Supplemental Environmental Impact Statement

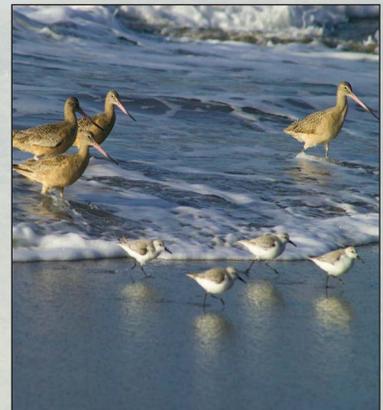

# Golden Gate National Recreation Area California

Draft Dog Management Plan /  
Supplemental Environmental Impact Statement

**UNITED STATES DEPARTMENT OF THE INTERIOR  
NATIONAL PARK SERVICE  
DRAFT DOG MANAGEMENT PLAN / SUPPLEMENTAL ENVIRONMENTAL IMPACT STATEMENT  
GOLDEN GATE NATIONAL RECREATION AREA, SAN FRANCISCO, CA**

Lead Agency: National Park Service (NPS), U.S. Department of the Interior

This Draft Dog Management Plan / Supplemental Environmental Impact Statement (draft plan/SEIS) was prepared for the Golden Gate National Recreation Area (GGNRA or park), which is comprised of multiple sites distributed across San Francisco, Marin, and San Mateo counties. This draft plan/SEIS describes six alternatives at 22 sites, including the preferred alternative (alternative F), for the management of dog walking activities at GGNRA, and details the resources that would be affected by the alternatives and the environmental consequences of implementing these alternatives. Because of the diversity of resources and the variety of use patterns across these park sites, a site-specific approach to analyzing the alternatives was adopted, resulting in a preferred alternative for each site.

The purpose of this action is to determine the manner and extent of dog use in appropriate areas of the park. Action is needed because GGNRA resources and values, as defined by the park's enabling legislation and the NPS *Organic Act*, could be compromised to the extent that, without action, these resources and values in some areas of the park might not be available for enjoyment by future generations. Additionally, a dog management policy inconsistent with NPS regulations and increased public expectations for use of the park for dog recreation have resulted in controversy, litigation, and compromised visitor and employee safety, affecting visitor experience and resulting in resource degradation. These conflicts will likely escalate if not addressed in a comprehensive plan/EIS.

Under alternative A (no action), current dog walking practices would continue. Alternative B would bring the park into alignment with the NPS-wide leash regulation (on-leash dog walking only). Alternative C would emphasize multiple use, and balance use by county (no dogs, on-leash dog walking, and dog walking under voice and sight control in regulated off-leash areas [ROLAs]). Alternative D would be the most protective of resources and visitor safety. Alternative E would provide dog walkers the greatest level of access per area (no dogs, on-leash dog walking, and dog walking under voice and sight control in ROLAs). Alternative D is the environmentally preferable alternative for all areas except for Ft. Funston and Upper and Lower Fort Mason, where alternative B is the environmentally preferable alternative. Alternative F is the NPS preferred alternative, and was altered, in part, in response to public comments received on the draft plan/EIS. Alternative F provides balanced visitor use (no dogs, on-leash dog walking, and dog walking under voice and sight control in ROLAs) as well as protection of natural resources and visitor safety.

The draft plan/SEIS is available for public and agency review and comment beginning with publication of the U.S. Environmental Protection Agency Notice of Availability in the Federal Register. Comments will be accepted during the 90-day public comment period electronically through the NPS Planning, Environment and Public Comment (PEPC) web site listed below or by hard copy sent to the name and address listed below by U.S. Postal Service, other mail delivery service, or hand delivery. Comments will also be accepted during public meetings on the draft plan/SEIS. Comments will not be accepted by fax, email, or in any other way than those specified above. Bulk comments in any format (hard copy or electronic) submitted on behalf of others will not be accepted. After public review, this document will be revised in response to public comments, and a notice of proposed rulemaking will be published for additional public notice and comment. A final version of this document will then be released, and a 30-day no-action period will follow. Following the 30-day period, the alternative or actions constituting the approved plan will be documented in a record of decision that will be signed by the Pacific West Regional Director. A final rule will then be issued. For further information regarding this document, please visit <http://parkplanning.nps.gov/goga> or contact

## **GOLDEN GATE NATIONAL RECREATION AREA**

# **DRAFT DOG MANAGEMENT PLAN / SUPPLEMENTAL ENVIRONMENTAL IMPACT STATEMENT**

**Fall 2013**

# EXECUTIVE SUMMARY

## PURPOSE AND NEED FOR ACTION

The *National Environmental Policy Act of 1969* (NEPA) requires an environmental impact statement (EIS) to briefly provide a statement of purpose and need for the action the agency is proposing. The purpose states the goal the park must achieve by taking action and the need for action summarizes why action is required.

### Purpose for Taking Action

The purpose of the Draft Dog Management Plan / Supplemental Environmental Impact Statement (draft plan/SEIS) is to determine the manner and extent of dog use in appropriate areas of the park. This draft plan/SEIS would promote the following objectives:

- Provide a clear, enforceable dog management policy
- Preserve and protect natural and cultural resources and natural processes
- Provide a variety of visitor experiences
- Improve visitor and employee safety
- Reduce user conflicts
- Maintain park resources and values for future generations.

### Need for Action

A plan/EIS is needed because Golden Gate National Recreation Area (GGNRA or park) resources and values, as defined by the park's enabling legislation and the National Park Service (NPS) *Organic Act*, could be compromised to the extent that, without action, those resources and values in some areas of the park might not be available for enjoyment by future generations. Additionally, a dog management policy inconsistent with NPS regulations and increased public expectations for use of the park for dog recreation have resulted in controversy, litigation, and compromised visitor and employee safety, affecting visitor experience and resulting in resource degradation. The conflicts will likely escalate if not addressed in a comprehensive plan/EIS.

## PURPOSE OF GOLDEN GATE NATIONAL RECREATION AREA

The purpose of GGNRA is to offer national park experiences to a large and diverse urban population while preserving and interpreting its outstanding natural, historic, scenic, and recreational values.

## OBJECTIVES

Objectives are specific goals that describe what GGNRA intends to accomplish by preparing a plan/EIS. These objectives come from a variety of sources, including NPS management policies, laws, and regulations. The objectives help develop alternatives for evaluation and public review. The internal scoping process yielded the following specific objectives for this planning process:

## **Visitor Experience and Safety**

- Minimize conflicts related to dog use by providing a variety of safe, high-quality visitor use experiences, including areas where dogs are allowed.

## **Law Enforcement / Compliance with Dog Rules, and Park Operations**

- Maximize dog walker compliance with clear, enforceable parameters in order to improve park operations and use of staff resources in managing dog walking.

## **Park Operations**

- Provide adaptability and flexibility so that information gathered from monitoring can be used in future decision making based on estimated outcomes, including in new park areas.
- Ensure a safe and healthy working environment for park staff.
- Evaluate commercial dog walking, and if allowed, create and implement an enforceable policy.

## **Natural Resources**

- Protect native wildlife and their habitat (including sensitive species and their habitat, and federally or state listed, unique, or rare species) from detrimental effects of dog use, including harassment or disturbance by dogs.
- Minimize degradation of vegetation, soil and water resources by dog use.
- Preserve opportunities for future natural resource restoration and enhancement.

## **Cultural Resources**

- Preserve opportunities for future cultural resource restoration and enhancement.
- Protect cultural resources from the detrimental effects of dog use.

## **Education**

- Build community support for the plan to maximize management of dog walking use.
- Increase public understanding of NPS policies.

## **BACKGROUND OF DOG MANAGEMENT AT GGNRA**

The history of dog walking in some areas of GGNRA began prior to the establishment of the park, when dog walking, including off-leash dog walking, occurred informally at sites under varied jurisdictions in San Francisco and Marin counties. Some of the lands designated as part of the new national recreation area had been formerly owned and managed by other public entities, and practices prohibited in national park system units, such as allowing dogs off leash, had been sanctioned or allowed on those lands. In the first years after GGNRA was established in 1972, those practices continued largely uninterrupted, although park staff recognized and documented issues arising from the practice during the early years of the park's existence.

In 1978, due to public requests from dog walkers, the Commission developed a pet policy for the park. In 1979, they formally recommended the policy, which has since been known as the "1979 Pet Policy"

(appendix A), to the park Superintendent. The 1979 Pet Policy, developed with input from park staff, provided general guidance for dog walking and recommended locations for both on-leash dog walking and off-leash or “voice control” dog walking in lands owned and managed by GGNRA, although this recommendation did not abide by the federal regulation regarding dog walking in national parks (36 CFR 2.15). The Code of Federal Regulations (CFR) is the codification of the general and permanent rules published in the Federal Register by the executive departments and agencies of the federal government.

Since the 1990s, the San Francisco Bay Area population and overall use of GGNRA park sites have increased, as have the number of private and commercial dog walkers. At the same time, the number of conflicts between park users with and without dogs began to rise, as did the fear of dogs and dog bites or attacks. The hours devoted by park staff to manage these conflicts, rescue dogs and owners, dispose of dog waste, educate the public on dog walking policies and regulations at each park site, and enforce regulations also increased. In addition, since the establishment of the park, several species with habitat in GGNRA areas used by dog walkers have been listed as threatened, endangered, or special-status species requiring special protection.

Underscoring the increasing conflict over off-leash dog use, dog walking groups filed a lawsuit against the NPS in March 2000 when GGNRA closed part of Fort Funston to the public to provide resource protection and restoration. The federal district court held that the NPS had not adequately obtained public input on the proposed closure as required by 36 CFR 1.5. Upon completion of public involvement efforts, the court agreed that GGNRA had fully complied with required sections of 36 CFR 1.5 and that the need for “prompt protective action” was “genuine.” The park closed the original 12 acres in February 2001, per the GGNRA Compendium. During this period, it was clarified by the Department of Justice, U.S. Attorney, and the Department of the Interior Solicitor Offices that the voice control policy then in effect at Fort Funston and other locations in the park was contrary to NPS regulations.

In a public meeting in January 2001, the Commission acknowledged that the voice control policy was contrary to 36 CFR 2.15(a)(2), prohibiting off-leash dogs in national parks, and therefore illegal and unenforceable. In the year following the Commission meeting, park staff attempted to facilitate the transition into compliance with 36 CFR 2.15(a)(2) through educational outreach, new signs, and law enforcement actions including verbal and written warnings. When these measures failed to bring about compliance with the regulation, law enforcement staff issued citations in addition to warnings. During this time, conflicts between dog walkers and park staff increased significantly.

The June 2, 2005, decision by U.S. District Court for Northern California Judge Alsup (*U.S. vs. Barley* 405 F.Supp.2d 1121 (N.D. Cal. 2005)) held that GGNRA cannot enforce the NPS-wide regulation requiring on-leash walking of pets (36 CFR 2.15(a)(2)) in areas that were included in the 1979 Pet Policy until notice and comment rulemaking under Section 1.5(b) is completed. In response, GGNRA revised its enforcement position to reflect that court decision, limiting enforcement of the NPS leash regulation to areas that were not included in the 1979 Pet Policy or that were identified as on-leash dog walking areas in the 1979 Pet Policy. In addition to the 2005 court decision, current dog management at GGNRA is guided by the GGNRA Compendium and the special regulation for protection of western snowy plovers (*Charadrius alexandrinus nivosus*).

A draft plan/EIS was released on January 14, 2011 and public comment was open until May 30, 2011 (136 days). As a result of substantive public comments, NPS determined that a number of changes to the draft plan/EIS would be necessary to be responsive to public comment. These changes include the following:

- the addition of new data (including additional law enforcement and visitor use data)

- new references
- additional *Americans with Disabilities Act* (ADA) information
- changes to the impacts analysis (including additional analysis of potential redistributive effects of opening/closing areas to dog walking)
- changes to the compliance-based management strategy (now referred to as the monitoring-based management strategy) by including natural and cultural resource monitoring and removing automatic triggers and restrictions
- evaluation of additional fencing as a method to minimize dog walking impacts
- relatively minor changes to each site specific preferred alternative.

Additionally, a site recently transferred to GGNRA, Rancho Corral de Tierra (Rancho), was added to the park sites specifically addressed by the plan and a range of reasonable alternatives for the site was developed and is analyzed in this draft plan/SEIS. When significant new information or substantial changes to the proposed action occur that are relevant to environmental concerns, a SEIS should be prepared (Council on Environmental Quality (CEQ) NEPA Regulations, 40 CFR 1502.9(c)). Preparing a draft plan/SEIS at this time gives the NPS the opportunity to hear comment from the public on the new information before NPS issues a Notice of Proposed Rulemaking, the final plan/SEIS and record of decision, and final rule.

## **CURRENT DOG MANAGEMENT ISSUES**

At the internal scoping session of NPS staff and NEPA consultants held in January 2005, observations of current issues surrounding the dog walking controversy generally fell into the following categories:

- Expectations and views of dog walkers and other visitors
- Impacts of dogs on cultural and natural resources in the park
- Visitor use and experience
- Employee, visitor, and dog health and safety
- Needs of urban area residents
- Public confusion over NPS-wide dog regulation, GGNRA-specific rules, NPS mission and policies
- Public lack of understanding and confusion over regulations for dogs at GGNRA park sites, including why some park areas are completely closed to dogs while other areas allow on-leash dog walking
- Visitor noncompliance with regulations
- Ability of law enforcement staff to enforce rules

## **ALTERNATIVES CONSIDERED**

This draft plan/SEIS considers the alternatives based on their impacts in individual areas, due to the complex nature of GGNRA and the various existing visitor use patterns and resource conditions. The draft plan/SEIS therefore defines dog management actions for 22 specific sites within the park. A summary of alternative elements at the 22 sites is listed in table ES-1.

**TABLE ES-1. SUMMARY OF ALTERNATIVE ELEMENTS BY COUNTY, NORTH TO SOUTH**

| GGNRA Site  | Alternative A:<br>No Action (36 CFR 2.15, 36 CFR 7.97 (d); 1979 Pet Policy; GGNRA Compendium) | Alternative B:<br>NPS Leash Regulation (36 CFR 2.15 and GGNRA Compendium) | Alternative C:<br>Emphasis on Multiple Use – Balanced by County (Contains Negotiated Rulemaking Committee Consensus)* | Alternative D: Most Protective of Resources and Visitor Safety | Alternative E: Most Dog Walking Access / Most Management Intensive (Contains Negotiated Rulemaking Committee Consensus and Elements of the 1979 Pet Policy that Meet Purpose, Need and Objectives of the Plan)* | Alternative F: NPS Preferred Alternative |
|---|---|---|---|--|---|--|
| <p><b>Common to All Action Alternatives:</b></p> <ul style="list-style-type: none"> <li>• Dog walking allowed only in areas designated for either on-leash or ROLA* dog walking.</li> <li>• ROLAs may be closed periodically to allow re-growth of vegetation.</li> <li>• All dogs must be licensed in county of residence.</li> <li>• Maximum number of dogs per dog walker is 3, unless permits allowed.</li> <li>• No off-trail dog walking; no dogs in campgrounds or public buildings; on leash in parking lots, picnic areas and on paved, public roads unless otherwise noted.</li> <li>• Service animals accompanying a person with a disability, as defined by Federal law and Department of Justice regulations (28 CFR 36.104), are allowed wherever visitors or employees are allowed.</li> <li>• Monitoring management strategy.</li> </ul> <p>*The concept of a ROLA walking area as a defined area where off-leash dog walking is allowed only under specific guidelines came from discussions in the Negotiated Rulemaking Committee for Dog Management at GGNRA.</p> |   |   |   |  |   |  |

| GGNRA Site  | Alternative A:<br>No Action (36 CFR 2.15, 36 CFR 7.97 (d); 1979 Pet Policy; GGNRA Compendium) | Alternative B:<br>NPS Leash Regulation (36 CFR 2.15 and GGNRA Compendium)   | Alternative C:<br>Emphasis on Multiple Use – Balanced by County (Contains Negotiated Rulemaking Committee Consensus)*   | Alternative D: Most Protective of Resources and Visitor Safety         | Alternative E: Most Dog Walking Access / Most Management Intensive (Contains Negotiated Rulemaking Committee Consensus and Elements of the 1979 Pet Policy that Meet Purpose, Need and Objectives of the Plan)* | Alternative F: NPS Preferred Alternative   |
|---|---|---|---|--|---|--|
| <b>Permits for More than three Dogs – Commercial and Individual Dog Walkers</b> | No permits.   | All dog walkers, including commercial dog walkers, allowed up to three dogs per person. All dogs must be on leash. No permit is required. | All dog walkers, including commercial dog walkers, allowed with up to 3 dogs per person. Commercial dog walkers and private individuals with more than 3 dogs can obtain a dog walking permit; limit is 6 dogs. In a ROLA, permit holders may have up to 6 dogs off leash. Permits would restrict use by time and area. Permits would only be issued for: Alta Trail, Rodeo Beach, Fort Baker (excluding Drown Fire Road), Fort Mason, Crissy Field, Baker Beach, and Fort Funston. | No commercial dog walking allowed and no permits for more than 3 dogs. | Same as alternative C.  | All dog walkers, including commercial dog walkers, allowed with up to 3 dogs per person. Commercial dog walkers and private individuals with more than 3 dogs can obtain a dog walking permit; limit is 6 dogs. In a ROLA, permit holders may have up to 6 dogs off leash. Permits would restrict use by time and area. Permits would only be issued for: Alta Trail, Rodeo Beach, Fort Baker (excluding Drown Fire Road), Fort Mason, Crissy Field, Baker Beach, and Fort Funston. On Alta Trail, permit holders allowed to junction with Oakwood Valley Trail. |

Table ES-1. Summary of Alternative Elements by County, North to South

| <b>GGNRA Site</b>   | <b>Alternative A:<br/>No Action (36 CFR 2.15, 36 CFR 7.97 (d); 1979 Pet Policy; GGNRA Compendium)</b> | <b>Alternative B:<br/>NPS Leash Regulation (36 CFR 2.15 and GGNRA Compendium)</b>   | <b>Alternative C:<br/>Emphasis on Multiple Use – Balanced by County (Contains Negotiated Rulemaking Committee Consensus)*</b> | <b>Alternative D: Most Protective of Resources and Visitor Safety</b> | <b>Alternative E: Most Dog Walking Access / Most Management Intensive (Contains Negotiated Rulemaking Committee Consensus and Elements of the 1979 Pet Policy that Meet Purpose, Need and Objectives of the Plan)*</b> | <b>Alternative F: NPS Preferred Alternative</b>                          |
|---|---|---|---|---|--|--|
| <b>Marin County Sites</b>                                     |   |   |   |   |  |  |
| <b>Stinson Beach</b><br>(parking lots and picnic areas only)  | On leash.   | Same as alternative A.  | Same as alternative A.  | No dogs.  | Same as alternative A.   | On leash with on-leash path to Upton Beach added from north parking lot. |
| <b>Homestead Valley</b>                                       | Entire site on leash or under voice control.  | Homestead Fire Road, and neighborhood connector trails (Homestead Trail and Homestead Summit Trail) to be designated in the future: on leash. | Same as alternative B.  | Homestead Fire Road: on leash.  | Same as alternative B.   | Same as alternative B.   |
| <b>Alta Trail<br/>Orchard Fire Road<br/>Pacheco Fire Road</b> | On leash or under voice control from Marin City to Oakwood Valley.                                    | Alta Trail: on leash to Orchard Fire Road. Orchard and Pacheco fire roads: on leash.  | Same as alternative B.  | No dogs.  | Alta Trail: on leash to junction with Morning Sun Trail (see Marin Headlands Trails alternative E for description of Morning Sun Trail). Orchard and Pacheco fire roads: on leash.                                     | Same as alternative E.   |

| <b>Rancho Corral de Tierra</b> | On leash.   | On leash on designated trails in two areas open to dog walking near Montara and El Granada. | Same as alternative B, with a ROLA between Le Conte and Tamarind Street, across the street and east of Farallone View School. | On leash on the two existing San Mateo County trails: Old San Pedro Mountain Road and the Farallon Cutoff in Montara. | Same as alternative C.  | Same as alternative B.                   |

## **DESCRIPTION OF THE ALTERNATIVES**

### **Alternative A: No Action (Continuation of Existing Management)**

The no-action alternative is defined in the NEPA guidelines as no change from current management and current conditions. In the impact analysis of no action, the draft plan/SEIS assumes current management would continue as it is now over the lifetime of the plan, which is approximately 20 years. Under the no-action alternative, current dog walking management and conditions would remain the same, which would include 36 CFR 2.15 (36 CFR 2.15(a)(2) applicable only in areas not part of 1979 Pet Policy—see below), 36 CFR 7.97(d), the Commission’s 1979 Pet Policy (appendix A), and the GGNRA Compendium (NPS 2001b; appendix B). The 1979 Pet Policy allows voice control dog walking in a number of areas of GGNRA. The 1979 Pet Policy described voice or leash control as a flexible system wherein success is dependent upon the willingness of visitors and local residents to cooperate with GGNRA personnel and the willingness of GGNRA personnel to manage dogs, people, and wildlife situations; to enforce regulations; and to cite visitors (1979 Pet Policy). As a result of the 2005 federal court decision (*U.S. v. Barley*, 405 F.Supp.2d 1121 (N.D. Cal. 2005)), the NPS currently cannot enforce the NPS-wide regulation requiring pets to be on leash (36 CFR 2.15(a)(2)) or designating an area “no dogs” for park sites that were included in the 1979 Pet Policy and where 36 CFR 1.5 was not followed (allowing for public comment). However, regulations that address disturbance to wildlife, removal of pet waste, and disturbance of other park visitors remain in effect in all areas open to dog walking in GGNRA. The GGNRA Compendium also includes provisions for the closure of park areas to dog and human use for resource or safety reasons. Under the current conditions commercial dog walkers use park lands and no permit is required.

### **Alternative B: NPS Leash Regulation**

Alternative B realigns GGNRA dog management to the policy governing dogs at the other 391 units of the national park system, as defined by 36 CFR 2.15(a)(2). Areas closed to dogs would be further defined by a special regulation or the GGNRA Compendium. All dog walkers, including commercial dog walkers, would be allowed up to three dogs per person. All dogs would have to be on leash and no permits would be needed for dog walking.

### **Alternative C: Emphasis on Multiple Use – Balanced by County**

Alternative C emphasizes the diversity of users of GGNRA sites and apportions dog walking geographically across Marin, San Francisco, and San Mateo counties by allowing a variety of options in each county. In Marin and San Francisco counties, there are options for on-leash areas, regulated off-leash areas (ROLAs) (“off leash” is assumed to mean “under voice and sight control” throughout the description of the action alternatives, per the definition outlined in “Dog Walking Requirements” (NPS 2009c, 1) in appendix E of this draft plan/SEIS), and areas where dogs would be prohibited. In San Mateo, there are options for on-leash areas and areas where dogs would be prohibited. GGNRA is used by visitors for a multitude of purposes and alternative C would minimize potential conflicts, reduce potential health and safety issues, and protect natural and cultural resources, while providing dog walkers with recreational options. Alternative C also includes the consensus agreements resulting from the Negotiated Rulemaking Committee meetings. All dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs without a permit. Any dog walker, commercial or private, would be able to obtain a permit to walk four to six dogs, whether on leash or in a ROLA, as allowed by the regulation. Permits could restrict dog walking use by time and area. Permits would only be issued for the following sites: Alta Trail, Rodeo Beach, Fort Baker, Fort Mason, Crissy Field, Baker Beach, and Fort Funston.

### **Alternative D: Most Protective of Resources and Visitor Safety**

Alternative D would provide the highest overall level of protection for natural and cultural resources and the highest overall level of visitor safety. Dog management practices listed in alternative D would allow options for dogs to be exercised on leash and in ROLAs but would be more protective in areas where natural resources (plant and wildlife species) and cultural resources are located. The more protective dog management elements offered in alternative D would also provide a stronger measure of visitor protection for both dog walkers and other park visitors by reducing circumstances that would cause conflicts among users and interactions among dogs, thereby minimizing direct and indirect effects of dogs on visitors. Dog walkers would be allowed to walk one to three dogs without a permit. No commercial dog walking would be allowed under this alternative.

### **Alternative E: Most Dog Walking Access / Most Management Intensive**

Alternative E would provide the greatest level of access for dog walkers throughout GGNRA. Alternative E would also require the most intensive long-term management to ensure that greater access for dog walkers did not impact natural and cultural resources, visitor safety, and visitor experience. Alternative E would also include the consensus agreements resulting from the Negotiated Rulemaking Committee meetings. All dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs without a permit. Any dog walker, commercial or private, could obtain a permit to walk four to six dogs. In a ROLA, permit holders could have up to six dogs under voice and sight control. Permits could restrict dog walking use by time and area. Permits would only be issued for the following sites: Alta Trail, Rodeo Beach, Fort Baker, Fort Mason, Crissy Field, Baker Beach, and Fort Funston.

### **Alternative F: National Park Service Preferred Alternative**

Alternative F is the preferred alternative, and was altered, in part, in response to public comments received on the draft plan/EIS. Alternative F provides balanced visitor use (no dogs, on-leash dog walking, and dog walking under voice and sight control in ROLAs) as well as protection of natural resources, cultural resources, and visitor safety. All dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs without a permit. Any dog walker, commercial or private, could obtain a permit to walk four to six dogs. In a ROLA, permit holders could have up to six dogs under voice and sight control. Permits could restrict dog walking use by time and area. Permits would only be issued for the following sites: Alta Trail, Rodeo Beach, Fort Baker, Fort Mason, Crissy Field, Baker Beach, and Fort Funston.

## **COMMERCIAL DOG WALKING AND DOG WALKING WITH MORE THAN THREE DOGS**

As stated in the above paragraphs, commercial dog walking would be allowed under alternatives B, C, E, and F. Commercial dog walking would not be allowed under alternative D. Under alternative B, commercial dog walking would be regulated under the same guidelines and regulations that apply to recreational dog walkers, including the three-dog maximum. Because alternative B does not allow for dog walking under voice control, commercial dog walking would be on leash only. Under alternatives C, E, and F, commercial dog walking would be allowed under the same guidelines and regulations that apply to recreational dog walkers, including walking up to three dogs without a permit. However, under these two alternatives, both commercial and recreational dog walkers could apply for a permit to walk up to six dogs. In a ROLA, permit holders may have up to six dogs under voice and sight control. Permits would restrict use by time and area. Permits would be issued for the following sites: Alta Trail, Rodeo Beach, Fort Baker, Fort Mason, Crissy Field, Baker Beach, and Fort Funston. Alternative D would not allow commercial dog walking, due to the emphasis on resource protection and visitor safety. The guidelines for professional dog walkers on GGNRA lands are presented in chapter 2.

## **MONITORING-BASED MANAGEMENT STRATEGY**

In order to ensure protection of resources from dog walking activities, the dog walking regulations defined in action alternatives B, C, D, E, and F would be regularly enforced by park law enforcement, and monitored by park staff. A monitoring-based management strategy would be implemented encourage compliance with the dog walking regulation and would apply to all action alternatives. It will allow staff to monitor and record noncompliance as well as impacts to natural and cultural resources. Monitoring would inform park management and law enforcement when, where, and how to prioritize responses to noncompliance. Noncompliance would include dog walking within restricted areas, dog walking under voice and sight control in designated on-leash dog walking areas, and dog walking under voice and sight control outside of established ROLAs. If noncompliance occurs, impacts to resources have the potential to increase and become short-term minor to major adverse. To prevent these impacts from increasing or occurring outside of the designated dog walking areas the NPS would regularly monitor all sites. When the level of compliance is deemed unacceptable based on violations and/or impacts to resources, primary management actions such as focused enforcement of regulations, education, and establishment of buffer zones, time and use restrictions, and SUP restrictions would be implemented. If noncompliance continues, secondary management actions including short-term closures (typically one year or less) would be implemented through the compendium. The park would evaluate whether to propose a long-term closure, which would be made available to the public. Impacts from noncompliance could reach short-term minor to major adverse, but the monitoring-based management strategy is designed to return impacts to a level that assumes compliance, as described in the overall impacts analysis.

## **PREFERRED ALTERNATIVE**

Alternative F was selected as the preferred alternative in this draft plan/SEIS (table ES-1). Due to the high number of sites and alternatives, a modified Choosing by Advantages process was used for choosing the preferred alternative. For each site, team members from GGNRA selected the alternative that best met the objectives of the plan (defined in chapter 1). Six main objectives were used to identify the preferred alternative. Each objective included more than one subtopic for the resource. Not all of the subtopics for each objective were compatible, requiring team members to balance competing needs. After evaluating each alternative against each objective, a preferred alternative was selected that best met the objectives for the dog management plan.

## **ENVIRONMENTALLY PREFERABLE ALTERNATIVE**

The environmentally preferred alternative was selected for each of the 22 sites during the Choosing by Advantages meeting. The rationale to support the decision for the selection of the environmentally preferred alternative for each site is presented in detail in chapter 2. Alternative D which is the most protective alternative based on resource protection and visitor safety was selected as the environmentally preferred alternative for all sites, except for Fort Funston and Upper and Lower Fort Mason where alternative B (NPS leash regulation) was chosen as the environmentally preferable alternative. In the case of Fort Funston and Upper and Lower Fort Mason, alternative B provides the maximum protection of natural and cultural resources at the site.

## **ENVIRONMENTAL CONSEQUENCES**

The summary of environmental consequences considers the actions being proposed and the cumulative impacts to resources from occurrences inside and outside the park. The potential environmental consequences of the actions are addressed for vegetation and soils, wildlife, special-status species, and cultural resources; other topics considered in detail include visitor use and experience, park operations,

and human health and safety. A brief summary of the environmental consequences for each site is presented below and is discussed in detail in chapter 4.

The environmental consequences analysis for the action alternatives was based on the assumption of compliance. If substantial noncompliance occurs under the action alternatives, it may result in elevated impacts that could reach short-term minor to major adverse. However, the monitoring-based management strategy which is discussed in detail in chapter 2, is designed to return impacts to a level that assumes compliance or provide beneficial impacts where dog walking is reduced or eliminated.

## **Marin County**

### **Stinson Beach**

Generally, impacts from action alternatives, B, C, D, and E to natural resources (vegetation, wildlife, and special-status species, including steelhead trout) would be no impact, a result of the fact that dogs would be prohibited on the trails, beach, and creek, and prohibited from the site entirely under alternative D. The preferred alternative F would have long-term, minor, adverse impacts to coastal vegetation as dogs would be prohibited on the beach but would be allowed on a formalized path to Upton Beach, which would contribute to continued erosion. However, the park would determine the most appropriate location for the access route to Upton Beach to reduce the potential for added dune erosion at this location and would consider restoration of the dunes in this area in the future. Alternative F would have no impact to wildlife or special-status species. Impacts for visitors who enjoy having dogs at the park would range from negligible to long-term, minor, adverse under action alternatives B, C, D, and E, and would be beneficial under the preferred alternative F. Impacts for visitors who did not prefer dogs at the park would be beneficial under all action alternatives including the preferred alternative F, since dogs would be prohibited from the majority of the beach except for the small connecting trail corridor at the northern boundary. Impacts to park operations would be short-term, moderate to major, and adverse for all action alternatives including the preferred alternative F from the addition of new employees and equipment costs. In the long-term, impacts would be negligible to minor after the initial education and enforcement period. Impacts to health and safety would be long-term, moderate, and adverse under the no-action alternative and long-term, minor, adverse under all action alternatives (including the preferred alternative F) except for D, which would have a negligible impact since dogs would be prohibited at the site.

### **Homestead Valley**

Impacts to natural resources under the action alternatives, including the preferred alternative F, are negligible for vegetation and special-status species (northern spotted owl) and range from negligible to long-term, minor adverse for wildlife. Under the no-action alternative, impacts to wildlife would be long-term, minor to moderate, and adverse. Impacts to visitors who enjoy having dogs at the park would be long-term, minor, and adverse under the action alternatives including the preferred alternative F, while the impacts to visitors who do not enjoy dogs at the park would be beneficial under the action alternatives including the preferred alternative F. Impacts to park operations would be short-term, moderate to major and adverse for all action alternatives including the preferred alternative F. In the long-term, impacts would be negligible to minor after the initial education and enforcement period. Health and safety impacts would be negligible under all alternatives including the preferred alternative F. Impacts to park operations would also be beneficial for all action alternatives, since the site would change from under voice and sight control to on leash.

### **Alta Trail, Orchard Fire Road, and Pacheco Fire Road**

Impacts to natural resources (vegetation and special-status species such as the mission blue butterfly) from the action alternatives, including the preferred alternative F, on vegetation would be negligible with the exception of alternative D, which would have no impact as dogs would not be allowed at the site. Impacts to wildlife from the action alternatives would range from negligible to long-term, minor, and adverse, with the exception of alternative D, which would have no impact as dogs would not be allowed at the site. The no-action alternative would result in long-term, minor to moderate, and adverse impacts for wildlife and long-term, minor, adverse impacts on special-status species such as the mission blue butterfly. Impacts to visitors who prefer dogs at the park would range from long-term, minor to moderate, and adverse for all action alternatives including the preferred alternative F, except alternative D, which would have a long-term, moderate to major, and adverse impact on this group of visitors. Visitors who do not prefer dogs at the park would experience beneficial impacts under the action alternatives including the preferred alternative F, and long-term, moderate, adverse impacts under the no-action alternative. Impacts to park operations would be short-term, moderate to major, and adverse for all action alternatives. In the long-term, impacts would be negligible to minor after the initial education and enforcement period. The action alternatives including the preferred alternative F would generally have a negligible to long-term, minor, adverse impact on health and safety.

### **Oakwood Valley**

Impacts to the natural resources (vegetation and wildlife) under the action alternatives generally would range from negligible to long-term, minor, and adverse. The action alternatives would result in negligible impacts to special-status species, including the mission blue butterfly and the northern spotted owl. The no-action alternative would result in negligible to long-term, moderate adverse impacts to vegetation, wildlife and special-status species, including the mission blue butterfly and the northern spotted owl. Alternatives C and E would provide a ROLA at Oakwood Valley. Impacts to visitors who prefer having dogs at the park would be negligible under alternatives with ROLAs, and long-term, moderate, and adverse for alternatives that do not have ROLAs. Under the preferred alternative F, long-term moderate adverse impacts for visitors who would prefer to walk dogs at the park would occur since off-leash dog walking would no longer be available and on-leash dog walking would be allowed only in designated areas. Visitors who do not prefer dogs at the park would have beneficial impacts from all action alternatives. Impacts to park operations under all the action alternatives including the preferred alternative F would be short-term, moderate to major, and adverse. In the long-term, impacts would be negligible to minor after the initial education and enforcement period. Negligible impacts to health and safety would occur under all alternatives, including the preferred alternative F.

### **Muir Beach**

Impacts to vegetation and wildlife would range from negligible to long-term, minor, and adverse impacts under the action alternatives, but alternative D would have no impacts on some of these communities. Impacts under the no-action alternative would range from negligible to long-term, minor, and adverse, to long-term, moderate and adverse for natural resources, while impacts from the action alternatives generally would range from negligible to long-term, minor, and adverse. Impacts to special-status species (including coho salmon, steelhead trout, and the California red-legged frog) under all action alternatives would be negligible and would range from negligible to long-term, minor, and adverse under the no-action alternative. Impacts on cultural resources would be negligible to long-term, minor, and adverse. Visitors who prefer having dogs at the site would experience long-term, minor to moderate and adverse impacts under all action alternatives except alternative D, which would have long-term, moderate, and adverse impacts. Impacts to visitors who do not prefer dogs would be beneficial under all action alternatives including the preferred alternative F, and long-term, moderate, and adverse under the

no-action alternative. Impacts to park operations would be short-term, moderate to major, and adverse, but would also include long-term, negligible to minor, and adverse impacts after the initial education and enforcement period. Impacts to health and safety would range from negligible to long-term, minor, and adverse.

### **Rodeo Beach/South Rodeo Beach**

Impacts to natural resources (vegetation, wildlife, and special-status species, include steelhead trout) would range from negligible to long-term, minor, and adverse under alternatives B and D. The no-action alternative would have impacts that range from negligible to long-term, moderate, and adverse on natural resources, while alternatives C, E, and the preferred alternative F would cause impacts ranging from long-term, minor, and adverse to long-term, moderate, and adverse impacts on some coastal community wildlife and vegetation due to the ROLA. Visitors who prefer dogs at the site would experience beneficial impacts under alternatives C, E, and the preferred alternative F, long-term, minor to moderate, and adverse impacts under alternative B, and long-term, moderate, adverse impacts under alternative D. Visitors who do not prefer dogs would experience beneficial impacts under alternatives B and D, and long-term, minor, and adverse impacts under alternatives C, E, and the preferred alternative F. Impacts to park operations would be short-term, moderate to major, and adverse under all action alternatives. Impacts would be long-term, negligible to minor, and adverse following the initial education and enforcement period. Impacts on health and safety would range from negligible to long-term, minor, and adverse for all alternatives.

### **Marin Headlands Trails**

Impacts to natural resources (vegetation, wildlife and special status-species, including the mission blue butterfly, steelhead trout, California red-legged frog, northern spotted owl, and marsh sandwort) range from long-term, minor to moderate, and adverse under the no-action alternative. Alternatives B and D would result in no impacts to natural resources. Under alternatives C, E, and the preferred alternative F, impacts to natural resources would range from negligible to long-term, moderate and adverse impacts for vegetation and wildlife. Cultural resource impacts would range from negligible to long-term, minor, and adverse localized impacts under all alternatives including the preferred alternative F, with the action alternatives including the preferred alternative F also having beneficial impacts. Visitors who enjoy having dogs at the park would experience long-term, minor to moderate, and adverse impacts under alternatives C, E, and the preferred alternative F, and long-term, moderate, and adverse impacts under alternatives B and D. Visitors who do not prefer having dogs at the site would experience beneficial impacts under all alternatives, including the preferred alternative F. Impacts to park operations would be short-term, moderate to major, and adverse for all action alternatives including the preferred alternative F. Impacts to park operations would also be long-term, negligible to minor, and adverse following the initial education and enforcement period. Alternatives B and D would have negligible impacts on health and safety, while alternatives C, E, and the preferred alternative F would have long-term, minor, and adverse impacts. Impacts to health and safety would be long-term, moderate, and adverse under the no-action alternative.

### **Fort Baker**

Impacts to natural resources (vegetation, wildlife, and special-status species such as the mission blue butterfly) would range from negligible to long-term, minor, and adverse for all action alternatives except alternative D, which would have no impacts on the mission blue butterfly. Under the no-action alternative, there would be a long-term, minor, to moderate and adverse impacts to natural resources (vegetation, wildlife, and special-status species such as the mission blue butterfly). Cultural resource impacts would range from negligible to long-term, minor, and adverse localized impacts under all

alternatives including the preferred alternative F, with the action alternatives including the preferred alternative F also having beneficial impacts. Visitors who prefer dogs at the site would experience negligible impacts under all action alternatives including the preferred alternative F, with the exception of alternative D, which would result in long-term, minor, and adverse impacts. Visitors who do not enjoy dogs would have negligible impacts under all action alternatives including the preferred alternative F except alternative D, which would result in beneficial impacts. Impacts to park operations would be short-term, moderate to major, and adverse for all action alternatives, including the preferred alternative F. Following the initial education and enforcement period, impacts would be long-term, negligible to minor, and adverse. All alternatives would result in negligible impacts to health and safety.

## **San Francisco County**

### **Upper and Lower Fort Mason**

Impacts to natural resources were not applicable at Upper and Lower Fort Mason. Impacts to cultural resources would range from negligible to long-term, minor, and localized adverse under all alternatives including the preferred alternative F, with the action alternatives including the preferred alternative F also having beneficial impacts. Visitors who enjoy dogs would experience negligible impacts under alternative B and the preferred alternative F, but beneficial impacts under all other action alternatives. Visitors who do not enjoy dogs would experience long-term, minor, and adverse impacts under alternatives B, D, and the preferred alternative F, and long-term, moderate, and adverse impacts under alternatives C and E. Impacts to park operations would be short-term, moderate to major, and adverse for all action alternatives including the preferred alternative F. Following the initial education and enforcement period, impacts would be long-term, negligible to minor, and adverse. Impacts to health and safety would be long-term, minor, adverse for alternative B and long-term, minor to moderate and adverse for alternatives C, D, E, and the preferred alternative F. Impacts to health and safety would be long-term, moderate and adverse for the no-action alternative.

### **Crissy Field (includes Wildlife Protection Area)**

In general, impacts to natural resources (vegetation, wildlife, and special-status species, including the Western snowy plover) would be negligible to long-term, minor, and adverse under the action alternatives. The exception would be the long-term, minor, to moderate impacts that would occur to wildlife and the long-term, minor, and adverse impacts that would occur to the Western snowy plover under alternative E. Under the no-action alternative, impacts to natural resources (vegetation, wildlife, and the Western snowy plover) would range from long-term, minor, to moderate, and adverse. Impacts to cultural resources would range from negligible to long-term, minor, and adverse localized under all alternatives including the preferred alternative F, with the action alternatives including the preferred alternative F also having beneficial impacts. Visitors who enjoy having dogs at the site would experience long-term, minor to moderate, adverse impacts under alternatives C, D, E, and the preferred alternative F, and long-term, moderate to major, and adverse impacts under alternative B. Visitors who do not enjoy dogs would have beneficial impacts under all action alternatives including the preferred alternative F, but long-term, moderate, and adverse impacts under the no-action alternative. Impacts to park operations would be short-term, moderate to major, and adverse for all action alternatives including the preferred alternative F. Following the initial education and enforcement period, impacts would be long-term, negligible to minor, and adverse. Health and safety impacts under the action alternatives would range from no impact to long-term, minor to moderate, and adverse depending on the area within the site. Impacts from the no-action alternative would be long-term, moderate to major, and adverse.

### **Fort Point Promenade/Fort Point NHS Trails**

Impacts to vegetation and wildlife were not analyzed at Fort Point as the site is largely developed. Fort Point however, does provide critical habitat for the Franciscan manzanita, although the plant does not currently occur at the site (USFWS 2012, 54530). Impacts to this special-status species, the Franciscan Manzanita, would be negligible for all action alternatives and long-term, minor, adverse for the no-action alternative because current dog use at the site, particularly off-leash dogs, could prevent successful introduction of the species to the site. Impacts to cultural resources would range from negligible to long-term, minor, and adverse localized under all alternatives including the preferred alternative F, with the action alternatives including the preferred alternative F also having beneficial impacts. Visitors who prefer having dogs at the park would experience negligible impacts under alternatives B, C, E, and the preferred alternative F, and long-term, minor, and adverse impacts under alternative D. Visitors who do not prefer having dogs at the site would experience negligible to long-term, minor, and adverse impacts under alternatives B, C, E, and the preferred alternative F. These visitors would experience beneficial impacts under alternative D. Impacts to park operations would be short-term, moderate to major, and adverse for all action alternatives including the preferred alternative F. Following the initial education and enforcement period, impacts would be long-term, negligible to minor, and adverse. Impacts to health and safety would be long-term, minor, and adverse under the action alternatives including the preferred alternative F, and long-term, minor to moderate, and adverse under the no-action alternative.

### **Baker Beach and Bluffs to Golden Gate Bridge**

Impacts to natural resources (vegetation, wildlife, and special-status species, including the mission blue butterfly and five listed plant species) would range from negligible to long-term, minor, and adverse for the action alternatives including the preferred alternative F, but long-term, minor to moderate, adverse impacts would occur to coastal community wildlife under alternative E. Impacts from the no-action alternative to natural resources (vegetation, wildlife, and special-status species, including the mission blue butterfly and five listed plant species) would range from negligible to long-term, moderate, and adverse. Impacts to cultural resources would range from negligible to long-term, minor, and adverse localized under all alternatives including the preferred alternative F, with the action alternatives including the preferred alternative F also having beneficial impacts. Visitors who enjoy having dogs at the park would experience long-term, minor to moderate, adverse impacts under alternatives B and C, long-term, moderate, and adverse impacts under alternative D and the preferred alternative F, and negligible impacts under alternative E. Visitors who do not prefer dogs would have beneficial impacts under all action alternatives including the preferred alternative F, with the exception of alternative E, which would have long-term, minor, and adverse impacts. The no-action alternative would result in long-term, minor to moderate and adverse impacts on these visitors. Impacts to park operations would be short-term, moderate to major, and adverse for all action alternatives including the preferred alternative F. Following the initial education and enforcement period, impacts would be long-term, negligible to minor, and adverse. Impacts on health and safety would be negligible for alternatives B, C, D, and the preferred alternative F, long-term, minor, adverse for alternative E, and long-term, minor to moderate, and adverse for the no-action alternative.

### **Fort Miley**

Impacts to natural resources would range from negligible to long-term, minor, and adverse for all alternatives including the preferred alternative F, but alternatives B and D would have no impact on wildlife in coniferous communities. Impacts to cultural resources would range from negligible to long-term, minor, and adverse localized under all alternatives including the preferred alternative F, with the action alternatives including the preferred alternative F also having beneficial impacts. Visitors who prefer having dogs at the park would experience long-term, minor, and adverse impacts under the action

alternatives including the preferred alternative F, while visitors who do not prefer dogs at the park would experience beneficial impacts under these alternatives. Impacts to park operations would be short-term, moderate to major, and adverse for all action alternatives including the preferred alternative F. Following the initial education and enforcement period, impacts would be long-term, negligible to minor, and adverse. Impacts on health and safety would be negligible for all alternatives.

### **Lands End**

Impacts on natural resources (vegetation and wildlife) from the action alternatives including the preferred alternative F would range from negligible to long-term, minor, and adverse. The no-action alternative would have impacts that range from negligible to long-term, moderate, and adverse on natural resources (vegetation and wildlife). Impacts on cultural resource would be negligible for all action alternatives including the preferred alternative F, and negligible to long-term, minor, and adverse localized impacts for the no-action alternative. Visitors who enjoy dogs at the park would experience long-term, minor to moderate, and adverse impacts under the action alternatives including the preferred alternative F, while visitors who do not enjoy dogs at the site would experience beneficial impacts under these alternatives. Impacts to park operations would be short-term, moderate to major, and adverse for all action alternatives including the preferred alternative F. Following the initial education and enforcement period, impacts would be long-term, negligible to minor, and adverse. Impacts to health and safety would be negligible for the action alternatives including the preferred alternative F, and would be long-term, minor to moderate, and adverse for the no-action alternative.

### **Sutro Heights Park**

Natural and cultural resources were not applicable at Sutro Heights Park. Impacts on visitors who enjoy having dogs at the park would be long-term, minor, and adverse for alternatives B, C, and D, and negligible for alternative E and the preferred alternative F. Visitors who do not enjoy dogs would experience beneficial impacts under alternatives B, C, and D, and negligible to long-term, minor, and adverse impacts under alternative E and the preferred alternative F. Impacts to park operations would be short-term, moderate to major, and adverse for all action alternatives including the preferred alternative F. Following the initial education and enforcement period, impacts would be long-term, negligible to minor, and adverse. Impacts on health and safety would be negligible for all alternatives.

### **Ocean Beach (Includes Snowy Plover Protection Area)**

Impacts to coastal community vegetation would range from negligible to long-term, minor, and adverse under all alternatives. However, impacts to the wildlife in the Ocean Beach SPPA would be long-term, moderate to major, and adverse to shorebirds under the no-action alternative, and long-term, minor, and adverse under alternative E. Alternatives B, C, D, and the preferred alternative F would have no impact on coastal community wildlife in the SPPA because dogs would be prohibited in this area. Coastal community wildlife outside the SPPA would experience long-term, moderate impacts under the no-action alternative, long-term, minor to moderate impacts under alternatives C, E, and the preferred alternative F, and long-term, minor, adverse impacts under alternatives B and D. Inside the SPPA, impacts to the Western snowy plover would be long-term, moderate, and adverse under the no-action alternative; impacts would be long-term, minor, and adverse under alternative E; no impacts under alternatives B, C, D, and the preferred alternative F would occur on this threatened species. Outside the SPPA, impacts on the Western Snowy Plover would range from negligible to long-term, minor, and adverse for the action alternatives including the preferred alternative F, and would be long-term, minor to moderate, and adverse under the no-action alternative. Impacts to visitors who enjoy having dogs at the park would be long-term, moderate to major and adverse under alternatives B and D, and long-term, minor to moderate, adverse under alternatives C, E, and the preferred alternative F. Impacts to visitors who do not enjoy dogs would

be beneficial under the action alternatives including the preferred alternative F, and long-term, moderate, and adverse under the no-action alternative. Impacts to park operations would be short-term, moderate to major, and adverse for all action alternatives including the preferred alternative F. Following the initial education and enforcement period, impacts would be long-term, negligible to minor, and adverse. Impacts to health and safety would be long-term, minor to moderate, and adverse under alternatives C, E, and the preferred alternative F, long-term, minor, and adverse under alternatives B and D, and long-term, moderate, and adverse under the no-action alternative.

### **Fort Funston**

Impacts to coastal community vegetation would be long-term, major, and adverse under the no-action alternative, long-term, moderate, adverse under alternative E, and long-term, minor to moderate and adverse under alternatives C, D, and the preferred alternative F. Alternative B would only have negligible impacts to vegetation. Coastal community wildlife would experience long-term, moderate to major, adverse impacts from the no-action alternative; long-term, moderate, and adverse impacts from alternatives C, E, and the preferred alternative F; and long-term, minor, adverse impacts from alternatives B and D. Impacts on the bank swallow would be long-term, minor and adverse under the no-action alternative, negligible under alternatives B and E. Alternatives C, D, and the preferred alternative F would have no impact on the bank swallow. Impacts to the San Francisco lessingia would be long-term, minor, and adverse for alternatives C, D, E, and the preferred alternative F, negligible for alternative B, and long-term, moderate, and adverse under the no-action alternative. Impacts to cultural resources would range from negligible to long-term, minor, and adverse localized under all alternatives including the preferred alternative F, with the action alternatives including the preferred alternative F also having beneficial impacts. Visitors who enjoy having dogs at the park would experience long-term, moderate to major, adverse impacts under alternative B and D, long-term, moderate, and adverse impacts under alternative C, and long-term, minor, adverse impacts under alternatives E and the preferred alternative F. Impacts to visitors who do not prefer dogs would be long-term, moderate to major, and adverse for the no-action alternative, long-term, moderate, and adverse under alternative E and the preferred alternative F, long-term, minor to moderate, and adverse for alternative C, long-term, minor, adverse for alternative D, and negligible to long-term, minor, and adverse under alternative B. Impacts to park operations would be short-term, moderate to major, and adverse for all action alternatives including the preferred alternative F. Following the initial education and enforcement period, impacts would be long-term, negligible to minor, and adverse. Impacts to health and safety would be long-term, moderate to major, and adverse for the no-action alternative, long-term, minor to moderate, adverse for alternatives C, D, E, and the preferred alternative F, and long-term, minor, and adverse for alternative B.

### **San Mateo County**

#### **Mori Point**

Impacts to natural resources (vegetation, wildlife, and special-status species including the California red-legged frog, San Francisco garter snake, and a listed plant species) would generally range from negligible to long-term, minor, and adverse, with alternative D having no impact. The no-action alternative would have a long-term, minor to moderate, adverse impact on coastal scrub, chaparral, and grassland wildlife, and a negligible to long-term, moderate, and adverse impact on the California red-legged frog. Impacts to visitors who prefer dogs at the park would be long-term, minor to moderate, and adverse for alternatives B and C, long-term, minor, adverse for alternative E and the preferred alternative F, and long-term, moderate to major and adverse for alternative D. Visitors who do not prefer dogs would experience beneficial impacts under the action alternatives including the preferred alternative F. Impacts to park operations would be short-term, moderate to major, and adverse for all action alternatives including the preferred alternative F. Following the initial education and enforcement period, impacts would be long-

term, negligible to minor, and adverse. Impacts to health and safety would be negligible for all alternatives.

### **Milagra Ridge**

Impacts to natural resources (vegetation and wildlife) would range from negligible to long-term, minor, and adverse for the action alternatives including the preferred alternative F, with alternative D having no impact. Impacts to special-status species (including the San Bruno elfin butterfly, mission blue butterfly, California red-legged frog, and San Francisco garter snake) would range from no impacts to negligible impacts under the action alternatives. The no-action alternative would have a long-term, minor to moderate and adverse impact on wildlife and negligible to long-term minor adverse impacts to special-status species. Impacts on visitors who enjoy dogs would be long-term, minor, and adverse for alternatives B, C, and the preferred alternative F; negligible to long-term, minor, adverse for alternative E; and long-term moderate adverse impacts under alternative D. Visitors who do not enjoy dogs at the park would experience beneficial impacts under all action alternatives, including the preferred alternative F. Impacts to park operations would be short-term, moderate to major, and adverse for all action alternatives including the preferred alternative F. Following the initial education and enforcement period, impacts would be long-term, negligible to minor, and adverse. Impacts on health and safety would be negligible for all action alternatives, including the preferred alternative F.

### **Sweeney Ridge/Cattle Hill**

Under all action alternatives, impacts to vegetation and the California red-legged frog would be negligible for alternatives C, E and the preferred alternative F and no impacts would occur under alternatives B and D. Impacts to wildlife would be long-term, minor to moderate, and adverse under the no-action alternative, and long-term, minor, and adverse under alternative E and the preferred alternative F. Impacts to wildlife would be long-term, minor, and adverse at Cattle Hill for alternative C. There would be no impact to wildlife under alternatives B and D, or at Sweeney Ridge under alternative C. Impacts to the mission blue butterfly would be negligible at Sweeney Ridge under alternative E and the preferred alternative F, and long-term, minor, and adverse at Sweeney Ridge under the no-action alternative. There would be no impacts to the mission blue butterfly at Cattle Hill under alternatives B, C, D, and the preferred alternative F. No impacts would occur to the San Francisco garter snake under alternatives B or D, or at Sweeney Ridge under alternative C and the preferred alternative F. Impacts at Cattle Hill under alternative C and the preferred alternative F would be negligible. Impacts under alternative E would be negligible for both sites. Impacts on visitors who enjoy dogs would be long-term, moderate, and adverse for alternatives B and D, long-term, minor to moderate, and adverse for alternative C, and long-term, minor, adverse for alternative E and the preferred alternative F. Visitors who do not enjoy dogs would experience beneficial impacts under alternatives B, C, and D; long-term, minor, and adverse impacts under alternative E; and negligible impacts under the preferred alternative F. Impacts on these visitors under the no-action alternative would be long-term, minor to moderate, and adverse. Impacts to park operations would be short-term, moderate to major, and adverse for all action alternatives including the preferred alternative F. Following the initial education and enforcement period, impacts would be long-term, negligible to minor, and adverse. Impacts on health and safety would be negligible at both sites for the no-action alternative and alternative E, and negligible for Cattle Hill under alternative C and the preferred alternative F. Negligible impacts on health and safety would occur under all action alternatives for Sweeney Ridge.

### **Pedro Point Headlands**

Under all action alternatives impacts to vegetation would range from no impacts to negligible impacts; the no-action alternative would result in long-term minor, adverse impacts to vegetation. There would be

long-term, minor to moderate and adverse impacts to wildlife from the no-action alternative, negligible to long-term, minor and adverse impacts from alternatives B, C, E, and the preferred alternative F, and no impacts under alternative D. Visitors who enjoy having dogs at the site would experience negligible to long-term, minor, adverse impacts under alternative E; long-term, minor to moderate, adverse impacts under alternatives B, C, and the preferred alternative F; and long-term, moderate, adverse impacts under alternative D. Visitors who do not enjoy dogs would experience beneficial impacts under all action alternatives, with the exception of alternative E, which would result in long-term, minor, adverse impacts. Impacts to park operations would be short-term, moderate to major, and adverse for all action alternatives including the preferred alternative F. Following the initial education and enforcement period, impacts would be long-term, negligible to minor, and adverse. Impacts to health and safety would be negligible under all action alternatives. The no-action alternative would have negligible to long-term, minor, and adverse impacts.

### **Rancho Corral de Tierra**

Impacts to natural resources (vegetation, wildlife, and special-status species including the California red-legged frog, San Francisco garter snake, and Hickman's potentilla) would generally range from negligible to long-term, moderate, and adverse for all action alternatives. The no-action alternative would have a long-term, minor adverse impact on vegetation; a long-term, minor to moderate, adverse impact on wildlife; and negligible to long-term, minor adverse impacts to special-status species including the California red-legged frog, San Francisco garter snake; a long-term moderate adverse impact would occur to the listed plant, Hickman's potentilla at Rancho Corral de Tierra since there are only nine populations of this plant at Rancho, two of which are adjacent to popular trails at the site. Impacts to visitors who prefer dogs at the park would be long-term, moderate and adverse for alternative D; long-term, minor to moderate for alternative B and the preferred alternative F; and negligible for alternatives C and E. Visitors who do not prefer dogs would experience beneficial impacts under alternatives B, D, and the preferred alternative F; under alternatives C and E impacts to these visitors would be negligible due to the ROLA. Impacts to visitors under the no-action alternative would be long-term, minor adverse. Impacts to park operations would be short-term, moderate to major, and adverse for all action alternatives including the preferred alternative F. Following the initial education and enforcement period, impacts would be long-term, negligible to minor, and adverse. Impacts to health and safety would be negligible for B, D, and the preferred alternative F, and would be long-term, minor and adverse under alternatives C and E. Impacts under the no-action alternative would be long-term, minor to moderate, and adverse.

This *Draft Dog Management Plan / Supplemental Environmental Impact Statetment* is organized by the chapters listed below. Each of the chapters has its own “mini” table of contents at the beginning of each section to give you an idea of how each is organized.

Purpose and  
Need for Action

# CHAPTER 1: PURPOSE AND NEED FOR ACTION

## INTRODUCTION

This “Purpose and Need for Action” chapter describes the reasons why the National Park Service (NPS) is taking action at this time and provides background information on the Golden Gate National Recreation Area (GGNRA or park) Draft Dog Management Plan / Supplemental Environmental Impact Statement (draft plan/SEIS).

## PURPOSE AND NEED FOR ACTION

The *National Environmental Policy Act of 1969* (NEPA) requires an environmental impact statement (EIS) to briefly provide a statement of purpose and need for the action the agency is proposing. The purpose states the goal the park must achieve by taking action and the need for action summarizes why action is required. An internal scoping session with park staff and NEPA consultants was held, as required by the NEPA and NPS *Director’s Order #12: Conservation Planning, Impact Analysis, and Decision Making* (NPS 2001a, 1), to define the purpose and need for taking action, and discuss planning objectives and conceptual approaches to alternatives (NPS 2005a, 11). At that internal scoping session, the following statements of purpose and need were developed.

The purpose of GGNRA is to offer national park experiences to a large and diverse urban population while preserving and interpreting its outstanding natural, historic, scenic, and recreational values.

### Purpose for Taking Action

The purpose of the draft plan/SEIS is to determine the manner and extent of dog use in appropriate areas of the park. This plan would promote the following objectives:

- Provide a clear, enforceable dog management policy
- Preserve and protect natural and cultural resources and natural processes
- Provide a variety of visitor experiences
- Improve visitor and employee safety
- Reduce user conflicts
- Maintain park resources and values for future generations.

---

*The purpose of the draft plan/SEIS is to determine the manner and extent of dog use in appropriate areas of the park.*

---

### Need for Action

A draft plan/SEIS is needed because GGNRA resources and values, as defined by the park’s enabling legislation and the NPS *Organic Act*, could be compromised to the extent that, without action, those resources and values in some areas of the park might not be available for enjoyment by future generations. Additionally, a dog management policy inconsistent with NPS regulations and increased public expectations for use of the park for dog recreation has resulted in controversy, litigation, and compromised visitor and employee safety, affecting visitor experience and resulting in resource degradation. The conflicts will likely escalate if not addressed in a comprehensive draft plan/SEIS.

## **OBJECTIVES**

Objectives are specific goals that describe what GGNRA intends to accomplish by preparing this draft plan/SEIS. These objectives come from a variety of sources, including NPS management policies, laws, and regulations. The objectives help develop alternatives for evaluation and public review. The internal scoping process yielded the following specific objectives for this planning process.

### **VISITOR EXPERIENCE AND SAFETY**

- Minimize conflicts related to dog use by providing a variety of safe, high-quality visitor use experiences, including areas where dogs are allowed.

### **LAW ENFORCEMENT / COMPLIANCE WITH DOG RULES, AND PARK OPERATIONS**

- Maximize dog walker compliance with clear, enforceable parameters in order to improve park operations and use of staff resources in managing dog walking.

### **PARK OPERATIONS**

- Provide adaptability and flexibility so that information gathered from monitoring can be used in future decision making based on estimated outcomes, including in new park areas.
- Ensure a safe and healthy working environment for park staff.
- Evaluate commercial dog walking, and if allowed, create and implement an enforceable policy.

### **NATURAL RESOURCES**

- Protect native wildlife and their habitat (including sensitive species and their habitat, and federally or state listed, unique, or rare species) from detrimental effects of dog use, including harassment or disturbance by dogs.
- Minimize degradation of vegetation, soil and water resources by dog use.
- Preserve opportunities for future natural resource restoration and enhancement.

### **CULTURAL RESOURCES**

- Preserve opportunities for future cultural resource restoration and enhancement.
- Protect cultural resources from the detrimental effects of dog use.

### **EDUCATION**

- Build community support for the plan to maximize management of dog walking use.
- Increase public understanding of NPS policies.

## BACKGROUND OF DOG MANAGEMENT AT GOLDEN GATE NATIONAL RECREATION AREA

Dogs that are not controlled by caging or a leash no longer than six feet are currently prohibited across the entire national park system (36 CFR 2.15 (a)(2)), with the exception of GGNRA. This exception is the result of a 2005 decision by the United States District Court for the Northern District of California but has its roots in earlier policy decisions by the park.

### GOLDEN GATE NATION RECREATION AREA LANDS INCLUDED IN THE DRAFT PLAN / SUPPLEMENTAL ENVIRONMENTAL IMPACT STATEMENT

In 1972, GGNRA was established by Congress with a boundary that encompassed 32,000 acres in San Francisco and Marin counties. Today, the park has more than doubled in size and its boundary now encompasses approximately 80,500 acres in San Francisco, Marin, and San Mateo counties.

Within this boundary, GGNRA owns approximately 34,000 acres and manages approximately 20,000 of those acres. This draft plan/SEIS will only address lands directly managed by GGNRA and certain additional lands that will be directly managed by the park in the near future. The draft plan/SEIS also provides a framework and criteria for the treatment of future new lands. GGNRA-owned lands in Olema Valley north of Bolinas-Fairfax Road will not be included, as they are managed by Point Reyes National Seashore through an agreement with GGNRA (see map 1 in the “Maps” section of this document). These areas will continue to be managed under 36 CFR 2.15.

---

*This draft plan/SEIS will only address lands directly managed by GGNRA and certain additional lands that will be directly managed by the park in the near future.*

---

Alternatives in this draft plan/SEIS include locations in Marin, San Francisco, and San Mateo counties. The selection of sites addressed in this draft plan/SEIS was determined by NPS managers, and was based on information from historical and current dog management in GGNRA, including the 1979 Pet Policy (appendix A); NPS law, policy, and regulations; park resources; and the Federal Panel Recommendations to the General Superintendent (NPS 2002a, 1). The panel concluded that under voice and sight control dog walking in GGNRA may be appropriate in selected locations where resource impacts can be adequately mitigated and public safety incidents and public use conflicts can be appropriately managed.

In addition to lands currently under GGNRA management, the draft plan/SEIS includes two areas within the park’s boundary that will be transferred to GGNRA in the near future: Pedro Point Headlands and Cattle Hill in San Mateo County. When the dog management planning process started, these two new portions were included because it was anticipated that acquisition would occur during, or shortly after, the planning process was completed. Another very recent change considered in this draft plan/SEIS is a third San Mateo property, Rancho Corral de Tierra (Rancho), which was transferred to the NPS in December 2011. As a result of this recent land transfer, the Rancho site is addressed in the draft plan/SEIS. Table 2 in chapter 2 lists the sites that were considered under the action

**Pedro Point**

Credit: NPS

alternatives for this draft plan/SEIS. Dog management for other lands that may be acquired and managed by the NPS in the future is discussed under “Elements Common to Action Alternatives” in chapter 2.

GGNRA-managed lands not specifically addressed in this draft plan/SEIS, but which are not currently closed to dogs, include (but are not limited to) the following:

- In Marin County: lands north of Stinson Beach and south of Bolinas-Fairfax Road (excluding Audubon Canyon Ranch lands), between Highway 1 and Marin Municipal Water District lands and Mount Tamalpais State Park lands—encompassing land in Morses Gulch and McKennan Gulch and the lands above Audubon Canyon Ranch.
- In Marin County: GGNRA coastal lands north of—and including—Muir Beach Overlook and west of Highway 1, and the former Banducci lands in Franks Valley.
- In San Mateo County: an easement over coastal lands and beach south of Fort Funston and north of Thornton State Beach totaling 31 acres; three parcels of coastal lands, totaling 2.5 miles in length and 120 acres, south of Thornton State Beach.

## **LAND USE PRIOR TO PARK ACQUISITION**

The history of dog walking in some areas of GGNRA began prior to the establishment of the park, when dog walking, including off-leash dog walking, occurred informally at sites under varied jurisdictions in San Francisco and Marin counties. Some of the lands designated as part of the new national recreation area had been formerly owned and managed by other public entities, and practices prohibited in national park system units, such as allowing dogs off leash, had been sanctioned or allowed on those lands. In the first years after GGNRA was established in 1972, those practices continued largely uninterrupted, although park staff recognized and documented issues arising from the practice during the early years of the park’s existence.

The 1975 agreement for the lands transfer from the City of San Francisco to the NPS states that “The National Park Service, acting through the General Superintendent, agrees to utilize the resources of GGNRA in a manner that will provide for recreational and educational opportunities consistent with sound principals of land use, planning and management, to preserve the GGNRA in its natural setting and protect it from development and uses which would destroy the scenic beauty and natural character of the area, and to maintain the transferred premises in a good and slightly condition:” There is no additional specificity as to what uses constituted “recreational opportunities.” The deeds for the transferred lands state that: “To hold only so long as said real property is preserved and used for recreation and park purposes,” also with no additional specificity as to what uses constituted recreation.

The lands in San Francisco known as the “Presidio” are managed by both the NPS and the Presidio Trust. The Presidio was once one of the oldest continuously operating military posts in the nation. Since 1994, when the Presidio was transferred to the NPS, it has been a distinct public park site in San Francisco. In 1996, Congress passed the Presidio Trust Act, which established the Presidio Trust and put the interior 80 percent of Presidio lands, approximately 1,170 acres, (known as Area B) under the management of the Presidio Trust. The coastal portions of the Presidio (known as Area A) remain under the management of the NPS. This draft plan/SEIS addresses only the Area A Presidio lands.

The Presidio Trust is a cooperating agency for this draft plan/SEIS. The NPS granted the Presidio Trust cooperating agency status with regard to those lands addressed by the draft plan/SEIS in Area A of the Presidio, adjacent to lands managed by the Presidio Trust, and based on the Trust’s special expertise in the Presidio Area B and the potential for spillover effects onto Trust lands from adjacent GGNRA areas.

## **GOLDEN GATE NATIONAL RECREATION AREA CITIZENS' ADVISORY COMMISSION AND THE 1979 PET POLICY**

The legislation establishing GGNRA in 1972 (PL-92-589) also established the GGNRA Citizens' Advisory Commission, which coordinated public involvement for the park. Their charter stated that they may advise the park on general policies and specific matters related to planning, administration, and development, and in doing so may seek the views of various citizen groups and members of the public.

In 1978, due to public requests from dog walkers, the GGNRA Citizens' Advisory Commission developed a pet policy for the park. In 1979, they formally recommended the policy, which has since been known as the 1979 Pet Policy (appendix A), to the park Superintendent. The 1979 Pet Policy, developed with input from park staff, provided general guidance for dog walking and recommended locations for both on-leash dog walking and off-leash or "voice control" dog walking in lands owned and managed by GGNRA, although this recommendation did not abide by the federal regulation regarding dog walking in national parks (36 CFR 2.15). The Code of Federal Regulations (CFR) is the codification of the general and permanent rules published in the Federal Register by the executive departments and agencies of the federal government.

The 1979 Pet Policy identified the following areas as appropriate for voice control of dogs:

- Homestead Valley
- Oakwood Valley
- Muir Beach
- Rodeo Beach
- Several trails in Marin County
- Crissy Field
- Baker Beach, north beach area
- East and West Fort Miley
- Lands End
- Ocean Beach
- Fort Funston.

Although in the policy the GGNRA Citizens' Advisory Commission referred to "regulations (that would) be developed by the NPS Field Solicitor's office," a special regulation to allow off-leash dog walking in GGNRA, based on this recommendation, was never promulgated by the NPS. The GGNRA Citizens' Advisory Commission's policy did not and could not override NPS regulations prohibiting pets off leash in national parks, but for more than 20 years, the park erroneously implemented the 1979 Pet Policy in contravention of Service-wide regulations.

## **INCREASE IN USE OF THE PARK FOR DOG WALKING AND OTHER RECREATIONAL USES**

Since the 1990s, the San Francisco Bay Area population and overall use of GGNRA park sites have increased, as have the number of private and commercial dog walkers. At the same time, the number of conflicts between park users with and without dogs began to rise, as did the fear of dogs and dog bites or attacks. The hours devoted by park staff to manage these conflicts, rescue dogs and owners, dispose of dog waste, educate the public on dog walking policies and regulations at each park site, and enforce regulations also increased. In addition, since the establishment of the park, several species with habitat in GGNRA areas used by dog walkers have been listed as threatened, endangered, or special-status species requiring special protection.

Underscoring the increasing conflict over off-leash dog use, dog walking groups filed a lawsuit against the NPS in March 2000 when GGNRA closed part of Fort Funston to the public to provide resource protection and restoration. In particular, the park intended to protect new nesting locations of the state threatened bank swallow (*Riparia riparia*) population; increase biological diversity by restoring coastal native dune scrub habitat; increase public safety by keeping visitors and their pets away from cliff areas; and protect geological resources, including the bluff top and interior dunes, that had been subject to accelerated erosion because of humans and dogs. The park discussed a 12-acre closure with interested groups, including both environmental and off-leash dog walking interests. Based on these discussions, the park reduced the closure to 10 acres. Upon initiation of the 10-acre closure, which reduced available off-leash areas, a lawsuit was filed. The federal district court held that the NPS had not adequately obtained public input on the proposed closure as required by 36 CFR 1.5. Upon completion of public involvement efforts, the court agreed that GGNRA had fully complied with required sections of 36 CFR 1.5 and that the need for “prompt protective action” was “genuine.” The park closed the original 12 acres in February 2001, per the GGNRA Compendium (NPS 2001b, 1; appendix B). During this period, it was clarified by the Department of Justice, the U.S. Attorney, and the U.S. Department of the Interior Solicitor Offices that the voice control policy then in effect at Fort Funston and other locations in the park was contrary to NPS regulations.

In a public meeting in January 2001, the GGNRA Citizens’ Advisory Commission acknowledged that the voice control policy was contrary to 36 CFR 2.15(a)(2), prohibiting off-leash dogs in national parks, and therefore illegal and unenforceable. Hundreds of people in favor of the 1979 Pet Policy attended the January 2001 GGNRA Citizens’ Advisory Commission meeting, and following the meeting, the park received significant comment in support of off-leash dog walking. At the same time, the park continued to receive an increasing number of complaints by park visitors, including minorities, seniors, and families with small children, alleging that off-leash dogs had prevented them from visiting the park for fear of being knocked over or attacked by dogs or verbally abused by dog owners, or that they had experienced these situations in visits to the park.

In the year following the GGNRA Citizens’ Advisory Commission meeting, park staff attempted to facilitate the transition into compliance with 36 CFR 2.15(a)(2) through educational outreach, new signs, and law enforcement actions including verbal and written warnings. When these measures failed to bring about compliance with the regulation, GGNRA law enforcement staff issued citations in addition to warnings. During this time, conflicts between dog walkers and park staff increased significantly.

In 2004, citations issued for off-leash dog walking at Crissy Field were challenged. Similar to the Fort Funston dog walking case, the federal district court found that the NPS did not have the authority to enforce 36 CFR 2.15 requiring that dogs be on leash, in areas that had allowed off-leash dog walking per the 1979 Pet Policy, without first completing notice and comment rulemaking as required under 36 CFR

1.5(b) due to the controversial nature of the closure (U.S. v. Barley, 405 F.Supp. 2d 1121 (N.D. Cal. 2005)).

Since that time, GGNRA has had a mixture of dog management regulations and legal conditions guiding the status of dog walking in the park: the NPS-wide leash regulation, the GGNRA Compendium, the special regulation for protection of the federally threatened western snowy plover (*Charadrius alexandrinus nivosus*), and the 1979 Pet Policy voice control conditions (which were effectively reinstated by the 2005 federal court decision). Table 1 summarizes current dog management conditions within the specific park sites addressed in this draft plan/SEIS. Maps located in the “Maps” section of this document, which show park sites by county, from north to south, also illustrate historic and current dog walking management (see maps 2-A, 3-A, 4-A, etc.).

\* Under current management, commercial dog walking occurs, but is not an authorized use.

## ADVANCE NOTICE OF PROPOSED RULEMAKING

In January 2002 the park published an Advance Notice of Proposed Rulemaking (ANPR) in the Federal Register asking for comment on potential options for future dog management in GGNRA that could include a special regulation for dog walking in GGNRA. During the public comment period, park staff held two informational meetings about the rulemaking process in March 2002 and a public oral comment session in April 2002. Through the ANPR and public comment process, the park asked for public input on a range of dog management questions and put forth two management options for comment: option A, which would continue to enforce the existing NPS regulations that allow only on-leash dog walking; and option B, which would begin the analysis and eventual rulemaking to allow some specific off-leash use areas. Option A indicated that the park would consider allowing on-leash dog walking in some areas where it was not permitted at the time. These areas included Stinson Beach, Fort Baker Pier, Phleger Estate, and portions of Tennessee Valley. The public was also asked for input on specific management

questions, including which areas should be closed to dogs, which areas should be fenced, which areas should allow on-leash dog walking, and which areas should allow dogs under voice control. Additional questions asked how the number of dogs should be limited, how to ensure the park was not liable for injuries caused by or to dogs, and what the potential environmental impacts of the alternatives might be.

In response to the ANPR in January 2002, the park received 8,580 documents and the results were published in a public comment analysis report by the Northern Arizona University Social Research Laboratory (NAU 2002a, 1). In this report, 71 percent of public comments favored option B, allowing for off-leash dog walking in selected GGNRA sites. Of the 71 percent, the majority were residents of San Francisco (88 percent of 4,222 comment documents). Twenty-eight percent of public comments favored option A, calling for the enforcement of existing leash laws in the GGNRA. Respondents from out of state overwhelmingly voted for option A (96 percent of 1,186 comment documents). Fort Funston, Crissy Field, and Ocean Beach were the sites most frequently mentioned by those preferring either option A or option B (NAU 2002a, 5, 7).

In response to the ANPR request for input on specific management questions, the public made the following suggestions for future management of dog walking in GGNRA, which were coded into the dataset of the public comment analysis report (NAU 2002a, 9-26):

- Separate dog walking under voice control from other visitor uses.
- Designate specific areas, or days, and times when dog walking under voice control is allowed.
- Fully enforce whatever regulations result, but if violations occur, do not assume that all dog owners are irresponsible and that areas need to be closed to dogs.
- Create a licensing process to demonstrate that dogs are under voice control.
- Fence environmentally sensitive areas or fence voice control areas.
- Limit the number of dogs on leash and/or under voice control per person.
- Encourage volunteer efforts to assist in stewardship of voice control areas.
- Educate the public about how to control dogs and about the impacts dogs have on park resources.
- Monitor the impacts of dogs and report the results every few years.

## **Telephone Survey**

To gain as broad an understanding of public opinion as possible, GGNRA commissioned Northern Arizona University's Social Research Laboratory to conduct a telephone survey in the four-county region surrounding GGNRA regarding NPS pet management regulations (NAU 2002b, 1). The survey design was initiated in the spring of 2002 during the ANPR public comment period and was conducted from May to July 2002. The survey was conducted with a random cross section of people from 400 households each (for a total of 1,600) in Alameda, Marin, San Francisco, and San Mateo counties to provide a more general overview of public support for or opposition to off-leash dog walking. Results of the telephone survey showed that 28 percent of the respondents owned or cared for one or more dogs. Among these dog owners, 50 percent had taken their dog(s) to a GGNRA site and 20 percent of that group had also hired a commercial dog walker to walk their dog(s) in a GGNRA site, which translates to one percent of all survey respondents using a commercial dog walker (NAU 2002b, 16-17).

The first set of questions asked the public if they generally supported or opposed the existing NPS regulation that allows on-leash dog walking at most GGNRA sites and prohibits any off-leash dog walking. Seventy-one percent of all respondents supported and 23 percent opposed the current NPS regulation for walking dogs on leash at most GGNRA sites and prohibiting off-leash dog walking. Survey results indicated that support for the existing NPS pet regulation was consistent throughout the four counties and across every demographic subset (NAU 2002b, 11, 83-86).

In another set of questions, when asked whether they specifically supported allowing off-leash dog walking in GGNRA, 40 percent of all respondents stated that they supported allowing dogs off leash in GGNRA. Of this 40 percent, 17 percent strongly supported and 23 percent somewhat supported allowing dogs off leash in GGNRA. Fifty-three percent of all respondents stated that they opposed allowing off-leash dog walking in GGNRA sites. Of this 53 percent, 17 percent opposed and 36 percent strongly opposed allowing off-leash dog walking in GGNRA sites. However, dog owners were closely divided on the question of whether they specifically supported allowing off-leash dog walking in GGNRA. Fifty-one percent of dog owners supported and 45 percent of dog owners opposed off-leash dog walking at GGNRA sites (NAU 2002b, 25).

The respondents were then read an abbreviated version of the GGNRA mission statement: “The mission of the Golden Gate National Recreation Area is the preservation, unimpaired, of the natural and cultural resources, and scenic and recreation values, of the park for present and future generations to enjoy” (NAU 2002b, 30). When these respondents were again asked if they supported or opposed off-leash dog walking at GGNRA sites, the percentage of all respondents in the four-county area opposing off-leash dog walking at GGNRA rose from 53 to 58 percent, and the percentage of respondents supporting off-leash dog walking in the park fell from 40 to 36 percent (NAU 2002b, 30-31).

