Negligible impacts, assuming compliance | Dogs would be physically restrained on leash | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Alternative D would have the same dog walking restrictions as alternative B (dogs would be prohibited at the site); therefore alternative D would result in no impacts on the northern spotted owl, assuming compliance.

No commercial dog walking would be allowed under alternative D; therefore, commercial dog walking would have no impact on the northern spotted owl.

**Cumulative Impacts.** Under alternative D, the cumulative impacts on the northern spotted owl at the Marin Headlands Trails would be the same as those under alternative B: negligible.

**MARIN HEADLANDS TRAILS ALTERNATIVE D CONCLUSION TABLE**

| <b>Northern Spotted Owl Impacts</b> | <b>Rationale</b>                     | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|-------------------------------------|--------------------------------------|---|-------------------------------|
| No impact, assuming compliance      | Dogs would be prohibited at the site | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would allow on-leash dog walking on the Conzelman Coastal Trail from Highway 101 to the McCullough intersection, and from there to the Coastal Trail Bike Route, including Julian Road, to Rodeo Beach parking lot. On-leash dog walking would be allowed on the Old Bunker Fireroad Loop (which includes a section of the Coastal Trail), Batteries Loop Trail, North Miwok Trail from Tennessee Valley to Highway 1, County View Trail, Marin Drive, Rodeo Avenue Trail, and Morning Sun Trail. This alternative would allow dog access only on these perimeter trails in the Marin Headlands, while preserving and maintaining the integrity of interior habitat. Impacts under this alternative would be the same as those under alternative C, assuming compliance: negligible.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. However, the Marin Headlands is not one of the sites where permits would be issued to walk more than three dogs. Since commercial dog walking is not common in this area, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on the northern spotted owl.

**Cumulative Impacts.** Under alternative E, the cumulative impacts on the northern spotted owl at the Marin Headlands Trails would be the same as those under alternative C: negligible.

**MARIN HEADLANDS TRAILS ALTERNATIVE E CONCLUSION TABLE**

| <b>Northern Spotted Owl Impacts</b>     | <b>Rationale</b>                             | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--|---|-------------------------------|
| Negligible impacts, assuming compliance | Dogs would be physically restrained on leash | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

## Chapter 4: Environmental Consequences

**Alternative F: Preferred Alternative.** The preferred alternative would allow on-leash dog walking along the Lower Rodeo Valley Trail Corridor, extending from the Rodeo Beach parking lot to the intersection of Bunker and McCullough roads via the Lagoon Loop Trail, a section of the Miwok Trail, the Rodeo Valley Trail. The corridor includes the connector trail from Rodeo Valley Trail to the Smith Road trailhead. On-leash dog walking would also be available on the Old Bunker Fire Road Loop (including a section of the Coastal Trail), Batteries Loop Trail, Rodeo Avenue Trail, and Morning Sun Trail. This alternative would allow dog access only on these perimeter trails in the Marin Headlands, while preserving and maintaining the integrity of interior habitat.

Assuming compliance, the preferred alternative would result in negligible impacts on the owl. This alternative would provide protection for the northern spotted owl through on-leash dog walking, but there would be no measurable or perceptible changes to individuals of a species or suitable habitat.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. However, the Marin Headlands is not one of the sites where permits would be issued to walk more than three dogs. Since commercial dog walking is not common at the Marin Headlands, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have negligible impacts on the northern spotted owl.

**Cumulative Impacts.** Projects and actions in and near Marin Headlands Trails were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the northern spotted owl at or in the vicinity of this site.

As stated previously for Oakwood Valley, the barred owl poses a complex threat to the spotted owl (USFWS 2011a). Recently at GGNRA there have been increased barred owl detections at the park. Barred owls present a much greater long-term threat to the northern spotted owl at GGNRA than dogs. A plan/EIS was recently initiated that will propose experimental removals of the barred owl, which could provide a cumulative benefit to the northern spotted owl. In addition to the barred owl, recent monitoring at GGNRA has documented several pairs of great horned owls in the vicinity of the Marin Headlands. The presence of great horned owls in these areas reduces the chance that northern spotted owls would be present. Besides competition from other owls, corvids (ravens, crows, and jays) or other nest predators may depredate spotted owl nests, thus also having a long-term negative effect on the northern spotted owl (NPS 2005b). However, there are many plans, projects, and activities that consider northern spotted owls in their planning and implementation, thus minimizing impacts, particularly during breeding season. Such activities include the *Marin Headlands/Fort Baker Improvement and Transportation Management Plan/EIS*, park stewardship programs, implementation of the *Fire Management Plan* (NPS 2005b), Wildland/Urban Interface Initiative projects, and maintenance operations. Catastrophic wildfire and sudden oak death (caused by an introduced pathogen) could negatively affect the habitat of the northern spotted owl.

The negligible impacts on the northern spotted owl from dogs at Marin Headlands Trails under the preferred alternative were considered together with the effects of the projects mentioned above. There would be a combination of adverse and beneficial effects on the northern spotted owl from actions in and around the Marin Headlands; when combined, these effects would balance out, resulting in negligible impacts. These negligible impacts combined with the negligible impacts from dogs under the preferred alternative would result in negligible cumulative impacts.

**MARIN HEADLANDS TRAILS PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| <b>Northern Spotted Owl Impacts</b>     | <b>Rationale</b>                             | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--|---|-------------------------------|
| Negligible impacts, assuming compliance | Dogs would be physically restrained on leash | Beneficial to no change, assuming compliance        | Negligible cumulative impacts |

**IMPACTS TO GUADALUPE FUR SEAL (FEDERALLY AND STATE THREATENED)**

This species is an occasional vagrant of offshore marine habitat and could be found hauled out or stranded, if injured or sick, along the coastal portions of GGNRA. However, this species is unlikely to be affected by dog management. In 9 years of collected data by the Marine Mammal Center (2000 through 2005 and 2007 through 2009), there was only one recorded stranding of a Guadalupe fur seal at GGNRA (Stinson Beach) (MMC 2010). Therefore, a detailed impact analysis of this species is not necessary for this project, but a general discussion of impacts on hauled-out or stranded pinnipeds is included in the “Wildlife” section of chapter 4 for each applicable site at GGNRA.

**IMPACTS TO STELLER SEA LION (FEDERALLY THREATENED)**

There is a historical sea lion haul-out location at Seal Rock in San Francisco, and this species is an occasional vagrant of offshore marine habitat. Steller sea lions could be found hauled out or stranded, if injured or sick, along the coastal portions of GGNRA. However, this species is unlikely to be affected by dog management and in 9 years of collected data by the Marine Mammal Center (2000 through 2005 and 2007 through 2009), there were no recorded strandings of Steller sea lions at GGNRA (MMC 2010). Therefore, a detailed impact analysis of this species is not necessary for this project, but a general discussion of impacts on hauled-out or stranded pinnipeds is included in the “Wildlife” section of chapter 4 for each applicable site at GGNRA.

**FEDERALLY AND STATE-LISTED PLANT SPECIES**

At GGNRA, the management of vegetation is primarily focused on research, monitoring, and actively restoring habitat for threatened, endangered, and unique plant species. Restoration efforts at GGNRA have included decompacting soils, removing non-native plant species, and planting listed and unique plant species to expand on existing (or historical) populations. For new and/or pending properties recently acquired by the park (Cattle Hill and Pedro Point Headlands), inventorying of listed and unique plant species is has not been completed because the properties are not yet managed by the NPS. Therefore, suitable habitat only is identified at these sites because site-specific information concerning listed plant species at these locations is not yet available. Once the properties transfer to the NPS, site-specific surveys would be planned. Federally and state-listed plant species are discussed in the following sections when the listed plant species occurs at or potential habitat is provided at specific GGNRA sites in areas that allow dogs. Although habitats at GGNRA support many species with special status, only those species potentially affected by this draft plan/SEIS are discussed in this section.

**IMPACTS TO MARSH SANDWORT (FEDERALLY ENDANGERED) BY SITE AND ALTERNATIVE**

This plant species inhabits wetland and riparian areas. In December 2011, two new populations of marsh sandwort were established in the Marin Headlands, including at a site near the Rodeo Beach overflow parking lot, and along the Miwok Trail in Rodeo Valley. Monitoring of these species has indicated that more than half of the established individuals are still surviving at these sites (Acierto et al. 2012).

### Marin Headlands

**Alternative A: No Action.** Currently, dog walking on leash and under voice control is allowed on the Coastal Trail from Golden Gate Bridge to Hill 88 (including the Lagoon Loop Trail), on the Coastal Trail, Wolf Ridge, and Miwok Trail Loop, and on the Old Bunker Fire Road Loop. On-leash dog walking is allowed on the Coastal Trail from Hill 88 to Muir Beach, and the Batteries Loop Trail.

Marin Headlands experiences low to moderate visitation from dog walkers. Dog-related incidents are high at this site. There was a total of 269 dog-related incidents from 2008 through 2011, with the majority of incidents for having dogs within areas closed to pets (table 16). Along these trails, physical disturbance and nutrient addition are currently happening along the trails and fire roads and in off-trail areas throughout the site due to unleashed dogs. Under alternative A, dogs could impact the two populations of the marsh sandwort and potential habitat through trampling, digging, or dog waste while traversing the site off leash. Because the populations of the marsh sandwort are located in proximity to trails and other areas where dogs are frequently walked off leash, this alternative would result in long-term moderate adverse impacts on suitable habitat for marsh sandwort at Marin Headlands. Because few individuals of the species currently exist at the site, it is possible that impacts could affect the reproductive success of individuals of the species; therefore, impacts would be moderate.

Under alternative A, no permit system exists for commercial dog walking. Currently, commercial dog walking use is low to moderate at Marin Headlands; therefore, commercial dog walking would have negligible impacts on marsh sandwort.

**Cumulative Impacts.** Several projects and actions in and near the trails of the Marin Headlands were considered in the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils. Such projects would likely restore and protect potential habitat for the marsh sandwort. Additionally, ongoing parkwide restoration and enhancement efforts, such as GGNRA natural resource stewardship programs and the *Marin Countywide Plan* (County of Marin 2007), can beneficially affect habitat at GGNRA park sites such as the Marin Headlands Trails. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance. Habitat restoration and the implementation of projects funded by the Wildland/Urban Interface Initiative on private lands could also impact the Marin Headlands Trails.

The long-term moderate adverse impacts on the marsh sandwort and potential habitat from dogs at the Marin Headlands Trails under alternative A were considered together with the effects of the actions mentioned above. The benefits to potential habitat from park stewardship programs and other restoration projects in the area of this site would not be expected to reduce the adverse impacts of this alternative; therefore, the cumulative analysis for this park site will focus on the results of the impact analysis for this alternative. The beneficial effects from park stewardship programs and other restoration projects combined with the long-term moderate adverse impacts from alternative A would result in long-term minor adverse cumulative impacts on the marsh sandwort.