### **Federal Panel Recommendation**

Subsequent to the ANPR, a panel of senior NPS officials from outside GGNRA was convened to review the public comment and other technical information. The purpose of the panel was to recommend to the Superintendent of GGNRA whether the park should proceed toward rulemaking to allow some off-leash dog walking or whether the current regulation—requiring that pets be on leash in all GGNRA areas where they are allowed—should remain in effect. The panel concluded that off-leash dog walking in GGNRA may be appropriate in selected locations where park resources would not be impaired if the standards for appropriate use (as defined in NPS policies and regulations) could be met, if adverse impacts to park resources could be adequately mitigated, and if public safety incidents and public use conflicts could be appropriately managed. The panel further recommended that the park pursue both rulemaking and comprehensive planning for pet management to address suitable locations and proper management strategies. Options for conducting an integrated rulemaking and planning process were included, as well as suggested criteria for formulating a proposed rule and implementation strategy. As a result of the federal panel review, public comment, and other internal park discussions, GGNRA chose to pursue negotiated rulemaking under the *Negotiated Rulemaking Act*.

## Negotiated Rulemaking

---

*In June 2005, a NOI to Establish a Negotiated Rulemaking Committee was published in the Federal Register, followed by a Notice of Establishment of the Committee in February 2006.*

---

In 2004 the NPS, working with the U.S. Institute of Environmental Conflict Resolution, hired a neutral team to assess the prospects for using a negotiated rulemaking process that would allow a representative group of stakeholders to have significant, direct input into the development of a special regulation for dog management at GGNRA. In June 2005, a Notice of Intent (NOI) to Establish a Negotiated Rulemaking Committee (Committee) was published in the Federal Register, followed by a Notice of Establishment of the Committee in February 2006. The Committee was composed of 19 primary representatives and alternates representing three informal caucuses—voice control advocates, environmental and conservation organizations, and other park users—as well as the NPS. The Committee’s goal was to reach consensus on a special regulation on dog management at GGNRA and recommend that regulation to the NPS. The Committee held seven full Committee meetings and nine Technical

Subcommittee meetings between March 2006 and October 2007. The Committee was only able to reach consensus on nine guiding principles, guidelines for commercial dog walking, and a site-specific alternative for Oakwood Valley (Marin County). It was not able to reach consensus on a proposed special regulation for dog management at GGNRA. A report summarizing the negotiated rulemaking process, products, and outcomes; negotiation structures, strategies, and approaches; and dynamics was prepared by the Facilitation Team of the Committee (Bourne et al. 2008, 1).

The NPS intent was to use the negotiated rulemaking process to provide public input for potentially drafting a special regulation for dog management in GGNRA. Since the Committee was not able to recommend a proposed regulation, the NPS will develop a draft rule for dog management. The findings of this draft plan/SEIS will inform the development of the regulation.

## Dog Management Plan / Environmental Impact Statement

The plan/EIS is required prior to implementation of a new regulation for dog management at GGNRA. During the period when the Committee was being formally created, the park began its required environmental planning process under NEPA. In late January 2005, GGNRA park staff and consultant specialists met with the NEPA team from the NPS Environmental Quality Division to draft the purpose, need, and objective statements to identify existing management problems and begin drafting possible solutions in the form of conceptual alternatives. This “internal scoping” is a process that can take many months and usually ends with publication in the Federal Register of a NOI to prepare an EIS and to hold meetings to gather public comment. The GGNRA NOI to prepare an EIS was published February 22, 2006.

---

*The draft plan/SEIS is required prior to implementation of a new regulation for dog management at GGNRA.*

---

GGNRA committed to having the NEPA and negotiated rulemaking processes proceed concurrently, to facilitate the sharing of information between the two processes and to allow any consensus from the negotiated rulemaking process to be fully analyzed along with a range of reasonable alternatives before choosing a preferred alternative. Additionally, since negotiated rulemaking requires that meetings of the full Committee be open to the public and has other fact-finding requirements that overlap with those of NEPA, the concurrent completion of both processes helped avoid duplication of effort and saved time.

A draft plan/EIS was released on January 14, 2011 and public comment was open until May 30, 2011 (136 days). As a result of substantive public comments, NPS determined that a number of changes to the draft plan/EIS would be necessary to be responsive to public comment. These changes include the following:

- the addition of new data (including additional law enforcement and visitor use data)
- new references
- additional *Americans with Disabilities Act* (ADA) information
- changes to the impacts analysis (including additional analysis of potential redistributive effects of opening/closing areas to dog walking)
- changes to the compliance-based management strategy (now referred to as the monitoring-based management strategy) by including natural and cultural resource monitoring and removing automatic triggers and restrictions
- evaluation of additional fencing as a method to minimize dog walking impacts
- relatively minor changes to each site specific preferred alternative.

Additionally, a site recently transferred to GGNRA, Rancho Corral de Tierra (Rancho), was added to the park sites specifically addressed by the plan, and a range of reasonable alternatives for the site was developed and is analyzed in this draft plan/SEIS. When significant new information or substantial changes to the proposed action occur that are relevant to environmental concerns, a SEIS should be prepared (Council on Environmental Quality (CEQ) NEPA Regulations, 40 CFR 1502.9(c)). Preparing a draft plan/SEIS at this time gives the NPS the opportunity to hear comments from the public on the new information before NPS issues a Notice of Proposed Rulemaking, the final plan/SEIS and record of decision, and final rule.

A Notice of Proposed Rulemaking will not be published in the Federal Register until comments on this draft plan/SEIS have been fully analyzed, as public comment may influence the substance of the proposed rule.

This draft plan/SEIS examines the impacts of a full range of alternatives for dog management, and assesses the impacts that could result from continuing current dog management practices. Upon conclusion of this decision-making process one of the alternatives, or an alternative composed of elements of a number of the alternatives, will be selected for implementation, which will guide future park actions related to dog management.

### **Current Dog Management**

Current dog management in the park is based on a number of factors. Areas covered by the GGNRA Citizens' Advisory Commission 1979 Pet Policy (appendix A) are managed in accordance with the June 2, 2005, decision by U.S. District Court for Northern California Judge Alsup (*U.S. vs. Barley* decision, 405 F.Supp.2d 1121 (N.D. Cal. 2005)) affirming that GGNRA cannot enforce the NPS-wide regulation requiring on-leash walking of pets (36 CFR 2.15(a)(2)) in areas that were included in the 1979 Pet Policy until notice and comment rulemaking under Section 1.5(b) is completed. In response, GGNRA revised its enforcement position to reflect that court decision, removing "leash required" signs in areas that had been selected for voice control in the 1979 Pet Policy and limiting enforcement of the NPS leash regulation to areas that were not included in the 1979 Pet Policy or that were identified as on-leash dog walking areas in the 1979 Pet Policy. However, in all areas where dog walking is allowed in GGNRA, whether under the NPS leash regulation or the 1979 Pet Policy, on-leash dog walking regulations that address areas

closed to pets, disturbance to wildlife, removal of pet waste, and creating a hazardous or offensive condition have remained in effect and are being enforced.

In addition, many park areas have been closed to dog and visitor use for resource or safety reasons through the GGNRA Compendium (NPS 2001b, 1), although areas closed where dog use had traditionally occurred were closed pursuant to notice and comment rulemaking. The closures are reviewed and updated each year. The GGNRA Compendium is the format wherein each park, where allowed by the CFR, can publish park-specific regulations to protect cultural or natural resources, enhance public health or safety, or avoid conflict among visitor use activities. It is considered the responsibility of park visitors to know park rules and regulations before they visit any park.

### Protection for the Western Snowy Plover

The western snowy plover was listed as a threatened species under the federal *Endangered Species Act* (ESA) in 1993 due to loss of habitat by encroachment of non-native vegetation, predation, disturbance from recreational use of beaches, and development. The plover's threatened status affords it protection from harassment, defined under the ESA as "an intentional or negligent act or omission which creates the likelihood of injury to wildlife by annoying it to such an extent as to significantly disrupt normal behavioral patterns which include, but are not limited to, breeding, feeding, or sheltering."

The NPS *Management Policies 2006* (NPS 2006a, 45) provide guidance to the NPS for the management of threatened and endangered species. Section 4.4.2.3 states, "The Service will survey for, protect, and strive to recover all species native to national park system units that are listed under the ESA. The Service will fully meet its obligations under the NPS *Organic Act* and the ESA to both proactively conserve listed species and prevent detrimental effects on these species."

The 2005 decision by Judge Alsup cited above noted that the court's action "in no way restricts the authority of the Superintendent to 'protect the resource,' including the protection of endangered and threatened species." Following notice and comment under 36 CFR 1.5(b), these actions can be taken through the GGNRA Compendium, wherein each park, where allowed by the CFR, can publish park-specific regulations to protect cultural or natural resources, enhance public health or safety, or avoid conflict among visitor use activities.

In November 2006, and again in 2007, the GGNRA Compendium amendments were signed to adopt emergency regulatory provisions for protection of the federally threatened western snowy plover on portions of Crissy Field and Ocean Beach, which had been reopened to off-leash use through the 2005 federal court decision. These seasonal use restrictions were necessary to provide an area of reduced disturbance for resting and feeding by the western snowy plover. The restrictions required that pets be walked on leash during the time the plovers overwinter (July–May, or until monitoring determines the species is no longer present). In 2007, the park initiated a notice and comment rulemaking process to provide a special regulation to ensure ongoing seasonal protection for the western snowy plover in two areas, Crissy Field WPA and Ocean Beach SPPA, until long-term dog management for those areas is addressed in the rule resulting from the draft plan/SEIS.

Protection Area Sign at Ocean Beach

Credit: NPS

A Final Rule (36 CFR Part 7.97(d)) for the protection of the western snowy plover came into effect October 20, 2008. This rulemaking provides temporary protection for plovers in the Crissy Field and Ocean Beach protection areas until a permanent determination is made through this planning process for a new regulation for dog management for the entire park.

## **CURRENT DOG MANAGEMENT ISSUES AND IMPACT TOPICS**

At the internal scoping session held in January 2005, observations of current issues surrounding dog walking generally fell into the following categories, some of which are described in more detail in the paragraphs below:

- Expectations and views of dog walkers and other visitors
- Impacts of dogs on cultural and natural resources in the park
- Visitor use and experience
- Employee, visitor, and dog health and safety
- Needs of urban area residents
- Public confusion over NPS-wide dog regulation, GGNRA-specific rules, NPS mission and policies
- Public lack of understanding and confusion over regulations for dogs at GGNRA park sites, including why some park areas are completely closed to dogs while other areas allow on-leash dog walking
- Visitor noncompliance with regulations
- Ability of law enforcement staff to enforce rules.

## **EXPECTATIONS AND VIEWS OF DOG WALKERS AND OTHER VISITORS**

As stated previously and in response to the ANPR in January 2002, a public comment analysis report was published (NAU 2002a, 1). In this report, 71 percent of public comments favored allowing off-leash dog walking in selected GGNRA sites (option B) and 28 percent of public comments favored the enforcement of existing leash laws in the GGNRA (option A) (NAU 2002a, 5). Also in the public comment analysis report, approximately 10 percent of the documents (984 of 8,580 documents) mentioned the sociability benefits that off-leash dog walking provided, not only for the dog owners, but for the dogs themselves (NAU 2002a, 16-17). Other respondents cited the “therapeutic value” dog owners experienced in knowing that their pets had been well exercised. More than 500 dog walkers affirmed their belief that it is their right to walk dogs off leash at park sites. Other reasons given in support of off-leash dog walking concerned the benefits to humans, including increased sociability with other dog walkers or with

**Dog Walkers at Fort Funston**

Credit: NPS

visitors who enjoyed interacting with dogs, and the safer feeling some dog owners have when they visit urban parks, especially at night, if their dogs are present (NAU 2002a, 17-20). Those respondents in favor of enforcing the leash law stated concerns for the environment, human health and safety, and the longevity of the park for the enjoyment of future generations. Nearly half expressed discomfort or fear of off-leash dogs and over 1,180 felt that allowing an exception to the NPS rules would set a negative precedent in other NPS units, giving “dog owners the excuse they want to continue to not obey laws and create confusion and conflict” (NAU 2002a, 9-15).

In addition to the ANPR public comment analysis report, a telephone survey regarding NPS pet management regulations was also conducted, which was discussed in more detail previously (NAU 2002b, 1). The results of the telephone surveyed showed that 71 percent of all respondents supported and 23 percent opposed the current NPS regulation for walking dogs on leash at most GGNRA sites and prohibiting off-leash dog walking (NAU 2002b, 11). When asked whether they specifically supported allowing off-leash dog walking in GGNRA, 40 percent of all respondents stated that they supported allowing dogs off leash in GGNRA and 53 percent of all respondents stated that they opposed allowing off-leash dog walking in GGNRA sites; after hearing the abbreviated GGNRA mission statement, the 53 percent rose to 58 percent opposition (NAU 2002b, 11).

## **IMPACTS OF DOGS ON NATURAL AND CULTURAL RESOURCES IN THE PARK**

A preliminary list of issues and impact topics was developed at the internal scoping meeting. This list was further reviewed by the NPS and the public and eventually became the list of issues and impact topics that were analyzed in this draft plan/SEIS. NEPA and resource specialists used a screening form to determine which resources might experience more than minor adverse or beneficial impacts. The form was also used to aid in determining whether the appropriate NEPA document should be an EIS or an environmental assessment (EA). Because several factors that normally trigger significant effects are present, the group confirmed that an EIS was appropriate to evaluate dog management options at GGNRA. The impact topics are presented in the following paragraphs by resource. These potential effects are particularly problematic for GGNRA, a unit of the NPS, an agency whose fundamental purpose is to conserve park resources and values, a requirement separate from the mandate that prohibits impairment of park resources and values (NPS 2006a, 10-11).

### **Vegetation and Soils**

**Issue.** Dogs, particularly those off leash and without adequate voice control, can affect vegetation and soils. As a result of recreational activities, vegetation can be affected by trampling indirectly through the consolidation of the soil and directly by treading upon the plant itself (Bates 1935, 476). Trampling initially bends and weakens leaves and branches and can ultimately cause breaking and injury to the plant (Douglass et al. 1999, 9.3; Bates 1935, 476). Some plant species can be damaged and completely destroyed by the action of treading, while other species are comparatively immune to harm of this kind (Bates 1935, 476). Vegetation along trails is particularly vulnerable to damage (Cole 1978, 281). Sensitive environments can be subject to physical disturbance by dogs (through digging or bed-making). Physical disturbance by dogs could affect vegetation, soils, and wildlife such as small mammal populations (Sime 1999, 8.9). “High foot traffic (both people and dogs) resulting from an off-leash area would result in trampling and disturbance of vegetation” (Andrusiak 2003, 5). In addition, heavy off-leash dog use increases deterioration of native dune communities (Shulzitski and Russell 2004, 5). Data from regional parks included observations of dogs in the water and uprooting beach and dune vegetation by digging (Andrusiak 2003, 3.2). Both dog and human traffic compact the soil and crush vegetation; this is unlikely to have significant effects on the unvegetated areas, but could contribute to degradation of vegetated areas (Andrusiak 2003, 3.2).

**Issue.** Dog waste contains nutrients and can increase the amount of nitrogen and phosphorus in the soil (CRCCD 2009, 1). Soils and vegetation can be affected by dogs through defecation and urination, but although mentioned in reviewed studies, this has not been specifically documented in peer-reviewed studies. The act of “marking” (scent marking with urine) could also affect vegetation by concentrating nutrients in particular areas. Although nitrogen and phosphorus are nutrients required for plant growth, dog waste could increase the amount of nutrients in the soil above natural levels. An increase in nutrients from dog excrement in concentrated areas could result in some areas becoming overfertilized and lead to changes in plant species and distribution as well as changes in soil organisms. Adding nutrients to nutrient-poor serpentine soils can alter soil chemistry, which may result in changes to the plants that occur in these soils (USFWS 1998a, I-12). At sites with serpentine soils, adding nutrients could change soil composition and eventually cause detrimental effects on sensitive plant species adapted to serpentine soils.

**Issue.** Dogs can be carriers of exotic plant seeds. Trailside plant communities usually contain locally occurring plant species and invaders from other sources, which are favored by the environmental conditions adjacent to trails (Cole 1978, 282). Dogs (as well as horses and hikers) can alter the dispersal of native and non-native plants along trail corridors, as seeds that adhere to their paws and fur are then transported to other locations, possibly resulting in the spread and establishment of new populations of invasive and/or non-native plants (Sime 1999, 8.9-8.10).

## **Wildlife**

**Issue.** Intensive dog use of an area could disrupt its use by wildlife or degrade the habitat, resulting in a multitude of possible negative consequences for wildlife population viability. The adverse effects of intensive dog use, such as chasing and flushing wildlife or disrupting nesting and foraging sites, can range from direct to less direct disturbance from physical effects such as trampling of habitat, the temporary or permanent loss of preferred habitat, and scent intrusion into predator territory. Domestic dogs behave as carnivores and at some level, still maintain instincts to hunt or chase (Sime 1999, 8.2) and are capable of catching and killing prey species (Lenth et al. 2008, 218). “Even if the chase instinct is not triggered, dog presence in and of itself may be an agent of disturbance or stress to wildlife” (Sime 1999, 8.3; Lenth et al. 2008, 218).

**Issue.** Dog play can compact the soil and trample vegetation, causing degradation to habitat for wildlife as discussed above. Emergent aquatic vegetation along the edge of watercourses and wetlands provides critical habitat for some listed species, and disturbance of this vegetation from dog play, such as by trampling, could compromise its value to wildlife or dislocate amphibian egg masses.

**Issue.** Dogs or dog waste can infect wildlife and vice versa. Domestic dogs that are not vaccinated can potentially introduce diseases (distemper, parvovirus, and rabies) and transport parasites from, or transmit diseases to, wild animals or wildlife habitats (Sime 1999, 8.2), although the role of dogs in wildlife diseases is not well understood (Sime 1999, 8.4). Dog-related viruses may be transmitted through dog feces to marine and terrestrial mammals (MDNRE 2010, 1; MVM 2008, 1). Canine distemper affects wildlife including canids (wolves, foxes, coyotes), raccoons, and mustelids (otters, badgers, and skunks) (MDNRE 2010, 1). Domestic dogs can be vectors for transmission diseases such as canine distemper, which can affect wild carnivore species (Sime 1999, 8.9). Studies have shown that proximity to urban areas or contact with humans and their pets can increase the risk of disease exposure for wild carnivore populations (e.g., canine parvovirus in foxes and feline calicivirus in bobcats) (Riley et al. 2004, 12, 18). However, the collection of dog waste and reducing feral and unaccompanied domestic animals in parks could help reduce the risk of transmission of many diseases (Riley et al. 2004, 19).

**Issue.** Habitat for all wildlife, including habitat for rare, unusual, or sensitive non-listed and/or monitored species may be affected by dog use of specific areas through disturbance, displacement, and habitat alteration. As a result of repeated disturbance, wildlife may relocate from preferred habitat to other areas to avoid harassment (Sime 1999, 8.4). However, animals with no suitable habitat nearby will be forced to remain despite the disturbance, regardless of whether this will affect survival or reproductive success (Gill et al. 2001, 266).

The shoreline of San Francisco Bay provides feeding, roosting, and wintering habitat for shorebirds and other bird species, such as gulls, terns, and the California brown pelican (*Pelecanus occidentalis californicus*). Resting and feeding habitat can be particularly important to migrating and overwintering shorebirds, and in some areas in GGNRA, thousands of roosting or migrating individuals congregate. Beach habitat within GGNRA is also used by over 25 species of shorebirds, including the federally threatened western snowy plover (Beach Watch 2009, 1; USFWS 2009a, 1). Although a variety of factors, including humans, cause disturbance, numerous studies have shown that shorebirds are particularly sensitive to dogs and have documented disturbance to shorebirds as a result of dogs at recreational/park settings (Kirby et al. 1993, 55; Smit and Visser 1993, 10; Yalden and Yalden 1990, 248-249; Thomas et al. 2003, 69; Lafferty 2001a, 1955-1956; Lafferty 2001b, 318; Lafferty et al. 2006, 2222; Burger et al. 2004, 287; Davidson and Rothwell 1993, 101). Frequent disturbance of shorebirds can affect fat reserves needed for migration and breeding. This type of disturbance could result in loss of preferred habitat as well as energy loss to migrating and wintering shorebirds, potentially reducing their chances of survival along their migratory routes and reducing fitness for successful reproduction. Even short-term disturbances to feeding and migration behavior could potentially affect energy expenditure in shorebirds (Kersten and Piersma 1987, 182, 185).

### **Species of Special Concern (Federally and State-listed Species or Species Proposed for Listing)**

**Issue.** Habitat used by federally threatened or endangered species may be vulnerable to impacts from intensive use of public areas by humans and dogs. GGNRA contains more federally protected endangered and threatened species than any other unit of the national park system in continental North America (NPS 2009a, 1). There are over 80 rare or special-status wildlife species currently identified as permanent or seasonal residents of the park or dependent on park lands and waters for migration, and there are 38 rare or special-status plant species currently identified within GGNRA (NPS 2009a, 1). Although habitats at GGNRA support many species with special status, only those species potentially affected by this draft plan/SEIS are discussed in this document. Of the 38 listed plant species, 7 are state and/or federally listed and have a detailed impacts analysis in this draft plan/SEIS. This group includes but is not limited to the following listed plants: Presidio (Raven's) manzanita (*Arctostaphylos hookeri* ssp. *ravenii*), Presidio clarkia (*Clarkia franciscana*), Marin western flax (*Hesperolinon congestum*), and San Francisco lessingia (*Lessingia germanorum*). Habitat for each exists in patches of coastal dune or coastal scrub/chaparral/grasslands, which have become increasingly rare and whose existence has been compromised by events caused by both humans and nature. Of the 80 listed wildlife species, 12 are state and/or federally listed and have a detailed impacts analysis in this draft plan/SEIS. This group includes but is not limited to the following: mission blue butterfly (*Icaricia icarioides* ssp. *missionensis*), tidewater goby, coho salmon, steelhead trout, California red-legged frog, San Francisco garter snake (*Thamnophis sirtalis tetrataenia*), bank swallow, and western snowy plover.

Visitors with dogs can affect special-status species through disturbance to wildlife and/or plants from chasing, barking, digging, and potential direct or indirect mortality as a result of encounters. In addition to direct impacts from dogs on habitat for listed species, indirect impacts as a result of dogs can also occur. For example, dogs can trample upland vegetation such as lupine plants along the edges of trails, which are host plants for the federally endangered mission blue butterfly.

Beach nesting bird species are presumed to be the most sensitive species to disturbance and several species, particularly coastal plovers in the genus *Charadrius*, are endangered or threatened (Lafferty 2001b, 315) and are very likely to leave an area altogether if disturbed (Kirby et al. 1993, 56-57). The federally threatened western snowy plover overwinters on wide, sandy beaches to build energy reserves for migration and breeding. Within GGNRA, this includes the SPPA at Ocean Beach and the WPA at Crissy Field. Monitoring data at the site have demonstrated that disturbance of western snowy plovers by off-leash dogs has increased in the Crissy Field WPA following the *U.S. v. Barley* decision (NPS 2006b; NPS 2008a, 2). At GGNRA, there have been multiple instances where dogs flushed or chased shorebirds or snowy plovers at Ocean Beach and Crissy Field as documented in NPS monitoring reports by the Natural Resources Division (NPS 2008a; Hatch et al. 2007a, 12; Hatch et al. 2007b, 4-6; Hatch et al. 2008, 2-4). Even though western snowy plovers do not nest at GGNRA, general impacts on the western snowy plover from dogs include chasing roosting or feeding shorebirds which causes shorebirds to expend energy, resulting in disturbance and/or harassment. Frequent disturbance of this type can affect fat reserves needed for migration and breeding. This type of disturbance could result in loss of preferred habitat as well as energy loss to migrating and wintering shorebirds, potentially reducing their chances of survival along their migratory routes and reducing fitness for successful reproduction.

Freshwater, brackish-water, and marine environments in GGNRA are habitat for the two listed salmonids, coho salmon (federally endangered and state endangered) and steelhead trout (federally threatened), and the federally listed endangered tidewater goby. These salmonids are visual feeders, and extended periods of high turbidity following dog play in ponds or creeks can result in reduced foraging time or success for these species. Male gobies dig breeding burrows in the spring after their lagoon habitat closes to the ocean (USFWS 2005a, 13). The habitat of the federally listed endangered tidewater goby can also be affected by dogs playing in water, as dogs may crush breeding burrows.

## **Park Operations**

**Issue.** Park staff, time, and money would be needed to manage any existing or future dog policies. Managing current dog walking policies in the park requires significant staff time for GGNRA law enforcement, maintenance of heavily used dog walking areas, and response to visitor concerns and complaints.

**Issue.** Park staff, time, and money are also needed to protect natural resources from dogs, including installation of protection measures such as fencing and signage; monitoring and maintenance by park staff would then be required for these protection measures.

## **Cultural Resources**

**Issue.** Dogs may affect cultural resources by dog-related ground disturbance such as digging and/or trampling, which would be a contributing element to natural erosion processes on or around sensitive cultural resources.

**Issue.** Dog urination/defecation may affect cultural resources by affecting vegetation associated with historic properties.

## **Land Use / Long-term Management of Resources or Land**

**Issue.** Dog use can damage resources that cannot be easily restored. Overuse by dogs can change the character of soils, vegetation, wildlife habitat, and the species of wildlife themselves. If these areas are affected by intense use over a long period of time, or if natural resources are particularly vulnerable to change or damage, the impacts caused by dogs can preclude restoration.

**Issue.** Dog management policy at GGNRA may impact or influence local, state, and federal policy at other parks and open space in the Bay Area, and this draft plan/SEIS has the potential to set a precedent for the NPS nationwide. Open spaces for recreation add to the quality of the urban environment, but the park must serve a variety of visitor needs. Because the San Francisco Bay Area is highly urbanized, dog owners may have only minimal options for exercising their dogs outdoors. In many parts of the San Francisco Bay Area, residents have come to expect that GGNRA lands will be available for dog walking and other recreational activities. These factors result in a high concentration of dog walkers among other visitors who engage in a variety of activities, which often leads to conflicts. California State Parks and San Mateo County Parks, as well as the rest of the national park system, have more restrictive dog-use policies than those currently in place at GGNRA. The comparatively relaxed regulations on GGNRA lands may attract visitors with dogs from other areas that have more restrictive policies. Such a concentration of dogs and dog owners within GGNRA lands would amplify the negative effects of dogs and their owners on the park. Maintaining relatively relaxed restrictions at GGNRA could reduce pressure on regional parks, as dog walkers would continue to be able to use GGNRA for dog walking, whereas tightening restrictions at GGNRA could increase pressure to lessen restrictions at regional parks to provide dog walking opportunities. Additionally, the less restrictive rules at GGNRA may result in other NPS units being challenged to review the existing NPS-wide 36 CFR 2.15(a)(2) leash regulations for other areas.

## VISITOR USE AND EXPERIENCE

Visitor experience represents the range of experiences a visitor might have, whether it be for recreational, educational, or scientific purposes, as well as the mutual compatibility or exclusivity of such uses, and may include using a park’s interpretative or educational services, regardless of where such use occurs (e.g., via internet access, library). It is possible that dog walking under voice control may be more of an “exclusive” than a shared use, although a document prepared to assess whether negotiated rulemaking was likely to succeed (U.S. Institute for Environmental Conflict Resolution 2004, 9) characterized this as an area of disagreement among those interviewed. The reasons it may be an exclusive use include visitor safety and experience. The paragraphs below discuss general impacts to visitor use and experience associated with aesthetics, soundscapes, and environmental justice.

### Visitor Use and Experience—Aesthetics

**Battery Davis**  
Credit: NPS

**Issue.** Dog walkers and visitors without dogs often come into conflict. Walkers, hikers, joggers, bicyclists, horseback riders, wildlife watchers, and those seeking a quiet and natural experience can all potentially be disturbed by running and barking dogs. During the public comment period for the draft plan/EIS, many park users noted disturbances associated with dogs. One commenter stated, “We are very frequent visitors to the GGNRA and long-time members of the Golden Gate Parks Conservancy. We love to hike, ride our bikes and enjoy the beaches. Dogs significantly detract from our enjoyment of the park areas” (NPS 2011a,

Correspondence 431). On the contrary, many commenters pointed out that the view of dogs running around and enjoying themselves added to the visitor experience at GGNRA and removing dogs from the

park would adversely impact their visitor experience. One commenter visits the park just to see the dogs, “I love dogs and am not allowed to have one in the apartment that I live in. I take walks at Fort Funston so I am allowed to mingle with dogs, enjoy their diversity and get some exercise on top of it” (NPS 2011a, Correspondence 1090).

The potential for visitors to be bitten by dogs at GGNRA also exists and is discussed as part of employee, visitor, and dog health and safety, which follows this section. Some visitors prefer to visit a national park area without encountering dogs. Additionally, dogs may adversely affect the aesthetics of the park by leaving waste on beaches, trails, or near water resources, and the overwhelming smell of urine in park areas with heavy dog use (e.g., Fort Funston) may also affect visitor experience at the park. Although signs indicate that dog owners are responsible for picking up their dogs’ waste, owners do not always comply. Park users also noted their concerns of dog waste during the public comment period. One commenter stated, “Besides their presence, dog-related litter is a significant problem. Though many owners pick up their dog’s waste, there are those who do not. In fact nobody cleans up urine. [The] amount of dog urine, combined with feces that is not picked-up or remains after most of it is removed causes heavily used areas like Fort Funston to smell, thus making it unpleasant for visitors who are not dog owners” (NPS 2011a, Correspondence 4683). Various dog groups and associations have even organized dog cleanups, provided bags, and tried to influence their members; but despite these efforts, many dog owners still do not comply with picking up dog waste.

### **Visitor Use and Experience—Soundscapes**

**Issue.** The natural sounds heard in GGNRA are a positive and valued park resource, as well as a component of the visitor experience, which dog barking may interrupt. Soundscapes within the park provide a variety of seasonally changing visitor experiences that are important to some park users as a refuge from the noise of the urban environment. An example is spring birdsong, which is most prevalent in more remote areas and along riparian and forested habitats. Other experiences—lapping waves and frog choruses—may also enrich the visitor experience. Walkers, hikers, joggers, bicyclists, horseback riders, wildlife watchers, and those seeking a quiet and natural experience and/or a national park experience without dogs can all potentially be disturbed (including park staff) by running, barking dogs—particularly by those that chase or harass people or wildlife. For example, the raucous sounds of a disturbed wildlife community—birds and small mammals giving alarm calls—also add to the disruption of the visitor’s experience of the soundscape. These potential disturbances from barking dogs may change the natural character of the area and the overall visitor experience. During the public comment period for the draft plan/EIS, one commenter stated that the “Constant loud and disturbing barking of dogs” ruined their park experience (NPS 2011a, Correspondence 1467).

### **Visitor Use and Experience—Environmental Justice**

**Issue.** Minority or low-income populations may be more negatively affected by off-leash dog walking than Caucasian, middle-income, or high-income populations. San Francisco County is a racially diverse area, with minority populations accounting for approximately 51 percent of the population. The largest minority group in the San Francisco area is people of Asian descent (33.3 percent), followed by Hispanic/Latino persons (15 percent) (U.S. Census Bureau 2012, 1). A phone survey conducted in 2002 by Northern Arizona University (NAU 2002b, 1) separated data by race and income as well as other variables, and found lower support from low-income families for allowing off-leash dog walking under voice control in GGNRA. The survey indicated that just over 13 percent of respondents with incomes lower than \$50,000 strongly supported off-leash dog walking, whereas almost 22 percent of those with incomes from \$50,000 to \$100,000 and just over 20 percent of those with incomes over \$100,000 strongly supported it. Racial differences were even more apparent, as only about five percent of African-American respondents strongly supported off-leash dog walking, whereas almost 17 percent of Caucasians and just

over 20 percent of Asian-Americans supported off-leash dog walking. However, when the “strongly support” and “somewhat support” categories were combined, very few racial differences could be seen; approximately 44 percent of African-American respondents, 40 percent of Caucasians and just over 37 percent of Asian-Americans supported (strongly and somewhat) off-leash dog walking in the telephone survey (NAU 2002b, 92-93). Also noteworthy is that 39.4 percent of respondents of Hispanic origin supported (strongly and somewhat) off-leash dog walking and 39.9 percent of respondents of non-Hispanic origin supported (strongly and somewhat) off-leash dog walking (NAU 2002b, 93). Therefore, the Hispanic and non-Hispanic populations supported off-leash dog walking by almost the same percentages. During the public comment period for the draft plan/EIS, some commenters noted the importance of off-leash dog walking by minority populations at the park. One commenter stated, “It is important to weigh the opinions of the ethnic “minorities” who actually go to the park to enjoy off-leash. The National Parks have a reputation of being unwelcoming to non-white ethnic groups. It would be a challenge to find a recreation that is more diverse than off-leash dog walking. Fort Funston has a better mix of Asians, Black Americans, Pacific Islanders, East Indian, etc. than you are likely to find elsewhere in the parks. Off-leash recreation is a success story in term of the National Parks being welcoming to ethnic minorities.” (NPS 2011a, Correspondence 4592).

## **EMPLOYEE, VISITOR, AND DOG HEALTH AND SAFETY**

**Issue.** GGNRA manages much of the publicly accessible San Francisco Bay and ocean coastal lands in San Francisco and Marin counties; park personnel have stated that the increased number of conflicts among park visitors is of great concern. Many of the issues related to the health and safety of visitors to the park and park employees are related to encounters with unruly or aggressive dogs. Reported incidents include being knocked down, intimidated, and bitten by dogs. Additionally, dog-on-dog bites and dog-on-horse bites often involve visitors who could be injured during these conflicts (e.g., attempts to separate dogs, horses bolting). The paragraphs below discuss statistics and issues regarding safety of employees (rangers, U.S. Park Police, and other employees of the park) and visitors from dogs.

Injuries to visitors from dogs jumping on them, chasing them, harassing them, or biting them are a serious concern, as are increased risks or hazards to rangers who rescue dogs or dog owners. The criminal incident reports for the years 2008 through 2011 recorded violations of 36 CFR 2.34 (a), “hazardous conditions,” resulting for dog interactions at GGNRA. This category includes dog bites and/or dog attacks that have occurred at the park. There were a total of 95 dog bites/attacks at GGNRA sites from 2008 through 2011. Park staff members have been involved in rescues of both dogs and visitors from certain areas of the park, particularly from the coastal bluffs at Fort Funston (29 rescues occurring from 2008 through 2011). Rescues have also been performed at Ocean Beach, Marin Headlands Trails, Sutro Heights Park and Baker Beach. There is a potential for ranger injuries to occur in the course of these rescues. If the owners had had their dogs leashed and under control, then many of these rescues could have been avoided.

From 2008 through 2011, GGNRA NPS rangers and U.S. Park Police (collectively referred to as law enforcement staff) recorded a total of 2,775 dog-related incidents for leash-law violations, dog bites or attacks, hazardous conditions or pet rescues, and failure to pick up pet excrement at GGNRA sites that are considered in this draft plan/SEIS. Of these citations, 510 violations occurred at Crissy Field and 969 occurred at Ocean Beach. A total of 1,487 reports of dogs in closed areas at GGNRA sites that are considered in this draft plan/SEIS were recorded by GGNRA law enforcement staff between 2008 and 2011. Of these, 729 reports were for dogs in the Ocean Beach SPPA and 283 reports for dogs in the Crissy Field WPA. Visitors have reported being jumped on and knocked down by unrestrained dogs. The park has had complaints from people who are so frightened of off-leash dogs that they avoid visiting the park entirely or visit only when least likely to encounter dogs (NPS 2002b, 3). During the public comment period for the draft plan/EIS, visitors expressed these concerns. One commenter stated, “I was

bitten in the GGNRA by an off-leash dog. I did not report it but have just avoided the GGNRA since” (NPS 2011a, Correspondence 1649). Even leashed dogs can be frightening to some people when dogs bark or strain at the leash. Conflicts between dogs walked under voice control and other visitors can be particularly intense along the beach areas of the park, as this area attracts large numbers of visitors, both with and without dogs, particularly on weekends and during the summer or on warm days. Visitors with children who play along the water’s edge or in the sand and are approached by dogs, either aggressively or not, may feel that their child’s safety may be at an elevated risk for dog bites or other injuries.

**Issue.** Guide dogs are at risk from off-leash dogs which can compromise the safety of the guided individual. Off-leash dogs can interfere with guide teams by attacking the guide dogs, threatening the physical and emotional well-being of guide dog teams. Even without physical injury, attacks and interference can negatively affect a guide dog’s behavior and work performance. Following an attack, guide dogs may be unable to work because of physical injuries, and they may develop undesirable behaviors towards other dogs (The Seeing Eye Guide 2011, 6). During the public comment period for the draft plan/EIS, commenters noted concerns pertaining to the safety of guide dog teams. One commenter stated, “An unleashed dog rushing the guide dog team can make the guide dog skittish and afraid. That puts the guide dog team at risk. If the guide dog is more worried about being rushed by another dog, that guide is not doing it’s job and injury to both the guide dog and guide dog user could occur.” (NPS 2011a, Correspondence 277).

**Issue.** A health concern associated with dog waste is pathogens that can infect humans if ingested. Organisms carried in dog feces include *Cryptosporidium*, *Giardia lamblia*, and *Salmonella*, which can induce symptoms ranging from skin sores to chest pain. Additionally, the bacteria called *Escherichia* can also be found in dog waste, and particular strains of some species of *Escherichia* are human pathogens, such as *E. coli*, commonly referred to as fecal coliform bacteria. Dog waste can also contain roundworms and other parasitic nematodes, which can cause fevers, bronchitis, asthma, or vision problems in severe infections (USEPA 2001, 2). Infection by any of these pathogens can occur through ingestion of contaminated sand, vegetation, or water.

**Issue.** Wildlife may transmit disease to dogs, and the quality of water where dogs play or drink may be poor. Dogs may pick up canine distemper virus and other diseases from infected wildlife. Wild birds, small mammals, and dogs can also introduce microorganisms into a water supply, and these microorganisms, algal blooms, and other naturally occurring phenomena can make dogs sick when they drink from affected streams or ponds.

**Crissy Field and San Francisco**

Credit: NPS

## **NEEDS OF URBAN AREA RESIDENTS**

Because the San Francisco Bay Area is highly urbanized, dog owners may have access to few outdoor areas for exercising their pets. Additionally, the adjacent city, county, and state public lands have fewer areas available for dogs and/or more restrictions on these areas, so potential use by urban dog owners is therefore pushed onto NPS lands. For residents of San Francisco and Marin particularly, and increasingly for San Mateo residents, GGNRA lands are the “backyards” of the citizens, and residents have come to expect public lands to be made available for dog walking and other recreational activities. Also, as noted previously, the management and thus enforcement of laws, regulations, and policies for much of the beach and other coastal property in this

highly urbanized area falls to the NPS. The coastal areas are highly popular parts of the San Francisco Bay Area, a region whose population is currently seven million and is expected to grow to eight million by 2020 (Adams et al. 2006, 40). The expectations of an increased number of visitors, many of whom expect to use the national park sites for their recreational needs, have increased management challenges for the present and future generations.

**PUBLIC CONFUSION OVER NATIONAL PARK SERVICE-WIDE DOG REGULATION, GOLDEN GATE NATIONAL RECREATION AREA-SPECIFIC RULES, NATIONAL PARK SERVICE MISSION AND POLICIES**

Off-leash, voice control dog walking has historically been allowed in some areas of GGNRA since before the park was established. This unofficial policy continued after the establishment of GGNRA for more than 20 years, and following the park’s 2001 return to the NPS-wide regulation (36 CFR 2.15(a)(2)) requiring dogs to be walked on leash, some visitors were either unaware of the changes or were opposed to implementation of the rule and chose to ignore it. Additional confusion arose in 2005 when GGNRA reverted to the 1979 Pet Policy in response to the federal court decision barring enforcement of 36 CFR 2.15(a)(2) in areas contained in the 1979 Pet Policy until notice and comment rulemaking took place. Finally, in 2006, GGNRA enacted a special regulation requiring seasonal leash restrictions for protection of the federally threatened western snowy plover on sections of Crissy Field and Ocean Beach.

Further complication arises from the disconnected nature of GGNRA park sites, which are interspersed with other public lands managed by city, county, state, or regional agencies. Each agency has its own set of rules and regulations regarding dog walking, some of which differ from NPS regulations (see “State and Local Laws, Regulations, and Policies” at the end of this chapter), and geographical boundaries between agency jurisdictions are not always obvious.

The public may also be largely unaware of the laws, regulations, and policies that guide the NPS in management of lands and resources, such as the GGNRA Compendium (NPS 2001b, 1). Members of the public may also not know that they must refer to the GGNRA Compendium, or to the park’s web site, to find which areas are closed to dog walking (or closed to visitors). Adding to the possible confusion, closures may change from year to year, and portions of park sites, rather than an entire site, may be closed to the public for resource protection or visitor safety.

As the dog walking regulations changed, GGNRA staff worked to educate the public by distributing information cards and brochures, meeting with organized dog walking groups and asking them to inform their constituencies, updating the park web site, media interviews and, particularly in 2001 and 2002, handing out free leashes to encourage adherence with the NPS leash requirement. Although it is likely that during the enforcement status changes many violations were intentionally committed by those aware of the rules and regulations of the area, public confusion added to the difficulty of enforcing on-leash dog walking rules.

## **ISSUES AND IMPACT TOPICS DISMISSED FROM ANALYSIS**

### **ENERGY REQUIREMENTS AND CONSERVATION POTENTIAL**

The CEQ requires that environmental documents consider energy requirements and the conservation potential of various alternatives and mitigation measures. Dog walkers using GGNRA arrive at park sites on foot or by private automobile. However, vehicle miles traveled because of recreational dog walking in GGNRA are negligible in the context of regional travel because the alternatives would result in negligible to minor changes in private vehicle trips to GGNRA sites considered in the alternatives. Any change in energy requirements as a consequence of modifications in the number of vehicle trips to GGNRA resulting from the implementation of any of the alternatives would be imperceptible. As a result, this topic has been dismissed under all alternatives.

### **NATURAL OR DEPLETABLE RESOURCE REQUIREMENTS AND CONSERVATION POTENTIAL**

Consideration of this topic is required by 40 CFR 1502.16. The NPS has adopted the concept of sustainable design as a guiding principle of facility planning and development (NPS 2006a, 124). Essentially, “sustainability” is the concept of living within the environment with the least impact on the environment. The objectives of sustainability are to design facilities to minimize adverse effects on natural and cultural values; to reflect the environmental setting and to maintain facilities to promote their resilience; and to illustrate and promote conservation principles and practices through sustainable design and ecologically sensitive use.

No facility planning or development is proposed in the alternatives considered in this draft plan/SEIS, although trail work and limited fencing is proposed. The alternatives would not result in an appreciable loss of natural or depletable resources. As a result, this topic was dismissed from further analysis in this document.

### **URBAN QUALITY AND DESIGN OF THE BUILT ENVIRONMENT**

Consideration of this topic is required by 40 CFR 1502.16. The quality of urban areas is not a significant factor in determining a dog management policy for GGNRA. No new building construction or rehabilitation of existing structures is proposed under the alternatives presented in this draft plan/SEIS; therefore, this topic has been dismissed from further analysis.

### **FLOODPLAINS**

NPS *Procedural Manual 77-2: Floodplain Management* (NPS 2003a, 1) provides agency-specific guidance for implementing Executive Order 11988, Floodplain Management. According to the guideline, an action class and applicable regulatory floodplain must be identified for a proposed action that is either subject to possible harm from flooding or has the potential for adverse floodplain impacts. Dog management actions are not expected to affect GGNRA floodplains, and possible flood events are not expected to affect dog management actions. As a result, this topic has been dismissed from further analysis.

### **PRIME AND UNIQUE AGRICULTURAL LANDS**

In August 1980 the CEQ directed that federal agencies assess the effects of their actions on farmland soils classified by the U.S. Department of Agriculture’s Natural Resources Conservation Service as prime or

unique. None of the soils at the GGNRA sites considered in the alternatives would qualify as prime or unique farmlands because they have not been used for production of crops during the past four years. Therefore, this topic has been dismissed from further analysis.

## **WILD AND SCENIC RIVERS**

The *Wild and Scenic Rivers Act of 1968* established the national wild and scenic river system to protect the nation's highest quality natural rivers. There are no designated wild and scenic rivers within the study area, so this topic has been dismissed from further analysis.

## **INDIAN TRUST RESOURCES AND SACRED SITES**

Indian trust assets are owned by Native Americans but held in trust by the United States. The U.S. Department of the Interior requires that any anticipated impacts to Indian trust resources due to a proposed project or action by Interior agencies be explicitly addressed in environmental documents (512 Departmental Manual 2). Since the lands within the park boundaries are not held in trust by the Secretary of the Interior for the benefit of Indians due to their status as Indians, this topic was dismissed.

## **SOCIOECONOMICS**

GGNRA park operations and visitors create social and economic links between the park and the surrounding community. However, dog management policies are not expected to have a noticeable impact on the economic links between GGNRA and the city of San Francisco. As a result, potential impacts on social and economic conditions would be highly unlikely to exceed a "negligible" threshold, and are therefore eliminated from detailed consideration.

Sufficient background information and description of the affected environment to support the preceding conclusion is presented below.

GGNRA has socioeconomic links with the community, including employment, income, taxes, and infrastructure. The socioeconomic environment affected by GGNRA dog policy includes the San Francisco metropolitan statistical area, comprising the counties of San Francisco, San Mateo, and Marin, each of which encompasses GGNRA lands. The gross domestic product for the San Francisco metropolitan statistical area was approximately \$268 billion in 2005 and total employment was approximately 2.7 million.

The GGNRA boundary encompasses approximately 80,500 acres of land in San Francisco, Marin, and San Mateo counties, or nearly 12 percent of the total three-county land area. Currently, the park employs 346 staff members (250 permanent positions, 52 term positions, and 44 temporary positions). In 2008, a total of approximately 14.5 million people made recreational visits to GGNRA.

According to an economic impact model developed for the NPS, in 2006 local day-use visitors to GGNRA spent approximately \$135.3 million out of an estimated total of \$231.7 million spent by all GGNRA visitors (Stynes 2007, 21). The spending numbers were generated using generic expenditure profiles developed for national parks. Based on data from a variety of surveys, local day-use visitors are assumed to spend on average \$38.70 per party per day. Visitation data on local visitors walking their dogs off leash in the park are not available; however, reports from park staff suggest that use of GGNRA by dog walkers has been increasing as regulations limiting or prohibiting off-leash dogs in areas managed by other agencies have been increasingly enforced. At the same time, the city of San Francisco has increased dog play areas in recent years.

The alternatives could affect visitation patterns of both dog owners, most of whom are likely local residents, and other local and nonlocal visitors in units of the park where dogs are permitted. Alternatives regarding the management of dog walking in the park could affect the socioeconomic environment through changes in spending by visitors at area businesses, which could also cause changes in employment and tax revenue. Restrictions on dog walking might reduce visitation by parties including dog owners and dog walkers. It is possible that visitation by individuals who prefer not to recreate near off-leash dogs (or dogs being walked on leash) might increase overall, or visitors might redistribute their visits across different park units, depending on the outcome of the final plan/SEIS. There is a broad business community linked to the GGNRA that serves both local and out-of-town visitors. NPS does not know which specific businesses would be most affected by changes in spending by dog owners and dog walkers; however, because dog owners and dog walkers are likely to be local residents, businesses that cater primarily to tourists are less likely to be affected.

Some commercial dog walking businesses visit GGNRA to exercise dogs under their care. These businesses would be directly impacted by changes in park policy that would restrict or prohibit use of the park by commercial dog walkers. Research and interviews indicate that there are at least 100 commercial dog walkers in the city, although there are also commercial dog walkers who do not have a business license and are not listed in the phone book. Many of these dog walkers are single individuals (who may or may not be licensed), as well as companies with several employees. There is at least one association for commercial dog walkers in San Francisco (Prodog). There are 68 registered businesses in the city of San Francisco providing pet care services and 216 such businesses in the San Francisco metropolitan statistical area (Reference USA 2005, 1). The park does not maintain official statistics on use of the park by dog walking businesses. According to interviews with stakeholders, most of the commercial dog walkers who use GGNRA visit at least once a week and others visit every day. In particular, commercial dog walkers use the Fort Funston area, the Crissy Field area, and Alta Trail above Marin City. Commercial dog walkers typically bring between four and ten dogs at a time to GGNRA and spend about one hour, twice a day, in the park. According to interviews, some dog owners request off-leash time for their dogs, and some dog walkers feel it is important to offer this service.

If commercial dog walking is not permitted in the park, commercial dog walkers may incur higher costs if they have to transport their dogs farther to find areas to walk their dogs, or if they have to reduce the number of dogs they walk at one time because of restrictive regulations in city dog parks or other public lands. While this would cause an impact on commercial dog walkers, the effects will be negligible within the context of employment within the San Francisco metropolitan statistical area (affecting less than 1/100 percent of the over 2.5 million jobs in the San Francisco metropolitan statistical area in 2005).

Based on the information summarized above, the NPS dismissed socioeconomic impact as an impact topic because implementation of alternative dog management policies is expected to have no measurable socioeconomic impact on the surrounding area. Estimated total spending by all local visitors to GGNRA accounts for 0.0008 percent of the total gross domestic product for the San Francisco metropolitan statistical area in 2005. Current spending by dog owners and dog walkers will be an even smaller fraction of the local gross domestic product. Changes in spending under alternative dog management proposals will have no impact or a negligible impact on the socioeconomic environment defined as employment, income, taxes, and infrastructure. In addition, spending by local residents does not have the same multiplier effect on the local economy as spending by nonlocal visitors. Local residents usually shift spending from one set of area businesses to another, leaving metropolitan statistical area-wide spending unchanged.

A separate cost-benefit analysis and regulatory impact analysis, as required under the *Regulatory Flexibility Act of 1980*, as amended in 1996, will be conducted during the rulemaking process.

## **ISSUES AND IMPACT TOPICS ELIMINATED FROM FURTHER CONSIDERATION IN THIS SEIS**

The following resources were analyzed in detail in the draft plan/EIS. The analysis determined that the impacts on the resource are thoroughly analyzed and described under another resource topic, and/or peer-reviewed literature or data does not exist to establish a direct impact from dogs on the resource. The following resources were dismissed from further analysis in the SEIS.

### **SOILS**

NPS *Management Policies 2006* requires the NPS “to understand and preserve the soil resources of parks, and to prevent, to the extent possible, the unnatural erosion, physical removal, or contamination of the soil or its contamination of other resources...Management action will be taken by superintendents to prevent or at least minimize adverse, potentially irreversible impacts on soil” (NPS 2006a, Section 4.8.2.4, 56).

A detailed literature review was conducted to determine the associations between dogs, soils, and vegetation. Our literature review found very few investigations, and no peer-reviewed, scientific studies, that document the isolated effects dogs have on soils in recreational settings. Similarly, no site-specific, peer-reviewed studies have been conducted that document impacts to soils from dogs at the GGNRA sites. The results of the literature review provide a general nexus for dog-related impacts to vegetation, but do not isolate specific impacts to soils as a result of dogs. A study of the literature indicates that the primary detrimental soil impacts from general recreation are loss of productivity, erosion, compaction, rutting, and displacement (Douglass et al. 1999, 9.5), but this study did not specifically discuss recreation in the form of dog walking. However, there are some known and generally accepted impacts to soils from dog waste, but these studies are generally not peer-reviewed. Dog waste contains nutrients and can increase the amount of nitrogen and phosphorus in the soil (CRCCD 2009, 1). Some soils in the park are particularly unique or are by nature low in nutrients and a change in soil chemistry could potentially cause a change in vegetation, and can ultimately affect wildlife habitat, and wildlife species. These impacts are discussed in detail in the vegetation and wildlife sections of this draft plan/SEIS. Due to lack of peer-reviewed, scientific studies regarding isolated impacts to soils as a result of dogs, soils have been dismissed as a stand-alone resource topic in this document. Although the soil resources topic is not carried forward, impacts to soils are integrated into the vegetation section of the draft plan/SEIS, since peer-reviewed literature is available on this topic.

### **WATER QUALITY**

Water resources at GGNRA include coastal waters, brackish lagoons, streams, ponds, seeps, springs, and wetlands. Significant watersheds located completely or partially within the park (from north to south) include Bolinas Lagoon, Redwood Creek, Coyote Creek, Nyhan Creek, Tennessee Valley (Elk Creek), Rodeo Creek/Lagoon, Lobos Creek, Calera Creek and Laguna Salada, San Pedro Creek, Milagra Creek, San Mateo Creek, West Union Creek, Martini Creek, Montara Creek, San Vicente Creek, Denniston Creek, and the San Francisco watershed lands in San Mateo County. Smaller watersheds drain steep coastal bluffs directly into San Francisco Bay or the Pacific Ocean. Current management actions to improve water quality in GGNRA include water quality monitoring, watershed planning and restoration, habitat restoration and revegetation, drainage improvements, trail realignments, contaminant source identification and remediation, and site planning and design to reduce erosion (Stafford and Horne 2004, 5). Most water quality sampling to date has focused on specific sites with known or suspected water quality impacts, including beach water quality monitoring. Water quality monitoring has been conducted in several of the park’s water bodies over the years, including areas covered under this plan: Redwood Creek, Rodeo Creek, Rodeo Lagoon, Oakwood Valley, Tennessee Valley, Easkoot Creek, Crissy Marsh,

and Lobos Creek. Water quality indicators measured included flow, temperature, pH, specific conductance, turbidity, total suspended solids, dissolved oxygen, biochemical oxygen demand, nitrogen, phosphorus, ammonia, metals, and biological indicators such as fecal coliform (Stafford and Horne 2004, 5).

Dogs playing in streams, wetlands, lagoons, and coastal areas can increase turbidity by stirring up sediments into the water column. Also, dog waste can increase nutrient levels in streams, wetlands, lagoons, and coastal areas. As with terrestrial habitats, changes in nutrient levels in aquatic environments can alter the type and growth of vegetation and the ability of wildlife to continue to use the area. Domestic dogs can also potentially introduce diseases (canine distemper, canine parvovirus, and rabies) and transport parasites into wildlife habitats (Sime 1999, 8.2). If pet waste is left on the ground, runoff from rain events may transport these microorganisms (including fecal coliform) to adjacent water bodies, thereby affecting water quality. Wild birds, small mammals, and dogs can also introduce microorganisms into a water supply, and these microorganisms, algal blooms, and other naturally occurring phenomena can make uninfected dogs sick when they drink from affected streams or ponds.

Although water quality monitoring currently occurs at GGNRA, no site-specific, peer-reviewed studies have been conducted at the GGNRA sites to document impacts to water quality specifically from dogs. It is also difficult to discern what is causing an impact to water quality, especially in a large metropolitan area where water quality may already be degraded. The literature review found very few investigations or peer-reviewed, scientific studies that document the isolated effects dogs have on water quality in recreational settings. Water quality has therefore been dismissed as a resource topic in this document due to lack of literature. There is concern about potential impacts of dog waste from a proposed regulated off-leash area (ROLA) on the airfield at Crissy Field on the water quality in Crissy Marsh. This is because the eastern 1/3 to 1/2 of the airfield directly connects to the marsh through perforated underdrains that connect to the stormwater system, which ultimately drains into the marsh in this area. During rainy periods, especially large rainfall events, contaminated runoff from dog waste could drain into the marsh and negatively impact water quality. However, compliance with regulations to pick up dog waste and organized pet waste clean-up days for this area would minimize this threat to water quality. GGNRA continues to put concerted effort into maintaining water quality in Crissy Marsh, including evaluating the water used for irrigating the airfield, stormwater management with the Presidio Parkway project, and supporting restoration of the Tennessee Hollow watershed.

## **SUMMARY OF BACKGROUND CONDITIONS AND REVIEW OF LITERATURE**

During the past seven years the park staff has amassed as much information as could be found on dog management-related topics. Topics for which information was collected include dog management policies from a variety of jurisdictions, shorebird data and information from scientists and organizations that monitor San Francisco Bay Area shorebird populations, and literature related to dog interactions with wildlife, diseases, and waste issues. Additional literature was evaluated for inclusion based on public comments on the draft plan/EIS.

### **DOG MANAGEMENT POLICIES FROM OTHER AGENCIES**

Federal, state, regional, county, and local agencies and land trusts are the primary providers of publicly accessible shoreline open space in the San Francisco Bay Area. In recent years, the popularity of dog walking has challenged many agencies, municipalities, and nongovernmental organizations that own these lands. Dog ownership in urban areas presents a unique set of circumstances that have increased the demand for outdoor, “dog-friendly” places to exercise and socialize dogs. Increasingly, municipalities are

providing dog parks or play areas where dog owners can allow their dogs to be off leash. Some parks and open space venues also may provide dedicated trails or portions of property for off-leash dog recreation and most have implemented regulations to reduce conflicts among various user groups and to protect sensitive natural and cultural resources as well as visitor experience and safety. To better understand the variety of circumstances dog management policies can address, NPS staff obtained dog management policies, information on visitor experience/conflict information, enforcement success, and other applicable information from a variety of NPS units and state, regional, county, and city park and recreation agencies. Information on dog management policies on lands adjacent to or near GGNRA sites was needed to clarify where other dog-related recreational opportunities were available in the vicinity of GGNRA and to assist with the development of alternatives that meet the goal of consistency with policies on adjacent lands. A summary of this information is stated below to provide an overview of dog management policies and the issues they raise.

## **OTHER NATIONAL PARK UNITS**

Thirty-three NPS units located along waterfronts similar to that of GGNRA provided information on dog policies at their locations. Six Pacific Coast, 17 Atlantic Coast, three Gulf Coast, and seven Great Lakes units were surveyed. Twenty-two of these units allow on-leash dog walking with access restricted to designated areas of the sites. Seven units allow on-leash dog walking throughout the park sites; one with restrictions. No sites allow off-leash dog walking, per federal regulations, and two sites do not allow dogs at all.

Of the NPS sites that allowed on-leash dog walking, restrictions primarily limit on-leash dog walking to developed areas (campgrounds, parking lots, picnic areas, and trails); some units also restrict on-leash dog walking to designated trails. Eleven units incorporate seasonal restrictions for on-leash dog walking on beaches for the protection of species of special concern, such as elephant seals, snowy and piping plovers and other shorebirds, and sea turtles. Other beach access restrictions result from beaches being designated as swimming beaches.

As stated previously, the Presidio Trust, a federal agency established by Congress within the GGNRA boundary, is a cooperating agency for this draft plan/SEIS and manages lands located immediately adjacent to GGNRA-managed lands. Within Area B of the Presidio, the lands managed by the Presidio Trust, dogs must be on leash where allowed. In November 2012, the Presidio Trust released a Notice of Proposed Rulemaking to limit the number of dogs walked by commercial dog walkers in Area B of the Presidio. This limit would require any commercial dog walker wishing to walk four or more dogs at one time to have a commercial dog walking permit issued by the City of San Francisco, and to comply with all provisions of that permit, including the limit of eight dogs per walker. The proposed rulemaking would also require that all dog walkers in the Presidio Area B remove pet excrement and deposit waste in refuse containers.

## **OTHER SAN FRANCISCO BAY AREA AGENCIES**

Dog management policies for jurisdictions in the San Francisco Bay Area—the California State Park System, Marin County (unincorporated Marin County, Marin County Open Space, and Marin Municipal Water District), Midpeninsula Regional Open Space District, East Bay Regional Parks, the City/County of San Francisco, and San Mateo Parks and Recreation—are summarized in the paragraphs that follow.

**California State Park System.** There are six state parks in the immediate vicinity of GGNRA. In the counties which encompass GGNRA sites, 24 state parks (Angel Island, Mount Tamalpais, Samuel P. Taylor, and China Camp in Marin County; Candlestick Point in San Francisco; and 19 parks and beaches in San Mateo County) are available for recreation. Dog walking is permitted in most state parks and some

beaches but dogs are either restricted to developed areas (e.g., picnic areas and campgrounds) or dogs must be in an enclosed vehicle, tent, or pen or be on a leash not more than six feet long. Unlike at GGNRA, even leashed dogs are generally not allowed on trails. For example, at Mount Tamalpais State Park, dogs are allowed on leash only in picnic areas and camping areas; no dogs are allowed on trails, fire roads, or undeveloped areas. There is no limit to the number of dogs allowed per individual, but all dogs must be on a leash no longer than six feet. Compliance is generally not an issue (State of California 2007, 1). Visitors with vicious, dangerous, noisy, or disturbing animals are evicted from park units (State of California 2007, 1). On-leash dog walking is allowed on Surfer's Beach in Half Moon Bay and Montara State Beach (includes McNee Ranch).

**Unincorporated Marin County.** Dog access regulations require dogs to be under immediate control at all times but do not require them to be on a leash. Regulations require that dogs be kept from physically harassing other people and animals, and the maximum number of dogs is regulated at "three over the age of four months unless the walker is a 'hobbyist' or has a ranch dog permit." There is no waste regulation in the unincorporated areas. There may be water access (bays, ocean, lakes, and reservoirs) at some locations. Rules are enforced by the Marin County Humane Society.

**Marin County Open Space.** There are parks and beaches managed by Marin County located near GGNRA, including Blithedale Summit Open Space Preserve and Camino Alto Open Space Preserve. At parks managed by Marin County, dogs are generally restricted to trails and fire roads. Dogs are allowed off leash only on fire roads. Leashes must be a maximum of six feet in length and dogs not on leash must be under direct and immediate control. A maximum of three dogs per person is allowed based on the county code for pets per household/per family. Sensitive areas have additional restrictions for dog management. Commercial dog walkers must obtain an annual conditional use permit, which allows up to six dogs to be walked at one time and requires at least three of the six dogs to be on leash at all times. Dog waste must be picked up by the dog walkers. Rangers enforce restrictions, and the largest area of noncompliance is off-leash dogs in areas where they are not allowed (County of Marin 2006a, 6 and 2006b, 1). Marin County also manages Bolinas Beach and Upton Beach, where dogs are allowed on the beach. Although managed by the county, Bolinas Beach also includes some private lands and off-leash dog walking is allowed at this beach. Upton Beach requires dogs to be on leash, but off-leash dog walking, while not permitted, does occur here.

**Marin Municipal Water District.** This district owns about 21,000 acres of watersheds and reservoirs. Dog walking is allowed only on leash (six feet) in all areas (except for water bodies), unless posted for temporary closures for construction projects or to protect species of special concern. There is no limit to the number of dogs as long as all are on leash. Enforcement is highest for noncompliance with the on-leash requirement (Marin Municipal Water District 2002, 25-26).

**Midpeninsula Regional Open Space.** Midpeninsula Regional Open Space District is a regional greenbelt system that includes more than 55,000 acres of land in 25 preserves. This district west of U.S. Highway 280 stretches from Los Altos in the south to San Carlos in the north. Dogs are allowed on all trails in six of 25 preserves and on designated trails in four additional preserves. Dogs are permitted to be off leash only in the marked off-leash area in the Pulgas Ridge Preserve. Walkers may have a maximum of three dogs and a maximum leash length of six feet for traditional leashes and 25 feet for retractable leashes (Midpeninsula Regional Open Space District 2007, 1). Dog walkers must move dog waste well off the trail and out of sight, or preferably, bag and remove waste from the preserves. There are no special regulations for commercial dog walking enterprises. Major enforcement problems arise from off-leash dogs in restricted areas (Midpeninsula Regional Open Space District 2004, 1 and 2007, 1).

**East Bay Regional Parks.** Dog walking is allowed on leash in parking lots, picnic sites, lawns, or developed areas, but dogs are prohibited at swimming beaches, pools, golf courses, wetlands, designated

nature study areas, and areas with sensitive habitat or endangered or threatened species. A maximum of three dogs per person is allowed and leashes must be no longer than six feet. Dogs are allowed off leash in most undeveloped areas except where restricted for resource and wildlife protection. Dogs are also allowed off leash at one developed site, Point Isabel Regional Shoreline, which is a state park area managed by East Bay Regional Park District and one of the most heavily used dog parks in the country. Commercial dog walkers and private individuals intending to walk more than three dogs are allowed to walk one to six dogs with an annual permit. All other restrictions for dog walkers apply to commercial dog walkers as well. Walkers are required to remove dog waste. The East Bay Regional Park system does not have any major compliance issues (East Bay Regional Parks 2006, 1, 4).

**San Francisco Public Utilities Commission.** The lands managed by the San Francisco Public Utilities Commission in San Mateo County are referred to as Peninsula Watershed lands. These lands serve as a state fish and game refuge and are designated by the California Department of Forestry as a hazardous fire area. On these lands, the NPS holds a scenic easement (approximately 19,000 acres) and a scenic and recreation easement (approximately 4,000 acres), which were established through an agreement with the U.S. Department of the Interior, Caltrans, and San Mateo County. Recreation activities such as hiking, biking, walking and running are permitted only in the scenic/recreation easement. Dogs and other pets are not allowed on the watershed lands with the exception of guide, search and rescue, and police dogs.

**City/County of San Francisco.** San Francisco Recreation and Park Department has 227 properties and 3,300 acres under its management (SFRPD 2007, 1). Outside of the 28 designated off-leash areas in San Francisco city parks, dogs are required to be on leashes no longer than six feet. Up to three dogs per owner are allowed and dog walkers must pick up dog waste. The San Francisco Recreation and Park Department's dog policy excludes dogs (on- and off-leash) from sensitive habitat areas, such as sensitive wildlife areas (e.g., breeding habitat for birds), sensitive remnant native plant communities (e.g., wetlands), sensitive plant populations (e.g., locally rare wildflower species), and high erosion prone areas. Dogs are also excluded temporarily from restoration areas (SFPD 2011, 156). Dogs are allowed off leash in 28 designated dog play areas (DPAs) within 24 city parks. Some of the DPAs are fenced and others use natural barriers such as topography or shrubbery; all DPAs have a minimum area of 10,000 square feet and any sensitive habitat or resource sections where dogs are prohibited have been fenced off or posted. In 2012, the San Francisco Board of Supervisors passed an ordinance that, starting in 2013, will require commercial dog walkers to obtain a permit to walk four or more dogs, with a limit of eight, on City of San Francisco park property (including some lands managed by the Port of San Francisco and by the San Francisco Public Utilities Commission).

**San Mateo County.** In San Mateo, dogs are not allowed in any county park and must be on leash when on public property or not in a fully enclosed area (County of San Mateo 2012,). However, in combination with Midcoast Park Lands (MDL), San Mateo County manages Quarry Park in El Granada, which allows on-leash dogs at this particular park.

**City of Pacifica.** Pacifica is the closest city to NPS lands within San Mateo County. There is one park managed by the City of Pacifica, known as Pacifica State Beach (at Linda Mar), that allows dogs on leash on the beach, and there are two off-leash areas, Esplanade Beach and the newly opened Sanchez Dog Park.

## **OTHER MUNICIPALITIES**

**City of Santa Cruz, California.** Dogs are allowed to run off leash in designated areas of seven parks, with time restrictions, and are not permitted in six parks. Walkers are required to remove dog waste (City of Santa Cruz 2009, 1).

**City of Boulder, Colorado.** City of Boulder Parks and Recreation District allows on-leash dog walking in all urban parks. Four urban parks also have dog parks where off-leash dog walking is allowed. A separate city department, Open Space and Mountain Parks, has 144 miles of trails, 94 percent of which are open to dogs with the exception of seasonal trail closures and leash restrictions for resource protection. Some of these trails require all dogs to be on leash, but others allow dogs off leash if they meet voice-and-sight-control standards. Those standards are from the Open Space and Mountain Parks-developed Voice-and-Sight Tag Program, an education and certification program required of all dog “guardians” wishing to walk their dogs off leash on Open Space and Mountain Parks trails that allow voice and sight control. Upon completion of the course, high-visibility tags can be purchased for any dogs that the guardian has agreed can adhere to the voice-and-sight-control guidelines. Open Space and Mountain Parks has also instituted a “Trailhead Area Leash Program” to reduce incidents at trailheads where there has been a high level of conflict between dog walkers and visitors without dogs (City of Boulder 2009, 1).

**Nashville, Tennessee.** All Nashville Metro parks are open to dogs on leash, and there are three dog parks that provide fenced areas for off-leash dogs. Dogs are not allowed in playgrounds or pool facilities. Owners/walkers must remove waste and keep dogs under control (City of Nashville and Davidson County 2005, 3-10). Prior to the establishment of the dog parks, Metro Park Police and other staff report that unrestrained dogs became one of the most frequent sources of complaints on park property (City of Nashville and Davidson County 2005, 3-10).

**Seattle, Washington.** Dogs are allowed to roam off leash at 11 of the 400 parks and recreation areas in the Seattle metro area. Although dogs are allowed on leash in most other park areas, they are not allowed on beaches, play areas, or organized athletic fields. Owners are responsible for waste removal. Fines are implemented for leash and waste-removal violations (Seattle Parks and Recreation 2009, 1, 3).

**British Columbia, Canada.** After the City of Surrey conducted an extensive literature review of impacts of dogs on the foreshore and nearshore at Blackie Spit Park, they concluded that the park would not be a good candidate for dog access to the intertidal zone due to highly sensitive and regionally important habitats located within the park, as well as the relatively small size of the less sensitive habitats. The City also decided that extensive fencing to prevent off-leash dogs from accessing other areas of the park and well-spaced signs that clearly indicated dog management regulations should be used. It was also concluded that the City of Surrey, the local dog owners’ group, and naturalists’ organizations should implement a dog park outside the park in an area that does not have high environmental value (Andrusiak 2003, 35).

## **DOGS AND NATURAL RESOURCES**

This section provides a general summary of the literature review conducted to determine the potential for adverse impacts from dogs or dog use on wildlife and wildlife diseases, and vegetation (including soils). Impact topics are discussed in more detail and used for the purposes of the impacts analysis presented in chapter 4.

**Dogs and Wildlife.** Numerous studies have documented disturbance to wildlife species as a result of domestic dogs in recreational/park settings (Burger et al. 2004, 287; Davidson and Rothwell 1993, 101; George and Crooks 2006, 14; Kirby et al. 1993, 55; Lafferty et al. 2006, 2222; Lenth et al. 2008, 223; Miller et al. 2001, 131; Smit and Visser 1993, 10; Thomas et al. 2003, 69; Yalden and Yalden 1990, 249). In recreational/park settings, domestic dogs and people are generally not mutually exclusive, and it is therefore difficult to isolate the impacts and effects of dogs alone on wildlife. However, visitors with dogs could impact natural resources such as wildlife to a greater extent than visitors without dogs. Studies have shown that people with dogs disturb wildlife more than people alone (Yalden and Yalden 1990, 248-249),

and that dogs may pose a different kind of threat compared to a pedestrian (Miller et al. 2001, 130). Studies have also suggested that dogs, particularly while off leash, increase the radius of human recreational influence or disturbance beyond what it would be in the absence of a dog (Banks and Bryant 2007, 2; Sime 1999, 8.4; Miller et al. 2001, 125; Lafferty 2001b, 318). For example, golden plovers (Yalden and Yalden 1990), marmots (Mainini et al. 1993, 162), mule deer (Miller et al. 2001, 131), squirrels, and rabbits (Lenth et al. 2008, 218) exhibited a greater response to or reduced levels of activity when human hikers were accompanied by a dog compared to solitary hikers. “Authors of many wildlife disturbance studies concluded that dogs with people, dogs on leash, or loose dogs all provoked the most pronounced disturbance reactions from their study animals” (Sime 1999, 8.2). Animals most often affected by disturbance from dogs include deer, small mammals, and birds (Denny 1974), although canids and other larger mammals such as bobcats can also be affected by disturbance (George and Crooks 2006, 14-15).

The majority of domestic dogs in the U.S. are pets that have their food requirements met at home, thus allowing them ample energy to interact with wildlife (Lenth et al. 2008, 218). Domestic dogs behave as carnivores and at some level still maintain instincts to hunt and/or chase (Sime 1999, 8.2) and are capable of catching and killing prey species (Lenth et al. 2008, 218). Dogs may disturb wildlife either accidentally or deliberately through chase (Andrusiak 2003). Even if the chase instinct is not triggered, dog presence in and of itself may be an agent of disturbance or stress to wildlife (Sime 1999, 8.3; Lenth et al. 2008, 218). If dogs chase or pursue wildlife, injuries to wildlife could be sustained directly or indirectly as a result of accidents that occur during the chase rather than direct contact with the dog (Sime 1999, 8.4). Dogs on leash disturb wildlife less frequently than dogs off leash, but actual direct injury or mortality to wildlife by dogs in either situation is rare (Andrusiak 2003). Dog presence has been correlated with altered patterns of habitat use for wildlife species (Lenth et al. 2008, 222). The modification of normal behaviors such as feeding, nesting, grooming, and resting can occur through repeated disturbance and wildlife may relocate from preferred habitat to other areas to avoid harassment, including the displacement of wildlife from public to private lands (Sime 1999, 8.4). However, disturbance avoidance may not accurately reflect species sensitivity to disturbance. Other factors such as availability of suitable habitat also should be weighed (Gill et al. 2001). Although disturbances are generally non-lethal and temporary, the cumulative effects of disturbance may be significant, particularly to sensitive species (Lafferty et al. 2006, 2217).

Generally, birds are more sensitive to the approach of dogs than to the approach of human beings (Andrusiak 2003, ES) and the “presence of dogs may intensify bird responses to pedestrians” (Sime 1999, 8.10). Shorebirds nesting on beaches are presumed to be the species most sensitive to disturbance and several species, particularly coastal plovers in the genus *Charadrius*, are endangered or threatened (Lafferty 2001b, 315) and are very likely to leave an area altogether if disturbed (Kirby et al. 1993, 56-57). At GGNRA, high levels of pedestrian and dog use of park beaches located along the Pacific Flyway can lead to reduced habitat quality for shorebirds “because disturbance may reduce foraging efficiency and opportunities for rest” (Lafferty 2001a, p. 1949). In Southern California, dogs disturbed shorebirds disproportionate to their numbers because some dogs chase shorebirds, and due to the possibility that snowy plovers are more sensitive to dogs than people (Lafferty 2001a, Lafferty 2001b). Although leashing makes it difficult for pets to chase birds and reduces the probability of disturbance and the number of birds impacted per disturbance, leashed pets still disturb birds (Lafferty 2001a, 1955). “Dogs can disrupt habitat use, cause displacement responses, and injure or kill birds” (Sime 1999, 8.10). Dogs that are off leash in natural areas during the breeding season can result in a higher level of disturbance to wildlife, including ground-nesting or colonially nesting birds (Andrusiak 2003, 20; Sime 1999, 8.4, 8.9). Birds may not habituate to dog disturbance (Banks and Bryant 2007, 2) because it is unpredictable and represents an actual physical threat (Andrusiak 2003, 3.2).

**Dogs and Diseases Related to Wildlife.** The role of dogs in wildlife diseases is poorly understood (Sime 1999, 8.4). Most dog owners responsibly vaccinate their pets for diseases such as canine distemper, canine parvovirus, and rabies. Domestic dogs that are not vaccinated can potentially introduce diseases into wildlife habitats (Sime 1999, 8.2). Viruses related to canine distemper virus have been documented in the deaths of a wide variety of wild animals, from seals, dolphins, and porpoises in Russia to lions in Africa, but there are fewer documented instances of deaths caused by canine distemper in areas where domestic animals are regularly vaccinated (Mills 1999, 2-8). Domestic dogs may also host both endoparasites and ectoparasites, and it is possible for dogs to contract diseases from or transmit diseases to wild animals (Sime 1999, 8.4). Dog feces have been implicated in the transmission of muscle cysts (*Sarcocystis* spp.), which can infect a variety of ungulate species, including mule deer and white-tailed deer. Dogs may also introduce diseases or parasites to small mammals. Additionally, in an area of GGNRA, Riley et al. (2004, 11) showed that proximity to urban areas or contact with humans can increase the risk of wild carnivore populations' exposure to disease, including canine parvovirus in foxes and feline calicivirus in bobcats.

**Dogs and Vegetation.** It has been documented that recreational activities can affect vegetation and soils, resulting in damage to plant communities (Cole 1978, 281; Douglass et al. 1999, 9.2). Sensitive environments can be subject to physical disturbance by dogs (through digging) and could damage vegetation and soils, with resulting influences on vegetation, soils, and wildlife such as small mammal populations (Sime 1999, 8.9). "High foot traffic (both people and dogs) resulting from an off-leash area would result in trampling and disturbance of vegetation" (Andrusiak 2003, 5). In addition, heavy off-leash dog use increases deterioration of native dune communities (Shulzitski and Russell 2004, 5). Dogs (as well as horses and hikers) may also alter dispersal of both native and non-native plants along trail corridors, as seeds that adhere to their paws and fur are then transported to other locations, possibly resulting in the spread and establishment of new populations of invasive and/or non-native plants (Sime 1999, 8.9-8.10). Dog waste contains nutrients and can increase the amount of nitrogen and phosphorus in the soil (CRCCD 2009, 1). Although nitrogen and phosphorus are nutrients required for plant growth, dog waste could increase the amount of nutrients in the soil above natural levels; dog urine could increase the natural salinity of soil. An increase in nutrients from dog excrement in concentrated areas could result in adverse impacts to native plants and soil organisms.

## HEALTH AND SAFETY

This section provides a general summary of the literature review conducted to determine the associations between dogs and diseases, encounters with unruly/aggressive dogs, and the safety of off-leash dogs, which is discussed in more detail and used for the purposes of the impacts analysis presented in chapter 4.

**Dogs and Diseases Related to Humans.** Pet waste can contain pathogens, such as *Giardia*, roundworms, *Salmonella*, *Escherichia* (particular strains of some species are human pathogens, such as fecal coliform bacteria), parvovirus, and many other microorganisms that can be harmful to human health (CRCCD 2009, 1). Leaving pet waste anywhere on the ground may expose children, adults, and other pets to these potential pathogens and bacteria (CRCCD 2009, 1). If dog waste from infected dogs is left on the ground, the surrounding soil can become contaminated with parasite eggs that are passed in animal feces and hatch in the soil. The collection of feces and reducing feral and unaccompanied domestic animals in parks could help reduce the risk of transmission of many diseases (Riley et al. 2004, 19).

There is also a risk of humans getting sick from drinking or swimming in waters contaminated by pet waste (CRCCD 2009, 1). If pet waste is left on the ground, runoff from rain events may transport microorganisms to adjacent water bodies. Fecal coliform bacteria are routinely measured at bathing beaches as an indicator of potential contamination from human or animal waste, although once contamination is detected, other tests are needed to determine the specific source. Wild birds, small

mammals, and dogs can also introduce microorganisms into a water supply, and these microorganisms, algal blooms, and other naturally occurring phenomena can make uninfected dogs sick when they drink from affected streams or ponds.

**Encounters with Unruly/Aggressive Dogs.** Encounters with unruly or aggressive dogs can pose a major health and safety concern to people and other pets. Serious bites can result in injury/disease, medical insurance and worker's compensation claims, lost wages, and sick leave (AVMA Task Force 2001, 1732-1749). At GGNRA, reported incidents of encounters with unruly/aggressive dogs include instances of visitors being knocked down, intimidated, and bitten by dogs. From 2008 through 2011, a total of 95 violations were given for dog bites or attacks at the GGNRA park sites as recorded by GGNRA law enforcement staff (appendix G). Data collected by the Centers for Disease Control and Prevention show that approximately 4.5 million Americans are bitten by dogs each year, and one in five dog bites results in injuries that require medical attention (Centers for Disease Control and Prevention 2009). Small children are typically the most common victims of dog-related injuries because of their natural behaviors, such as running, yelling, grabbing, or hitting, which may sometimes threaten a dog. Children are also more likely than adults to receive medical attention (Centers for Disease Control and Prevention 2009). Elderly people are also considered at a higher risk of complications from dog-related injuries due to their increased susceptibility to bruising and lacerations. Additionally, elderly people may have decreased sensory perception, which could result in them not seeing or hearing a dog or could make them unable to escape from an aggressive dog (AVMA Task Force 2001, 1742).

**Guide Dogs.** Off-leash dogs can interfere with guide teams (a person and their guide dog), often by attacking the guide dogs, threatening the physical and emotional well being of guide dog teams. Even without physical injury, attacks and interface can negatively affect a guide dog's behavior and work performance. Following an attack, guide dogs may be unable to work because of physical injuries, and they may develop undesirable behaviors towards other dogs (The Seeing Eye Guide 2011, 6). Guide dog teams are more vulnerable in areas under voice and sight control, due to off-leash dogs. Service animals accompanying a person with a disability, as defined by Federal law and Department of Justice regulations (28 CFR 36.104), are allowed wherever visitors or employees are allowed.

**Exercise.** Visitors with dogs, including elderly and handicapped visitors may experience beneficial effects of walking their dogs. Dog walking provides mental health benefits by providing a social community for many people. Studies have shown that dog owners exercise more than people who do not own dogs. A study in Australia looked at how dog ownership influenced physical activity (Cutt et al. 2008). Dog owners walked their dog on average 2.6 times per week. Frequency and duration of total walking, walking for recreation, walking in the neighborhood, and total physical activity were higher among dog owners than those that did not own dogs. The results confirm the potentially important role that dogs could play in increasing levels of physical activity among owners (Cutt et al. 2008). In a separate study, 61 percent of the 2,170 dog owners sampled walked their dog for at least 10 minutes at a time. The median number of times dog owners reported walking their dog each week was three and the median duration was 25 minutes. The median weekly duration of dog walking was high among young dog owners, declined in middle age, and increased in persons aged 65 years and older. Dog walking contributed to a significant increase in the total amount of walking conducted per week (Reeves et al. 2011). In addition to providing physical health benefits, dog companionship has been linked to better physiological, social, and mental health.

## **DOGS AND VISITOR EXPERIENCE**

The presence of dogs, whether on or off leash in parks, may affect visitor experience. Some visitors enjoy the sight of dogs in the park, and enjoy the ability to interact with other people's dogs. For others, dogs off leash create fear, and some people just prefer to avoid encounters with dogs (Roberts 2007, iii). Dog

walkers can indirectly affect the aesthetics of the park, as well as affecting visitor experience through reduced enjoyment, when they do not pick up their dogs' waste on trails, beaches, or in picnic areas (Roberts 2007, iii). Also, dog walking results in the smell of dog urine, which can be an especially displeasing experience on a hot summer day. Park visitors with dogs typically use GGNRA for dog walking because of leash laws in the surrounding areas, where off-leash dog walking is prohibited or limited, and because they prefer to visit areas with access to beaches, shoreline, and greater exercise opportunities for their dogs.

As stated previously and in response to the ANPR in January 2002, a public comment analysis report was published (NAU 2002a, 1). In this report, 71 percent of public comments favored allowing off-leash dog walking in selected GGNRA sites (option B) and 28 percent of public comments favored the enforcement of existing leash laws in the GGNRA (option A) (NAU 2002a, 5). More than 500 respondents affirmed their belief that it is their right to walk dogs off leash at park sites. Other reasons given in support of off-leash dog walking concerned the benefits to humans, including increased sociability with other dog walkers or with visitors who enjoyed interacting with dogs, and the safer feeling some dog owners have when they visit urban parks, especially at night, if their dogs are present (NAU 2002a, 17-20). However, approximately 13 percent of the comments received cited feelings of discomfort around or fear of off-leash dogs and felt that off-leash dogs were dangerous to children; a similar percentage also stated that dogs in general make the park unsafe for visitors (NAU 2002a, 10).

In addition to the ANPR public comment analysis report, a telephone survey regarding NPS pet management regulations was also conducted, which was discussed in more detail previously (NAU 2002b, 1). The results of the telephone survey showed that 71 percent of all respondents supported and 23 percent opposed the current NPS regulation for walking dogs on leash at most GGNRA sites and prohibiting off-leash dog walking (NAU 2002b, 11). When asked whether they specifically supported allowing off-leash dog walking in GGNRA, 40 percent of all respondents stated that they supported allowing dogs off leash in GGNRA and 53 percent stated that they opposed allowing off-leash dog walking in GGNRA sites (NAU 2002b, 11). A total of 28 percent of the respondents were dog owners or dog caregivers; of these respondents, 50 percent used GGNRA for dog walking purposes (NAU 2002b, 16). Almost one-third of visitors from each of four counties surveyed who had seen off-leash dogs while visiting GGNRA sites viewed that experience positively, but the largest proportion of visitors from each county stated that off-leash dogs had neither a positive nor negative effect on their experience at GGNRA (NAU 2002b, 20). Some of the respondents stated that they enjoy playing with other visitors' dogs and that dogs at play add to the park's visual appeal (NAU 2002b, 19-20). Also during the 2002 telephone survey, a total of 22 percent of respondents who saw dogs off leash in GGNRA said that it detracted from their visitor experience; additional comments received during the survey found that visitors who are not familiar with dogs or who have had unpleasant experiences with dogs in the past are easily intimidated by dogs (NAU 2002b, 19-20).

To collect current and detailed information regarding visitor use of the park by dog owners, NPS conducted a survey in 2012 to measure customer satisfaction related to dog walking at GGNRA sites. This survey, *GGNRA Dog Walking Satisfaction Visitor Study* (NPS 2012a), evaluated the perception of and satisfaction with the current on and off-leash dog walking policies, and potential for redistribution of use based on access changes resulting from implementation of this plan/SEIS. Of the dog walkers that responded to the survey 36 percent of individuals indicated that they were "not satisfied" or "slightly satisfied" with on-leash dog walking opportunities at their most frequently visited sites at the park and 30 percent of individuals were "not satisfied" or "slightly satisfied" with off-leash dog walking opportunities their most frequently visited sites at the park (NPS 2012a, 11, 16). Details of this study are discussed in chapter 3 under *Visitor Use and Experience*.

## ENVIRONMENTAL JUSTICE

In a study conducted by San Francisco State University in 2007 on ethnic minority visitor use experience at GGNRA, research found that dogs were a problem mentioned by all Latino and Asian groups (Roberts 2007, iii). Research found that these minority groups mentioned dogs, especially dog waste, as a barrier to park visitation, and overall, Latinos were the most concerned with dog owners' lack of concern or control of their dogs (Roberts 2007, iii). However, in the telephone survey conducted by Arizona University's Social Research Laboratory, 39.4 percent of respondents of Hispanic origin supported (strongly and somewhat) off-leash dog walking and 39.9 percent of respondents of non-Hispanic origin supported (strongly and somewhat) off-leash dog walking (NAU 2002b, 93). Therefore, the Hispanic and non-Hispanic populations supported off-leash dog walking by almost the same percentages. The telephone survey also divided respondents by Asian-American, Black/African-American, and Caucasian races. Racial differences in opinion did not vary by many percentage points for support of off-leash dog walking. Approximately 44 percent of African-American respondents, 40 percent of Caucasians, and just over 37 percent of Asian-Americans supported (strongly and somewhat) off-leash dog walking in the telephone survey (NAU 2002b, 92-93). Only when the support category was further divided into "strongly support" and "somewhat support" could racial differences be seen. For example, only about 5 percent of African-American respondents strongly supported off-leash dog walking, whereas almost 17 percent of Caucasians and just over 20 percent of Asian-Americans strongly supported off-leash dog walking (NAU 2002b, 93).

A visitor survey documenting visitor experience for Crissy Field, Ocean Beach, and the Presidio (including some sites in Area B, which is outside of the analysis of this draft plan/SEIS) was conducted in the summer and fall of 2008. The first phase of the survey involved an intercept survey (personal contact with visitor) to provide a visitor population profile, including a more thorough understanding of who visits the parks, use patterns, visitors' likes and dislikes, and a preliminary understanding of their visitor experience (Tierney et al. 2009, 1). The second phase of the survey included a follow-up telephone survey with the same visitors interviewed in the first phase; the purpose was to gather more detailed information on visitor experiences, satisfaction, and opinions about park management (Nakagawa, Rodgers, and Adock et al. n.d., 8). In the first phase, respondents were asked questions about their background (ethnicity, language spoken at home, state of residence, income), as well as ease of access to the sites, quality rating of the sites, reasons for visiting the park, likes or dislikes about the sites, and suggestions for improving the visitor experience. Both phases of the 2008 study found that frequency of suggestions about keeping dogs on leash and citing off-leash dogs was fairly consistent among Asian and White respondents. During the survey, visitors were asked if they had suggestions for improving the experience at the park. The survey allowed for open-ended answers. Of the respondents, 3.3 percent stated that dogs should be kept on leash, visitors should be cited for off-leash dogs, or that dogs should not be allowed at the park (Tierney et al. 2009, 69). White respondents suggested that dogs be kept on leash 3.4 percent of the time, and Asian respondents suggested this 3.2 percent of the time (Tierney et al. 2009, 75). This concern was not cited by Black/African American, Native Hawaiian, or American Indian respondents who were asked for suggestions on how to improve the park experience (Tierney et al. 2009, 75).

In the second phase of the survey (telephone survey), 16 percent of all respondents noted dogs off leash as a "moderate" or "serious" problem associated with the park experience. It was found that 20 percent of Hispanic respondents and 19 percent of Asian respondents cited dogs off leash as a moderate or serious problem at these sites (Crissy Field, Ocean Beach, and the Presidio Area B), while 14 percent of White respondents noted off-leash dog walking as a serious issue (Nakagawa, Rodgers, and Adock et al. n.d., 51). Alternately, 10 percent of the respondents in the follow-up survey listed dogs (dog owners, rules, or presence of dogs) as a reason to return to the park sites. The percentage of respondents who listed dogs as a reason for returning to the park sites (Crissy Field, Ocean Beach, and the Presidio Areas A and B) was similar among different racial and ethnic groups, with White respondents listing dogs 11 percent of the

time, and Asian and Hispanic respondents 9 percent of the time (Nakagawa, Rodgers, Adock et al. n.d., 62). Similarly, 7 percent of all respondents mentioned dogs when they were asked to describe special park qualities. The percentage of respondents who mentioned dogs in response to this question varied slightly across racial and ethnic groups, with 8 percent of Whites, 9 percent of Hispanics, and 11 percent of Asians noting dogs (Nakagawa, Rodgers, Adock et al. n.d., 67).

## SCOPING PROCESS AND PUBLIC PARTICIPATION

Scoping is an early and open process to determine the breadth of environmental issues and alternatives to be addressed in a planning document prepared in accordance with NEPA. Scoping includes obtaining early input about the planning project from the public, staff, interested agencies, or any agency with jurisdiction by law or expertise. Scoping activities for this project are summarized below. Additional information on the public involvement process and ongoing agency coordination is presented in “Chapter 5: Consultation and Coordination.”

---

*Scoping is an early and open process to determine the breadth of environmental issues and alternatives to be addressed in a planning document prepared in accordance with the NEPA.*

---

## PUBLIC INVOLVEMENT WITH THE NATIONAL ENVIRONMENTAL POLICY ACT PROCESS

Significant public involvement on dog walking in GGNRA has occurred since 2001, as described in previous sections, including the following:

- Public attendance and comments at the GGNRA Citizens’ Advisory Commission meeting in January 2001, in which the voice control policy was acknowledged as contrary to 36 CFR 2.15(a)(2), prohibiting off-leash dogs in national parks.
- Public comments on the ANPR received within the 91-day comment period, January to April 2002.
- Public informational meetings on the ANPR in March 2002 and an oral comment session in April 2002.
- Phone survey by Northern Arizona University of 1,600 households in the four-county San Francisco Bay Area in spring 2002.
- Interviews with stakeholders conducted as part of the negotiated rulemaking assessment process in 2004.
- NOI to Establish the Negotiated Rulemaking Committee, published in the Federal Register on June 28, 2005, which invited the public to comment on the proposal to create the Committee.
- Notice of Establishment of the Negotiated Rulemaking Committee, published in the Federal Register on February 17, 2006.
- Dog Management Negotiated Rulemaking Advisory Committee Meetings in March 2006, April 2006, May 2006, July 2006, September 2006, April 2007, and October 2007.
- Dog management draft plan/EIS public scoping comment period and public meetings, February–April 2006.
- Release of the Dog Management draft plan/EIS in January 2011 with a public comment period open until May 2011.

- Four public open-house format meetings, during the public comment period for the draft plan/EIS, held in Marin, San Francisco, and San Mateo counties, March 2011.
- Numerous emails, phone calls, correspondence, and media stories regarding the issue.

## **GOALS OF THE PUBLIC INVOLVEMENT PROCESS**

At the January 2005 internal scoping meeting, NPS staff discussed goals for future public involvement on this issue and the means and processes that might be used to involve the interested and affected public effectively. The following public involvement goals were derived from the January 2005 internal scoping meeting:

- Work toward community acceptance of the process and the solution.
- Allow the community to participate, maximizing creative thinking.
- Enhance public understanding of natural and cultural resource values.
- Enhance public understanding of the requirements of the ESA and other legal obligations.
- Provide notice that the park is moving forward, and that now, not later, is the time for the public to provide input.
- Create broad, representative input at a local, regional, and national level.
- Educate members of the public on competing and similar interests of all involved groups or individuals.
- Enhance public appreciation of park resources and the challenges of park management.
- Promote understanding of the park's mandate and mission and of its connections to legislation, the ESA, the *National Historic Preservation Act* (NHPA), and other elements.
- Promote public understanding that the NPS policies for national recreation areas do not differ from those of national parks.
- Form positive relationships with stakeholder groups.
- Clarify distinctions and differences among GGNRA and local/regional parks and other local land management agencies.
- Keep elected officials informed.

## **PUBLIC INVOLVEMENT IN THE ENVIRONMENTAL IMPACT STATEMENT PROCESS**

The EIS process formally began with a NOI published in the Federal Register on February 22, 2006, announcing the intention both to prepare this EIS and to begin public scoping. The public was asked to submit comments within 30 days after the NOI publication. In mid-March, the Public Scoping Brochure for the GGNRA draft plan/EIS was mailed to the names on the park's dog management project and general mailing lists for public review and comment. A Notice of Extension of Comment Period was published in the Federal Register on March 29, 2006, to extend the period for public comment on the scope of the planning process and potential alternatives through April 24, 2006. During the scoping period, two public scoping workshops were held. The first was held at the Bay Model Visitor Center in Sausalito on April 4, 2006, and the second was held at the Fort Mason Officers Club on April 5, 2006. Both workshops presented information about current GGNRA dog management and the planning and negotiated rulemaking processes. Park staff and other NPS specialists were on hand to answer questions and provide additional information to workshop participants. During the scoping period, over 500 pieces

of correspondence were entered into the NPS Planning, Environment, and Public Comment (PEPC) web-based database, either by direct entry by the commenter, or by uploading of emails, faxes, and hard-copy letters by NPS staff.

---

*The NEPA process for this project was initiated and run concurrently with the negotiated rulemaking process.*

---

In addition to the brochure and workshops, the public was kept up to date on the project by information on the park's project telephone information line and posted on the NPS PEPC web site (<http://parkplanning.nps.gov/goga>) and the park's web site ([www.nps.gov/goga](http://www.nps.gov/goga)). A summary report of the public comments received during the public scoping phase of the draft plan/EIS was prepared in August 2006 and is posted, along with the NOI and the Public Scoping Brochure (NPS 2006c, 1), on the PEPC web site and linked to the park web site.

As described previously, the NEPA process for this project was initiated and run concurrently with the negotiated rulemaking process. During the negotiated rulemaking process the public had additional opportunities for listening and providing input by attending the seven meetings of the full Negotiated Rulemaking Committee.

On January 14, 2011, the NPS released the draft plan/EIS to the public for review and comment. The draft plan/EIS was available for public review until May 30, 2011. Following the release of the draft plan/EIS and during the public comment period, public meetings were held in March 2011 for the public to submit comments on the draft plan/EIS.

A total of four public meetings were held in Marin, San Francisco, and San Mateo counties. Meetings were held in Mill Valley on March 2nd; in San Francisco on March 5th and 7th; and in Pacifica on March 9th. Three of the meetings were held in the evening from 4:00 until 8:00 p.m.; one San Francisco meeting was held during the day, from 11:00 a.m. till 4:00 p.m. The public meetings were in an open house format, with approximately 20 NPS staff on hand to discuss the plan with meeting attendees, answer questions and facilitate public input on the plan. The public were able to submit their comments on the draft plan/EIS using any of the following methods:

- Electronically through the NPS PEPC website
- In person at the public meetings
- By mailing comments to the GGNRA Superintendent.

The NPS received nearly 5,000 pieces of correspondence containing over 7,900 individual comments during the comment period from over 31 states. The majority of correspondence (4,463) was submitted by California residents. Among the commenters from California, the topics that received the majority of the comments were expressions of support for, or opposition to, the draft plan/EIS; expressions of support for, or opposition to, the different alternatives at each site; concerns regarding the park visitor experience; concerns for wildlife and wildlife habitat and concerns about the health and safety of individuals and dogs. A public comment analysis report was prepared and is posted on the GGNRA dog management website, <http://www.nps.gov/goga/parkmgmt/dog-management.htm> and NPS PEPC website <http://parkplanning.nps.gov/projectHome.cfm?projectID=11759>.

## **RELATED LAWS, REGULATIONS, AND POLICIES**

GGNRA is guided by a variety of legal directives, including federal and state laws, regulations, executive orders, NPS management policies, director's orders, other agency and departmental policies, decisions made through other NEPA planning processes, and legal agreements. Foremost among these directives is

the *NPS Organic Act of 1916* and its interpretation in the *NPS Management Policies 2006* (NPS 2006a, 10). Park units also turn to their park-specific enabling legislation to determine the park purpose, significance, and mission (why the unit was established as a park, its unique features, and what the park should accomplish).

## **NATIONAL PARK SERVICE ORGANIC ACT AND MANAGEMENT POLICIES**

By enacting the *NPS Organic Act of 1916* (Organic Act), Congress directed the U.S. Department of the Interior and the NPS to manage units “to conserve the scenery and the natural and historic objects and wildlife therein and to provide for the enjoyment of the same in such a manner and by such a means as will leave them unimpaired for the enjoyment of future generations” (16 USC 1). The Organic Act prohibits actions that impair park resources unless a law directly and specifically allows for these actions (16 USC 1a-1). An action constitutes an impairment when its impacts “harm the integrity of park resources or values, including the opportunities that otherwise would be present for the enjoyment of those resources or values” (NPS 2006a, 11). Congress reiterated this mandate in the *Redwood National Park Expansion Act of 1978* by stating that the NPS must conduct its actions in a manner that will ensure no “derogation of the values and purposes for which these various areas have been established, except as may have been or shall be directly and specifically provided by Congress” (16 USC 1a-1).

Despite these mandates, the Organic Act and its amendments afford the NPS latitude when making resource decisions that balance visitor recreation and resource preservation. In these acts, Congress “empowered [the NPS] with the authority to determine what uses of park resources are proper and what proportion of the park’s resources are available for each use” (*Bicycle Trails Council of Marin v. Babbitt*, 82 F.3d 1445, 1453 (9th Cir. 1996)).

Because conservation remains its predominant mandate, the NPS seeks to avoid or to minimize adverse impacts on park resources and values.

The NPS has discretion to allow negative impacts when necessary (NPS 2006a, 10); however, while some actions and activities cause impacts, the NPS cannot allow an adverse impact that constitutes impairment (NPS 2006a, 11). To determine impairment, the NPS must evaluate “the severity, duration, and timing of the impact; the direct and indirect effects of the impact; and the cumulative effects of the impact in question and other impacts” (NPS 2006a, 11). The *NPS Management Policies 2006* require that these determinations, and all planning decisions in the Service, be based on current scientific and scholarly understanding of park resources and ecosystems, as well as professional judgment of the NPS decision maker (NPS 2006a, 11, 12, 24). The *NPS Management Policies 2006* also have separate chapters on the appropriate management of the parks and their resources (e.g., wilderness, natural resources) and state that “the law enforcement program is an important tool in carrying out the NPS mission” (NPS 2006a, 108).

Park units vary in their enabling legislation, natural resources, cultural resources, and missions. Management activities appropriate for each unit and for areas within each unit vary as well. An action appropriate in one unit could impair resources or values in another unit. Thus, this plan/SEIS will analyze the context, duration, and intensity of impacts related to dog management only within GGNRA, as well as the potential for resource impairment, as required by the *NPS Director’s Order #12* and handbook (NPS 2001a, 1).

## **Impairment of National Park Resources**

In addition to determining the environmental consequences of implementing the preferred and other alternatives, *NPS Management Policies 2006* (Section 1.4) requires analysis of potential effects to determine whether or not proposed actions would impair a park's resources and values.

The fundamental purpose of the national park system, established by the Organic Act and reaffirmed by the *General Authorities Act*, as amended, begins with a mandate to conserve park resources and values. NPS managers must always seek ways to avoid, or to minimize to the greatest degree practicable, adverse impacts on park resources and values. However, the laws do give the NPS the management discretion to allow impacts on park resources and values when necessary and appropriate to fulfill the purposes of the park. That discretion is limited by the statutory requirement that the NPS must leave resources and values unimpaired unless a particular law directly and specifically provides otherwise.

The prohibited impairment is an impact that, in the professional judgment of the responsible NPS manager, would harm the integrity of park resources or values, including the opportunities that otherwise would be present for the enjoyment of those resources or values (NPS 2006a). Whether an impact meets this definition depends on the particular resources that would be affected; the severity, duration, and timing of the impact; the direct and indirect effects of the impact; and the cumulative effects of the impact in question and other impacts.

An impact on any park resource or value may, but does not necessarily, constitute impairment. An impact would be more likely to constitute impairment to the extent that it affects a resource or value whose conservation is:

- necessary to fulfill specific purposes identified in the establishing legislation or proclamation of the park, or
- key to the natural or cultural integrity of the park or to opportunities for enjoyment of the park, or
- identified in the park's general management plan (GMP) or other relevant NPS planning documents as being of significance.

An impact would be less likely to constitute an impairment if it is an unavoidable result of an action necessary to preserve or restore the integrity of park resources or values and it cannot be further mitigated.

Impairment may result from visitor activities; NPS administrative activities; or activities undertaken by concessioners, contractors, and others operating in the park. Impairment may also result from sources or activities outside the park.

Impairment findings are not necessary for visitor experience, public health and safety, environmental justice, and park operations, etc., because impairment findings relate back to park resources and values. A written non-impairment determination will ultimately be prepared for the selected action and appended to the Record of Decision (ROD).

## **GOLDEN GATE NATIONAL RECREATION AREA LAWS, POLICIES, AND PLANS**

### **Golden Gate National Recreation Area Enabling Legislation**

---

*The enabling legislation requires that the park and its visitors “utilize the resources in a manner which will provide for recreation and education opportunities consistent with sound principles of land use planning and management...”*

---

GGNRA was established by Congress in 1972 (PL 92-589). The language of the enabling legislation states the park’s purpose as follows: “In order to preserve for public use and enjoyment certain areas of Marin and San Francisco counties, California, possessing outstanding natural, historic, scenic, and recreational values and in order to provide for the maintenance of needed recreational open space necessary to urban environment and planning, the Golden Gate National Recreation Area is hereby established.” The hearing records pertinent to the enabling legislation reveal that the future use of the park was the subject of considerable discussion. The nearby presence of several million people provided an unprecedented opportunity to make national park resources and programs available to a wide variety of visitors, many of whom had not been able or willing to access the more remote national parks. Based on the record, this “parks to the people” idea was clearly intended by Congress and the administration to be a major purpose of GGNRA (NPS 1980, 7).

The enabling legislation also requires that the park and its visitors “utilize the resources in a manner which will provide for recreation and education opportunities consistent with sound principles of land use planning and management,” and that the recreation area be preserved “as far as possible in its natural setting” and protected from uses that would “destroy the scenic beauty and natural character of the area.”

### **The Golden Gate National Recreation Area General Management Plan**

The NPS is in the process of updating the original GGNRA GMP (NPS 1980, 1) and published the Draft GGNRA and Muir Woods National Monument GMP/EIS in September 2011. A GMP is a document that ensures that a park has a clearly defined direction that sets achievable and sustainable goals for resource preservation and visitor use. GGNRA constitutes one of the largest urban national parks in the world, encompassing many miles of bay and ocean shorelines. The park is diverse in natural, cultural, and historic resources, drawing in approximately 16-20 million visitors per year. Although Muir Woods National Monument is managed as part of GGNRA it is not included in this draft plan/SEIS. Muir Woods has never been open to dog walking, and thus was not under consideration for dog walking in this planning process. Since the 1980 GMP, a number of changed circumstances, including an increased demand for use of the park sites for recreational activities, have created the need for an updated GMP (NPS 2011b, 4).

Management objectives in the draft 2011 GMP that are relevant to dog management include the following:

- The park has significantly expanded in size and includes many new lands in San Mateo County. This planning process takes a comprehensive parkwide approach that will help ensure that the management of the natural and cultural resources and visitor experiences are consistent and thorough across all park areas.
- There is an increased public demand for access to, and use of, open spaces within the San Francisco Bay region. The GMP provides a regional collaborative approach to open space preservation and recreation use.

- The changing demographics in the Bay Area are bringing notable shifts in park visitation, uses, and trends. The GMP provides desired conditions that will guide the decision making needed to manage the anticipated visitation growth.
- Through research and park management that have occurred since the 1980 plan, the park staff has gathered a considerable amount of new information and knowledge regarding resources and visitor use. This new awareness is reflected in the desired conditions, proposed management actions, and policies of this GMP.

Since 1980, GGNRA has doubled in size, and park staff members have gained a better understanding of the natural and cultural resources and recreational uses within the park. Although always valued for its preservation of public open spaces, GGNRA is now considered to be one of the most biologically diverse areas along the California coast and is recognized by the United Nations as part of the Golden Gate Biosphere Reserve. Numerous and varied landscapes, including military landscapes, ranch sites, and historic districts, have been identified in the park since 1980, expanding awareness of the park's historical importance.

Because the GMP is currently in the draft stage, it is subject to change based on public and agency comments. However, the preferred alternative for San Mateo, San Francisco, and Marin counties of GGNRA is based on a plan to connect people to the park. The draft GMP explains the rationale for this alternative:

This concept emphasizes the park's management commitment to the founding idea of "parks to the people," and the park's fundamental purpose of bringing national park experiences to a large and diverse urban population. Improving connections between the park and the people is fundamental to achieving the park's purpose and to maintaining the public's continued interest and support (NPS 2011b, 49).

While the draft plan/SEIS is compatible with zoning prescriptions in the GMP, the GMP has deferred site-specific, dog management planning to this draft plan/SEIS, and potential interim measures. Once the GMP is complete, its preferred alternative will be implemented as the new management plan for the next 20 years.

### **Crissy Field Plan Golden Gate National Recreation Area Environmental Assessment**

The EA for the Crissy Field Plan (NPS 1996, 1) was developed for a cultural and ecological restoration of Crissy Field that would be consistent with the NPS mission of conservation. The proposal also allowed Crissy Field to maintain its role in San Francisco as a "people place" that provides a variety of recreational activities and offers ways to enhance that role. The plan was based on the NPS GMP Amendment (GMPA) (NPS 1994, 1) and formulated on a public involvement process.

The Crissy Field Plan included the restoration of a 20-acre portion of a historical tidal marsh and the cultural resources of the historic airfield, the establishment of a waterbird protection area, and improvements to parking, transportation, and circulation at Crissy Field. The plan also had the objective of continuing existing multiple recreational opportunities, including voice control dog walking.

### **General Management Plan Amendment, Presidio of San Francisco / Presidio Trust Management Plan**

GGNRA legislation ensured that if the military deemed the Presidio of San Francisco in excess of its needs, jurisdiction would be transferred to the NPS. In 1989 the Presidio was designated for closure, and

in 1994 the U.S. Army transferred the Presidio to the NPS. The GMPA (NPS 1994, 1) was developed by the NPS to provide direction and policy guidance in the transition of this former military post to a unit of the NPS, and provide guidelines for management, use, and development of the overall site. The GMPA assumed that a federally chartered partnership institution would be established under the U.S. Department of the Interior with the NPS retaining primary oversight and management responsibility for the entire Presidio.

However, in 1996, two years after the NPS adopted the GMPA, Congress passed the *Presidio Trust Act*, creating the Presidio Trust as a wholly owned, federal government corporation and granting jurisdiction of the 1,168-acre interior area of the Presidio, known as Area B, to the Presidio Trust. This transferred jurisdiction of Area B from the Secretary of the Interior to the Trust and required that the Trust conform only to the purposes of the GGNRA establishing legislation and the general objectives of the GMPA.

In 2002, the Presidio Trust approved the Presidio Trust Management Plan to update and supersede the GMPA in Area B. The Presidio Trust Management Plan EIS acknowledges that the NPS is currently engaged in a process that could ultimately lead to a rulemaking procedure to develop new dog management regulations for GGNRA and that the Trust is closely monitoring this rulemaking process and “will give future consideration to its regulation regarding dogs once the GGNRA rulemaking process is concluded” (Presidio Trust 2002, 2:4-225).

Management objectives in the Presidio Trust Management Plan that the Presidio Trust, in their comment letter on the draft plan/EIS, identified as relevant to dog management include the following:

- Provide for safe and enjoyable recreational use of the Presidio.
- Identify and protect sensitive wildlife species, and restore and maintain their habitats.
- Provide diverse opportunities for both passive and active recreation.
- Maintain an atmosphere that is open, inviting and accessible to visitors.
- Consider activities best suited to the Presidio.
- Balance recreational opportunities with resource protection; to achieve this balance, consider the type and level of visitor use that can be accommodated while sustaining the desired resource and visitor experience conditions.

## **OTHER FEDERAL REGULATIONS, LAWS, AND POLICIES**

The NPS is also governed by multiple laws, regulations, and management plans relevant to this planning effort. The following excerpts describe those that are key to this planning effort.

### **NATIONAL ENVIRONMENTAL POLICY ACT, 1969, AS AMENDED**

Section 102(2)(C) of this act requires that an EIS be prepared for proposed major federal actions that may significantly affect the quality of the human environment.

### **NATIONAL PARKS OMNIBUS MANAGEMENT ACT OF 1998**

The *National Parks Omnibus Management Act* (16 USC 5901 et seq.) underscores NEPA in that both are fundamental to NPS park management decisions. Both acts provide direction for articulating and connecting resource management decisions to the analysis of impacts, using appropriate technical and scientific information. Both also recognize that such data may not be readily available, so they provide

alternative options for resource impact analysis should this be the case. Specifically, the *National Parks Omnibus Management Act* directs the NPS to use the findings of science and the analyses of scientifically trained resource specialists in decision making. It also provides guidance for the issuance of commercial use authorizations and concessions contracts.

### **PRESIDIO TRUST ACT**

The Presidio Trust manages the interior 80 percent of Presidio lands (known as Area B) and NPS manages the coastal areas of Presidio lands (known as Area A). The agencies work together to preserve open spaces, improve the Presidio trail system, and provide visitor programs. The Presidio Trust's regulations are issued pursuant to the Presidio Trust Act (16 USC 460bb appendix), as amended in December 2001, and are elements of federal law. Area B is subject to the Presidio Trust's regulations, which the Trust adopted after publication for comment and which appear as 36 CFR 1001. Presidio Trust regulations do not allow dogs to be off leash in Area B (Presidio Trust 2002, 161).

### **ENDANGERED SPECIES ACT OF 1973, AS AMENDED**

This act requires all federal agencies to consult with the Secretary of the Interior on all projects and proposals having potential impacts on federally threatened and endangered plants and animals.

### **MIGRATORY BIRD TREATY ACT AND EXECUTIVE ORDER 13186**

The *Migratory Bird Treaty Act of 1918* makes it unlawful to kill, capture, buy, sell, import, or export migratory birds, eggs, feathers, or other parts. Executive Order 13186, issued in January 2001, restated the value of migratory birds and directed agencies to develop and implement memoranda of understanding with the U.S. Fish and Wildlife Service (USFWS) to protect them. The NPS memorandum of understanding, signed in 2010, requires park units to restore and enhance migratory bird habitat and support conservation of migratory birds.

### **THE NATIONAL HISTORIC PRESERVATION ACT OF 1966, AS AMENDED**

Section 106 of the NHPA requires that federal agencies consider the effects of their undertakings on properties listed or potentially eligible for listing on the National Register of Historic Places (NRHP). All actions affecting the parks' cultural resources must comply with this legislation.

### **COASTAL ZONE MANAGEMENT ACT**

The *Coastal Zone Management Act* was enacted as a plan to manage coastal areas. The *Coastal Zone Management Act* encourages state, local, regional, and federal agencies to cooperate when implementing their coastal zone programs. The act requires a balance between the protection of resources and economic interests within the coastal zone. Each state may develop a coastal zone management plan, which defines allowed land and water uses within the coastal zone.

### **CODE OF FEDERAL REGULATIONS**

The regulations under title 36 of the CFR provide "for the proper use, management, government, and protection of persons, property, and natural and cultural resources within areas under the jurisdiction of the National Park Service." The sections below are specifically called out as relevant to the draft plan/SEIS. Sections of Title 36 of the CFR are included as appendix D of this document. Regulations under title 50 of the CFR address management of wildlife and fisheries.

**36 CFR 1.5 (f)** covers closures and public use limits in units of the national park system that are required for public safety, protection of resources, for scientific research, management responsibilities, or avoidance of conflict between user groups. This includes a provision stating that the violation of any closure, designation, use activity restriction or condition, the schedule of visiting hours, or public use limits is prohibited.

**36 CFR 2.1** covers the preservation of natural, cultural, and archeological resources. The following is prohibited under this section: possessing, destroying, injuring, defacing, removing, digging, or disturbing from its natural state living or dead wildlife, plants, or cultural or archeological resources; and walking on, climbing, entering, etc. an archeological or cultural resource.

**36 CFR 2.2** covers wildlife protection. The following is prohibited under this section: the taking of wildlife; the feeding, touching, teasing, frightening, or intentional disturbing of wildlife nesting, breeding, or other activities; and possessing unlawfully taken wildlife or portions thereof.

**36 CFR 2.15** lists the regulations for pets:

- (a) The following are prohibited:
  - (1) Possessing a pet in a public building, public transportation vehicle, or location designated as a swimming beach, or any structure or area closed to the possession of pets by the superintendent. This subparagraph shall not apply to guide dogs accompanying visually impaired persons or hearing-ear dogs accompanying hearing-impaired persons.
  - (2) Failing to crate, cage, restrain on a leash which shall not exceed six feet in length, or otherwise physically confine a pet at all times.
  - (3) Leaving a pet unattended and tied to an object, except in designated areas or under conditions which may be established by the superintendent.
  - (4) Allowing a pet to make noise that is unreasonable considering location, time of day or night, impact on park users, and other relevant factors, or that frightens wildlife by barking, howling, or making other noise.
  - (5) Failing to comply with pet excrement disposal conditions which may be established by the superintendent.
- (b) In park areas where hunting is allowed, dogs may be used in support of these activities in accordance with applicable federal and state laws and in accordance with conditions which may be established by the superintendent.
- (c) Pets or feral animals that are running-at-large and observed by an authorized person in the act of killing, injuring, or molesting humans, livestock, or wildlife may be destroyed if necessary for public safety or protection of wildlife, livestock, or other park resources.
- (d) Pets running-at-large may be impounded, and the owner may be charged reasonable fees for kennel or boarding costs, feed, veterinarian fees, transportation costs, and disposal. An impounded pet may be put up for adoption or otherwise disposed of after being held for 72 hours from the time the owner was notified of capture or 72 hours from the time of capture if the owner is unknown.
- (e) Pets may be kept by residents of park areas consistent with the provisions of this section and in accordance with conditions which may be established by the superintendent. Violation of these conditions is prohibited.

- (f) This section does not apply to dogs used by authorized federal, state, and local law enforcement officers in the performance of their official duties.

**36 CFR 2.31** prohibits trespassing, tampering, and vandalism of property. Vandalism includes destroying, injuring, defacing, or damaging property or real property.

**36 CFR 2.34** prohibits disorderly conduct. This section would include dogs that are unmanaged and are creating hazardous or physically offensive conditions.

**36 CFR 7.97(d)** describes the seasonal dog walking restrictions for western snowy plovers in the SPPA at Ocean Beach and in the WPA at Crissy Field.

**50 CFR 17** implements the ESA of 1973, and includes provisions to identify wildlife and plants determined to be threatened or endangered.

**36 CFR Part 1002.15 (Proposed)** places a public use limit on persons walking four or more dogs in Area B of the Presidio. This proposed rule was released in November 2012 for public comment, and would require that visitors walking four or more dogs at one time in Area B of the Presidio have a San Francisco commercial dog walking permit. The rule also states that visitors walking dogs must comply with all provisions of the permit, including the limit of eight dogs per person. The proposed rule would also require that all pet walkers in the Presidio Area B remove pet excrement and deposit waste in refuse containers.

## **NATIONAL PARK SERVICE DIRECTOR'S ORDERS**

**Director's Order #9** (NPS 2006d) (Chapter 4.6 Community Relations and Outreach) directs efforts to identify appropriate opportunities to enhance the effectiveness of by assisting in public education and awareness about the full range of threats to and the challenges of protecting park resources.

**Director's Order #12** (NPS 2001a) prescribes NPS-specific requirements for NEPA analysis, including analyzing a full range of reasonable alternatives, and analyzing impacts to park resources in terms of their context, duration, and intensity. *Director's Order #12* also requires that an analysis of impairment to park resources and values be made as part of the NEPA document.

**Director's Order #28** (NPS 1998) states that NPS will protect and manage cultural resources in agreement with *NPS Management Policies 2006*. NPS will also comply with the requirements of the Secretary of the Interior's Standards and Guidelines for Archeology and Historic Preservation and the 1995 Service-wide Programmatic Agreement with the Advisory Council on Historic Preservation and the National Conference of State Historic Preservation Officers (SHPOs).

**Director's Order #75A** (NPS 2007a) emphasizes the NPS commitment to civic engagement and public involvement. It provides a framework for successfully engaging the public in NPS activities and work and providing them with information from a range of sources. The order also ensures NPS responsiveness to the concerns, views, and values of the public. It provides guidance and direction on ways to engage the public in decisions at park and program levels and establishes processes that can track improvements to civic engagement and involvement within NPS.

## **STATE AND LOCAL LAWS, REGULATIONS, AND POLICIES**

The following laws, regulations, and policies are currently in effect or are being developed for future application by other land management agencies in the Bay Area:

**California State Park System.** As stated previously in the “Summary of Background Conditions and Review of Literature” section, dog walking is permitted in most state parks and some beaches but dogs are either restricted to developed areas (e.g., picnic areas and campgrounds) or dogs must be in an enclosed vehicle, tent, or pen or be on a leash not more than six feet long.

**California State Water Resources Control Board.** The Board disseminates information on pet waste pollution and the need to comply with county ordinances (California State Water Resources Control Board 2009, 1).

**Marin County.** This county includes both unincorporated Marin County (rules enforced by the Marin County Humane Society) and Marin County Open Space (rules enforced by the County of Marin Rangers). As stated previously in the “Summary of Background Conditions and Review of Literature” section, dog regulations in Marin County range from allowing off-leash dogs under immediate control to requiring that dogs be on a leash no longer than six feet in length in areas designated for dog walking. Marin County Municipal Code 8.04.185 states that “it is unlawful for any person to keep or harbor more than three dogs which are over the age of four months on any lot, premises, dwelling, building, structure, boat, or living accommodation.”

**Marin Municipal Water District.** As stated previously in the “Summary of Background Conditions and Review of Literature” section, on-leash dog walking is permitted in the District but dogs are not allowed to enter, wade, or swim in any stream or reservoir or enter within the high water mark of any reservoir (Marin Municipal Water District 2002, 26).

**Midpeninsula Regional Open Space District.** As stated previously in the “Summary of Background Conditions and Review of Literature” section, dogs are allowed on all trails in six of 25 preserves in this District and on designated trails in four additional preserves; off-leash dogs are permitted only in the marked area of the Pulgas Ridge Preserve.

**City/County of San Francisco.** The Municipal Health Code—SEC. 37—Keeping and Feeding of Small Animal, Poultry and Game Birds (a) Number of Animals states that “it shall be unlawful for any person, firm or corporation to keep or feed, or cause to be kept or fed, or permit to be kept or fed, on any premises over which any such person, firm, or corporation may have control within residential districts, (1) more than three dogs of age six months or older without obtaining a proper permit and license to operate a dog kennel as defined in Section 220 of the San Francisco Business and Tax Regulations Code.”

**San Francisco Recreation and Park Department.** As stated previously in the “Summary of Background Conditions and Review of Literature” section, dogs are generally required to be on a leash no longer than six feet in length in San Francisco city parks unless dogs are using one of the established DPAs; 28 DPAs have been established within 24 city parks of San Francisco.

**San Francisco Public Utilities Commission.** Only limited public access is allowed within the San Francisco watershed lands. Walking of domestic dogs is prohibited within the watershed lands with the exception of guide, search and rescue, and police dogs. The San Francisco Public Utilities Commission has also instituted a citywide pet waste pollution prevention program to encourage compliance with 7.2 Health Code Section 40, requiring pet waste pick-up (SFPUC 2007, 1).

**San Mateo County.** The San Mateo County Ordinance Code 6.20.020—The Keeping of Dogs and Cats (a) states that “it shall be unlawful for any person, business or entity to keep or cause to be kept five (5) or more dogs, or five (5) or more cats, or five (5) dogs and cats in any combination per dwelling unit or per business establishment unless in conformance with this chapter.” As stated previously in the “Summary of Background Conditions and Review of Literature” section, in San Mateo, dogs are generally not

allowed in any county park and must be on leash when on public property or not in a fully enclosed area (County of San Mateo 2012).

**Pacifica.** Pacifica is the closest city to NPS lands within San Mateo County. As stated by the Pacifica Permit Office, the number of dogs within a household has no upper limit; however, a permit is required if a household has more than three dogs. Dogs are allowed on leash at Pacifica parks and beaches, and there are two off-leash areas within the city.

Alternatives

## CHAPTER 2: ALTERNATIVES

### INTRODUCTION

This “Alternatives” chapter describes current management and the various actions that could be implemented for future dog management within Golden Gate National Recreation Area (GGNRA or park). The *National Environmental Policy Act of 1969* (NEPA) requires that federal agencies explore a range of reasonable alternatives and provide an analysis of what impacts the alternatives could have on the natural and human environment. “Chapter 4: Environmental Consequences” of this Draft Dog Management Plan / Supplemental Environmental Impact Statement (draft plan/SEIS) presents the results of the analysis. Table 4 at the end of this chapter summarizes the impacts of each alternative.

The alternatives under consideration must include a “no action” alternative as prescribed by 40 CFR 1502.14. The no-action alternative in this draft plan/SEIS is the continuation of the current National Park Service (NPS) regulations, the GGNRA Compendium, management policies, and a legally prescribed practice for dog management within GGNRA – the 1979 Pet Policy pursuant to *U.S. v. Barley* (405 F.Supp.2d 1121 (N.D. Cal. 2005)). The no-action alternative assumes that the NPS would not make major changes to current management. The five action alternatives presented in this chapter were developed from consideration of current laws, regulations, policies and sources of information as listed in chapter 1, including the following:

- The GGNRA Citizen’s Advisory Commission’s 1979 Pet Policy (appendix A)
- NPS *Management Policies 2006* (NPS 2006a)
- Title 36 of the Code of Federal Regulations (CFR) (sections are included in appendix D)
- The *Endangered Species Act* (ESA)
- The *Organic Act*
- The GGNRA enabling legislation
- The GGNRA Compendium (NPS 2012b; appendix B)
- The Federal Panel Recommendations to the General Superintendent on Proposed Rulemaking for Pet Management at GGNRA (NPS 2002a)
- Findings of the Negotiated Rulemaking Committee for Dog Management at GGNRA
- The 2005 federal court decision (*U.S. v. Barley*, 405 F.Supp.2d 1121 (N.D. Cal. 2005))
- Information from review of park resources, visitor use information and surveys, and feedback received during the NEPA and negotiated rulemaking public comment processes.

### STUDY AREA DEFINITION

Primarily because of GGNRA’s proximity to a large urban population center, there is a history of dog walking in some park sites prior to the establishment of GGNRA in 1972, when these sites were managed by various other agencies.

Alternatives in this draft plan/SEIS address locations in Marin, San Francisco, and San Mateo counties. The selection of sites addressed in this draft plan/SEIS was determined by NPS managers, and was based on information from historical and current dog management in GGNRA, including the 1979 Pet Policy;

NPS law, policy, and regulations; park resources; and the Federal Panel Recommendations to the General Superintendent (NPS 2002a). The panel concluded that off-leash dog walking in GGNRA may be appropriate in selected locations where resource impacts can be adequately mitigated and public safety incidents and public use conflicts can be appropriately managed.

In addition to lands currently under GGNRA management, the draft plan/SEIS includes two sites within the park’s boundary that are expected to be transferred to GGNRA in the near future: Pedro Point Headlands and Cattle Hill, both in San Mateo County. When the dog management planning process started, these two sites were included because it was anticipated that the areas would be acquired in the immediate future; those actions are still pending. Another San Mateo property, Rancho Corral de Tierra, was transferred to the NPS in December 2011. This property was addressed in the New Lands section in the draft plan/EIS; in this draft plan/SEIS, Rancho Corral de Tierra is addressed as a separate site. Table 2 lists the sites now being considered under the action alternatives for this draft plan/SEIS.

This draft plan/SEIS defines dog management actions for the specific sites within the park shown in table 2. Site-specific maps located in the “Maps” section of this document show park sites by county, from north to south, illustrating the current and proposed dog walking management (see “Maps”).

**TABLE 2. GOLDEN GATE NATIONAL RECREATION AREA PARK SITES CONSIDERED FOR DOG MANAGEMENT IN THE ALTERNATIVES**

| <b>Marin County</b>   |
|---|
| Stinson Beach (parking lots/picnic areas only)                          |
| Homestead Valley  |
| Alta Trail / Orchard Fire Road / Pacheco Fire Road                      |
| Oakwood Valley  |
| Muir Beach  |
| Rodeo Beach / South Rodeo Beach   |
| Marin Headlands Trails  |
| Fort Baker  |
| <b>San Francisco County</b>   |
| Upper and Lower Fort Mason  |
| Crissy Field (including Crissy Field Wildlife Protection Area (WPA))    |
| Fort Point Promenade / Fort Point National Historic Site (NHS) Trails   |
| Baker Beach and Bluffs to Golden Gate Bridge                            |
| Fort Miley  |
| Lands End   |
| Sutro Heights Park  |
| Ocean Beach (including Ocean Beach Snowy Plover Protection Area (SPPA)) |
| Fort Funston  |
| <b>San Mateo County</b>   |
| Mori Point  |
| Milagra Ridge   |
| Sweeney Ridge / Cattle Hill   |
| Pedro Point Headlands   |
| Rancho Corral de Tierra   |

GGNRA lands north of Bolinas-Fairfax Road in western Marin County (comprising approximately 14,357 acres) are managed by the Point Reyes National Seashore under an agreement between the two NPS units. The interior portion of the Presidio of San Francisco (Area B), bounded by Mason Street on the north and Lincoln Avenue on the west, is managed by the Presidio Trust, a federal corporation. Because these areas are not under the direct management of GGNRA, they are not included in the dog management study area.

## ALTERNATIVES DEVELOPMENT PROCESS

### RANGE OF ALTERNATIVES

The management actions under consideration within GGNRA sites are detailed in the range of alternatives presented in this chapter. A summary of the alternative elements is presented in table 3.

**Alternative A** is the no-action alternative. The no-action alternative is defined in NEPA guidelines as no change from current management and current conditions (Council on Environmental Quality (CEQ) 1981, Question 3). In the impact analysis of no-action, the draft plan/SEIS assumes current management would continue as it is now over the lifetime of the plan, which is 20 years. The description of no-action is also referred to in this draft plan/SEIS as the current conditions, and the impacts of each action alternative are analyzed against those of the current conditions for comparative purposes. Under the no-action alternative, current dog walking management and conditions would remain the same, which would include 36 CFR 2.15 (36 CFR 2.15(a)(2) (applicable only in areas not addressed by the 1979 Pet Policy—see below), 36 CFR 7.97(d), the GGNRA Citizens Advisory Commission’s 1979 Pet Policy (appendix A), and the GGNRA Compendium (NPS 2012b; appendix B). The 1979 Pet Policy allows voice control dog walking in a number of areas of GGNRA (table 3). The 1979 Pet Policy described voice or leash control as a flexible system wherein success is dependent upon the willingness of visitors and local residents to cooperate with GGNRA personnel and the willingness of GGNRA personnel to manage dogs, people, and wildlife situations; to enforce regulations; and to cite visitors (1979 Pet Policy). As a result of the 2005 federal court decision (*U.S. v. Barley*, 405 F.Supp.2d 1121 (N.D. Cal. 2005)), the NPS currently can neither enforce the NPS-wide regulation requiring pets to be on leash (36 CFR 2.15(a)(2)) nor restrict or prohibit dog walking in park sites that were included in the 1979 Pet Policy because 36 CFR 1.5(b) (requiring public notice and comment rulemaking for actions of a highly controversial nature) was not followed for any dog management changes. However, NPS regulations that address disturbance to wildlife, removal of pet waste, and disturbance of other park visitors remain in effect in all areas open to dog walking in GGNRA. The GGNRA Compendium also includes provisions for the closure of park areas to visitors, including areas closed to dog walkers, for resource or safety reasons. Under the current conditions commercial dog walkers use park lands and no permit is required.

**Alternative B** realigns GGNRA dog management to the policy governing dog walking at the other 397 units of the national park system, as defined by 36 CFR 2.15(a)(2). Any areas to be closed to dog walking would be included in a special regulation or the GGNRA Compendium. All dog walkers, including commercial dog walkers, would be allowed up to three dogs per person. All dogs would have to be on leash and no permits would be needed for dog walking. This alternative provides a mix of visitor experiences, including opportunities for visitors with disabilities.

**Alternative C** emphasizes the diversity of users of GGNRA sites and apportions dog walking geographically across Marin, San Francisco, and San Mateo counties by allowing a variety of options in each county. In Marin, San Francisco, and San Mateo counties, there are options for on-leash areas, regulated off-leash areas (ROLAs) (“off leash” is assumed to mean “under voice and sight control” throughout the description of the action alternatives, per the definition outlined in “Dog Walking Requirements” in appendix E of this draft plan/SEIS), and areas where dogs would be prohibited.

GGNRA is used by visitors for a multitude of purposes and alternative C would minimize potential conflicts, reduce potential health and safety issues, provide opportunities for visitors with disabilities, and protect natural and cultural resources, while providing dog walkers with a variety of recreational options. Alternative C also includes the consensus agreements resulting from the Negotiated Rulemaking Committee meetings. All dog walkers, including commercial dog walkers, would be allowed to walk up to three dogs without a permit. Any dog walker, commercial or private, would be able to obtain a permit to walk more than three dogs, with a limit of six dogs, whether on leash or in a ROLA, in the seven areas where permitted dog walking would be allowed. In specified ROLAs, permit holders could have up to six dogs under voice and sight control. Permits could restrict dog walking use by time and area.

**Alternative D** would provide the highest overall level of protection for natural and cultural resources and the highest overall level of visitor safety. Dog management practices listed in alternative D would allow options for dogs to be exercised on leash and in ROLAs but would be more protective in areas where natural resources (plant and wildlife species) and cultural resources are located. The more protective dog management elements offered in alternative D would also provide a stronger measure of visitor protection for both dog walkers and other park visitors by reducing circumstances that would cause conflicts among users and interactions among dogs, thereby minimizing direct and indirect effects of dogs on visitors. Alternative D also provides opportunities for visitors with disabilities. Dog walkers would be allowed to walk one to three dogs without a permit. No commercial dog walking would be allowed under this alternative.

**Alternative E** would provide the greatest level of access for dog walkers throughout GGNRA. Alternative E reflects those portions of the 1979 Pet Policy that can meet the purpose and need of the plan. Because all elements of the 1979 Pet Policy do not meet the purpose and need, particularly the goals of protecting park resources and increasing the safety of visitors, this alternative is more restrictive than the 1979 Pet Policy. Alternative E also assumes compliance with the special regulation to be promulgated, whereas the 1979 Pet Policy in its current form is unenforceable because it is a policy, not a promulgated regulation. For a detailed description of why the 1979 Pet Policy has been considered but dismissed, refer to the “Alternatives Elements Eliminated from Further Consideration” section in this chapter.

Alternative E provides a mix of visitor experiences, including opportunities for visitors with disabilities. It includes the monitoring management strategy; the ROLA guidelines; and elements common to all the action alternatives, including increased education, outreach, and enforcement. Alternative E would also require the most intensive long-term monitoring and management due to having the most areas open to dog walking. Alternative E includes the consensus agreements resulting from the Negotiated Rulemaking Committee meetings. Additionally, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs without a permit. Any dog walker, commercial or private, could obtain a permit to walk up to six dogs in the seven areas that allow permitted dog walking. In specified ROLAs, permit holders could have up to six dogs under voice and sight control. Permits could restrict dog walking by time and area.

**Alternative F** is also a mix of the site-specific action alternatives presented in the draft plan/SEIS (alternatives B–E), but with some changes based on public comment. These changes are listed under the description of each site.

The following sections describe in detail how these alternatives were developed.

## **Review of Existing Data and Application of Research**

The review of existing information was initiated by the interdisciplinary team first by reviewing information provided by park resource specialists on topics such as sensitive species and their habitats, wildlife, soil, vegetation, park operations, visitor experience, and health and safety to gain the information necessary to stimulate informed discussions. The team also reviewed applicable literature and park documents and visited the park sites addressed in this draft plan/SEIS. Guided by a NEPA specialist and the Environmental Quality Division project manager, the park held a series of internal scoping sessions with the interdisciplinary team to review the data and determine existing conditions within the park.

Existing conditions at GGNRA vary among park sites due to the diversity of resources within sites, which are scattered throughout three counties. After existing conditions were established, data (soils, vegetation, etc.) for each park site was characterized to more fully understand the park's resources, the visitor experience, and the impacts of dog walking activities at each park site, developing an informed basis for future management decisions. Addressing the issue by individual park site allowed a level of specificity and provided an organizational tool to help analyze potential resource impacts under each of the action alternatives described in this chapter. This site-specific analysis was a useful tool in gauging how each of the management alternatives met the objectives in taking action, as described in "Chapter 1: Purpose and Need for Action."

To aid in their deliberations, the Negotiated Rulemaking Committee received a number of presentations from the NPS interdisciplinary team and other NPS staff explaining the NEPA process and the rationale for determining which GGNRA sites could be considered for dog walking. NPS staff also presented resource information for the sites under consideration for dog walking that had been gathered for the park interdisciplinary team meetings.

Following the public comment period for the draft plan/EIS, another detailed literature review was performed. Public comments included many studies suggested for inclusion in the draft plan/SEIS. Public comments also suggested deleting some of the studies that had been previously used in the draft plan/EIS. An NPS review of the literature suggested by public commenters included a summary of the suggested document, a determination if the citation had been peer reviewed, and the number of times the document had been cited in other literature. Following the preparation of the literature review, the interdisciplinary team, with input from other NPS senior staff, determined which documents would be used in the preparation of this draft plan/SEIS. Citations were chosen for incorporation if the document had been previously peer reviewed, if methods to studies had been previously peer reviewed, or if the document was cited in other literature. Citations not meeting these criteria were either not incorporated in the draft plan/SEIS or incorporated in the draft plan/SEIS as background information but not used to form conclusions or management decisions.

In addition, the interdisciplinary team met to revise the action alternatives based on public comments received. The objective of the meeting was to review the public's suggestions to alternatives, determine what suggestions would be feasible, and adjust the action alternatives as necessary. Senior NPS staff not employed at GGNRA participated in the meeting to provide an outside perspective on managing natural resources and managing large, urban parks.

This section provides an overview of how the analysis of data, expert opinion, and best professional judgment was applied to develop management alternatives. "Chapter 4: Environmental Consequences" provides further details of how research was used to evaluate the effects of those management alternatives.

## Development of Management Actions for Alternatives B, C, D, E, and F

As discussed in chapter 1, the action alternatives must meet each of the objectives of this EIS. Many objectives were developed for this EIS, including protecting sensitive species and their habitats from the detrimental effects associated with dogs and minimizing conflicts related to dog use by providing a variety of safe, high-quality, visitor use experiences, including areas where dogs are allowed. A complete list of objectives can be found in the “Objectives” section of chapter 1.

During their discussions, the interdisciplinary team grouped the park sites by county (Marin, San Francisco, and San Mateo), which allowed for an informed discussion of strategies and management goals from the countywide level, and, ultimately, for the preferred alternative (alternative F), a more balanced approach in each county.

The entirety of the alternatives development effort, filtered through the specific expertise of the park interdisciplinary team and verified against the purpose and objectives of this planning effort and knowledge of park resources, resulted in the formulation of the alternatives presented in this SEIS.

## ALTERNATIVE A: NO ACTION (CONTINUATION OF EXISTING MANAGEMENT)

The no-action alternative for the draft plan/SEIS is based on a combination of NPS regulations, the 2005 federal court decision (*U.S. v. Barley*, 405 F.Supp.2d 1121 (N.D. Cal. 2005)), and public use practices. Because dog walking regulations and policies, including guidelines in the 1979 Pet Policy, are often ignored or not followed by visitors at many park sites, on-the-ground activities sometimes vary widely from posted regulations. These differences are attributable in part to changes in dog walking policies over the years, court decisions regarding dog walking in GGNRA, and public confusion due to those circumstances and variable levels of enforcement. The changing history of dog management is described in “Chapter 1: Purpose and Need for Action” of this draft plan/SEIS.

---

*The no-action alternative for the draft plan/SEIS is based on a combination of NPS regulations, the 2005 federal court decision, and public use practices.*

---

## CURRENT REGULATIONS AND POLICIES

Dog walking in the park is managed under several legal provisions. Some areas remain closed to dogs or to all public use, or have restrictions imposed by special regulation, the GGNRA Compendium, or consultation under the ESA, which results in a compendium closure or closure by special regulation. Dog walking is authorized in compliance with 36 CFR 1.5, “Visiting Hours, Public Use Limits, and Closures,” and 36 CFR 2.15, “Pets.” The authority to close or restrict areas to protect resources or public safety, or for a variety of other reasons, derives from 36 CFR 1.5(a), which states, in part, “based upon a determination that such action is necessary for the maintenance of public health and safety, protection of environmental and scenic values, protection of natural and cultural resources, [and] aid to scientific research ... the superintendent may ... designate areas for a specific use or activity, or impose conditions or restrictions on a use or activity.” Such restrictions are to be available in writing, and the reasons for them referenced either in the GGNRA Compendium itself or another document, such as consultation under ESA. Under 36 CFR 2.15, pets are prohibited in public buildings, public transportation vehicles, or locations designated as a swimming beach, or any structure or area closed to pets by the superintendent. The GGNRA Compendium is updated each year and is available to the public by request or on the park’s web site ([www.nps.gov/goga](http://www.nps.gov/goga)).

In addition to these general provisions, dog walking in GGNRA is currently managed in accordance with a 2005 federal court decision (*U.S. v. Barley*, 405 F.Supp.2d 1121 (N.D. Cal. 2005)). This decision preserves dog walking under voice control in those areas covered by the 1979 Pet Policy until the NPS has developed a dog management plan and special regulation pursuant to public notice and comment.

## **CURRENT COSTS FOR DOG MANAGEMENT**

Current total costs for alternative A are estimated at \$430,559. The bulk of these costs are associated with the personnel for maintaining the current conditions. For a more detailed explanation of personnel costs under alternative A, see the “Park Operations” section in chapter 4.

## **STATUS OF CURRENT DOG WALKING ACTIVITIES UNDER ALTERNATIVE A**

Below are the park sites considered for dog management, listed in order from north to south, and shown on alternative A maps (see “Maps”). Details on the resource impacts for these sites can be found in the impact analyses in chapter 4.

### **Marin County Sites (No-action Alternative)**

#### **Stinson Beach**

On-leash dog walking is allowed only in the parking lot and picnic areas of Stinson Beach. Dogs are not allowed on the beach itself, because it is a designated swimming beach (closed per 36 CFR 2.15). Dog walking under voice control is not allowed.

#### **Homestead Valley**

On-leash dog walking or dog walking under voice control is allowed at the entire site.

#### **Alta Trail / Orchard Fire Road / Pacheco Fire Road**

On-leash dog walking or dog walking under voice control is allowed from Marin City to Oakwood Valley.

#### **Oakwood Valley**

On-leash dog walking or dog walking under voice control is allowed on Oakwood Valley Fire Road and the section of the Oakwood Valley Trail from its junction with the Fire Road to the junction with Alta Trail. On-leash dog walking is allowed on the Oakwood Valley Trail from the trailhead to the junction with the Oakwood Valley Fire Road.

#### **Muir Beach**

On-leash dog walking or dog walking under voice control is allowed on the beach. Dogs are prohibited in the lagoon and Redwood Creek per the GGNRA Compendium.

#### **Rodeo Beach / South Rodeo Beach**

On-leash dog walking or dog walking under voice control is allowed on Rodeo Beach and South Rodeo Beach. Dogs and visitors are prohibited in Rodeo Lagoon per the GGNRA Compendium.

### **Marin Headlands Trails**

Dog walking on leash or under voice control is allowed on the Coastal Trail from the Golden Gate Bridge to Hill 88 (includes the Lagoon Loop Trail), the Coastal Trail / Wolf Ridge Trail / Miwok Trail Loop, and the Old Bunker Fire Road Loop. On-leash dog walking is allowed on the Coastal Trail from Hill 88 to Muir Beach, the Batteries Loop Trail, North Miwok Trail, and the County View Road and Marin Drive connectors to the North Miwok Trail.

### **Fort Baker**

On-leash dog walking is allowed in areas not closed to dogs. Areas closed to dogs include the Chapel Trail and the Fort Baker pier. The old roadbed around Vista Point is currently closed to all visitors; however, a trail is expected to be constructed on this alignment in 2014 and would be open to on-leash dog walking.

### **San Francisco County Sites (No-action Alternative)**

#### **Upper and Lower Fort Mason**

On-leash dog walking is allowed throughout Upper and Lower Fort Mason, except that dogs are prohibited in the Community Garden in Upper Fort Mason and inside buildings in Upper and Lower Fort Mason. Dog walking under voice control is not allowed, per the 1979 Pet Policy.

#### **Crissy Field**

The Crissy Field WPA is defined in 36 CFR 7.97(d), Snowy Plover Protection, as an area “encompassing the shoreline and beach north of the Crissy Field Promenade (excluding the paved parking area, sidewalks and grass lawn of the former Coast Guard Station complex) that stretches east from the Torpedo Wharf to approximately 700 feet east of the former Coast Guard station, and all tidelands and submerged lands to 100 yards offshore.” It was later discovered that a measurement error was made on the eastern boundary of the Crissy Field WPA. The correct measurement is approximately 900 feet east of the former Coast Guard Station. The action alternatives (B–F) presented in this draft plan/SEIS considers the latter, expanded (by 200 feet) definition of the Crissy Field WPA; the former definition will be applied only to existing conditions as described in chapter 3 and alternative A – no-action alternative impact analysis in chapter 4. Dogs are allowed in the Crissy Field WPA under voice control from May 15 to July 1, with a seasonal leash restriction the rest of the year for the protection of the federally threatened western snowy plover (*Charadrius alexandrinus nivosus*) per 36 CFR 7.97(d), “Snowy Plover Protection.”

Dog walking on leash or under voice control is allowed on the Promenade (from the east end of East Beach to the Warming Hut), the airfield, East and Central beaches, the trails and grassy areas south of East Beach, and the Mason Street Bike Path. Dogs must be on leash in parking lots and picnic areas per the 1979 Pet Policy.

#### **Fort Point Promenade / Fort Point National Historic Site Trails**

On-leash dog walking is allowed outside the historic fort but is prohibited inside the fort or on the Fort Point pier. Areas for on-leash dog walking include the Fort Point Promenade, Battery East Trail, Andrews Road, Presidio Promenade, and grassy area near the parking lot restroom. Dog walking under voice control is not allowed at Fort Point.

### **Baker Beach and Bluffs to Golden Gate Bridge**

Dog walking on leash or under voice control is allowed on the beach north of Lobos Creek. Dogs must be on leash on all trails except on the Batteries to Bluffs Trail, where dogs are prohibited per the GGNRA Compendium for the protection of irreplaceable natural resources.

### **Fort Miley**

Dogs are allowed on leash or under voice control within East and West Fort Miley.

### **Lands End**

Dogs are allowed on leash or under voice control throughout the entire site.

### **Sutro Heights Park**

On-leash dog walking is allowed throughout Sutro Heights Park. Dog walking under voice control is not allowed.

### **Ocean Beach**

Dogs are allowed in the SPPA (Stairwell 21 to Sloat Boulevard) on leash or under voice control from May 15 to July 1, with a seasonal leash restriction the rest of the year for the protection of the federally threatened western snowy plover, per 36 CFR 7.97(d), “Snowy Plover Protection.”

Dog walking on leash or under voice control is allowed north of Stairwell 21 and south of Sloat Boulevard, the sections of the beach that are outside the SPPA. Dog walking on leash is allowed on the Ocean Beach Trail east of the dunes that runs parallel to the Great Highway from the end of the seawall to Sloat Boulevard.

### **Fort Funston**

Dog walking on leash or under voice control is allowed throughout Fort Funston, excluding the 12-acre habitat protection area closure, the closure due to erosion for all visitors north of the intersection of the Funston Horse Trail and the Sunset Trail, and the voluntary seasonal closure for all park visitors at the base of the northernmost bluffs to protect nesting bank swallows (April 1–August 15).

### **San Mateo County Sites (No-action Alternative)**

#### **Mori Point**

On-leash dog walking is allowed on all trails and on the section of beach within the park boundary at Mori Point. Dog walking under voice control is not allowed.

#### **Milagra Ridge**

On-leash dog walking is allowed on all trails at Milagra Ridge. Dog walking under voice control is not allowed.

### **Sweeney Ridge / Cattle Hill**

On-leash dog walking is allowed on all trails at Sweeney Ridge except the Notch Trail, which is closed to dog walking for the protection of mission blue butterfly (*Icaricia icarioides missionensis*) habitat. Dog walking under voice control is not allowed at Sweeney Ridge.

Cattle Hill is not currently owned or managed by GGNRA. The site is owned by the City of Pacifica, although it is not actively managed; dog walking, both on-leash and under voice control, currently occurs at this site. Cattle Hill is within the park boundary and it is anticipated that it will transfer to NPS management in the near future, at which point the servicewide regulation for dog walking (36 CFR 2.15) will apply, and areas may be closed to dog walking to protect resources and visitor experience until sufficient information about this new site is acquired.

### **Pedro Point Headlands**

Pedro Point Headlands is not currently owned or managed by GGNRA. However, this land is within the park boundary and it is anticipated that the land will transfer to NPS management in the near future. On-leash dog walking and dog walking under voice control both currently occur at this site.

---

*Several elements are common to all of the action alternatives (alternatives B, C, D, and E).*

---

### **Rancho Corral de Tierra**

Rancho Corral de Tierra transferred to GGNRA on December 9, 2011, after the draft plan/EIS was released. Like other GGNRA sites acquired after 1979, Rancho was not addressed in the 1979 Pet Policy. Historically, although off-leash dog walking was not officially sanctioned by the previous private owner, off-leash use occurred frequently. Under current NPS management, on-leash dog walking is allowed throughout Rancho Corral de Tierra, while off-leash or voice control dog walking is not allowed. NPS regulations, which take effect when properties are transferred to the NPS, require that pets must be physically confined or restrained on a leash where they are allowed (36 CFR 2.15(a)(2)). This conforms to CEQ guidance implementing NEPA, which defines no action in this case as “an action such as updating a land management plan where ongoing programs initiated under existing legislation and regulations will continue, even as new plans are developed. In these cases ‘no action’ is ‘no change’ from current management direction or level of management intensity” (CEQ 1981, Question 3).

## **ELEMENTS COMMON TO ACTION ALTERNATIVES**

These prior use patterns are discussed in “Chapter 3, Affected Environment,” but are not part of the no-action alternative. They are considered in the impact analysis in “Chapter 4, Environmental Consequences” as a cumulative past impact. Several elements are common to all of the action alternatives (alternatives B, C, D, E, and F, the preferred alternative). These elements provide overall clarification and detail for the proposed dog management framework at GGNRA.

### **AREAS OPEN TO DOG WALKING**

Dog walking would be allowed only in designated on-leash areas or ROLAs; all other areas of the park would be closed to dog walking. Guidelines for ROLAs originated in discussions by the Negotiated Rulemaking Committee for Dog Management at GGNRA and were finalized by NPS staff. Under the action alternatives, voice control within a ROLA would be specifically defined and incorporated into the new special regulation for dog walking at GGNRA. It would be expected that the ROLA guidelines,

reinforced by education and outreach efforts, would change the behavior of dog walkers in the future at GGNRA. Complete dog walking requirements are in appendix E and include the following:

- Each off-leash dog must be under voice and sight control at all times, meaning that dogs must be within direct eyesight of the dog walker, and that dog walkers must be able to immediately recall their dog(s) to their side so that a leash can be attached to the dog(s)'s collar, and shall demonstrate this ability when requested by law enforcement personnel.
- Uncontrolled dogs are prohibited. Dogs are presumed not to be under control if they
  - annoy, harass, or attack people, livestock, or other leashed or unleashed dogs,
  - intentionally or unintentionally annoy, pursue, hunt, harass, harm, wound, chase, attack, capture, or kill wildlife,
  - enter leash-required or dog-prohibited areas, and/or
  - dig, destroy vegetation, or enter fenced or closed areas.
- Aggressive dogs (snarling, unwanted jumping) are not allowed in ROLAs and are subject to fines per 36 CFR 2.34(a)(4).
- Dogs under four months old must be leashed.
- Dogs in heat are not allowed in ROLAs.
- Dogs must be licensed and wear an identification tag at all times that includes the name and phone number of the owner.
- All dog walkers must have a functional 6-foot leash that can be attached to a collar or harness on the dog, for each dog under their care.
- Dog walkers must keep dogs on leash in parking lots and on paths that access ROLAs.
- Dog walkers must keep dogs out of any area closed by fence or sign for restoration, habitat protection, or safety concerns.
- Dog walkers must pick up their dogs' feces immediately and dispose of them in a garbage container.
- ROLAs would be periodically closed to allow re-growth of vegetation on an as needed basis.

Additional elements common to all of the action alternatives (B, C, D, E, and F the preferred alternative), are as follows:

- All dogs must be licensed in county of residence.
- Areas designated for on-leash dog walking require walkers to have full control of their dog(s) by using a functional leash no more than 6 feet long that must be attached to the dog and simultaneously held by the dog walker.
- On-leash dogs would be allowed in all parking lots, picnic areas, and paved public roads (roads open to public vehicular traffic) throughout to provide for visitor and staff safety, except as follows:
  - Alternative D—
    - Stinson Beach, no dogs in parking lots or picnic areas
    - Crissy Field, no dogs in West Bluff picnic area.

- Alternative B and D—West Fort Miley, no dogs
- Dogs would be prohibited in all campgrounds and off designated trails.
- Dogs would be prohibited in public buildings, including restrooms and showers, excluding the Crissy Field dog rinse station (also applies to alternative A).
- No more than three dogs may be walked, on leash or in a ROLA, by an individual at any time in any of the GGNRA sites, except under alternatives that allow a permit for up to six dogs in the seven sites where permitted dog walking is allowed.
- Service animals accompanying a person with a disability, as defined by Federal law and Department of Justice regulations (28 CFR § 36.104), are allowed wherever visitors or employees are allowed. Under the *Americans with Disabilities Act* (ADA), service animals must be harnessed, leashed, or tethered, unless these devices interfere with the service animal's work or the individual's disability prevents using these devices. In that case, the individual must maintain control of the animal through voice, signal, or other effective controls (U.S. Department of Justice 2010). The NPS is currently revising its regulations to be consistent with Department of Justice regulations covering the ADA (28 CFR 36).

### **PERMITS FOR MORE THAN THREE DOGS – COMMERCIAL AND INDIVIDUAL DOG WALKERS**

Commercial dog walking would be allowed under alternatives B, C, E, and F (the preferred alternative). Commercial dog walking would not be allowed under alternative D. Under alternative B, commercial dog walking would be regulated under the same guidelines and regulations that apply to recreational dog walkers, including the three-dog maximum. Because alternative B would not allow for dog walking under voice control, commercial dog walking would be on leash only. Under alternatives C, E, and F, commercial dog walking would be allowed under the same guidelines and regulations that apply to recreational dog walkers, including walking up to three dogs without a permit. However, under these three alternatives, both commercial and recreational dog walkers could apply for a special use permit (SUP) to walk up to six dogs. In a ROLA, permit holders may have up to six dogs under voice and sight control. Permits would restrict use by time and area. Permits would be issued for the following sites: Alta Trail, Rodeo Beach, Fort Baker, Fort Mason, Crissy Field, Baker Beach, and Fort Funston. The hours for commercial dog walking would be limited to 8:00 a.m. to 5:00 p.m. Monday through Friday, and from 8:00 a.m. to 11:00 a.m. on weekends. See appendix F for SUP conditions and enforcement associated with noncompliance with the permit. Refer to appendix F for additional permit conditions.

### **OUTREACH AND EDUCATION**

Education and public outreach would be a large component of all the action alternatives. GGNRA would establish a long-term public outreach campaign to help educate and inform the public about the selected alternative and new dog management regulations for the park based on the preferred alternative. The park would develop a comprehensive dog management guide that would be available at visitor centers and on the park's web site. The dog walking guide would contain clear, concise, illustrated explanations of the new dog management regulation by GGNRA site. New regulatory and interpretive signs would be developed for dog walking areas with consistent design and style that is clear and concise so the public can understand the regulations at specific sites. SUPs for large special events will require that the event organizer provide educational materials on the dog walking program during their event. GGNRA would encourage media coverage of the new dog walking regulation and would place ads in community newspapers and dog walking magazines, as funding allows, to help inform the dog walking community of the new regulation. Dog management information would be available at all the park's quarterly open

house meetings, allowing the public to talk with park staff about dog management. Park staff and outreach volunteers would provide information to the public about the new dog management regulation. The park would also consider regularly meeting with stakeholder organizations for information sharing on dog management. Summaries of these meetings would be posted on the park web site.

## **PARTNERSHIPS**

The federal panel recommended that dog walking groups be active partners in management of dog walking in the park, including disseminating accurate information to constituents regarding dog management regulations (NPS 2002a, 11). This was also stated in the parameters and scope of the negotiated rulemaking discussion. The NPS would actively seek partnerships with stakeholder groups and members of the public—particularly those who have been involved in the development of GGNRA dog management policies—to help in disseminating dog walking information and guidelines, including ROLA guidelines, to park visitors in order to reduce noncompliance.

## **Monitoring-based Management Strategy**

### **Background**

The monitoring-based management strategy (formerly the compliance-based management strategy) has been designed to encourage compliance with sections of the CFR applicable to dog management, and ensure protection of park resources, visitors and staff. It will provide the framework for monitoring and recording observed noncompliance with the applicable sections of the CFR, including the new 36 CFR Part 7 special regulation, and will guide use of park resources to address those violations. Noncompliance with federal regulations related to dog management will be met with a range of management responses. It will also monitor for impacts to natural and cultural resources.

### **Changes Based on Public Comment**

GGNRA received multiple public comments regarding the monitoring-based management strategy (formerly the compliance-based management strategy). Some of those are addressed in specific detail in the response to comments on the draft plan/EIS (found on the NPS Planning, Environment, and Public Comment (PEPC) website (<http://parkplanning.nps.gov/projectHome.cfm?projectID=11759>)). Broadly speaking, concerns included the following:

- Comment: Various changes to weighting options for measuring compliance.  
Response: see responses to see specific comment on the PEPC website (<http://parkplanning.nps.gov/projectHome.cfm?projectID=11759>), including responses to “Save Our Seashore.”
- Comment: Specific recommendations were provided by commenters to make the strategy more similar to adaptive management (monitoring for resource impacts, not just regulation violations).  
Response: Resource impacts will be monitored.
- Comment: Include a citizen recreation deliberative body to be consulted before an area is changed to the next most restrictive level of dog management.  
Response: This suggestion will not be implemented because areas will no longer change automatically upon reaching a pre-established threshold. Additionally, establishing such a committee would require a Federal Advisory Committee Act Charter, which would expire after a

two-year period and could only be renewed one additional time, and by law could only serve in an advisory, as opposed to decision-making capacity.

- Comment: Repeat individual violators should not count towards the overall total, but should instead be dealt with on an individual basis.

Response: The revised monitoring-based management strategy alone will not restrict or close an area based on a preset number of violations. Rather, individual violations will be one of many factors evaluated to determine what, if any, management actions are needed.

- Comment: Open up more areas to dog walking, then reduce as needed based on monitoring data. And, if an area is changed to a more restrictive status, allow it to open again at some point in the future.

Response: The dog management plan's range of alternatives sets the maximum allowance for areas open to dog walking while still meeting the purpose and need for the plan.

- Comment: Provide additional examples of education and outreach.

Response: Education and outreach is not limited by the examples provided in the plan, but rather by staffing and budget constraints. GGNRA recognizes that education and outreach can be a cost-effective and effectual way of managing dog walking, and intends to focus on these methods as much as possible, particularly through collaboration with other organizations.

- Comment: Define buffer zones.

Response: A buffer zone is an area temporarily off set to provide increased protection for sensitive habitat and species, or provide separation between distinct user groups, which may include fencing or informal barriers or markers to designate the area.

The monitoring-based management strategy will no longer serve as a strict measurement of compliance which could trigger an automatic change in use in an area or zone. Although simplicity and ease of measurement supported a uniform measurement and threshold, the numbers and types of visitor uses and range of resources varies widely at different sites. Given these differing contexts, uniform application of a 75 percent threshold and uniform weighting of violations could lead to divergent outcomes with less than uniform protection of NPS resources and values. For example, based on visitation data, a 75 percent threshold could trigger restrictions in some areas by only one hundred violations, while other sites might require several thousand violations before a change was implemented, despite greater impacts to resources and values in the latter case.