**MARIN HEADLANDS TRAILS ALTERNATIVE A CONCLUSION TABLE**

| <b>Marsh Sandwort Impacts</b>      | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>                    |
|------------------------------------|---|---|--|
| Long-term moderate adverse impacts | Off-leash dogs could affect populations of the marsh sandwort, as well as suitable habitat through digging, trampling, and dog waste; known populations are in proximity to trail and parking areas | N/A   | Long-term, minor, adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Under alternative B, no dogs would be allowed at the Marin Headlands, which would eliminate physical disturbance by dogs and nutrient addition from dog waste. Therefore, assuming compliance, alternative B would result in no impact on the marsh sandwort or habitat at the site.

Since no dog walking would be permitted under alternative B at the Marin Headlands, commercial dog walking under alternative B would have no impacts on the marsh sandwort.

**Cumulative Impacts.** The lack of impacts on the marsh sandwort and marsh sandwort habitat from dogs at the Marin Headlands under alternative B were considered together with the effects of the projects mentioned above under alternative A. The anticipated beneficial effects from park stewardship programs and the watershed plan combined with the lack of impacts on the marsh sandwort from alternative B would result in beneficial cumulative impacts.

**MARIN HEADLANDS TRAILS ALTERNATIVE B CONCLUSION TABLE**

| <b>Marsh Sandwort Impacts</b>  | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--------------------------------|---|---|-------------------------------|
| No impact, assuming compliance | Dogs would not be allowed at the site, protecting the marsh sandwort from adverse impacts of dogs | Beneficial, assuming compliance                     | Beneficial cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would allow on-leash dog walking along the Lower Rodeo Valley Trail Corridor. This corridor extends from the Rodeo Beach parking lot to the intersection of Bunker and McCullough roads via North Lagoon Loop Trail, a section of the Miwok Trail, and the Rodeo Valley Trail, and includes the connector trail from the Rodeo Valley Trail to the Smith Road Trailhead. On-leash dog walking would also be allowed on the Old Bunker Fire Road Loop (including a section of the Coastal Trail), and the Batteries Loop Trail.

Dogs would be physically restrained on leash on trails open to dog walking at this site. Although having dogs on leash would limit impacts to the marsh sandwort, one of the populations is along a trail that is open to dog walking, and on-leash dogs may still impact this population. Impacts would be measurable and perceptible, but would be localized in a relatively small area. Therefore, assuming compliance, alternative C would result in overall long-term minor adverse impacts on the marsh sandwort at Marin Headlands.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Marin Headlands Trails is not one of the park sites where permits

## Chapter 4: Environmental Consequences

would be issued allowing dog walkers to have more than three dogs. Since commercial dog walking is not common at the Marin Headlands Trails, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on the marsh sandwort.

**Cumulative Impacts.** The long-term minor adverse impacts on marsh sandwort and suitable habitat from dogs at the Marin Headlands under alternative C were considered together with the effects of the projects mentioned above under alternative A. The anticipated beneficial effects from park stewardship programs should reduce some of the adverse impacts on the marsh sandwort from alternative C. Therefore, the cumulative impacts on marsh sandwort under this alternative would be expected to be negligible.

**MARIN HEADLANDS TRAILS ALTERNATIVE C CONCLUSION TABLE**

| <b>Marsh Sandwort Impacts</b>                                | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Overall long-term minor adverse impacts, assuming compliance | A known population is located along a trail open to dog walking; physical restraint of dogs would protect marsh sandwort and potential habitat in all other areas of the site | Beneficial change, assuming compliance              | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Similar to alternative B, no dogs would be allowed at the Marin Headlands under alternative D, which would eliminate physical disturbance by dogs and nutrient addition from dog waste. Therefore, assuming compliance, alternative D would result in no impact on the marsh sandwort of habitat at the site.

Since no dog walking would be permitted under alternative D at the Marin Headlands, commercial dog walking under alternative D would have no impacts on the marsh sandwort.

**Cumulative Impacts.** Under alternative D cumulative impacts on the marsh sandwort at Marin Headlands would be the same as under alternative B: beneficial cumulative impacts.

**MARIN HEADLANDS TRAILS ALTERNATIVE D CONCLUSION TABLE**

| <b>Marsh Sandwort Impacts</b>  | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--------------------------------|---|---|-------------------------------|
| No impact, assuming compliance | Dogs would not be allowed at the site, protecting the marsh sandwort from adverse impacts of dogs | Beneficial, assuming compliance                     | Beneficial cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would allow on-leash dog walking on the Conzelman Coastal Trail from Highway 101 to the McCullough intersection and from there to the Coastal Trail Bike Route, which includes Julian Road to the Rodeo Beach parking lot. On-leash dog walking would be allowed on the Old Bunker Fire Road Loop (which includes a section of the Coastal Trail), Batteries Loop Trail, North Miwok Trail from Tennessee Valley to Highway 1, County View Trail, Marin Drive, Rodeo Avenue Trail, and Morning Sun Trail.

Dogs would be physically restrained on leash on trails open to dog walking at this site. Although having dogs on leash would limit impacts to the marsh sandwort, one of the populations is along a trail, and on-leash dogs may still impact this population. Impacts would be measurable and perceptible, but would be

localized in a relatively small area. Therefore, assuming compliance, alternative E would result in overall long-term minor adverse impacts on the marsh sandwort at Marin Headlands.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Marin Headlands Trails is not one of the park sites where permits would be issued allowing dog walkers to have more than three dogs. Since commercial dog walking activity is not common at the Marin Headlands Trails, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on the marsh sandwort.

**Cumulative Impacts.** The long-term minor adverse impacts on marsh sandwort and suitable habitat from dogs at the Marin Headlands under alternative E were considered together with the effects of the projects mentioned above under alternative A. The anticipated beneficial effects from park stewardship programs should reduce some of the adverse impacts on the marsh sandwort from alternative E. Therefore, the cumulative impacts on marsh sandwort under this alternative would be expected to be negligible.

**MARIN HEADLANDS TRAILS ALTERNATIVE E CONCLUSION TABLE**

| Marsh Sandwort Impacts                                       | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Overall long-term minor adverse impacts, assuming compliance | A known population is located along a trail open to dog walking; physical restraint of dogs would protect marsh sandwort and potential habitat in all other areas of the site | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative would allow on-leash dog walking along the Lower Rodeo Valley Trail Corridor, extending from the Rodeo Beach parking lot to the intersection of Bunker and McCullough Roads via the North Lagoon Loop Trail, a section of the Miwok Trail, and the Rodeo Valley Trail. The corridor includes the connector trail from Rodeo Valley Trail to the Smith Road trailhead. On-leash dog walking would also be available on the Old Bunker Fire Road Loop (including a section of the Coastal Trail), Batteries Loop Trail, Rodeo Avenue Trail, and Morning Sun Trail. This alternative would allow dog access only on these perimeter trails in the Marin Headlands, while preserving and maintaining the integrity of interior habitat. Impacts in areas adjacent to the trails/fire roads would be long term, minor, and adverse since this vegetation would be affected by trampling and dog waste. Impacts would be measurable and perceptible, but would be localized in a relatively small area.

Dogs would be physically restrained on leash on trails open to dog walking at this site. Although having dogs on leash would limit impacts to the marsh sandwort, one of the populations is along a trail, and on-leash dogs may still impact this population. Impacts would be measurable and perceptible, but would be localized in a relatively small area. Therefore, assuming compliance, the preferred alternative would result in overall long-term minor adverse impacts on the marsh sandwort at Marin Headlands.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Marin Headlands Trails is not one of the park sites where permits would be issued allowing dog walkers to have more than three dogs. Since commercial dog walking activity is not common at the Marin Headlands Trails, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have negligible impacts on marsh sandwort.

## Chapter 4: Environmental Consequences

**Cumulative Impacts.** Several projects and actions in and near the trails of the Marin Headlands were considered in the cumulative impacts analysis (appendix K). There would be beneficial impacts from park stewardship programs that enhanced habitat. Ongoing parkwide restoration and enhancement projects, including the GGNRA natural stewardship programs and the *Marin Countywide Plan* (County of Marin 2007) would also have beneficial impacts. Lastly, the GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance. Habitat restoration and the implementation of projects funded by the Wildland/Urban Interface Initiative on private lands could also impact the Marin Headlands Trails. These projects would have beneficial impacts.

The long-term minor adverse impacts on marsh sandwort and suitable habitat from dogs at the Marin Headlands under alternative F were considered together with the effects of the projects mentioned above. The anticipated beneficial effects from park stewardship programs should reduce some of the adverse impacts on the marsh sandwort from the preferred alternative. Therefore, the cumulative impacts on marsh sandwort under this alternative would be expected to be negligible.

**MARIN HEADLANDS TRAILS PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| Marsh Sandwort Impacts                                       | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Overall long-term minor adverse impacts, assuming compliance | A known population is located along a trail open to dog walking; physical restraint of dogs would protect marsh sandwort and potential habitat in all other areas of the site | Beneficial, assuming compliance              | Negligible cumulative impacts |

### FRANCISCAN MANZANITA (FEDERALLY ENDANGERED)

This plant species inhabits serpentine chaparral shrub. The only known occurrence of this species occurs in the Presidio Area B, but three areas of the Presidio Area A (within GGNRA) have been designated as critical habitat for the Franciscan manzanita even though the plant does not currently occur in these areas. These critical habitat areas are within Fort Point and Baker Beach (USFWS 2012).

#### Fort Point

**Alternative A: No Action.** Currently, on-leash dog walking is allowed on the Fort Point Promenade, Andrews Road, Presidio Promenade, and Battery East Trail. Dogs are allowed on leash on the grassy area near the bathroom. Fort Point has low to high visitor use by dog walkers, and off-leash dog walking is frequently observed at the site.

Although Fort Point provides critical habitat for the Franciscan manzanita, the plant does not currently occur at the site (USFWS 2012, 54530). There is a mapped critical habitat area for the Franciscan manzanita at this site, but current dog use at the site, particularly off-leash dogs, could prevent successful introduction of the species to the site. Potential habitat for the Franciscan manzanita is found within the vegetated areas between the promenade and the buildings, parking lots, and roads. The Battery East Trail, Andrews Road, and Presidio Promenade all cross through a portion of this critical habitat. Compliance issues with off-leash dogs along these trails could result in trampling, digging, or dog waste, which may preclude the introduction of the Franciscan manzanita to Fort Point. Off-leash and on-leash dog walking under alternative A would result in long-term minor adverse impacts on Franciscan manzanita habitat. Impacts from on-leash dog walking on trails to soils and habitat would be limited to the trails and the 6-

foot corridor immediately adjacent to the trail, and impacts would be localized to a relatively small area when compared to the whole site. The impacts of noncompliant off-leash dogs could occur throughout the site.

Under alternative A, there is no permit system for commercial dog walking. However, commercial dog walking is currently uncommon in the Fort Point area; therefore, commercial dog walking would have negligible impacts on the Franciscan manzanita.

**Cumulative Impacts.** Projects and actions in and near Fort Point were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on Franciscan manzanita habitat at or in the vicinity of this site.