This change will also allow NPS to weigh violations within the context of an area. For example, disturbance of threatened and endangered species and habitat would be a high priority for management to address. Additionally, while the monitoring-based management strategy will continue to monitor for violations as indicators of possible harm to resources and values, it will also monitor for measurable damage to resources and values. This information will guide the park in the future if additional, future closures are necessary. Law enforcement will continue to issue citations for individual violations, whether or not counted as part of the monitoring-based management strategy. Additionally, monitoring data will provide law enforcement with information on where to prioritize these efforts.

### **Timeline**

Monitoring will begin with plan implementation, or soon thereafter. A detailed monitoring plan will be developed to guide compliance monitoring, data management, and reporting.

All areas and zones (see frequently asked questions 1 below) addressed by the dog management plan will be subject to monitoring. Starting with the implementation of the dog management plan, months 1–3 will be a public education period, and in months 3–6 the monitoring strategy will be tested. During months 6–18, a baseline of numbers and rates of visitors with and without dogs, numbers of dogs per visitor, type of use (on leash or voice control) and noncompliance with regulations (including noncompliance observed but not resulting in citations) will be established. After this baseline has been established, monitoring efforts may be prioritized, with the park reducing the frequency of monitoring in low use or high compliance areas to focus on areas with high use or low compliance as needed. Monitoring will continue in all areas for at least 4 years. However, all areas addressed in the dog management plan will be periodically monitored for changes in baseline to reprioritize monitoring as needed. Park management responses will focus on areas with demonstrated noncompliance with the regulations and impacts to resources not otherwise captured through violation monitoring. Monitoring will inform park management and law enforcement when, where, and how to prioritize responses to noncompliance.

NPS will prepare annual reports documenting monitoring data collected and any consequent short-term management actions, including short-term closures, or proposed long-term closures, which will be made available to the public. NPS will also release a preliminary report providing baseline data after the first 6 months of monitoring (month 12 after plan initiation).

Below are examples of federal regulations that will be monitored for compliance:

- Vegetation damage: 36 CFR 2.1 (a) (1) (ii)
- Wildlife disturbance: 36 CFR 2.2(a)(2)
- Disturbance to threatened and endangered species: 36 CFR 2.2 (a) (2), 50 CFR Part 17
- Violation of areas closed to dogs (threatened and endangered species and sensitive habitat): New Part 7 Special Regulation or 36 CFR 2.15
- Violation of areas closed to all (threatened and endangered species and sensitive habitat): 36 CFR 1.5 (f) or 36 CFR 2.15
- Violation of areas closed to dogs (safety): 36 CFR 1.5 (f), New Part 7 Special Regulation or 36 CFR 2.15
- Hazardous condition (aggressive behavior, pet rescues): 36 CFR 2.34 (a)
- Degree of compliance with special regulation (no dogs, on leash, ROLA): New 36 CFR Part 7 Special Regulation or 36 CFR 2.15
- Government property damage: 36 CFR 2.31 (a) (3)
- Pet excrement: 36 CFR 2.15 (a) (5).

### **Triggers and Management Responses**

Primary management response: When the level of compliance is deemed unacceptable based on violations and/or impacts to resources (not otherwise captured through violations data), NPS would weigh appropriate management options and would respond from a suite of potential actions that include the following: focused enforcement of regulations, education (e.g., additional information and regulatory signs and exhibits, brochures and fliers, public meetings, meetings with user groups, etc.), establishment of buffer zones to protect sensitive habitat and species and/or provide separation between distinct user groups, time/use restrictions, and SUP restrictions.

- Areas with the highest rates of noncompliance, and/or sensitive resources, will receive first priority for primary management responses<sup>1</sup>.
- Aggressive dogs or unsafe behavior (e.g., resulting in cliff rescues) are treated on an individual, case-by-case basis, and may result in banning a particular dog from the park, or if applicable, a SUP restriction. However, violations recorded by the monitoring team will count towards the rate of noncompliance.

Secondary management response: If compliance rates are deemed unacceptable based on the previous 12 months' monitoring data in one of the zones, in spite of the park's primary management actions, the park will evaluate secondary management responses and institute short-term measures, including but not limited to short-term closures and/or establishment of buffer zones, and will evaluate whether to propose long-term closures. Note that primary management responses may continue to apply. A short-term closure is a closure contained in the GGNRA Compendium, typically one year or less in length. A long-term closure is typically longer than one year in length, and would likely require a special regulation. Examples of buffer zones or short-term closures being triggered include a change in resource conditions requiring resource protection, such as sensitive species moving into an area, creek channel migration, beach erosion, habitat expansion or habitat restoration (such as allowing vegetation within a ROLA to recuperate), or re-establishment of a baseline level of compliance.

### Frequently Asked Questions

1. What is an area versus a zone?

An area is a specific geographic site. The dog management plan addresses 22 areas. A zone denotes a type of use allowed in an area (on leash, voice control, or no dogs). An area may have more than one zone, depending on the alternative.

2. Will the monitoring plan be peer-reviewed before implementation?

Yes, the plan will be subject to peer review and public comment, as required by U.S. Department of the Interior policy to ensure integrity of scientific data. Such a review will include monitoring protocols to ensure statistical rigor and accuracy, and training of monitoring staff to ensure uniform measurement and interpretation of data.

3. How do law enforcement citations or other instances of noncompliance, such as a case incident report, factor into management responses?

Although violations will likely occur that are not documented by the monitoring team, including those resulting in law enforcement citations, those would not count towards the cumulative total for a particular zone, because the number of incidents of noncompliance at any zone must be measured against the total number of dogs and/or dog walkers in the area during monitoring. However, all violations reported to the park, including citations, may be used to inform the monitoring team where to focus its efforts.

---

<sup>1</sup> If Section 7 consultation pursuant to the ESA requires preparation of a Biological Opinion, management responses related to threatened and endangered species will be governed by the terms and conditions described in the Biological Opinion, and would be separate from the monitoring-based management strategy. Emergency closures for listed species protection may also occur outside of the monitoring-based management strategy.

4. Does baseline information factor into management responses?

No. Baseline information is used to prioritize monitoring initially, and reevaluate monitoring if use patterns change. It does not set a standard for measurement.

5. What are some examples of the monitoring-based management strategy in practice at different periods in time?

- Month 15 of the plan implementation: The monitoring team visits a specific area at random times of the day and week. The team will count the total number of dogs, dog walkers and types of use (on leash, voice control) over a pre-set monitoring period, while also recording the number of violations in each zone contained in the area. This information will be compiled with the preceding months' monitoring data to develop a cumulative total number of dogs and violations. Information gained through monitoring will direct use of park resources to initiate primary management responses as required. In 3 more months the monitoring team will have 12 months of data to evaluate, to determine if additional, or secondary management measures are warranted.
- Month 18 of the plan: The monitoring team has continued to visit this specific area at random times of the day and week, following the same monitoring protocols as noted above. If compliance rates or resource impacts are deemed unacceptable based on the previous 12 months' monitoring data in one of the zones, in spite of the park's primary management actions, the park will evaluate secondary management responses, including short-term closures. However, a permanent closure may require a special regulation.

6. What kind of public notice will be provided before initiation of a secondary management response?

GGNRA will provide notice through its website, notices posted in the specific area, and outreach to affected groups.

7. Why is the secondary management response necessary?

The dog management final plan/SEIS and the resulting special regulation, along with existing regulations applicable to dog management, determine appropriate behavior for visitors with dogs within GGNRA. NPS does not condone any level of noncompliance, and the primary management response detailed above is sufficient to address noncompliance where it is not widespread. The secondary management response is meant to apply when it is clear that park management has been unable to reduce noncompliance through conventional means, and when there is continued and widespread noncompliance occurring over a longer period of time, at which point the benefits in allowing the use is outweighed by the NPS administrative burden required to manage the use, draining limited resources needed for other important park programs. The secondary management response provides visitors with dogs an additional incentive to comply with the dog regulations, and because it is site-specific, it encourages a communal response to address noncompliance. It also places a burden on NPS to take an initial, proactive approach to dog management by addressing individual violators and by increasing public awareness through community education and outreach, and not punish the majority for individual or isolated violations. At the same time, this secondary response is intended to ensure that NPS does not allow activities that do not correspond with its primary conservation mandate, or that cause unacceptable impacts. It recognizes that NPS has multiple competing priorities to address with its funding and does not have unlimited resources with which to ensure compliance with dog regulations.

## UNFORESEEABLE CHANGES TO PLAN IMPLEMENTATION

Minor changes to plan implementation may be required as a result of changing conditions (e.g., coastal erosion and loss of parkland, storm damage) of the park’s dynamic ecosystem to ensure the safety of visitors and staff and to protect natural resources. The park is not able to foresee how all future resource and visitor use conditions and patterns will change. Minor changes include actions such as trail realignments to protect natural resources, establishment of buffer zones, short-term closures, and park map revisions due to inadvertent errors (i.e., boundary of the Crissy Field WPA).

While this draft plan/SEIS presents areas open to dog walking activities, the Superintendent has the discretion to close these areas to dog walking to protect visitor safety and natural resources, as may be required due to minor and major changes. Major changes will continue to require a public process; however, the park currently closes areas through the GGNRA Compendium, and will continue to close areas in the future, as needed to protect visitor safety and natural resources. Closures and public use limits will follow 36 CFR 1.5, which includes public use limits and closures, and 36 CFR 1.7, “Public Notice.”

## ALTERNATIVE B: NPS LEASH REGULATION (36 CFR 2.15 AND GOLDEN GATE NATIONAL RECREATION AREA COMPENDIUM)

Alternative B reflects the NPS-wide approach to dog walking as defined in NPS policy and regulations. Management conditions for alternative B are regulated by the CFR, specifically 36 CFR 2.15(a)(2), and the GGNRA Compendium. This alternative does not include the voice control provisions of the 1979 Pet Policy. The federal regulation 36 CFR 2.15(a)(2) prohibits failing to crate, cage, restrain on a leash, which shall not exceed 6 feet in length, or otherwise physically confine a pet at all times in national parks (appendix D). The compendium is the format wherein each park, as allowed by the CFR, can publish park-specific actions to establish closures and public use limits to protect cultural or natural resources, enhance public health or safety, or manage public use and recreation (NPS 2012b; appendix B).

Some areas of the park would be closed to dogs or to all public use, or have restrictions imposed on them by the GGNRA Compendium or consultation under the ESA. Section 1.5, “Visiting Hours, Public Use Limits, and Closures,” and Section 2.15, “Pets,” are the sections of the compendium that establish site closures in the park for visitors and restrictions for pets. Section 2.15 of 36 CFR states that pets are prohibited in public buildings, public transportation vehicles, locations designated as swimming beaches, or any structure or area closed to pets by the superintendent. The authority to close or restrict areas to protect resources or public safety, or for a variety of other reasons, derives from 36 CFR 1.5, which states in part, “based upon a determination that such action is necessary for the maintenance of public health and safety, protection of environmental or scenic values, protection of natural or cultural resources, [or] aid to scientific research ... the superintendent may ... designate areas for a specific use or activity, or impose conditions or restrictions on a use or activity.” Such restrictions are to be available in the GGNRA Compendium, and the reasons for them referenced either in the compendium itself or the separate written determination as to why the restriction or use limit is necessary. In addition, the public must be notified of closures and use limits put in place through the compendium by signs or brochures as stated in 36 CFR 1.7(a).

---

*Alternative B reflects the NPS-wide approach to dog walking as defined in NPS policy and regulations.*

---

The compendium is updated each year and is available to the public by request and on the park’s web site. These restrictions are intended to reduce any possible conflict between users, to protect natural, cultural, and archeological resources, and for public safety concerns (NPS 2008b, p. 23).

In the GGNRA Compendium, some areas of the park are designated as closures due to public safety concerns (e.g., steep coastal cliffs) and other areas have natural and cultural resources that are highly sensitive to damage. The ESA and NPS policy require special protection for the threatened and endangered species and the anadromous fish (fish living mostly in the ocean and breeding in freshwater) found in areas of GGNRA. Some park areas provide vital protection of habitat for the state threatened bank swallow and federally threatened western snowy plover as well as habitat for shorebirds, marine mammals, and other sea life. Restrictions on pets in these areas provide important areas of reduced disturbance for resting and feeding waterbirds, shorebirds, and other marine wildlife. Some vegetated areas of the park contain significant native plant communities that are subject to human-induced impacts, like the coastal bluffs and dunes of Fort Funston. Other vegetated areas contain native and/or culturally significant vegetation that is susceptible to erosion due to environmental factors but is also exacerbated as a result of trampling, short-cutting and off-trail travel.

In addition, the GGNRA Compendium could include restrictions for pets in areas of the park for public health and safety, protection of cultural resources, and avoidance of conflict among visitor use activities.

In all sites allowing dog walking in this alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person without a permit. All dogs would be required to be on a leash.

## **COST OF IMPLEMENTATION**

The total costs of implementing alternative B are estimated at \$2,416,046. The bulk of these costs are associated with the hiring of additional personnel for implementing the dog management plan. For a more detailed explanation of personnel costs under alternative B, see the “Park Operations” section in chapter 4.

## **DOG WALKING ACTIVITIES PROPOSED UNDER ALTERNATIVE B**

Detailed information on alternative B for individual park sites, listed in order from north to south, is presented below and shown on alternative B maps (see “Maps”). The following rationale for the alternative options for each site describes resource impacts from dog walking in a generalized way. Details of these resource impacts can be found in the impact analyses in chapter 4.

### **Marin County Sites (Alternative B)**

#### **Stinson Beach**

As in alternative A, on-leash dog walking would be allowed only in the parking lot and picnic areas of Stinson Beach. Dogs would not be allowed on the beach itself, because it is a designated swimming beach (closed to dogs, per the CFR). Leashed dogs in the parking lot and picnic areas would minimize conflict with visitors in these areas. In addition, leashed dogs would also reduce the concern for health and safety issues associated with dogs in the picnic areas.

#### **Homestead Valley**

This alternative would allow on-leash dog walking only on Homestead Fire Road and on neighborhood connector trails (Homestead Trail and Homestead Summit Trail) that will be designated by the park in the future. Homestead Valley is regularly used by local residents. This alternative would provide neighborhood connections for dog walkers. Requiring that pets be walked on leash would protect native

plant communities, wildlife habitat, and the federally listed northern spotted owl (*Strix occidentalis caurina*).

### **Alta Trail / Orchard Fire Road / Pacheco Fire Road**

On-leash dog walking would be allowed on Alta Trail up to the junction with Orchard Fire Road and on Pacheco and Orchard fire roads, which branch off Alta Trail and connect to Marin City. The on-leash designation requires that pets be walked on leash, thereby protecting native plant communities and wildlife habitat—and specifically protecting habitat for the federally listed mission blue butterfly, which is consistent with the treatment of mission blue butterfly habitat throughout GGNRA. The on-leash designation would also limit the potential for dog/coyote interaction.

### **Oakwood Valley**

On-leash dog walking would be allowed only on Oakwood Valley Fire Road and on Oakwood Valley Trail to the junction with the Fire Road. This alternative would provide protection for contiguous habitat beyond the trail and fire road junction and would limit the potential for dog/coyote interaction. It would also provide protection for potential habitat for species of concern, such as the mission blue butterfly habitat nearby and possible habitat for the northern spotted owl.

### **Muir Beach**

On-leash dog walking would be allowed on the beach, the bridge and path to the beach, and the proposed Muir Beach Trail, which is to be built as part of the Muir Beach Wetland and Creek Restoration Project (NPS 2007b, 1-4). Requiring that pets be leashed would protect federally listed coho salmon and steelhead in Redwood Creek, as well as sensitive wetland, riparian, and dune habitat. This designation would also allow for multiple uses on this beach.

### **Rodeo Beach / South Rodeo Beach**

On-leash dog walking would be allowed on both Rodeo Beach and South Rodeo Beach, and on the S. Rodeo Beach access trail and the footbridge to the main beach. Dogs and visitors are prohibited in Rodeo Lagoon per the GGNRA Compendium to protect the federally listed tidewater goby and California brown pelican, as well as waterbirds and shorebirds that use the lagoon. On-leash dogs would be allowed on the beach because this area has a low incidence of dog/visitor conflicts. Fenced areas (existing or future) are closed to the public to protect dunes, sensitive habitats/species, restoration areas, or other sensitive resources.

### **Marin Headlands Trails**

This alternative would not allow dogs on any of the trails in the Marin Headlands, including those previously open to dogs. This restriction would protect resources by maintaining the integrity of the native plant communities and wildlife habitat, including habitat for the federally listed mission blue butterfly.

### **Fort Baker**

On-leash dog walking would be allowed on Drown Fire Road, the Bay Trail (excluding the Battery Yates Loop), the trail to be built around Vista Point that will connect with the Bay Trail, the Lodge and Conference Center grounds and the parade ground. This restriction would be for visitor protection in an area of increasing visitation, both around the lodge and conference center and along the waterfront. The

restriction would also be for the protection of the mission blue butterfly habitat surrounding the area. The Chapel Trail, which is adjacent to mission blue butterfly habitat, is closed to dogs per the GGNRA Compendium.

## **San Francisco County Sites (Alternative B)**

### **Upper and Lower Fort Mason**

On-leash dog walking would be allowed throughout Upper Fort Mason, including the Great Meadow, the vendor area, Laguna Green, lawns, sidewalks, trails, open areas around housing, and the parade ground. On-leash dog walking would also be allowed at Lower Fort Mason, except that dogs are not allowed in public buildings. Requiring on-leash dog walking is for visitor safety, since this is a multiple-use area (picnicking, sunbathing, walking, running, and bike riding). Rescues of dogs and people have occasionally occurred on the cliffs on the northern edge of Fort Mason.

### **Crissy Field**

**Wildlife Protection Area (Torpedo Wharf to approximately 900 feet east of the pier at the former Coast Guard station).** No dogs would be allowed in the Crissy Field WPA under this alternative. The federally threatened western snowy plover has been observed in the WPA at Crissy Field during the non-breeding season since 2006. Prohibiting dogs in the WPA would be consistent with the Crissy Field Recovery Plan Environmental Assessment (EA) (NPS 1996) and the General Management Plan Amendment (GMPA) EIS for the Presidio of San Francisco (NPS 1994). This alternative would afford the maximum protection for the western snowy plover, marine mammals (including immature elephant seals, which have been using the area recently), other wildlife, and native dune habitat.

**Crissy Field Promenade, Airfield, Beaches, Trails, and Grassy Areas.** On-leash dog walking would be allowed on the promenade, airfield, East and Central beaches, the paths leading to Central Beach, the trails and grassy areas near East Beach, the Mason Street Bike Path, and within the grassy areas near the old Coast Guard station. The leash requirement would provide visitor and pet safety as well as visitor satisfaction for those who would prefer to visit this site without encountering off-leash dogs. The leash requirement would also reduce the potential for dog/visitor conflict in this heavily visited, multiple-use area. Crissy Field receives intense visitor use, including from individual and commercial dog walkers. Staff estimates that there are generally ten to fifteen commercial dog walkers per day (fewer on weekends than weekdays), and typically at least three present, with at least four to six dogs each, at any given time of the day. These dogs are often walked under voice control, as are many of the dogs walked by individual dog owners. The area is busy with a variety of visitors, including joggers, cyclists, pedestrians, kiteboarders, windsurfers, and rollerbladers. Particularly on nice days, the high level and variety of visitor uses have resulted in conflicts, including visitor intimidation, dogs knocking people over, dog-on-dog fights, and dogs biting people.

### **Fort Point Promenade / Fort Point National Historic Site Trails**

As in alternative A, on-leash dog walking would be allowed only outside the fort (Fort Point Promenade, Battery East Trail, Andrews Road, Presidio Promenade, and the grassy area near the parking lot restroom) and would be prohibited inside the historic fort or on the Fort Point pier. This would minimize conflicts on the promenade along the entrance road and on the trails near the Golden Gate Bridge, where joggers, cyclists, and walkers share space with dog walking visitors. In addition, this alternative's requirement for on-leash use reduces risks to dogs from the adjacent roadways (Marine Drive and Lincoln Boulevard) and the edge of the seawall.

### **Baker Beach and Bluffs to Golden Gate Bridge**

On-leash dog walking would be allowed on Baker Beach and on all trails except on the Batteries to Bluffs Trail and Battery Crosby Trail, where dogs would be prohibited per the GGNRA Compendium for the protection of irreplaceable natural resources. Requiring on-leash dog walking on the beach and trails would provide protection for shorebirds, sensitive serpentine bluffs, and rare plant habitat as well as for visitors.

### **Fort Miley**

No dogs would be allowed at either East or West Fort Miley under this alternative, due to conflicting uses such as picnicking and bird watching. At West Fort Miley, dogs would not be allowed in picnic areas as there is no dog walking access. This alternative would provide the most protection for bird habitat. Due to the concrete bunkers edged by steep embankments at both East and West Fort Miley and the location of the Veteran's Administration (VA) hospital directly adjacent to the site, safety is a concern at this location. Hospital patients use the area, and the site is typically subject to heavy pedestrian and vehicular traffic, which also cause safety concerns.

### **Lands End**

On-leash dog walking would be allowed only on the El Camino del Mar Trail and Lands End Coastal Trail and connecting trails and steps. On-leash dog walking would increase visitor safety on the heavily used, ADA accessible, restored section of the Lands End Coastal Trail. Resources in this area that are potentially subject to impacts by dogs include natural seeps, migratory birds, and coyotes. A visitor center, the Lands End Lookout, was recently completed at the Merrie Way parking lot in the Lands End area, which has increased use of this area.

### **Sutro Heights Park**

On-leash dog walking would be allowed only on the paths and parapet of Sutro Heights Park. This restriction is needed because this area is a multiple-use area. The park has formal landscaping and is frequently used for special events, including weddings.

### **Ocean Beach**

**Snowy Plover Protection Area (SPPA) (Stairwell 21 to Sloat Boulevard).** Dogs would be prohibited in the SPPA, but would be allowed on leash on the Ocean Beach Trail east of the dunes, adjacent to Great Highway. The Ocean Beach SPPA was established to protect western snowy plovers when they are present on the beach during their nonbreeding season. Prohibiting dog walking in the SPPA and having on-leash dog walking only along the adjacent trail would provide protection for the western snowy plover consistent with the *Final Recovery Plan for the Western Snowy Plover* (USFWS 2007a). In addition, there are multiple reported instances of dogs flushing or chasing shorebirds or plovers in this area. This alternative would allow on-leash dog walking adjacent to the beach while protecting plover and shorebird habitat by separating the dogs from the habitat.

**North of Stairwell 21 and South of Sloat Blvd.** Outside the SPPA, on-leash dog walking would be allowed north of Stairwell 21 and south of Sloat Boulevard. Having on-leash dog walking north of Stairwell 21 would reduce conflicts between dogs and visitors in this heavily visited area, which is located close to the parking area at the beach. Requiring on-leash dog walking south of Sloat Boulevard would provide protection for shorebirds in this southernmost section of Ocean Beach, which averages the highest density of shorebirds at Ocean Beach (Beach Watch 2006, 10).

## **Fort Funston**

On-leash dog walking would be allowed on the beach and on trails that are not closed to dogs. A strip of beach at the foot of the northernmost bluffs would also have a seasonal closure to visitors and dogs when the state-threatened bank swallows are nesting (April 1–August 15). The seasonal closure and the requirement for on-leash dog walking on the beach are for the protection of bank swallows and shorebirds, but also reduce the possibility of conflict between user groups. Requiring on-leash dog walking on the trails south of the main parking lot is for the protection of a large restored area at Fort Funston and would provide increased opportunities to restore coastal dune and bluff habitat and allow for the reintroduction of San Francisco lessingia. The on-leash dog walking requirement would also reduce possible disturbance or safety concerns for the school programs of the San Francisco Unified School District, the NPS Maintenance facility and site maintenance operations, and would increase visitor safety, particularly in the area used for take-off and landing by hang gliders.

Requiring on-leash dog walking on the trails north of the main parking lot, an area with a high incidence of dog/human technical cliff rescues, reduces risks to dogs and dog owners due to the hazardous cliffs. The leash requirement also provides protection for the restored habitat area and for Battery Davis, a historic battery built in 1936, as well as visitor safety, and minimizes the possibility of conflict between visitors. The Funston Horse Trail is closed to dogs to protect the habitat corridor and reduce visitor conflicts.

## **San Mateo County Sites (Alternative B)**

### **Mori Point**

On-leash dog walking would be allowed only on the Mori Coastal Trail and the beach area within the park boundary at Mori Point, which would be consistent with the City of Pacifica regulations for the levee area and the beach. This alternative would minimize disturbance and damage to restored ponds that provide habitat for federally listed endangered species (California red-legged frog and San Francisco garter snake (*Thamnophis sirtalis tetrataenia*)) and would allow visitors the opportunity to experience the area without potential disturbance from the presence of dogs.

### **Milagra Ridge**

On-leash dog walking would be allowed only on the Fire Road, the trail to the overlook and World War (WW) II bunker, and the Milagra Battery Trail (to be built - future connector to lower Milagra). Allowing on-leash dog walking on some, but not all, trails at Milagra Ridge would allow visitors to experience the site with or without dogs. Dogs would not be allowed on the unpaved, hiking-only trail, which would provide a no-dog experience for visitors. This alternative would provide protection for federally endangered species (mission blue butterfly, San Bruno elfin butterfly (*Incisalia mossii bayensis*), and California red-legged frog) and their habitats that exist at Milagra Ridge and is consistent with GGNRA's parkwide management of mission blue butterfly habitat areas. Milagra Ridge is an island of habitat in a fragmented landscape; therefore, it is important to minimize further impacts to this area.

### **Sweeney Ridge / Cattle Hill**

No dogs would be allowed at Sweeney Ridge or Cattle Hill under this alternative. This area has mission blue butterfly habitat as well as a large area of relatively undisturbed, contiguous native habitat. This alternative is consistent with regulations of adjacent lands managed by the San Francisco Public Utility Commission. Intensive restoration efforts have occurred at Cattle Hill, including soil erosion mitigation and trail development, in partnership with the City of Pacifica.

### **Pedro Point Headlands**

Dog management at Pedro Point Headlands under alternative B would allow on-leash dog walking on the Coastal Trail Multi Use (to be built). No dog walking would be allowed on the trails proposed by the Pacifica Land Trust, including the South Ridge Trail, Bluff Trail, North Ridge Trail, Middle Ridge Trail, and Arroyo Trail. This would best protect the rare habitat in the northwest section of the site, including red-legged frog and garter snake habitat in the valley. Safety is also enhanced by avoiding the steep drop-offs at the bluff edge.

### **Rancho Corral de Tierra**

In alternative B, on-leash dog walking would be allowed on designated trails within two areas near Montara and El Granada, which were identified by the local dog walking group as key areas for this use. On-leash dog walking on designated trails in these two areas would allow direct access for this use by the community and other visitors, while protecting habitat in the more remote sections of the Rancho site which are contiguous with surrounding, protected open space managed by other agencies. Allowing on-leash dog walking in these two specific, clearly defined areas would also allow a no-dog experience on other trails at the site, and would be easily communicated to visitors.

## **ALTERNATIVE C: EMPHASIS ON MULTIPLE USE – BALANCED BY COUNTY**

This alternative balances a variety of dog walking opportunities with areas where dogs are not allowed within each of the three counties containing park sites (Marin, San Francisco, and San Mateo), and contains the consensus agreement for the Oakwood Valley site resulting from the negotiated rulemaking process. Details of the Negotiated Rulemaking Committee consensus are provided in chapter 1.

Alternative C would emphasize recreational opportunities and experiences for multiple user groups, including dog walkers, while considering visitor and dog safety and minimizing conflict between dog walkers and other visitors. The alternative would provide a no-dog experience for visitors to some sites within GGNRA and protection for significant cultural and natural resources.

Alternative C, like alternatives D and E, would include some ROLAs, where users would have to adhere to specific guidelines initiated by the Negotiated Rulemaking Committee and finalized by NPS staff (appendix E).

Alternative C would allow all dog walkers, including commercial dog walkers, to walk one to three dogs without requiring a permit. Any dog walker, private or commercial, could obtain a permit to walk more than three dogs, to a maximum of six dogs. See appendix F for details on the SUP conditions. All dogs are required to be on a leash where they are allowed, unless in a designated ROLA where they are allowed under voice and sight control. Permits may restrict use based on time and location. Permits would be issued for Alta Trail, Rodeo Beach, Fort Baker, Fort Mason, Crissy Field, Baker Beach, and Fort Funston.

---

*Alternative C balances a variety of dog walking opportunities with areas where dogs are not allowed, and contains the consensus agreement for the Oakwood Valley site resulting from the negotiated rulemaking process.*

---

## **COST OF IMPLEMENTATION**

The total costs of implementing alternative C are estimated at \$2,505,686. The bulk of these costs are associated with the hiring of additional personnel for implementing the dog management plan. For a more detailed explanation of personnel costs under alternative C, see the “Park Operations” section in chapter 4.

## **DOG WALKING ACTIVITIES PROPOSED UNDER ALTERNATIVE C**

The following rationale for the alternative options for each site describes resource impacts from dog walking in a generalized way. Details on these resource impacts can be found in the impact analyses in chapter 4. Below is a description of alternative C for each park site, listed in order from north to south, and shown on alternative C maps (see “Maps”).

### **Marin County Sites (Alternative C)**

#### **Stinson Beach**

Alternative C for Stinson Beach would be the same as alternative A (on-leash dog walking).

#### **Homestead Valley**

Alternative C for Homestead Valley would be the same as alternative B (on-leash dog walking).

#### **Alta Trail / Orchard Fire Road / Pacheco Fire Road**

Alternative C for Alta Trail and Orchard and Pacheco fire roads would be the same as alternative B (on-leash dog walking).

#### **Oakwood Valley**

Dog walking under voice and sight control would be allowed within a gated and fenced ROLA on the Oakwood Valley Fire Road that would extend from Tennessee Valley Road to the junction with the Oakwood Valley Trail. The concept of ROLAs on trails was dismissed from consideration in the action alternatives. However, the ROLA on the Oakwood Valley Fire Road is being considered because it was a consensus agreement of the Negotiated Rulemaking Committee. On-leash dog walking would be allowed on the Oakwood Valley Trail only from the junction of Oakwood Valley Fire Road to a new gate that would be installed at the top of the Oakwood Valley Trail at the junction with Alta Trail.

The consensus agreement of the Negotiated Rulemaking Committee stipulated that double gates at each end of the ROLA and continuous fencing along the road would be required to reduce impacts to sensitive habitat. Fencing would also reduce the potential for disturbance and possible interactions among dogs under voice and sight control and wildlife in the area. Interactions between dogs under voice and sight control can endanger both animals and visitors. This alternative also protects potential habitat for species of special concern, including nearby mission blue butterfly habitat and possible habitat for the northern spotted owl.

#### **Muir Beach**

Alternative C for Muir Beach would be the same as alternative B (on-leash dog walking).

### **Rodeo Beach / South Rodeo Beach**

Dog walking under voice and sight control would be allowed within a ROLA at Rodeo Beach, bounded on the inland edge by the proposed fence (to be installed as part of a separate park project) along the western edge of Rodeo Lagoon and by the bluff to the south. The Rodeo Beach ROLA would allow dogs to be under voice and sight control in an area that historically has had relatively few conflicts between dog walkers and other users. Rodeo Beach is not heavily used by migrating and wintering shorebirds, so disturbance from chasing by dogs would be expected to be minimal. By limiting the ROLA to only widest portion of the main beach, alternative C also would provide for the protection of South Rodeo Beach, which is adjacent to Bird Island, where seabirds such as brown pelicans, common murre (*Uria aalge*), and Brandt's cormorants (*Phalacrocorax penicillatus*) are found. On-leash dog walking would be allowed on the footbridge to the beach. Lastly, opportunities for visitors to experience a beach in the Marin Headlands without the presence of dogs would be available at other beaches in the Marin Headlands, including South Rodeo Beach.

### **Marin Headlands Trails**

On-leash dog walking would be allowed only on: the lower Rodeo Valley trail corridor, including the connector trail to the Smith Road Trailhead, which runs from the Rodeo Beach parking lot to the intersection of Bunker and McCullough roads on the North Lagoon Loop Trail, and sections of the Miwok Trail, and Rodeo Valley trail; the Batteries Loop Trail and the Old Bunker Fire Road Loop. All other trails in the Marin Headlands, which includes Tennessee Valley, would be no-dog areas, providing visitors the opportunity to experience the park without the presence of dogs.

This alternative would maintain the integrity of habitat within the interior of the Marin Headlands by restricting dog walking to trails at the perimeter of the large expanse of contiguous habitat. This alternative would also provide protection for wildlife and native habitat and protect mission blue butterflies and their habitat along the North Miwok Trail and the sections of the Coastal Trail/Fire Road.

### **Fort Baker**

For Fort Baker, alternative C would be the same as alternative B (on-leash dog walking), except that alternative C would add on-leash dog walking on Battery Yates Loop Road.

### **San Francisco County Sites (Alternative C)**

#### **Upper and Lower Fort Mason**

Dog walking under voice and sight control would be allowed only within ROLAs in the Inner Great Meadow and Laguna Green areas, with barriers to separate the ROLAs from other uses. Upper Fort Mason is easily accessible from residential neighborhoods in San Francisco and the ROLAs would provide areas for dogs to exercise and socialize in an unrestricted environment. On-leash dog walking would be required on all sidewalks, roadways, paved trails, and open areas around housing at Fort Mason, as well as on the lawn below the path paralleling Laguna Street; on-leash dog walking would also be allowed in Lower Fort Mason. The on-leash requirement for public access pathways and trails and in the parking lots at Lower Fort Mason would increase safety for visitors by reducing interactions with dogs under voice and sight control that may result in public conflict and visitor injuries due to falls or bites. Portions of the Great Meadow and the parade ground would continue to provide visitors the opportunity to experience the park without the presence of dogs.

## **Crissy Field**

**Wildlife Protection Area (Torpedo Wharf to approximately 900 feet east of the former Coast Guard Pier).** Dog walking would not be allowed within the Crissy Field WPA, the same as in alternative B.

**Promenade, Airfield, Beaches, Trails, and Grassy Areas.** Dog walking under voice and sight control would be allowed only within ROLAs on the airfield and Central Beach. These two ROLAs would provide areas for off-leash exercise and socialization for dogs in less heavily used sections of Crissy Field. The ROLA on the airfield would be in the middle section, between the easternmost and westernmost north/south paths.

The NPS would reduce or temporarily suspend the ROLA as necessary for special events. Fencing would not be required to establish the ROLA boundaries, eliminating a potential impact to cultural resources at the airfield. Central Beach is not heavily used by visitors except dog walkers. Designating only the Central Beach portion of the Crissy Field beachfront as a ROLA would reduce potential conflict among the many diverse users of East Beach and improve visitor safety and enjoyment.

On-leash dog walking would be allowed on the eastern and western sections of the airfield, east of the easternmost north/south path, and west of the westernmost north/south path. On-leash dog walking would also be allowed on the promenade, the paths leading to Central Beach, the trails and grassy areas south of East Beach, the Mason Street Bike Path, and within the grassy areas near the old Coast Guard station.

## **Fort Point Promenade / Fort Point National Historic Site Trails**

Alternative C for the Fort Point Promenade and NHS trails within GGNRA would continue under the current management policy (alternative A, allowing on-leash dog walking on the Fort Point Promenade, Battery East Trail, Andrews Road, Presidio Promenade, and grassy area near the parking lot restroom).

## **Baker Beach and Bluffs to Golden Gate Bridge**

Alternative C would be the same as alternative B (on-leash dog walking except for the Batteries to Bluffs and Battery Crosby Trails).

## **Fort Miley**

On-leash dog walking would be allowed only in the trail corridor along the east edge of East Fort Miley. This would provide visitor safety, separating visitors from the hazardous, steep embankments above the adjacent concrete bunkers, and would minimize the potential for visitor conflicts in the picnic area. In addition, this restriction would minimize conflicts with users coming to the area for bird watching, and, particularly during migratory season, would protect bird habitat from potential damage resulting from dogs under voice control. Based on the outcome of discussions with the City of San Francisco, a new trail may connect the East Fort Miley trail corridor with El Camino del Mar across San Francisco property.

Alternative C would not allow dogs in West Fort Miley, providing visitors the opportunity for passive recreational experiences without the presence of dogs and eliminating the potential for visitor conflicts around the Fort Miley Adventure Challenge Course. This alternative would also provide protection for significant bird habitat and prime bird watching areas for visitors. At West Fort Miley, dogs would not be allowed in picnic areas as there is no dog walking access.

### **Lands End**

Dog walking at Lands End under alternative C would be the same as under alternative B (on-leash dog walking on the El Camino del Mar Trail, Lands End Coastal Trail, and connecting trails and steps). The restored section of the Lands End Coastal Trail is heavily used and ADA accessible; its use is projected to increase because of the restoration and ADA compatibility. The new Lands End Visitor Center has also increased visitation in the Lands End area. Requiring on-leash dog walking along the Lands End Coastal Trail would reduce the potential for user conflicts and would enhance visitor safety and dog safety.

This alternative would provide protection of wildlife from potential interactions with dogs.

### **Sutro Heights Park**

For Sutro Heights Park, alternative C would be the same as alternative B (on-leash dog walking on the paths and parapet).

### **Ocean Beach**

**Snowy Plover Protection Area (SPPA), Stairwell 21 to Sloat Boulevard.** Under alternative C, dog management within the SPPA would be the same as described under alternative B (on-leash dog walking only on the Ocean Beach Trail adjacent to the Great Highway; no dogs allowed on the beach between Stairwell 21 and Sloat Boulevard).

**North of Stairwell 21 and South of Sloat Boulevard.** Dog walking under voice and sight control would be allowed in a ROLA stretching north from Stairwell 21 to the north end of Ocean Beach. Dogs would not be allowed south of Sloat Boulevard. Data shows that wintering and migratory shorebird use along this section of the beach is lower than in the SPPA south of Stairwell 21 and on the section of beach south of Sloat Boulevard, and restricting dog walking to north of Stairwell 21 would provide protection for wintering and migratory shorebirds elsewhere on the beach. This restriction would also allow visitors a beach experience that would not include the presence of dogs. Alternative C would also provide consistent dog management along the beach from the Fort Funston Beach Trail north to Stairwell 21.

### **Fort Funston**

Dog walking under voice and sight control would be allowed in two designated ROLAs, one on the beach south of the Funston Beach Trail North and a second between (and not including) the Chip Trail, Sunset Trail, and parking lot. On-leash dog walking would be allowed on all trails north of the parking lot except the section of the Sunset Trail between the parking lot and the Chip Trail, Battery Davis Trail, and Funston Horse Trail, which would be closed to dogs. South of the main parking lot, on-leash dog walking would be allowed on the Funston Beach Trail South (sand ladder) and the Sunset Trail along the south perimeter of the parking lot. The combination of ROLAs and on-leash trails would provide a loop for dog walkers from either the main parking lot or the John Muir parking lot to the Funston Beach Trail North, then down to the beach and into the ROLA south of the Funston Beach Trail North. From the southern end of the beach ROLA, the Funston Beach Trail South (sand ladder) would return dog walkers to the main parking lot and the adjacent ROLA. No dog walking would be allowed on the beach north of the Funston Beach Trail North.

This alternative would provide protection to migratory and wintering shorebirds and bank swallow habitat north of the beach access trail and would provide visitors with the opportunity to experience the area both with and without the presence of dogs. Alternative C would also provide protection for cultural resources (Battery Davis) and habitat areas undergoing restoration. Requiring on-leash dog walking along trails

would provide protection for dogs and their owners near the sand cliffs and would reduce the potential for user conflicts and safety incidents among dogs as well as with visitors as a result of having dogs under voice control.

## **San Mateo County Sites (Alternative C)**

### **Mori Point**

On-leash dog walking would be allowed only on Old Mori Trail, the Mori Coastal Trail, and the section of the beach that is within the GGNRA boundary. Requiring on-leash dog walking at Mori Point is for the protection of sensitive habitat and of the federally listed California red-legged frog and San Francisco garter snake.

### **Milagra Ridge**

Under alternative C, dog management designations for Milagra Ridge would be the same as those under alternative B (on-leash dog walking on the Fire Road, trail to overlook, WW II bunker, and future Milagra Battery Trail).

### **Sweeney Ridge / Cattle Hill**

Under alternative C, dog management at Sweeney Ridge would be identical to dog management actions described in alternative B (no dogs). On-leash dog walking would be allowed at Cattle Hill on the Baquiano Trail from Fassler Avenue to, and including, the Farallon View Trail.

### **Pedro Point Headlands**

Dog management at Pedro Point Headlands under alternative C would be identical to dog management actions described in alternative B (on-leash dog walking on the Coastal Trail Multi Use, which is to be built). No dog walking would be allowed on the South Ridge Trail, Bluff Trail, North Ridge Trail, Middle Ridge Trail, and Arroyo Trail.

### **Rancho Corral de Tierra**

Alternative C would be the same as alternative B, with the addition of a ROLA on open land between Le Conte Avenue and Tamarind Street, across the street and east of Farallone View School. The addition of a small ROLA in this alternative would provide an option for dog walking under voice and sight control for the neighborhood, but would not be expected to draw significant visitation from outside the neighborhood due to the small size of the ROLA. This would reduce the potential for parking or traffic impacts on the neighborhood, and the small size and access from the street would also simplify enforcement. This alternative would provide an additional dog walking opportunity at this site while maintaining protection for the more remote habitat that is contiguous with protected open space managed by other agencies and providing options for those visitors who prefer a no-dog experience.

## **ALTERNATIVE D: MOST PROTECTIVE OF RESOURCES AND VISITOR SAFETY**

Alternative D would offer greater protection of GGNRA natural and cultural resources, including sensitive and protected species, while allowing recreation opportunities and experiences for multiple user groups, including dog walkers. However, this alternative would prohibit commercial dog walking. Alternative D would also offer more protection for visitors and staff from potential incidents with dogs. Similar to alternatives C and E, this alternative would include some areas for dog walking under voice and sight control in ROLAs, where users must adhere to specific guidelines initiated by the Negotiated Rulemaking Committee and finalized by NPS staff (appendix E).

---

*Alternative D would offer greater protection of GGNRA natural and cultural resources, including sensitive and protected species.*

---

### **COST OF IMPLEMENTATION**

The total costs of implementing alternative D are estimated at \$2,150,489. The bulk of these costs are associated with the hiring of additional personnel for implementing the dog management plan. For a more detailed explanation of personnel costs under alternative D, see the “Park Operations” section in chapter 4.

### **DOG WALKING ACTIVITIES PROPOSED UNDER ALTERNATIVE D**

A description of the specific aspects of alternative D and their rationale are presented here for each park site, listed in order from north to south, and shown on alternative D maps (see “Maps”). The following discussion of the alternative options for each site describes resource impacts from dog walking in a generalized way. Details on these resource impacts can be found in the impact analyses in chapter 4.

#### **Marin County Sites (Alternative D)**

##### **Stinson Beach**

Under alternative D, no dogs would be allowed in any area of Stinson Beach. As in all the alternatives, the beach, as a designated swimming beach, is closed to dogs by the CFR. Prohibiting dogs in the picnic areas and parking lots would remove the potential for conflicts between dogs and visitors and would provide visitors the opportunity to experience Stinson Beach without the presence of dogs.

##### **Homestead Valley**

On-leash dog walking would be allowed only on Homestead Fire Road, which runs from Panoramic Highway to Lattie Lane in Mill Valley. This alternative would provide the most protection for native plant communities and wildlife, including habitat for the federally listed northern spotted owl. Allowing on-leash dog walking on only the fire road would provide visitors the opportunity to experience the site without the presence of dogs, while still allowing access for dog walkers from the local area.

##### **Alta Trail / Orchard Fire Road / Pacheco Fire Road**

Under alternative D, Alta Trail and the two fire roads in this site (Pacheco and Orchard) would be no-dog areas. Prohibiting dogs would provide the most protection for native plant communities and wildlife habitat, including habitat for the federally listed mission blue butterfly, and would eliminate the potential

for conflicts between dogs and coyotes. Alternative D would also allow multiple user groups to experience Alta Trail and Pacheco and Orchard fire roads without the presence of dogs. This management option would also eliminate the potential for incidents between dogs, dog walkers, and other users, resulting in the potential for improved visitor safety.

### **Oakwood Valley**

On-leash dog walking would be allowed only on Oakwood Valley Fire Road and on Oakwood Valley Trail to the junction with the Fire Road. This alternative would provide protection for contiguous habitat beyond the trail and fire road junction and would limit the potential for dog/coyote interaction. It would also provide protection for potential habitat for species of concern, such as the mission blue butterfly habitat nearby and possible habitat for the northern spotted owl.

### **Muir Beach**

Alternative D would allow on-leash dog walking only along the proposed Muir Beach Trail; dogs would not be allowed on the beach. Alternative D would provide the most protection to sensitive dune, riparian, and wetland habitats. Protection of riparian and wetland habitats would result in protection of species such as the federally listed steelhead and coho salmon from potential impacts resulting from dog waste and disturbance in shallow water areas. This management option would also provide the most protection for wintering and migrant shorebirds from potential disturbance by dogs. Muir Beach is a heavily used, multiple-use area; restricting dog walking to the proposed Muir Beach Trail would provide a no-dog beach experience for visitors at this site.

### **Rodeo Beach / South Rodeo Beach**

On-leash dog walking would be allowed only on the section of Rodeo Beach north of the footbridge and on the footbridge itself. This would provide some beach access for dog walking at Rodeo Beach but would maximize resource protection of Rodeo Lagoon, providing habitat for resting and feeding for shorebirds and waterbirds in the area. Lastly, visitors would have the opportunity to experience a portion of the beach without the presence of dogs.

### **Marin Headlands Trails**

Under alternative D, dog management designations for Marin Headlands Trails would be the same as those under alternative B (no dogs).

### **Fort Baker**

On-leash dog walking would be allowed only on the Lodge and Conference Center grounds, the Bay Trail (not including the Battery Yates Loop) and the trail to be built around Vista Point that will connect with the Bay Trail. The on-leash designation would allow maximum resource protection for sensitive species and their habitats, including the mission blue butterfly, and would minimize the potential for conflicts around the lodge and conference center, where visitation has increased over recent years (NPS 2012c). The proposed future improvements to the waterfront area at Fort Baker are anticipated to further increase overall visitation to the site. Prohibiting dogs in areas beyond the Lodge and Conference Center grounds and the Bay Trail in this alternative would provide visitors with an opportunity to experience the park without the presence of dogs and maximize safety for visitors.

## **San Francisco County Sites (Alternative D)**

### **Upper and Lower Fort Mason**

Dog walking under voice and sight control would be allowed only in a ROLA on the Laguna Green area. On-leash dog walking would be allowed on the Great Meadow, the lawn below Laguna Street path, and on all public access pathways, trails, open areas around housing, and in Lower Fort Mason, increasing safety for visitors. The existing planted landform between the Laguna Green ROLA and the Great Meadow would reduce the potential for conflict between on-leash dogs and dogs under voice and sight control and would provide safety for visitors to areas outside the ROLA. The ROLA would be easily accessible from residential neighborhoods in San Francisco and would allow dogs to enjoy exercise and socialization in an unrestricted environment. Other visitors would still find areas of Upper Fort Mason in which to experience the park without the presence of dogs.

### **Crissy Field**

**Wildlife Protection Area.** (Torpedo Wharf to approximately 900 feet east of the former Coast Guard Pier). As with alternatives B and C, dogs would not be allowed in the WPA under this alternative.

**Promenade, Airfield, Beaches, Trails, and Grassy Areas.** Dog walking under voice and sight control would be allowed in a ROLA on the western portion (area west of the easternmost north/south path across the airfield) of the airfield. The NPS would reduce or temporarily suspend the ROLA as needed for special events using the airfield. On-leash dog walking would be allowed on the Promenade (East Beach to the Warming Hut), the eastern portion of the airfield (area east of the easternmost north/south path), the trails and grassy areas south of East Beach, the Mason Street Bike Path, and within the grassy areas near the old Coast Guard station. No dog walking would be allowed on the East and Central Beaches.

Although all other alternatives are guided by the common element applicable to all action alternatives of on-leash dog walking being allowed in parking lots and picnic areas throughout the park, this alternative closes the West Bluff picnic area to dogs. This option was suggested by a dog walking group that participated in the negotiated rulemaking process to provide an area for visitors desiring a picnic area without the presence of dogs and to provide maximum protection to the WPA adjacent to the picnic area, where dogs are prohibited.

Alternative D would maximize visitor safety on the beaches and eliminate the potential for conflict between multiple user groups, particularly on the heavily used East Beach. Alternative D would also provide the maximum protection of natural resources on the beaches from dog waste and disturbance.

### **Fort Point Promenade / Fort Point National Historic Site Trails**

On-leash dog walking would be allowed only on the Battery East Trail, which leads from the eastern end of the Fort Point Promenade up to the Golden Gate Bridge. This alternative addresses safety concerns for visitors and dogs on the promenade, which is between the edge of a heavily used roadway and the edge of the seawall, and on trails at this site that are heavily used by visitors and can be congested. This alternative reduces the potential for conflicts among users and the possibility of interactions with aggressive dogs and compromised visitor and dog safety.

### **Baker Beach and Bluffs to Golden Gate Bridge**

On-leash dog walking would be allowed on the beach south of the north end of the north parking lot and on all trails to the beach south of the north end of the north parking lot, as well as on the Coastal Trail.

Alternative D would allow visitors the opportunity to experience a portion of the beach without the presence of dogs by providing distinctly separate and direct access to a no-dog portion of the beach, an area where the new Batteries to Bluffs trail has increased visitation. This alternative would also provide protection from disturbance for wintering and migrant shorebirds on the beach.

### **Fort Miley**

Under alternative D, dog management at both East and West Fort Miley would be the same as alternative B (no dogs).

### **Lands End**

On-leash dog walking would be allowed on the El Camino del Mar Trail and on the Lands End Coastal Trail up to and including the connecting trail between those two trails, providing a dog walking loop trail experience. The stairs connecting the Lands End Coastal Trail with the Memorial Parking Lot would also be on leash. This alternative would provide protection for natural resources and visitor safety. The restored portion of the Lands End Coastal Trail, which is ADA accessible, is heavily used by visitors, and the recent completion of the new Lands End Visitor Center has increased visitation to the area. This alternative would minimize visitor conflicts with dogs and dog walkers and would also allow a significant section of the Lands End Coastal Trail where visitors can experience the area without the presence of dogs.

### **Sutro Heights Park**

Under alternative D, no dogs would be allowed throughout the Sutro Heights Park area, where weddings and other special events are frequently scheduled. Prohibiting dogs in the area would provide protection for the formal landscaping. Dog walkers would be able to access other nearby area trails, such as those at Lands End, from the parking area.

### **Ocean Beach**

**Snowy Plover Protection Area (SPPA), Stairwell 21 to Sloat Boulevard.** Under alternative D, dog management for the Ocean Beach SPPA would be the same as described in alternative B (on-leash dog walking only on the Ocean Beach Trail adjacent to the Great Highway; no dogs would be allowed on the beach between Stairwell 21 and Sloat Boulevard).

**North of Stairwell 21 and South of Sloat Boulevard.** On-leash dog walking would be allowed on the beach north of Stairwell 21. No dogs would be allowed south of Sloat Boulevard. The on-leash designation would reduce the potential for conflict among visitors in the heavily used north end of the beach, closest to the parking lot, and would maximize protection for wintering and migratory shorebirds south of Sloat Boulevard. This management option would also be consistent with the alternative D actions for the northern section of the beach at Fort Funston, which is immediately south of Ocean Beach.

### **Fort Funston**

Dog walking under voice and sight control would be allowed only in an upland ROLA established, with fencing, in a disturbed area across the Sunset Trail from the top of the Funston Beach Trail North. On-leash dog walking would be allowed on the beach south of the Funston Beach Trail North to the southern boundary of the Fort Funston beach. On-leash dog walking would also be allowed on all trails except the Funston Horse Trail, where dogs are not allowed to prevent user conflicts and impacts to the habitat

corridor, and the section of the Sunset Trail north of its junction with the Funston Horse Trail, where all visitors are prohibited due to severe erosion.

This alternative would provide dog walkers with an on-leash loop option, starting either at the main parking lot or the John Muir parking lot, following trails north to the ROLA adjacent to the Funston Beach Trail North. From there, the loop would continue down the Funston Beach Trail North and south along the beach to the Funston Beach Trail South (sand ladder), which leads back to the main parking lot and the Sunset Trail.

This alternative would protect restored habitat and Battery Davis; reduce conflict with multiple user groups, including school groups visiting the Environmental Education Center; and reduce safety concerns near the cliffs. The alternative would also provide protection for wintering and migratory shorebirds and the seasonal bank swallow colony in the sand cliffs at the north end of the Fort Funston beach. The exclusion of dogs from the beach area north of the Funston Beach Trail North would provide visitors the opportunity to experience the area without the presence of dogs. In addition, this alternative would also allow continuity with dog management for the south end of Ocean Beach, which is located directly north of the Fort Funston beach.

## **San Mateo County Sites (Alternative D)**

### **Mori Point**

Alternative D would prohibit dogs at Mori Point. This alternative would provide the most protection for newly restored, sensitive habitat and for the federally listed California red-legged frog and San Francisco garter snake. This alternative would also reduce the potential for conflict with other user groups, particularly walkers, hikers, and bicyclists. This management option would allow visitors the opportunity to experience the area without the potential for disturbance from the presence of dogs.

### **Milagra Ridge**

Alternative D would prohibit dogs at Milagra Ridge. This alternative would provide the greatest level of protection for federally endangered species (mission blue butterfly, San Bruno elfin butterfly, San Francisco garter snake and California red-legged frog) and their habitats that exist at Milagra Ridge and is consistent with GGNRA's park wide management of mission blue butterfly habitat areas. Alternative D would also protect restored habitat and the wildlife species that inhabit the area. Dog interactions with wildlife, including coyotes, could be detrimental to the safety of both dogs and wildlife from physical conflicts. This management option would provide an expanse of trails for visitors to experience without the potential for disturbance from the presence of dogs.

### **Sweeney Ridge / Cattle Hill**

The dog management actions for Sweeney Ridge and Cattle Hill in alternative D would be the same as alternative B (no dogs).

### **Pedro Point Headlands**

Alternative D at Pedro Point would prohibit dogs at the site. This alternative would provide the greatest level of protection for extensive areas of restored native habitat, including coastal bluff habitat, and for wildlife species that inhabit the headlands. It would also protect possible habitat for special-status species. This alternative would not be consistent with management of the Coastal Trail beyond the NPS boundary

at Pedro Point, where other agencies allow on-leash dog walking on the Coastal Trail Multi Use, which is to be built.

**Rancho Corral de Tierra**

Alternative D would allow on-leash dog walking on the two existing San Mateo County trails: Old San Pedro Mountain Road and Farallon Cutoff in Montara. This alternative would provide maximum protection for habitat and wildlife, while allowing on-leash dog walking access and management consistency on the two trails that connect the Rancho site with the adjacent McNee State Park. This alternative would also provide ample opportunities for visitors who prefer a no-dog experience.

**ALTERNATIVE E: MOST DOG WALKING ACCESS / MOST MANAGEMENT INTENSIVE**

Alternative E would offer recreation opportunities and experiences for multiple user groups, including dog walkers; however, this alternative would allow dog walkers more access to GGNRA areas than the other alternatives while still providing protection for natural and cultural resources, including sensitive and protected species. Alternative E also provides for visitor protection and dog safety, and minimizes conflict between dog walkers and other visitors.

---

*Alternative E would offer recreation opportunities and experiences for multiple user groups, including dog walkers.*

---

For all sites, alternative E allows all dog walkers, including commercial dog walkers, to walk one to three dogs without a permit. A permit may be obtained to walk more than three dogs, to a maximum of six dogs (appendix F). Dogs must be on a leash unless in a ROLA, where permit holders may have up to six dogs under voice and sight control. Permits may restrict use by time and location. Permits would be issued for Alta Trail, Rodeo Beach, Fort Baker, Fort Mason, Crissy Field, Baker Beach, and Fort Funston.

Similar to alternative C, alternative E includes the Negotiated Rulemaking Committee consensus on Oakwood Valley. Details on the negotiated rulemaking process are provided in chapter 1.

**COST OF IMPLEMENTATION**

The total costs of implementing alternative E are estimated at \$2,784,691. The bulk of these costs are associated with the hiring of additional personnel for implementing the dog management plan. For a more detailed explanation of personnel costs under alternative E, see the “Park Operations” section in chapter 4.

**DOG WALKING ACTIVITIES PROPOSED UNDER ALTERNATIVE E**

A description of the specific aspects of alternative E and their rationale are presented here for each park site, listed in order from north to south, and shown on alternative E maps (see “Maps”). The following discussion of the alternative options for each site describes resource impacts from dog walking in a generalized way. Details on these resource impacts can be found in the impact analyses in chapter 4.

## **Marin County Sites (Alternative E)**

### **Stinson Beach**

As with alternatives B and C, alternative E would allow on-leash dog walking only in the parking lots, and picnic areas at Stinson.

### **Homestead Valley**

Alternative E would be the same for Homestead Valley as alternative B (on-leash dog walking on the Homestead Fire Road and neighborhood connector trails, the Homestead Trail and Homestead Summit Trail, that will be designated in the future).

### **Alta Trail / Orchard Fire Road / Pacheco Fire Road**

Alternative E would allow on-leash dog walking on Alta Trail to the junction with the Morning Sun Trail. On-leash dog walking would also be allowed on the Orchard and Pacheco fire roads. Alternative E would provide an on-leash trail loop (using public streets in addition to NPS trail system) for Marin City residents to access Alta Trail and would allow additional neighborhood access by extending on-leash access on the Alta Trail to two connector trails further south (See Marin Headlands Trails alternative).

### **Oakwood Valley**

Similar to alternative C, the management of Oakwood Valley represents the consensus agreement of the Negotiated Rulemaking Committee. Dog walking under voice and sight control would be allowed within a ROLA, with the installation of double gates and fencing, on Oakwood Valley Fire Road to the junction with the Oakwood Valley Trail. However, in this alternative the fencing would be non-continuous, as opposed to the continuous fencing in alternative C. On-leash dog walking would be required on Oakwood Valley Trail from the junction with the Oakwood Valley Fire Road to a new gate at the junction with Alta Trail. This approach would reduce the potential for dogs to access and potentially damage sensitive habitat and would provide protection for nearby habitat for mission blue butterfly habitat. This alternative would also reduce the potential for disturbance and possible interactions between dogs under voice and sight control and wildlife in the area, especially other canids, such as coyotes. Park visitors would also have the opportunity for a no-dog park experience on the southern section of the Oakwood Valley Trail.

### **Muir Beach**

Dog walking under voice and sight control would be allowed only within a ROLA on the beach south of the access path from the parking lot; dogs would be prohibited on the remainder of the beach outside the ROLA. On-leash dog walking would be allowed on the proposed Muir Beach Trail, and the bridge and path to the beach. In the future, ROLA boundaries may need to be adjusted to correspond with habitat restoration occurring as part of the Muir Beach Wetland and Creek Restoration Project. As part of the restoration project, areas may be fenced (existing or future) or signed as closed to the public to protect dunes, sensitive habitat/species, restoration areas, or other sensitive resources. On-leash dog walking would be allowed on the proposed Muir Beach Trail (part of the Muir Beach Wetland and Creek Restoration Project (NPS 2007b, 1-4), on the boardwalk, and on the path to the beach. Muir Beach is a multiple-use area, which requires management to provide balanced use for all user groups, including dog walkers. Alternative E provides recreational experiences at Muir Beach for dog walkers as well as for visitors preferring a park experience without the presence of dogs. As discussed previously for alternative C, restricting on-leash dog walking to designated areas would provide protection for riparian and wetland habitat, as well as for federally listed steelhead and coho salmon.

### **Rodeo Beach / South Rodeo Beach**

Dog walking under voice and sight control would be allowed within ROLAs on Rodeo Beach and South Rodeo Beach under alternative E, and on leash on the bridge and trail that access those beaches. The main Rodeo Beach ROLA would be bounded on the inland edge by the proposed fence along the western edge of Rodeo Lagoon. The South Rodeo Beach ROLA would encompass that entire beach. The two ROLAs would provide space for exercising dogs under voice and sight control in areas that historically have had relatively few conflicts between dog walkers and other users. The Rodeo Beach/South Rodeo Beach area is not heavily used by migrating and wintering shorebirds, so disturbance from chasing by dogs would be expected to be minimal. Opportunities for visitors to experience a Marin Headlands beach without the presence of dogs would be available on other beaches in the Marin Headlands area, although access to those beaches is less direct than access to Rodeo Beach or South Rodeo Beach.

### **Marin Headlands Trails**

On-leash dog walking would be allowed on the Coastal Trail from Highway 101 to the Rodeo Beach parking lot (following the Conzelman Coastal Trail paralleling Conzelman Road from Highway 101 to the intersection with McCullough Road and then following the Coastal Trail Bike route – including Julian Road – to Rodeo Beach Parking lot); the Old Bunker Fire Road Loop; the Batteries Loop Trail; the North Miwok Trail (Tennessee Valley to Highway One); County View Trail; Marin Drive access trail; Rodeo Avenue Trail and the Morning Sun Trail. Alternative E would provide the largest amount of access and connections to local communities and greatest variety of on-leash dog walking opportunities within the Marin Headlands. At the same time it would protect the expanse of contiguous habitat within the interior of the Marin Headlands by requiring dogs to be on leash and allowing that use only on trails near the built area on the perimeter of the site. This alternative would also protect native habitat, including mission blue butterfly habitat, and provide visitors the opportunity to experience this large natural area of the park without the presence of dogs.

### **Fort Baker**

For Fort Baker, alternative E would be the same as alternative C, allowing on-leash dog walking on the Drown Fire Road, Bay Trail including the Battery Yates Loop Road, the new Vista Loop Trail to be built in 2014 that will connect to the Bay Trail and on the Lodge/Conference Center grounds and the parade ground. Alternative E would provide a mix of visitor uses, including a large variety of opportunities for dog walkers, while still protecting natural and cultural resources at the site and allowing some areas for a no-dog experience.

### **San Francisco County Sites (Alternative E)**

#### **Upper and Lower Fort Mason**

Alternative E would be the same as alternative C, allowing dog walking under voice and sight control within ROLAs in the Inner Great Meadow and Laguna Green areas, with barriers to separate the ROLAs from other uses. The ROLAs would provide areas for dogs to exercise and socialize in an unrestricted environment. On-leash dog walking would be required on all sidewalks, roadways, paved trails, and open areas around housing at Fort Mason, as well as on the lawn below the path paralleling Laguna Street; on-leash dog walking would also be allowed in Lower Fort Mason. The on-leash requirement would increase safety for visitors by reducing interactions with dogs under voice and sight control that may result in public conflict and visitor injuries due to falls or bites. Portions of the Great Meadow and the parade ground would continue to provide visitors the opportunity to experience the park without the presence of dogs.

## **Crissy Field**

**Wildlife Protection Area (Torpedo Wharf to approximately 900 feet east of the former Coast Guard Pier).** On-leash dog walking would be allowed in the WPA. This would provide expanded dog walking on the beach while still reducing the disturbance to the federally listed western snowy plover and other wintering and migratory shorebirds.

**Promenade, Airfield, Beaches, Trails, and Grassy Areas.** Dog walking under voice and sight control would be allowed in ROLAs established on Central Beach and on the airfield. Central Beach is not heavily used by visitors other than dog walkers, and the airfield is a relatively little-used portion of Crissy Field except during special events. On-leash dog walking would be allowed along the Promenade (East Beach to the Warming Hut), on East Beach, the trails and grassy areas south of East Beach, the paths to Central Beach, within the grassy areas near the old Coast Guard station and the Mason Street Bike Path, which are heavily used by pedestrians, bicyclists, and other visitors, to reduce uncontrolled dog/human interactions and provide visitor safety. No fencing would be used around the airfield ROLA, in order to minimize impacts to the cultural landscape.

The East Beach portion of Crissy Field is heavily used by multiple user groups because of its proximity to parking, picnic areas and facilities. Having Central Beach dedicated as a ROLA while requiring on-leash dog walking at East Beach would reduce potential conflict between dogs under voice and sight control and the many and diverse users of East Beach. In turn, this would improve visitor safety and enjoyment.

## **Fort Point Promenade / Fort Point National Historic Site Trails**

Alternative E would be the same as the current management policy (alternative A); on-leash dog walking allowed on the Fort Point Promenade, Battery East Trail, Andrews Road, Presidio Promenade, and grassy area near the parking lot restroom.

## **Baker Beach and Bluffs to Golden Gate Bridge**

Dog walking under voice and sight control would be allowed in a ROLA on the section of Baker Beach south of the north parking lot to the NPS boundary at Lobos Creek. On-leash dog walking would be allowed on the section of Baker Beach north of the north parking lot and on all trails except the new Batteries to Bluffs Trail and the Battery Crosby Trail, where dog walking would be prohibited. Requiring that dogs be on leash on the northern section of beach would provide an area of protection from disturbance by uncontrolled dogs for wintering shorebirds while providing the most dog walking access at Baker Beach.

## **Fort Miley**

On-leash dog walking would be allowed in the trail corridor along the east edge of East Fort Miley. This would provide visitor safety, separating visitors from the hazardous, steep embankments above the adjacent concrete bunkers, and would minimize the potential for visitor conflicts in the West Fort Miley picnic area. In addition, this restriction would minimize conflicts with users coming to the area for bird watching, and, particularly during migratory season, would protect bird habitat from potential damage resulting from dogs under voice control. Based on the outcome of discussions with the City of San Francisco, a new trail may connect the East Fort Miley trail corridor with El Camino del Mar across San Francisco property.

In West Fort Miley, on-leash dog walking would be allowed only on the old roadway through the site. This would allow the multiple users of the area to have a park experience either with or without the

presence of dogs. This alternative also provides protection for significant bird habitat and prime bird watching areas.

### **Lands End**

Alternative E would allow the same on-leash dog walking opportunities for Lands End as alternative B (on-leash dog walking on the El Camino del Mar Trail, Lands End Coastal Trail, and connecting trails and stairs).

### **Sutro Heights Park**

On-leash dog walking would be allowed on the paths, parapet, and lawns of Sutro Heights Park. This alternative would provide the greatest dog walking access to Sutro Heights Park. Because the area is heavily landscaped and developed, and the existing plant community is not native, on-leash dog walking would not disturb or destroy native habitat. The area is also frequently used for weddings and other special events, so it would not be suitable for dog walking under voice and sight control. Maintaining Sutro Heights Park as an on-leash area would protect the formal landscaping and reduce the potential for visitor conflict and safety incidents that could occur if dogs were under voice and sight control.

### **Ocean Beach**

**Snowy Plover Protection Area (SPPA) - Stairwell 21 to Sloat Boulevard.** Dog walking would be allowed on leash in the SPPA and along Ocean Beach Trail adjacent to the Great Highway. This alternative would provide the most dog walking access. Requiring on-leash dog walking would maintain the level of protection currently in place seasonally for western snowy plovers and other shorebirds but would extend that protection throughout the year to eliminate visitor confusion and provide better year-round protection for the shorebirds.

**North of Stairwell 21 and South of Sloat Boulevard.** Dog walking under voice and sight control would be allowed in a ROLA established from Stairwell 21 to the northern end of the beach. Long-term data indicates that shorebird use along this section of the beach is lower than in the SPPA between Stairwell 21 and Sloat Boulevard.

On-leash dog walking would be allowed south of Sloat Boulevard to Fort Funston. This management proposal for the southern section of Ocean Beach would be consistent with the alternative E proposal for the adjacent Fort Funston beach north of the beach access trail, and together with the on-leash proposal for the SPPA in this alternative would provide approximately three miles of on-leash dog walking along the beach. The on-leash requirement south of Sloat Boulevard would provide protection for the high number of shorebirds that use this area.

### **Fort Funston**

Dog walking under voice and sight control would be allowed in two ROLAs at Fort Funston. One ROLA, on the beach south of the Funston Beach Trail North to the southern boundary of Fort Funston, would provide part of a loop trail for dog walkers between the Fort Funston uplands and the beach. A second ROLA would be established as a corridor from north of the trail to be built along the northern edge of the main parking lot that extends to, and includes the Funston Beach Trail North. The ROLA corridor includes the Chip Trail and sections of the Sunset Trail, Funston Road and Battery Davis Road - all north of the parking lot. The ROLA also extends into the disturbed area across from the Funston Beach Trail North.

On-leash dog walking would be allowed on the beach north of the Funston Beach Trail North, except for a seasonal closure at the base of the northernmost sand cliffs to provide protection for the bank swallow colony that nests in the sand cliffs (April 1–August 15). On-leash dog walking would also be allowed on all trails at Fort Funston outside the ROLA corridor except the Funston Horse Trail, which is within a habitat corridor running along the eastern boundary of Fort Funston and is closed to dogs for resource protection and to eliminate visitor conflicts. The combination of the on-leash walking along the Funston Beach Trail South (sand ladder), the beach ROLA and the upland ROLA corridor which includes the Funston Beach Trail North, would provide dog walkers with a loop trail around Fort Funston, starting from either the main parking lot or the John Muir parking lot. Also, the on-leash designation for the Fort Funston beach north of the Funston Beach Trail North, together with the alternative E on-leash proposal for Ocean Beach from its southern end to Stairwell 21, would provide approximately three miles of on-leash dog walking along the beach.

This alternative would provide the greatest expanse of ROLA compared to the other alternatives. Requiring on-leash dog walking along trails would provide protection for dogs and their owners and would reduce the potential for user conflicts and safety incidents among dogs and visitors. The seasonal closure at the base of the northernmost sand cliffs would provide protection of the bank swallow colony from disturbance related to dog walking during the bank swallow nesting season. This alternative would also provide protection of restored areas at the site and at Battery Davis.

### **San Mateo County Sites (Alternative E)**

#### **Mori Point**

On-leash dog walking would be allowed on the Mori Coastal Trail, Old Mori Trail, Pollywog Trail, and the beach area within the GGNRA boundary. This alternative provides the most dog walking access for visitors. The on-leash designation would be consistent with the City of Pacifica regulations for the levee area and beach and would facilitate access to Mori Point for the neighboring community residents who want to walk with their dogs. Requiring dogs to be on leash along the Old Mori Trail would also provide protection for habitat for the federally listed California red-legged frog and San Francisco garter snake, including their breeding habitat in restored ponds adjacent to the road. This alternative would also allow visitors the opportunity to experience some trails in the area without the presence of dogs.

#### **Milagra Ridge**

Alternative E would be the same at Milagra Ridge as alternative B (on-leash dog walking allowed only on the Fire Road, the trail to the overlook and WW II bunker, and the Milagra Battery Trail), with the addition of on-leash access on the paved trail leading to the top of the hill opposite the bunker. The on-leash designation for the fire road and trail takes into account the need for protection of restored habitat where wildlife, including coyotes, could encounter dogs if under voice and sight control. Dog interactions with wildlife could be detrimental to the safety of both dogs and wildlife. This alternative would also provide an area for visitors to experience portions of the site without the presence of dogs.

#### **Sweeney Ridge / Cattle Hill**

On-leash dog walking would be allowed at Sweeney Ridge on Sneath Lane, the section of the Sweeney Ridge Road north of the Portola Discovery Site to the Notch Trail and to the Mori Ridge Trail. On-leash dog walking would be allowed on Cattle Hill only on the Baquiano Trail from Fassler Avenue to, and including, the Farallon View Trail.

This alternative would provide protection to a large expanse of native habitat, including habitat for the federally listed mission blue butterfly, at Sweeney Ridge and Cattle Hill, while still providing some trails on which visitors could walk their dogs. Requiring on-leash dog walking would also reduce the potential for dogs interacting with wildlife, which could cause conflicts and safety issues for the dogs, their owners, and wildlife. Finally, the alternative would provide trails that would allow a visitor experience without the presence of dogs.

**Pedro Point Headlands**

On-leash dog walking would be allowed on the Coastal Trail Multi Use and on the trails proposed by the Pacific Land Trust, including the South Ridge Trail, Bluff Trail, North Ridge Trail, Middle Ridge Trail, and Arroyo Trail, all of which would need to be rerouted and/or rehabilitated in order to make them more sustainable. Requiring on-leash dog walking for this alternative is to protect the restored native habitat at Pedro Point, limit the disturbance of wildlife and provide visitor safety. On-leash dog walking along trails with sensitive habitat was added to alternative E following the public comment period of the draft plan/EIS. The public requested that local trails be included for consideration for dog walking. Since alternative E provides the most dog access, that request was included in alternative E.

Pedro Point is expected to have a high level of visitor use with multiple recreational activities as a result of the planned trail along the present Highway 1 roadway, following the rerouting of the highway through the new tunnel. This alternative would be consistent with adjoining land management regulations for the Coastal Trail, where on-leash dog walking is allowed.

**Rancho Corral de Tierra**

Alternative E would be the same as alternative C. This alternative would provide dog walking both on leash and in a ROLA, but due to the small size of the ROLA, would not be expected to draw significant levels of visitation from outside the neighborhood that would cause significant traffic or parking impacts. This would reduce the potential for parking or traffic impacts on the neighborhood and the small size and access from the street would also simplify enforcement. This alternative would allow multiple dog walking opportunities while maintaining protection for the more remote habitat that is contiguous with protected open space managed by other agencies and would provide options for those visitors who prefer a no-dog experience.

**HOW THE ALTERNATIVES MEET THE OBJECTIVES**

Objectives are specific goals that describe what GGNRA intends to accomplish by preparing a draft plan/SEIS. These objectives come from a variety of sources, including NPS management policies, laws, and regulations. The objectives help develop alternatives for evaluation and public review. The internal scoping process yielded the following specific objectives for this planning process:

---

*Objectives are specific goals that describe what GGNRA intends to accomplish by preparing a draft plan/SEIS.*

---

**Visitor Experience and Safety**

- Minimize conflicts related to dog use by providing a variety of safe, high-quality visitor use experiences, including areas where dogs are allowed.

## **Law Enforcement / Compliance with Dog Rules, and Park Operations**

- Maximize dog walker compliance with clear, enforceable parameters in order to improve park operations and use of staff resources in managing dog walking.

## **Park Operations**

- Provide adaptability and flexibility so that information gathered from monitoring can be used in future decision making based on estimated outcomes, including in new park areas.
- Ensure a safe and healthy working environment for park staff.
- Evaluate commercial dog walking, and if allowed, create and implement an enforceable policy.

## **Natural Resources**

- Protect native wildlife and their habitat (including sensitive species and their habitat, and federally or state listed, unique, or rare species) from detrimental effects of dog use, including harassment or disturbance by dogs.
- Minimize degradation of vegetation, soil and water resources by dog use.
- Preserve opportunities for future natural resource restoration and enhancement.

## **Cultural Resources**

- Preserve opportunities for future cultural resource restoration and enhancement.
- Protect cultural resources from the detrimental effects of dog use.

## **Education**

- Build community support for the plan to maximize management of dog walking use.
- Increase public understanding of NPS policies.

During the modified choosing by advantages workshop team members from GGNRA compared each of the alternatives for each site to the objectives listed above. Some of the subtopics for each objective were not compatible, requiring team members to balance competing needs. After evaluating each alternative against each objective for each site, it was determined that all action alternatives met the objectives of the draft plan/EIS. Some of the action alternatives met the objectives better than others and the alternative that best met the objectives for the dog management plan was selected as the preferred alternative as described below.

## **ALTERNATIVE ELEMENTS ELIMINATED FROM FURTHER CONSIDERATION**

During the alternatives development process, including revision and development of alternatives following public comment, several alternative elements were considered but eliminated from further consideration, as described below.

## Additional ROLAs and On Leash Areas

Establishing ROLAs on trails throughout some of the GGNRA sites was considered but dismissed. Establishing ROLAs on park trails would create safety concerns for other park users since many trails are relatively narrow and have limited line of sight, which could inhibit use of areas by some visitors due to having to travel through a ROLA when using any trails wholly, or even partly, designated as ROLAs. There is also a higher likelihood of impacts to adjacent resources as off-leash dogs can more easily access habitat adjacent to trails than a dog walked on leash. Even if a trail is a wide, multi-use trail or fire road, a ROLA would still interfere with access by other users, and unless fenced, would allow impacts to adjacent habitat. For these reasons, ROLAs would not be established on park trails or fire roads. However, due to the consensus agreement by the Negotiated Rulemaking Committee, and the park's commitment to include the committee's consensus agreements in the range of alternative for analysis, a ROLA on a fire road/trail is being considered under alternatives C and E at Oakwood Valley (northern section of the Oakwood Valley Loop Trail).

A ROLA that would encompass all of Fort Funston, both beach and uplands, was considered but dismissed. Allowing dog walking in all areas does not meet the purpose of this draft plan/SEIS, which includes preserving and protecting natural resources, providing a variety of visitor experiences, improving visitor and employee safety, reducing visitor conflicts, and maintaining park resources and values for future generations. Specifically, providing a diversity of visitor uses at Fort Funston, including hiking, bird watching, equestrian activities, hang gliding, and others, precludes a ROLA throughout the area. Resource protection requirements also preclude a ROLA throughout the area.

Establishing a ROLA on East Beach at Crissy Field was considered but dismissed. Establishing a ROLA on East Beach would provide maximum access to off-leash dog walkers. However, in order to provide better access and visitor safety for multiple user groups, a key objective of this plan, only no dog walking (alternatives C and D) and on-leash dog walking (alternatives B and E) were the options considered for East Beach in the action alternatives.

---

*During the alternatives development process, several elements were considered but eliminated from further consideration.*

---

Establishing a ROLA within the majority of San Mateo lands was considered but dismissed. The Cattle Hill site was evaluated for voice and sight control, but accessibility is difficult, and the public access through the area is entirely on trails that would require fencing if the area was proposed for voice and sight control. Extensive restoration has also been completed at Cattle Hill and there is habitat for the mission blue butterfly on Sweeney Ridge, directly adjacent to Cattle Hill, and a strong likelihood that this habitat also exists at Cattle Hill. A ROLA in this area would not meet the purpose of preserving and protecting natural resources. The only other trail where voice and sight control is proposed is in Oakwood Valley, but to allow that use, a fence and double gates would be constructed. The ROLA on the northern section of the Oakwood Valley Loop Trail is being considered because it was part of the consensus agreement of the Negotiated Rulemaking Committee.

Pedro Point was evaluated for ROLAs, but the uplands portion of the property has undergone restoration, and voice and sight control would not meet the purpose of preserving and protecting natural resources. Additionally, the park has sought to make dog management consistent with neighboring land management areas; at Pedro Point adjacent landowners require dogs to be on leash, and a GGNRA on-leash option would be consistent with neighboring management. Sweeney Ridge, Milagra, and Mori Point were also evaluated for voice and sight control, but this option was dismissed because there is endangered species habitat immediately adjacent to the trails in these areas. Establishment of a ROLA at these sites would not meet the purpose of the draft plan/SEIS, which is to preserve and protect natural resources.

A small ROLA, consistent with visitor and resource protection, is considered in two alternatives for Rancho Corral de Tierra (see table 3). Additional or larger ROLAs for the Rancho site were considered but dismissed due to resource-related concerns. A large ROLA north of the Farallone View School was considered, but the presence of habitat of a federally threatened species, the California red-legged frog, adjacent to the site and a report from the California Department of Transportation biologists that red-legged frogs were found in drainages to either side of this site eliminated this as an option since there is insufficient distance between the site and the habitat to provide a protective buffer. A proposed site in a previously disturbed area west of the intersection of Coral Reef and Sevilla Avenues in El Granada was also considered, but was found to contain wetland plant species and to have seasonal standing water. Placing any use in this area would violate Director's Order #77-1, Wetland Protection. In addition, habitat modeling performed in 2010 predicts a high likelihood of encountering threatened species in this area based on surrounding observations of California red-legged frogs and habitat suitability. Another previously disturbed site near El Granada, known as Flat Top, was also considered for a ROLA. This site would have required that dog walkers keep their dogs on leash on the approximately half-mile, steep trail connecting the neighborhood trailhead to the ROLA site. The lack of immediate access, a location removed from the site's built edge and the park's desire to ultimately restore this site eliminated this area as a possible ROLA.

The upland areas of the Rancho site were removed from consideration for ROLA use. The adjacent, publically owned lands of McNee State Park, San Pedro Valley County Park, and the San Francisco Public Utility Commission watershed, together with the Rancho uplands, create a large area of relatively undisturbed, contiguous habitat, particularly important for large mammals. In order to provide the greatest protection for wildlife and habitat, dog walking on leash or in a ROLA was not considered for the upland portions of the Rancho site in the action alternatives, consistent with regulations prohibiting dog walking in San Pedro Valley County Park and the San Francisco watershed. Dog walking on leash is allowed in McNee Ranch State Park, adjacent to the lower areas of Rancho where on-leash dog walking and a small ROLA are proposed in the range of alternatives for Rancho. Limiting dog walking, including the ROLA, to the lower section of Rancho is consistent with the overall project goal of maintaining the integrity of the remaining, large expanses of contiguous habitat by restricting dog walking to areas near the park boundary, close to built areas and parking.

Additionally, the creation of a ROLA of significant size at Rancho would very likely increase traffic and create parking impacts in the Montara and El Granada neighborhoods. In the coastal area from Pacifica to Half Moon Bay, there are currently only three off-leash areas: two in Pacifica – a small section of beach at the end of Esplanade Drive and the half-acre Sanchez Dog Park and the Coastside Dog Park in Half Moon Bay - a small, fenced, volunteer-run site. Creation of a significantly larger ROLA at the Rancho site would be likely to draw dog walkers from communities beyond Montara and El Granada, similar to the draw of popular dog walking sites in San Francisco such as Crissy Field and Fort Funston. Local residents supporting dog walking under voice control have expressed their support for off-leash access to the Rancho site, while many residents also express strong concerns about the potential for increased traffic and visitation in the Montara and El Granada neighborhoods now that Rancho is a public, NPS-owned site. Those impacts that would likely be even greater with the establishment of a multi-acre ROLA in this area.

### **On-leash Loop Trails**

On-leash loop trails were considered for addition at Mori Point and Milagra Ridge, however, both options were dismissed because of the potential to adversely impact natural resources. For Mori Point, the Lishumsha Trail, which combined with Old Mori Trail could have created a loop trail, crosses San Francisco garter snake habitat. At Milagra, there is mission blue butterfly habitat directly adjacent to the

narrow trail corridors which could have completed a loop trail experience. On-leash dog walking is not allowed on any narrow GGNRA trails that run through or are adjacent to mission blue butterfly habitat.

### **Fence or Barrier Construction**

In the draft plan/EIS, fence or barrier construction for trails to allow voice and sight control of dogs was considered but dismissed because fences and barriers may alter the aesthetic landscape and must be of sufficient construction to contain dogs not on leash, which would then hinder or prevent wildlife movement. The only site in the draft plan/EIS where fence construction was considered was on the northern section of the Oakwood Valley Loop Trail, because it was a part of the Negotiated Rulemaking Committee consensus, which the NPS agreed to carry forward for consideration in the alternatives. Following the public comment period, the action alternatives were revised and at some sites alternatives included fencing or natural or vegetative barriers. At Muir Beach, fencing would be installed along the dunes and the lagoon to protect the natural resources in these areas. The fencing would act as a visible barrier, but would not completely exclude dogs from the area. At Fort Funston, a fence or natural barrier to separate the upland ROLA from the adjacent wildlife corridor would be designed that would allow wildlife movement. The park would still dismiss enclosing ROLAs with any type of fencing or barriers that would prevent the movement of wildlife. During the 2012 visitor satisfaction survey, when respondents were asked how satisfied they would be if areas within GGNRA designated as ROLAs were fenced, nearly 70 percent indicated they would not be satisfied or slightly satisfied. The remaining 30 percent of respondents indicated that they would be moderately satisfied to completely satisfied with fencing around ROLAs (NPS 2012a, 35).

### **Leashes Longer than 6 Feet**

In on-leash areas a functional 6-foot leash must be attached to the dog and simultaneously held by the dog walker. The use of other types of leashes such as electronic leashes, remote training collars, and 12-foot leashes in lieu of the 6-foot leash were considered but dismissed from further consideration. These types of leashes would allow dogs to go further than 6 feet from the dog walker and would allow them to more easily enter into habitat area especially in locations where trails are narrow. Long leashes can also be problematic in high-traffic areas, including areas with cyclists and runners.

### **Time of Use Restrictions**

Time-of-use restrictions (such as hour of day or day of week) were considered but dismissed for all but SUPs (required for those wishing to walk more than three dogs) in the draft plan/SEIS. One objective of the draft plan/SEIS is to maximize dog walker compliance with clear, enforceable parameters in order to improve park operations and use of staff resources in managing dog walking. Time-of-use restrictions create confusion among the public and lead to noncompliance with dog regulations. GGNRA briefly used time of use restrictions in limited areas in the 1970s and currently uses time-of-year restrictions in the Crissy Field WPA and Ocean Beach SPPA. However, the seasonal nature of the plover restriction has added to public confusion about dog walking regulations and public comment on the draft plan/EIS included suggestions to simplify the restriction by changing it from seasonal to year-round and eliminating time of use altogether. Historically, and up to present day, time of use restrictions have not been favored. In 1978, an evaluation from the GGNRA San Francisco Unit Supervisor noted a number of problems with dog management at Baker Beach, one of those being: “certain times of the day open to dogs, closed at all other times type of law is very confusing to the public.... Areas should either be designated open to dogs on leash or no leash or closed to dogs.” Current law enforcement personnel have encountered similar public confusion at Crissy Field and Ocean Beach despite clear signage and frequent enforcement.

Other public comments on the draft plan/EIS suggested time of use restrictions be used for both on-leash and off-leash dog walking. However, during the 2012 visitor satisfaction survey, when respondents were asked how satisfied they would be if areas within GGNRA designated as ROLAs had time of use restrictions, 70 percent indicated they would not be satisfied or slightly satisfied. The remaining 30 percent of respondents indicated that they would be moderately satisfied to completely satisfied with time of use restrictions (NPS 2012a, 36). Additionally, areas and times suggested for time of use restrictions in public comments on the draft plan/EIS, such as early mornings and evenings, are typically when wildlife is more likely to be present. Concentrating dog walking at these times would be more likely to impact wildlife. Other land management agencies, including state and local agencies in various jurisdictions, have utilized time of use restrictions at various times of day to manage multiple uses with mixed results. Although time of use restrictions can be difficult to enforce and are not a preferred management method, the park will allow this management concept to remain as an option for dog management in the future if conditions warrant. Time of use restrictions would also be used in limited circumstances as a mitigation measure under the monitoring-based management strategy and as a way to manage SUPs.

During the public comment period for the draft plan/EIS, commenters also suggested requiring a daily, monthly, or annual dog walking fee at the park. The fee costs collected could cover maintenance or restoration of the area. GGNRA is prohibited by law to charge entrance fees; that prohibition would apply to fees for dog walkers. Therefore, dog walking fees were dismissed from further analysis. However in the future, the park could consider establishing parking fees and concession fees to provide a new source of funding to be used to improve areas of the park used for dog walking.

### **Increase in Fines**

During the public comment period for the draft plan/EIS, commenters suggested that fines for dog-related incidents should be increased. Fines for dog walking violations are not determined by the NPS, but are established in the Federal Magistrate Bail Schedule, which is set by the court system. Fines have been recently increased for repeat offenders. GGNRA will work with the Federal Magistrate to determine violations as appropriate, however, GGNRA does not have the authority to set fines. For these reasons, an increase in fines has been dismissed from further analysis.

### **Volunteer Law Enforcement**

During the public comment period for the draft plan/EIS, commenters suggested that volunteers should be allowed to issue citations, should be on site to monitor and call enforcement when needed, and volunteer rescue crews could be used at Fort Funston. Suggestions provided by commenters for enforcement by volunteers would not be feasible per NPS Director's Order 7, Section 8.4, which states that the Volunteers in Parks Act of 1969 does not permit use of volunteers for law enforcement. The Volunteer in Parks Act explicitly states in Chapter 1, Section 8: "Some examples of duties a VIP should not perform include serving as backup on patrol, issuing citations..." Consequently, this has been dismissed from analysis.

### **Dog ROLA Certification Program**

A dog ROLA certification program was considered but dismissed. This program would have required any dog walker who wanted to bring their dog to a ROLA to undergo an education and certification program, which the park would oversee and which would require recertification every two years. This program was cost prohibitive and would have required substantial park staff time. The City of Boulder Open Space and Mountain Parks in Colorado launched the voice and sight tag program in the summer of 2006 with goals to increase compliance with existing voice and sight rules and to decrease dog-related conflict on Open Space and Mountain Parks-managed lands (City of Boulder 2011, *i*). A year after implementation of the program, the percentage of visitors complying with the voice and site control increased to about 40

percent in 2007. However, the same level of compliance (41 percent) existed in 2010; therefore, compliance with the voice and site control requirement did not measurably increase after the first year of monitoring (City of Boulder 2011, 7). Compliance with the excrement removal requirement was generally low; just over 45 percent of the visitor parties complied with the excrement requirement in 2010 (City of Boulder 2011, 11). The monitoring study also found that the incidence of conflictive behaviors in 2010 returned to the 2006 pre-program level, suggesting that the program was not effective in decreasing conflict involving dogs on Open Space and Mountain Parks properties (City of Boulder 2011, 10 and 17).

The proposed monitoring management strategy includes focused education and enforcement as the primary management response for noncompliance, and would better achieve the purpose, need, and objectives of the draft plan/SEIS than a certification program, including protection of natural resources, enhancement of visitor experience, and use of monitoring for future decision making. Additionally, dog walkers applying for a permit to walk more than three dogs need proof of training. A dog certification program could be used in the future, but at this time is not a primary dog management strategy to be implemented. GGNRA has initiated dog training workshops in collaboration with the San Francisco SPCA and a local dog group. The park would look into increasing such opportunities, again in collaboration with local dog groups and humane societies such as San Francisco SPCA, the Marin Humane Society and the Peninsula Humane Society.

### **Voice and Sight Control Dog Walking in More Areas than “No Action” Alternative A**

An alternative proposing voice and sight control in more areas than the no-action alternative (alternative A) was considered but dismissed. NPS *Management Policies 2006* Section 1.4.3 (NPS 2006a, 10-11) describes the affirmative obligation to conserve and provide for the enjoyment of park resources and values. It states, in part, “The fundamental purpose of the national park system, established by the Organic Act and reaffirmed by the General Authorities Act, as amended, begins with a mandate to conserve park resources and values. This mandate is independent of the separate prohibition on impairment and applies all the time with respect to all park resources and values, even when there is no risk that any park resources or values may be impaired. NPS managers must always seek ways to avoid, or to minimize to the greatest extent practicable, adverse impacts on park resources and values when necessary and appropriate to fulfill the purposes of a park, so long as the impact does not constitute impairment of the affected resources and values.” The NPS carefully evaluated each alternative for its adherence to conservation of park resources and values. Based on the best professional judgment of park staff, visitor use surveys, public comment, and the draft plan/EIS impact analysis, it became clear that allowing the current level and type of use under alternative A, which provides for the greatest amount of dog walking use, or increasing that use in additional areas, would not meet this mandate.

This project is unique in that adverse impacts to park resources and values are currently occurring as a result of alternative A and are therefore described as “continued” because they are occurring and will continue to occur without action. These impacts are in part documented by numerous pet-related incident reports and citations. Under alternative A, an undefined policy never promulgated as enforceable regulations for dog activities within the park compromises the visitor experience and natural resources of the park as well as the ability of future generations to enjoy the park. Dog walking activities would continue within the park as they have under the 1979 Pet Policy (appendix A) and 36 CFR 2.15 and 7.97(d) (appendix D) and the GGNRA Compendium. The lack of specificity and enforceability of the 1979 Pet Policy would result in long-term, adverse impacts: degradation of vegetation; disturbance to native wildlife and their habitat as well as listed species; detraction from visitor experience; disturbance to cultural resources; and compromised visitor health and safety within the park. Dog activities under the no-action alternative continue to threaten other special-status species and their habitat, including the tidewater goby, coho salmon, steelhead trout, bank swallow, and many others. Listed vegetation species,

including the mission blue butterfly, Presidio manzanita, Marin western flax, and San Francisco lessingia, are a few of the many federally listed species that would continue to be adversely affected by the no-action alternative. The no-action alternative does not provide protection for these listed species, nor is it consistent with the recovery plans for these species, including the San Bruno elfin butterfly, mission blue butterfly, northern spotted owl, western snowy plover, San Francisco garter snake, tidewater goby, and California red-legged frog. Additionally, the 1979 Pet Policy that would continue as a result of the no-action alternative would be inconsistent with NPS regulations and would continue the current confusion, controversy and conflict over the status of dog walking in the park. Finally, adverse impacts to park operations and health and safety would continue to occur as a result of alternative A.

It was precisely these impacts to park resources and values, including visitor experience, which led to this planning effort. The no-action alternative (alternative A), which provides for the highest level of dog walking under unregulated voice control, does not meet the purpose and need for this draft plan/SEIS. It would not preserve and protect natural and cultural resources and natural processes, would not provide for a variety of visitor experiences, would not improve visitor and employee safety, would not be compliant with the ADA, would not reduce user conflicts, and would not maintain park resources and values for future generations. The need for this draft plan/SEIS directly addresses the fact that alternative A, or use greater than alternative A, would compromise park resources and values to the extent that “without action, those resources and values in some areas of the park might not be available for enjoyment by future generations.”

### **Allowing More than Six Dogs per Dog Walker**

**Number of Permitted Dogs per Dog Walker.** NPS considered but dismissed allowing more than six dogs for commercial and private dog walkers, which would not meet the purpose, need, and objectives for the plan.

NPS received multiple public comments on the draft plan/EIS regarding the appropriate number of dogs allowed per dog walker. Some commenters expressed support for limiting the number at six dogs with strict guidelines. Other commenters, including some dog walkers, expressed concern that public health and safety would be adversely impacted by allowing more than three dogs per dog walker (commercial or private), with some noting that four or more dogs could be hard to control. Some commercial dog walkers noted the potential economic impacts to their businesses of limiting the number of dogs to a maximum of six, while other commenters requested that commercial dog walking not be allowed at all.

NPS, in establishing a threshold number, was concerned first and foremost with resource protection and visitor experience and safety, two key objectives of the plan/EIS. NPS questions whether a dog walker could consistently control more than six dogs under voice and sight control, particularly in an NPS area where there is a primary mandate of resource protection and a secondary mandate of visitor (not commercial) experience. NPS was unable to find literature supporting the idea that more than six dogs would not damage park resources or impact visitor experience and safety, or put another way, would provide both resource protection and visitor experience and safety. Based on public comment, feedback from the discussions of the Negotiated Rulemaking Committee for dog management, park staff observations and research, and law enforcement experience, NPS believes that allowing more than three dogs without a permit system, or more than six dogs total could negatively impact visitor experience and safety, and would not meet the purpose of and need for the plan/EIS. Consequently, the preferred alternative requires dog walkers with more than three dogs to obtain a SUP (see appendix F for permit conditions and restrictions) which would have an upper limit of six dogs. Dog walking compliance, including compliance with SUPs and impacts to resources, are monitored through the monitoring-based management strategy. Where that monitoring finds non-compliance with SUP conditions, permit

restrictions such as individual permit revocations, time of use restrictions or number of permits issued, may be instituted as mitigation.

NPS also seeks consistency with adjacent jurisdictions. Since a consistent number of dogs would be easier to understand and enforce, GGNRA researched other local and non-local government entities that have addressed this issue. Two local government entities, Marin County Open Space District and the East Bay Regional Park District, limit numbers to six dogs per dog walker. The City of San Francisco recently passed an ordinance regulating commercial dog walking that would require a permit for four to eight dogs, liability insurance and proof of training. The ordinance did not address private dog walkers. The Presidio Trust is currently proposing to adopt the City of San Francisco regulation, but their proposed regulation states that once GGNRA has a new dog management regulation in place, they may adopt the permit conditions in GGNRA's final rule. Multiple entities outside the San Francisco Bay Area have also limited the number of dogs for commercial dog walkers to no more than six, including Boulder County, Colorado Open Space and Mountain Parks, which addressed dog walking in a comprehensive management plan. Those jurisdictions with a primary resource protection and recreation mandate settled on six as the appropriate number.

Comments in favor of no numerical restrictions or a higher number primarily described the economic impacts commercial dog walkers would experience with a numerical limit. NPS did consider these impacts. Socioeconomic impacts to commercial dog walkers was found to have negligible impacts to the local economy, and would affect less than 1/100 percent of the over 2.5 million jobs in the San Francisco metropolitan statistical area. This impact topic was consequently dismissed.

Finally, NPS received numerous public comments on the draft plan/EIS urging the park to prohibit commercial dog walking altogether instead of limiting the number of dogs allowed. These comments noted that commercial uses of parks are highly regulated, and while commercial uses of parks typically address some aspect of visitor experience, commercial dog walking does not. GGNRA agrees that commercial park uses, particularly those that do not provide visitor services, deserve greater scrutiny than commercial services for visitors, and cannot trump the use of the park by the general public. However, one objective of the plan/EIS is to evaluate commercial dog walking, and if allowed, create and implement an enforceable policy. Therefore, the range of alternatives evaluates allowing and prohibiting commercial dog walking, and if allowed, limiting to three dogs per dog walker with no permit system or four to six dogs with a permit system. If the preferred alternative, or other alternative allowing commercial dog walking, is ultimately selected, GGNRA would regulate commercial dog walking through a special regulation pursuant to NPS authority to promulgate special regulations under the NPS Organic Act (16 USC Section 1, et. seq.). If so, commercial dog walking would be subject to the strict permitting protocol described above if more than three dogs are allowed, and with compliance evaluated through the monitoring-based management strategy (see the "Monitoring-based Management Strategy" section for more details).

### **“No Action” (Alternative A) which Assumes Compliance**

Also considered but dismissed is an alternative which would be a version of alternative A which assumes compliance, and includes increased education, outreach, and enforcement, the monitoring management strategy, the ROLA guidelines, and permitted dog walking for visitors with up to 6 dogs. Instead, alternative E was revised to represent the greatest level of access for dog walkers, including incorporating all elements of the 1979 Pet Policy which would meet the purpose, need, and objectives of the plan. The 1979 Pet Policy, as a whole, would not meet the purpose or need of the plan, and fails to meet virtually all of the plan's objectives, even assuming compliance, increased education and enforcement, ROLA guidelines, and a monitoring management strategy. A primary reason for this failure is the geographic scope of the 1979 Pet Policy, which opens many *entire* sites to off-leash dog walking with no restrictions

on the areas of use within the sites, including the primary dog walking areas of Fort Funston, Ocean Beach, and Crissy Field. NPS received many public comments complaining that dog use precluded their enjoyment of these and other areas. Commenters included visitors with a fear of dogs, concerned parents whose children had been playfully attacked or knocked over by dogs, picnickers whose lunches had been taken, visitors who were unable to birdwatch due to dogs chasing birds, hang-gliders and equestrians attacked by dogs, visitors who had stepped in dog excrement, elderly visitors who no longer visited the park because of a fear of being attacked or knocked over and injured, as well as visitors with disabilities, such as seeing-impaired or blind individuals with guide dogs, whose highly trained dogs had been attacked by off-leash dogs resulting in their complete preclusion from the area. Because the 1979 Pet Policy opened many primary visitor areas to off-leash dog walking with no option for balance of user groups afforded by providing on-leash or no dog areas within the sites, these areas would fail to provide a balance of visitor uses or be ADA compliant. Taking into account the overall tenor of these and other public comments, law enforcement statistics and other studies, the balance NPS seeks to achieve by allowing a multiplicity of visitor experiences would not be achieved by opening entire areas to off-leash dog walking, which precludes many other legitimate park visitors.

The 1979 Pet Policy also opened many trails to both on and off leash. Although all the action alternatives considered many trails for on-leash dog walking, as well as one trail for off-leash use, it was generally found that off-leash dog walking on trails would not meet the purpose, need, and objectives of the plan. Many of the trails in GGNRA are curvy, hampering the line of sight requirement for voice and sight control. Because many types of visitors use trails, and trails serve as access points to specific areas within a site, allowing off-leash use on trails could also preclude other users wishing to visit areas accessed by those trails. In contrast, a ROLA is intended to be a specific, contained geographic area which other visitors may avoid while still having reasonable access to nearby portions of a site. In considering trails appropriate for off-leash dog walking, the Negotiated Rulemaking Committee was itself only able to identify one area, the northern section of the Oakwood Valley Loop trail, which has been considered in alternatives C and E.

Finally, there are also resource concerns associated with dog walking, both on and off leash, which are amplified in off-leash areas where there are few or no strategic geographic restrictions for protection of sensitive species and habitat (i.e., the off-leash sites as described in the 1979 Pet Policy). For information on the types of impacts that may occur from dog walking, even where there are restrictions on areas of use and where compliance is assumed, please see chapter 4.

In short, opening entire sites and trails to off-leash dog walking, even assuming compliance, precludes other visitor uses, would not be ADA compliant, would adversely impact natural and cultural resources, and does not meet the purpose and need of the plan nor any of the planning objectives. Accordingly, alternative E allows the most voice- and sight-control dog walking in areas contained in the 1979 Pet Policy that the NPS believes, in its best professional judgment, could be allowed while continuing to meet its mandate to conserve park resources and values, as well as the purpose, need and objectives of this draft plan/SEIS.

## **New Lands**

In the draft plan/EIS, the four action alternatives included management options for new lands not already included in the draft plan that might come under GGNRA management in the future. Rancho Corral de Tierra, acquired during the final stages of development of the draft plan/EIS, was addressed programmatically under new lands in that document, because the baseline studies, needed to allow a site-specific evaluation of dog walking regulations, were not completed in time to allow inclusion of the site in the draft plan/EIS. However, since the release of the draft plan/EIS, Rancho Corral de Tierra was transferred to the NPS, has been under NPS management per 36 CFR 2.15, for almost two years, and park

staff have been conducting on-site resource surveys, allowing the site specific treatment of Rancho Corral de Tierra in this draft plan/SEIS. Consequently, it was determined that a programmatic evaluation of dog walking for new lands is now outside the scope of this plan. Therefore, this topic was dismissed from the draft plan/SEIS.

## **SUMMARY—CONSISTENCY WITH SECTIONS 101(B) AND 102(1) OF NEPA**

The NPS requirements for implementing NEPA include an analysis of how each alternative meets or achieves the purposes of NEPA, as stated in Sections 101(b) and 102(1). Each alternative analyzed in a NEPA document must be assessed as to how it meets the following purposes:

1. Fulfill the responsibilities of each generation as trustee of the environment for succeeding generations.
2. Ensure for all Americans safe, healthful, productive, and esthetically and culturally pleasing surroundings.
3. Attain the widest range of beneficial uses of the environment without degradation, risk of health or safety, or other undesirable and unintended consequences.
4. Preserve important historic, cultural, and natural aspects of our national heritage and maintain, wherever possible, an environment that supports diversity and variety of individual choice.
5. Achieve a balance between population and resource use that would permit high standards of living and a wide sharing of life's amenities.
6. Enhance the quality of renewable resources and approach the maximum attainable recycling of depletable resources.

---

*The NPS requirements for implementing NEPA include an analysis of how each alternative meets or achieves the purposes of NEPA.*

---

CEQ Regulation 1500.2 establishes policy for federal agency implementation of NEPA. Federal agencies shall, to the fullest extent possible, interpret and administer policies, regulations, and public laws of the United States in accordance with the policies set forth in NEPA (Sections 101(b) and 102(1)); therefore, other acts and NPS policies are referenced as applicable in the following discussion.

1. Fulfills the responsibilities of each generation as trustee of the environment for succeeding generations.

Alternatives B through F provide increased protection to special-status species by establishing dog management guidelines that restrict dog walking from sensitive habitats, require on-leash dog walking, or establish specific areas where dog walking under voice and sight control would be allowed. Limitations on dog walking access would not only benefit special-status species when compared to the no-action alternative, but would also provide protection to other resources including, vegetation, wetlands, and other wildlife.

Alternative B reflects the NPS-wide approach to dog walking as defined in NPS policy and regulations. Management conditions would also be regulated by the GGNRA Compendium, which can establish park-specific actions to establish closures and public use limits to protect cultural and natural resources. By requiring on-leash dog walking, this alternative would protect natural resources including wildlife, vegetation, and special-status species, as well as soils and water quality. If impacts to the resources occur, impacts would be limited to the defined trail/roads/beaches and the 6-foot-wide corridor adjacent to trails and roads. Alternative B would

fully meet the purpose of fulfilling the responsibilities of each generation as trustee for the environment.

Alternative C balances a variety of dog walking opportunities with areas where dogs are not allowed within each of the three counties containing park sites. Alternative C emphasizes recreation opportunities and experiences for multiple user groups, including dog walkers, while considering visitor and dog safety and minimizing conflict between dog walkers and other user groups. This alternative also restricts dogs from some areas in order to provide a no-dog experience for some visitors and also protect significant natural resources. Alternative C would include ROLAs in designated areas. This alternative has been designed to protect natural resources including sensitive species, wildlife, vegetation, and soils, and water quality. Dog walking would be restricted from sensitive habitats, such as the lagoons, creeks, and other wetland areas that contain special-status species. On-leash dog walking would be required in most areas to restrain dogs from entering areas that have not been previously impacted. Impacts would generally be limited to selected trails/roads/beaches and adjacent 6-foot-wide corridor. The location of the ROLAs would be located away from any sensitive species or habitats. Consequently, alternative C would also fully meet the purpose of fulfilling the responsibilities of each generation as trustee of the environment.

Alternative D would offer the greatest protection of natural resources, including sensitive species/habitats, wildlife, vegetation, soils, and water quality, among the action alternatives. Alternative D would also allow recreation opportunities and experiences for multiple user groups, including dog walkers. Alternative D offers the least amount of area to dog walkers. Of the alternatives that provide off-leash dog walking areas (alternatives A, C, D, E, and F), alternative D offers the least area for ROLAs. On-leash dog walking would be required in most areas open to dog walking under this alternative, in order to restrain dogs from entering undisturbed areas or impacting other users. Alternative D has the most amount of area closed to dog walking when compared to the other action alternatives. Consequently, alternative D would also fully meet the purpose of fulfilling the responsibilities of each generation as trustee of the environment.

Alternative E would offer recreation opportunities and experiences for multiple user groups, including dog walkers; however, this alternative would allow more opportunities for dog walkers to access portions of GGNRA than other alternatives while still providing protection of resources. Even though alternative E offers the most area for dog walking of all the action alternatives, this alternative would fully meet the purpose of fulfilling the responsibilities of each generation as trustee of the environment. Alternative E would protect special-status species, wildlife, and vegetation. ROLAs would be established in areas that would avoid impacts to sensitive species and habitats. Like the other action alternatives, alternative E would allow on-leash dog walking on selected trails/roads/beaches. By restraining dogs on leash in many of the areas open to dog walking under this alternative, and confining off-leash use to specific areas with specific guidelines, impacts would be reduced to the trail/road/beach and the 6-foot-wide corridor adjacent to the on-leash areas. In many cases, areas for on-leash dog walking and ROLAs have been previously disturbed.

Alternative F offers recreational activities and resource protection, and represents the preferred alternative for each site as chosen through a choosing by advantages process. This alternative would fully meet the purposes of fulfilling the responsibilities for each generation as a trustee of the environment. Alternative F would provide protection for special-status species, wildlife, and vegetation, while still allowing for recreational activities, including off-leash dog walking. On-leash dog walking would be required in most areas to restrain dogs from entering areas that have not been previously impacted. Impacts would generally be limited to selected trails/roads/beaches and adjacent 6-foot-wide corridor. The location of the ROLAs would be located away from any sensitive species or habitats.

Alternative A would not fully meet the purpose of fulfilling the responsibilities of each generation as trustee for the environment. The no-action alternative is based on a combination of NPS regulations, the 2005 federal court decision (*U.S. v. Barley*, 405 F.Supp.2d 1121 (N.D. Cal. 2005)), and the 1979 Pet Policy. Because dog walking regulations are routinely ignored by visitors at many park sites, on-the-ground activities sometimes vary widely from posted regulations. These differences are attributable in part to changes in dog walking policies over the years, court decisions regarding dog walking in GGNRA, and public confusion due to both those changing circumstances and variable levels of enforcement. Off-leash dog walking currently occurs at many of the sites. Dogs enter areas where sensitive species or habitats may occur. Dogs also frequently go off the trails or roads and create impacts to soils and vegetation through compaction, trampling, and nutrient addition. Under the no-action alternative, dog walking activities would remain the same and adverse impacts to vegetation, wildlife, special-status species, soils, and water quality would continue unregulated and unmitigated.

2. Ensure for all Americans safe, healthful, productive, and aesthetically and culturally pleasing surroundings.

Alternatives B, C, D, E, and F would fully meet the purpose of ensuring for all Americans safe, healthful, productive, and aesthetically and culturally pleasing surroundings. The action alternatives would increase safety by minimizing visitor conflicts and dog-related injuries. Visitor conflicts and injuries are expected to decrease since the new dog management regulations would be clear to all visitors and would be enforced by law enforcement staff. Requiring on-leash dog walking in most areas open to dog walking would also decrease visitor conflicts and injuries since dog walkers would have more control over their pets. Additionally, dog walking under voice and sight control would be restricted to designated areas that could be easily avoided by those visitors who do not prefer dogs. The action alternatives would require all dog walkers to clean up dog waste. Together with the limit on the number of dogs allowed per dog walker, and the specific requirement for dogs to be on leash or under very specific voice control, this would greatly reduce dog waste and nutrient additions to the soil. It is assumed that leash control and/or regulated voice and sight control would reduce dog waste and nutrient addition in comparison to the current, unregulated voice control status because owners would be in closer contact with their dogs and presumably would be more likely to comply with cleanup regulations. The reduction of pet waste would reduce health and safety issues associated with dog waste and also improve the aesthetics and cultural landscape of the park.

Alternative D would best meet this purpose when compared to the other action alternatives, since alternative D is the most restrictive of dog walking, allowing the least amount of both on-leash dog walking and dog walking under voice and sight control. Since this alternative is the most restrictive, fewer conflicts and dog-related incidents may occur. Additionally, dog waste would be further reduced. Alternative E would meet this purpose, although to a lesser degree than the other action alternatives. Alternative E would allow the most on-leash dog walking and dog walking under voice and sight control but may have a greater risk of visitor conflicts and safety issues.

Under the monitoring management strategy, park staff would regularly monitor dog walking activities at the park sites to ensure that visitors with dogs are in compliance with new and existing regulations, including picking up pet waste, not going outside of on-leash areas or ROLAs, as well as monitoring for vegetation, wildlife, and special-status species damage. Where noncompliance over a period of time is observed, multiple, targeted management strategies would be initiated to bring compliance back to acceptable levels.

Alternative A would not fully meet the purpose of ensuring for all Americans safe, healthful, productive, and aesthetically and culturally pleasing surroundings. Dog walking regulations

would continue to be unclear to visitors and would continue to create visitor and dog conflicts. Off-leash dog walking would continue throughout areas, many with high visitor use and multiple user groups, which increases the risk of dog-related injuries. Unkempt dog waste would also continue to be a problem, which would increase health and safety concerns and decrease the aesthetic and cultural landscape of the park.

3. Attain the widest range of beneficial uses of the environment without degradation, risk of health or safety, or other undesirable and unintended consequences.

Alternatives B, C, D, E, and F would meet the purpose of attaining the widest range of beneficial uses of the environment without degradation, risk of health or safety, or other undesirable and unintended consequences. All action alternatives would continue to allow a wide range of visitor use opportunities. On-leash dog walking and dog walking under voice and sight control would be allowed within designated areas. Additionally, some areas would prohibit dog walking, which would allow visitors who do not prefer dogs to have a no-dog experience at the park. Other visitor uses at the park including hiking, biking, running, birding, equestrian use, board sailing and hang gliding would continue. Eliminating dog walking or requiring either on-leash dog walking or voice and sight control in clearly defined areas with specific guidelines in sites where multiple visitor uses occur, would reduce risks to health and safety. The action alternatives have been designed to allow multiple uses of the area without degradation of important resources including special-status species, wildlife, and vegetation. Alternative D would best meet the purpose because it is the most protective of the resources and would offer the least amount of area for dog walking activities. Alternative E would also meet the purpose by allowing the most area for dog walking, while still protecting resources. Alternative C is the most balanced of the alternatives in terms of multiple visitor use and protection of resources. Alternative F would meet this purpose because it would allow for resource protection while still providing areas for both no-dog experiences and dog walking, including ROLAs that would be placed away from sensitive resources. All action alternatives would reduce multiple visitor use conflicts and provide protection of the environment.

Alternative A would not fully meet the purpose of attaining the widest range of beneficial uses of the environment without degradation, risk of health or safety, or other undesirable and unintended consequences. Under the no-action alternative, unregulated off-leash dog walking would still occur throughout areas, some with high multiple visitor use, creating visitor conflicts and dog-related injuries. Dog walking regulations would remain confusing, which would also contribute to visitor conflicts and dog-related injuries. In addition, off-leash dogs would enter areas where sensitive species or habitat exists, trample vegetation, compact soils, or chase wildlife, all of which would degrade the natural environment.

4. Preserve important historic, cultural, and natural aspects of our national heritage and maintain, wherever possible, an environment that supports diversity and variety of individual choice.

The action alternatives (alternatives B, C, D, E, and F) would fully meet the purpose of preserving important historic, cultural, and natural aspects of our national heritage and maintain, wherever possible, an environment that supports diversity and variety of individual choice. Allowing on-leash dog walking and dog walking under voice and sight control with strict guidelines and within designated areas would be expected to result in a decreased potential for trampling and ground disturbance of sensitive cultural resources. The physical restraint of dogs would prevent dogs from entering important cultural resource areas. In addition the ROLAs would be established in areas away from known cultural resources at the park. To preserve cultural resources, dog walking would also be prohibited in some areas, including the Batteries to Bluffs Trail and the Battery Crosby Trail north of Baker Beach within the Presidio National

Historic Landmark (NHL), where a number of sensitive historic structures occur. Alternative D would be the most protective of the resources and would best meet the purpose when compared to the other action alternatives. Alternative E would fully meet this purpose, but to the least extent when compared to the other action alternatives, since alternative E would allow the most dog walking opportunities. As described above, the alternatives have been designed to protect natural resources including sensitive species, wildlife, vegetation, and soils, and water quality. The action alternatives would allow on-leash dog walking on selected trails/roads/beaches. By restraining dogs on leash, impacts would be reduced to the trail/road/beach and the adjacent 6-foot-wide corridor. In most cases, areas for on-leash dog walking are on fire roads and previously used trails. ROLAs would be established in areas that would avoid impacts to sensitive species and habitats.

Alternative A would not fully meet the purpose of preserving important historic, cultural, and natural aspects of our national heritage and maintain, wherever possible, an environment that supports diversity and variety of individual choice. Currently ground disturbance by dog walking, specifically under voice control is damaging to cultural resources at sites such as Fort Funston and structures within the Presidio NHL. Under the no-action alternative, dog walking under voice control could continue in areas that would damage the cultural resources.

5. Achieve a balance between population and resource use that would permit high standards of living and a wide sharing of life's amenities.

Balancing population and resource use under the draft plan/SEIS would include protecting the resources unimpaired for the enjoyment of present and future generations and providing access for visitors to experience the natural resources of the park. *NPS Management Policies 2006* states that the enjoyment that is contemplated by the *Organic Act* is broad; it is the enjoyment of all the people of the United States and includes enjoyment both by people who visit parks and by those who appreciate them from afar. It also includes deriving benefit (including scientific knowledge) and inspiration from parks, as well as other forms of enjoyment and inspiration. Congress, recognizing that the enjoyment by future generations of the national parks can be ensured only if the superb quality of park resources and values is left unimpaired, has provided that when there is a conflict between conserving resources and values and providing for enjoyment of them, conservation is to be predominant. As discussed above, alternatives B, C, D, E, and F would provide opportunities for on-leash dog walking and dog walking under voice and sight control, as well as opportunities for a no-dog experience at the park, all of which, when compared to the no-action alternative, would benefit the natural and physical resources at the park. In addition, the action alternatives would provide a variety of visitor experiences that would all contribute to a high standard of living. All of the alternatives evaluated would allow some level of access to the park by both dog walkers and visitors who do not prefer dogs, which would contribute to the sharing of these amenities. As visitation to the park increases and the population of the area continues to increase, having clearly defined areas with designated dog walking regulations under the action alternatives would contribute to the protection of the park's natural and physical resources.

Given this, all the action alternatives would fully meet this purpose because each action alternative would provide the public access and ability to share the park's physical amenities and would protect the resources so that they would be available for future generations. Protection is evident both in how areas were chosen for level and type of use, and by the implementation of the monitoring management strategy. Park staff would regularly monitor dog walking activities at the park sites to ensure that visitors with dogs are in compliance with new and existing regulations, including picking up pet waste, not going outside of on-leash areas or ROLAs, as well as monitoring for vegetation, wildlife, and special-status species damage. Where noncompliance

over a period of time is observed, multiple, targeted management strategies would take effect to bring compliance back to acceptable levels.

Alternative D would meet this purpose to the highest degree because it is the most protective of the resources, while still offering opportunities for on-leash dog walking and dog walking under voice and sight control. Alternative E would also meet this purpose, but to the least extent when compared to the other action alternatives. Alternative E allows the greatest amount of area for dog walking under voice and sight control. To ensure that resources are protected, ROLAs would be established away from sensitive areas, and in certain cases barriers would separate ROLAs from visitors in adjacent areas. On-leash dog walking would be required in designated areas to minimize impacts to undisturbed vegetation, soil, and wildlife.

Alternative A would not fully meet the purpose of achieving a balance between population and resource use that would permit high standards of living and a wide sharing of life's amenities. Under the no-action alternative, dog walking regulations would continue to be unclear to visitors. Dog walking would continue to occur in restricted areas or with insufficient controls and would continue to adversely impact other user groups and the park's natural and physical resources. Although visitors would have the opportunity for dog walking at the park, resources would continue to be depleted. Without higher protection of resources and clear dog management regulations, these amenities would not be available for the enjoyment of future generations.

6. Enhance the quality of renewable resources and approach the maximum attainable recycling of depletable resources.

For the reasons discussed above, the action alternatives (alternatives B, C, D, E, and F) would enhance the quality and protect the park's biological and physical resources. Alternative D would provide the greatest protection of these resources since it would allow the least amount of dog walking when compared to the other resources. Alternative A would not meet the purpose of enhancing the quality of renewable resources. Under the no-action alternative, dog walking would continue to contribute to the adverse impacts to the park's resources. The second purpose, "approach the maximum attainable recycling of depletable resources," is less relevant to the dog management plan, as it is geared toward a discussion of "green" building or management practices. There would be no construction related to the no-action alternative (alternative A), so this purpose would not apply. The action alternatives would involve the installation of new signage throughout the park stating the dog walking regulations for each site, and some construction of fencing or barriers. Environmentally appropriate design standards and materials would likely be used to minimize impacts to depletable resources.

## **ENVIRONMENTALLY PREFERABLE ALTERNATIVE**

The NPS is required to identify the environmentally preferable alternative in its NEPA documents for public review and comment. The NPS, in accordance with the U.S. Department of the Interior policies contained in the Department Manual (515 DM 4.10) and CEQ's Forty Questions, defines the environmentally preferred alternative (or alternatives) as the alternative that best promotes the national environmental policy expressed in NEPA (Section 101(b)) (516 DM 4.10). The CEQ's Forty Questions (Q6a), and the U.S. Department of the Interior NEPA regulations (43 CFR 46.30) further clarify the identification of the environmentally preferable alternative stating, "this means the alternative that causes the least damage to the biological and physical environment; it also means the alternative that best protects,

---

*The NPS is required to identify the environmentally preferable alternative in its NEPA documents for public review and comment.*

---

preserves, and enhances historic, cultural, and natural resources.”

The environmentally preferable alternative was selected during the choosing by advantages meeting for each of the 22 sites. The following discussion identifies the environmentally preferable alternative for each site and the rationale to support the decision.

### **Stinson Beach**

Alternative D was chosen as the environmentally preferable alternative. Alternative D would not allow dogs at the site. It provides protection of the dunes area and the creek adjacent to the parking lot that has been restored.

### **Homestead Valley**

Alternative D was chosen as the environmentally preferable alternative. Alternative D would not allow dogs at the site. Alternative D would provide the most protection for the contiguous habitat with little fragmentation, the northern spotted owl and a rare native grassland plant.

### **Alta Trail / Orchard Fire Road / Pacheco Fire Road**

Alternative D was chosen as the environmentally preferable alternative for Alta Trail/Orchard Fire Road/Pacheco Fire Road. No dogs would be allowed on the Alta Trail, Orchard Fire Road or the Pacheco Fire Road. Alternative D provides the most protection for sensitive species, adjacent habitat for the mission blue butterfly and contiguous habitat in the area.

### **Oakwood Valley**

Alternative D was chosen as the environmentally preferable alternative for Oakwood Valley. On-leash dog walking would be allowed on the Oakwood Valley Fire Road to the junction with the Oakwood Valley Trail. Alternative D provides the most protection for sensitive species and contiguous habitat in the area.

### **Muir Beach**

Alternative D was also chosen as the environmentally preferable alternative. On-leash dog walking would be allowed on the proposed Muir Beach Trail. Alternative D would provide maximum protection for the restored lagoon, shorebirds, steelhead, Coho, and the riparian wetlands.

### **Rodeo Beach / South Rodeo Beach**

Alternative D was chosen as the environmentally preferable alternative for Rodeo Beach. Alternative D would allow on-leash dog walking on the beach north of the footbridge and on the footbridge to the beach. Alternative D provides the maximum resource protection and provides resource protection for the beach area closest to Bird Island.

### **Marin Headlands Trails**

Alternative D was chosen as the environmentally preferable alternative for the Marin Headlands Trails. Alternative D would not allow dog walking at the site. Alternative D is the most protective of the resources by maintaining the integrity of the core Marin Headlands habitat.

### **Fort Baker**

Alternative D was chosen as the environmentally preferable alternative. Alternative D would allow on-leash dog walking in the Lodge/Conference Center grounds and the Bay Trail, not including the Battery Yates Loop. Alternative D provides the maximum resource protection for sensitive species and cultural resources. This alternative is also the most protective of the parade ground and mission blue butterfly habitat at Battery Yates.

### **Upper and Lower Fort Mason**

Alternative B was chosen as the environmentally preferable alternative for Upper Fort Mason. Alternative B includes on-leash dog walking in all areas where dogs are allowed (Great Meadow, Laguna Green, lawns, sidewalks, paved trails, parking lots and open areas around housing). Alternative B provides the maximum protection of natural and cultural resources at the site.

### **Crissy Field**

Alternative D was chosen as the environmentally preferable alternative for Crissy Field. Alternative D does not allow dogs within the WPA or on the East and Central Beaches. On-leash dog walking would be allowed on the Crissy Field Promenade and within the grassy areas near the old Coast Guard station and a ROLA would be established on the western portion of the airfield. Alternative D provides the most resource protection of the Western Snowy Plover and other shorebirds. It also minimizes the potential for impacts to water quality and wildlife within the tidal marsh.

### **Fort Point Promenade / Fort Point National Historic Site Trails**

Alternative D was chosen as the environmentally preferable alternative for Fort Point. Alternative D would allow for on-leash dog walking on the Battery East Trail. Alternative D would allow dog walking on the least number of trails when compared to the other alternatives presented. Alternative D would protect the natural and cultural resources in the area to the greatest extent.

### **Baker Beach and Bluffs to Golden Gate Bridge**

Alternative D was chosen as the environmentally preferable alternative for Baker Beach. Alternative D would allow on-leash dog walking on the beach south of the north end of the North Parking Lot. On-leash dog walking would also be allowed on the trails leading to the beach south of the north parking lot and on the Presidio Coastal Trail. Dog walking would not be allowed on the northern section of the beach. Alternative D provides the most protection to the shorebirds and other natural and cultural resources at the site.

### **Fort Miley**

Alternative D was chosen as the environmentally preferable alternative. Alternative D would not allow dogs in East or West Fort Miley. Alternative D provides the most protection of the bird habitat and bird watching area. It also provides the most protection for hospital workers/patients, school groups, and visitors. Alternative D provides the maximum protection of the cultural resources in the area.

### **Lands End**

Alternative D was chosen as the environmentally preferable alternative. Alternative D would allow on-leash dog walking on the El Camino del Mar trail and on the Lands End Coastal Trail as far as the

connector trail leading to the El Camino del Mar Trail. This alternative would also allow on-leash dogs on the connecting stairs to the Lands End Coastal Trail from the Memorial Parking lot. Since the Lands End Coastal Trail east of the stairway would not allow dogs, alternative D provides the greatest resource protection, including the maximum protection for the coastal scrub communities at the site.

### **Sutro Heights Park**

Alternative D was chosen as the environmentally preferable alternative. Alternative D would no longer allow dogs at the site. Alternative D is the most protective of the resources at the site including the formally landscaped sites that are heavily used for weddings and other events.

### **Ocean Beach**

Alternative D was chosen as the environmentally preferable alternative. Alternative D would allow on-leash dog walking on the Ocean Beach Trail along the Great Highway adjacent to the SPPA and on the beach north of Stairwell 21. No dogs would be allowed within the SPPA or on the beach below Sloat Boulevard. Alternative D provides the maximum protection of natural resources including shorebirds and plovers.

### **Fort Funston**

Alternative B was chosen as the environmentally preferable alternative. Alternative B would allow dogs on leash on the beach and on trails not closed to dogs. ROLAs would not be allowed under alternative B. Dog walking on leash throughout the site would protect a restored area at Fort Funston south of the main parking lot and would provide increased opportunities to restore coastal dune and bluff habitat and allow for the reintroduction of San Francisco lessingia. Alternative B would also include a seasonal closure to visitors and dogs along a strip of beach at the foot of the northernmost bluffs when the bank swallows are nesting. This alternative provides the most protection of the cultural and natural resources in the area including Battery Davis, bank swallow habitat, shorebirds, and the restored areas.

### **Mori Point**

Alternative D was chosen as the environmentally preferable alternative. Alternative D would not allow dog walking at the site; therefore the alternative would provide the most protection of sensitive habitat, California red-legged frogs and San Francisco garter snakes.

### **Milagra Ridge**

Alternative D was chosen as the environmentally preferable alternative. Alternative D would not allow dog walking at Milagra Ridge. Alternative D provides the maximum protection for sensitive habitat, California red-legged frogs, San Francisco garter snake, and mission blue butterfly. It would also best protect the restored habitat and wildlife such as coyote, which are susceptible to disturbance from dogs.

### **Sweeney Ridge / Cattle Hill**

Alternative D was chosen as the environmentally preferable alternative. Alternative D would not allow dog walking at Sweeney Ridge or Cattle Hill. Alternative D would provide maximum protection to the rare, relatively undisturbed, contiguous wildlife habitat and eliminates disturbance to wildlife and vegetation. This alternative also protects habitat of special-status species and habitat restoration areas.

### **Pedro Point Headlands**

Alternative D was chosen as the environmentally preferable alternative. Alternative D would not allow dog walking at Pedro Point. Alternative D would provide maximum protection to the contiguous wildlife habitat and eliminate disturbance to wildlife and vegetation. This alternative also protects habitat of potential special-status species and habitat restoration areas.

### **Rancho Corral de Tierra**

Alternative D was chosen as the environmentally preferable alternative. Alternative D would limit on-leash dog walking to the two existing San Mateo County trails in the Montara area of the site: Old San Pedro Mountain Road and Farallon Cutoff. Alternative D would provide the greatest protection for resources and to the contiguous habitat, while still allowing some dog walking access.

## **NATIONAL PARK SERVICE PREFERRED ALTERNATIVE (F)**

A preferred alternative was selected for each of the 21 sites identified in the draft plan/SEIS and the additional site now included, Rancho Corral de Tierra. Due to the high number of sites and alternatives, a modified choosing by advantages process was used for choosing the preferred alternative for each site in the draft plan/EIS. The choosing by advantages workshop took place May 26–27, 2010. A similar process was used for selecting the preferred alternative at Rancho Corral de Tierra. For each site, team members from GGNRA selected the alternative that best met the objectives of the plan (defined in chapter 1). Six main objectives were used to identify the preferred

---

*A preferred alternative  
was selected for each  
of the 22 sites  
identified in this draft  
plan/SEIS.*

---

alternative. Each objective included more than one subtopic for the resource. Not all of the subtopics for each objective were compatible, requiring team members to balance competing needs. After evaluating each alternative against each objective, a preferred alternative was selected that best met the objectives for the dog management plan. In addition, a preferred alternative was selected for the handling of permits at GGNRA. To ensure consistency of the permitting process within the park, it would be applied to applicable park sites for alternatives that would include permits. Alternative C was selected as the preferred alternative for permits. This alternative states that all dog walkers, including commercial dog walkers, are allowed up to three dogs per person. Commercial dog walkers and private individuals with more than three dogs can obtain a dog walking permit; however the limit is six dogs. In a ROLA, permit holders may have up to six off-leash dogs. Permits would restrict use by time and area. Permits would only be issued for: Alta Trail, Rodeo Beach, Fort Baker, Upper Fort Mason, Crissy Field, Baker Beach, and Fort Funston. This alternative provides a variety of park sites for visitors with more than three dogs to experience GGNRA.

### **Public Comment on the Draft Plan/EIS**

The draft plan/EIS, which contained a range of alternatives, including a preferred alternative for each of the original 21 park sites addressed by the plan, was made available to the public for review from January 14, 2011 through May 30, 2011. In total, 4,713 correspondences were received and reviewed. Due to the high number of correspondence received and the substance of many of those correspondences, a workshop with the GGNRA interdisciplinary team and senior NPS staff from outside the park took place from September 13, 2011, through September 16, 2011, to discuss possible changes to the preferred alternatives as suggested by the public. Additional meetings and conference calls were held to evaluate new studies and data and determine how this might change impacts analysis and alternatives. Two of the goals of GGNRA dog management planning were to allow dog walking while providing a variety of visitor uses and experiences, and reducing visitor conflicts at GGNRA park sites. GGNRA received

multiple public comments requesting that the park sites allow balanced use, including opportunities for dog walking both on and off leash, and also numerous complaints about both on-leash and off-leash dog walking. While GGNRA does not seek to ban dog walking, allocation of space to allow use by a variety of user groups in such a way as to ensure visitor health, safety, and enjoyment is a primary NPS management responsibility, and well within NPS agency discretion. The NPS Organic Act directs the Secretary of the Interior to conserve the natural elements of the parks for the future, provide for the enjoyment of the parks, and manage the parks “in light of the high public value and integrity of management of the parks” (16 USC Section 1a-1). GGNRA’s enabling legislation is similar, and not only incorporates the NPS Organic Act by reference, but also states that the Secretary of the Interior “shall utilize the resources in a manner which will provide for recreation and educational opportunities consistent with sound principles of land use planning and management. In carrying out the provisions of this subchapter, the Secretary shall preserve the recreation area, as far as possible, in its natural setting, and protect it from development and uses which would destroy the scenic beauty and natural character of the area” (16 USC, Section 460bb). The following discussion identifies the preferred alternative for each site and the rationale to support the decision. Suggestions made by the public were taken into consideration. The preferred alternatives for some sites were changed to incorporate the public’s comments and ideas which met the plan objectives. Some suggestions such as creating ROLAs on trails, and completely enclosing ROLAs with fences or barriers that would contain off-leash dogs were determined to not be feasible or to not meet plan objectives, and were dismissed from further analysis. Explanations for the dismissal of these suggestion are explained in more detail in the section titled “Alternative Elements Eliminated from Further Consideration” above.

### **Stinson Beach**

Alternative C was originally chosen as the preferred alternative for Stinson Beach; however, after reviewing public comments, the preferred alternative was slightly modified to establish an on-leash path or corridor on the north end of Stinson Beach to provide legal access to Upton Beach, which is the Marin County-managed section of Stinson Beach where dog walking is allowed. This access trail would include fencing or a barrier to separate this trail from the GGNRA beach where dogs are prohibited. The preferred alternative would stay consistent with 36 CFR 2.15, which states that dog walking is prohibited on a designated NPS swimming beach. Designated swimming beaches are those that the park has identified (using signs, brochures etc.) as available to the public for contact recreational water activities. Therefore, on-leash or off-leash dog walking would not be allowed on the GGNRA portion of beach, but would remain available on the county section of Stinson beach immediately adjacent to the GGNRA portion. On-leash dog walking would be allowed within the GGNRA parking lots and picnic areas. Overall, the preferred alternative would provide multiple visitor experiences, including on-leash dog walking, protect park resources, and would be easily explainable and enforceable by park law enforcement staff.

### **Homestead Valley**

Alternative C was chosen as the preferred alternative for Homestead Valley. Alternative C would allow dog walking that is clearly defined, easily understood by visitors and enforceable by park law enforcement staff. On-leash dog walking would be allowed on the Homestead Fire Road and the neighborhood connector trails (Homestead Trail and Homestead Summit Trail) that will be formally established in the future. Natural resources within the Homestead Valley site include coyotes, spotted owls, rare native grassland, and coastal scrub. Requiring leashes would prevent dogs from entering habitats along the trail corridors. ROLAs would not be allowed due to the presence of wildlife and wildlife habitat; it would be difficult to prevent dogs from entering wildlife habitat. Homestead Valley, although easily accessible off a major local highway, does not have sufficient parking areas to support visitation to a formalized ROLA. In addition, as discussed above, ROLAs on trails and fire roads create safety concerns. Local visitors looking for an off-leash dog walking opportunity could use the adjacent

network of trails managed by the Homestead Valley Trust on the eastern boundary of the site where off-leash dog walking is allowed.

Overall, the preferred alternative would provide multiple visitor experiences, including on-leash dog walking, would protect park resources, and would be easily explainable and enforceable by park law enforcement staff.

### **Alta Trail / Orchard Fire Road / Pacheco Fire Road**

Alternative C was originally chosen as the preferred alternative for Alta Trail/Orchard Fire Road/Pacheco Fire Road; however, after reviewing public comments the preferred alternative was modified to extend on-leash dog walking on the Alta Trail south to the junction with the Morning Sun Trail. On-leash dog walking would continue on the Orchard and Pacheco fire roads. Dog walking requiring a permit (more than three dogs) would be allowed on the Alta Trail, but permit holders would only be allowed as far as the junction with the Orchard Fire Road. The preferred alternative for the Alta Trail site provides dog walking opportunities to visitors while being protective of mission blue butterfly habitat in that the leash requirement would prohibit dogs from entering mission blue butterfly habitat. Additional fencing to protect the mission blue butterfly habitat would be added as needed; particularly along the section of Alta Trail between the junction with Pacheco Fire Road and the junction with the Oakwood Valley Trail. The preferred alternative also provides protection for contiguous habitat with little fragmentation where dogs can impact top predators such as coyotes. A full loop trail within the site, beginning and ending at the top of Donahue Street is not feasible since it would require GGNRA to create a new trail to create the loop in the northern portion of the site which contains mission blue butterfly habitat. Currently a social trail makes that connection but because it goes through mission blue butterfly habitat, it would not be formalized. The park would monitor the area to ensure that park users do not use the social trails off Alta Trail so that the mission blue butterfly habitat is protected.

ROLAs would not be established on the Alta Trail or on Pacheco or Orchard Fire Road. Alta Trail is heavily used by commercial dog walkers. Allowing off-leash dog walking, particularly at a site regularly used by commercial dog walkers, could inhibit use of the site by other visitors as they would have to travel through a ROLA in order to use the trail or access the interior sections of the Marin Headlands. In addition, allowing off-leash dog walking would impact the mission blue butterfly and its habitat. NPS *Management Policies 2006* require that NPS “ensure that conservation will be predominant when there is a conflict between the protection of resources and their use” (NPS 2006a). A ROLA is inappropriate in areas where there is core habitat, including habitat for listed species, which can be harmed by off-leash dogs.

Overall, the preferred alternative would provide multiple visitor experiences, including on-leash dog walking, would protect park resources, and would be easily explainable and enforceable by park law enforcement staff.

### **Oakwood Valley**

Alternative C was originally chosen as the preferred alternative for Oakwood Valley; however, after reviewing public comment, the preferred alternative was modified to allow on-leash dog walking along the Oakwood Valley Fire Road. On-leash dog walking would also be allowed on the Oakwood Valley Trail from its junction with the Oakwood Valley Fire Road to the junction with the Alta Trail. Permitted dog walking allowing more than 3 dogs per walker would not be allowed at this site. On-leash dog walking would provide protection to the sensitive species and habitat located along the trails. A no dog walking experience would be allowed on the portion of the Oakwood Valley Trail from the trailhead at Tennessee Valley Road to the junction with the Oakwood Valley Fire Road.

ROLAs would not be established at Oakwood Valley because ROLAs would allow dogs to enter sensitive habitat. Protective fencing along trails, and double gates at either end of the ROLA to contain off-leash dogs would not be installed to allow a ROLA because it would also impede the movement of wildlife and interfere with the use of the trail by other users, such as equestrians and bicyclists. The park also finds that ROLAs on trails and fire roads would inhibit some park users and create safety hazards as discussed previously. In addition, sufficient parking is not available to support a formalized ROLA as visitation could increase once the new dog walking regulation for GGNRA is finalized and the GGNRA ROLAs become more widely known.

Overall, the preferred alternative would provide multiple visitor experiences, including on-leash dog walking, protect park resources, and would be more easily explainable and enforceable by park law enforcement staff.

### **Muir Beach**

Alternative D was originally chosen as the preferred alternative for Muir Beach; however, after considering public comments the preferred alternative was modified to allow on-leash dog walking along the connecting bridge, on the beach and on the proposed Muir Beach Trail. Fencing would be installed along the dunes and the lagoon to protect the natural resources in these areas. The fencing would act as a visible barrier, but would not completely exclude dogs from the area, as this type of fencing would be inappropriate at Muir Beach and not sustainable due to tidal action. Allowing on-leash dog walking on the beach and installing visual barriers would enable the park to manage the area in order to restore, protect, and sustain the wetlands, creeks, dunes, and lagoon. The preferred alternative would also provide protection for the shorebirds, California red-legged frog, steelhead trout, coho salmon, and other wildlife in the area. Allowing on-leash dog walking on the beach would protect the visitor experience and enhance visitor safety, as dogs are under control on a 6-foot leash.

A ROLA would not be established at Muir Beach. Muir Beach is a small site and there is not sufficient space to allow multiple visitor use areas on the beach (i.e., a ROLA and no-dog area). In addition, the fencing installed along the dunes and lagoon would only act as a visible barrier and would not protect resources as off-leash dogs would still be able to access these sensitive habitats. NPS *Management Policies 2006* require that NPS “ensure that conservation will be predominant when there is a conflict between the protection of resources and their use” (NPS 2006a). A ROLA is inappropriate in areas where there is habitat for listed species which can be harmed by off-leash dogs. There is some limited availability for off-leash dog walking, on the beach below the adjacent neighborhood, a small county beach (Little Beach) adjacent to the NPS beach. Visitors could access Little Beach by walking their dogs on leash across Muir Beach. However, Rodeo Beach, in southern Marin, much, larger than Muir Beach, is available for off-leash dog walking in Marin County. Overall, the preferred alternative would provide for multiple visitor experiences, including on-leash dog walking, protect park resources, and would be easily explainable and enforceable by park law enforcement staff.

### **Rodeo Beach / South Rodeo Beach**

Alternative C was originally chosen as the preferred alternative for Rodeo Beach. After reviewing public comments the preferred alternative was modified to extend the ROLA the entire length of the main beach, from the northern boundary of the beach south to the sea stacks dividing the main beach from South Rodeo Beach. Allowing a ROLA at Rodeo Beach would provide a large, wide beach area for an extensive off-leash dog experience in Marin County. Compared to other beaches within Marin County, shorebird counts along the beach are considered low, which allows a ROLA with minimal disturbance to shorebirds. Fencing would be installed when funding becomes available through another park project from the footbridge across the western edge of Rodeo Lagoon, providing protection for that sensitive

habitat; the fencing was approved as part of the Marin Headlands transportation plan. During marine mammal strandings and releases, the beach area would be closed off to the public. This site is considered a low conflict area and due to the large size of the beach, other users such as school groups would continue to safely use the area without conflicts. On-leash dog walking on the footbridge to the beach would provide safe access for visitors with and without dogs to the beach area.

The preferred alternative would provide a separate beach area, South Rodeo Beach, for a no-dog experience. This beach is accessed through a separate trail off the parking area near the Batteries Loop Trail. A project to repair and improve the access trail to this beach will be completed in 2013. Allowing a no-dog beach experience would benefit children groups such as those from the Point Bonita Young Men's Christian Association that frequently use this area. Eliminating dog walking from South Rodeo Beach also provides resource protection on the section of beach closest to Bird Island.

Overall, the revised preferred alternative would provide for multiple visitor experiences, including on-leash and voice- and sight-control dog walking, would protect park resources, and be easily explainable and enforceable by park law enforcement staff.

### **Marin Headlands Trails**

Alternative C was originally chosen as the preferred alternative for Marin Headlands Trails. After reviewing public comments the preferred alternative was modified to add on-leash dog walking on the Rodeo Avenue and Morning Sun Trails which both connect with the Alta Trail, allowing on-leash dog walking from the Morning Sun Trail or Rodeo Avenue trailheads to the end of Alta Trail at Donahue Street, above Marin City. This would provide additional on-leash dog walking mileage and increased access for nearby neighborhoods. On-leash dog walking would be allowed on the Lower Rodeo Valley trail corridor, (from the Rodeo Beach parking lot to the intersection of Bunker and McCullough Roads via the North Lagoon Loop Trail, Miwok Trail, and Rodeo Valley Trail); the Old Bunker Fire Road Loop and the Batteries Loop Trail. On-leash dog walking would be generally restricted to the perimeter of the Marin Headlands in order to protect the large area of relatively undisturbed habitat in the Marin Headlands interior. A no-dog experience would be available on the interior trails in this area. The central or core area of the Marin Headlands, including Tennessee Valley, is being managed to protect a large area of relatively undisturbed, contiguous habitat that contains wildlife that could be disturbed by the presence of dogs. Dog walking, whether on leash or under voice and sight control is not protective of this core habitat and is therefore not permitted in the central portion of the site.

ROLAs would not be established within the Marin Headlands. NPS *Management Policies 2006* require that NPS "ensure that conservation will be predominant when there is a conflict between the protection of resources and their use" (NPS 2006a). A ROLA is inappropriate in areas where there is core habitat, including habitat for listed species and habitat, which can be harmed by off-leash dogs. The park also finds that ROLAs on trails and fire roads would create safety hazards as discussed previously, and could inhibit use of trails by visitors who prefer to experience the park without dogs. Visitors wanting to walk dogs off leash would be able to use the large ROLA on Rodeo Beach nearby. Overall, the preferred alternative would provide for multiple visitor experiences, including on-leash dog walking, protect park resources, and would be easily explainable and enforceable by park law enforcement staff.

### **Fort Baker**

Alternative C was chosen as the preferred alternative for Fort Baker because it would best meet the objectives of the plan. On-leash dog walking would be allowed on the Drown Fire Road, Bay Trail including the Battery Yates Loop Road, the Vista Point Trail, anticipated to be completed in 2014, the Lodge and Conference Center grounds and the parade ground. The preferred alternative provides a variety

of areas for dog walking that could be clearly described and enforced by park law enforcement staff. Alternative C provides protection for the mission blue butterfly habitat including the unfenced habitat near Battery Yates and the fenced habitat adjacent to the Chapel Trail. The Drown Fire Road is a wide trail with fencing that provides a visual barrier, separating the fire road from the adjacent mission blue butterfly habitat. Dogs being walked on a 6-foot leash would be unlikely to access this important habitat. Alternative C provides some areas with a no-dog experience such as the waterfront, which is currently popular for visitors and is anticipated to have an increase in visitation in the future when that section of Fort Baker is improved. Overall, alternative C would provide the most opportunity for multiple user groups.

ROLAs would not be established at Fort Baker. Creating a ROLA on the parade ground would be incompatible with the historic district and could impact the visitor experience in the historic area. ROLAs on trails and fire roads would create safety hazards and could inhibit other user groups as discussed previously. ROLAs would also create impacts to mission blue butterfly habitat located along the Drown Fire Road and at Battery Yates.

### **Upper and Lower Fort Mason**

Alternative B was originally chosen as the preferred alternative for Upper Fort Mason. After reviewing public comments the preferred alternative was modified to establish a ROLA on Laguna Green, a grassy area on the southwest portion of Fort Mason with no sensitive habitat, largely separated from the main Fort Mason area by a barrier, so that the use is not likely to impact other user groups. Either fencing or a vegetative barrier would be installed to further separate the ROLA from the remaining on-leash dog walking areas and to prevent dogs from entering the road. All other areas, including Lower Fort Mason, Great Meadow, the lawn below the Laguna Street path, parking areas, lawns, sidewalks, paved trails, and open areas around housing would remain available for on-leash dog walking. A no-dog experience would be available, on the lawn area below the Officer's Club, the parade ground and within the Community Garden.

Although the 1979 Pet Policy required on-leash dog walking at Fort Mason, the dog management plan re-evaluates dog walking in consideration of numerous factors (see chapter 1). One management objective of the plan is to allow a mix of visitor uses and experiences where appropriate. While Fort Mason is not an environmentally sensitive area relative to other sites, the site is heavily used. It contains park headquarters, an international hostel, the Community Garden, is used for social and special events, and is heavily used for local and tourist pedestrian and bicycle transit. Allowing off-leash dog walking throughout Fort Mason is neither practical nor appropriate given the many other uses at the site and the potential for impacts to cultural resources.

The Great Meadow and adjacent path receives high use by bicyclists, picnickers, and casual recreators. Establishing a ROLA within this area would create safety hazards for multiple visitor uses. Creating a ROLA within the parade ground would also be inappropriate. It is likely that cultural artifacts exist within the parade ground since the area was the central portion of the early fort. Recently, human remains were uncovered during restoration of the former post hospital, directly adjacent to the parade ground. Creating a ROLA would create a risk of dogs digging within the area and disturbing or damaging unknown cultural resources.

### **Crissy Field**

Alternative C was originally chosen as the preferred alternative for Crissy Field. After reviewing public comments the preferred alternative was slightly modified to add fencing and address ADA accessibility to

the Central Beach ROLA, add on-leash dog walking on the grassy areas around the old Coast Guard station, and move the ROLA to the eastern portion of the airfield.

Overall, the revised preferred alternative would provide the best option for multiple user groups to experience the site, including on-leash dog walking, dog walking under voice and sight control, and a no-dog experience. It is anticipated that clear geographic boundaries would aid visitor understanding and compliance with the regulations. Since the preferred alternative provides multiple dog walking options, it would be easy for park staff to direct park users to a section of this site that meets their use needs.

The preferred alternative would include no dogs within the WPA to provide maximum protection for the western snowy plover and other shorebirds and listed species. No dogs would be allowed on East Beach, which is nearest to the parking facilities and frequently used by families with small children and other user groups including windsurfers, kiteboarders, sunbathers, and picnickers. Allowing dog walking within this area could impact the visitor experience of the many varied groups that use this section of Crissy Field. In addition, East Beach is very crowded on weekends and good weather days, which could cause safety concerns. The no-dog area on East Beach would include the adjacent mouth of the Crissy Lagoon, which would keep dogs from accessing the lagoon via the outlet. Dogs would continue to not be allowed within public buildings, including the restrooms and the adjacent shower; however, they would be allowed to use the newly installed dog rinse station.

Although portions of Crissy Field contain coastal native dune communities that provide an important and unique habitat, ROLAs would be established on the eastern portion of the airfield and Central Beach where natural resources are limited or protected by barriers. On the airfield, a ROLA would be established on the eastern section between the easternmost north/south path and the path along the west end of the Crissy Marsh. If a fence is determined to be needed through monitoring, it would be installed to delineate the east end of the airfield ROLA. Limiting the ROLA to the eastern portion of the airfield allows an on-leash experience on the airfield for visitors who would rather walk their dogs on leash and for visitors who do not wish to be around off-leash dogs. In addition, the ROLA on the airfield could be closed during special events in order to allow multiple visitor uses at the site; however, special events most often take place on the western half of the airfield. A ROLA would also be established on Central Beach. Central Beach has been designated as a ROLA because it does not provide as suitable a habitat for shorebirds as does the beach in the WPA. Central Beach also receives less use by visitor groups other than dog walkers and it offers a sizeable stretch of beach for dogs to exercise. Fencing would be maintained around the dunes bordering Central Beach and added at the east edge of the Central Beach ROLA. Fencing would provide a buffer between the ROLA and East Beach, including the marsh outlet, where dog walking would be prohibited. Fencing would also protect vegetation, wildlife, and wildlife habitat. If funding is available, an accessible beach mat similar to those used elsewhere in GGNRA would be installed to provide access to the ROLA on the Central Beach. The ROLAs established at this site would allow dog walkers two separate environments for off-leash dog walking, a portion of the grassy area of the airfield and the entire central portion of the beach.

The preferred alternative would allow on-leash dog walking on the Promenade, which would provide visitor safety and resource protection. On-leash dog walking is necessary for the safety of all visitors and dogs because the Promenade receives high use by many user groups including walkers of all ages, joggers, bicycles, children, and parents with strollers. On-leash dog walking on this trail is appropriate due to the high, multiple uses of the Promenade. On-leash dog walking along the Promenade and the access trails to Central Beach would give dog walkers access to the ROLA on Central Beach. The central and western sections of the airfield would also be available for on-leash dog walking. The trails and grassy areas near East Beach, the grassy areas around the old Coast Guard station, and the Mason Street Bike Path and the East Beach parking lot would also require dog walking on leash. The on-leash regulation in these areas would benefit the safety of both visitors and pets and reduce conflicts in the area.

The preferred alternative is consistent with the GGNRA GMPA and the Final Recovery Plan for the Western Snowy Plover, and amends the Crissy Field EA. Commenters have noted that the preferred alternative is inconsistent with the Crissy Field EA, which provided up to 70 acres of off-leash use. However, the Crissy Field EA was a broad planning document initiated at the beginning of the Crissy Field redevelopment and restoration project, before clear user patterns and preferences could be known, and before GGNRA began a comprehensive review of dog management for its managed lands. Now that GGNRA has managed the restored Crissy Field for a decade, visitation patterns, user complaints, natural resources, and enforcement issues have been noted and it is clear that dog walking is a use that must be balanced with other competing uses within this extremely popular area.

### **Fort Point Promenade / Fort Point National Historic Site Trails**

Alternative B was chosen as the preferred alternative for Fort Point because it would best meet the objectives of the plan. Alternative B would provide on-leash dog walking on the Fort Point Promenade, Battery East Trail, Andrews Road, Presidio Promenade, and the small grassy area near the parking lot restroom. The on-leash regulation would provide visitor safety in an area of high congestion and multiple uses. It would also provide safety to dogs and dog walkers on the Fort Point Promenade due to the close proximity of the roadway and the edge of the seawall. A no-dog experience would continue to be available on the pier and within the fort itself. Fort Point is a relatively small site with few trails; therefore, it is a challenge to divide the trails to provide different experiences. Although there are parallel trails at Fort Point that could be managed differently, because the loops intersect one another it would be confusing to the public if some trails were designated as no-dog areas. The nearest no-dog trail to the Fort Point site is the Batteries to Bluff trail to the west of the Golden Gate Bridge. Alternative B provides a reasonable approach for the multiple user groups at the site and provides clear regulations that would be easily enforceable by park law enforcement staff. ROLAs would not be established at Fort Point. The park finds that ROLAs on trails and fire roads would create safety hazards and could inhibit other user groups as discussed previously. In addition, there is no beach available for establishment of a ROLA at Fort Point because the shoreline of the Fort Point site is a rock seawall and the small beach located west of the historic fort is not open for public use.

### **Baker Beach and Bluffs to Golden Gate Bridge**

Alternative D was chosen as the preferred alternative for Baker Beach because it would best meet the objectives of the plan. Alternative D would allow on-leash dog walking on the beach south of the North Parking Lot. On-leash dog walking would also be allowed on the trails to the beach south of the north parking lot, on the Coastal Trail, and within the picnic areas and parking lots. Dog walking would not be allowed on the section of beach north of the North Parking Lot or on trails accessing the north section of Baker Beach. Restricting dogs from this area would provide a no-dog experience to visitors who prefer to not be within the vicinity of dogs while enjoying their beach experience. Alternative D provides areas for different user groups and direct visitor access to the no dog area. Alternative D also provides the greatest protection for shorebirds on the beach.

A ROLA would not be established at Baker Beach. Use of this site by dog walkers is relatively low and the park does not see a definite need for a ROLA at this location, since there are ROLA options available on nearby San Francisco beaches. Additionally, the southern portion of the beach where the preferred alternative allows on-leash dog walking is inappropriate for a ROLA because of high shorebird activity. *NPS Management Policies 2006* require that NPS “ensure that conservation will be predominant when there is a conflict between the protection of resources and their use” (NPS 2006a). A ROLA is inappropriate in areas where there is habitat for listed species which can be harmed by off-leash dogs. Baker Beach is also the only beach in San Francisco that would provide an on-leash dog walking opportunity along the beach; all other beaches are either designated as a ROLA or no dog area. Some

visitors may prefer to walk dogs on leash on a beach designated as “on leash only” rather than within a ROLA. In addition, visitors using guide dogs would be able to experience a beach on the ocean without encountering off-leash dogs, which can negatively impact both the visitor and his or her guide dog. A ROLA on the Presidio Coastal Trail would also be inappropriate because the park finds that ROLAs on trails and fire roads would create safety hazards and could inhibit use by other user groups as discussed previously. Overall, the preferred alternative would provide for multiple visitor experiences, including on-leash dog walking, protect park resources, and would be easily explainable and enforceable by park law enforcement staff.

### **Fort Miley**

Alternative C was chosen as the preferred alternative for Fort Miley because it would best meet the objectives of the plan. Alternative C would allow on-leash dog walking in the east side trail corridor at East Fort Miley. The on-leash requirement in that area would provide safety for visitors and staff given the adjacent park maintenance operations area, in concrete bunkers surrounded by steep embankments. Alternative C in East Fort Miley also provides both a dog and no-dog experience for visitors. No dogs would be allowed in West Fort Miley. This would provide a no-dog experience for special use groups at that site such as school groups, Ropes Course participants, picnickers and birders. Overall alternative C would provide additional safety for visitors with dogs, given the site’s traffic due to both construction and hospital workers and patients from the adjacent VA hospital.

ROLAs would not be established at Fort Miley because the park finds that ROLAs on trails and fire roads would create safety hazards and could inhibit other user groups as discussed previously.

Overall, the preferred alternative would provide for multiple visitor experiences, including on-leash dog walking, protect park resources, and would be easily explainable and enforceable by park law enforcement staff.

### **Lands End**

The preferred alternative would allow on-leash dog walking on El Camino del Mar Trail and the Lands End Coastal Trail and on connecting trails and stairs. This area has been improved, and visitation has increased, due to the new visitor center, accessible trail, and additional parking; therefore, on-leash dog walking is more appropriate than a ROLA. On-leash dog walking would also increase visitor safety on the heavily used/ADA accessible restored section of the Lands End Coastal Trail.

A ROLA would not be established at Lands End, which is consistent with the park not allowing ROLAs on trails as described previously.

Overall, the preferred alternative would provide for multiple visitor experiences, including both on-leash dog walking and no dog areas, protect park resources, and would be easily explainable and enforceable by park law enforcement staff.

### **Sutro Heights Park**

Alternative E was chosen as the preferred alternative because it would best meet the objectives of the plan. Alternative E allows the most dog walking access, with on-leash dog walking on the paths, parapet, and lawns within Sutro Heights Park. This alternative would be easily enforceable since it is clear, straightforward, and easy to understand. Dog walking would not be allowed within the formal, landscaped gardens. Areas for a no-dog experience would not be available due to the small size of the site. A no-dog experience would be available on the no-dog trails at Lands End, adjacent to Sutro Heights Park.

A ROLA would not be established at Sutro Heights Park. Historically this site has always been designated as an on-leash area. Allowing off-leash dog walking areas within the formal gardens is not compatible with the desired visitor experience or desired conditions at the site. In addition, the park has received multiple complaints from neighborhoods about off-leash dogs within the formal planted areas. This draft plan/SEIS would result in the establishment of a large ROLA on the north end of Ocean Beach, a short distance from this site.

Overall, the preferred alternative would provide for multiple visitor experiences, including on-leash dog walking, protect park resources, and would be easily explainable and enforceable by park law enforcement staff.

### **Ocean Beach**

Alternative C was chosen as the preferred alternative because it would best meet the objectives of the plan. Alternative C would provide for multiple visitor opportunities.

Alternative C would establish a large ROLA on the beach between Stairwell 21 and the north end of Ocean Beach. This northern portion of the beach is appropriate for a ROLA because of the lower density of shorebirds and, in spite of its high use largely due to ease of visitor access, the beach is wide enough to accommodate multiple uses. On-leash dog walking would also be allowed on the Ocean Beach Trail along the Great Highway, on the east side of the dunes adjacent to the SPPA. No dog walking would be allowed along the beach within the SPPA, between Stairwell 21 and Sloat Boulevard. The beach within this area is an important shorebird habitat. Populations of the federally threatened western snowy plover occur south of Lincoln Way, specifically between July and May. The preferred alternative would provide maximum protection of shorebirds within the SPPA, including the federally threatened western snowy plover. Dog walking would also be prohibited south of Sloat Boulevard to the boundary with Fort Funston, as this area also has high shorebird activity compared to other beaches within GGNRA (Beach Watch 2009) and the beach is very narrow. This also provides continuity with management of dog walking no-dog experience on the northern section of the Fort Funston beach.