Improvements are being made to Fort Point facilities to improve visitor accessibility (NPS 2010g, 1). The Doyle Drive replacement project will replace the 73-year-old Doyle Drive and make structural and seismic improvements that will take place on lands in Area B of the Presidio (USDOT 2009, 1; Presidio Parkway 2010, 1). This project has the potential to adversely affect Franciscan manzanita habitat at Fort Point through construction and project work in areas that may provide potential habitat for Franciscan manzanita. This could limit the success of potential introduction of this species at the site. The PTMP includes the preservation of the Presidio's cultural, natural, scenic, and recreational resources. The PTMP focuses on the long-term preservation of the park, including replacing pavement with green space, improving and enlarging the park's trail system, restoring stream corridors and natural habitats, and reusing historic structures. The PTMP would be beneficial for the Franciscan manzanita, as these projects may improve or expand potential habitat for the species.

The long-term minor adverse impacts on suitable Franciscan manzanita habitat from dogs at Fort Point were considered together with the effects of the projects mentioned above. The anticipated beneficial effects from the PTMP program should reduce the adverse impacts on Franciscan manzanita habitat from the Doyle Drive replacement and from alternative A. Therefore, cumulative impacts on Franciscan manzanita under alternative A are anticipated to be negligible.

**FORT POINT ALTERNATIVE A CONCLUSION TABLE**

| <b>Franciscan Manzanita Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|-------------------------------------|---|---|-------------------------------|
| Long-term minor adverse impacts     | Off-leash dogs could affect suitable habitat for Franciscan manzanita through digging, trampling, and dog waste | N/A   | Negligible cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Similar to alternative A, alternative B would allow on-leash dog walking on the Fort Point Promenade, Andrews Road, Presidio Promenade, Battery East Trail, and on the grassy area near the bathroom.

There are currently no mapped occurrences of Franciscan manzanita at Fort Point, but a critical habitat area is mapped at this site. The LOD would include trails through a critical habitat area that is open to dog walking and the area adjacent to the trail up to 6 feet. Because dogs would be physically restrained on-leash on the trails, this alternative would provide relative protection for suitable habitat for the Franciscan manzanita, as impacts in the LOD would be small compared to the entire site. Overall, assuming compliance with regulations, alternative B would result in negligible impacts on the Franciscan

## Chapter 4: Environmental Consequences

manzanita. No measurable or perceptible changes are anticipated to critical Franciscan manzanita habitat, and on-leash dog walking on trails is not expected to preclude the introduction of the species to the site.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs on leash per person with no permit required. Since commercial dog walking at Fort Point Promenade/Fort Point NHS Trails is not common, it is likely that commercial dog walking would have negligible impacts on the Franciscan manzanita.

**Cumulative Impacts.** The negligible impacts on suitable Franciscan manzanita habitat from dogs at Fort Point under alternative B were considered together with the effects of the projects mentioned above under alternative A. The anticipated beneficial effects from the PTMP with the negligible impacts on the Franciscan manzanita habitat from the Doyle Drive replacement project and from alternative B would result in negligible cumulative impacts.

**FORT POINT ALTERNATIVE B CONCLUSION TABLE**

| Franciscan Manzanita Impacts                    | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs on leash would protect suitable habitat for Franciscan manzanita | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Under alternative C, on-leash dog walking would be allowed on the same trails as alternative B and alternative C would have the same impacts: negligible impacts on Franciscan manzanita habitat, and negligible cumulative impacts.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs on leash per person with no permit required. Fort Point is not one of the park sites where permits would be issued allowing dog walkers to have more than three dogs. Since commercial dog walking at Fort Point Promenade/Fort Point NHS Trails is not common, it is likely that commercial dog walking would have negligible impacts on the Franciscan manzanita.

**Cumulative Impacts.** The negligible impacts on suitable Franciscan manzanita habitat from dogs at Fort Point under alternative C were considered together with the effects of the projects mentioned above under alternative A. The anticipated beneficial effects from the PTMP with the negligible impacts on the Franciscan manzanita habitat from the Doyle Drive replacement project and from alternative C would result in negligible cumulative impacts.

**FORT POINT ALTERNATIVE C CONCLUSION TABLE**

| Franciscan Manzanita Impacts                    | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs on leash would protect suitable habitat for Franciscan manzanita | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Under alternative D, on-leash dog walking would only be allowed on the Battery East Trail. Currently, Franciscan manzanita does

not occur at Fort Point, but there is a critical habitat area mapped at this site. The Battery East Trail would go through this critical habitat area.

Impacts to Franciscan manzanita habitat would be limited to the trail and the 6-foot corridor immediately adjacent to the trail. The impacts would be negligible because restraining dogs on-leash on the Battery East Trail through critical habitat would restrict impacts to a relatively small region when compared to the whole site, particularly since dog walking would only be allowed on one trail at the site. Impacts in the LOD would occur as a result of disturbance by dogs through trampling, dog waste, and nutrient addition, but these impacts would be localized in a relatively small area. Overall, impacts would be negligible, assuming compliance under alternative D, because no measurable or perceptible changes in Franciscan manzanita habitat would be expected. Additionally on-leash dog walking on the trail is not expected to preclude the introduction of the species to the site.

No commercial dog walking would be allowed under alternative D, and no permits would be issued allowing any dog walker to have more than three dogs. Private dog walkers would be allowed up to three dogs. Since commercial dog walking is not common at the Fort Point Promenade/Fort Point NHS Trails, it is likely that prohibiting commercial dog walking from this site would have negligible impacts on Franciscan manzanita habitat.

**Cumulative Impacts.** Under alternative D, the cumulative impacts on Franciscan manzanita at this park site would be the same as those under alternative B: negligible.

**FORT POINT ALTERNATIVE D CONCLUSION TABLE**

| <b>Franciscan Manzanita Impacts</b>             | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--|---|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs on leash would protect suitable habitat for Franciscan manzanita | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would have the same dog walking restrictions as alternative B, and impacts would be the same: negligible.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs on leash per person with no permit required. Fort Point is not one of the park sites where permits would be issued allowing dog walkers to have more than three dogs. Since commercial dog walking at Fort Point Promenade/Fort Point NHS Trails is not common, it is likely that commercial dog walking would have negligible impacts on the Franciscan manzanita.

**Cumulative Impacts.** Under alternative E, the cumulative impacts on potential Franciscan manzanita habitat at Fort Point would be the same as those under alternative B: negligible.

**FORT POINT ALTERNATIVE E CONCLUSION TABLE**

| <b>Franciscan Manzanita Impacts</b>             | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--|---|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs on leash would protect suitable habitat for Franciscan manzanita | Beneficial, assuming compliance                     | Negligible cumulative impacts |

## Chapter 4: Environmental Consequences

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative B. On-leash dog walking would be allowed on the Fort Point Promenade, Andrews Road, Presidio Promenade, Battery East Trail, and on the grassy area near the bathroom.

There are currently no mapped occurrences of Franciscan manzanita at Fort Point, but a critical habitat area is mapped at this site. The LOD would include trails through critical habitat that are open to dog walking and the area adjacent to the trail up to 6 feet. Because dogs would be physically restrained on-leash on the trails, this alternative would provide relative protection for suitable habitat for the Franciscan manzanita, as impacts in the LOD would be small compared to the entire site. Overall, assuming compliance with regulations, alternative F would result in negligible impacts on the Franciscan manzanita. No measurable or perceptible changes are anticipated to occur to critical Franciscan manzanita habitat, and on-leash dog walking on trails is not expected to preclude the introduction of the species to the site.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs on leash per person with no permit required. Fort Point is not one of the park sites where permits would be issued allowing dog walkers to have more than three dogs. Since commercial dog walking at Fort Point Promenade/Fort Point NHS Trails is not common, it is likely that commercial dog walking would have negligible impacts on the Franciscan manzanita.

**Cumulative Impacts.** Under alternative F, the cumulative impacts on potential Franciscan manzanita habitat at Fort Point would be the same as those under alternative B: negligible.

Improvements are being made to Fort Point facilities to improve visitor accessibility (NPS 2010g, 1). The Doyle Drive replacement project will replace the 73-year-old Doyle Drive and make structural and seismic improvements that will take place on lands in Area B of the Presidio (USDOT 2009, 1; Presidio Parkway 2010, 1). This project has the potential to adversely affect Franciscan manzanita habitat at Fort Point through construction and project work in areas that may provide potential habitat for Franciscan manzanita. This could limit the success of potential introduction of this species at the site. The PTMP includes the preservation of the Presidio's cultural, natural, scenic, and recreational resources. The PTMP focuses on the long-term preservation of the park, including replacing pavement with green space, improving and enlarging the park's trail system, restoring stream corridors and natural habitats, and reusing historic structures. The PTMP would be beneficial for the Franciscan manzanita because these projects may improve or expand potential habitat for the species.

**FORT POINT PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| <b>Franciscan Manzanita Impacts</b>             | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--|---|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs on leash would protect suitable habitat for Franciscan manzanita | Beneficial, assuming compliance                     | Negligible cumulative impacts |

### **Baker Beach and Bluffs to the Golden Gate Bridge**

**Alternative A: No Action.** Currently dogs are allowed under voice control on the beach north of Lobos creek and on-leash on all trails except the Batteries to Bluffs Trail. Baker Beach and the Bluffs to the Golden Gate Bridge experience low to moderate visitor use by visitors with dogs. Baker Beach does not have a known occurrence of the Franciscan manzanita, but a critical habitat area has been mapped for this species at the site (USFWS 2012, 54530). Dog presence at this site could inhibit the successful

introduction of the Franciscan manzanita to Baker Beach. Off-leash dogs on the beach are not anticipated to impact the Franciscan manzanita habitat, which is found above the bluffs in vegetated chaparral shrub areas with serpentine soils.

If off-leash dogs were able to access these areas, they could affect the habitat for the Franciscan manzanita through trampling, digging, or dog waste. Additionally, dogs on-leash may adversely impact on-leash trails and the area adjacent to the trail up to 6 feet. Such impacts may limit the successful introduction of individuals into this critical habitat. This critical habitat is crossed by several trails including the Dune Trail and Battery Crosby Trail. Under on-leash dog walking, impacts to soils and habitat would be limited to the trails and the 6-foot corridor immediately adjacent to the trail, and impacts would be localized to a relatively small area when compared to the whole site, whereas impacts from off-leash dogs would be concentrated on the beach where voice control is allowed, but may also occur from noncompliance on the entire site. Overall, dog walking under alternative A would have long-term minor adverse impacts on Franciscan manzanita habitat.

There is no permit system for commercial dog walking under alternative A. At Baker Beach and Bluffs to Golden Gate Bridge, commercial dog walking is uncommon; therefore, commercial dog walking would have negligible impacts on the Franciscan manzanita habitat.

**Cumulative Impacts.** Projects and actions in and near Baker Beach and Bluffs to the Golden Gate Bridge were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on Franciscan manzanita habitat at or in the vicinity of this site.