Overall, the preferred alternative would provide for multiple visitor experiences (including both on- and off-leash dog walking), would protect park resources, and would be easily explainable and enforceable by park law enforcement staff.

### **Fort Funston**

Alternative C was originally chosen as the preferred alternative. However, after reviewing public comments the preferred alternative was modified to increase the size of the upland ROLA, which would provide a more functional loop connecting the upland and beach ROLAs. The revised upland ROLA would be a corridor from just north of the new trail (to be built along the northern edge of the parking lot) that extends to, and includes the Funston Beach Trail North. The ROLA corridor would include the Chip Trail and sections of the Sunset Trail, Funston Road, and Battery Davis Trail – all north of the parking lot. The ROLA would also extend into the disturbed area across from the Funston Beach Trail North. The ROLA would be separated by barriers from the trail along the northern edge of the parking lot and no dog trails/areas. In order to provide more ROLA accessibility for the elderly and disabled, the surface of the Chip Trail would be hardened. For those needing a hardened surface but preferring to experience the area without dogs off-leash, the Sunset Trail, with its hardened surface, would allow dogs on leash and would not be included within the ROLA.

The beach ROLA would extend south of the Funston Beach Trail North to the Fort Funston boundary. Together, the two ROLAs would provide the majority of a loop trail (completed by the on-leash use of the

Funston Beach Trail South- sand ladder), and a large amount of space to avoid overcrowding. The ROLAs would be connected by the Funston Beach Trail South (sand ladder), where on-leash dog walking would be required for safety reasons related to the adjacent hang glider area and visitor safety on the sand ladder. The park would use fencing or natural barriers to separate the upland ROLA from the main parking lot, the adjacent trails where dog walking is not allowed (Funston Horse Trail and trail to Battery Davis) and the adjacent on-leash trails (sections of the Sunset Trail).

On-leash dog walking would be available on the trails south of the main parking lot, the Funston Beach Trail South (sand ladder) and Sunset Trail south of the parking lot, and trails north of the main parking lot, the Sunset Trail north of the Funston Beach Trail North and the trails leading up from the John Muir parking lot. The on-leash, on-trail requirement for these trails provides an on-leash visitor experience, protection for the restored habitat areas and separation from areas in the southern section of Funston used by school groups and by the GGNRA maintenance staff who work at the Fort Funston facility.

In order to protect shorebirds, coastal bluffs, and bank swallows on the northern beach and to provide a no-dog experience on the beach, no dog walking would be permitted on the beach north of the Funston Beach Trail North. In addition, no dogs would be allowed along the Funston Horse Trail to provide a no-dog visitor experience and protect restored habitat and the wildlife corridor.

GGNRA has sought to provide a balanced mix of visitor uses and experiences throughout the 22 areas addressed in this draft plan/SEIS, including Fort Funston. The revised preferred alternative would provide on-leash dog walking, off-leash dog walking, and no-dog experiences at this site. Fort Funston has the highest number of dog walkers of all the sites addressed by the dog management plan, thus the preferred alternative was adjusted to allow more access to dog walkers, while still providing a mix of visitor experiences, reducing visitor conflicts, and ensuring resource protection. No dogs on the Funston Horse Trail would also reduce the possibility of dog/horse conflicts at the site.

Overall, the preferred alternative would provide for multiple visitor experiences, including on and off-leash dog walking, protect park resources, and would be explainable and enforceable by park law enforcement staff.

### **Mori Point**

Alternative C was originally chosen as the preferred alternative for Mori Point. However, after reviewing public comments, the preferred alternative was slightly modified to add the Pollywog Trail as an on-leash trail. The preferred alternative provides adequate space for multiple user groups and provides access to the site from the adjacent neighborhood. This alternative would allow on-leash dog walking on the Mori Coastal Trail, Old Mori Trail, Pollywog Trail and the beach within the GGNRA boundary. On-leash dog walking along these trails would give dog walkers direct access from the neighborhood and would provide a variety of trail options, while still allowing a no-dog experience for other visitors. In addition, the Pollywog Trail and Old Mori Trail were improved to provide accessibility for elderly or disabled visitors. Fencing would be installed along the Pollywog Trail to provide protection for the federally threatened California red-legged frog. No dogs would be allowed on the Timigtac, Lishumsha, Upper Mori, Mori Bluff, and Mori Headlands Trails. This would provide a variety of no-dog experiences and would protect the sensitive resources at the site. The site would be clearly signed and would be easily enforceable by park rangers and law enforcement.

No ROLAs would be established at this site in order to protect the listed species in the area including the California red-legged frog and San Francisco garter snake. NPS *Management Policies 2006* require that NPS “ensure that conservation will be predominant when there is a conflict between the protection of resources and their use” (NPS 2006a). A ROLA is inappropriate in areas where there is habitat for listed

species that can be harmed by off-leash dogs. In addition, ROLAs would not be established on trails or fire roads to avoid creating safety hazards and inhibiting other user groups as discussed previously.

Overall, the preferred alternative would provide for multiple visitor experiences, including on-leash dog walking, protect park resources, and would be easily explainable and enforceable by park law enforcement staff.

### **Milagra Ridge**

Alternative C was chosen as the preferred alternative for Milagra Ridge. The preferred alternative provides both a dog and no-dog experience at the site by allowing on-leash dog walking on the Fire Road, the trail to the western-most overlook and WW II bunker, and the Milagra Battery Trail (future connector to lower Milagra) and a no-dog experience on the Milagra Ridge Road and the Milagra Ridge Spur which, together, extend across the site. This alternative provides protection for species and is consistent with the parkwide policy regarding mission blue butterfly habitat areas. The preferred alternative would reduce further fragmentation of the habitat at this site.

A ROLA would not be established at Milagra Ridge as this would be inconsistent with the park not allowing ROLAs on trails, as described above. In addition, a ROLA would not provide sufficient protection for the mission blue butterfly habitat, California red-legged frogs, San Francisco garter snake, and other wildlife such as coyotes and bobcats occurring at the site. *NPS Management Policies 2006* require that NPS “ensure that conservation will be predominant when there is a conflict between the protection of resources and their use” (NPS 2006a). A ROLA is inappropriate in areas where there is core habitat, including habitat for listed species and habitat, which can be harmed by off-leash dogs.

Overall, the preferred alternative would provide for multiple visitor experiences, including on-leash dog walking, protect park resources, and would be easily explainable and enforceable by park law enforcement staff.

### **Sweeney Ridge / Cattle Hill**

Alternative C was originally selected as the preferred alternative for Sweeney Ridge and Cattle Hill. After reviewing public comments and resource information, the preferred alternative was modified to add on-leash dog walking at Sweeney Ridge on Sneath Lane and on the Sweeney Ridge Trail between the Portola Discovery Site and Nike Missile Site. Both of these trails are old roads, mostly paved and are located on the perimeter of the core habitat, and not directly adjacent to mission blue butterfly habitat. On-leash dog walking would also be allowed at Cattle Hill on the Baquiano Trail from Fassler Avenue to, and including, the Farallon View Trail. No dog walking would be allowed on the Baquiano Trail beyond the Farallon View Trail, Sweeney Ridge Trail north of the Nike Missile Site and south of the Portola Discovery Site, Notch Trail, Sweeney Horse Trail, or Sweeney Meadow Trail. These trails pass through areas of core habitat, mission blue butterfly habitat, and habitat for a diverse array of wildlife. Dog walking in this area would conflict with a primary NPS mandate to protect resources. This site is contiguous with the San Francisco watershed, which is closed to public access, including dog walking. The preferred alternative would be clear to the public and would be easily enforceable by park law enforcement staff.

ROLAs would not be established at the Sweeney Ridge and Cattle Hill site. The Sweeney Ridge site contains core habitat, mission blue butterfly habitat, and a diversity of wildlife as confirmed by recent surveys. The majority of the Cattle Hill and Sweeney Ridge site is managed to protect endangered species and the core habitat created by the large contiguous natural landscape extending into the San Francisco Public Utilities Commission Peninsula Watershed. *NPS Management Policies 2006* require that NPS

“ensure that conservation will be predominant when there is a conflict between the protection of resources and their use” (NPS 2006a). A ROLA is inappropriate in areas where there is core habitat, including habitat for listed species, which can be harmed by off-leash dogs. In addition, establishing ROLAs at these sites would be inconsistent with the park not allowing ROLAs on trails as described above.

GGNRA seeks to provide a mix of visitor uses and experiences at the Cattle Hill and Sweeney Ridge site, but must also assure that park resources and values are protected. The preferred alternative protects the mission blue butterfly habitat and large area of undisturbed contiguous habitat that is rare and contains wildlife that could be disturbed by the presence of dogs.

Overall, the preferred alternative would provide for multiple visitor experiences, including on-leash dog walking, protect park resources, and would be easily explainable and enforceable by park law enforcement staff.

### **Pedro Point Headlands**

Alternative C was chosen as the preferred alternative because it would best meet the objectives of the plan. Alternative C would provide an opportunity for many visitor uses, including dog walking. Alternative C would allow on-leash dog walking on the Coastal Trail Multi Use which is to be built, and is consistent with the management of the Coastal Trail by the adjoining land management agencies. No dog walking would be allowed on trails accessible from adjacent community because of sensitive chaparral habitat that extends up the ridge and along the riparian area. Dog walking would also be prohibited on the South Ridge Trail, Bluff Trail, North Ridge Trail, Middle Ridge Trail, and Arroyo Trail. This would best protect the potential habitat for special-status species in the northwest section of the site, and for California red-legged frog and San Francisco garter snake habitat in the valley. Safety is also enhanced by avoiding the steep drop-off on the Bluff Trail where it runs along the bluff edge.

Alternative C protects the habitat and helps to limit the disturbance of wildlife, vegetation, and possible special-status species habitat. It provides safety to both dogs and dog walkers by keeping dogs on leash and away from the cliff edges.

Overall, the preferred alternative would provide for multiple visitor experiences, including on-leash dog walking, protect park resources, and would be easily explainable and enforceable by park law enforcement staff.

### **Rancho Corral de Tierra**

Alternative B was chosen as the preferred alternative for this site based on the protection of resources in an area of contiguous habitat (McNee State Park, San Pedro Valley County Park and the San Francisco Watershed) as well as consistency with management in the adjacent State Park. The preferred alternative would allow on-leash dog walking on designated trails in two areas that would be open to dog walking near Montara and El Granada. The preferred alternative would provide multiple visitor experiences, including on-leash dog walking; protect park resources; and would be easily explainable and enforceable by park law enforcement. ROLAs would not be established on trails because the park finds that ROLAs on trails and fire roads would create safety hazards and could inhibit other user groups, as discussed previously. The preferred alternative would limit future impacts on both the neighborhoods and the visitor experience that would be likely to occur if a ROLA was established at this site. There are currently only three relatively small off-leash areas in the San Mateo between Pacifica and Half Moon Bay; a new ROLA would very likely increase visitation to the site and cause neighborhood impacts such as increased traffic and parking. Although off-leash dog walking did informally occur informally extensively at

Rancho prior to the transfer to NPS, when the property was privately owned, off-leash dog walking was not a legal, permitted activity by that private land owner.

### **Cost of Implementation of the Preferred Alternative**

The total costs of implementing the preferred alternative are estimated at \$2,505,686. The bulk of these costs are associated with the hiring of additional personnel for implementing the dog management plan. For a more detailed explanation of personnel costs under the preferred alternative, see the “Park Operations” section in chapter 4.

**TABLE 3. SUMMARY OF ALTERNATIVE ELEMENTS BY COUNTY, NORTH TO SOUTH**

| GGNRA Site  | Alternative A:<br>No Action (36 CFR 2.15, 36 CFR 7.97 (d); 1979 Pet Policy; GGNRA Compendium) | Alternative B:<br>NPS Leash Regulation (36 CFR 2.15 and GGNRA Compendium) | Alternative C:<br>Emphasis on Multiple Use – Balanced by County (Contains Negotiated Rulemaking Committee Consensus)* | Alternative D: Most Protective of Resources and Visitor Safety | Alternative E: Most Dog Walking Access / Most Management Intensive (Contains Negotiated Rulemaking Committee Consensus and Elements of the 1979 Pet Policy that Meet Purpose, Need and Objectives of the Plan)* | Alternative F: NPS Preferred Alternative |

| <b>Special-status Species</b>               |   |  |   |   |  |   |  |  |  |   |  |  |
| Coho Salmon and Steelhead Trout             | Negligible to long-term, minor, adverse impacts | Lagoon and Redwood Creek closures have been violated; adult and juvenile life stages could be affected by dogs; increased turbidity by trampling shoreline areas   | Negligible impacts assuming compliance      | The lagoon and Redwood Creek would be closed to dogs; physical restraint of dogs would not allow access to the creek or its shorelines  | Negligible impacts assuming compliance                       | The lagoon and Redwood Creek would be closed to dogs; physical restraint of dogs would not allow access to the creek or its shorelines  | Negligible impacts assuming compliance                         | The lagoon and Redwood Creek would be closed to dogs; physical restraint of dogs would not allow access to the creek or its shorelines   | Negligible impacts assuming compliance                             | The lagoon and Redwood Creek would be closed to dogs; physical restraint of dogs would not allow access to the creek or its shorelines; ROLA has not been sited near or adjacent to Redwood Creek | Negligible impacts, assuming compliance      | The lagoon and Redwood Creek would continue to be closed to dogs; physically restraining dogs on leash would prevent dog access to the creek and its shorelines  |
| Cumulative Impacts                          | Negligible cumulative impacts                   |  | Beneficial cumulative impacts               |   | Beneficial cumulative impacts                                |   | Beneficial cumulative impacts                                  |  | Beneficial cumulative impacts                                      |   | Beneficial cumulative impacts                |  |
| Impact change compared to current condition | NA  |  | Beneficial to no change assuming compliance |   | Beneficial to no change assuming compliance                  |   | Beneficial to no change assuming compliance                    |  | Beneficial to no change assuming compliance                        |   | Beneficial to no change, assuming compliance |  |
| California Red-Legged Frog                  | Negligible to long-term, minor, adverse impacts | Although lagoon closures are violated frequently, there is no frog breeding at the Muir Beach site, but the site provides non-breeding habitat; breeding occurs at a pond offsite and noncompliant dogs could access this area; frog eggs, juveniles, and adults could be affected by dogs through habitat or behavioral disturbance | Negligible impacts assuming compliance      | Water bodies would continue to be closed to dogs and the fence would discourage access; physically restraining dogs on leash would prevent dog access to water bodies that may provide habitat to juvenile or adult frogs | Negligible impacts assuming compliance                       | The lagoon and Redwood Creek would continue to be closed to dogs; physically restraining dogs on leash would prevent dog access to water bodies that may provide habitat to juvenile or adult frogs | Negligible impacts assuming compliance                         | The lagoon and Redwood Creek would continue to be closed to dogs; physically restraining dogs on leash would prevent dog access water bodies and part of the creek, the lagoon, and the shoreline are in areas where dogs a prohibited under alternative D | Negligible impacts assuming compliance                             | The lagoon and Redwood Creek would continue to be closed to dogs; physical restraint of dogs would not allow access to the creek or its shorelines; ROLA would not be sited near Redwood Creek    | Negligible impacts, assuming compliance      | The lagoon and Redwood Creek would continue to be closed to dogs; physically restraining dogs on leash would prevent dog access water bodies and part of the creek, the lagoon, and the shoreline are in areas where dogs a prohibited under the preferred alternative |
| Cumulative Impacts                          | Negligible cumulative impacts                   |  | Beneficial cumulative impacts               |   | Beneficial cumulative impacts                                |   | Beneficial cumulative impacts                                  |  | Beneficial cumulative impacts                                      |   | Beneficial cumulative impacts                |  |
| Impact change compared to current condition | NA  |  | Beneficial to no change assuming compliance |   | Beneficial to no change assuming compliance                  |   | Beneficial to no change assuming compliance                    |  | Beneficial to no change assuming compliance                        |   | Beneficial to no change, assuming compliance |  |

|   | Impacts  | Rationale   | Impacts   | Rationale  | Impacts  | Rationale   | Impacts  | Rationale   | Impacts  | Rationale  | Impacts   | Rationale  |
| Wetlands and Aquatic Habitat                | Long-term, minor, adverse impacts on tidal wetlands (Negligible impact to freshwater wetlands) | Tidal marsh vegetation is affected by dogs through trampling and increased turbidity; despite fencing, dogs under voice control gain access to the tidal marsh; freshwater wetland areas are fenced to prohibit access by dogs and people   | Negligible impacts assuming compliance                              | Physical restraint of dogs, and the existing fence would protect tidal marsh wetlands, which would be closed to dogs   | Negligible impacts assuming compliance                       | Physical restraint of dogs and the existing fence would protect tidal marsh wetlands, which would be closed to dogs   | Negligible impacts assuming compliance                         | Compliance in ROLA, physical restraint of dogs, and the existing fence would protect tidal marsh wetlands, which would be closed to dogs            | Negligible impacts assuming compliance                             | Compliance in ROLA, physical restraint of dogs, and the existing fence would protect tidal marsh wetlands, which would be closed to dogs   | Negligible impacts, assuming compliance               | Compliance in the ROLAs, physical restraint of dogs, and the existing fence would protect tidal marsh wetlands, which would be closed to dogs  |
| Cumulative Impacts                          | Negligible to long-term, minor, adverse cumulative impacts                                     |   | Negligible cumulative impacts                                       |  | Negligible cumulative impacts                                |   | Negligible cumulative impacts                                  |   | Negligible cumulative impacts                                      |  | Negligible cumulative impacts                         |  |
| Impact change compared to current condition | NA   |   | Beneficial to no change assuming compliance                         |  | Beneficial to no change assuming compliance                  |   | Beneficial to no change assuming compliance                    |   | Beneficial to no change assuming compliance                        |  | Beneficial to no change, assuming compliance          |  |
| <b>Wildlife</b>                             |  |   |   |  |  |   |  |   |  |  |   |  |
| Coastal Community                           | Long-term, minor to moderate, adverse impacts  | Shorebirds on beach and within WPA (seasonal leash restriction is often violated in the WPA) are occasionally to frequently subjected to impacts dogs through barking and chasing; visitor usage is high at this site; marine mammals would occasionally be subjected to impacts from dogs on the beach | Negligible to long-term, minor, adverse impacts assuming compliance | Physical restraint of dogs would protect shorebirds and marine mammals, although on-leash dogs can still disturb birds; impact range is due to changing seasonal presence of the birds and level of activity at the site | Long-term, minor, adverse impacts assuming compliance        | Shorebirds would be protected through WPA site closure to dogs and by physical restraint of dogs in other areas; beach ROLA encompasses about one-third of beach habitat at the entire site | Negligible impacts assuming compliance                         | Prohibiting dogs on all beach areas would protect shorebirds and stranded marine mammals; no coastal community habitat or wildlife in airfield ROLA | Long-term, minor to moderate, adverse impacts assuming compliance  | Dogs allowed in majority of coastal community at Crissy Field, including WPA and East Beach (on leash) as well as ROLA; beach ROLA encompasses about one-third of beach habitat; on-leash dogs can still disturb birds | Long-term, minor adverse impacts, assuming compliance | Shorebirds would be protected through WPA site closure to dogs and by physically restraining dogs on leash in other areas; the Central Beach ROLA encompasses about one-third of the beach habitat at the site |
| Cumulative Impacts                          | Negligible to long-term, minor, adverse cumulative impacts                                     |   | Negligible cumulative impacts                                       |  | Negligible cumulative impacts                                |   | Negligible cumulative impacts                                  |   | Negligible to long-term, minor, adverse cumulative impacts         |  | Negligible cumulative impacts                         |  |
| Impact change compared to current condition | NA   |   | Beneficial to no change assuming compliance                         |  | Beneficial to no change assuming compliance                  |   | Beneficial assuming compliance                                 |   | No change assuming compliance                                      |  | Beneficial to no change, assuming compliance          |  |

| Resource                                    | Alternative A: No Action                     |   | Alternative B: NPS Leash Regulation    |   | Alternative C: Emphasis on Multiple Use – Balanced by County |  | Alternative D: Most Protective of Resources and Visitor Safety |  | Alternative E: Most Dog Walking Access / Most Management Intensive |   | Alternative F: NPS Preferred Alternative     |  |
|---|--|---|--|---|--|--|--|--|--|---|--|--|
|   | Impacts                                      | Rationale   | Impacts                                | Rationale   | Impacts  | Rationale  | Impacts  | Rationale  | Impacts  | Rationale   | Impacts                                      | Rationale  |
| Wetlands and Aquatic Habitat                | Long-term, minor, adverse impacts            | The tidal marsh is a high usage area for birds and is fenced although dogs have been observed in the marsh; dogs that gain access to the marsh can disturb by barking, chasing, and proximity to roosting or feeding birds; visitor usage is high at this site  | Negligible impacts assuming compliance | Dogs would be prohibited in marsh; physical restraint of dogs would not allow access to marsh; on-leash dogs could still infrequently disturb roosting and feeding birds by barking and their presence  | Negligible impacts assuming compliance                       | Dogs would be prohibited in marsh; physical restraint of dogs and compliance in ROLA would not allow access to marsh; on-leash dogs could still infrequently disturb roosting and feeding birds by barking and their presence  | Negligible impacts assuming compliance                         | Dogs would be prohibited in marsh; physical restraint of dogs and compliance in ROLA would not allow access to marsh; on-leash dogs could still infrequently disturb roosting and feeding birds by barking and their presence  | Negligible impacts assuming compliance                             | Dogs would be prohibited in marsh; physical restraint of dogs and compliance in ROLAs would not allow access to marsh; on-leash dogs could still infrequently disturb roosting and feeding birds by barking and their presence  | Negligible impacts, assuming compliance      | Dogs would be prohibited in marsh; physical restraint of dogs on leash and compliance in the ROLAs would not allow dogs access to marsh or shorelines used by shorebirds, wading birds, waterbirds, and other wildlife; on-leash dogs could still disturb roosting and feeding birds through barking and by their presence |
| Cumulative Impacts                          | Long-term, minor, adverse cumulative impacts |   | Negligible cumulative impacts          |   | Negligible cumulative impacts                                |  | Negligible cumulative impacts                                  |  | Negligible cumulative impacts                                      |   | Negligible cumulative impacts                |  |
| Impact change compared to current condition | NA   |   | Beneficial assuming compliance         |   | Beneficial assuming compliance                               |  | Beneficial assuming compliance                                 |  | Beneficial assuming compliance                                     |   | Beneficial to no change, assuming compliance |  |
| <b>Special-status Species</b>               |  |   |  |   |  |  |  |  |  |   |  |  |
| Western Snowy Plover                        | Long-term, moderate, adverse impacts         | The seasonal leash restriction is frequently violated in the WPA; dogs would continue to disturb and/or harass the birds in the WPA and potentially limit their use of preferred habitat, interrupt roosting or foraging behavior; frequent disturbance of this type affects fat reserves needed for migration and breeding | Negligible impacts assuming compliance | Habitat and individual species of western snowy plovers would be protected through WPA site closure to dogs and by physical restraint of dogs in other areas; use of preferred habitat in WPA by the plover would not be limited; is consistent with the Recovery Plan for the western snowy plover | Negligible impacts assuming compliance                       | Habitat and individual species of western snowy plovers would be protected through WPA site closure to dogs and by physical restraint of dogs in other areas; use of preferred habitat in WPA by the plover would not be limited; consistent with the Recovery Plan for the western snowy plover | Negligible impacts assuming compliance                         | Habitat and individual species of western snowy plovers would be protected through WPA site closure to dogs and by physical restraint of dogs in most areas; ROLA is not located adjacent to WPA; use of preferred habitat in WPA by the plover would not be limited; consistent with the Recovery Plan for the western snowy plover | Long-term, minor, adverse impacts assuming compliance              | Physical restraint of dogs in the WPA would reduce chasing, but leashed dogs can bark and/or lunge at feeding and roosting western snowy plovers, causing disturbance and/or harassment in a relatively small area; beach ROLA is located adjacent to WPA; use of preferred habitat in WPA by the plover may be limited; not consistent with the Recovery Plan for the western snowy plover | Negligible impacts, assuming compliance      | Western snowy plover habitat and individuals would be protected by closing the WPA site to dogs and physically restraining dogs on leash in other areas; plovers' use of preferred habitat in the WPA would not be limited; this alternative is consistent with the recovery plan for the western snowy plover             |

Affected  
Environment

## CHAPTER 3: AFFECTED ENVIRONMENT

### INTRODUCTION

This “Affected Environment” chapter describes the resources of Golden Gate National Recreation Area (GGNRA or park) that could be affected as a result of implementation of any of the dog management alternatives. The resource descriptions provided in this chapter serve as the baseline against which to compare the potential effects of the management actions considered in this Draft Dog Management Plan / Supplemental Environmental Impact Statement (draft plan/SEIS). The resource topics presented in this chapter and the organization of the topics correspond to the resource impact discussions contained in the “Environmental Consequences” chapter. The general project setting has been included to provide the background necessary to understanding the park resources and environment. The following resource topics are included: vegetation, soils, and wildlife, special-status species, cultural resources, visitor use and experience, park operations, and human health and safety.

---

*The resource descriptions provided in this chapter serve as the baseline against which to compare the potential effects of the management actions considered in this plan/SEIS.*

---

### GENERAL PROJECT SETTING

GGNRA was created from federal lands and state, city, and private lands. Within the park’s boundary established by Congress are 80,033 acres in three counties: Marin, San Francisco, and San Mateo (see map 1). The northern (Marin County) areas of the park are separated from the southern (San Francisco and San Mateo) park areas by the Golden Gate entrance to San Francisco Bay. Of the total acreage within the park’s boundary, GGNRA owns and manages 10,786 acres in Marin County, 1,278 acres in San Francisco County, and 6,842 acres in San Mateo County; GGNRA also manages Fort Point National Historic Site (29 acres) and Muir Woods National Monument (523 acres). The park lands border on lands with a wide range of ownership type and land use, a mix of private residential and agricultural lands, public watershed, parks, and open space. Forty-eight percent of Marin County is held as park lands, open space, and municipal watershed. GGNRA Marin lands include much of the coastline and southern portion of that county. Park lands in San Francisco border both private and commercial properties as well as City of San Francisco properties. In San Mateo County, GGNRA park lands are primarily located in the northern portion of the county, adjacent to the city of Pacifica. Because of the urban setting of GGNRA, some park parcels may be close but not contiguous to other parcels, resulting in many separate park sites. GGNRA supports numerous programs that enhance and/or restore natural resources in different areas of the park and under different contexts. For this chapter and hereafter, these programs will be referred to as park stewardship programs and will encompass such park-sponsored and volunteer programs as the Site Stewardship Program, the Presidio Park Stewards, the Habitat Restoration Team, the Invasive Plant Patrol, the Trails Forever Program, Golden Gate National Parks Conservancy, the Headlands Institute, and the Presidio Trust. The lands in San Francisco known as the “Presidio” are managed by both National Park Service (NPS) and this project’s cooperating agency, the Presidio Trust. Congress established the Presidio Trust in 1996, which works with NPS to manage the Presidio lands. The Presidio Trust manages the interior 80 percent of lands (known as Area B) and NPS manages the coastal areas (known as Area A). This chapter primarily discusses resources in Area A, the Presidio lands managed by NPS. However, other nearby parks that provide dog walking areas but are located outside of GGNRA (including Area B of the Presidio), are discussed at the end of this chapter. As a result of this draft plan/SEIS, impacts to these nearby dog walking areas are expected. Therefore, a short description of nearby dog walking areas

is included that discusses natural resources present, the location of the areas, the size of on-leash and off-leash areas, amenities (if any) present, and recreational opportunities.

GGNRA is part of the Golden Gate Biosphere Reserve, which was designated by the United Nations and recognized internationally for its importance to the conservation of biodiversity, sustainable development, and relevant education and research. The Golden Gate Biosphere Reserve includes over 2 million acres of protected lands and waters administered by a variety of agencies and organizations (NPS 2005b, 4). In addition, GGNRA lies in the California Floristic Province, a Nature Conservancy biodiversity hotspot. Biodiversity hotspots are identified when a high number of endemic species are found in an area. Of the nearly 3,500 species of plants found in the California hotspot, 61 percent are endemic to the area (CAS 2005, 2).

*GGNRA is part of the  
Golden Gate  
Biosphere Reserve.*

---

This “Affected Environment” chapter addresses the topics that were not dismissed from further consideration as described in the “Purpose and Need for Action” chapter for the planning area. A detailed discussion regarding natural resources includes vegetation, soils, wildlife, and special-status species. The human environment section follows and discusses cultural resources, climate change, visitor use and experience, park operations, and human health and safety.

## **DOG-RELATED INCIDENTS AT GGNRA**

Under the U.S. Department of the Interior, NPS rangers or U.S. Park Police can submit a “criminal incident record” for an incident including any charges that have been filed for visitors on park property. These records are referred to as incident reports and include violations of park regulations and/or applicable portions of 36 CFR that result in a citation, verbal warning, or a written warning by NPS rangers or U.S. Park Police. Dog-related incident reports were compiled for GGNRA using the criminal incident reports written by both divisions. The following paragraphs describe the methods used for compiling, analyzing, and presenting these data.

To fully describe dog-related incidents that have occurred at GGNRA, the annual law enforcement incident databases for years 2001 through 2011 were obtained for this analysis. For these years, the annual incident databases were edited to remove all incident reports that did not occur on GGNRA lands, were administrative in nature (e.g., reports documenting overtime, radio issues, alarm off, maintenance needed), or did not include reports of incidents or injuries involving visitors or staff. Incident types were grouped into categories to reflect the overarching incident types occurring within GGNRA (e.g., assist citizen, search and/or rescue, drugs). Incident reports were then sorted by these incident categories. A percentage for each incident category was obtained for GGNRA as a whole (number of specified incident type / total incidents) for each of the 11 years of the analysis. Incident categories for which the individual incident percentage was <5 percent were lumped into the “Other” category for presentation purposes.

Table 5 compares the number of total dog-related incident reports to other types of incident reports recorded within GGNRA. From 2001 through 2011, a total of 4,932 dog-related incident reports were recorded at the park, which represents 11 percent of all violations at GGNRA. Dog-related incident reports that have been recorded at GGNRA for the past 10 years have remained constant at 11 percent. From 2001 through 2005, the total number of dog incident reports was 2,233; from 2006 through 2011, the total number of dog incident reports was 2,699. In both cases, those numbers were approximately 11 percent of total incidents during those years (table 5).

**TABLE 5. NUMBER AND TYPES OF INCIDENT REPORTS WITHIN GGNRA, 2001–2011**

| Type of Incident | Number of Incidents by Year* |              |              |              |              |              |              |              |              |              |              | Total         |

\*For each year, there is a small percentage of reports not included due to missing reports or reports that were not submitted. However, the numbers presented in this table represent all case numbers taken for dog incidents.

There are a number of limitations associated with the collected data. For example, the number of citations issued to visitors not complying with dog walking regulations is not equal to the number of violations at the park. There are many more violations, as suggested by calls and complaints from the public, but are not recorded because they are not observed by the law enforcement staff or not reported by the public. Also, law enforcement patrols are not conducted daily at all GGNRA sites, partly due to the size of the park and the distance between park sites, but also due to the inability of limited staff to cover so many areas on each shift. Law enforcement is responsible for approximately 80 miles of non-contiguous park sites. There are approximately nine law enforcement staff members and U.S. Park Police patrolling park sites per shift; therefore, law enforcement must strategize which sites to patrol each shift. In addition, many law enforcement staff patrol in pairs when monitoring for pet-related compliance. Low use sites and small sites are not as regularly patrolled due to staffing limitations. Approximately 1 percent of law enforcement time is devoted to dog management–related issues.

As stated above, many more violations occur than are recorded, which can also be attributed the court decision in *U.S. vs. Barley* (405 F. Supp.2d 1121 (N.D. Cal. 2005)), that required the park to revert to the 1979 Pet Policy until a notice and comment rulemaking was completed. Due to that rulemaking, in sites where the 1979 Pet Policy recommended “no restrictions,” the NPS leash law cannot be enforced but there is no regulation governing voice control. Thus the 1979 Pet Policy requiring the “management” of dogs is not enforceable until an unmanaged dog is the cause of an incident, triggering a regulation such as those governing wildlife protection and disorderly conduct. As a result of these limitations, dog-related incidents presented in this draft plan/SEIS are underestimated. Although GGNRA cannot provide an exact number of incidents, these data document the concern with dog-related incidents and substantiate the need to regulate dog walking to protect resources, diverse visitor experiences, and health and safety.

In addition to obtaining the annual law enforcement incident databases from 2001 through 2011, paper copies of the dog-related law enforcement incident reports for the years 2008 through 2011 were obtained from GGNRA to conduct a more detailed analysis for each GGNRA site. Each dog-related incident report was reviewed individually to identify violations of applicable portions of 36 CFR that occurred with the

incident as well as the action taken, if any. Paper copies of the incident reports for the years 2001 through 2006 were unavailable (due to previous disposal in accordance with NPS Records Disposal guidelines). Paper incident reports for the year 2007 were only available for part of that year and were therefore not used in the analysis. The number of dog-related incidents in the 2008 through 2011 analysis does not match the number of incidents in the analysis of the overall law enforcement data in table 5 (which includes incidents not related to dogs) because incident reports may contain more than one violation. This analysis is based on a review of the incident descriptions in each law enforcement report; there were often multiple incident violations per incident report. This was not done for the overall law enforcement data analysis because incident reports not related to dogs did not generally include multiple violations and there was insufficient staff time available to review the approximately 40,000 incident reports not related to dogs. The detailed analysis for each GGNRA site for the years 2008 through 2011 is discussed when applicable in this chapter under the “Vegetation, Soils, and Wildlife” section and the “Visitor Use and Experience” section.

## VEGETATION, SOILS, AND WILDLIFE

The coastal ecosystem at GGNRA supports a rich assemblage of plant and wildlife species. The park’s grasslands, coastal scrub, wetlands, and forests support 387 documented vertebrate species. GGNRA is also home to 80 vegetation alliances (or plant communities), which provide habitat for at least 53 species of mammals, 250 species of birds (including shorebirds, ground-nesting birds, and many others), 20 species of reptiles, and 11 species of amphibians (NPS 2009a, 1). This section describes the vegetation, soils, and wildlife communities at GGNRA potentially affected by dog management activities; therefore, not all communities present at GGNRA will be described in this section. Plant and wildlife species that are federally or state-listed are described in the “Special-status Species” section.

Of the general vegetation communities that have been mapped at GGNRA, the ones of interest for analysis of potential impacts resulting from the dog management alternatives in this draft plan/SEIS are described in detail below and are presented by site in maps 22 through 24. In this section, each vegetation community is described by general location in GGNRA, overall species composition in the community, plant species of interest or management concern, and wildlife species that occur or may occur in the community. Species of interest include plants or wildlife species that are not federally or state-listed but that have status or ranking through either the California Department of Fish and Game or the California Native Plant Society (CNPS). Many bird species that occur at GGNRA are not federally or state-listed, but are still protected under the *Migratory Bird Treaty Act* and are also considered species of interest or watch list species. All the bird species at GGNRA discussed in this section with the exception of starlings, pigeons, crows, and game birds are protected under the *Migratory Bird Treaty Act*. Additionally, some species with the “fully protected” status also exist at GGNRA; a fully protected species means that the state has either restricted issuing take permits for the species or the state will only issue take permits for research or enhancement actions (DFG 2010, 1).

---

*The coastal ecosystem at GGNRA supports a rich assemblage of plant and wildlife species.*

---

The following vegetation communities in GGNRA and associated soils and wildlife are described in this section:

- Coastal communities
- Coastal scrub and chaparral
- Grasslands
- Wetlands and open water

- Native hardwood forest
- Riparian forests and streams
- Douglas-fir and coast redwood
- Monterey cypress
- Invasive plant species.

Because soils have been dismissed as a stand-alone section in this document, discussions of soil types and impacts resulting from soil compaction and subsequent changes to soils are included in the vegetation and wildlife section of chapters 3 and 4. Overall, the soils in GGNRA belong to the following complexes: Cronkhite-Barnabe complex, Centissima-Barnabe complex, Barnabe-Candlestick complex, Alambique-McGarvey complex, Tamalpais-Barnabe variant, and Saurin-Bonnydoon complex (NRCS 2004a, 9; 2004b, 9). All these soils are susceptible to water erosion when they are disturbed or exposed (e.g., when vegetation is trampled or removed). Some soils in the park are considered Urban Lands, which are lands and soils whose characteristic properties have been modified as a result of development (NRCS 2005, 9). When applicable, a discussion of soils is included in the vegetation discussion in the paragraphs that follow.

At GGNRA, vegetation and wildlife management is primarily focused on research, monitoring, and meeting desired conditions. Management activities include reestablishing and/or establishing native plant species, controlling weeds and trampling, and removing and/or controlling invasive species. The goal of vegetation and wildlife management at GGNRA is to improve monitoring, restore or enhance populations and/or remove threats, and reduce conflicts between park visitors and sensitive species. Restoration efforts include decompacting soils, removing exotic species, and planting. Park stewardship programs also support efforts to protect and improve resources at the park, such as renovating and expanding GGNRA trails and providing assistance in restoration efforts (NPS 2009a, 1).

In addition to stewardship programs, GGNRA participates in monitoring through the San Francisco Bay Area Network Inventory and Monitoring Program. This Inventory and Monitoring Program monitors resources at GGNRA identified as vital signs and includes the following: salmonid fish, landbirds, harbor seals, listed species (western snowy plover and northern spotted owl), plant communities, invasive plants, specific habitats (riparian, wetland, and rocky intertidal), weather and climate, landscape dynamics, stream flow, and water quality. GGNRA conducts monitoring in all three counties (San Francisco, Marin, and San Mateo County) and monitors resources outside of the Inventory and Monitoring Program, including joint monitoring efforts between GGNRA and Golden Gate National Parks Conservancy for the following: listed species (mission blue butterfly, San Bruno elfin butterfly, California red-legged frog, San Francisco garter snake, rare plants), invasive plants, and water quality. In addition, GGNRA monitors bats, bank swallows, and the endangered tidewater goby.

The park collects data regarding disturbance to wildlife and habitats at GGNRA sites. For example, these data are collected through western snowy plover and bank swallow monitoring programs. These data are also collected as incident reports when visitors violate park regulations as previously discussed at the beginning of this chapter. For example, 36 CFR 2.1 covers the preservation of natural resources. Vegetation damage is described in 36 CFR 2.1 (a) (1) (ii). The following is applicable to vegetation and soils and is prohibited: possessing, destroying, injuring, defacing, removing, digging, or disturbing from its natural state. In addition, 36 CFR 2.2 covers the protection of wildlife. Wildlife disturbance is described in 36 CFR 2.2 (a) (2) and the following is prohibited: feeding, touching, teasing, frightening, or intentional disturbing of wildlife nesting, breeding, or other activities. 36 CFR 7.97(d) describes the seasonal dog walking leash restrictions for the western snowy plover in the Snowy Plover Protection Area

(SPPA) at Ocean Beach and in the Wildlife Protection Area (WPA) at Crissy Field, discussed in more detail in the Special-Status section.

From the years 2008 through 2011, law enforcement recorded incidents directly related to natural resources, including damages to vegetation, disturbing wildlife, and possessing dogs in areas closed due to sensitive natural resources (included in table 6). Because Rancho Corral de Tierra was just transferred to NPS in December 2011, law enforcement data and statistics are not yet available for this site. From 2008 through 2011, a total of 1,537 dog-related incidents associated with natural resources occurred at GGNRA. The law enforcement incident reports from 2008 through 2011 showed that Ocean Beach has the most incidents, with a total of 815 recorded dog-related incidents associated with natural resources. The majority of the incidents reported were for having a dog off leash within the Ocean Beach SPPA (729 recorded incidents, table 6) during the period when dogs must be leashed (July 1 through May 15). From 2008 through 2011, Crissy Field had the second most incidents, with a total of 358 recorded dog-related incidents associated with natural resources. The most common incident at Crissy Field was for having off-leash pets within the WPA (283 reported incidents, table 6) during the period when dogs must be leashed (July 1 through May 15).

**TABLE 6. DOG-RELATED INCIDENTS FOR VEGETATION, SOILS, AND WILDLIFE, 2008–2011**

| Park Site  | Recorded Incidents, 2008–2011 |   |                          |       |

\*Includes incidents reported for having an unleashed dog within the Ocean Beach SPPA or the Crissy Field WPA during the period (July 1–May 15) when dogs must be leashed.

Excerpts of quotes from the law enforcement incident reports included below demonstrate the natural resources issues associated with dogs at GGNRA sites.

#### Closed Areas:

- “We observed the canine swim in Rodeo Lagoon (which is prohibited). We observed the same canine bark at and repeatedly chase numerous water-fowl [sic] that were in the lagoon.” (Rodeo Beach, May 19, 2010, Incident Report # 10-005086)
- “While patrolling with a NPS Ranger in a marked patrol vehicle along Mason, I observed an off-leash dog running in the posted and fenced closed wildlife area adjacent to Crissy Field. The area is posted closed with no entry allowed.” (Crissy Field, May 23, 2009, Incident Report # 09-005249)
- “I observed the two dogs run into the Muir Beach Lagoon, an area that is closed to pets.” (Muir Beach, November 9, 2010, Incident Report # 10-012822)

#### Damaging Vegetation:

- A NPS “Ranger and I observed two dogs running off leash on the protected plant area of Battery Chamberlin.” (Baker Beach, January 12, 2009, Incident Report # 09-432)
- “I observed two off-leash dogs running around the Fort Funston Ranger Office. I observed them running around and digging up native plants near the native plant nursery.” (Fort Funston, September 29, 2010, Incident Report # 10-011098)
- “They were accompanied by an unrestrained Australian Shepherd-like dog which was walking over the just-revegetated slope west of the stairs, cordoned off to allow growth.” (Mori Point, March 17, 2009, Incident Report # 09-002701)
- “We noticed a male in the area with a dog conducting resource damage by digging.” (Sutro Heights, March 26, 2009, Incident Report # 09-003043)

#### Chasing Wildlife:

- “I saw a man... wearing a backpack and accompanied by an unrestrained dog, walk toward a small herd of about five deer. His direction of travel was purposeful and directly toward the deer. The dog appeared excited, but sat repeatedly on command, until about one hundred feet from the deer. I exited my vehicle and approached the man, wanting to discuss wildlife harassment. Shortly before I began my contact, the dog rushed toward the deer, chasing them over a small rise and up the hillside. The man called his dog and the dog finally returned from a distance of about two hundred feet.” (Marin Headlands, November 25, 2009, Incident Report # 09-013103)
- “While on foot patrol of the Wildlife Protection Area at Ocean Beach near Judah, I observed a male-adult walking with his two unleashed pets though the signed and designated Wildlife Protection area. The dogs ran up to approximately forty yards away from the owner chasing nearby shorebirds.” (Ocean Beach Wildlife Protection Area, January 10, 2010, Incident Report # 10-368)
- “I observed two female-adults, one of which was hitting a tennis ball with a racquet for a black medium large dog to fetch as they walked along the beach. I observed her hit the ball thirty to forty yards away as the dog would chase shore birds, fetch the ball, and return it.” (Ocean Beach Wildlife Protection Area, January 10, 2010, Incident Report # 10-374)
- “I observed a male-adult throwing a soft Frisbee for a small speckled cattle dog mix to fetch as he walked along the beach. I observed him throw the Frisbee thirty plus yards away as the dog would

chase shore birds, fetch the Frisbee, and return it. I saw him continue to allow the dog to run throughout the area as he walked southbound from Judah to my location at Noriega.” (Ocean Beach Wildlife Protection Area, January 11, 2010, Incident Report # 10-419)

- “I observed an unrestrained brown Labrador Retriever type dog playing catch with its owner... on the Meadow at Fort Baker, within the Golden Gate National Recreation Area. I also observed two deer grazing within the same meadow. When the dog saw the deer it gave chase; chasing the deer west, into the trees.” (Fort Baker, August 23, 2010, Incident Report # 10-009283)
- “I observed a medium sized, white/black colored, off-leash dog running unrestrained southbound on Ocean Beach near Pacheco St. This dog was chasing shore birds at the water line causing the birds to take flight.” (Ocean Beach, August 25, 2010, Incident Report # 10-009355)
- “I observed a small, black off-leash dog running unrestrained after shorebirds northbound on Ocean Beach near Noriega St. I also observed a medium sized, white, off-leash dog running unrestrained northbound on Ocean Beach near Noriega St... At one point, I observed the black dog running approx. 50 feet ahead of [the owner] while chasing shorebirds and causing them to go into flight. During this contact, I observed this dog twice run uncontrolled after shorebirds.” (Ocean Beach, January 24, 2009, Incident Report # 09-000853)

#### Killing Wildlife:

- “NPS Dispatch took a phone report of a dog attack in Rodeo Lagoon. The dog, described as a large black Labrador, chased a male deer into Rodeo Lagoon, where the deer subsequently drowned while trying to defend itself from the unleashed dog.” (Rodeo Beach, June 13, 2010, Incident Report # 10-006226)

### COASTAL COMMUNITIES

The coastal communities at GGNRA include habitats such as coastal dunes, beaches, adjacent open water, and rocky intertidal areas, of which only the coastal dune habitat supports plant communities that are likely to be affected by dogs. In the study area at GGNRA, coastal dune habitat is found at Muir Beach, Rodeo Beach, Crissy Field, Baker Beach, Ocean Beach, and Fort Funston. There is also beach and coastal dune habitat at Stinson Beach, but this area is not affected by dog management alternatives and is not discussed further in this draft plan/SEIS. The following areas in the dog management planning areas at GGNRA have beach habitat: Muir Beach, Rodeo Beach, Crissy Field, Baker Beach, Ocean Beach, Fort Funston, and Mori Point; dogs are currently allowed access to these beaches or portions of these beaches. As applicable, these beach areas are discussed in more detail in the following paragraphs. Many of the coastal sites in GGNRA have rocky intertidal areas and rocky cliffs, including Muir Beach, Rodeo Beach, Fort Baker, Fort Mason, Lands End, Fort Funston, Mori Point, and Pedro Point (which is not yet part of GGNRA), but rocky intertidal areas are not the dominant habitat type at these sites or this habitat is generally not accessible to visitors and are not discussed further in this draft plan/SEIS.

Coastal dune habitat develops wherever there is accumulated sand resulting from wind and wave action above the high tide line. Dune systems, which rely on natural disturbance regimes for their ecological function, are very susceptible to artificial disturbance, which can disrupt the natural processes. Dune and beach systems are predominantly comprised of sand. At Baker Beach, Lands End, Sutro Heights Park, Ocean Beach, and Fort Funston, the soil complex known as Sirdak Sands exists (NRCS 2004b, 12). Sirdak Sands are deposited in dunes, can reach a depth of 120 feet, are somewhat excessively drained and have a low available water capacity (NRCS 2004b, 12). Crissy Field and Stinson Beach also have dune systems. Stinson Beach is supplied with sand material from the sand dunes in the area (SBCWD 1998, 1). Other soils at the park are characterized as “Beach” in coastal areas at the following sites: Baker Beach,

Ocean Beach, Fort Funston, Mori Point, Pedro Point, Rodeo Beach, and Muir Beach (NRCS 2004b, 12). Muir Beach is a Holocene beach composed of sand deposits at the mouth of Redwood Creek (NPS 2007b, 3–11). The beach is supplied with sand that comes from both Redwood Creek and the long-shore transport of sand along the coast. The remnant undeveloped coastal corridor supports exceptional native biodiversity and provides refuge for one of the largest concentrations of rare, threatened, and endangered species in the national park system (NPS 2011b, Volume I:17). The active foredunes and inner, stabilized dunes support a simple, yet unique, plant community. Dunes create unique habitats that support some of the park's rare and endangered plant species (Elder n.d., 11). The overall diversity of plant species that inhabit coastal dunes is low, and plants are usually prostrate or low growing. Naturally stabilized dunes at GGNRA are inhabited by low-growing perennial shrub species also found in the coastal scrub habitat. Active foredunes are usually colonized by pioneering species such as coastal buckwheat (*Eriogonum latifolium*), sand verbena (*Abronia maritima*), and beach bur (*Ambrosia chamissonis*) (Powell 1978, 41–42). The beach at Rodeo Beach supports coastal vegetation consisting mainly of native low-growing dune species. These dune perennials are easily disturbed by trampling, digging, and other human-related activities, creating opportunities for the establishment of non-native and/or invasive plant species, such as ice plant (*Carpobrotus edulis*).

The Lands End Coastal Trail at Lands End is currently being improved and the surrounding forest is being revitalized through park stewardship programs. A portion of the beach habitat at Ocean Beach is designated as the Ocean Beach SPPA and a portion of the beach habitat at Crissy Field is designated as the Crissy Field WPA. Both areas are protected to provide overwintering habitat for the federally threatened western snowy plover and are described in more detail in the “Special-status Species” section of this chapter. Ocean Beach today represents a highly constructed and manipulated beach environment influenced by a combination of natural processes and human influences on those natural processes (NPS 1999, 42). While vegetation is minimal on the portions of Ocean Beach that experience periodic wave overwash, the beach is backed by an extensive dune complex dominated by non-native European beach grass (*Ammophila arenaria*), which was historically planted to stabilize the sand and prevent it from blowing onto the highway and further inland.

The native dune community at Crissy Field and the dune scrub community at Baker Beach provide important and unique habitat. The Baker Beach dune scrub is one of the few remaining intact stands of this vegetation type in San Francisco. Dune scrub is found on the sand terrace slopes above Baker Beach and in the Lobos Creek Dunes, and the listed San Francisco lessingia is found in association with this community. The San Francisco lessingia, listed as federally and state-endangered, is described in detail in the “Special-status Species” section of this chapter. The dunes around Crissy Field, Baker Beach, and Lobos Creek Valley have been seeded with San Francisco dune gilia (*Gilia capitata* ssp. *chamissonis*) and San Francisco Bay spineflower, both species of interest at GGNRA because of their inclusion on CNPS List 1B (CNPS 2010, 1). Both Fort Funston and Baker Beach have been designated as San Francisco lessingia recovery and enhancement sites (USFWS 2003, 52). Other plant species of interest or management concern that occur at individual sites in the coastal dune habitat at GGNRA are described below, as applicable. One CNPS-listed plant species, the pink sand-verbena (*Abronia umbellata* ssp. *breviflora*), is found in the coastal dune habitat at Stinson Beach and is being reintroduced at Baker Beach, below completed remediation sites. Trampling of the camphor tansy or dune tansy (*Tanacetum camphoratum*) species is being reduced and controlled through the restoration work of park stewardship programs. Patches of non-native ice plant at GGNRA have been removed by park stewardship programs as well.

The intertidal zone in the upper sandy beach (swash zone) supports amphipods, polychaetes (marine worms), and flies that also provide food for shorebirds (Fong et al. 2000), including the western snowy plover. The western snowy plover uses the active foredune and beach areas at GGNRA and forages along the intertidal areas. This species is discussed in more detail in the “Special-status Species” section of this

chapter. A variety of other shorebird species migrate or overwinter in coastal areas of GGNRA and are often found in the same habitats as those used by the western snowy plover. All the bird species discussed in this habitat are protected under the *Migratory Bird Treaty Act*. Species abundance and diversity of shorebirds is monitored by the park and the Gulf of the Farallones National Marine Sanctuary Beach Watch program. The highest density of shorebirds on monitored GGNRA beaches generally occurs during shorebird northbound (April) and southbound (September) migration (Beach Watch 2006, 1). Beach Watch bird count data were analyzed for the following beaches included in this draft plan/SEIS: Baker Beach, Muir Beach, Ocean Beach (North, South, and Central), Rodeo Beach, and Fort Funston (or Thornton Beach North). Collected data for beaches have indicated that willet (*Catoptrophorus semipalmatus*), marbled godwit (*Limosa fedoa*), sanderling (*Calidris alba*), and whimbrel (*Numenius phaeopus*) are the most common species of shorebirds using beaches in GGNRA and are often found to some extent year-round (Beach Watch 2006, 1). Numerous other species of waterbirds occur in the park in open water marine and rocky intertidal habitats, cliffs, and beach areas. These include a mix of migrant, wintering, and breeding species, such as loons, grebes, ducks, geese, gulls, terns, wading birds (herons and egrets), the long-billed curlew, and the California brown pelican (recently delisted from the federal and state *Endangered Species Act* (ESA)). The sanderling, long-billed curlew, and the marbled godwit, commonly found at GGNRA, are considered watch list species by the American Bird Conservancy and the National Audubon Society; these species are not yet listed but are in need of conservation (American Bird Conservancy and National Audubon Society 2007, 2). Muir Beach and Rodeo Beach sites had documented low shorebird abundance and diversity compared to other GGNRA coastal beaches that had high shorebird abundance and diversity such as Ocean Beach (Central and South) and Fort Funston (or Thornton Beach North) (Beach Watch 2006, 11).

Common bird species that use the coastal dune and tidal zone (areas subject to tidal actions) include western gull (*Larus occidentalis*), Heermann's gull (*Larus heermanni*), ring-billed gull (*Larus delawarensis*), Caspian tern (*Hydroprogne caspia*), semipalmated plover (*Charadrius semipalmatus*), western sandpiper (*Calidris mauri*), dunlin (*C. alpina*), and least sandpiper (*C. minutilla*). Figures 1 and 2 present numbers of commonly observed shorebird species by GGNRA site and month from 1993 through 2009. The Caspian tern and the elegant tern (*Sterna elegans*, a watch list species) both roost on the park's beaches during the summer months. Seabirds and diving ducks also use nearshore habitat along the outer coast of GGNRA and inside San Francisco Bay for foraging and resting. Common seabirds include several species of loons, grebes, and cormorants. In addition to the bird species listed above, common mammal species also use the coastal areas in GGNRA, including skunks (*Mephitis mephitis*) and raccoons (*Procyon lotor*). Deer mice (*Peromyscus maniculatus*) and a western harvest mouse (*Reithrodontomys megalotis*) were captured in the dune area at Muir Beach during small mammal surveys (Takekawa et al. 2003, 7). Roof rat, a non-native mammal species were also captured in dune habitat during the surveys (Takekawa et al. 2003, 7) and feral house cats (*Felis silvestris catus*) have also been observed in coastal areas at GGNRA.

Fort Funston is the largest of several significant remnants of the San Francisco dune complex (Shulzitski and Russell 2004, 4). The NPS implemented a restoration project in 1991 to protect habitat for the bank swallow, restore native dune vegetation, and reduce human-induced impacts to the coastal bluffs and dunes (Shulzitski and Russell 2004, 5). The 12-acre Fort Funston Habitat Protection Area is closed per the GGNRA Compendium (NPS 2008b, 9). A nesting colony of the state-threatened bank swallow occupies burrows in coastal bluff habitat at Fort Funston, which has a voluntary seasonal closure during nesting season and is discussed in more detail in the "Special-status Species" section of this chapter.

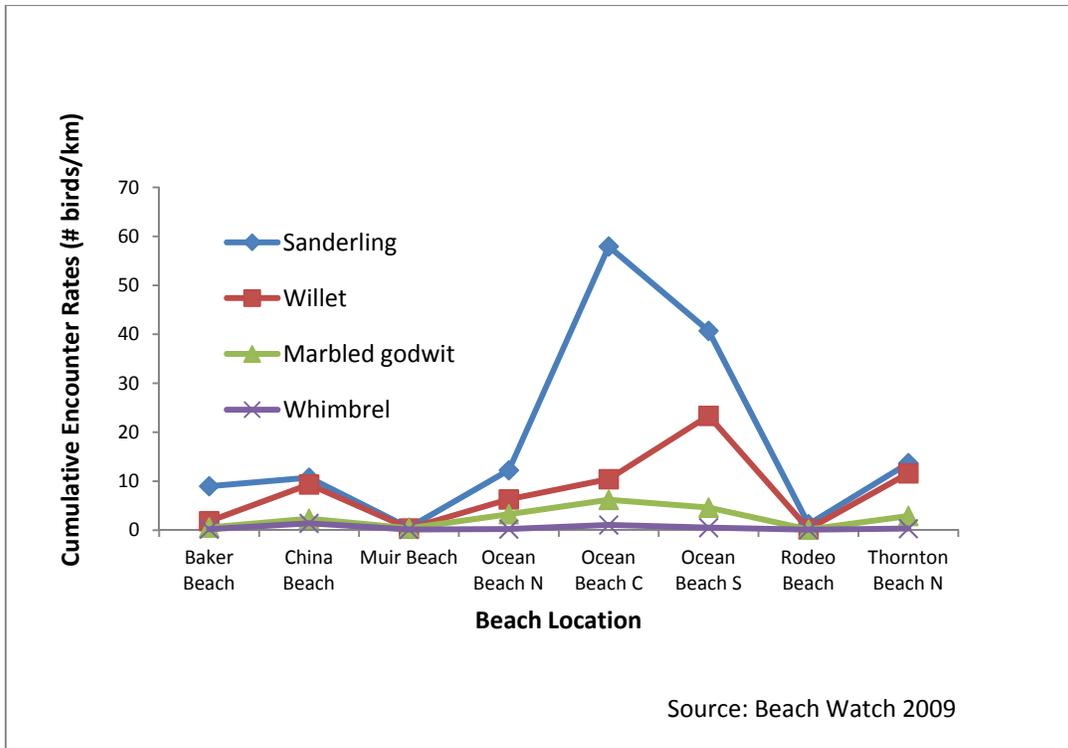

FIGURE 1. COMMONLY OBSERVED SHOREBIRD SPECIES AT GGNRA BEACHES, 1993–2009

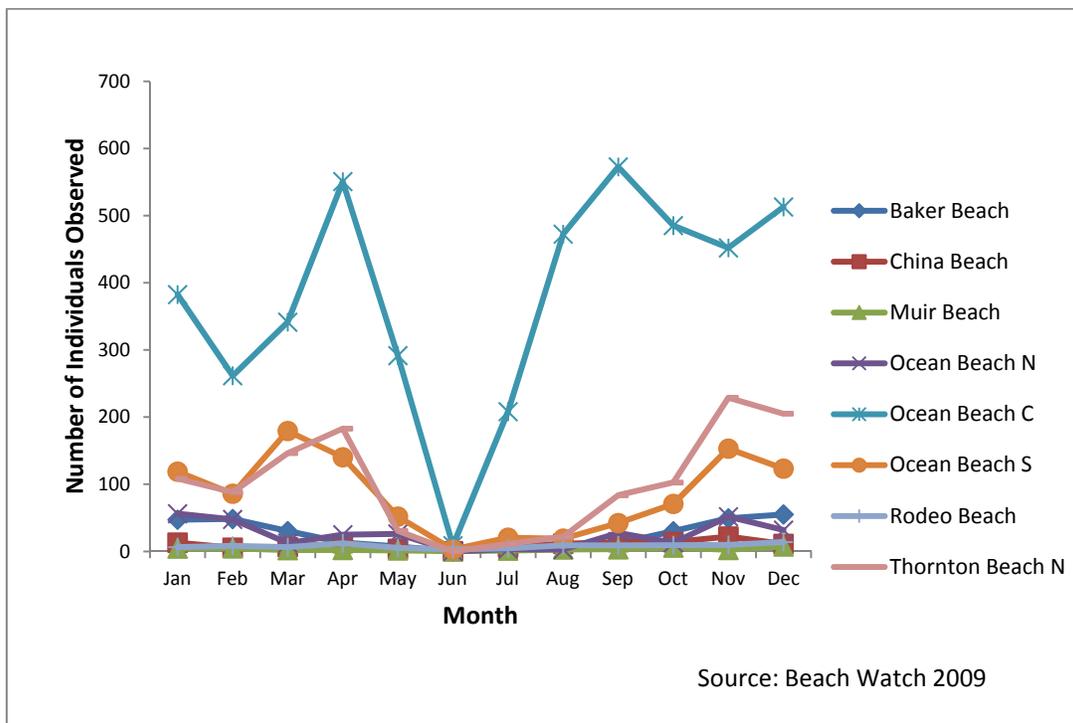

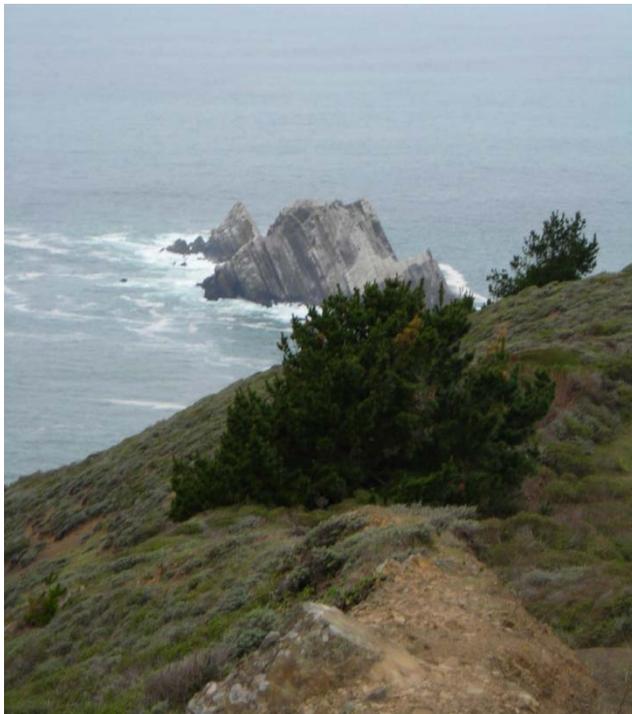

FIGURE 2. AVERAGE SHOREBIRD DENSITY BY MONTH AND BEACH AT GGNRA, 1993–2009

Nearshore areas offshore of the beaches in GGNRA are likely used by fish species such as English sole (*Pleuronectes vetulus*), speckled sand dab (*Citharichthys stigmaeus*), white croaker (*Genyonemus lineatus*), shiner surfperch (*Cymatogaster aggregate*), barred surfperch (*Amphistichus argenteus*), and striped bass (*Roccus saxatilis*) (McCormick 1992). Marine mammals use the waters and shorelines of GGNRA, including rocky, intertidal habitat that provides haul-out sites. Haul-out sites have been documented at Bonita Cove, Seal Rocks, Lands End, and Pedro Point. Pacific harbor seals (*Phoca vitulina*) are known to haul out primarily at Bonita Cove but may be found at any site with appropriate conditions, including mapped haul-out locations at Pedro Point along both the mainland shoreline within the GGNRA boundary and on offshore rocks outside of the GGNRA boundary (URS Corporation 2010, Figure 4). Point Bonita is located on the shoreline at the southernmost tip of the Marin Headlands. Up to 250 harbor seals haul out in Point Bonita Cove at Marin Headlands, and significant harbor seal pupping areas are found in Bolinas Lagoon and Tomales Bay in or directly adjacent to the park (NPS 1999, 13). California sea lions (*Zalophus californianus*) are found in association with Pacific harbor seals at Seal Rocks and Lands End but are sporadic in their use of the sites. All marine mammals are protected under the *Marine Mammal Protection Act*.

Marine mammals that have been found stranded, sick, or injured on beaches in GGNRA are recorded by the Marine Mammal Center. A list of recent live animal reports for stranded animals in GGNRA from 2000 through 2011 was compiled from the Marine Mammal Center data and is presented in table 7 (MMC 2012a, 1). The Marine Mammal Center data indicate that the following marine mammals have been found stranded in GGNRA: whales (not identified to species level), the bottlenose dolphin (*Tursiops truncatus*), the northern right-whale dolphin (*Lissodelphis borealis*), the harbor porpoise (*Phocoena phocoena*), Pacific harbor seal, the California state fully protected northern elephant seal (*Mirounga angustirostris*), the federally listed threatened Guadalupe fur seal (*Arctocephalus townsendi*), the northern fur seal (*Callorhinus ursinus*), the California sea lion, the federally listed threatened southern sea otter (*Enhydra lutris nereis*), and the river otter (*Lontra canadensis*) (MMC 2012a, 1). Sites at GGNRA that experience marine mammal strandings based on Marine Mammal Center data are noted in table 7 (MMC 2012a, 1).

It has been noted that as the northern elephant seal population rapidly increases, individuals of this species are encountered more frequently on sandy beaches throughout the region (NPS 1999, 13), not necessarily as strandings but also hauling out. Three immature elephant seals hauled out on the beach in the Crissy Field WPA for a few days each on three separate occasions in December 2009 and January 2010, necessitating temporary closure of portions of the beach: two of these seals were molting, and one, it was later learned, had a brain condition. Stranded marine mammals and marine mammals that have hauled-out on GGNRA lands often attract the attention of dogs and people. The Marine Mammal Center data indicate that marine mammals are often harassed by dogs. Dogs have been observed surrounding

marine mammals, chasing them back to the water, and in one case, attacking a California sea lion (MMC 2012a, 1).

Harbor porpoises and whale species, such as California gray whales (*Eschrichtius robustus*), use offshore waters, and young whales occasionally wander into San Francisco Bay. Southern sea otters are infrequently seen offshore, with numbers increasing as the population spreads north (NPS 1999, 13). Further discussions of listed marine mammals are included in the “Special-status Species” section of this chapter.

**TABLE 7. THE MARINE MAMMAL CENTER TOTAL NUMBER OF INDIVIDUAL LIVE ANIMAL REPORTS FOR STRANDING IN GGNRA, 2000–2011**

| GGNRA Location   | Whales, Dolphins, Porpoises | California Sea Lion | Northern Elephant Seal | Northern Fur Seal | Guadalupe Fur Seal | Pacific Harbor Seal | Otters (River or Sea) | Total*     | Average per year |

\*Does not include unidentified species, carcasses, or animal reports from outside the project area.

## COASTAL SCRUB AND CHAPARRAL

Scrub communities, such as bluff scrub, coastal scrub, and serpentine scrub, and chaparral communities are found throughout GGNRA. Bluff scrub occurs rarely in GGNRA on the steep ocean-side and along the bay-exposed bluffs. Coastal scrub is similar to bluff scrub, but is found at a slightly higher elevation on slopes and inland areas and is dominated by low shrubs along the California coast. The coastal scrub community creates a mosaic with the grassland community and is found throughout the park from near mean sea level (msl) up to approximately 2,500 feet above msl. Coastal scrub plants must contend with harsh conditions such as steep rocky soils and shearing winds. Interspersed among the shrubs are areas of forbs and grasses. Bluff scrub is dominated by low shrubs and herbaceous species. Serpentine scrub habitat occurs on serpentine outcrops and shallow serpentine soils and as a result is rare and localized in GGNRA. Because serpentinite is altered mantle rock, its chemistry is unlike most other continental rocks.

Serpentine is low in potassium and calcium, which are important plant nutrients. It also contains high levels of magnesium, nickel, and chromium that are potentially toxic to plants. Therefore, plants living on serpentine soils are specially adapted to these unusual chemical conditions (NPS 2011b, Volume II:28). Some species that are presumably unable to compete with other plants also occupy only these harsh environments, where more common species do not grow (USFWS 1998a, I-10). These communities are often high in diversity and contain high numbers of rare, threatened, and endangered plant species (Elder n.d). At least 28 species of plants and animals occur either exclusively or primarily on serpentine soils in the Bay Area (USFWS 1998a, I-14). Of these, half are federally listed as threatened or endangered and the rest are species of concern (USFWS 1998a, I-13) (see “Special-status Species” for more detail on threatened or endangered plant species). Serpentine soils support grassland and shrubland vegetation communities. Listed plant species that occur on serpentine soils and are associated with scrub and chaparral communities, include the following CNPS-listed plant species: Tamalpais manzanita (*Arctostaphylos hookeri* ssp. *montana*), Franciscan manzanita, Tamalpais jewel-flower (*Streptanthus glandulosus*), coast rock-cress (*Arabis blepharophylla*), Franciscan thistle (*Cirsium andrewsii*), Marin checker lily (*Fritillaria lanceolata* var. *tristulis*), fragrant fritillary (*Fritillaria liliacea*), San Francisco gumplant (*Grindelia hirsutula*), and Crystal Springs lessingia (*Lessingia arachnoidea*).

Chaparral is a specific type of scrubland that also occurs along the California coast. In GGNRA the presence of chaparral is rare and localized. Most of the shrubs that make up chaparral are tough-leaved evergreens, and many species have thorns or prickly leaves to guard against grazing. Chaparral occurs in dry soils, which often occur on the south-facing slopes of coastal mountains adjacent to coastal scrub or woodlands. During the dry season, chaparral is extremely vulnerable to fire; thus, plant species that inhabit this environment are adapted to regular fires. Chaparral is dominated by many species of manzanita (*Arctostaphylos* spp.), buckbrush or California lilac (*Ceanothus* spp.), poison-oak, buckthorn (*Rhamnus* spp.), chamise (*Adenostoma* spp.), and other shrubs, including yerba santa (*Eriodictyon* sp.) and black sage (*Salvia mellifera*).

Coastal scrub and chaparral communities are found in the following park sites included in this draft plan/SEIS: Homestead Valley, Oakwood Valley, Alta Trail, Muir Beach, Marin Headlands, Fort Baker, Baker Beach (bluff scrub), Fort Point (bluff scrub and coastal scrub), Lands End, Fort Miley, Mori Point, Milagra Ridge, Cattle Hill/Sweeney Ridge, Pedro Point Headlands, and Rancho Corral de Tierra. Serpentine scrub chaparral provides habitat for several of the park’s endangered, threatened, or rare plant species, including Presidio manzanita, Franciscan manzanita, Marin dwarf-flax, and Presidio clarkia, which all inhabit low-growing serpentine coastal scrub and rock outcrops (see “Special-status Species” section for more detail on threatened or endangered plant species). Serpentine outcroppings with serpentine-dependent plant species exist adjacent to coastal and bluff scrub communities, which lie along bluffs east and north of Baker Beach (USFWS 2003, 6) and are also located behind the fort at Fort Point (May & Assoc. 2005, 9). Serpentine coastal scrub is also found at the Marin Headlands. Serpentine soils can be found at Baker Beach, Muir Beach, Lands End, and Crissy Field. The serpentine soils at Muir Beach lie outside the study area for this draft plan/SEIS. At Crissy Field, serpentine soils are found only in the study area adjacent to Marine Drive. The serpentine soils at Baker Beach are located on the coastal bluffs between Baker Beach and the Golden Gate Bridge (USFWS 2003, 17). The serpentine soils at Lands End are located at the western end of the site, near Fort Miley. Chaparral also occurs in the higher elevations of Rancho Corral de Tierra. The endemic Montara manzanita (*Arctostaphylos montarensis*), and the brittle-leaf manzanita (*Arctostaphylos tomentosa* ssp. *crustacea*) are found in the maritime chaparral at Rancho Corral de Tierra (POST 2001, 20). Coastal scrub and chaparral communities also provide habitat for other CNPS-listed plant species, including Kellogg’s horkelia (*Horkelia cuneata* var. *sericea*), Choris’s popcornflower (*Plagiobothrys chorisianus* var. *chorisianus*), Santa Cruz microseris (silverpuffs) (*Stebbinsoseris decipiens*), San Mateo tree lupine (*Lupinus arboreus* var. *eximius*), and San Francisco campion (*Silene verecunda* ssp. *Verecunda*).

Coastal scrub is dominated by low shrubs and herbaceous species, such as California blackberry (*Rubus ursinus*), poison-oak (*Toxicodendron diversilobum*), and toyon (*Heteromeles arbutifolia*). The coastal scrub community is dominated by coyote brush (*Baccharis pilularis*), California sagebrush (*Artemisia californica*), bush lupine (*Lupinus arboreus*), and poison-oak, with variations in dominant species based on moisture levels, soil types and slopes, and past land use history (NPS 2005b, 192). Other plant species that inhabit the coastal scrub include sticky monkey flower (*Mimulus aurantiacus*), ceanothus (*Ceanothus* spp.), and coffee berry (*Rhamnus californica*), as well as various forbs and grasses that grow interspersed between the shrubs described above. Vines such as hillside morning glory (*Calystegia* spp.), wild cucumber (*Marah macrocarpus*), and giant vetch (*Vicia gigantea*) trail over the shrubs. Plant species such as blackberry, osoberry (*Oemleria cerasiformis*), and twinberry (*Lonicera involucrata*) provide food sources for wildlife. The coastal scrub community also contains large numbers of non-native species, and at times is dominated by non-native shrubs such as French broom (*Genista monspessulana*) and thoroughwort (*Ageratina adenophora*). The serpentine scrub habitat, found on serpentine outcrops and shallow serpentine soils, is dominated by ceanothus, toyon, osoberry, and blackberry.

Invertebrates that inhabit the coastal scrub habitat include various species of butterflies: skippers, swallowtails, hairstreaks, blues, ladies, admirals, and crescents. A wide variety of small mammals use the coastal scrub and chaparral habitats, including pocket gophers (*Thomomys* spp.), deer mice, brush rabbits, raccoons, spotted and striped skunks, and black-tailed deer (*Odocoileus hemionus*) (Semenoff-Irving and Howell 2005, 9, 10). Predators such as gray and red foxes (*Urocyon cinereoargenteus*, *Vulpes vulpes*), bobcats (*Felis rufus*), and coyotes (*Canis latrans*) hunt small mammals in the vicinity; mountain lions (*Felis concolor*) and feral cats are also possible (Semenoff-Irving and Howell 2005, 9-10). Both red foxes and feral cats are non-native mammal species. Coyotes are present in coastal scrub at the San Francisco sites, including a known den at Milagra Ridge, a potential den at Mori Point, and a possible recent den site at Fort Miley. Other mammals include the Mexican free-tailed bat (*Tadarida brasiliensis*), which forages over the coastal scrub habitat. Coastal scrub provides habitat for reptiles that burrow or use underground den sites, such as western fence lizards (*Sceloporus occidentalis*), red-sided garter snakes (*Thamnophis sirtalis*), and alligator lizards (*Elgaria* spp.).

Many bird species also use the coastal scrub and chaparral habitats. All the bird species discussed in this habitat are protected under the *Migratory Bird Treaty Act* (with the exception of starlings, pigeons, crows, and game birds). From bird point count censuses in 1999 and 2000 (PRBO 2002, 1), the most abundant species in the coastal scrub habitat were the white-crowned sparrow (*Zonotrichia leucophrys*) and spotted towhee (*Pipilo maculatus*). Several other resident bird species forage, roost, nest, and/or breed in scrub habitat, including the house wren (*Troglodytes aedon*), western scrub jay (*Aphelocoma californica*), Steller's jay (*Cyanocitta stelleri*), California towhee (*Pipilo crissalis*), California thrasher (*Toxostoma redivivum*), northern flicker (*Colaptes auratus*), mourning dove (*Zenaida macroura*), Wilson's warbler (*Wilsonia pusilla*), and acorn woodpecker (*Melanerpes formicivorus*). Various sparrows, including the song sparrow (*Melospiza melodia*), various thrushes, the wrenit (*Chamaea fasciata*), and other small ground- or shrub-nesting birds also use this community. California quail are low-/ground-nesting birds that use this habitat and, locally, are extremely rare in San Francisco, although they do occur at the majority of the GGNRA sites and the Presidio provides an important refuge for this species because it is a small, non-contiguous parcel where quail numbers had historically declined. The Presidio currently supports a breeding population of California quail, which is mostly found in coastal scrub areas, in forests, lawns, and areas of ornamentals. Other low- and ground-nesting birds besides California quail that occur in this habitat at GGNRA and are considered in the Point Reyes Bird Observatory Conservation Science in the Landbird Habitat Modeling project include: San Francisco common yellowthroat (*Geothlypis trichas sinuosa*), northern harrier (*Circus cyaneus*), grasshopper sparrow (*Ammodramus savannarum*), Bewick's wren (*Thryomanes bewickii*), Wilson's warbler, white-crowned sparrow, Swainson's thrush (*Catharus ustulatus*), rufous-crowned sparrow (*Aimophila ruficeps*), western meadowlark (*Sturnella neglecta*), MacGillivray's warbler (*Oporornis tolmiei*), and dark-eyed junco

(*Junco hyemalis*). Scrub habitat also attracts predators, such as Cooper's hawk (*Accipiter cooperii*), red-tailed hawk (*Buteo jamaicensis*), and other raptors.

## GRASSLANDS

The grassland community forms a mosaic with the coastal scrub community and mixed evergreen forests (NPS 2005b, 194). At GGNRA, this community extends from mean sea level to nearly 2,600 feet above mean sea level (msl) and includes both coastal prairie grasslands and serpentine grasslands. California grasslands in general have been disturbed and changed due to cultivation, grazing, fire suppression, and the spread of non-native, invasive plant species. The original, pristine grasslands in California were composed of perennial bunchgrasses with annual forbs occupying areas between tussocks, including purple needlegrass (*Nassella pulchra*), the designated California state grass, as well as tufted hair grass (*Deschampsia caespitosa*), blue wild rye (*Elymus glaucus*), and California oatgrass (*Danthonia californica*). Grasslands are found in GGNRA at Homestead Valley, Oakwood Valley, Alta Trail, Marin Headlands, Fort Baker, Milagra Ridge, Mori Point, Cattle Hill/Sweeney Ridge, Pedro Point Headlands, and Rancho Corral de Tierra. A native grassland exists at Mori Point that is dominated by purple needlegrass, and native grasses also persist in the grasslands at Homestead Valley.

As stated previously, serpentine soils support grassland vegetation communities. Serpentine grasslands occur on well-developed serpentine soils formed by the rock serpentinite. Serpentine occurs in fault zones and is associated with high levels of heavy metals, such as zinc and magnesium, and low levels of nutrients. Serpentine and native coastal grasslands are dominated by needlegrasses (*Nassella* spp.) and support some federally and state-listed plant species, such as Marin dwarf-flax, white-rayed pentachaeta (*Pentachaeta bellidiflora*), and fountain thistle (*Cirsium fontinale* var. *fontinale*); the federally and state-threatened Marin dwarf-flax is discussed in more detail in the "Special-status Species" section. The Mission Delores (San Francisco) campion (*Silene verecunda* ssp. *verecunda*), San Francisco owl's-clover (*Triphysaria floribunda*), Franciscan onion (*Allium peninsulare* var. *franciscanum*), and San Francisco wallflower (*Erysimum franciscanum*) are CNPS-listed plant species that can inhabit serpentine grasslands. There are mapped occurrences of the San Francisco wallflower at Pedro Point and Rancho Corral de Tierra and suitable habitat exists for this species at Cattle Hill/Sweeney Ridge (URS Corporation 2010, Figure 17). Suitable habitat also exists for Franciscan onion at Pedro Point, Rancho Corral de Tierra, and Cattle Hill/Sweeney Ridge (URS Corporation 2010, Figure 17). At Rancho Corral de Tierra, the federally endangered Hickman's potentilla also occurs in grasslands. In GGNRA, serpentine grasslands are found north and east of where Lobos Creek enters the ocean at Baker Beach. These serpentine grasslands provide habitat for a variety of raptors and other birds as well as native mammals, reptiles, and amphibians. In addition, the Oakland mariposa lily (*Calochortus umbellatus*) is a CNPS-listed grassland plant species that occurs in a very limited distribution at Homestead Valley.