Urbanization, development, and loss of habitat are past actions that have impacted the Franciscan manzanita. Other factors include loss of habitat continuity, the establishment and overall dominance by non-native plant species, and land management practices including placement of roads and trails for park users. In particular, urban development and landscaping have reduced the available habitat for these species, with the gradual creation of islands of intact vegetation surrounded by infrastructure and associated non-native species. Populations of rare plants have become isolated from each other, which decreases opportunities for cross-pollination or seed movement. This gradually causes a reduction in the overall adaptability or elasticity of populations to respond to changing environmental conditions, resulting in long-term adverse impacts on population sizes and overall species survival.

Current transportation, trail, and development planning efforts in GGNRA and beyond NPS-managed boundaries would have direct short-term effects on special-status plant species in the disturbance area, and long-term direct and indirect effects on vegetation as a whole through potential creation of habitat (through ground-disturbing activities) for non-native plant species encroachment and establishment. However, ongoing efforts to identify mitigation for these projects, such as pre-project weed control, post-project planting and weeding, and use of weed-free products (soils, fill material, and equipment), would reduce the potential for these types of impacts. Since special-status plants are mapped and monitored on a regular basis and are considered during site design and avoided wherever possible, these impacts would be minor to negligible. Other ongoing programs, including non-native plant removal projects in the park, habitat restoration programs, volunteer opportunities sponsored by the park, and maintenance operations all have the potential to affect listed plant species at GGNRA. The Wildland/Urban Interface Initiative projects on private lands and lands managed by other agencies adjacent to GGNRA-managed lands, the GGNRA *Fire Management Plan* (NPS 2005b), and the vegetation management plan for the Presidio would beneficially affect the park's vegetation and associated listed plant species, including the Franciscan manzanita. Additionally, park stewardship programs, which include native plant habitat restoration projects that occur throughout the park, will provide beneficial effects to the Franciscan manzanita.

## Chapter 4: Environmental Consequences

The Franciscan manzanita is located in a few isolated areas throughout San Francisco, but critical habitat has been designated in areas that provide the conditions suitable for this species. The Franciscan manzanita was believed to be extinct in the wild until a population was found, and the only known specimen occurs in the Presidio Area B. Critical habitat for this species can be found along the vegetated areas of Baker Beach and the Bluffs to Golden Gate Bridge. In addition, under the PTMP for the Presidio, habitat for rare and unique plant and wildlife species will be protected and enhanced (Presidio Trust 2002, 4) which would have a long-term beneficial impact to the Franciscan manzanita.

The long-term minor adverse impacts on suitable Franciscan manzanita habitat from dogs at Baker Beach and Bluffs to the Golden Gate Bridge were considered together with the effects of the projects mentioned above. The anticipated beneficial effects from the PTMP program and other habitat restoration efforts should reduce the adverse impacts on Franciscan manzanita habitat from alternative A. Therefore, cumulative impacts on Franciscan manzanita under alternative A are anticipated to be negligible.

**BAKER BEACH AND BLUFFS TO THE GOLDEN GATE BRIDGE ALTERNATIVE A CONCLUSION TABLE**

| Franciscan Manzanita Impacts    | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---------------------------------|--|--|-------------------------------|
| Long-term minor adverse impacts | Off-leash and on-leash dogs could affect suitable habitat for Franciscan manzanita through digging, trampling, and dog waste | N/A  | Negligible cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Similar to alternative A, alternative B would allow on-leash dog walking on all trails except the Batteries to Bluffs Trail and Battery Crosby Trail, which would be closed to dog walking. On-leash dog walking would be allowed on the beach.

Currently Franciscan manzanita does not occur at Baker Beach, but there is a critical habitat area mapped at this site. This critical habitat is crossed by several trails including the Dune Trail, which would be open to dog walking under alternative B. Because dogs would be physically restrained on leash on trails open to dog walking, this alternative would provide relative protection for suitable habitat for the Franciscan manzanita because impacts in the LOD would be small compared to the entire site. Overall, assuming compliance with regulations, alternative B would result in negligible impacts on the Franciscan manzanita. No measurable or perceptible changes are anticipated to occur to critical Franciscan manzanita habitat, and on-leash dog walking on trails is not expected to preclude the introduction of the species to the site.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is not common at Baker Beach and Bluffs to Golden Gate Bridge, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have a negligible impact on the Franciscan manzanita.

**Cumulative Impacts.** The negligible impacts on suitable Franciscan manzanita habitat from dogs at Baker Beach and Bluffs to the Golden Gate Bridge under alternative B were considered together with the beneficial effects of the projects mentioned above under alternative A. The anticipated beneficial effects from the PTMP with the negligible impacts on the Franciscan manzanita habitat from alternative B would result in beneficial cumulative impacts.

**BAKER BEACH AND BLUFFS TO THE GOLDEN GATE BRIDGE ALTERNATIVE B CONCLUSION TABLE**

| <b>Franciscan Manzanita Impacts</b>             | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--|---|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs on leash would protect suitable habitat for Franciscan manzanita | Beneficial, assuming compliance                     | Beneficial cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Under alternative C, on-leash dog walking would be allowed on the same trails and on the beach, in the same as alternative B. Impacts on the Franciscan manzanita would also be the same: negligible, with beneficial cumulative impacts.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs with a limit of six dogs on leash, and permits may be restricted by time and area. Permits would be allowed at Baker Beach. Impacts on the Franciscan manzanita from permit holders with four to six dogs would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is not common at Baker Beach and Bluffs to Golden Gate Bridge, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on the Franciscan manzanita.

**Cumulative Impacts.** The negligible impacts on suitable Franciscan manzanita habitat from dogs at Baker Beach and Bluffs to the Golden Gate Bridge under alternative C were considered together with the effects of the projects mentioned above under alternative A. The anticipated beneficial effects from the PTMP and other restoration projects and the negligible impacts from alternative C would result in beneficial cumulative impacts.

**BAKER BEACH AND BLUFFS TO THE GOLDEN GATE BRIDGE ALTERNATIVE C CONCLUSION TABLE**

| <b>Franciscan Manzanita Impacts</b>             | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--|---|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs on leash would protect suitable habitat for Franciscan manzanita | Beneficial, assuming compliance                     | Beneficial cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Under alternative D, on-leash dog walking would only be allowed on the beach south of the north end of the North Parking Lot, on the trails to the beach south of the north end of the North Parking Lot, and on the Coastal Trail.

Although the beach does not provide habitat for the Franciscan manzanita, the trails to the beach would traverse critical habitat for the Franciscan manzanita. Impacts to Franciscan manzanita habitat would be limited to the trails and the 6-foot corridor immediately adjacent to the trails. The impacts would be negligible because restraining dogs on-leash on the trails through critical habitat would restrict impacts to a relatively small region when compared to the whole site. Impacts in the LOD would occur as a result of disturbance by dogs through trampling, dog waste, and nutrient addition, but these impacts would be localized in a relatively small area. Overall, impacts would be negligible, assuming compliance under alternative D, because no measurable or perceptible changes in Franciscan manzanita habitat would be

## Chapter 4: Environmental Consequences

expected. On-leash dog walking on the trails is not expected to preclude the introduction of the species to the site.

No commercial dog walking would be allowed under alternative D. Private dog walkers would be allowed up to three dogs. Commercial dog walking from this site would have negligible impacts on Franciscan manzanita habitat.

**Cumulative Impacts.** Under alternative D, the cumulative impacts on Franciscan manzanita at Baker Beach and Bluffs to the Golden Gate Bridge would be the same as those under alternative B: beneficial.

**BAKER BEACH AND BLUFFS TO THE GOLDEN GATE BRIDGE ALTERNATIVE D CONCLUSION TABLE**

| <b>Franciscan Manzanita Impacts</b>             | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--|---|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs on leash would protect suitable habitat for Franciscan manzanita | Beneficial, assuming compliance                     | Beneficial cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Under alternative E there would be a ROLA for off-leash dog walking on the beach south of the north end of the North Parking Lot. On-leash dog walking would be allowed on the beach north of the north end of the North Parking Lot and on all trails except the Batteries to Bluffs trail and Battery Crosby Trail, which would be closed to dog walking.

Currently Franciscan manzanita does not occur at Baker Beach, but there is a critical habitat area mapped at this site. This critical habitat is crossed by several trails including the Dune Trail and the trails to the beach, which would be open to dog walking under alternative E. Impacts to Franciscan manzanita habitat would be limited to the trails and the 6-foot corridors immediately adjacent to the trails because all dog walking on trails would be on leash. The impacts would be negligible because restraining dogs on leash on trails through the critical habitat would restrict impacts to a relatively small region when compared to the whole site. Impacts in the LOD would occur as a result of disturbance by dogs through trampling, dog waste, and nutrient addition, but these impacts would be localized in a relatively small area. The ROLA at Baker Beach under alternative E is adjacent to Franciscan manzanita habitat, but does not contain any habitat suitable for the species. Assuming compliance under alternative E, dogs would not access this suitable habitat adjacent to the ROLA. Overall, impacts to the Franciscan manzanita habitat at Baker Beach would be negligible, assuming compliance under alternative E. Additionally on-leash dog walking on the trails is not expected to preclude the introduction of the species to the site.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. In a ROLA, permit holders may walk one to six dogs off leash and the permit may restrict use by time and area. Permits would be allowed for Baker Beach. Since commercial dog walking is not common at Baker Beach and Bluffs to Golden Gate Bridge, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on Franciscan manzanita habitat.

**Cumulative Impacts.** Under alternative E, the cumulative impacts on Franciscan manzanita at this site would be the same as those under alternative B: beneficial.

**BAKER BEACH AND BLUFFS TO THE GOLDEN GATE BRIDGE ALTERNATIVE E CONCLUSION TABLE**

| Franciscan Manzanita Impacts                    | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs on leash would protect suitable habitat for Franciscan manzanita; assuming compliance, dogs in ROLA would not access adjacent habitat that could support the Franciscan manzanita | Beneficial, assuming compliance              | Beneficial cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative D. On-leash dog walking would only be allowed on the beach south of the north end of the North Parking Lot, on the trails to the beach south of the north end of the North Parking Lot, and on the Coastal Trail.

Although the beach does not provide habitat for the Franciscan manzanita, the trails to the beach would traverse critical habitat for the Franciscan manzanita. Impacts to Franciscan manzanita habitat would be limited to the trails and the 6-foot corridor immediately adjacent to the trails. The impacts would be negligible because restraining dogs on-leash on the trails through critical habitat would restrict impacts to a relatively small region when compared to the whole site. Impacts in the LOD would occur as a result of disturbance by dogs through trampling, dog waste, and nutrient addition, but these impacts would be localized in a relatively small area. Overall, impacts would be negligible, assuming compliance under alternative F, because no measurable or perceptible changes in Franciscan manzanita habitat would be expected. Additionally, on-leash dog walking on the trails is not expected to preclude the introduction of the species to the site.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. At Baker Beach, any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs; permits could restrict use by time and area. Since commercial dog walking is not common at Baker Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have negligible impacts on Franciscan manzanita habitat.

**Cumulative Impacts.** Projects and actions in and near Baker Beach and Bluffs to the Golden Gate Bridge were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on Franciscan manzanita habitat at or in the vicinity of this site.

Urbanization, development, and loss of habitat are past actions that have impacted the Franciscan manzanita. Other factors include loss of habitat continuity, the establishment and overall dominance by non-native plant species, and land management practices including placement of roads and trails for park users. In particular, urban development and landscaping have reduced the available habitat for these species, with the gradual creation of islands of intact vegetation surrounded by infrastructure and associated non-native species. Populations of rare plants have become isolated from each other, which decreases opportunities for cross-pollination or seed movement. This gradually causes a reduction in the overall adaptability or elasticity of populations to respond to changing environmental conditions, resulting in long-term adverse impacts on population sizes and overall species survival.

Current transportation, trail, and development planning efforts in GGNRA and beyond NPS-managed boundaries would have direct short-term effects on special-status plant species in the disturbance area,

## Chapter 4: Environmental Consequences

and long-term direct and indirect effects on vegetation as a whole through potential creation of habitat (through ground-disturbing activities) for non-native plant species encroachment and establishment. However, ongoing efforts to identify mitigation for these projects, such as pre-project weed control, post-project planting and weeding, and use of weed-free products (soils, fill material, and equipment), would reduce the potential for these types of impacts. Since special-status plants are mapped and monitored on a regular basis and are considered during site design and avoided wherever possible, these impacts would be minor to negligible. Other ongoing programs, including non-native plant removal projects in the park, habitat restoration programs, volunteer opportunities sponsored by the park, and maintenance operations all have the potential to affect listed plant species at GGNRA. The Wildland/Urban Interface Initiative projects on private lands and lands managed by other agencies adjacent to GGNRA-managed lands, the GGNRA *Fire Management Plan* (NPS 2005b), and the vegetation management plan for the Presidio would beneficially affect the park's vegetation and associated listed plant species, including the Franciscan manzanita. Additionally, park stewardship programs, which include native plant habitat restoration projects that occur throughout the park, will provide beneficial effects to the Franciscan manzanita.

The Franciscan manzanita is located in a few isolated areas throughout San Francisco, but critical habitat has been designated in areas that provide the conditions suitable for this species. The Franciscan manzanita was believed to be extinct in the wild until a population was found, and the only known specimen occurs in the Presidio Area B. Critical habitat for this species can be found along the vegetated areas of Baker Beach and the Bluffs to Golden Gate Bridge. In addition, under the PTMP for the Presidio, habitat for rare and unique plant and wildlife species will be protected and enhanced (Presidio Trust 2002, 4) which would have a long-term beneficial impact to the Franciscan manzanita.

Under alternative F, the cumulative impacts on Franciscan manzanita at this park site would be the same as those under alternative B: beneficial. The negligible impacts on suitable Franciscan manzanita habitat from dogs at Baker Beach and the Bluffs to the Golden Gate Bridge under alternative F were considered together with the beneficial effects of the projects mentioned above. The anticipated beneficial effects from the PTMP with the negligible impacts on the Franciscan manzanita habitat from alternative F would result in beneficial cumulative impacts.

### BAKER BEACH AND BLUFFS TO THE GOLDEN GATE BRIDGE PREFERRED ALTERNATIVE F CONCLUSION TABLE

| Franciscan Manzanita Impacts                    | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs on leash would protect suitable habitat for Franciscan manzanita | Beneficial, assuming compliance              | Beneficial cumulative impacts |

### IMPACTS TO PRESIDIO (RAVEN'S) MANZANITA (FEDERALLY AND STATE ENDANGERED) BY SITE AND ALTERNATIVE

The only known single natural surviving individual of Presidio manzanita occurs on a small portion of a 0.6-acre serpentine outcrop in the general vicinity of the WW II Memorial in Area B of the Presidio (USFWS 1984). Clones from this plant have been introduced in several places in the adjacent area and across Lincoln Boulevard in Area B of the Presidio, near Baker Beach in suitable serpentine coastal prairie habitat (Presidio Trust 2002, 99).

## **Baker Beach and Bluffs to Golden Gate Bridge**

**Alternative A: No Action.** Under current conditions, dogs are allowed under voice control on the beach north of Lobos Creek and on-leash dog walking is allowed on the trails to the beach and on the Battery Crosby Trail; the Batteries to Bluffs Trail is closed to dog walking. This site has documented low to high visitor use, including low to moderate use by dog walkers (table 9). Additionally, in some areas at this site, dogs and their owners/walkers have created a myriad of social trails in serpentine coastal prairie habitat. At Baker Beach, clones of the plant species exist in the vicinity of the Coastal Trail (midway to the Golden Gate Bridge). Currently, this trail is not heavily used but is located immediately adjacent to the road and some off-leash dog use occurs in the area of the clones despite these conditions.

Additionally, as part of a future project, the widening of the Coastal Trail may increase the impacts from off-leash dogs on the clones. As a result of alternative A, the near-future changes, and the current level of off-leash dog use in the area, dogs could affect the Presidio manzanita through frequent trampling, digging, or dog waste, and planted clones of this species could be injured or killed. Therefore, this alternative would result in continued long-term moderate adverse impacts on the Presidio manzanita. Impacts associated with dog use preclude the NPS from protecting the habitat; these impacts also prevent any future reintroductions of clones or seedling plants of this species at Baker Beach and Bluffs to Golden Gate Bridge, and the reproductive success of clones of this species may be affected by dogs.

Under alternative A, no permit system exists for commercial dog walking. At Baker Beach and Bluffs to Golden Gate Bridge, commercial dog walking is uncommon; therefore, commercial dog walking would have negligible impacts on the Presidio manzanita.

**Cumulative Impacts.** Projects and actions in and near Baker Beach and Bluffs to Golden Gate Bridge were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the Presidio manzanita at or in the vicinity of this site.

A single natural clonal colony of Presidio manzanita remains on an ocean facing serpentine bedrock outcrop within a larger serpentine soil area near the WW II Memorial at the end of Kobbe Avenue in the Presidio, above Baker Beach, San Francisco (USFWS 2003, 61-62). A clone from this population was planted at another serpentine outcrop at Inspiration Point in the Presidio, off Arguello Boulevard (USFWS 2003,62) but survival is currently unknown. The Golden Gate National Recreation Area has prepared a comprehensive vegetation management plan (NPS and Presidio Trust 2001), which proposed to increase protection and maintenance of the habitat of the clones at the WW II Memorial site and transplants introduced to other Presidio locations (USFWS 2003,75). In addition, symbolic fencing, interpretive signs, and improved coordination with road maintenance and other staff of the Golden Gate National Recreation Area reduced threats of trampling and accidental damage, which resulted in expansion of the clone in a generally healthy condition most years (USFWS 2003,74).

Through park stewardship programs, the Coastal Trail alignment has been designed to stay at least 100 feet from any of the Presidio manzanita clones, which would provide long-term protection of this species. The Presidio Trust coordinates the PTMP activities with the USFWS to ensure that relevant Recovery Plans, including the Presidio manzanita, are effectively implemented (Presidio Trust 2002, 236), which would have a long-term beneficial impact to this plant species. Additionally, other GGNRA park stewardship programs, which include native plant habitat restoration projects, occur throughout the park. These programs are led by NPS natural resources staff and will provide beneficial effects to the Presidio manzanita. Off-leash impacts could increase if the Coastal Trail is widened in the future and receives more use.

## Chapter 4: Environmental Consequences

The long-term moderate adverse impacts on the Presidio manzanita from dogs at Baker Beach and Bluffs to Golden Gate Bridge under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from the park stewardship programs, including plant habitat restoration, should reduce some of the adverse impacts on the Presidio manzanita from alternative A. Therefore, cumulative impacts on the Presidio manzanita under this alternative would be expected to be long term, minor, and adverse.

**BAKER BEACH AND BLUFFS TO GOLDEN GATE BRIDGE ALTERNATIVE A CONCLUSION TABLE**

| Presidio (Raven's) Manzanita Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts                         |
|--------------------------------------|---|--|--|
| Long-term moderate adverse impacts   | Clones of this serpentine endemic plant exist in the vicinity of the Coastal Trail midway to the Golden Gate Bridge; off-trail dogs could affect this species although it exists in soil outcrops that are relatively inaccessible at the site; dogs could affect this plant by trampling, digging, or dog waste; the restored population is being affected and few individuals of the species exist at the site, so impacts could affect the reproductive success of the plant | N/A  | Long-term minor adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking on the beach north of Lobos Creek Inlet and on all trails in the vicinity of Baker Beach except the Batteries to Bluffs Trail and the Battery Crosby Trail, where no dog walking would be allowed. In general, impacts would be limited to the trails and the 6-foot corridor immediately adjacent to the trails; the beach is not suitable habitat for the Presidio manzanita. Impacts on the Presidio manzanita adjacent to the trails (LOD area) would be long term, minor, and adverse since these areas contain naturally functioning soils that could support the growth of the Presidio manzanita. Impacts would occur as a result of disturbance by dogs through trampling or dog waste; nutrient addition could also occur from outside the LOD area, but these impacts would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area at Baker Beach and Bluffs to Golden Gate Bridge would affect only a portion of the entire site. Physically restraining dogs on leash would protect the Presidio manzanita, potential habitat and the restored population would be protected, and no measurable or perceptible changes in the Presidio manzanita would be expected at this site as a result of alternative B. Therefore, assuming compliance, alternative B would result in overall negligible impacts on the Presidio manzanita at Baker Beach and Bluffs to Golden Gate Bridge.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is not common at Baker Beach and Bluffs to Golden Gate Bridge, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have negligible impacts on the Presidio manzanita.

**Cumulative Impacts.** The negligible impacts on the Presidio manzanita from dogs at Baker Beach and Bluffs to Golden Gate Bridge under alternative B were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the park stewardship programs,

including plant habitat restoration, combined with the negligible impacts on the Presidio manzanita under alternative B would be expected to result in beneficial cumulative impacts.

**BAKER BEACH AND BLUFFS TO GOLDEN GATE BRIDGE ALTERNATIVE B CONCLUSION TABLE**

| Presidio (Raven’s) Manzanita Impacts            | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs on leash would protect Presidio manzanita and potential habitat; the restored population would be protected | Beneficial, assuming compliance              | Beneficial cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would have the same dog walking restrictions as alternative B, and impacts would be the same, assuming compliance: long term, minor, and adverse in the LOD area and negligible overall.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs, and permits may be restricted by time and area. Permits would be allowed at Baker Beach. Impacts on the Presidio manzanita from permit holders with four to six dogs would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is not common at Baker Beach and Bluffs to Golden Gate Bridge, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on the Presidio manzanita.

**Cumulative Impacts.** The negligible impacts on the Presidio manzanita from dogs at Baker Beach and Bluffs to Golden Gate Bridge under alternative C were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the park stewardship programs, including plant habitat restoration, combined with the negligible impacts on the Presidio manzanita under alternative C would be expected to result in beneficial cumulative impacts.