Today, many grasslands in the park are dominated by non-native annual grasses and forbs adapted to the climate (NPS 2005b, 194). As with many park sites in GGNRA, the spread of non-native plant species is a management concern and is discussed further in the "Invasive Plant Species" portion of this section. Additionally, the exclusion of grazing, extirpation of large native mammals, and suppression of wildfires have caused a decrease in grasslands and a marked increase in acreage of coyote brush, resulting in an increase in the acreage of coastal scrub community in the San Francisco Bay Area (McBride and Heady 1968). The grassland community also includes coastal prairie grasslands. The coastal prairie is found on coastal terraces with well-developed soils and is dominated by native perennial bunchgrasses of purple needlegrass, foothill needlegrass (*Nassella lepida*), California oatgrass, and many non-native grasses. Management to control weeds, reduce trampling (through park stewardship programs), and establish new populations at completed remediation sites is being conducted for Mission Delores campion; management to control invasive species and to reduce trampling is being conducted for San Francisco owl's clover.

A number of species of lupine occur in GGNRA, including three species of lupine that occur in the grassland community: silver-leaf lupine (*Lupinus albifrons*), summer lupine (*L. formosus*), and many-colored lupine (*L. variicolor*). Dudley's lupine (*Lupinus latifolius var. dudleyi*) is another lupine species found at Rancho Corral de Tierra (POST 2001, 28). Silver-leaf lupine is the primary host plant for the federally endangered mission blue butterfly. Mission blue butterfly habitat and host plants are found at Oakwood Valley, Alta Trail, Marin Headlands (Tennessee Valley, Slacker Ridge, Fort Barry Rifle Range, Wolfback Ridge, below Conzelman Road, Hawk Hill, etc.), Fort Baker, Milagra Ridge, Cattle Hill/Sweeney Ridge, and Rancho Corral de Tierra, which are discussed in detail in the "Special-status Species" section. In addition to the mission blue butterfly, many other species of invertebrates are primary inhabitants of the grassland community, including the red admiral (*Vanessa atalanta*), American lady (*Vanessa virginiensis*), anise swallowtail (*Papilio zelicaon*), and common sulfurs (*Colias* spp.). Two federally listed species of butterflies, the San Bruno elfin butterfly (*Incisalia mossii bayensis*) and the mission blue butterfly (*Icaricia icaroides ssp. missionensis*), occur in grasslands at GGNRA and are discussed in more detail in the "Special-status Species" section.

Typical bird species of grasslands include western scrub jay, northern mockingbird (*Mimus polyglottos*), and a variety of species of sparrows and hawks. All the bird species discussed in this habitat are protected under the *Migratory Bird Treaty Act* (with the exception of starlings, pigeons, crows, and game birds). The California thrasher also uses grassland habitats at GGNRA, though it is not very common. Grasslands support many rodents (mice, gophers, and voles), which are hunted by raptors such as great horned owl (*Bubo virginianus*), red-tailed hawk, and American kestrel (*Falco sparverius*). Ground-nesting birds also make their home in the grassland, including several species of sparrows. Common mammalian species that occupy grassland habitats include raccoons, black-tailed deer, small rodents (voles, moles, and mice), jackrabbits (*Lepus californicus*), California ground squirrels (*Spermophilus beecheyi*), and striped skunks. Some species, such as the western harvest mouse (*Reithrodontomys megalotis*), appear to be restricted to areas where native perennial grasses persist. Carnivorous mammals that use grasslands include foxes, coyotes, bobcats, and mountain lions. Reptiles such as western fence lizards, gopher snakes (*Pituophis catenifer*), and alligator lizards (*Elgaria* spp.) have been observed in grasslands at GGNRA (Semenoff-Irving and Howell 2005, 17).

## WETLANDS AND OPEN WATER

GGNRA has abundant wetland resources, including estuarine, riverine, and palustrine wetlands. Wetlands, according to the definition developed by the U.S. Fish and Wildlife Service (USFWS) and adopted by the NPS, are lands transitional between terrestrial and aquatic systems, where the water table is usually at or near the surface or the land is covered by shallow water (Cowardin et al. 1979, 11). Typical wetlands in GGNRA include wet meadows, seeps, streams, riparian forests, ponds, and lagoons. Deepwater habitats such as rivers, lakes, and estuaries are not technically wetlands, but are classified as aquatic sites using the same classification system (NPS 2006a, section 4.6.5). Wetlands and open water communities, including ponds, seeps, freshwater wetlands, lagoons, and salt marshes, are discussed in this section. Streams and riparian forests are discussed in detail in the sections that follow.

Wetlands in GGNRA are generally located in valley bottoms, with seeps and small intermittent streams reaching into the higher portions of the watersheds (NPS 2005b, 203). Estuarine wetlands and salt marshes also exist at GGNRA. The following areas have herbaceous wetlands and woody vegetation in GGNRA: Crissy Field (palustrine and estuarine wetlands), Muir Beach, Baker Beach (seeps along bluffs and Lobos Creek), Rodeo Beach (Rodeo Lagoon and Rodeo Lake), Lands End (seeps), Mori Point (four created ponds with associated wetlands), and Milagra Ridge (pond). Many of these wetland areas at GGNRA either have undergone or are currently undergoing restoration efforts, as described in the paragraphs below by project site. Other wetland areas also exist at GGNRA, including at Tennessee Valley and Pedro Point Headlands, but these particular wetland areas are not described in detail because they are not affected by dog activities at the park.

**Crissy Field Marsh**

Credit: NPS

Hydric soils are defined as a soil formed under conditions of flooding, saturation, or ponding extended enough for the soil to develop anaerobic conditions (USACE 1987, 19) and are present in GGNRA areas characterized as wetlands. Hydric soils are present at Oakwood Valley and include the Blucher-Cole complex. This complex runs along the Oakwood Valley floor, experiences occasional flooding, and is characterized as silty clay loam. Rodeo Clay Loam is a hydric soil located in the Marin Headlands which runs along the Tennessee Valley floor. These clay loam and clay soils are poorly drained and have a high available water capacity (the amount of water soils can store that is available for use by plants) (NRCS 2004a, 17). There are hydric soils located at Tennessee Valley, inland of Tennessee Cove and along the Elk Valley Creek in the Marin Headlands (NRCS 2004a, 16). These soils are flat, very poorly drained, and have a very low available water capacity (NRCS 2004a, 16).

Hydric soils support hydrophytic plant species that grow in wetland areas. The majority of wetlands in the park are herbaceous wetlands, which have vegetation consisting of a mix of low-growing species of sedges (*Carex* spp. and *Cyperus* spp.), rushes (*Juncus* spp.), bulrushes (*Scirpus* spp.), cattails (*Typha* spp.), horsetails (*Equisetum* spp.), and other wetland-dependent species, as well as non-native species of wetland-tolerant grasses and forbs. Areas covered with various reeds along the shoreline of lagoons and ponds, herbaceous strips of vegetation along perennial and ephemeral stream courses, and isolated wetland patches where seeps emerge are found throughout the park (NPS 2005b, 196). Freshwater seeps, where groundwater flows onto the surface, are dominated by rushes and sedges and occur along the bluffs north of Baker Beach and are widely distributed at Lands End (May & Assoc. 2005, 13). These seeps and small wetlands provide a source of freshwater and vegetative cover for songbirds and other wildlife, as well as possible breeding habitat for amphibians (NPS 1993, 6-11, 6-12). All the bird species discussed in this habitat are protected under the *Migratory Bird Treaty Act* (with the exception of starlings, pigeons, crows, and game birds).

Both freshwater and estuarine wetlands exist at Crissy Field. Freshwater wetlands in the swale include tule reed (*Scirpus californicus*) and cattails. Crissy Field Tidal Marsh supports salt marsh habitat and is closed to public access per the GGNRA Compendium. From 1998 through 2000, the restoration of Crissy Field included the restoration of an 18-acre tidal marsh linked to the San Francisco Bay (NPS 2010a, 1). The Point Reyes (north coast) bird's-beak (*Cordylanthus maritimus* ssp. *palustris*) is the only CNPS-listed plant species that occurs in coastal salt marshes. This small annual was introduced to the salt marsh at Crissy Field in 2001 (NPS 2010a, 1). Following restoration efforts, nearly 100 species of birds have been documented using the tidal marsh at Crissy Field, including migrating ducks, pelagic birds diving for fish, and shorebirds (Ward and Ablog 2006, 1). The park has installed fencing to restrict access by

dogs and people to Crissy Field Tidal Marsh, and signage has been installed to educate visitors on the access restrictions; however, dogs gain access to the marsh through the tidal channel under the pedestrian bridge, and have been observed by park staff in the tidal marsh (NPS 2010a, 1).

Rodeo Lagoon is located in Marin County at Rodeo Beach and consists of herbaceous wetlands and wet meadows. An estuarine emergent wetland fringe surrounds Rodeo Lagoon, which is sustained by a mix of freshwater and tidal water input. Central California steelhead trout (*Oncorhynchus mykiss*) occur in the drainages to Rodeo Lagoon (NPS 2005b, 211). Rodeo Lake provides suitable breeding habitat for California red-legged frogs (*Rana draytonii*), while both the lagoon and the lake are used outside the breeding season for rearing (Fong and Campo 2006). Rodeo Lagoon provides foraging and loafing habitat for a variety of aquatic birds, such as California brown pelicans, grebes, gulls, terns, cormorants, shorebirds, ducks, egrets, and herons. The lagoon waters support several fish species, including native species such as prickly sculpin (*Cottus asper*) and threespine stickleback (*Gasterosteus aculeatus*). River otters have also been observed in the lagoon. Rodeo Lagoon is closed to public access for overall resource protection per the GGNRA Compendium, but NPS staff members regularly observe dogs in the lagoon. The park has estimated that they observe dogs in the lagoon at least once a week and during good weather on a daily basis.

A small, intermittently tidal lagoon with open water is located adjacent to Muir Beach. The lagoon was restored in 2009; surveys prior to the restoration found that the diversity of waterbirds was low, with only mallards (*Anas platyrhynchos*), killdeer (*Charadrius vociferus*), and bufflehead (*Bucephala albeola*) present, with mallards representing 88 percent of the total number of individuals observed (Dybala 2002, 4).

The NPS created four ponds at Mori Point to enhance the freshwater wetland habitat and provide foraging habitat for the San Francisco garter snake. These ponds also provide breeding and rearing habitat for the California red-legged frog. The San Francisco garter snake's main prey item is the California red-legged frog, and both species are discussed in detail in the "Special-status Species" section. Native wetland plant species were planted around the ponds and invasive plant species were removed. Educational signage and fences have been placed around the ponds and wetland habitat at Mori Point to prevent direct impacts to frogs and indirect impacts to frog habitat. The fence that currently exists around the ponds excludes both visitors and dogs.

## **NATIVE HARDWOOD FOREST**

This variable community extends from approximately 200 to 2,500 feet above msl in elevation, and is dominated by a number of oak species (*Quercus* spp.), California bay laurel (*Umbellularia californica*), and tanbark oak (*Notholithocarpus densiflorus*). Along the moisture boundary of this mixed evergreen forest is the Douglas-fir/redwood community, and along the xeric boundary are coastal scrub and grassland habitats (NPS 2005b, 196). In the planning area at GGNRA, native hardwood forests exist at Oakwood Valley, Alta Trail/Orchard Fire Road/Pacheco Fire Road, and Fort Baker. The Douglas-fir and coast redwood community is found sporadically in portions of Homestead Valley and within Oakwood Valley but outside the area accessed by dogs and is not discussed further in this draft plan/SEIS.

Coast live oak (*Quercus agrifolia*) dominates this community at elevations below 1,000 feet above msl. It is often the only species present on hills in the foggy, coastal climate of GGNRA. Interior live oak (*Q. wislizenii*) occasionally replaces coast live oak in canyon bottoms and on north-facing slopes. As the community approaches 1,000 feet above msl, California bay, tanbark oak, and other hardwoods become common (NPS 2005b, 196). Since 1995, large numbers of tanbark oaks, coast live oaks, and black oaks (*Q. kelloggii*) in California coastal counties have been dying from a disease referred to as sudden oak death. Sudden oak death is caused by a fungus-like organism, *Phytophthora ramorum*, which is a very

aggressive pathogen that can infect and kill otherwise healthy trees and may be spread through infected wood, soil, and rainwater (NPS 2013a, 1). At GGNRA, sudden oak death has killed many of the tanbark oaks and has also affected other hardwood tree species (NPS 2009b, 1).

In forested habitats, bushtits (*Psaltriparus minimus*), chestnut-backed chickadees (*Poecile rufescens*), dark-eyed juncos, Pacific-slope flycatchers (*Empidonax difficilis*), and winter wrens (*Troglodytes troglodytes*) were commonly detected during point count censuses in 1999 and 2000 (PRBO 2002, 1). The native hardwood forest community also provides habitat for the threatened northern spotted owl (*Strix occidentalis caurina*), which is discussed in more detail in the “Special-status Species” section. Live oaks are known for attracting high insect diversity, and thus, birds that are gleaners (insectivores). Oaks also attract jays and acorn woodpeckers, both of which cache acorns. They also provide cover and shade in what is otherwise extremely exposed habitat. All the bird species discussed in this habitat are protected under the *Migratory Bird Treaty Act* (with the exception of starlings, pigeons, crows, and game birds). The hardwood forest provides habitat for the vagrant shrew (*Sorex vagrans*), Trowbridge’s shrew (*Sorex trowbridgii*), Sonoma chipmunk (*Tamias sonomae*), western gray squirrel (*Sciurus griseus*), and dusky-footed woodrat (*Neotoma fuscipes*). Wide-ranging mammals such as the bobcat and coyote will travel through or use the native hardwood forest habitat as well.

## **RIPARIAN FORESTS AND STREAMS**

Riparian plant communities in GGNRA include streamside corridors of forests, shrubs, and herbaceous vegetation that tolerate moist conditions. The sites in GGNRA that possess riparian habitat include: Easkoot Creek at Stinson Beach, Redwood Creek at Muir Beach in Marin County, Marin Headlands Trails along the Rodeo Valley Trail Corridor from Rodeo Beach to Capehart Housing, and Lobos Creek at Baker Beach. The area at the Lobos Creek inlet that supports riparian vegetation is generally not used by visitors with dogs and is not affected by this draft plan/SEIS. At Easkoot Creek, the creek is densely vegetated with riparian plant species and generally difficult to access. These creeks are closed per the GGNRA Compendium (NPS 2008b, 9). As a result, riparian vegetation at both Lobos Creek at Baker Beach and Easkoot Creek at Stinson Beach are not discussed further in this section. Below and discussed in more detail include the following sites: Muir Beach (Redwood Creek), Marin Headlands Trails (along the Rodeo Valley Trail Corridor from Rodeo Beach to Capehart Housing), and Rancho Corral de Tierra (along most streams). Other riparian areas exist in GGNRA, but these areas are outside the scope of this project. Streamside forests and shrub areas are dominated by broad-leaved deciduous trees or shrubs, most commonly arroyo and Pacific willows (*Salix lasiolepis* and *S. lucida* ssp. *lasiandra*) and occasionally red alder (*Alnus rubra*). The understory is typically dense, with a variety of shrubs, including berries, such as the native salmonberry (*Rubus spectabilis*), thimbleberry (*R. parviflorus*), and California blackberry (*R. ursinus*) as well as non-natives such as Himalayan blackberry (*R. discolor*) and Cape ivy (*Delairea odorata*). In addition to shrubs, numerous herbaceous species, including ferns, rushes, and sedges, dominate the understory. Non-native trees, including eucalyptus (*Eucalyptus* spp.) and Monterey cypress (*Cupressus macrocarpa*), have become established in some riparian forests in the park (NPS 2005b, 196). These non-native species are discussed in more detail in the “Invasive Plant Species” section. Riparian forests provide habitat for the following CNPS-listed plant species: western leatherwood (*Dirca occidentalis*) and California bottlebrush grass (*Elymus californicus*). Suitable habitat for both of these CNPS-listed species exists in riparian forests along streams at Rancho Corral de Tierra in the project area (URS Corporation 2010, Figures 14 and 24).

Riparian trees support many invertebrates, such as insects, that are important to resident and migrating songbirds (NPS 2009c, 205). Some commonly observed bird species that nest in riparian habitats at GGNRA include Swainson's thrush (*Catharus ustulatus*), Wilson's warbler, warbling vireo (*Vireo gilvus*), song sparrow (*Melospiza melodia*), Brewer's blackbird (*Euphagus cyanocephalus*), and American goldfinch (*Carduelis tristis*) (Williams 2003). Other bird species that use riparian habitats at GGNRA include the red-winged blackbird (*Agelaius phoeniceus*), American robin (*Turdus migratorius*), cedar waxwing (*Bombycilla cedrorum*), and black-headed grosbeak (*Pheucticus melanocephalus*), as determined by point counts from 1998 to 2002 (PRBO 2002, 1). The riparian forest also provides habitat for the threatened northern spotted owl, which is discussed in more detail in the "Special-status Species" section. All the bird species discussed in this habitat are protected under the *Migratory Bird Treaty Act* (with the exception of starlings, pigeons, crows, and game birds). Riparian corridors also provide important habitat for amphibians such as tree frogs, newts, salamanders, and the endangered California red-legged frog, as well as the arboreal salamander (*Aneides lugubris*), California toad (*Bufo boreas halophilus*), coast range newt (*Taricha torosa torosa*), and western fence lizard. Riparian areas provide a water supply and cover habitat for flying insects and, in turn, for bats. Several bat species have been recorded using riparian habitats such as Lobos Creek and Redwood Creek in the park, including the Mexican free-tailed bat and California myotis (*Myotis californicus*). Because roost sites for bat species are generally not accessible to dogs, it is not expected that bats would be affected by dogs. Therefore, bats are excluded from further discussion in this draft plan/SEIS. The freshwater stream Lobos Creek supports a variety of invertebrates, including water striders, dragonflies, and water beetles. Threespine sticklebacks also occupy Lobos Creek.

The Muir Beach area is at the mouth of the Redwood Creek watershed, which features a riparian corridor that is currently dominated by red alders and some arroyo willows. The Redwood Creek watershed extends from the peaks of Marin County's tallest mountain, Mount Tamalpais, to the Pacific Ocean at Muir Beach. Pacific tree frogs (*Hyla regilla*) and California newts (*Taricha torosa*) inhabit both the creek and riparian habitat at Muir Beach. California giant salamanders (*Dicamptodon ensatus*) inhabit areas higher up Redwood Creek. Each winter coho salmon (*Oncorhynchus kisutch*) and steelhead trout return to Redwood Creek to spawn where they were born. Steelhead trout and coho salmon in Redwood Creek are federally listed as threatened and endangered, respectively. These species are discussed in more detail in the "Special-status Species" section. The park has closed the Redwood Creek area to people and dogs, including the trail along Redwood Creek and at the creek crossing near Muir Beach. Off-leash dogs have frequently been observed in Redwood Creek and Redwood Lagoon despite these closures (appendix G). A post-and-cable fence installed by NPS between lower Redwood Creek and lagoon is intended to discourage visitors from accessing the water; however, it does not physically exclude dogs or visitors from the area. The lagoon restoration at Muir Beach, discussed previously, also aims to improve the quality and quantity of coho salmon and steelhead trout habitat (NPS 2008c). Within the Marin Headlands Trails, the Rodeo Valley Trail Corridor parallels riparian habitat for its entire length (along the Rodeo Valley Trail Corridor from Rodeo Beach to Capehart Housing) and the Lagoon Loop Trail both passes through and is adjacent to riparian habitat along both sides of Rodeo Lagoon.

## **DOUGLAS-FIR AND COAST REDWOOD**

Many species contribute to the Douglas-fir and coast redwood forest community. Major overstory and understory tree species include coast redwood (*Sequoia sempervirens*), Douglas-fir (*Pseudotsuga menziesii*), California bay laurel, tanbark oak, California hazel (*Corylus californica*), and madrone (*Arbutus menziesii*). The coast redwood requires moist areas in valleys or near springs and is characteristically associated with tanbark oak and California bay laurel. In the understory of the coast redwood community, shrubs such as hazelnut (*Corylus* spp.), thimbleberry, and wood rose (*Rosa gymnocarpa*) are common, as well as wildflowers such as wild ginger (*Asarum* spp.), trillium (*Trillium* spp.), redwood sorrel (*Oxalis oregana*), sweet coltsfoot (*Petasites frigidus*), and elk clover (*Aralia*

*californica*); sword ferns (*Polystichum* spp.) are a common ground cover (NPS 2009c). The Douglas-fir and coast redwood forest community is found sporadically in portions of Homestead Valley and Oakwood Valley. The inner gorges of the watershed near Stinson Beach and the habitat at Muir Woods are dominated by the Douglas-fir and coast redwood community, but these areas are outside the scope of this project.

The Douglas-fir and coast redwood community provides habitat for the barred owl (*Strix varia*) and also for the threatened northern spotted owl, which is discussed in more detail in the “Special-status Species” section. Originally an eastern species closely related to the northern spotted owl, the barred owl has expanded its range westward and its range now overlaps with that of the northern spotted owl in most of the coastal woodlands of the west. The barred owl competes with the northern spotted owl for prey and habitat and is currently the most important threat facing the northern spotted owl (USFWS 2011a, vii). All the bird species discussed in this habitat are protected under the *Migratory Bird Treaty Act* (with the exception of starlings, pigeons, crows, and game birds). Many small mammals, such as the gray squirrel and Sonoma chipmunk, inhabit the forest canopy, while larger mammals, like raccoons and gray foxes, seek shelter in hollows in trees and logs. Amphibians such as the California giant salamander, slender salamander (*Batrachoseps* spp.), and rough-skinned newt (*Taricha granulosa*) inhabit the leaf litter on the forest floor. There are few insects, due to repellants produced by the tannins in redwood bark, and the deep shade of the coniferous canopy limits the number of flowers and fruit produced. This lack of food sources restricts the diversity of bird species, although the old growth forest does support the threatened northern spotted owl, as discussed above (NPS 2009c).

## MONTEREY CYPRESS

Stands of the non-native tree Monterey cypress are found within GGNRA, including at the Fort Miley site, at Lands End, and in several locations at Rancho Corral de Tierra. The park has targeted the 22 most invasive non-native species for control, including Monterey pine and Monterey cypress. Most areas of Monterey cypress at Rancho Corral de Tierra were planted for wind breaks and as timber sources in the 1800s, as well as later for street trees and to provide shade. While these trees provide habitat for some nesting bird species, the creation of a densely shaded canopy and acidic soils disrupt the natural distribution of native species at Rancho Corral de Tierra (POST 2001, 54). In 1933, the City of San Francisco and the federal government’s Civilian Works Administration planted thousands of Monterey Cypress around Lands End. East Fort Miley is dominated by older stands of densely planted Monterey cypress, but also includes some wetland/riparian vegetation around the fringes of the site. A large portion of Fort Miley is developed and only a small portion of the entire site supports mature, coniferous vegetation (which includes primarily the non-native Monterey cypress) in areas that are open to dogs. The densely planted trees leave little to no opportunity for light to reach the ground, so ground cover is minimal to non-existent except in areas where old trees have died and/or fallen. The dense Monterey cypress canopy with little understory diminishes songbird use of the site, but common landbirds most likely use this habitat; the pygmy nuthatch and Swainson’s thrush (in migration) may utilize this habitat. Dark-eyed juncos, California towhees, song sparrows, white-crowned sparrows, and spotted Towhees may use the edges of this forested habitat at Fort Miley for nesting and foraging. Additionally, raccoons, and skunks are probably present and non-native red foxes and feral cats are common in the vicinity of the Navy Memorial parking lot and Fort Miley. Coyotes are also present and may have recently been denning in the Fort Miley area. Non-native species present in this habitat include black and Norwegian rats and European starlings. Slender salamanders are probably present at Fort Miley as well.

## INVASIVE PLANT SPECIES

The park stewardship programs at GGNRA coordinate habitat restoration activities in over 10,000 acres of the park (NPS *Government Performance Results Act* reporting). An invasive species is defined as a non-native or exotic species whose introduction causes or is likely to cause economic or environmental harm or harm to human, animal, or plant health (NISC 2006, 1). Non-native plant species thrive in the park, particularly in areas subject to intensive historical land use (grazing, military occupation) or adjacent to urbanized areas that are a constant source of invasive weeds (NPS 1999, 23). The spread of non-native plants represents the most significant threat to the biodiversity of GGNRA and affects approximately 85 percent of the park's estimated 80 vegetation alliances (NPS 1999, 23). Non-native species directly threaten habitat for listed species, including the federally endangered mission blue and San Bruno elfin butterflies, Presidio manzanita, Presidio clarkia, and San Francisco lessingia, as well other special-status plants (state and CNPS listed) (NPS 1999, 23). GGNRA currently is targeting over 80 invasive plant species parkwide, which require constant stewardship. The following paragraphs describe invasive and/or non-native species by site in GGNRA, where information is available.

Sites in GGNRA in Marin County, San Francisco County, and San Mateo County all have documented problematic invasive plant species. Particularly at Milagra Ridge, invasive, non-native plants continue to be the primary threat to native plant communities. The species of most concern include Cape ivy, pampas grass (*Cortaderia selloana*), French broom, Scotch broom (*Cytisus scoparius*), ice plant, cotoneaster (*Cotoneaster* sp.), Monterey pine (*Pinus radiata*), Monterey cypress, and eucalyptus. Habitat at the Pedro Point Headlands includes coastal scrub, coastal bluff scrub, and coastal prairie. The north slope of the Pedro Point Headlands includes a large, non-native woodland of eucalyptus and Monterey pine. Several invasive plant species are also of concern at Rancho Corral de Tierra, particularly Cape ivy, French broom, eucalyptus and pampas grass (POST 2001, 56; URS Corporation 2010, Figure 2).

As with other park sites in GGNRA, the spread of non-native species is a management concern at Mori Point. Plant species that have been targeted for removal include pampas grass, Cape ivy, ice plant, French and Scotch broom, and cotoneaster. The *Mori Point Restoration and Trail Plan* includes measures for preserving and restoring the ecological integrity of Mori Point habitats by reducing threats to native plant communities and natural processes through restoration of native plant communities (NPS 2006e, 1).

At Fort Funston, the topography, stability, and soils of San Francisco dune remnants have been highly modified by the residual effects of past introductions of dune-stabilizing vegetation starting in the 1870s. Non-native European beachgrass was first planted in the 1870s to stabilize otherwise mobile dunes and has created steep, hummocky topography; the non-native ice plant was planted to stabilize both mobile and relatively stable dunes. Even though these plant species were historically planted for dune stabilization, they are now being targeted for removal. Non-native trees and shrubs, such as Monterey cypress, eucalyptus, and wattle (*Acacia* spp.), were also planted to act as strong baffles to dune-forming winds (Shultziski and Russell 2004, 2).

## SPECIAL-STATUS SPECIES

Special-status species are plants and animals that are legally protected under the state and federal ESA of 1973 or other regulations, as well as species that are considered sufficiently rare by the scientific community to qualify for such status. The federal ESA was enacted to protect plant and animal species considered to be in danger of extinction and affords legal protection to species listed as endangered and threatened, including protection of their habitats. Critical habitat is defined in the federal ESA as a specific geographic area that contains habitat features essential for the conservation of a threatened or endangered species (USFWS 2005b, 1). The USFWS of the U.S. Department of the Interior and the National Oceanic and Atmospheric Administration Fisheries of the Department of Commerce share

responsibility for administration of the federal ESA. The terms *threatened* and *endangered* generally describe the official federal status of vulnerable species, as defined by the federal ESA. Additional federal regulations protect both listed and non-listed wildlife species in the park, including the *Fish and Wildlife Coordination Act of 1934* (as amended), the *Bald and Golden Eagle Protection Act*, the *Marine Mammal Protection Act*, and the *Migratory Bird Treaty Act*.

Designated critical habitat areas are necessary for the recovery of endangered or threatened species, even though the species of concern may not be documented in these areas. An evolutionarily significant unit is considered to be a distinct population segment and thus a species under the federal ESA. When applicable, critical habitat is discussed in the paragraphs below for listed species. The constituent elements of critical habitat defined by the USFWS and National Oceanic and Atmospheric Administration Fisheries (1998, 4-36) as follows:

Physical and biological features of designated or proposed critical habitat essential to the conservation of the species, including, but not limited to: (1) space for individual and population growth, and for normal behavior; (2) food, water, air, light, minerals, or other nutritional or physiological requirements; (3) cover or shelter; (4) sites for breeding, reproduction, rearing of offspring, germination, or seed dispersal; (5) habitats that are protected from disturbance or are representative of the historic geographic and ecological distributions of a species.

The California ESA is similar to the federal ESA both in process and substance; it is intended to provide additional protection to threatened and endangered species in California. The California ESA does not supersede the federal ESA, but operates in conjunction with it. The California Department of Fish and Game maintains an informal list of plant and wildlife species of special concern because of population declines and restricted distributions, and/or because they are associated with habitats that are declining in California. The CNPS has developed lists of plants of special concern in California. Although federal agencies are not required to comply with California's Fish and Game Code, the NPS makes every reasonable effort to conduct its actions in a manner consistent with relevant state laws and regulations. Due to the extensive numbers of plant and wildlife species included on the lists produced by the CNPS and the California Department of Fish and Game, these species are discussed in the "Vegetation and Wildlife" section. However, these species are still given equal consideration in this draft plan/SEIS compared to the federally and state-listed threatened and endangered species that are included in this section. In addition to special concern species, some animal species with the "fully protected" status also exist at GGNRA; most fully protected species have also been listed as threatened or endangered species under the state or federal ESA (DFG 2010, 1). Fully protected species are noted in this section as applicable.

---

*The federal ESA was enacted to protect plant and animal species considered to be in danger of extinction and affords legal protection to species listed as endangered and threatened, including protection of their habitats.*

---

GGNRA has one of the highest numbers of threatened and endangered species occurring within its boundaries of any unit of the NPS in the continental United States (NPS 2009c). Nearly all of the park's threatened and endangered species for GGNRA were listed after the 1979 Pet Policy; changing conditions in the park can therefore affect listed species. If an observation of a species has been entered in GGNRA records, it is assumed that this species could occur at the park wherever suitable habitat exists. If habitat is not currently found at Marin County, San Francisco County, or San Mateo County park sites for a particular species of special status, the species is discounted from further analysis and discussion. "Appendix H: Special-status Species" includes an annotated table of all listed or candidate wildlife or plant species potentially present in the study area of GGNRA and affected by this draft plan/SEIS, as well

as a brief summary of presence/absence of suitable habitat and any distribution notes. This list in appendix H includes species that could be affected by dog management activities based upon the presence of suitable habitat in the previously defined sites of the planning area for this project. Federally and state-listed species are discussed in the following sections when the listed species occurs, or potential habitat is present in areas that allow dogs at specific GGNRA sites. Although habitats at GGNRA support many species with special status, only those species potentially affected by this draft plan/SEIS are discussed in this section. Special-status species that are considered vagrants (e.g., species where individuals have been documented in the park on occasion) are not discussed further because these species are not likely to be affected by the draft plan/SEIS due to the short-term nature of their presence at GGNRA. Also, marine mammal species such as whales and sea otters are not expected to be affected by dogs. However, the stranding of sick and injured pinnipeds (and sometimes healthy pinnipeds as well) is common on park beaches of GGNRA, as described in table 7. Because stranded marine mammals may provide an opportunity for contact or disturbance by dogs on beaches, the species in this category are included in this section for discussion.

### **FEDERALLY AND STATE-LISTED THREATENED AND ENDANGERED SPECIES AND CANDIDATE SPECIES**

The following wildlife and plant species are discussed in this section: species listed or proposed for listing as threatened or endangered under the California or federal ESA (no candidate species are found in GGNRA).

**Endangered species.** If the USFWS determines that a species is on the brink of extinction, it is listed as endangered. Listing as endangered gives the species protection under section 9 of the federal ESA, which prohibits the unauthorized take of a federally listed endangered wildlife species and malicious damage or destruction of federally listed plant species.

**Threatened species.** If the USFWS determines that a species is experiencing serious threats that may eventually lead to its extinction but the situation is not yet critical, the species is classified as threatened. Species listed as threatened do not automatically have protection under the federal ESA, but the USFWS has applied most of the same protection described above to threatened species (authorized by section 4(d) of the federal ESA).

Because of the diversity of habitats and sensitive areas available at GGNRA and the protected nature of NPS lands, a total of 19 threatened and endangered species and associated critical habitat (when applicable) are being considered in this draft plan/SEIS. Table 8 presents the wildlife and plant species being considered in this draft plan/SEIS that have federal and/or state status. The wildlife and plant species included in table 8 either have mapped occurrences at the GGNRA sites described or the sites provide potential habitat to that particular listed species. A detailed life history of each species follows the table.

**TABLE 8. FEDERALLY AND STATE-LISTED SPECIES CONSIDERED IN THIS DRAFT PLAN/SEIS**

| Group        | Scientific Name                              | Common Name                          | Federal Status <sup>a</sup> | State Status <sup>a</sup> | GGNRA Location of Mapped Occurrence or Potential Habitat  |
|--------------|--|--------------------------------------|-----------------------------|---------------------------|---|

| Plant | <i>Potentilla hickmanii</i>                       | Hickman's potentilla (Hickman's cinquefoil) | FE                          | SE                        | Mori Point, Pedro Point, and Rancho Corral de Tierra     |

<sup>a</sup> FE = federally endangered, FT = federally threatened, CH = critical habitat, SE = state endangered, ST = state threatened.

<sup>b</sup> =Critical habitat has been designated for this species, but the critical habitat does not occur in GGNRA.

## ENDANGERED, THREATENED, AND CANDIDATE SPECIES: WILDLIFE

### San Bruno Elfin Butterfly (*Callophrys mossii* ssp. *bayensis*)

The San Bruno elfin butterfly is federally listed as endangered. The USFWS has prepared a recovery plan for this species with the objective of protecting, maintaining, and enhancing existing populations of the two endangered butterfly species, the San Bruno elfin and mission blue butterflies (USFWS 1984, 2). The larval host plant for the San Bruno elfin butterfly is sedum (*Sedum spathulifolium*), a succulent that grows on rocky, north-facing slopes along the coast (coastal scrub) and occurs in colonies at Milagra Ridge in GGNRA (Newby 2000, 4). Existing San Bruno elfin butterfly populations are closely tied to their sedum host and nectar plants where the butterfly lays its eggs and the larvae develop; adults emerge for only a short time (Newby 2000, 4). At Milagra Ridge, San Bruno elfin populations and sedum occur on rocky outcrops that are relatively inaccessible to people and dogs (NPS 2005b, 206). At Rancho Corral de Tierra, these sedum communities also occur in rocky out-crops at the site, and the butterfly has been observed at the site and in the vicinity, though these observations have been unconfirmed (POST 2001, 34; URS Corporation 2010, 3-4 and Figure 8). At Milagra Ridge, GGNRA natural resource managers follow the recommendations found in the *Recovery Plan for San Bruno Elfin and Mission Blue Butterflies* (USFWS 1984, 48) by periodically monitoring the population. Only on-leash dog walking is allowed on trails in Milagra Ridge, and trails are routed away from known habitat to minimize possible impacts to this species.

### Mission Blue Butterfly (*Icaricia icarioides* ssp. *missionensis*)

The mission blue butterfly is federally listed as endangered (DFG 2009, 3). The mission blue butterfly is very closely tied to just three species of lupine, called host plants, which are the sole food source for mission blue caterpillars (NPS 2009d, 1): *Lupinus albifrons*, *L. formosus*, and *L. variicolor*. Larvae feed on lupine host plants and undergo diapauses (similar to hibernation) at the base of the lupine plants and emerge in the spring. The larvae then undergo a series of molts and metamorphose into butterflies that live 7-10 days (less than 3 percent of the entire life cycle) during a single, brief period each spring. Lupine tends to grow in thin, rocky soils, particularly in patches of grasslands found in areas of coastal scrub, favoring sites that have been recently disturbed (NPS 2009d, 1). Lupine will typically not grow in areas dominated by dense areas of coastal scrub or chaparral. The lupine host plant species that support

mission blue butterflies are disturbance-associated species, which means the plants require disturbance prior to growth. In the past, periodic fires and Tule elk grazing kept shrubs and trees from taking over the grasslands that supported lupine and provided the disturbance needed to stimulate lupine seeds to germinate. Fire suppression and the loss of elk have potentially contributed to declines in both the quality and quantity of lupine habitat (NPS 2009d, 1). In addition to more natural areas, the lupine host plants are also found along road cuts, former quarry sites, and along and adjacent to trails and in trail treads in some locations at GGNRA. The mission blue butterfly has been documented at Alta Trail / Orchard Fire Road / Pacheco Fire Road, Oakwood Valley, the Marin Headlands Trails, Fort Baker, Milagra Ridge, and Sweeney Ridge / Cattle Hill; Tennessee Valley, in the Marin Headlands Trails, also has mission blue butterfly habitat and documented occurrences of mission blue butterfly (Bennett 2008, 8; USFWS 1984, 1). Lupine host plants have been documented in inventories conducted at Sweeney Ridge (May & Associates, Inc. 2006). Small patches of the host plant *L. varicolor* for the mission blue butterfly can also be found at Rancho Corral de Tierra (URS Corporation 2010, Figure 6). Also in San Mateo County, 2,000 acres of habitat (on San Bruno Mountain, located outside the planning area) are being managed by the San Mateo County Department of Parks and Recreation. San Francisco's Twin Peaks population of mission blue butterfly was rediscovered in 2001. The City of San Francisco did a small mission blue butterfly reintroduction/population enhancement at Twin Peaks in 2009 by moving several gravid (pregnant) female mission blue butterflies to the site (SFRPD and USFWS 2009, 1).

In response to the butterfly's endangered status, GGNRA initiated a broad-scale habitat restoration program to remove French broom, pampas grass, and other targeted invasive plant species throughout mission blue butterfly habitat in the park during the late 1980s and early 1990s. Habitat restoration efforts for the butterfly have continued annually, consistent with recovery objectives for the species (NPS 2009c). Park stewardship programs in Marin County are also working to protect butterfly habitat adjacent to trails. Habitat restoration is ongoing at Milagra Ridge, where vegetation management involves removal of exotic species, including broom, pampas grass, and ice plant. At Fort Baker, where restoration has been ongoing since 1990, approximately 55 acres of mission blue butterfly habitat has been enhanced and restored to date.

The recovery plan for the San Bruno elfin and the mission blue butterflies calls for the protection of essential habitat for the mission blue butterfly, prevention of further degradation of habitat and recommends the enhancement of habitat when possible (USFWS 1984,4). The plan also recommends that land managers minimize use of herbicides, insecticides, and other toxic substances; control off-road vehicle activity; remove exotic weeds; transplant selected native flora; and improve seedling establishment of native flora. It also directs managers to restore or rehabilitate habitat in the butterfly's historical range (USFWS 1984, 48). Actions have been identified in the recovery plan that NPS can implement to help in the recovery of this species.

The population of mission blue butterfly in GGNRA has been monitored since 1994 at Marin Headlands and Fort Baker, since 1995 at Milagra Ridge, and since 2004 at Oakwood Valley/Alta Trail by a variety of methods. At Fort Baker, Battery Yates has mission blue butterfly habitat that is partially fenced (post-and-cable) but does not physically exclude dogs and Drown Fire Road is adjacent to mission blue butterfly habitat. The mission blue butterfly is known to occur along the Notch Trail at Sweeney Ridge and the host plants are known to occur in other areas at Sweeney Ridge (USFWS 1995, 3), including along Mori Ridge Trail, Sweeney Ridge Trail, the Baquiano Trail, the Sweeney Horse Trail, and the Sweeney Meadow Trail (May & Associates, Inc. 2006). Recent habitat surveys indicate that mission blue butterfly host plants are not present at Cattle Hill (NRM Environmental Consulting 2007, 2; URS Corporation 2010, Figure 6). At Milagra Ridge, the mission blue butterfly is known to occur at the site in an area referred to as the "Mission Blue Butterfly Corridor," located in portions of this site (NPS 2005c), including sections of the Milagra Ridge Road and Milagra Ridge Spur. There is no mapped mission blue butterfly habitat directly along the Alta Trail or Oakwood Valley Trail and Oakwood Valley Fire Road.

However, there is mapped mission blue butterfly habitat very nearby in the grassy hillsides between the two areas, where social trails have connected the trail and fire road. These social trails are closed, but are still used by both visitors and dogs. These grassy, west-facing hillsides adjacent to the Alta Trail (mapped mission blue butterfly habitat) are a favorite use area for commercial dog walkers. Mission blue butterfly presence and habitat exist along the North Miwok Trail corridor, where dogs are allowed on leash, and along a section of the Julian Road where voice control dog walking is allowed. NPS installed fencing in an attempt to discourage dogs and people from accessing mission blue butterfly habitat at the Alta Trail and along sections of the Coastal Fire Road/Trail in the Marin Headlands; however, the installed fencing is post and cable and does not exclude dogs from the habitat, especially if they are off leash. The park practice is to close trails through mission blue butterfly habitat to bikes, dogs, and horses, but allow dogs on leash on fire roads through mission blue butterfly habitat.

### **Tidewater Goby (*Eucyclogobius newberryi*)**

The tidewater goby is listed as federally endangered. This species is a small benthic fish that occurs in California coastal lagoons with salinity less than 10 parts per thousand (USFWS 2005a, iii). While generally found in coastal embayments, gobies are also known to occur in streams. The tidewater goby is present in high densities in Rodeo Lagoon at GGNRA. The tidewater goby burrows in Rodeo Lagoon's soft shoreline sediment and completes its entire life cycle in the lagoon habitat. Males dig breeding burrows and then females aggressively spar with each other for access to males with burrows (Swenson 1995). The males care for the embryos for 9 to 11 days until they hatch, rarely if ever emerging from the burrows to feed (USFWS 2005a, 13). Because the fish do not enter the ocean, each population of the tidewater goby is isolated from the others (USFWS 2005a, 6). Various genetic markers demonstrate that pronounced differences in the genetic structure of tidewater gobies exist, and that tidewater gobies in some locations are genetically distinct (USFWS 2005a, 31); the population of tidewater gobies in Rodeo Lagoon is isolated from other populations and is genetically distinct (Dawson et al. 2001, 4). The lagoon is closed to both humans and dogs for overall resource protection. However, there is no physical barrier to prevent dogs from accessing the lagoon, specifically at the beach-lagoon shoreline. A concurrent NPS project includes the installation of a post-and-cable fence along the beach side of Rodeo Lagoon to discourage visitors from accessing the lagoon, though it would not physically exclude dogs or visitors from this area. Additionally, the voice control areas are located immediately adjacent to the shoreline of the lagoon. Pet citations have been issued as a result of dogs accessing closed areas (Rodeo Lagoon) at Rodeo Beach (appendix G).

A recovery plan for the tidewater goby, dated December 2005, is in effect. The recovery plan calls for protection and enhancement of currently occupied habitat, including managing freshwater inflow, exotic species, channelization, water quality, and human impacts; development of strategies to prevent further loss of habitat; and research and monitoring (USFWS 2005a, 43–45). The plan also names increasing public awareness and possible translocation of gobies as strategies to help populations recover (USFWS 2005a, 44–45). In January 2008, the USFWS published a Final Rule re-designating critical habitat for the tidewater goby to include additional sites throughout the range of the goby. Rodeo Lagoon was included in the revised designation of critical habitat for the tidewater goby and is described as critical habitat unit MAR-4 in the Final Rule. The Final Rule states that “tidewater gobies are abundant within Rodeo Lagoon, and the lagoon was occupied by tidewater gobies at the time of the listing and is currently occupied” (50 CFR Part 17).

### **Coho Salmon (*Oncorhynchus kisutch*)**

The central California coast coho salmon evolutionarily significant unit is listed as federally endangered as well as state endangered (DFG 2004, ES.1). The evolutionarily significant unit includes all naturally spawned populations of coho salmon from Punta Gorda in northern California south to and including the

San Lorenzo River in central California, as well as populations in Redwood Creek at Muir Beach in GGNRA. This species occurs in several creeks in the planning area, as well as the nearshore waters of the Pacific Ocean and estuarine sites such as Bolinas Lagoon and the San Francisco Bay. A single cohort of coho salmon was found in Easkoot Creek (Marin County) (DFG 2004, 6.45). Designated critical habitat for coho in GGNRA includes some estuarine and stream areas in the coastal watersheds of Marin County, including Redwood Creek, that are accessible to coho salmon (64 FR 24053). The park has closed the Redwood Creek area to dogs, including the trail along Redwood Creek and at the creek crossing near Muir Beach. However, these closures are not always followed; a citation was issued for a dog in the creek in 2006 (appendix G).

**Muir Beach**  
Credit: NPS

Coho salmon use Redwood Creek during many of their life stages (DFG 2004, 6.44). Coho salmon return to their home streams (Redwood Creek in the draft plan/EIS area) to spawn and lay eggs in nests called redds. Salmonids require gravel areas of substrate for laying eggs, and these areas are located upstream of the area where dogs can access Redwood Creek. When the eggs hatch, the young salmon are called alevins. Each alevin remains in the gravel and lives off its yolk sac until it is depleted. At this point, they are called fry and leave the gravel to feed on small prey in the stream; after 16 months, the young salmon are called

smolts. Smolts migrate to the sea, remaining at sea until they return as adults to spawn in their home streams. A genetically distinct run of coho salmon are found in Redwood Creek (Marin County). The park monitors coho salmon annually and has begun a research and habitat restoration effort that is restoring streamside habitat at Redwood Creek and adding woody debris to enhance the in-stream habitat. In addition, the park has initiated the restoration of the Redwood Creek lagoon to help in restoring coho habitat near Muir Beach. Redwood Creek empties into the lagoon just upstream from the entrance channel of the creek at Muir Beach and ultimately enters the Pacific Ocean. Coho salmon have been declining in Redwood Creek in recent years (NPS 2008c, 2). Specifically, there were no spawning coho salmon observed in Redwood Creek during the 2007–2008 winter monitoring period, although a small number of coho fry were observed the next spring. While a portion of this recent decline can be attributed to a regional oceanic phenomenon, local conditions that have not yet been determined may also have been a factor (NPS 2008c, 2). A historical reference of coho salmon is recorded at a location on Denniston Creek at Rancho Corral de Tierra. The species has not been recorded at this site since 1941, and there are currently barriers to fish migration at the site (URS 2010, 3-2). As such, this species is not analyzed in chapter 4.

### **Steelhead Trout (*Oncorhynchus mykiss*)**

The central California coast steelhead trout distinct population segment is listed as federally threatened. This species occurs in several creeks in the planning area. In the study area, steelhead trout occurs in Stinson Beach (Easkoot Creek), Muir Beach (Redwood Creek), Rodeo Beach (Rodeo Lagoon), the Marin Headlands Trails (Rodeo Creek and Gerbode Creek), and Rancho Corral de Tierra (Denniston and Martini Creeks) (Becker and Reining 2008). Designated critical habitat for central California coast

steelhead includes most of the coastal streams of Marin County, including Redwood Creek and Denniston Creek below Denniston Reservoir (NOAA 2005, 76). As stated above for coho salmon, the park has closed the Redwood Creek area to dogs, including the trail along Redwood Creek and at the creek crossing near Muir Beach. In addition, NPS has installed a post-and-cable fence along the beach side of lower Redwood Creek and lagoon to discourage visitors from accessing the water; however, the fence would not physically exclude dogs or visitors from the area, and voice control areas are located immediately adjacent to the shoreline of the lagoon. These closures have been violated, and pet violations have been recorded in the past (appendix G). Adult steelhead enter streams (including streams in GGNRA) in the late winter through spring to reach spawning sites. The amount of time steelhead rear in freshwater and marine/estuarine habitats is variable, ranging between 1 and 3 years. The park monitors steelhead and is conducting research and restoration efforts, particularly in Redwood Creek, as described above for coho salmon (NPS 2008c, 2). There is also a historic record of steelhead trout in San Vicente creek at Rancho Corral de Tierra (POST 2001, 35-36), but there is little current evidence to suggest that the creek currently supports steelhead (Becker and Reining 2008). Currently, physical blockages to the creeks at Rancho Corral de Tierra affect steelhead use of the site (POST 2001, 35-36).

### **California Red-legged Frog (*Rana draytonii*)**

The California red-legged frog is listed as federally threatened. This species uses diverse habitat elements, including aquatic, riparian, and upland habitats (USFWS 2002, iv). Breeding sites of the California red-legged frog are located in a variety of aquatic habitats. Larvae, tadpoles, and metamorphs have been collected from streams, deep pools, backwaters in streams and creeks, ponds, marshes, sag ponds, dune ponds, and lagoons (USFWS 2002, iv). Numbers of California red-legged frogs have decreased dramatically in the urbanized San Francisco Bay Area, but populations persist at Marin County at Tennessee Valley (Tennessee Valley pond provides breeding habitat), Muir Beach (water bodies at site provide habitat but no known breeding occurs), Rodeo Beach (Rodeo Lake provides breeding habitat), as well as at Mori Point (ponds provide breeding habitat), Milagra Ridge (ponds provide breeding habitat), Sweeney Ridge/Cattle Hill. Cattle Hill has mapped occurrences of the California red-legged frog at the site, but neither Sweeney Ridge nor Cattle Hill has known breeding that has been documented to date (URS Corporation 2010, figure 3). However, both Sweeney Ridge and Cattle Hill provide potential breeding and nonbreeding habitat for the California red-legged frog based upon modeling efforts (URS Corporation 2010, figure 3). Although the California red-legged frog is normally associated with wetland areas and water bodies, this species can also use upland and riparian habitat as well. The USFWS designated critical habitat units for the California red-legged frog in 2001 and revised the units in 2006, 2008, and 2010 (USFWS 2010). For the California red-legged frog, critical habitat covers most of Sweeney Ridge and Rancho Corral de Tierra (USFWS 2010). Designated critical habitat also occurs at Pedro Point (USFWS 2010). Although the California red-legged frog is normally associated with wetland areas and water bodies, this species can also use upland habitat. In consultation with USFWS, the Milagra Ridge and Wolf Ridge site management plans include habitat enhancement for California red-legged frogs and the designation of several sites (Wolf Ridge, Rodeo Lagoon, and Redwood Creek) as special habitats with the objective of protecting habitat for the California red-legged frog and other species. Based on NPS winter breeding surveys, breeding populations of California red-legged frogs are present at Rancho Corral de Tierra at two known locations (NPS unpublished data). Occurrences of the frog are mapped in areas of Rancho Corral de Tierra, and the site provides ample dispersal and upland aestivation habitat. Existing trails at Rancho Corral de Tierra cross upland and dispersal habitat for this species (URS Corporation 2010, Figure 3). The California red-legged frog is the primary prey of the federally and state-endangered San Francisco garter snake (as discussed below).

**Cattle Hill**  
Credit: NPS

Current management of the California red-legged frog at GGNRA includes the placement of educational signs at Rodeo Lagoon, Rodeo Lake, and Mori Point. The NPS created four ponds at Mori Point to enhance the freshwater wetland habitat and to provide foraging habitat for the San Francisco garter snake, and these ponds also provide breeding and rearing habitat for the California red-legged frog. The pond habitat at Mori Point is currently fenced to reduce dog impacts. Current GGNRA regulations require on-leash dog walking at Mori Point, but some off-leash dogs have been observed at this site by park staff (see the “Visitor Use and Experience” section under “Visitor Use by Dog Owners”). The existing closure of Tennessee Valley to dog walkers (with the exception of the sections of the Coastal Trail that cross Tennessee Valley) may also benefit the California red-legged frog at GGNRA.

### **San Francisco Garter Snake (*Thamnophis sirtalis tetrataenia*)**

The San Francisco garter snake is listed as both federally and state endangered. The San Francisco garter snake is also a fully protected animal in California. Habitat requisites of the San Francisco garter snake include densely vegetated ponds near open hillsides where there are basking areas, cover, and food. Cattails, bulrushes, and spike rushes (*Juncus* spp. and *Eleocharis* spp.) are plant species preferred as cover by the snake (NPS n.d.a, 1–2). The San Francisco garter snake is normally associated with wetland areas and water bodies, but also uses upland habitat for basking and/or burrowing (USFWS 1985, 9). Essential habitat for a breeding San Francisco garter snake population includes open, grassy uplands and shallow marshlands with adequate emergent vegetation; an open water component is also important to the San Francisco garter snake (USFWS 2006, 9-10). On the California coast, snakes hibernate during the winter, and adults may aestivate in rodent burrows during months when ponds dry. The primary food of the San Francisco garter snake is the California red-legged frog, but the snakes will also capture small bullfrogs (NPS n.d.a, 1). Young snakes depend primarily on Pacific tree frogs for food (USFWS 2007b, 2). The decline of the California red-legged frog (the adult snakes’ primary prey) and the introduction of exotic predators such as bullfrogs into aquatic habitats are both threats to the San Francisco garter snake (USFWS 2002, 24). Habitat loss and the degradation of remaining habitat continue to be the primary threats to the recovery of the San Francisco garter snake (USFWS 2006, 15). Other threats include the increased presence of invasive species (such as bullfrogs mentioned above), water level fluctuations, vehicular strikes (USFWS 2006, 25) and since the Recovery Plan was established, the continued loss of grazing lands, the improper management of suitable habitat and the reduction in prey for the San Francisco garter snake (USFWS 2006, 30). Additionally, the San Francisco garter snake has historically been collected due to its rarity and beautiful coloration, and some amount of illegal collection likely still occurs (USFWS 2006, 20). In GGNRA, habitat for the San Francisco garter snake is found in San Mateo County. Specifically, the San Francisco garter snake has been documented as occurring at Mori Point and most of Mori Point contains habitat for the San Francisco garter snake. The NPS created four ponds at Mori Point to enhance the freshwater wetland habitat and provide breeding and rearing habitat for the California red-legged frog as well as providing foraging habitat for the San Francisco garter snake. NPS recorded San Francisco garter snakes using these constructed ponds at Mori Point as areas for foraging for California red-legged frogs (USFWS 2006, 6). Milagra Ridge has suitable aquatic, adjacent upland, and dispersal habitats for the San Francisco garter snake; other sites such Sweeney Ridge and Pedro Point may serve as dispersal habitat for the San Francisco garter snake. Pedro Point is in close proximity to California red-legged frog occurrences on San Pedro Creek and Shamrock Ranch, but Swain Biological (2006) rated the habitat quality as poor. In addition, habitat assessments have concluded that Sweeney

Ridge and Cattle Hill are important to the overall conservation of the San Francisco garter snake because these sites provide connectivity between known populations of the snake or between high quality aquatic habitats that potentially supports the snake (Swaim Biological 2006). However, with the exception of the South Meadow area of Sweeney Ridge, habitat quality for the San Francisco garter snake was rated low (Swaim Biological 2006). Several areas of the Rancho Corral de Tierra site provide suitable habitat for the San Francisco garter snake, where the California red-legged frog is present. There was a sighting of the San Francisco garter snake at Rancho Corral de Tierra in 1996 at the Denniston Reservoir (Swaim Biological 2007). There was also a mapped occurrence of the San Francisco garter snake at Denniston Creek near a trail in the Rancho site (URS Corporation 2010, Figure 11). Rancho Corral de Tierra provides suitable aquatic habitat and adjacent upland dispersal habitat are crossed by trails throughout Rancho Corral de Tierra (URS Corporation 2010, Figure 11).

### **Western Snowy Plover (*Charadrius alexandrinus nivosus*)**

The western snowy plover is a subspecies found along the Pacific coast from Washington to Baja California, portions of the interior western and southwestern United States, the Gulf coast of Texas, and interior portions of Mexico (Page et al. 1995, 1). The population of western snowy plovers nesting within 50 miles of the Pacific Coast of North America from southern Washington to Baja California was declared as federally threatened by the USFWS in March 1993 (USFWS 2007a, 1). Therefore, the subspecies of western snowy plover that occurs along the shorelines of GGNRA is federally threatened. In September of 2005, the USFWS published a Final Rule to re-designate critical habitat for the western snowy plover along the coasts of California, Oregon, and Washington (50 CFR Part 17). The *Recovery Plan for the Pacific Coast Population of the Western Snowy Plover*, developed by the USFWS in 2007, indicates that monitoring and management of western snowy plover breeding, wintering, and migrating habitat (including reducing disturbance to this species) continue to be important steps for this species' recovery (USFWS 2007a, vi). In GGNRA, the western snowy plover uses areas with wide, sandy, dune-backed beaches for roosting and foraging during the nonbreeding season. This species forages above and below the mean high waterline, typically gathering food from the surface of the sand, wrack line, or low foredune vegetation. There is no documentation of western snowy plovers nesting in GGNRA, but they overwinter at the Ocean Beach SPPA and at the Crissy Field WPA from July through May. There is a record from 1854 that a snowy plover (*Charadrius nivosus nivosus*) specimen was collected at the Presidio [in GGNRA] in early May (Grinnell 1932, 271-272), indicating that this bird was historically present on GGNRA beaches.

### **Western Snowy Plover Monitoring**

NPS monitors snowy plovers at Ocean Beach and Crissy Field to determine changes in abundance and distribution, and to understand potential threats, including dogs, to plovers from recreational and maintenance activities (NPS 2008a, 1). Western snowy plover monitoring has been conducted at Ocean Beach using the same monitoring protocol since December 1994. This monitoring protocol was peer reviewed by an external panel through the NPS Inventory and Monitoring Program peer review process (Merkle et al. 2011, ii). The monitoring season runs from July through May and is referred to by the year of the July start; the winter season, from November through February, is the time period that best defines the western snowy plovers that consistently inhabit beaches during the nonbreeding season by removing the fall and spring migration periods when some of the plovers are moving through these areas.

In addition to presenting the average numbers of observed plovers in this section, maximum numbers for individual survey counts are presented as well to further describe plover use of the sites, since there are normally several months in the survey period when plover numbers are very low. The average number of plovers observed per survey during the winter was highest in the 1994 through 1995 survey period, at more than 54 plovers (with a maximum of 85 plovers), and was lowest in 1999, at less than 13 plovers

(NPS 2008a). The winter population of western snowy plovers was on average above 30 plovers per winter survey in 2002 through 2006 (NPS 2008a). Maximum annual single survey counts of snowy plovers from 2000 through 2006 ranged from a low of 23 in 2000 to a high of 62 in 2003 (NPS 2006b, 8; Hatch et al. 2007a, 1; Hatch et al. 2007b). For the 2007 season (July 2007 through February 2008), the maximum number of snowy plovers counted on a survey was 49 (Hatch et al. 2008, 1). Western snowy plover numbers have still not matched those recorded in 1994 when a maximum of 85 snowy plovers and an average of 56 plovers were recorded (Hatch et al. 2007a, 8). The numbers of western snowy plovers vary year to year based on a variety of factors, including conditions on the breeding grounds, along migration corridors and at other wintering sites, beach width, the severity of storms, and other influences. Even though the western snowy plover distribution at Ocean Beach has fluctuated over time, the plovers have consistently concentrated in two primary areas of the beach at this site.

The NPS has been monitoring shorebirds at Crissy Field WPA since 2000, and records of western snowy plover pre-date the focused monitoring program there, which began in 2004 (NPS 2008a, 1). The western snowy plover monitoring protocol at Crissy Field was peer reviewed by an external panel through the NPS Inventory and Monitoring Program peer review process. Monitoring under this protocol started in 2006 using the same methods used at Ocean Beach. Two to eight western snowy plovers have overwintered in Crissy Field WPA annually since individuals were first observed there in January 2005. Additionally, wintering site fidelity was demonstrated by two color-banded individuals that were observed overwintering in the WPA in the 3 consecutive years from 2004 through 2006 (NPS 2008a, 2). Monitoring data indicate consistent western snowy plover use of the Crissy Field WPA, although this population is relatively small in size.

### **Presence and Impacts of Dogs on Western Snowy Plover**

As stated previously, 36 CFR 7.97(d) describes the seasonal dog walking leash restrictions for the western snowy plover at the Ocean Beach SPPA and at Crissy Field WPA. Off-leash dogs are brought into the Crissy Field WPA and the Ocean Beach SPPA by park visitors during the seasonal leash restriction. The law enforcement incident reports from 2008 through 2011 showed that Ocean Beach has the most incidents, with a total of 815 recorded dog-related incidents associated with natural resources. The majority of the incidents reported were for having a dog off leash within the Ocean Beach SPPA (729 recorded incidents, table 6) during the period (July 1 through May 15) when dogs must be leashed. Also from 2008 through 2011, Crissy Field had the second most incidents, with a total of 358 recorded dog-related incidents associated with natural resources. The most common incident at Crissy Field was for having off-leash pets within the WPA (283 reported incidents, table 6) during the period (July 1 through May 15) when dogs must be leashed.

**Ocean Beach**

Credit: NPS

The western snowy plover monitoring program at GGNRA has focused on summarizing snowy plover distribution and relative abundance in the SPPA at Ocean Beach and the WPA at Crissy Field, as well as summarizing numbers and trends for people and dog use (Hatch et al. 2007b, 1). At GGNRA, there have been multiple instances of dogs flushing or chasing shorebirds, including western snowy plovers (Hatch 1996, ii; Hatch et al. 2007a, 4). As described in the collected law enforcement data previously and through the plover monitoring program, the seasonal leash restrictions designed to protect western snowy

plovers at Ocean Beach are frequently violated and disturbance of shorebirds, including western snowy plovers by dogs and people has occurred (Hatch 1996; Hatch et al. 2007a, 2008; USFWS 2007a). During western snowy plover monitoring surveys conducted at Ocean Beach from December 1994 to May 1996, 362 dogs were observed chasing birds; 19 dogs were observed chasing at least 62 western snowy plovers; and roaming dogs inadvertently disturbed at least 100 additional western snowy plovers (Hatch 1996). During a long-term monitoring survey conducted from 1994 to 2006, 48 off-leash dogs were observed chasing western snowy plovers (Ward and Ablog 2006).

Similar to Ocean Beach, dogs have specifically been documented disturbing western snowy plovers at the Crissy Field WPA, although these numbers likely undercount disturbances. In June through July 2006, there were two observed instances of dogs chasing birds within the Crissy Field WPA (Hatch et al. 2007a, 14) and during the September 2006 through April 2007 surveys, there were three observations of dogs chasing shorebirds within the Crissy Field WPA (Hatch et al. 2007b, 5). There were no observations of dogs chasing shorebirds or plovers during the July 2007 through February 2008 surveys within the Crissy Field WPA (Hatch et al. 2008, 3). Western snowy plovers infrequently use the habitat at Central Beach (including the tidal inlet from Crissy Marsh), where there are no leash restrictions, although this area is not as wide and the beach characteristics may not provide the same quality of snowy plover or shorebird habitat as the WPA.

The primary objectives of the snowy plover monitoring program are to determine trends in population size and spatial distribution of snowy plovers at the Crissy Field WPA and the Ocean Beach SPPA (Merkle et al. 2011, xi). However, the monitoring program also has management objectives to reduce human-caused disturbance to wintering plovers. In support of these objectives, data on the number and distribution of people and dogs, compliance rates with seasonal restrictions requiring pets to be on leash, and instances of dogs chasing snowy plovers and shorebirds is collected at Ocean Beach and Crissy Field. Because the monitoring program is designed to census snowy plovers and determine where they are on the beach, there are data limitations and limits to analyses of these surveys that may result in underestimating rates of dogs disturbing western snowy plovers. One limitation of the survey is that low numbers of observational hours were used to draw conclusions. Also, using encounter rates (number of dogs encountered per hour) to measure the rate of disturbance may be unsuitable because it is a challenge to obtain encounter rates from observations made along a transect moving in one direction. The low numbers of observational hours and the use of encounter rates in western snowy plover monitoring may underestimate instances of dogs disturbing western snowy plovers. Also, using median or average values to describe disturbance rates may not be useful in assessing disturbance at the sites. For example, averaging the number of dogs per hour observed chasing shorebirds (Hatch et al. 2007a, 10) obscures the fact that no or few disturbances have been averaged with great or high disturbances. Because of the sensitive nature of western snowy plovers, even small numbers of disturbances can greatly affect this shorebird and this fact may be further obscured by averaging the data.

Below, are samples of some recent excerpts from 2009 and 2010 incident records from law enforcement. These quotes describe the issues and provide specific examples of dogs disturbing western snowy plovers in the Crissy Field WPA and the Ocean Beach SPPA. Additional quotes and examples of dogs disturbing other natural resources at GGNRA sites are included at the beginning of this chapter.

- “I observed two medium sized brown dogs running unleashed throughout the Snowy Plover Protection area. I observed the dogs for at least five minutes run-at-large as they ran southward in my direction. One of the dogs ran well over one-hundred feet away from the owner who was jogging along the shore, I observed the dog chase several resting shorebirds as well as run directly through and disturb a small colony of resting Snowy Plovers.” (Ocean Beach, January 28, 2010, Incident Report # 09-981)

- “I was dispatched to the Crissy Field Wildlife Protection Area (WPA) for a dog off leash. Furtado is a snowy plover monitor who reported to dispatch that a man was jogging with a group of kids and a dog off leash when they ran directly over the area were two snowy plovers were resting on the beach, and the plovers flew off.” (Crissy Field Wildlife Protection Area, October 21, 2009, Incident Report # 09-011750)
- “While patrolling Ocean Beach I observed a dog (Labrador type) off leash on Ocean Beach north of Sloat Blvd, and south of Stair Well 21 in violation of numerous clearly visible posted signs stating Snowy Plover Wild Protection Area — Leash Pets... I watched the dog chasing a small flock of Snowy Plovers from 1350 hours until 1411 hours. The dog would charge into the flock of Plovers and cause them to take flight and then chase them as they flew above the beach and charge into them again when they landed. This went on unabated for 21 minutes (timed by my wristwatch). Nobody was near the dog and nobody attempted to stop the dog. I attempted to call the dog and stop the dog, but it would not heed my voice commands.” (Ocean Beach, January 29, 2009, Incident Report # 09-001038)

### **Regulatory Actions and Current Status of Western Snowy Plover**

In 2004, the decision in *U.S. vs. Barley* (405 F.Supp.2d 1121 (N.D. Cal. 2005)) allowed off-leash dogs in certain areas of the park. Monitoring data indicate that disturbance of western snowy plovers due to off-leash dogs increased in both the Crissy Field WPA and the Ocean Beach SPPA following the *U.S. v. Barley* decision (NPS 2006e; NPS 2008a, 2). After the seasonal leash requirement was put in place at Ocean Beach in November 2006, the median number of dogs per hour decreased, as did the percentage of off-leash dogs; for the entire 2006 season, the median percentage of off-leash dogs at Ocean Beach was 64 percent (NPS 2008a, 2). Results of monitoring from the Crissy Field WPA also indicated an upward trend in dog use after the *U.S. vs. Barley* decision, and increases in the number of off-leash dogs and incidence of dogs chasing snowy plovers and other shorebirds (NPS 2008a, 2).

In November 2006 and July 2007, GGNRA adopted emergency regulatory provisions under 36 CFR 1.5, requiring on-leash dog walking when plovers are present (July 1 through May 15) in the Crissy Field WPA and Ocean Beach SPPA, and signs stating the seasonal restrictions were posted. A final seasonal protection rule, as detailed in the GGNRA Compendium (NPS 2009e, 31), was published on September 19, 2008. However, despite education and enforcement efforts, current compliance with the 2008 seasonal protection rule remains low. The NPS recently (January 2010) installed new fencing, gates, and signage at the eastern boundary of the WPA at Crissy Field to better demarcate where dog walking restrictions start; gates and signage were also installed at trail entry points to the WPA.

### **Bank Swallow (*Riparia riparia*)**

The bank swallow is listed as state threatened. A recovery plan for the bank swallow has been developed by the State of California (DFG 1992, 1) and a conservation plan has been developed by Partners in Flight (Garrison 2004, 1). The bank swallow nests in burrows and holes in bluffs and cliffs. Channelization and stabilization of banks of nesting rivers, as well as other destruction and disturbance of nesting areas, have caused a decline of the species (DFG 1992, ii). The bluffs just below Fort Funston are one of only two coastal cliff breeding sites for the bank swallow in coastal California (Chow 1996, 1; NPS 2007c, 1). The bank swallows dig holes in the bluffs which may be as much as 200 feet above sea level along the beach at Fort Funston. These bluffs consist of layers of sandstone, mudstones, and conglomerates and are known as the Merced and Colma formations. These formations are described as soft, easily erodible, sedimentary rocks and are very susceptible to disturbance.

The bank swallow colony at Fort Funston has been observed since at least 1905 (NPS 2007c, 3), has been documented at Fort Funston by California Department of Fish and Game since 1956 (DFG 1992, 20), and has been monitored since 1993 by NPS (Chow 1996, 1; NPS 2007c, 1). The bank swallow colony at Fort Funston runs from the north end of the beach (near the Great Highway across from the Oceanside Water Pollution Control Plant) to Panama Point, a rocky outcrop north of the main sand ladder (NPS 2007c, 2). The total number of bank swallow burrows observed at the site from 1993 to 2006 through the NPS monitoring program has ranged from a high of 924 burrows in 1994 (Chow 1996, 2) to a low of 140 burrows observed in 1998 (NPS 2007c, 3). The number of burrows was high for the years 1993 through 1996, with total counts above 500 burrows (NPS 2007c, 3). Storm events associated with El Nino conditions during the winter of 1997 into 1998 wiped out all the burrows through heavy erosion at the site (NPS 2007c, 3). The cliffs are subject to rapid erosion from storm events outside the breeding season (NPS 2007c, 1). This erosion removes burrows from the previous season. The bank swallows respond by digging new burrows in the soft cliffs each year. Years without large storm events often result in burrows remaining from previous years, and these are recounted in the monitoring, though these burrows are not always active with swallows. From 2000 through 2006, the number of burrows ranged from 142 in 2001 to a high of 255 in 2004 (NPS 2007c, 3). Approximately 40 to 60 percent of burrows are actively used for nesting in a given year based on burrow occupancy estimates for bank swallows in the western United States, including data for California and Fort Funston (Laymon et al. 1987, 25; DFG 1995, 4; Garrison 1999, 19-21). Records and monitoring indicate that the bank swallow colony at Fort Funston has always been fairly small (Etchell 2010, 2-3), the number of burrows varies each year, and bank swallows have shifted locations along the cliffs at Fort Funston over time (NPS 2007c, 3; Etchell 2010, 2-3). Bank swallows are present at Fort Funston during their nesting season (April 1 to August 15) and spend the nonbreeding season in South America (Garrison 2004, 1). A voluntary seasonal closure is in effect that restricts access to the bluffs from above and 50 feet out from the bluff face during the bank swallow nesting season (NPS 2001b, 6). Other closures at Fort Funston include the north end of the Sunset Trail due to erosion and a 12-acre Habitat Protection Area. The 12-acre fenced Habitat Protection Area was closed to protect bank swallows, protect geologic resources, provide visitor safety, and allow habitat restoration (NPS 2001b). The nesting colony is currently monitored about once per week by park personnel. Visitors can access areas surrounding the bluffs from above the beach in the area around the Funston Beach Trail, north at the junction with the Sunset Trail. Signage and fencing (currently mostly buried) have been installed along the trails adjacent to the closure area, and signs along the beach below the colony request that visitors voluntarily comply with restricted access to the northern section of the bluffs when the swallows are nesting. Fort Funston has high visitor use, and in 2007–2008 there were two pet citations, warnings, and reports taken related to wildlife disturbance at the site (appendix G).

### **Northern Spotted Owl (*Strix occidentalis caurina*)**

The northern spotted owl, a subspecies of the spotted owl, is listed as federally threatened and was originally listed by USFWS due to the widespread loss of suitable habitat across the owl's range and the inadequacy of existing regulatory mechanisms to conserve the owl (USFWS 2011a, vi). Northern spotted owls occur in coniferous and evergreen hardwood forests on GGNRA lands north of the Golden Gate, most notably at Muir Woods National Monument (which is closed to dogs), Homestead Valley, Oakwood Valley, and Marin Headlands Trails (Coyote Creek Drainage). A potential predator of northern spotted owls, great horned owls, have been detected in and around the area in recent years; their presence may preclude northern spotted owls from using the area. Marin County, at the southern limit of the subspecies' range, supports relatively high densities of this owl in appropriate habitat (NPS 2009b). The local population is considered healthy and is protected by the large expanse of public lands in Marin County. Additionally, NPS works with other land managers and the county to monitor and actively protect northern spotted owls and habitat, including providing information to Marin County planners. The dusky-footed woodrat is the primary prey for northern spotted owls (Hamm et al. 2007, 1). Therefore, any changes in the abundance and/or distribution of the dusky-footed woodrat could indirectly affect the

northern spotted owl. The revised final recovery plan for the northern spotted owl developed in 2011 by the USFWS stated that competition from the barred owl poses a complex threat to the northern spotted owl as the barred owl expands its territory to the western states (USFWS 2011a, vii). The recovery plan recommends barred owl removal experiments to assess the best path to recovery for the northern spotted owl (USFWS 2011a, Recovery Action 29). Barred owls currently occur in Marin County and pose a new threat to the northern spotted owl population in Marin County (NPS 2009b). The recovery plan was revised in 2011, which stated that many populations of spotted owls continue to decline, even with extensive maintenance and restoration of spotted owl habitat in recent years (USFWS 2011a, vi). The revised recovery plan continues to list barred owl management as the third of four steps in the recovery strategy (USFWS 2011a, vii). In addition to describing specific actions to address the barred owl threat, the revised recovery plan describes the importance of maintaining and restoring high value habitat for the recovery and long-term survival of the spotted owl (USFWS 2011a, vii). NPS management focuses on protecting northern spotted owl habitat and reducing disturbance (including from dogs) to the greatest extent possible to ensure their long-term survival. The calls of territorial northern spotted owls have been described as sounding like dog barks, and these territorial northern spotted owls may respond to barking dogs. Young northern spotted owls that have recently fledged are sometimes found on the ground, where they are susceptible to dogs, especially those dogs that are off leash. There have been a few cases reported of dogs discovering young northern spotted owls on the ground or alerting owners to the presence of owls on the ground.

### **Guadalupe Fur Seal (*Arctocephalus townsendi*)**

The Guadalupe fur seal is listed as both federally and state threatened. This seal breeds along the eastern coast of Guadalupe Island, approximately 200 kilometers west of Baja California. However, individuals have been sighted in the Southern California Channel Islands, including two males who established territories on San Nicolas Island. This species is an occasional vagrant from offshore marine habitat. In the park sites, the Guadalupe fur seal is primarily at risk from dogs if found stranded on beaches that allow dogs. The twelve years of data (from 2000 through 2011) collected by the Marine Mammal Center indicate there were six strandings of Guadalupe fur seals at GGNRA: two at Stinson Beach, one at Rodeo Beach, two at Ocean Beach, and one at Fort Funston (MMC 2012a, table 7). Due to the extremely low numbers of Guadalupe fur seal strandings that have occurred at GGNRA over the past twelve years, a detailed impact analysis of this species is not necessary for this project, but a general discussion of impacts to hauled-out or stranded pinnipeds is included in the “Wildlife” section of chapter 4 for each applicable site at GGNRA.

### **Steller Sea Lion (*Eumetopias jubatus*)**

The Steller sea lion is listed as federally threatened. This sea lion breeds from the northern Channel Islands north to the Aleutians and Pribilofs, and a breeding colony exists on Año Nuevo Island, Santa Cruz County, approximately 50 miles south of San Francisco and GGNRA. A historical haul-out was also located at Seal Rock, near the Lands End site. This species is an occasional vagrant from offshore marine habitat. Critical habitat for the sea lion in the vicinity of San Francisco is designated for both Año Nuevo Island (a state reserve) and Southeast Farallon Island in the Farallon National Wildlife Refuge, both located in the Pacific Ocean approximately 55 miles to the south and 30 miles to the northwest of San Francisco; no critical habitat is mapped at GGNRA. From twelve years of collected data by Marine Mammal Center (2000 through 2011), there were no strandings of Steller sea lions at GGNRA (MMC 2012a). Therefore, a detailed impact analysis of this species is not necessary for this project, but a general discussion of impacts to hauled-out or stranded pinnipeds is included in the “Wildlife” section of chapter 4 for each applicable site at GGNRA.

## THREATENED, ENDANGERED, AND CANDIDATE SPECIES: PLANTS

### Marsh Sandwort (*Arenaria paludicola*)

*Arenaria paludicola* is a federally endangered plant that grows in wetland and riparian ecosystems. It is a small perennial forb in the pink family. It was once found along much of the west coast of the United States, but there are now only approximately a dozen wild individuals, all in San Luis Obispo County. Management of this species is guided by the Recovery Plan for Marsh Sandwort (*Arenaria paludicola*) and Gambel's Watercress (*Rorippa gambelii*) (USFWS 1998b). The recovery plan identifies establishing new populations as an important recovery action for this species. One of the historic populations of this species, recorded by early botanists, was from Fort Point, just south of the Golden Gate Bridge in San Francisco. The site is now part of Golden Gate National Recreation Area, but the marsh sandwort found there in the early 1900s are no longer there. Because of this history, the GGNRA was identified as a promising introduction site for a new population. In December of 2011, two new populations (over 800 individuals) were established in the Marin Headlands near the Rodeo Beach overflow parking lot and along the Miwok Trail in Rodeo Valley. Monitoring results as of July 2012 indicate that over half of these individuals are still surviving (Acierto et al. 2012).

### Franciscan Manzanita (*Arctostaphylos franciscana*)

Franciscan manzanita is a federally endangered serpentine chaparral shrub. It is also perennial and prostrate and likely grew in close association with the Raven's manzanita. This species was presumed extinct in the wild for over 60 years, until a single individual was discovered on a serpentine road cut in the Presidio of San Francisco in 2009. This individual was transplanted to Presidio Area B (Chassé et al. 2009). The Franciscan manzanita was listed as federally endangered in 2012 and critical habitat has been proposed. Proposed critical habitat areas include three units in the Presidio Area A: Fort Point, Fort Point Rock, and the World War (WW) II Memorial. The Fort Point unit includes 12 acres near Fort Point east of the Golden Gate Bridge and north of Doyle Drive along Long Avenue and Marine Drive. The Fort Point Rock unit consists of 36 acres west of the Golden Gate Bridge and west of Lincoln Boulevard from the toll plaza south to Kobbe Avenue. The WW II Memorial unit includes 3 acres in two subunits. Subunit 3A is west of Lincoln Boulevard at the intersection of Lincoln Boulevard and Kobbe Avenue. Subunit 3B is in Presidio Area B (USFWS 2012). The NPS is currently working with the Presidio Trust and the USFWS to identify suitable locations within the proposed critical habitat to plant clones of the single wild Franciscan manzanita individuals.