**BAKER BEACH AND BLUFFS TO GOLDEN GATE BRIDGE ALTERNATIVE C CONCLUSION TABLE**

| Presidio (Raven’s) Manzanita Impacts            | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs on leash would protect Presidio manzanita and potential habitat; the restored population would be protected | Beneficial, assuming compliance              | Beneficial cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Alternative D would allow on-leash dog walking on the section of the beach north of Lobos Creek and south of the northern parking lot and on all trails leading to the section of beach south of the northern parking lot. Dog walking would not be permitted on the Batteries to Bluffs Trail and the Battery Crosby Trail. In general, impacts would be limited to the trails and the 6-foot corridor immediately adjacent to the trails; the beach is not suitable habitat for the Presidio manzanita. Impacts on the Presidio manzanita adjacent to the trails (LOD area) would be long term, minor, and adverse since these areas contain naturally functioning soils that could support the growth of the Presidio manzanita. Impacts would occur as a result of disturbance by dogs

## Chapter 4: Environmental Consequences

through trampling or dog waste; nutrient addition could also occur from outside the LOD area, but these impacts would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area would affect only a portion of the entire site. Physically restraining dogs on leash would protect the Presidio manzanita and potential habitat, the restored population would be protected, and no measurable or perceptible changes in the Presidio manzanita would be expected at this site as a result of alternative D. Therefore, assuming compliance, alternative D would result in overall negligible impacts on the Presidio manzanita at Baker Beach and Bluffs to Golden Gate Bridge.

No commercial dog walking would be allowed and no permits to walk more than three dogs would be issued under alternative D; therefore, commercial and permitted dog walking would have no impact on the Presidio manzanita.

**Cumulative Impacts.** The negligible impacts on the Presidio manzanita from dogs at Baker Beach and Bluffs to Golden Gate Bridge under alternative D were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the park stewardship programs, including plant habitat restoration, combined with the negligible impacts on the Presidio manzanita under alternative D would be expected to result in beneficial cumulative impacts.

**BAKER BEACH AND BLUFFS TO GOLDEN GATE BRIDGE ALTERNATIVE D CONCLUSION TABLE**

| <b>Presidio (Raven's) Manzanita Impacts</b>     | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs on leash would protect Presidio manzanita and potential habitat; the restored population would be protected | Beneficial, assuming compliance                     | Beneficial cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would allow on-leash dog walking on the northern portion of the beach and on all trails in the vicinity of Baker Beach except the Batteries to Bluffs Trail and the Battery Crosby Trail, where no dog walking would be allowed. A ROLA would be established on the beach between Lobos Creek and the north end of the north parking lot. This ROLA would not be located in suitable habitat for the Presidio manzanita; therefore, no impacts to the Presidio manzanita would occur within the ROLA. In general, impacts would be limited to the trails and the 6-foot corridor immediately adjacent to the trails because the beach is not suitable habitat for the Presidio manzanita. Impacts on the Presidio manzanita adjacent to the trails (LOD area) would be long term, minor, and adverse since these areas contain naturally functioning soils that could support the growth of the Presidio manzanita. Impacts would occur as a result of disturbance by dogs through trampling or dog waste; nutrient addition could also occur from outside the LOD area, but these impacts would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area at Baker Beach and Bluffs to Golden Gate Bridge would affect only a portion of the entire site. Physically restraining dogs on leash would protect the Presidio manzanita and potential habitat, the restored population would be protected, and no measurable or perceptible changes in the Presidio manzanita would be expected at this site as a result of alternative D. Therefore, assuming compliance, alternative D would result in overall negligible impacts on the Presidio manzanita at Baker Beach and Bluffs to Golden Gate Bridge.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. In a ROLA, permit holders may have up to six dogs off leash and the permit may restrict use by time and area. Permits would be allowed at Baker Beach. Impacts on the Presidio manzanita from permit holders with four to six dogs off leash would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is not common at Baker Beach and Bluffs to Golden Gate Bridge, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on the Presidio manzanita.

**Cumulative Impacts.** The negligible impacts on the Presidio manzanita from dogs at Baker Beach and Bluffs to Golden Gate Bridge under alternative E were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the park stewardship programs, including plant habitat restoration, combined with the negligible impacts on the Presidio manzanita under alternative E would be expected to result in beneficial cumulative impacts.

**BAKER BEACH AND BLUFFS TO GOLDEN GATE BRIDGE ALTERNATIVE E CONCLUSION TABLE**

| <b>Presidio (Raven's) Manzanita Impacts</b>     | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs on leash would protect Presidio manzanita and potential habitat; the restored population would be protected | Beneficial, assuming compliance                     | Beneficial cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative D, allowing on-leash dog walking on the beach south of the north parking lot, in picnic and parking areas, on the trails to the southern beach area, and on the Coastal Trail. No dog walking would be permitted on the northern section of the beach, on trails leading to that section of beach, or on the Batteries to Bluffs or Battery Crosby trails. In general, impacts would be limited to the trails and the 6-foot corridor immediately adjacent to the trails; the beach is not suitable habitat for the Presidio manzanita. Impacts on the Presidio manzanita adjacent to the trails (LOD area) would be long term, minor, and adverse since these areas contain naturally functioning soils that could support the growth of the Presidio manzanita. Impacts would occur as a result of disturbance by dogs through trampling or dog waste; nutrient addition could also occur from outside the LOD area, but these impacts would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area at Baker Beach and Bluffs to Golden Gate Bridge would affect only a portion of the entire site. Physically restraining dogs on leash would protect the Presidio manzanita and potential habitat, the restored population would be protected, and no measurable or perceptible changes in the Presidio manzanita would be expected at this site as a result of the preferred alternative. Therefore, assuming compliance, the preferred alternative would result in overall negligible impacts on the Presidio manzanita at Baker Beach and Bluffs to Golden Gate Bridge.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs, and permits may be restricted by time and area. Permits would be allowed at Baker Beach. Impacts on the Presidio manzanita from permit holders with four to six dogs would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog

## Chapter 4: Environmental Consequences

walking is not common at Baker Beach and Bluffs to Golden Gate Bridge, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have negligible impacts on the Presidio manzanita.

**Cumulative Impacts.** Projects and actions in and near Baker Beach and Bluffs to Golden Gate Bridge were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the Presidio manzanita at or in the vicinity of this site.

Through park stewardship programs, the Coastal Trail alignment has been designed to stay at least 100 feet from any of the Presidio manzanita clones, which would provide long-term protection of this species. The Presidio Trust coordinates the PTMP activities with the USFWS to ensure that relevant Recovery Plans, including the Presidio manzanita, are effectively implemented (Presidio Trust 2002, 236), which would have a long-term beneficial impact to this plant species. Additionally, other GGNRA park stewardship programs, which include native plant habitat restoration projects, occur throughout the park. These programs are led by NPS natural resources staff and will provide beneficial effects to the Presidio manzanita. Trail widening and improvements could increase the occurrence of off-leash dog impacts.

The negligible impacts on the Presidio manzanita from dogs at Baker Beach and Bluffs to Golden Gate Bridge under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from the park stewardship programs, including plant habitat restoration, combined with the negligible impacts on the Presidio manzanita under the preferred alternative would be expected to result in beneficial cumulative impacts.

### BAKER BEACH AND BLUFFS TO GOLDEN GATE BRIDGE PREFERRED ALTERNATIVE F CONCLUSION TABLE

| Presidio (Raven's) Manzanita Impacts            | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs on leash would protect Presidio manzanita and potential habitat; the restored population would be protected | Beneficial, assuming compliance              | Beneficial cumulative impacts |

### IMPACTS TO PRESIDIO CLARKIA (FEDERALLY ENDANGERED) BY SITE AND ALTERNATIVE

This plant species inhabits serpentine soils around 50 meters in elevation (Jepson Interchange 2013). This species can be found in coastal scrub, and grasslands in valleys and foothills. The Presidio clarkia is endemic to California in San Francisco and Alameda counties. There are only five known occurrences, including one population in the Presidio (Area B, outside GGNRA) and one in Baker Beach, near the Coastal Trail.

#### Baker Beach and Bluffs to the Golden Gate Bridge

**Alternative A: No Action.** Currently dogs are allowed under voice control on the beach north of Lobos Creek, and on leash on all trails except the Batteries to Bluffs Trail. Baker Beach and the Bluffs to the Golden Gate Bridge experience low to moderate visitor use by visitors with dogs. A population of Presidio clarkia exists on a steep bluff alongside a popular trail. The presence of dogs, particularly off-leash dogs, could result in adverse impacts to this species.

If off-leash dogs were able to access this area, they could affect the Presidio clarkia through trampling, digging, or dog waste. Because the occurrence of Presidio clarkia is alongside a trail, on-leash dogs may impact plants within a close distance of the trail. Overall, dog walking under alternative A would have long-term moderate adverse impacts on the Presidio clarkia.

Under alternative A, there is no permit system for commercial dog. At Baker Beach and Bluffs to Golden Gate Bridge, commercial dog walking is uncommon; therefore, commercial dog walking would have negligible impacts on the Presidio clarkia.

**Cumulative Impacts.** Projects and actions in and near Baker Beach and Bluffs to the Golden Gate Bridge were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the Presidio clarkia at the site, as well as effects on potential habitat at or in the vicinity of this site.

The Presidio clarkia has been impacted by urbanization, development, and loss of habitat. Other factors include loss of habitat continuity, the establishment and overall dominance by non-native plant species, and land management practices including placement of roads and trails for park users. In particular, urban development and landscaping have reduced the available habitat for these species, with the gradual creation of islands of intact vegetation surrounded by infrastructure and associated non-native species. Populations of rare plants have become isolated from each other, which decreases opportunities for cross-pollination or seed movement. This gradually causes a reduction in the overall adaptability or elasticity of populations to respond to changing environmental conditions, resulting in long-term adverse impacts on population sizes and overall species survival.

Current transportation, trail, and development planning efforts in GGNRA and beyond NPS-managed boundaries would have direct short-term effects on special-status plant species in the disturbance area, and long-term direct and indirect effects on vegetation as a whole through potential creation of habitat (through ground-disturbing activities) for non-native plant species encroachment and establishment. However, ongoing efforts to identify mitigation for these projects, such as pre-project weed control, post-project planting and weeding, and use of weed-free products (soils, fill material, and equipment), would reduce the potential for these types of impacts. Since special-status plants are mapped and monitored on a regular basis and are considered during site design and avoided wherever possible, these impacts would be minor to negligible. Other ongoing programs, including non-native plant removal projects in the park, habitat restoration programs, volunteer opportunities sponsored by the park, and maintenance operations all have the potential to affect listed plant species at GGNRA. The Wildland/Urban Interface Initiative projects on private lands and lands managed by other agencies adjacent to GGNRA-managed lands, the GGNRA *Fire Management Plan* (NPS 2005b), and the vegetation management plan for the Presidio would beneficially affect vegetation at the park and listed plant species, including the Presidio clarkia. Additionally, park stewardship programs, which include native plant habitat restoration projects that occur throughout the park, will provide beneficial effects to the Presidio clarkia.

Many of the known occurrences of the Presidio clarkia are within the Presidio Area B. Under the PTMP for the Presidio, habitat for rare and unique plant and wildlife species will be protected and enhanced (Presidio Trust 2002, 4) which would have a long-term beneficial impact to the Presidio clarkia.

The long-term, moderate adverse impacts on the Presidio clarkia from dogs at Baker Beach and Bluffs to the Golden Gate Bridge were considered together with the effects of the projects mentioned above. The anticipated beneficial effects from the PTMP program and other habitat restoration efforts should reduce the adverse impacts on the Presidio clarkia from alternative A. Therefore, cumulative impacts on Presidio clarkia under alternative A are anticipated to be long-term, minor, and adverse.

**Chapter 4: Environmental Consequences**

**BAKER BEACH AND BLUFFS TO THE GOLDEN GATE BRIDGE ALTERNATIVE A CONCLUSION TABLE**

| <b>Presidio Clarkia Impacts</b>    | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>                    |
|------------------------------------|---|---|--|
| Long-term moderate adverse impacts | Off-leash and on-leash dogs could affect the known population of Presidio clarkia located adjacent to the Coastal Trail through digging, trampling, and dog waste | N/A   | Long-term, minor, adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Similar to alternative A, alternative B would allow on-leash dog walking on all trails except the Batteries to Bluffs Trail and Battery Crosby Trail, which would be closed to dog walking. On-leash dog walking would be allowed on the beach.

A known occurrence of the Presidio clarkia is located adjacent to the Coastal Trail, which would be open to on-leash dog walking under alternative B. The LOD would include trails open to dog walking, and an area adjacent to the trail up to 6 feet. Although dogs would be physically restrained on leash, they may still impact the Presidio clarkia population alongside the trail through trampling and dog waste. These impacts are expected to be less than impacts from off-leash dogs as described above for alternative A. Overall, assuming compliance with regulations, alternative B would result in long-term minor adverse impacts on the Presidio clarkia.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is not common at Baker Beach and Bluffs to Golden Gate Bridge, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have a negligible impact on the Presidio clarkia.

**Cumulative Impacts.** The negligible impacts on the Presidio clarkia from dogs at Baker Beach and Bluffs to the Golden Gate Bridge under alternative B were considered together with the beneficial effects of the projects mentioned above under alternative A. The anticipated beneficial effects from the PTMP combined with the long-term minor adverse on the Presidio clarkia from alternative B would result in negligible cumulative impacts.

**BAKER BEACH AND BLUFFS TO THE GOLDEN GATE BRIDGE ALTERNATIVE B CONCLUSION TABLE**

| <b>Presidio Clarkia Impacts</b>                               | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|---|---|-------------------------------|
| Overall long-term, minor adverse impacts, assuming compliance | Physically restraining dogs on leash would limit dog impacts on the Presidio clarkia, but dogs may still impact the population along the Coastal Trail from trampling and dog waste | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Under alternative C, on-leash dog walking would be allowed on the same trails as in alternative B and impacts on the Presidio clarkia would also be the same: long-term, minor, adverse impacts on Presidio clarkia and negligible cumulative impacts.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs with a limit of six dogs on leash, and permits may be restricted by time and area. Permits would be allowed only on the beach at Baker Beach. Since commercial dog walking is not common at Baker Beach and permit holders would only be allowed on the beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on the Presidio clarkia.

**Cumulative Impacts.** The long-term minor adverse impacts to the Presidio clarkia from dogs at Baker Beach and Bluffs to the Golden Gate Bridge under alternative C were considered together with the effects of the projects mentioned above under alternative A. The anticipated beneficial effects from the PTMP and other restoration projects and the long-term minor adverse impacts from alternative C would result in negligible cumulative impacts.

**BAKER BEACH AND BLUFFS TO THE GOLDEN GATE BRIDGE ALTERNATIVE C CONCLUSION TABLE**

| Presidio Clarkia Impacts                                     | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Overall long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would limit dog impacts on the Presidio clarkia, but dogs may still impact the population along the Coastal Trail from trampling and dog waste | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Under alternative D, on-leash dog walking would only be allowed on the beach south of the north end of the north parking lot, on the trails to the beach south of the north end of the north parking lot, and on the Coastal Trail.

A known occurrence of the Presidio clarkia is located adjacent to the Coastal Trail, which would be open to on-leash dog walking under alternative D. The LOD would include trails open to dog walking and an area adjacent to the trail up to 6 feet. Although dogs would be physically restrained on leash, they may still impact the Presidio clarkia population alongside the trail through trampling and dog waste. Overall, assuming compliance with regulations, alternative D would result in long-term minor adverse impacts on the Presidio clarkia.

No commercial dog walking would be allowed under alternative D. Private dog walkers would be allowed up to three dogs. Commercial dog walking from this site would have negligible impacts on the Presidio clarkia.

**Cumulative Impacts.** Under alternative D, the cumulative impacts on Presidio clarkia at this park site would be the same as those under alternative B: negligible.

**Chapter 4: Environmental Consequences**

**BAKER BEACH AND BLUFFS TO THE GOLDEN GATE BRIDGE ALTERNATIVE D CONCLUSION TABLE**

| <b>Presidio Clarkia Impacts</b>                              | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Overall long-term minor adverse impacts, assuming compliance | Physically restraining dogs on leash would limit dog impacts on the Presidio clarkia, but dogs may still impact the population along the Coastal Trail from trampling and dog waste | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Under alternative E, there would be a ROLA for off-leash dog walking on the beach south of the north end of the north parking lot. On-leash dog walking would be allowed on the beach north of the north end of the north parking lot, and on all trails except the Batteries to Bluffs trail and Battery Crosby Trail, which would be closed to dog walking.

A known occurrence of the Presidio clarkia is located adjacent to the Coastal Trail, which would be open to on-leash dog walking under alternative E. The LOD would include trails open to dog walking, and an area adjacent to the trail up to 6 feet. Although dogs would be physically restrained on leash, they may still impact the Presidio clarkia population alongside the trail through trampling and dog waste. Overall, assuming compliance with regulations, alternative E would result in long-term minor adverse impacts on the Presidio clarkia.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. In a ROLA, permit holders may walk one to six dogs off leash and the permit may restrict use by time and area. Permits would be allowed only on the beach portion of Baker Beach. Since commercial dog walking is not common at Baker Beach and permit holders would only be allowed on the beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on Presidio clarkia habitat.

**Cumulative Impacts.** Under alternative E, the cumulative impacts on the Presidio clarkia at this park site would be the same as those under alternative B: negligible.

**BAKER BEACH AND BLUFFS TO THE GOLDEN GATE BRIDGE ALTERNATIVE E CONCLUSION TABLE**

| <b>Presidio Clarkia Impacts</b>                               | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|---|---|-------------------------------|
| Overall long-term, minor adverse impacts, assuming compliance | Physically restraining dogs on leash would limit dog impacts on the Presidio clarkia, but dogs may still impact the population along the Coastal Trail from trampling and dog waste | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative D. On-leash dog walking would only be allowed on the beach south of the north end of the north parking lot, on the trails to the beach south of the north end of the north parking lot, and on the Coastal Trail.

A known occurrence of the Presidio clarkia is located adjacent to the Coastal Trail, which would be open to on-leash dog walking under the preferred alternative. The LOD would include trails open to dog walking and an area adjacent to the trail up to 6 feet. Although dogs would be physically restrained on leash, they may still impact the Presidio clarkia population alongside the trail through trampling and dog waste. Overall, assuming compliance with regulations, the preferred alternative would result in long-term minor adverse impacts on the Presidio clarkia.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. At Baker Beach, any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs; permits could restrict use by time and area. Since commercial dog walking is not common at Baker Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have negligible impacts on the Presidio clarkia.

**Cumulative Impacts.** Projects and actions in and near Baker Beach and Bluffs to the Golden Gate Bridge were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the Presidio clarkia at the site, as well as effects on potential habitat at or in the vicinity of this site.

The Presidio clarkia has been impacted by urbanization, development, and loss of habitat. Other factors include loss of habitat continuity, the establishment and overall dominance by non-native plant species, and land management practices including placement of roads and trails for park users. In particular, urban development and landscaping have reduced the available habitat for these species, with the gradual creation of islands of intact vegetation surrounded by infrastructure and associated non-native species. Populations of rare plants have become isolated from each other, which decreases opportunities for cross-pollination or seed movement. This gradually causes a reduction in the overall adaptability or elasticity of populations to respond to changing environmental conditions, resulting in long-term adverse impacts on population sizes and overall species survival.

Current transportation, trail, and development planning efforts in GGNRA and beyond NPS-managed boundaries would have direct short-term effects on special-status plant species in the disturbance area, and long-term direct and indirect effects on vegetation as a whole through potential creation of habitat (through ground-disturbing activities) for non-native plant species encroachment and establishment. However, ongoing efforts to identify mitigation for these projects, such as pre-project weed control, post-project planting and weeding, and use of weed-free products (soils, fill material, and equipment), would reduce the potential for these types of impacts. Since special-status plants are mapped and monitored on a regular basis and are considered during site design and avoided wherever possible, these impacts would be minor to negligible. Other ongoing programs, including non-native plant removal projects in the park, habitat restoration programs, volunteer opportunities sponsored by the park, and maintenance operations all have the potential to affect listed plant species at GGNRA. The Wildland/Urban Interface Initiative projects on private lands and lands managed by other agencies adjacent to GGNRA-managed lands, the GGNRA *Fire Management Plan* (NPS 2005b), and the vegetation management plan for the Presidio would beneficially affect vegetation at the park and listed plant species, including the Presidio clarkia. Additionally, park stewardship programs, which include native plant habitat restoration projects that occur throughout the park, will provide beneficial effects to the Presidio clarkia.

Many of the known occurrences of the Presidio clarkia are within the Presidio Area B. Under the PTMP for the Presidio, habitat for rare and unique plant and wildlife species will be protected and enhanced (Presidio Trust 2002, 4) which would have a long-term beneficial impact to the Presidio clarkia.

## Chapter 4: Environmental Consequences

Under alternative F, the cumulative impacts on the Presidio clarkia at this park site would be the same as those under alternative B: negligible. The long-term minor adverse impacts on the Presidio clarkia from dogs at Baker Beach and Bluffs to the Golden Gate Bridge under alternative F were considered together with the beneficial effects of the projects mentioned above under alternative A. The anticipated beneficial effects from the PTMP with the long-term minor adverse impacts on Presidio clarkia from alternative F would result in negligible cumulative impacts.

### BAKER BEACH AND BLUFFS TO THE GOLDEN GATE BRIDGE PREFERRED ALTERNATIVE F CONCLUSION TABLE

| Presidio Clarkia Impacts                                      | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall long-term, minor adverse impacts, assuming compliance | Physically restraining dogs on leash would limit dog impacts on the Presidio clarkia, but dogs may still impact the population along the Coastal Trail from trampling and dog waste | Beneficial, assuming compliance              | Negligible cumulative impacts |

### IMPACTS TO MARIN DWARF-FLAX (FEDERALLY AND STATE THREATENED) BY SITE AND ALTERNATIVE

The Marin dwarf-flax is found in coastal serpentine prairie and scrub habitat in GGNRA as two subpopulations. One subpopulation is located west of Lincoln Boulevard of the Presidio and the other subpopulation is located in soil outcrops above Baker Beach, near the one remaining natural Presidio manzanita location (USFWS 2003; NPS 2008i).

#### Baker Beach and Bluffs to Golden Gate Bridge

**Alternative A: No Action.** Under current conditions, dogs are allowed under voice control on the beach north of Lobos Creek and on-leash dog walking is allowed on the trails to the beach and on the Battery Crosby Trail; the Batteries to Bluffs Trail is closed. This site has documented moderate low to high visitor use and low to moderate use by dog walkers (table 9). In some areas at this site, dogs and their owners/walkers have created a myriad of social trails in coastal vegetation.

This species exists in soil outcrops that are in the vicinity of the Coastal Trail midway to the Golden Gate Bridge. Under alternative A, on-leash dog walking could affect the Marin dwarf-flax and the sensitive serpentine habitat through trampling, digging, or dog waste; individuals of the species could be injured or killed. Therefore, this alternative would result in continued long-term moderate adverse impacts on the Marin dwarf-flax. Because few individuals of the species currently exist at the site, it is possible that impacts could affect the reproductive success of individuals of the species; therefore, impacts would be moderate.

No permit system exists for commercial dog walking under alternative A. At Baker Beach and Bluffs to Golden Gate Bridge, commercial dog walking is uncommon; therefore, commercial dog walking would have negligible impacts on the Marin dwarf-flax.

**Cumulative Impacts.** Projects and actions in and near Baker Beach and Bluffs to Golden Gate Bridge were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on the Marin dwarf-flax at or in the vicinity of this site.

The Presidio supports populations of Marin dwarf-flax and the NPS has been actively managing the Presidio plant population since 1994 (USFWS 1998a, I-15-I-16). Annual censuses of the single population of Marin dwarf-flax have been conducted since 1994 and fencing was erected in 1995 to protect this largest population at the Presidio USFWS 1998a, I-15-I-16). The Presidio Trust coordinates the PTMP activities with the USFWS to ensure that relevant Recovery Plans, including the Marin dwarf-flax, are effectively implemented (Presidio Trust 2002, 236), which would have a long-term beneficial impact on this plant species.

The Presidio Coastal Trail project, invasive plant species control, park stewardship programs, volunteer opportunities sponsored by the park, and maintenance operations all have the potential to affect listed plant species at GGNRA. Efforts to manage this species are underway at the two subpopulations in GGNRA and the NPS is currently considering translocation of seed to suitable habitat areas in these subsites (NPS 2008i). Additionally, park stewardship programs, which include native plant habitat restoration projects, will provide beneficial effects to the Marin dwarf-flax.

The long-term moderate adverse impacts on the Marin dwarf-flax from dogs at Baker Beach and Bluffs to Golden Gate Bridge under alternative A were considered together with the effects of the actions mentioned above. The benefits to the Marin dwarf-flax from the park stewardship programs, the Presidio Coastal Trail project, and invasive plant species control, should reduce some of the adverse impacts of this alternative. Therefore, the cumulative impacts under this alternative would be long term, minor, and adverse.

**BAKER BEACH AND BLUFFS TO GOLDEN GATE BRIDGE ALTERNATIVE A CONCLUSION TABLE**

| Marin Dwarf-flax Impacts           | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts                         |
|------------------------------------|---|--|--|
| Long-term moderate adverse impacts | This annual serpentine endemic plant exists in the vicinity of the Coastal Trail midway to the Golden Gate Bridge; off-trail dogs could affect this species by trampling, digging, or dog waste; individuals of the species could be injured or killed; few individuals of the species exist at the site, so reproductive success could be affected | N/A  | Long-term minor adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking on the beach north of Lobos Creek Inlet and on all trails in the vicinity of Baker Beach except the Batteries to Bluffs Trail and the Battery Crosby Trail, where no dog walking would be allowed. In general, impacts would be limited to the trails and the 6-foot corridor immediately adjacent to the trails; the beach is not suitable habitat for the Marin dwarf-flax. Impacts on the Marin dwarf-flax adjacent to the trails (LOD area) would be long term, minor, and adverse since these areas contain naturally functioning soils that could support the growth of the Marin dwarf-flax. Impacts would occur as a result of disturbance by dogs through trampling or dog waste; nutrient addition could also occur from outside the LOD area, but these impacts would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area at Baker Beach and Bluffs to Golden Gate Bridge would affect only a portion of the entire site, and the Marin dwarf-flax exists in soil outcrops that are relatively inaccessible at the site. Physically restraining dogs on leash would protect the Marin dwarf-flax and potential habitat, the restored population would be protected, and no measurable or

## Chapter 4: Environmental Consequences

perceptible changes in the Marin dwarf-flax would be expected at this site as a result of alternative B. Therefore, assuming compliance, alternative B would result in overall negligible impacts on the Marin dwarf-flax at Baker Beach and Bluffs to Golden Gate Bridge.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is not common at Baker Beach and Bluffs to Golden Gate Bridge, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have a negligible impact on the Marin dwarf-flax.

**Cumulative Impacts.** The negligible impacts on the Marin dwarf-flax from dogs at Baker Beach and Bluffs to Golden Gate Bridge under alternative B were considered together with the effects of the actions mentioned above under alternative A. The benefits to the Marin dwarf-flax from the park stewardship programs and other actions combined with the negligible impacts from alternative B would result in negligible cumulative impacts.

**BAKER BEACH AND BLUFFS TO GOLDEN GATE BRIDGE ALTERNATIVE B CONCLUSION TABLE**

| Marin Dwarf-flax Impacts                        | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs on leash would protect Marin dwarf-flax and potential habitat; the restored population would be protected | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would have the same dog walking restrictions as alternative B, and impacts would be the same: long term, minor, and adverse in the LOD area and negligible overall.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs, and permits may restrict use by time and area. Permits would be issued for Baker Beach, but those permits would not include the trails in the area. Impacts on the Marin dwarf-flax from permit holders with four to six dogs would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is not common at Baker Beach and Bluffs to Golden Gate Bridge, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on the Marin dwarf-flax.

**Cumulative Impacts.** The negligible impacts on the Marin dwarf-flax from dogs at Baker Beach and Bluffs to Golden Gate Bridge under alternative C were considered together with the effects of the actions mentioned above under alternative A. The benefits to the Marin dwarf-flax from the park stewardship programs and other actions combined with the negligible impacts from alternative C would result in negligible cumulative impacts.

**BAKER BEACH AND BLUFFS TO GOLDEN GATE BRIDGE ALTERNATIVE C CONCLUSION TABLE**

| <b>Marin Dwarf-flax Impacts</b>                 | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs on leash would protect Marin dwarf-flax and potential habitat; the restored population would be protected | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Alternative D would allow on-leash dog walking on the section of the beach north of Lobos Creek and south of the northern parking lot and on all trails leading to the section of Baker Beach south of the north parking lot and on the Coastal Trail. The Batteries to Bluffs and Battery Crosby trails, would be closed to dog walking. In general, impacts would be limited to the trails and the 6-foot corridor immediately adjacent to the trails; the beach is not suitable habitat for the Marin dwarf-flax. Impacts on the Marin dwarf-flax adjacent to the trails (LOD area) would be long term, minor, and adverse since these areas contain naturally functioning soils that could support the growth of the Marin dwarf-flax. Impacts would occur as a result of disturbance by dogs through trampling or dog waste; nutrient addition could also occur from outside the LOD area, but these impacts would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area at Baker Beach and Bluffs to Golden Gate Bridge would affect only a portion of the entire site, and the Marin dwarf-flax exists in soil outcrops that are relatively inaccessible at the site. Physically restraining dogs on leash would protect the Marin dwarf-flax and potential habitat, the restored population would be protected, and no measurable or perceptible changes in the Marin dwarf-flax would be expected at this site as a result of alternative D. Therefore, assuming compliance, alternative D would result in overall negligible impacts on the Marin dwarf-flax at Baker Beach and Bluffs to Golden Gate Bridge.

No commercial dog walking would be allowed and no permits to walk more than three dogs would be issued under alternative D; therefore, commercial and permitted dog walking would have no impact on the Marin dwarf-flax.

**Cumulative Impacts.** The negligible impacts on the Marin dwarf-flax from dogs at Baker Beach and Bluffs to Golden Gate Bridge were considered together with the effects of the actions mentioned above under alternative A. The benefits to the Marin dwarf-flax from the park stewardship programs and other actions combined with the negligible impacts from alternative D would result in negligible cumulative impacts.

**BAKER BEACH AND BLUFFS TO GOLDEN GATE BRIDGE ALTERNATIVE D CONCLUSION TABLE**

| <b>Marin Dwarf-flax Impacts</b>                 | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs on leash would protect Marin dwarf-flax and potential habitat; the restored population would be protected | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would allow on-leash dog walking on the northern portion of the beach and on all trails in the vicinity of Baker Beach except the Batteries to Bluffs Trail and the Battery Crosby Trail, where no dog walking would be

## Chapter 4: Environmental Consequences

allowed. A ROLA would be established on the southern portion of the beach, immediately north of Lobos Creek, for dog walking under voice and sight control; this ROLA would not be located in suitable habitat for the Marin dwarf-flax. In general, impacts would be limited to the trails and the 6-foot corridor immediately adjacent to the trails; the beach is not suitable habitat for the Marin dwarf-flax and therefore, no impacts would occur in the ROLA. Impacts on the Marin dwarf-flax adjacent to the trails (LOD area) would be long term, minor, and adverse since these areas contain naturally functioning soils that could support the growth of the Marin dwarf-flax. Impacts would occur as a result of disturbance by dogs through trampling or dog waste; nutrient addition could also occur from outside the LOD area, but these impacts would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area at Baker Beach and Bluffs to Golden Gate Bridge would affect only a portion of the entire site, and the Marin dwarf-flax exists in soil outcrops that are relatively inaccessible at the site. Physically restraining dogs on leash would protect the Marin dwarf-flax and potential habitat, the restored population would be protected, and no measurable or perceptible changes in the Marin dwarf-flax would be expected at this site as a result of alternative E. Therefore, assuming compliance, alternative E would result in overall negligible impacts on the Marin dwarf-flax at Baker Beach and Bluffs to Golden Gate Bridge.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. In a ROLA, permit holders may have up to six dogs off leash and the permit may restrict use by time and area. Permits would be allowed at Baker Beach. Impacts on the Marin dwarf-flax from permit holders with four to six dogs off leash would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is not common at Baker Beach and Bluffs to Golden Gate Bridge, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on the Marin dwarf-flax.

**Cumulative Impacts.** The negligible impacts on the Marin dwarf-flax from dogs at Baker Beach and Bluffs to Golden Gate Bridge under alternative E were considered together with the effects of the actions mentioned above under alternative A. The benefits to the Marin dwarf-flax from the park stewardship programs and other actions combined with the negligible impacts from alternative E would result in negligible cumulative impacts.