### Presidio (Raven's) Manzanita (*Arctostaphylos hookeri* ssp. *ravenii*)

Presidio manzanita is listed as federally and state endangered and is a perennial, prostrate to low-growing, shrub. It exists as a single individual east of Lincoln Boulevard (in Area B) of the Presidio on a serpentine outcrop (USFWS 1984). As part of restoration efforts to reintroduce this species at GGNRA, clones of this individual have been planted west of Lincoln Boulevard, near Baker Beach, in suitable serpentine coastal prairie habitat. The Presidio manzanita is a self-fertile plant, which means the plants can pollinate themselves and produce viable offspring. The management of this species is guided by the *Recovery Plan for Coastal Plants of the Northern San Francisco Peninsula* (USFWS 2003, 63-64), which suggests that the species is stress tolerant with sparse competing vegetation, but is relatively intolerant of direct vegetative competition such as shading from shrub or tree canopies. There have been no reports of natural seedling or clone establishment around the remnant wild Presidio manzanita, which may indicate a lack of viable seed, seed predation, or lack of sufficient seedling microsites. The Trust has removed non-native vegetation around the single clone and has installed fencing and interpretive signs.

### **Presidio Clarkia (*Clarkia franciscana*)**

The Presidio clarkia (*Clarkia franciscana*) is a federally endangered herbaceous annual plant. The habitat of Presidio clarkia is generally described as being composed of serpentine soils, and is around 50 meters in elevation (Jepson Interchange 2013). This species occurs in coastal scrub, valley grassland, and foothill grassland plant communities (CNPS 2013). This plant is endemic to California, where it is restricted to San Francisco and Alameda counties, and is known from fewer than five occurrences (CNPS 2013). There are two populations of this species in and adjacent to GGNRA lands. One population is located outside of GGNRA at the WW II Memorial east of Lincoln Blvd in Area B of the Presidio. The second population is located at the Presidio Coastal Bluffs at the Baker Beach site along the Coastal Trail, near Battery Boutelle and south of the Golden Gate Bridge.

### **Marin dwarf-flax (*Hesperolinon congestum*)**

Marin dwarf-flax (or Marin western flax) is listed as federally and state threatened and is a small herbaceous annual of the flax family with slender threadlike stems. This species is included in the September 1998 *Recovery Plan for Serpentine Soil Species of the San Francisco Bay Area* (USFWS 1998a, iv) and the management of this species is also guided by the *Recovery Plan for the Coastal Plants of the Northern San Francisco Peninsula* (USFWS 2003, iii). It is found in GGNRA as a small population west of Lincoln Boulevard of the Presidio. It grows in the serpentine chaparral (coastal prairie-grassland) habitat and is exclusive to serpentine or other bedrock outcrops (USFWS 2003, 20). At GGNRA, Marin dwarf-flax occurs in serpentine grassland soil outcrops above Baker Beach, near the one remaining natural Presidio manzanita location (USFWS 2003, 65). Of the 11 locations in Marin County where Marin dwarf-flax currently resides, 2 are in GGNRA: the Presidio and Baker Beach (USFWS 2003, 89; 1998a, II-98).

**Baker Beach**  
Credit: NPS

However, Baker Beach is the only GGNRA site where the Marin dwarf-flax occurs that is considered in this draft plan/SEIS. The species is threatened by residential and recreational development as well as by competition with non-native, invasive species. Population trend monitoring of GGNRA populations and adjacent populations indicates stable to increasing numbers in the area, although trends are difficult to interpret due to fluctuating annual population sizes typical for annual species. Results from other areas, not under direct management of the NPS, suggest that overall impacts on the species are from non-native and native plant species encroachment, particularly by shrubs. These species encroach on suitable habitat and limit the annual display of this species (USFWS 2003, 89). It has also been suggested that the occurrence of this species may also be threatened by trampling when people and dogs walk off of established trails (Buxton 1998). Current efforts to restore Marin dwarf-flax are underway in the Presidio, where NPS biologists will be attempting to experimentally establish new populations.

### **San Francisco Lessingia (*Lessingia germanorum*)**

San Francisco lessingia is listed as federally endangered and state endangered and is a low-growing, slender-stemmed annual herb of the sunflower family (Asteraceae). Populations of this species occur primarily in small, local remnants of dune scrub in the Presidio. Dune scrub is found on the sand terrace slopes above Baker Beach and in the Lobos Creek Dunes, and San Francisco lessingia is found in association with this community at Baker Beach. Both Fort Funston and Baker Beach have been

designated as San Francisco lessingia recovery and enhancement sites (USFWS 2003, 128, 141). Although dune scrub habitat occurs at Fort Funston, the San Francisco lessingia does not currently occur there. Reintroduction of the species is precluded by the current unmanaged (or unrestricted) dog use at Fort Funston. In the Baker Beach site, there are areas designated for further study and potential recovery of the San Francisco lessingia (NPS and Presidio Trust 2001, Chap. 3, 3). Additionally, at Baker Beach, a dunes site at Lobos Creek is an area of early-succession stable dune scrub that was recently (1995 to 1997) restored as a mitigation effort (USFWS 2003, 29). The San Francisco lessingia prefers sparse, relatively open native dune scrub, coastal scrub, and grassland vegetation and specific substrates described as old coastal sand deposits (USFWS 2003, iii). Historical populations were probably associated with early stages of succession following natural dune blowouts (hollows derived from wind erosion of dunes) or other local disturbances in coastal dune scrub (USFWS 2003, 38). The San Francisco lessingia is now narrowly associated with either sparse vegetative cover or substantial vegetation gaps, usually related to past disturbance of the substrate or the vegetation. The management of this species is guided by the *Recovery Plan for the Coastal Plants of the Northern San Francisco Peninsula* (USFWS 2003, iii), which indicates that primary impacts on this species are related to the edge effects of adjacent vegetation, including shading, non-native plants, and wind blockage. This plan suggests that primary protection and recovery actions should focus on removing non-native plant species, minimizing edge effects, and increasing or enhancing suitable habitat around the population and can be implemented by NPS to help in the recovery of this species.

### **Hickman's Potentilla (*Potentilla hickmanii*)**

Hickman's potentilla (Hickman's cinquefoil) is listed as federally and state endangered. This species is a perennial herb that is endemic to California (CNPS 2009, 1). At Rancho Corral de Tierra, Hickman's potentilla is found primarily in coastal grasslands. This species is seriously threatened by urbanization, recreational activities, non-native grasses, and grazing (CNPS 2009, 2). Suitable habitat to support Hickman's potentilla occurs at both Mori Point and the Pedro Point Headlands (URS Corporation 2010, figure 19), but there are no mapped occurrences of this plant at either the Mori Point or Pedro Point Headlands sites. There are several known occurrences of Hickman's potentilla at Rancho Corral de Tierra in the Montara Area, but most of the populations are located away from areas with heavy foot or vehicle traffic. However, there are two populations that are crossed by or are adjacent to current trails that experience regular use (POST 2001, 28). In addition, potential habitat is located throughout the Rancho site (URS Corporation 2010, Figure 19).

## **CULTURAL RESOURCES**

Cultural resources are material manifestations of past human activities. They include prehistoric and historic structures, objects, landscapes, etc. Of the many cultural resources in the park, the only ones that have been analyzed for this draft plan/SEIS are those believed eligible for or listed on the National Register of Historic Places (NRHP) and that are resources composed of or including features that are earthen and vegetative, which are considered vulnerable to impacts from visitors with dogs.

Erosion and ground disturbance are primary factors in the loss of integrity of cultural resources. The loss of integrity can be caused by natural forces (wind, rain, seismic activity, soil instability, burrowing animals) as well as human factors (park visitors, dogs—trampling, digging). The presence of humans and their dogs, both on and off trail, is believed to increase natural erosion processes, furthering the potential to negatively affect cultural resources in GGNRA (e.g., seacoast fortifications and their integral earthworks, field fortifications, archeological resources). In addition, some cultural resources are

---

*Erosion and ground disturbance are primary factors in the loss of integrity of cultural resources.*

---

affected by dog urination (e.g., detrimental effects to character-defining features, such as vegetation, associated with historic districts and structures).

## **AREA OF POTENTIAL EFFECTS**

The area of potential effects (APE) is defined by the *National Historic Preservation Act* (NHPA) Section 106 regulations as the “geographic area or areas within which an undertaking may directly or indirectly cause alterations in the character or use of historic properties” (36 CFR 800.16(d)). Historic properties are those cultural resources listed in or considered eligible for inclusion on the NRHP. In this case, the APE is defined primarily by national historic district and landmark boundaries, as well as a few individual resource areas where smaller, general boundaries are used. These cultural resource boundaries do not readily conform to defined geographic areas as are used in the analysis of other resource topics and, consequently, this section is structured differently than others.

The APE was determined prior to resource analysis and includes multiple areas in both Marin and San Francisco counties (map 25, Marin County sites, and map 26, San Francisco County sites). Boundaries of these areas were established based on the occurrence of cultural resources within areas for which dog management actions have been proposed.

Many of the individual resources that may be affected by the plan are encompassed within larger district or landmark designations: Forts Baker, Barry, and Cronkhite Historic District; the Presidio of San Francisco National Historic Landmark (NHL) (Presidio NHL); Fort Mason Historic District; and the Fort Miley Military Reservation. While the APE encompasses these larger historic district boundaries, the potential effects of the dog management plan are more limited to discrete elements of these districts (historic structures, etc.), as identified below.

The general boundaries of the Forts Baker, Barry, and Cronkhite Historic District include uplands and tidelands in southern Marin County, extending west from the north side of the Golden Gate along the Pacific Ocean coastline and east to the San Francisco Bay. The general boundaries of the Presidio NHL include a large area from Crissy Airfield (San Francisco Bay) west to the Pacific Ocean. The Fort Mason Historic District is located just east of the Presidio NHL, along San Francisco Bay. Fort Miley Military Reservation is located on Point Lobos bordered by Clement Street and Lincoln between 40th Avenue and 48th Avenue.

In addition, smaller areas containing cultural resources that have the potential to be affected by the plan are included in the defined APE. These include general locations of archeological resources at Muir Beach and Point Lobos, as well as Battery Davis at Fort Funston and the U.S. Coast Guard Station Historic District, which is a 5-acre district containing historic structures that contribute to Presidio NHL. While listed on the NRHP, the Montara Light Station in San Mateo County near Rancho Corral de Tierra is found outside of the APE for this draft plan/SEIS and is therefore not analyzed further.

## **CULTURAL RESOURCE CONTEXT**

### **Pre-Contact Context**

Native American population densities in California were among the highest in all of North America. Evidence of Native American use of the general area dates back approximately 10,000 years. At the time of Native Americans’ first contact with European and Mexican visitors, the lands around San Francisco Bay were occupied by numerous small tribes that, as a result of linguistic similarities, are described as belonging to two major linguistic areas: the Coast Miwok (approximately 15 tribes north of the Golden Gate) and the Ohlone (approximately 50 tribes south of the Golden Gate). These tribes were organized

into small, politically independent groups, living in small villages associated with coastal and marshland areas. Groups were often organized by watershed areas, which could result in a single group defining its territory by one or more watersheds. Subsistence activities were based on annual group movements—seasonal rounds of hunting, fishing, and gathering—between temporary and permanent village sites (NPS 2008d, 1).

Early European and Mexican visitors to the area noted a variety of resources included in the native inhabitants' diet—crabs, birds, deer, nuts, herbs, and fruits. Villages contained a variety of structures of vegetation, earth, and supporting pole construction used for a variety of functions, including dwelling, assembly, ceremony, sweathouses, food processing and storage, etc. With a subsistence strategy tied to the ocean and bay, villages were typically located along the coastlines, and numerous prehistoric shellmounds and other artifacts have been identified in these areas (Toogood 1980). Coast Miwoks and Ohlones are believed to have engaged in periodic burning of the landscape to promote the growth of desirable native vegetation species for seed gathering, to drive game animals for harvest, and to create forage for hunting prey (deer, elk) (NPS 2008d, 1). The park's oldest indigenous archeological site consists of shell material found at Lands End, dating to AD 150 (NPS 2008d, 1).

The Spanish settlement of the area in the late 18th century resulted in dramatic cultural and organizational changes for the indigenous people of the San Francisco Bay Area. Ultimately, these changes resulted in the devastation of the native cultures through introduced diseases, forced labor, and disruption of family and social structures (NPS 2008d, 2). Despite the devastation, the Coast Miwoks and Ohlones survived.

## **Historical Context**

In the late 18th century, Spanish military and civilian settlers began establishing their military, religious, and civilian presence in the area. As a part of this settlement of the San Francisco Bay Area, activities such as cattle grazing, dairy farming, timber harvesting, and other agricultural pursuits were introduced throughout the 19th century, particularly north of the Golden Gate (NPS 2009c, 123–126). The San Francisco Bay developed into one of the most important harbors on the Pacific Coast during the 19th century, serving as an outlet for products from approximately 70 percent of California by 1927 (Toogood 1980).

The beginnings of military defenses in the area began in 1776 with the establishment of the Spanish Presidio, which was intended to protect the claim of the Spanish crown to the northernmost permanent outpost of its empire on the Pacific. During the approximately 230 years since the Presidio was established, numerous fortifications have been built along the San Francisco coastline by the governments of Spain (1776–1822), Mexico (1822–1846), and the United States (1846–1974). Fortifications constructed by the United States include those designed to ensure coastal and harbor defense during the Civil War, the Spanish-American War, WW I, WW II, and the Cold War, making this coastline one of the best defended on the West Coast (Freeman et al. 1999).

## **CULTURAL RESOURCE TYPES**

The NPS recognizes five categories of cultural resources for management purposes: archeological resources, historic structures, cultural landscapes, ethnographic resources, and museum objects (NPS 1998). It is not expected that ethnographic resources or museum collections will be affected by this draft plan/SEIS and they are not included in this analysis. Appendix I is a list of cultural resources included in this analysis.

## Archeological Resources

Archeological resources are the remains of past human activity and the records documenting the scientific analysis of these remains. They are often buried but may extend aboveground. They are commonly associated with native peoples but can also be products of more contemporary society (NPS 1998). Archeological sites are considered fragile, nonrenewable resources. While field fortifications (military earthwork features, such as foxholes and trenches) feature some characteristics of archeological sites, they are addressed as features of cultural landscapes for this analysis.

The three archeological resources addressed in this draft plan/SEIS are indigenous in nature and are either listed on or considered eligible for the NRHP. The Marin County site (CA-MRN-333) is located in the general Muir Beach/lagoon area. The site is a relatively intact pre-contact shell midden, which was listed on the NRHP in 1979 (NPS 2008e).

The San Francisco County sites (CA-SFR-5 and CA-SFR-21) are located in the general area of Point Lobos and were listed in the NRHP in 1976. They are described as containing, among other items, “mammalian and fish bones, chert and obsidian flakes, a bead and stone fishing weight, and a prehistoric hearth of fire-cracked rocks” (NPS 2005d, 30). Both have been stabilized with native vegetation; site CA-SFR-5 is fenced, but not in a way that precludes entry into the area by visitors or dogs.

## Historic Structures

Historic structures include buildings, bridges, roads, temples, and other manufactured objects that extend the limits of human capability. Structures allow humans to live in harsh climates and in areas far removed from where they work and live (NPS 1998). The structures analyzed in this draft plan/SEIS include permanent seacoast fortifications and their integral earthworks and Crissy Airfield. The majority of structures analyzed within this draft plan/SEIS are located within the boundaries of the Forts Baker, Barry, and Cronkhite Historic District; the Presidio NHL; the Fort Mason Historic District; and the Fort Miley Military Reservation (appendix I).

### Permanent Seacoast Fortifications and Their Integral Earthworks

Permanent seacoast fortifications (sometimes referred to as batteries) within GGNRA consist of numerous gun batteries of brick, stone, and concrete, partially covered with carefully designed earthworks for additional protection. These seacoast fortifications were a part of an integrated defensive network and contained features and equipment needed to support the big guns mounted therein. This network of defense included permanent fortifications constructed along the San Francisco area coastline and was “designed and emplaced to protect naval bases, seaports, and other important coastal waters from the intrusion of hostile warships” (Freeman et al. 1999, xxi). The history of these defensive structures ranges from the Spanish Colonial and Mexican eras (1794) through the Cold War Era (1974) (Freeman et al. 1999).

The earthwork portions of these permanent seacoast fortifications are defined as “military construction formed chiefly of earth, used in both defensive and offensive operations” (Freeman et al. 1999, xiv) and are inherently fragile in nature. They consist of earth placed over and around fortifications of brick, stone, and concrete (batteries) that were used as defensive structures, with features and equipment necessary to support a variety of artillery (figure 3). There are several reasons for the use of earth as a construction material, including its blunting properties against the brunt of powerful offensive ordnance, the relative ease with which structures could be built and repaired, and the rapidly changing military technology that made it difficult to know what to prepare for defensively (Freeman et al. 1999, 46-47).

The earthwork portions of these seacoast fortifications were designed not only to absorb artillery impact but also to camouflage fortifications from the air and sea. While the earthworks are the most apparent visual element of these structures, they mask the internal hardened (concrete, stone, masonry) features within such as magazines, artillery emplacements, armatures, entryways, etc. To avoid penetration by offensive artillery, the resistance of a battery was calculated in “so many feet of earth placed in front of so many feet of concrete” (Freeman et al. 1999, 47). As of 1910, the Office of the Chief of Coast Artillery required that all exterior slopes of new coastal defenses conform to their surrounding topography, with geometrical contours avoided, and be further concealed by the appropriate planting of the slopes (Freeman et al. 1999, 80).

**FIGURE 3. BATTERY EAST, WITH EROSION OF EARTHWORKS EVIDENT**

The earthwork portions of seacoast fortifications evaluated in this draft plan/SEIS are associated primarily with Fort Baker within the Forts Baker, Barry, and Cronkhite Historic District; Fort Scott and Fort Point within the Presidio NHL; Fort Mason Historic District; and Fort Miley Military Reservation (appendix I). All are considered “well-preserved examples of nearly every important development in military fortification engineering from before the Civil War to the guided-missile era” (Freeman et al. 1999, 1) and are considered contributing features to NRHP or NHL resources. Fort Funston, which includes Battery Davis, was removed from the NRHP in 2006 due to resource degradation related to erosion and human use to the point where the site lacked integrity. However, Battery Davis was singled out for eventual inclusion in a NHL District for seacoast fortifications of San Francisco Bay. This nomination is being prepared as of this writing. For this reason, Battery Davis is included in the analysis of historic structures. In general, permanent seacoast fortifications are described as being in good condition (Freeman et al. 1999, 116). However, they are considered fragile and are subject to natural erosion processes that are accelerated by loss of vegetative cover, digging, social trail uses, etc.

### **Crissy Airfield**

Crissy Airfield is located along the northern shoreline of the Presidio NHL on the site of a previous landfill completed for the 1915 exposition (map 26). Crissy Airfield was established in 1919, functioning

as the center of West Coast military aviation operations from 1919 to 1936 (NPS 2009f). It is the only Air Coast Defense Station airfield in the country that retains the majority of its original buildings—hangars, barracks, guardhouse, etc. A related signal cable hut constructed in 1921 (building 946—partially buried structure) could also be affected by the plan. Both the airfield and the signal hut are considered to be in good condition.

## **Cultural Landscapes**

Cultural landscapes are environmental settings that humans have created that reveal the fundamental ties between people and the land and reflect the human need to grow food, give form to settlements, meet a need for recreation or work, or bury the dead (NPS 1998). They are the result of decades—or in some cases, centuries—of cumulative human land uses, politics, economies, and cultures. Alterations to cultural landscape features can adversely affect the resource and its NRHP status.

Most of the historic structures that are analyzed in this draft plan/SEIS are located within larger cultural landscapes or historic districts. As effects on elements (e.g., historic structures) of a cultural landscape can affect its overall integrity, both cultural resource types are analyzed. Cultural landscapes within the project APE include the Forts Baker, Barry, and Cronkhite Historic District; the Presidio NHL (including the U.S. Coast Guard Station Historic District); Fort Mason Historic District; and Fort Miley Military Reservation (maps 25 and 26). The Rancho Corral de Tierra site may be potentially eligible for listing on the NRHP for ties to the history of ranching operations dating back to the Mexican rancho era. This site includes landscape features, structures, and archeological sites, including the Francisco Guerrero Adobe Site, and the Martini Creek Ohlone sites (NPS 2011b, 105).

### **Forts Baker, Barry, and Cronkhite Historic District**

The Forts Baker, Barry, and Cronkhite Historic District encompass approximately 2,300 acres in Marin County (map 25). Its period of significance ranges from 1866 to 1974 and it is associated with the history of coastal defense in the San Francisco Bay Area. Fortifications constructed in this area were designed to enhance those at the Presidio, south of the Golden Gate, in guarding against the entry of enemy ships into San Francisco Bay (NPS 2005d, 3; 2008f). Resources that could be affected by the plan include earthwork portions of seacoast fortifications at Fort Baker (see discussion above) as well as numerous field fortifications primarily associated with Fort Cronkhite.

**Field Fortifications.** Though no less significant than previously described earthwork portions of seacoast fortifications (above), field fortifications are less conspicuous WW II features that include hand-dug foxholes, trenches, machine gun pits, etc. that provided supplemental support to nearby fortified batteries (appendix I) (figure 4). Those associated with Fort Cronkhite are primarily located north of the cantonment area, in the general vicinity of Wolf Ridge. Similar resources also appear on the high ground at Fort Barry and Fort Baker (map 25). All are considered contributing resources to the Forts Baker, Barry, and Cronkhite Historic District.

All of these features represent simple “fighting positions,” measuring about 6 to 8 feet long and 2 feet deep, where one or two men could provide defensive fire with rifles. These positions could be quickly dug with the simplest hand tools and only provided minimal protection. When time allowed, deeper and longer zigzag trenches were constructed that were reinforced with wooden sides and thwarts to keep them from collapsing. The purpose of the zigzags was to limit shrapnel damage and prevent attacking aircraft from strafing the entire length of the trench (Martini n.d.a, 40).

There is little formal military documentation of these temporary defensive works, with period photographs providing the best record of the extent and design of these features. Many of them have been

lost to the elements. Photos taken after WW II indicate that grading activities in these areas may have filled in many of these features. Today, their locations are generally indicated only by suspicious landforms or gun mounts sticking up from the sand (Martini n.d.a.). What is left of these temporary fighting positions is inherently fragile in nature; they are extremely vulnerable to erosion and ground disturbance (e.g., digging). In some cases, dense vegetation offers some protective cover for these resources.

Source: Martini n.d.a, 43

**FIGURE 4. EXAMPLE OF TEMPORARY FIELD FORTIFICATION WHICH SUPPORTED NEARBY FORTIFIED BATTERIES**

### **The Presidio of San Francisco National Historic Landmark**

The Presidio was designated a NHL in 1962 and is described as

the oldest Army installation operating in the American West and one of the longest-garrisoned posts in the country. The size and duration of this installation has resulted in a complex landscape in which many layers of history overlap in a relatively small geographical area. (NPS 2006f, 19)

The Presidio's NRHP eligibility is related to its numerous historical, architectural, and archeological resources associated with important events in American history. Its period of significance is from 1776 to 1945 and also includes the year 1951. This period encompasses the Spanish colonial, Mexican, and American periods of governance. It is described as a "vast district entity ... [that] possesses exceptional value in illustrating the history of the United States through its association with important historical events and its outstanding representation of patterns of national development through multiple periods" (NPS 2006f, 20).

The boundaries of the Presidio NHL encompass numerous cultural resources that could be affected by this plan, including Crissy Airfield, the U.S. Coast Guard Station Historic District, numerous seacoast

fortifications and their integral earthworks, and field fortifications associated with Fort Winfield Scott and Fort Point. These resources are associated with the Presidio's Political and Military Affairs period (1865–1939) and the WW II period (1941–1945) (NPS 2006f, 20) and are considered as contributing to the significance of the Presidio NHL (map 26). Descriptions of the earthwork portions of seacoast fortifications and Crissy Airfield are found under “Historic Structures” above.

### **U.S. Coast Guard Station**

The U.S. Coast Guard Station Historic District is a 5-acre district containing historic structures determined to be contributing to the larger Presidio NHL. Its period of significance dates from 1915 to 1964 and is related to several important structures associated with maritime transportation and early social and humanitarian efforts, such as providing aid to stranded or wrecked ships (NPS 2006f, 21). Affected elements of the district include a cypress hedge planted in 1915, which defined the buildings and site perimeter of the U.S. Coast Guard Station. Much of this hedge was replaced with junipers in 1996 and, along with other landscaping, continues to convey the original formal design intent and define the edges of the property, setting it apart from the rest of the area (i.e., Crissy Airfield and the Presidio) (NPS 2006f) (map 26).

### **Fort Winfield Scott**

Fort Scott was established in the western part of the Presidio of San Francisco as a separate coastal artillery post in 1912, serving as an artillery garrison and headquarters of the Artillery District of San Francisco. The fort housed 17 Endicott-era gun batteries that were constructed, armed, and manned at varying levels between 1891 and 1946 (NPS 2013b, 1). Seacoast fortifications and their integral earthworks and field fortifications within Fort Scott (along Baker Beach) are included in this analysis.

### **East Battery—Fort Point**

Construction activities at Fort Point, located at the south shore of the Golden Gate, ranged from 1853 to 1861 (Martini n.d.b). At completion, the fort and its outworks had emplacements for 141 guns of various types, but only a fraction of those were mounted at that time. The lowest tier of artillery was constructed as close as possible to water level so cannonballs could ricochet across the water's surface to hit enemy ships at the waterline. The structure was protected by 7-foot-thick walls, had multi-tiered casemated construction typical of Third System forts, and was unique to the West Coast (NPS n.d.b, 1). Earthwork portions of seacoast fortifications within the fort are included in this analysis.

**Field Fortifications.** Many of these features are located within the Presidio NHL and are more specifically associated with Fort Winfield Scott along the coastal bluffs north of Baker Beach. These resources are represented as “hastily built field fortifications constructed ... in the aftermath of the Japanese attack on Pearl Harbor, when the possibility of raiding parties landing on Baker Beach was a very real threat” (Martini n.d.a, 4). During WW II, mobile antiaircraft guns were situated in sandbagged positions, and numerous trenches and foxhole fighting positions were dug along the Baker Beach bluff area (Martini n.d.a). All are considered contributing resources to the Presidio NHL. Please refer to the discussion above (Forts Baker, Barry, and Cronkhite Historic District) for more general information on field fortifications.

### **Fort Mason Historic District**

The roughly rectangular 68.5-acre historic district is located east of the Presidio NHL, along San Francisco Bay. It is represented by a collection of military structures and its period of significance is from 1855 to 1953. The fort illustrates “the evolution of military landscape planning and architecture over a

one-hundred-year period” (NPS 2004a, 4). Earthwork portions of seacoast fortifications located within this historic district have the potential to be affected by the draft plan/SEIS (map 26).

### **Fort Miley Military Reservation**

The Fort Miley Military Reservation is a roughly rectangular area (approximately 54 acres) located south of the Golden Gate Bridge on Point Lobos, just east of the existing El Camino del Mar Trail and Road. The U.S. Army acquired the land in 1893 with the intent of constructing gun and mortar batteries for the defense of San Francisco Bay. The military reservation is composed of three distinct complexes of structures (east, west, and central). Elements that contribute to the historic district include several batteries on the east and west sides of the reservation, a searchlight power plant, a few miscellaneous earthworks, fire control stations, and an ordnance storehouse. Descriptions of the earthwork portions of seacoast fortifications at Fort Miley are included under “Historic Structures” (above). Between the east and west portions of the reservation, a large Veterans Administration (VA) hospital replaced a variety of historic barracks, storehouses, etc. in 1934. Earthwork portions of masonry gun batteries located within this historic district have the potential to be affected by the draft plan/SEIS (map 26).

### **San Francisco Bay Discovery Site**

Located at Sweeney Ridge, the San Francisco Bay Discovery Site, or Portola Discovery Site, is the location on which Captain Juan Gaspar de Portola and his party discovered the San Francisco Bay. The party had gotten lost while looking for Monterey Bay, eventually scaling Sweeney Ridge for a vantage point. At the top Portola discovered the San Francisco Bay, which had not yet been discovered by seafarers. This discovery led to the development of the Presidio to protect the Bay Area for the next two centuries (NPS 2007d). No structures are or have been present at the site, and the view has changed greatly with the development of the Bay Area, but still affords an expansive view of the Bay Area (NPS 2007d; NRHP 1978). The site is designated as a NHL, and is listed on the NRHP.

## **CLIMATE CHANGE**

The *National Environmental Policy Act of 1969* (NEPA) process cannot be used to regulate greenhouse gases, but it can be used to analyze the impacts of actions that would intensify climate change. Recent mandates have been issued that will provide support and guidelines for addressing climate change. Secretarial Order 3289 established the Climate Change Response Council, which will work to increase the understanding of climate change and to coordinate an effective response to its impacts (SOI 2009, 1-2). Executive Order 13514, Federal Leadership in Environmental, Energy, and Economic Performance, requires agencies to measure, manage, and reduce greenhouse gas emissions toward agency-defined targets in an effort to support sustainable practices. The order also requires agencies to meet energy, water, and waste-reduction targets (NPS 2009g, 1). On February 18, 2010, the Council on Environmental Quality (CEQ) released a draft Guidance Memorandum on the consideration of greenhouse gas emissions and climate change impacts as part of compliance with NEPA (Nelson et al. 2010, 1). GGNRA is one of 52 NPS units involved in the Climate Friendly Parks Program, which is a collaboration of the NPS and the U.S. Environmental Protection Agency aimed at addressing climate change. The purpose of the program is to measure greenhouse gas emissions, develop sustainable strategies to mitigate these emissions and adapt to climate change impacts, and educate the public about these efforts (NPS 2009h, 1).

All beaches in GGNRA are highly to very highly vulnerable to climate change effects because of their coastal slope, wave heights, and the range of local tides. A sea-level rise of 3 feet or more would likely inundate most, if not all, of the sandy beaches at GGNRA (Saunders et al. 2006, 17–18). If global warming progresses at predicted rates, sea level could rise 3 feet or more along coastal California by the end of this century.

---

*All beaches in GGNRA are highly to very highly vulnerable to climate change effects because of their coastal slope, wave heights, and the range of local tides.*

---

The sea level at Crissy Field has risen by 0.2 meter (0.7 feet) over the past 100 years, and predictions indicate that it would rise 0.5 to 1.6 meters (1.6 to 5.2 feet) more by 2100 (NPS n.d.c, 1). By 2100, the volume and effects of each annual flood could be the equivalent of today's 100-year flood (NPS n.d.c, 1). Since the term of this draft plan/SEIS is only 20 years and changes to sea level along the coast of California are predicted by 2100, climate change is not discussed further in this document because shoreline changes would not be expected during the life of this draft plan/SEIS.

GGNRA sites are also vulnerable to the effects of an increase in the intensity of storms as a result of climate change. Climate change effects are predicted to include changes in temperature, precipitation, evaporation rate, ocean and atmospheric chemistry, local weather patterns, and increases in storm intensities (NPS 2011b, 1-31). Such storms may result in increased storm wave energy and altered flow regimes (NPS 2011b, 1-132). These storms can cause a drop in air pressure, which increases tide height, causing a greater flooding threat. Additionally, higher-intensity storms bring greater winds, which can result in larger and more erosive waves (Tam 2012, 3). Storms may also increase rainfall, resulting in a greater volume of water in creeks and waterways. Because approximately 40 percent of California's land drains to the San Francisco Bay, storm floods are anticipated to last longer within the bay (Tam 2012, 3).

## VISITOR USE AND EXPERIENCE

### PARK VISITATION INFORMATION

Since measurement of park visitation began in 1973, it is estimated that over 500 million people have visited Golden Gate, making it one of the NPS's most highly visited units (NPS 2008f, 2). Since GGNRA is made up of many park areas and does not have a central entrance where visitors can be counted, it is difficult to accurately count the number of people who visit GGNRA sites each year. The park employs a variety of counting methods to capture the number of visitors who drive to the sites as well as visitors who walk, bike, or ride public transportation to the sites. Most of the traffic counters multiply the number of vehicles by a multiplier to account for the number of people in each car. Some sites have additional seasonal multipliers to capture walk-in visitors (NPS 1997, 1).

The park exposes visitors to many of the resource values that exemplify America's national park system. The area includes miles of hiking trails, five campgrounds, hundreds of historic sites and structures, and 59 miles of bay and ocean shoreline and beaches. There are five visitor centers in the park and nine retail facilities run by park concessionaires, nonprofit partners of the park. Overnight stays are available at four walk-in campsites in the Marin Headlands, one drive-in campsite at Kirby Cove, two hostels (one at Fort Mason and another in the Marin Headlands), the newest national park lodge at Fort Baker, and local hotels and inns in areas outside the park boundaries (NPS 2009c, 131). Overnight facilities at Rodeo Beach are used extensively by youth groups, such as the Headlands Institute and Point Bonita Young Men's Christian Association. Activities include hiking, jogging, water sports, hang gliding, horseback riding, fishing, bike riding, camping, wildlife viewing, dog walking, sunbathing,

---

---

stewardship opportunities, and interpretive and educational opportunities. Visitors to the park come as individuals, as families, and as part of private and commercial tour groups and educational groups (schools, summer programs, youth groups, after-school programs, etc.). They come to recreate, learn, and attend special events. Additionally, participants in special use permits (SUPs) and events also are exposed to the park settings and resources.

**Summary of Visitation Trends**

The annual visitation trends for GGNRA show a dramatic increase from its creation in 1972 (first annual visitation recorded in 1973) to its peak of over 21 million visitors from 1986-88, with a slight decrease from 1983 to 1985 (figure 5) (NPS Stats). The initial growth and variability in visitation from 1973 to 1988 is expected since the park was expanding during these years—more than 28,000 acres were added to the park since 1974 (Rothman 2002). In addition, prior to 1989, visitor counts at the GGNRA included visitors to the San Francisco Maritime National Historical Park. Since 1989, visitor counts for the GGNRA and San Francisco Maritime National Historical Park have been tabulated separately, resulting in a drop in annual visitation from the GGNRA of approximately 5 million. When factoring for the change in visitation counts related to the authorization of San Francisco Maritime National Historical Park, annual visitation to the GGNRA is shown to have reached a capacity of 13 to 15 million visitors since 1980.

**FIGURE 5. RECORDED ANNUAL VISITATION TO GOLDEN GATE NATIONAL RECREATION AREA, 1973 TO 2011**

Monthly visitor use data from 2005 through 2011 were analyzed to evaluate the variance of visitation rates by month (NPS Stats). The data indicated only slightly higher use from April through September, accounting for approximately 54% of visitors year round. This shows that visitation to the park is fairly constant regardless of the time of year.

### Forecasts of Future Park Visitation (Based on Visitation Trends)

The 2013/2014 NPS Forecast of Recreation Visits for GGNRA predicts a stable annual visitation in 2013 and 2014 of 14.6 million (figure 6) based on trend line extension of visitation data from the past five years (NPS Stats). Trend line extensions usually work well for projections two to three years into the future for park facilities. However, the confidence level is fairly low when extending this kind of forecast out to 20 years (Gramann 2003).

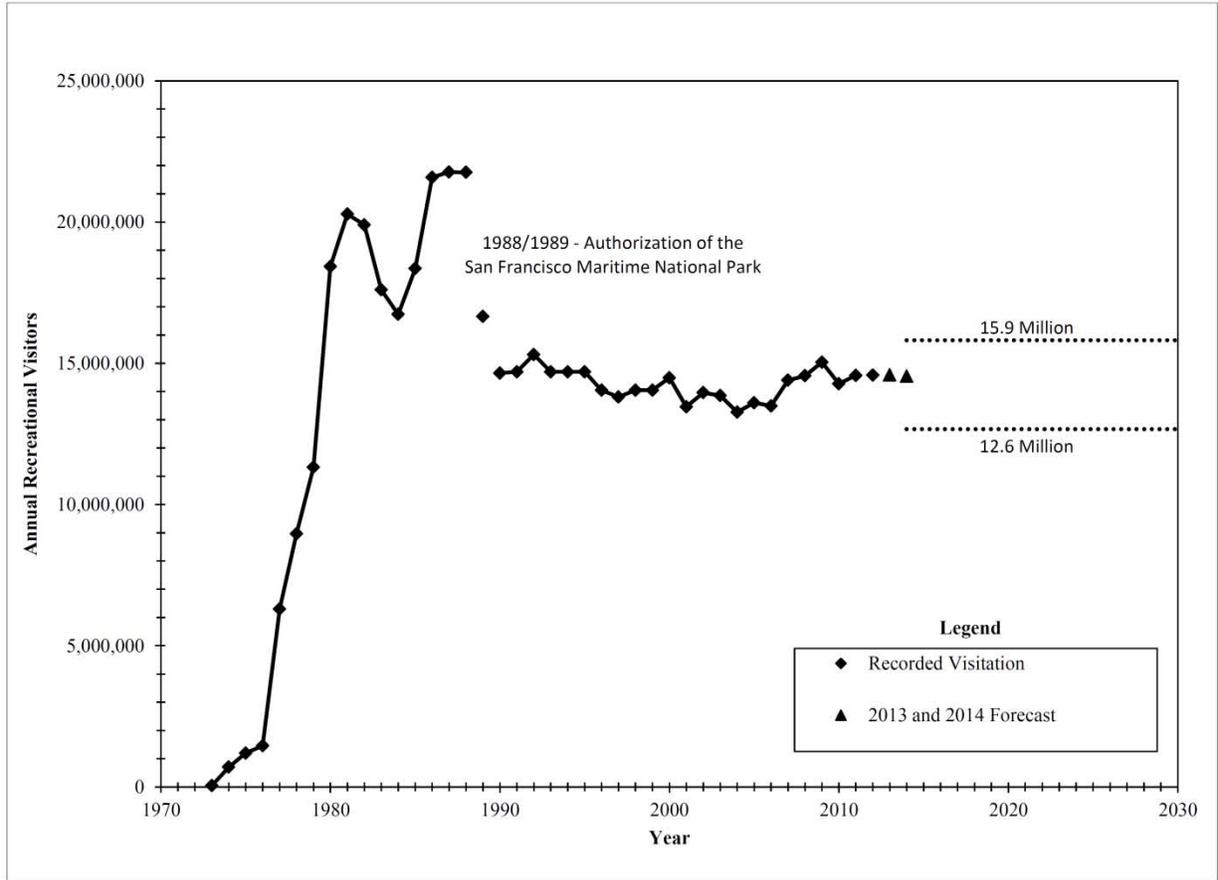

FIGURE 6. FORECASTED ANNUAL VISITATION TO GOLDEN GATE NATIONAL RECREATION AREA

Our long-term forecast method utilizes data recorded since 1990, since this is after San Francisco Maritime National Historical Park was removed and there have been minor changes to the “Public Use Counting and Recording” methodologies<sup>2</sup>. Within this longer time frame of 20-years, visitation does not exhibit any significant increasing or decreasing trend, but rather is observed to oscillate about a mean annual visitation of approximately 14 million. This pattern of visitation is assumed to continue unless a large expansion or change of the park boundaries occurs. A 99% prediction interval (PI) was developed representing the lower and upper limits of annual visitation with 99% confidence using the following formula:

**Visitors Arriving at Rodeo Beach**  
Credit: NPS

$$PI = \bar{x} \pm t_{1-\alpha/2, n-1} \times \sqrt{s_x^2 \left( 1 + \frac{2}{n} \sum_{l=1}^5 (n-1) \rho_l \right) \left( \frac{1}{n} + 1 \right)}$$

- $\bar{x}$  = average annual visitation from 1990 to 2011,
- $s_x$  = standard deviation in annual visitation from 1990 to 2011,
- $n$  = number of years in data set ( $n = 20$  years),
- $\rho_l$  = the autocorrelation between visitation  $l$  years apart, and
- $t_{1-\alpha/2, n-1}$  = critical value of the two-sided  $t$ -statistic with  $\alpha = 0.01$  for a 99% prediction interval.

This formula accounts for correlation between annual visitations up to 5 years apart consistent with the NPS practice of conducting 2-year forecasts by linear regression of the past 5-years of visitation data. The results of the prediction interval calculation are presented in figure 6 that shows that annual visitation is expected to remain in the range of 12.6 to 15.9 million.

---

<sup>2</sup> From 1981 to 1994, “Public Use Counting and Recording Instructions” were mildly different than the methodologies used from 1997 to the present day. The older standard included fewer traffic counters (11 compared to 18), and used slightly different “Persons per Vehicle (PPV)” multipliers. The methodologies for the years 1995-1996 are unavailable online, but are assumed to resemble the current procedures that have been in place since 1997.

### **Forecasts of Future Park Visitation (Considering Population Trends)**

Predicting future park visitation based on population forecasts is often problematic when looking at smaller-scales (i.e., state and county levels) (Gramann 2003). This is due to several reasons. For example, the state-level Census Bureau projections do not incorporate the influence of economic swings on population change, and the Census Bureau does not project population change at the county level—which is left to the individual states, and thus is not standardized. In addition, park facilities that are designed for repeat visitors would be affected differently by changes in the local population than those designed for one-time visitors or travelers. In result, it is suggested that describing visitor population characteristics and tracking how they are changing is critical to accurate long-term forecasting (Gramann 2003). Annual visitation data for GGNRA (NPS Stats) was compared to population growth trends of the San Francisco Bay Area<sup>3</sup> (Bay Area Census), and it was found that there is no apparent association (coincident, leading, or lagging) between Bay Area population and annual visitation to the park, most likely because park visitation is influenced by other factors than just resident population, such as amount of non-resident visitors, recreation use, etc. This suggests that the predicted 15.8%<sup>4</sup> increase in population estimated for the San Francisco Bay area in 2030 would not result in an equal increase in park-use. However, although not directly correlated, the projected population increase may still result in some increased park usage.

### **Overall Forecasts of Future Park Visitation**

Given the overall visitation trends to GGNRA, it can be interpreted that the park has been operating at capacity since 1990, and would not experience a significant increase in visitation over the next 20 years. Assuming there are no major changes in park boundaries or facilities, park visitation would range between 12.6 million to 15.9 million people annually, similar to how it has been operating over the previous 20 years.

### **Visitor Use by Dog Owners**

The San Francisco Bay Area is highly urbanized. In many parts of the Bay Area, GGNRA lands are the backyards of the citizens, and residents have come to expect public lands to be made available for dog walking and other recreational activities. Many visitors report that they enjoy visiting GGNRA sites with their dogs off leash. They cite the importance of adequate exercise opportunities for their dogs as well as the importance of social connections with other dog walkers as reasons for the necessity of off-leash recreation (NAU 2002a, 42). Many dog walkers are specifically looking for an off-leash beach experience for their dogs. Because GGNRA manages the majority of the City of San Francisco bay and ocean shorelines, they come to this park.

To collect current and detailed information regarding visitor use of the park by dog owners, NPS conducted a survey in 2012 to measure customer satisfaction related to dog walking at the GGNRA sites and to determine where visitors would go if they were not satisfied. This survey, *GGNRA Dog Walking Satisfaction Visitor Study* (NPS 2012a), evaluated the perception of and satisfaction with the current on and off-leash dog walking policies by both dog walkers and non-dog walkers, and the potential for redistribution of use based on access changes. The survey is a result of the public comments made by individuals representing both dog walkers and non-dog walkers of the park who requested additional

---

<sup>3</sup> The Bay Area consists of nine counties: Alameda, Contra Costa, Marin, Napa, San Francisco, San Mateo, Santa Clara, Solano and Sonoma

<sup>4</sup> The 15.8% increase is the average increase of all the Bay Area counties; San Francisco County in particular is only expected to increase by 1% by 2030. Found here: <http://www.abag.ca.gov/planning/currentfcst/regional.html>.

analysis of the possible redistributive effects which could occur through managing and restricting dog walking. A postcard was mailed or emailed to all individuals (approximately 7,000) on the GGNRA dog management mailing list. The respondents were given the option to respond to the survey on line or to request a hard copy of the survey for mailing back to the park. The survey consisted of 15 questions, with a primary focus on where a visitor might go instead if dog walking (both on and off leash) were allowed or restricted. The respondents were also asked to provide feedback regarding how well they were satisfied with the management practices and processes, and what improvements they might make to inform the future management for both dog walkers and non-dog walkers.

Of the approximately 7,000 individuals contacted, only 897 responded to the survey. Respondents included 662 dog walkers, 20 commercial dog walkers, and 212 individuals who do not walk dogs at the park (NPS 2012a, 6). General satisfaction at the park was included in the survey using the following categories: “not at all satisfied,” “slightly satisfied,” “moderately satisfied,” “very satisfied,” and “completely satisfied” (NPS 2012a, 10). Of the dog walkers that responded to the survey, 431 individuals indicated that they were “not at all satisfied,” “slightly satisfied,” or “moderately satisfied,” with on-leash dog walking opportunities at the park. These same respondents were then asked if they would go (inside or outside GGNRA) to an alternative site for dog walking. The five most popular alternative sites indicated in the survey for off-leash dog walking included Pine Lake/Stern Grove, Golden Gate Park (all areas), McLaren Park, Ocean Beach, and Alta Plaza (NPS 2012a, 13-15). The five most popular alternative sites for on-leash dog walking included Pine Lake / Stern Grove, Golden Gate Park (all areas), McLaren Park, Marin Headlands Trails, and Alta Plaza (NPS 2012a, 19-21). In addition, a high number of answers to survey questions asking where they would go instead of their preferred dog walking locations if they were not satisfied, included “I don’t know.” For example, the second most popular answer to the question about an alternative site for on-leash dog walking was “I don’t know” and the second most popular answer to the question about an alternative site for off-leash dog walking was “I don’t know” (NPS 2012a, 13, 19).

Of the dog walkers that responded to the survey, 244 individuals indicated that they were “not satisfied” or “slightly satisfied” with on-leash dog walking opportunities at their most frequently visited sites at the park and 206 individuals were “not satisfied” or “slightly satisfied” with off-leash dog walking opportunities their most frequently visited sites at the park (NPS 2012a, 11, 16). A total of 433 individuals indicated that they were “moderately satisfied” to “completely satisfied” with on-leash dog walking at their most frequently visited sites at the park and 470 individuals indicated the same for off-leash dog walking areas (NPS 2012a, 11, 16). Nearly half of the respondents indicated that their round trip travel to their favorite GGNRA sites is up to 10 miles (NPS 2012a, 7). Limitations to this survey included a small sample size of respondents; less than 13 percent of individuals responded to the survey.

In addition to the *GGNRA Dog Walking Satisfaction Visitor Study* (NPS 2012a), information on the current use of GGNRA sites has been compiled and is discussed in this section. For general purposes, overall visitor use and dog use at each GGNRA site is characterized as either low, moderate, or high (table 9). An area with high visitor use is defined as a park beach, trail, or other feature that is nearly always occupied and is often crowded; an area with moderate visitor use is defined as one that is usually occupied, but the area is only occasionally crowded; and an area with low visitor use is defined as one where visitors sometimes see other visitors, but the area is never crowded. At some sites, use is dependent on weather conditions, so a range in the use pattern is described. Use by visitors walking dogs is considered high when it reaches >30 percent, moderate is 10–30 percent, and low is <10 percent. These qualitative thresholds were developed by the NPS with input by the Negotiated Rulemaking Advisory Committee. They were used by the Committee to provide feedback to the NPS on levels of use in park areas (NPS 2006g, 1–10).

**TABLE 9. SUMMARY OF VISITOR USE AT EACH SITE IN GGNRA**

| Site   | Visitor Use   | Percentage of Visitors Walking Dogs   |
|--|---|---|
| Stinson Beach                                      | High on weekends, low to moderate on weekdays (swimmers on beach) <sup>b</sup>  | Moderate to high (picnic area) <sup>a</sup>                                 |
| Homestead Valley                                   | Low—local use <sup>a</sup>  | Low <sup>a</sup>  |
| Alta Trail / Orchard Fire Road / Pacheco Fire Road | Low to moderate (runners, bikers, hikers) <sup>a</sup>  | High (commercial dog walkers) <sup>a</sup>                                  |
| Oakwood Valley                                     | Moderate (hikers, runners, bikers; equestrian riders)—local use <sup>a,b</sup>  | Moderate <sup>a</sup>   |
| Muir Beach   | High on weekends, moderate to high on weekdays (beachgoers, hikers)—local use <sup>b</sup>  | Low to high <sup>b,c</sup>  |
| Rodeo Beach  | Moderate to high (beachgoers) <sup>b</sup>  | Low to moderate <sup>b,c</sup>  |
| Marin Headlands Trails (includes Tennessee Valley) | Low to high (hikers, runners, cyclists, beachgoers, equestrian riders, school group trips) <sup>b</sup>                           | Low to moderate <sup>b</sup>  |
| Fort Baker   | Moderate <sup>a</sup>   | Low <sup>a</sup>  |
| Upper and Lower Fort Mason                         | Moderate to high (walkers, bikers, runners, sightseers)—local and visitor use <sup>a,b</sup>                                      | Low to moderate (private and commercial dog walkers)—local use <sup>b</sup> |
| Crissy Field                                       | Moderate to high (walkers, bikers, runners, school group trips, sightseers) <sup>a,b</sup>  | Low to high (private and commercial dog walkers) <sup>b,c</sup>             |
| Crissy Field WPA                                   | Low to moderate (walkers, beachgoers) <sup>a</sup>  | Low to moderate <sup>a</sup>  |

| Rancho Corral de Tierra                            | Low to moderate (hikers, runners, bicyclists, equestrians) – local use <sup>a</sup>   | Low to moderate   |

<sup>a</sup>Based on best professional judgment of park staff.

<sup>b</sup>Based on the GGNRA Dog Management Plan/EIS Current Conditions table developed by the Negotiated Rulemaking Advisory Committee dated September 15, 2006 (NPS 2006g).

<sup>c</sup>Based on visitation surveys collected over a four day period in 2008 and 2011 (IEC 2011).

Table 9 includes results of a park visitation study conducted in 2008 and 2011 at six of the most popular GGNRA sites. On-site visitor count studies were conducted in 2008 at four of the beach sites addressed in this draft plan/SEIS (Rodeo Beach, Crissy Field, Baker Beach, and Ocean Beach) as part of the Cosco Busan Oil Spill Natural Resource Damage Assessment (USFWS 2009b). On-site count studies were conducted in August 2011 at two additional popular GGNRA beaches (Muir Beach and Fort Funston), in a survey titled *Assessment of Visitor Activities at Six Sites Within Golden Gate National Recreation Area* (IEC 2011). To ensure consistency, the 2011 survey was conducted using the same methodology as the 2008 surveys (IEC 2011, 10). On-site counts were conducted over a four day period which included two weekdays and two weekends. The counts were scheduled to cover nearly all daylight hours. Visitor counts were maintained on a tally sheet where field personnel recorded all visitors leaving the site. Every visitor was placed in one (and only one) of the following activity categories: hang glider (Fort Funston only), surfer/windsurfer/ kiteboarder, motorized boater, non-motorized boater, angler, biker, rollerblader/ rollerskater/skateboarder, picnicker, dog walker, runner/walker, crabber, other recreator, park staff/law enforcement, and school group (Rodeo Beach only). When visitors left in groups, each person in the group was categorized individually, according to the equipment that he or she was carrying and according to whether or not he or she was accompanied by a dog. For example, if two visitors left the park together but only one carried a fishing pole, then only one would be classified as an angler. Similarly, if two visitors were walking a single dog, only one would be classified as a dog walker. The only exception to this rule was for picnickers and boaters, as all members in the group were placed in a single category. Many visitors could not be categorized and were classified as “Other.” The “Other” category is a catch-all category capturing visitors who were not carrying identifiable equipment, did not have a dog with them, and were clearly not running or walking for exercise. Visitors classified as “Other” frequently included beach visitors and sightseers. During the 2011 visitor counts at Fort Funston and Muir Beach, field personnel counted the number of dogs in addition to counting people. The dog counts covered all dogs leaving the site, including dogs with visitors who were not classified as dog walkers (e.g., a dog with a fisherman or picnicker). Field personnel did not record whether dogs were on or off leash (IEC 2011, 1-4).

It is important to note that while all visitors could be classified, the activity classifications may not be accurate for all visitors. In particular, visitors who leave the site without identifiable equipment and without a dog are difficult to classify. In addition, the characterization of activities is based on observations by field personnel rather than interviews with visitors. The characterizations may differ from the responses visitors would provide if they were asked to select a primary activity from a list of potential options. For several activities, the observer characterizations are likely to be reasonably accurate. For example, visitors with equipment (such as surfers and bikers), and school groups are easily identifiable. For activities without clearly identifiable equipment, observer characterizations are likely to be less accurate. There may be some error in determining whether or not visitors are dog walkers. For example, when two individuals were observed walking a dog, only one of the visitors were classified as a dog walker, but it is possible that both would describe themselves as dog walkers if interviewed. Conversely, some observers with dogs and classified as a dog walkers may not characterize their primary activity at the site as dog walking if they were interviewed; rather they may say they were walking, running, picnicking, or sightseeing.

It is also important to note that the survey conclusions were based on only four days of on-site observations. These four days may not accurately represent a mix of activities pursued by visitors throughout the year. Visitor activities can vary throughout the year due to seasonal variations in weather, the amount of available daylight for outdoor recreation, and the number of vacation days available. In addition to seasonal changes, the mix of visitor activities could have been impacted by unusual weather or special events occurring at specific sites. At Fort Funston, the annual hang gliding race and barbeque occurred during the on-site count weekend. There was also unusually warm weather during the weekend

counts in 2008, which may have increased the number of visitors pursuing water-related activities such as surfing and swimming (IEC 2011, 21).

Monthly visitation estimates were developed by combining visitation estimates from the four-day count period with monthly vehicle counts provided by NPS. Automated vehicle counters are located at site entrances and count vehicles entering each site. Vehicle counters were used to determine the number of vehicles entering each site on each day of the four-day count period. The daily vehicle counts were combined with daily visitation estimates to estimate the number of visitors per vehicle. These visitors-per-vehicle estimates were then multiplied by the monthly vehicle counts to estimate monthly visitation at each site. Monthly visitation estimates were not developed for Rodeo Beach because the site does not have a vehicle counter at the main entrance (IEC 2011, 7-8). The seasonality of visitation did not appear to be particularly strong at the six sites surveyed. Visitation was fairly consistent throughout the year; however, the late spring to early fall months (May through September) generally had the highest visitation levels, while the late fall and early winter months (October through December) generally have the lowest. Across the sites with automated vehicle counters (excludes Rodeo Beach), July had the highest total visitation while December had the lowest. Results of the visitor use surveys at the six sites are shown in table 10 and are discussed below under the appropriate site in the paragraphs that follow (IEC 2011, 17).

The results of the visitation surveys conducted in 2008 and 2011 at Rodeo Beach, Crissy Field, Baker Beach, Ocean Beach, Muir Beach, and Fort Funston are discussed in more detail in the “Visitor Experience” section.

**TABLE 10. SUMMARY OF VISITOR ACTIVITIES AT MUIR BEACH, RODEO BEACH, CRISSY FIELD, BAKER BEACH, OCEAN BEACH, AND FORT FUNSTON<sup>A,B</sup>**

Source: IEC 2011, 10

<sup>a</sup> Observations at Rodeo Beach, Crissy Field, Baker Beach, and Ocean Beach are from November 2008. Observations at Muir Beach and Fort Funston are from August 2011.

<sup>b</sup> At each location, percentages are calculated as weighted average of weekday and weekend percentages, where weights reflect the relative visitation on weekdays versus weekends.

<sup>c</sup> Ocean Beach north is defined as the area of Ocean Beach north of Lincoln Way; Ocean Beach south is defined as the area of Ocean Beach south of Lincoln Way. To calculate the total visitation for Ocean Beach the estimated visitors to the north and the estimated visitors to the south were combined and used to calculate the average using these combined estimates. Therefore, the percentages for Ocean Beach total are effectively weighted averages of the percentages for north and south, with North receiving a higher weight because the visitation estimates are higher in the north.

## VISITOR EXPERIENCE

In a 2001 random telephone survey conducted by Northern Arizona University in the four-county area surrounding GGNRA (Marin, San Francisco, San Mateo, and Alameda counties) respondents were asked a series of questions regarding their use of the park. Of the 29 percent of respondents who either owned or cared for a dog, about half (14 percent) had walked their dogs at GGNRA. Of the 14 percent of respondents who walked dogs at the park, approximately 75 percent lived in San Francisco County and 69 percent lived in Marin County. The percentage in San Mateo and Alameda counties was lower: 44 percent and 29 percent, respectively (NAU 2002b, 43). Among those visitors, one in five visited a GGNRA site daily or weekly. Residents in the four-county area who had visited a GGNRA site more than five times within the past year were the most likely to make use of the park for dog walking. Nearly 18 percent of the dog-owning population had also asked that someone else take their dog for a walk in a GGNRA site (NAU 2002b, 17). Regarding visitor experience, approximately 22 percent of all respondents who had visited the park and had seen an off-leash dog reported that off-leash dogs detracted from their visitation experience. Twenty-seven percent said that seeing an off-leash dog added to their visitation experience and 49 percent stated that off-leash dogs did not affect their experience (NAU 2002b, 17). About 74 percent of those surveyed who were supportive of off-leash dog walking said they would prefer dogs off-leash only in limited park areas (NAU 2002b, 27). When asked if they supported or opposed allowing off-leash dog walking on trails used by hikers, cyclists, or horses, about 56 percent of respondents who were not strongly opposed to off-leash dog walking either “somewhat opposed” or “strongly opposed” the statement, while about 40 percent either “somewhat supported” or “strongly supported” it (NAU 2002b, 49).

A visitor survey documenting visitor experience for Crissy Field, Ocean Beach, and the Presidio (including some sites in Area B, which is outside of the analysis of this draft plan/SEIS) was conducted in two phases in the summer and fall of 2008. The first phase of the survey involved an intercept survey (personal contact with visitor) to provide a visitor population profile, including a more thorough understanding of who visits the parks, use patterns, their likes and dislikes, and a preliminary understanding of their visitor experience (Tierney et al. 2009, 1). The second phase of the survey included a follow-up telephone survey with the same visitors interviewed in the first phase to gather more detailed information on visitor experiences, satisfaction, and opinions about park management (Nakagawa, Rodgers, and Adock et al. n.d., 8). Visitors were asked during the survey if they had any suggestions on how their experience at the park site could be improved, allowing for open-ended answers. Of the respondents, 3.3 percent noted that dogs should be kept on leash, visitors should be cited for off-leash dogs, or that there should be no dogs (Tierney et al. 2009, 69). The study also found that 9.6 percent of respondents listed dog walking as their primary reason for visiting the site; the third most cited reason for visiting the sites after walking and jogging. In the second phase of the survey (telephone survey), results found that 16 percent of all respondents cited dogs off-leash as a moderate or serious concern associated with their park experience. Although some respondents cited dogs as an issue in the survey, 10 percent of all respondents cited dogs as a reason for returning to the park sites (Crissy Field, Ocean Beach, and the Presidio Areas A and B) (Nakagawa, Rodgers, Adock et al. n.d. 58). Approximately 7 percent of all respondents mentioned dogs when they were asked to describe special park qualities (Nakagawa, Rodgers, Adock et al. n.d., 67).

In response to the GGNRA Advance Notice of Proposed Rulemaking (ANPR) published in the Federal Register, many park users and nonusers submitted comments regarding their preferences for either the NPS leash regulation or allowing some off-leash dog walking in GGNRA. Thirteen percent of all respondents to the ANPR (49 percent of those who preferred the NPS leash regulation) cited feelings of discomfort around and/or fear of off-leash dogs and/or believed that dogs could endanger their children. Certain user groups may be intimidated by dogs based on past experience or lack of experience with dogs. A similar percentage of comments stated that dogs make the park unsafe for park users. The following is

an illustrative quote related to the issue: “Unleashed dogs present safety hazards to the GGNRA’s wide variety of recreational users. Dogs can bite other dogs and people; trip pedestrians, skaters, and cyclists; and jump on and knock down people” (NAU 2002a, 10).

The majority of comments to the ANPR (71 percent) supported some form of off-leash dog walking in GGNRA. This percentage rose to 98 percent among dog owners. Respondents supporting off-leash dog recreation in the park cited the exercise and sociability benefits for off-leash dogs and their owners, the responsibility of dog owners, and the unique park status of GGNRA as a recreational area as reasons for their position (NAU 2002a, 16–17).

In many cases, it appears that how a visitor reacts to off-leash dogs is influenced by whether the visitor owns a dog. For instance, when telephone survey respondents were asked how off-leash dogs affected their visitor experience at GGNRA, 37 percent of dog owners responded that it “added to” it, while 23 percent of visitors that did not own dogs responded similarly. Conversely, only 9 percent of dog owners responded that the presence of off-leash dogs “detracted from” their experience, while 28 percent of visitors that did not own dogs answered similarly. Approximately half of all respondents (54 percent of those who owned dogs and 47 percent of those who did not) stated that the presence of off-leash dogs did not affect their experience (NAU 2002b, 18).

It is not uncommon for users to take more than one dog to the park. Some of these visitors may be dog owners with more than one dog, but many of these users are commercial dog walkers. Commercial dog walkers visit the park with multiple dogs per trip. Fort Funston, Fort Mason, Crissy Field, and Alta Trail in the Marin Headlands are very popular destinations for commercial dog walkers. Some respondents to the ANPR (less than 1 percent of total comments) expressed concern related to the use of public lands for commercial purposes such as dog walking. The following is an illustrative quote related to the issue: “Make commercial dog walkers park concessionaires. Require them to pay for the privilege of doing business on park lands” (NAU 2002a). In contrast, an equal percentage of respondents believed that commercial dog walkers provide a public service.

Fifty-eight percent of the 2002 telephone survey respondents believed that the numbers of dogs walked by any one person should be limited. Of those who stated there should be limits, 13 percent stated that one dog should be the limit, 40 percent stated that two dogs should be the maximum, and 28 percent stated that no more than three dogs should be allowed. About 15 percent believed that limits should be four or more dogs per person (NAU 2002b, 29–30).

Many people responding to the ANPR reported that they enjoyed visiting GGNRA sites with their dogs off leash. They cited the importance of adequate exercise opportunities for their dogs as well as the importance of social connections with other dog walkers as reasons for the necessity of off-leash recreation (NAU 2002a, 16–18). For example, “Just like healthy human beings, dogs need exercise that they cannot adequately get walking on a leash” (NAU 2002a, 16). Most of the organized groups that support off-leash dog recreation at GGNRA sites advocate responsible dog ownership, which includes picking up dog waste, discouraging dogs from digging holes or chasing/harassing wildlife, and leashing aggressive dogs.

### **Site-Specific Visitation Results and Dog-related Incidents at GGNRA**

As stated previously, many visitors report that they enjoy visiting GGNRA sites with their dogs. However, dog-related incidents do occur at GGNRA and are collected by two independent NPS law enforcement divisions (the U.S. Park Police and NPS rangers). Incident reports are written by either U.S. Park Police or NPS rangers when visitors violate park regulations. Dog-related incidents were compiled for GGNRA using the criminal incident reports written by both divisions. A detailed discussion of these

methods and incidents is included at the beginning of this chapter. This section provides a more detailed site-specific discussion of dog-related incidents. For each GGNRA site described in this section below, the tables identify the number and type of dog-related incidents that occurred from 2008 through 2011 using the law enforcement reports (tables 11 through 28).

Dog-related incidents include violations of the leash law, hazardous conditions (includes a dog bite, dog attack, or dog rescue), unattended pet violation, failure to pick up pet excrement, possessing a pet in a closed area, violation of a closed area, wildlife disturbance, and vegetation damage. A leash violation can include having a dog off leash in a leash-only area, including violations of 36 CFR 7.97(d), which describe seasonal dog walking restrictions (on leash only) for western snowy plovers in the SPPA at Ocean Beach and in the WPA at Crissy Field. Possessing a pet in a closed area is described in 36 CFR 2.15 (a)(1) as possessing a pet in a public building, public transportation vehicle, or location designated as a swimming beach, or any structure or area closed by the superintendent to the possession of pets. This regulation does not apply to service dogs. Violation of a closed area (36 CFR 1.5 (f)) applies to both humans and pets and is described as violating a closure, designation, use or activity restriction or condition, schedule of visiting hours, or public use limit. U.S. Park Police and NPS rangers appear to cite these regulations interchangeably on incident reports, and therefore, these incidents were kept separate and not compiled in tables 11 through 28. For example, Stinson Beach is open to the public, but closed to pets. In 2010, two separate people in two separate instances were issued citations for having dogs on the beach. One incident (2010, Incident Report # 1003935) resulted in a verbal warning, citing 36 CFR 1.5(f), violation of a closed area. The other incident (2010, Incident Report # 1009278) resulted in a citation for violation of 36 CFR 2.15(a)(1), possessing a pet in a closed area. Vegetation damage is described in section 36 CFR 2.1 (a) (1) (ii) and the following is applicable to vegetation and soils and prohibited: possessing, destroying, injuring, defacing, removing, digging, or disturbing from its natural state: plants or the parts or products thereof. Wildlife disturbance is described in section 36 CFR 2.2 (a) (2) and the following is prohibited: feeding, touching, teasing, frightening or intentional disturbing of wildlife nesting, breeding or other activities. At GGNRA, it is required by law for people to clean up dog fecal matter. Violations have been written for park visitors at GGNRA who have not cleaned up after their dogs, under 36 CFR 2.34(a) (4), creating a “physically offensive condition” and 36 CFR 2.15 (a) (5), “failing to comply with pet excrement disposal conditions established by the superintendent.”

In addition to a discussion of dog-related incidents, this section provides results of site-specific visitation surveys, when applicable, including the visitor count studies conducted in 2008 for the Cosco Busan Oil Spill Natural Resource Damage Assessment (USFWS 2009b), visitor count studies conducted in 2011 as part of the *Assessment of Visitor Activities at Six Sites Within Golden Gate National Recreation Area* (IEC 2011), and results of the most popular sites (generally top 10 sites) recorded in the 2012 *GGNRA Dog Walking Satisfaction Visitor Study* (NPS 2012a).

### **Stinson Beach**

On-leash dog walking is allowed in parking lots and picnic areas, but not on Stinson Beach, because it is a designated swimming beach (which is closed per the CFR and the GGNRA Compendium (NPS 2008b, 20)). There is an adjacent beach, owned by Marin County, Upton Beach, that allows on-leash dog walking. Allowing on-leash dog walking at the adjacent Upton Beach may lead to confusion in the GGNRA-owned portion of Stinson Beach that does not allow dogs. Visitor use at Stinson Beach is high on nice weekends especially during the summer and fall, and dog use in the picnic and parking lot areas is moderate to high (table 9). During the *GGNRA Dog Walking Satisfaction Visitor Study* (NPS 2012a), when dog walkers were asked which GGNRA sites they visited most frequently, 2.2 percent indicated Stinson Beach, ranking it as the seventh most frequently visited site by dog walkers. (NPS 2012a, Appendix A: 6). Stinson Beach also tied as the seventh most frequently visited site by non dog walkers during that survey (3.5 percent) (NPS 2012a, Appendix A: 69).

Compliance is relatively low on the beach, with over 70 warnings/citations given to dog owners for having a dog in an area closed to dogs from 2008 through 2011 (table 11). In addition, lifeguards stationed at fixed duty posts on the beach have observed multiple dog bites/attacks. The hazardous condition reported in 2009 was a dog bite/attack (table 11). Compliance is considered good in the parking lots and picnic areas, with only 4 off-leash violations recorded (table 11).

**TABLE 11. NUMBER AND TYPE OF DOG-RELATED INCIDENTS AT STINSON BEACH, 2008–2011**

| Incident Type                  | Year      |           |          |          | Total     |
|--------------------------------|-----------|-----------|----------|----------|-----------|
|                                | 2008      | 2009      | 2010     | 2011     |           |
| Possessing Pet in Closed Area* | 53        | 9         | 3        | 6        | 71        |
| Off-leash Violation            | 3         | 0         | 1        | 0        | 4         |
| Violation of Closed Area*      | 0         | 3         | 1        | 1        | 5         |
| Hazardous Condition            | 0         | 1         | 0        | 0        | 1         |
| Unattended Pet                 | 0         | 0         | 1        | 1        | 2         |
| Pet Excrement                  | 0         | 1         | 0        | 0        | 1         |
| Other                          | 0         | 0         | 0        | 1        | 1         |
| <b>Total</b>                   | <b>56</b> | <b>14</b> | <b>6</b> | <b>9</b> | <b>85</b> |

\* The closed area resulting in violations at this site is the NPS section of the beach, which is closed to pets but adjacent to Upton Beach, which allows on-leash dog walking. U.S. Park Police and NPS rangers appear to cite these regulations interchangeably on incident reports, and therefore, these incidents were kept separate and not compiled in this table.

**Homestead Valley**

On-leash dog walking or dog walking under voice control is currently allowed throughout the site. This site is primarily used by local Mill Valley residents; use by visitors other than those walking dogs is relatively low (table 9). A few commercial dog walkers have been seen using this site. There were no dog-related incidents documented recorded from 2008 through 2011 at Homestead Valley.

**Alta Trail, Orchard Fire Road, and Pacheco Fire Road**

The 1979 Pet Policy allowed on-leash dog walking or dog walking under voice control between Marin City and Oakwood Valley but did not specify which trails or fire roads were the intended routes. Dogs are allowed under voice control or on leash from Marin City to Oakwood Valley. The Alta Trail, on the ridge above Marin City, connects to the Oakwood Valley Trail and can be accessed either from the end of Donahue Street or from the Orchard or Pacheco fire roads. Local visitor use of the Alta Trail by hikers, runners, and bikers is low to moderate, as access and parking are readily available off Highway 101 at the end of Donahue Street (table 9). The Alta Trail has very high use by commercial dog walkers, and park staff estimate that there are usually 5 to 12 dogs per commercial walker, resulting in 30 to 50 dogs at a time in the area during periods of heaviest use. Dogs walked by both commercial dog walkers and private individuals are generally not on a leash.

There were 8 violations for having a dog in a closed area and 5 leash law violations recorded from 2008 through 2011 (table 12). Park personnel have indicated dog/coyote conflicts occur in this area. The high concentration of dog walkers may discourage some other users in this area.

**TABLE 12. NUMBER AND TYPE OF DOG-RELATED INCIDENTS AT ALTA TRAIL, ORCHARD FIRE ROAD, AND PACHECO FIRE ROAD, 2008–2011**

| Incident Type                  | Year     |          |          |          | Total     |
|--------------------------------|----------|----------|----------|----------|-----------|
|                                | 2008     | 2009     | 2010     | 2011     |           |
| Possessing Pet in Closed Area* | 3        | 1        | 1        | 3        | 8         |
| Off-leash Violation            | 2        | 0        | 1        | 2        | 5         |
| <b>Total</b>                   | <b>5</b> | <b>1</b> | <b>2</b> | <b>5</b> | <b>13</b> |

\* The closed areas resulting in violations at this site are portions of the Alta Trail, Oakwood Valley Trail, and Bobcat Trail, which are closed to pets.

### Oakwood Valley

The 1979 Pet Policy allowed on-leash dog walking or dog walking under voice control on Oakwood Valley Fire Road and on the Oakwood Valley Trail from the junction with Oakwood Valley Fire Road to the junction with the Alta Trail. On-leash dog walking is permitted on the Oakwood Valley Trail from the trailhead to the junction with Oakwood Valley Fire Road. Visitor use in this area by hikers, runners, and bikers is considered moderate (table 9). Park staff have observed that some local dog walkers allow their dogs to be under voice control as soon as they exit their vehicles along Tennessee Valley Road, in the large, open, grassy meadow at the start of the Oakwood Valley Trail, and along the trail itself, as well as on an open, grassy hillside east of the Oakwood Valley Trail. Oakwood Valley receives use by local residents, with the majority of use occurring in the morning. Most visitors are private individuals, rather than commercial dog walkers. Park personnel have indicated dog/coyote conflicts occur in this area. From 2008 through 2011, only one incident was reported for possessing a pet in a closed area (table 13).

**TABLE 13. NUMBER AND TYPE OF DOG-RELATED INCIDENTS AT OAKWOOD VALLEY, 2008–2011**

| Incident Type                  | Year     |          |          |          | Total    |
|--------------------------------|----------|----------|----------|----------|----------|
|                                | 2008     | 2009     | 2010     | 2011     |          |
| Possessing Pet in Closed Area* | 1        | 0        | 0        | 0        | 1        |
| <b>Total</b>                   | <b>1</b> | <b>0</b> | <b>0</b> | <b>0</b> | <b>1</b> |

\* The closed area resulting in a violation at this site is the asphalt road into Tennessee Valley, which is closed to pets.

### Muir Beach

On-leash dog walking or dog walking under voice control is currently allowed on Muir Beach per the 1979 Pet Policy, including the path to the beach. Park staff have observed that some dogs owned by residents at Muir Beach are not kept in yards or homes, but instead roam off leash along the beach or in the lagoon, creek, or upland areas. Muir Beach has a post-and-cable fence along the beach side of lower Redwood Creek and lagoon that is intended to discourage visitors from accessing the water; however, the fencing does not physically exclude dogs or visitors from the area. Warnings and citations have been issued to dog owners for dogs in areas closed to pets. Few commercial dog walkers use Muir Beach. A 2003 visitor experience and resource protection study at Muir Beach and Muir Woods found that 21 percent of visitors walked their dogs at Muir Beach. When asked what they enjoyed least about the site, 22 percent cited the wind and foggy weather, while about 9 percent cited dog conflicts as the least enjoyable aspect of the site (NPS 2003b, 14).

Muir Beach is heavily used by visitors (beach-goers and hikers) on nice days or weekends (table 9). During the August 2011 visitor surveys, 79 percent of visitors at Muir Beach were general beach visitors and were placed in the catch-all “Other” category. Other activities observed at Muir Beach included running/walking (10 percent), dog walking (6 percent), picnicking (3 percent), surfing (2 percent), and angling (1 percent) (table 10) (IEC 2011, 9-10). Dog walking was relatively consistent on the observed day; 5 percent of dog walkers were recorded on a weekday and 6 percent were recorded on the weekend (IEC 2011, 13). It is important to note visitation estimates only include visitors who spent time on the beach. They do not include visitors who picnicked in the parking lot area or hikers who did not visit the beach but who used the Muir Beach parking lot to access the Coastal Trail. During two days of the survey (August 18-19), there was a children’s surfing camp that took place at Muir Beach (IEC 2011, 22). During the *GGNRA Dog Walking Satisfaction Visitor Study* (NPS 2012a), when dog walkers were asked which GGNRA sites they visited most frequently, 1.9 percent indicated Muir Beach, which tied with two other sites as the eighth most frequently visited site by dog walkers. (NPS 2012a, Appendix A: 6). Muir Beach also tied as the seventh most frequently visited site by non dog walkers during that survey (3.5 percent) (NPS 2012a, Appendix A: 69).

A total of 24 dog-related violations were reported at Muir Beach from 2008 through 2011 (table 14). The most common violations were for having dogs off leash (9 violations) and having dogs within closed areas (4 violations) (table 14). There were also 2 violations for dog bites/attacks (hazardous condition) (table 14).

**TABLE 14. NUMBER AND TYPE OF DOG-RELATED INCIDENTS AT MUIR BEACH, 2008–2011**

| Incident Type                  | Year     |          |          |          | Total     |
|--------------------------------|----------|----------|----------|----------|-----------|
|                                | 2008     | 2009     | 2010     | 2011     |           |
| Hazardous Condition            | 1        | 0        | 1        | 0        | 2         |
| Off-leash Violation            | 1        | 6        | 1        | 1        | 9         |
| Pet Excrement                  | 1        | 0        | 0        | 0        | 1         |
| Violation of Closed Area*      | 1        | 0        | 0        | 0        | 1         |
| Possessing Pet in Closed Area* | 0        | 2        | 3        | 0        | 5         |
| General Pet Violations         | 0        | 1        | 0        | 0        | 1         |
| Wildlife Disturbance           | 0        | 0        | 1        | 0        | 1         |
| Other                          | 0        | 0        | 2        | 2        | 4         |
| <b>Total</b>                   | <b>4</b> | <b>9</b> | <b>8</b> | <b>3</b> | <b>24</b> |

\* The closed areas resulting in violations at this site include Redwood Creek and Muir Beach Lagoon (closed to humans and pets) and Coastal Trail and Bobcat Trail (closed to pets). U.S. Park Police and NPS rangers appear to cite these regulations interchangeably on incident reports, and therefore, these incidents were kept separate and not compiled in this table.

**Rodeo Beach/ South Rodeo Beach**

Currently, dog walking on leash or under voice control is allowed on Rodeo Beach and South Rodeo Beach; on-leash dog walking is permitted on the bridge connecting to the beach and the trail connecting to South Rodeo Beach. Rodeo Lagoon is closed to people and dogs for overall natural resource protection including the federally endangered tidewater goby, the California brown pelican, sensitive waterbird and shorebird habitat, as well as water quality. Although this area is closed, dogs are frequently seen in Rodeo Lagoon. One citation was issued for a dog in a closed area and four for dogs disturbing wildlife in 2010 (table 15). Because people and dogs regularly walk along the western edge of the lagoon, the NPS is

planning to construct a post-and-cable fence along the beach side of Rodeo Lagoon to discourage visitors and pets from accessing the lagoon and to protect birds roosting near the shoreline of the lagoon, though it would not physically exclude dogs from this area.

During the November 2008 visitor surveys, general beach visitors represented 39 percent of all individuals observed (IEC 2011, 10). After general beach visitors, the next two largest groups of visitors were classified as runners/walkers (18 percent) or visiting the beach with a school group (19 percent). Other popular activities observed included dog walking (8 percent), picnicking (7 percent), surfing (7 percent), and biking (2 percent) (table 10). School groups visited Rodeo Beach primarily on the weekdays (IEC 2011, 9-10). The percentage of dog walkers was slightly higher on the weekend (9 percent of visitors) when compared to the weekday results (7 percent) (IEC 2011, 13). Schoolchildren use the beach as part of the education programs associated with Nature Bridge and the Young Men's Christian Association. During the *GGNRA Dog Walking Satisfaction Visitor Study* (NPS 2012a), when dog walkers were asked which GGNRA sites they visited most frequently, 1.9 percent indicated Rodeo Beach, which tied with two other sites as the eighth most frequently visited site by dog walkers. (NPS 2012a, Appendix A: 6).

Even though there is a low to moderate level of use by visitors with dogs at this site, the length of Rodeo Beach disperses the concentration of dog walkers, allowing them to avoid other users; therefore, incidents among visitors and dogs are relatively uncommon: three dog bite/attack incidents were recording from 2008 through 2011 (table 15). A total of 30 dog-related incidents were reported with 9 off-leash violations and 7 incidents involving pets within closed areas (table 15).

**TABLE 15. NUMBER AND TYPE OF DOG-RELATED INCIDENTS AT RODEO BEACH / SOUTH RODEO BEACH, 2008–2011**

| Incident Type                  | Year     |          |          |           | Total     |
|--------------------------------|----------|----------|----------|-----------|-----------|
|                                | 2008     | 2009     | 2010     | 2011      |           |

| Pet Excrement                  | 0        | 0        | 0        | 1         | 1         |
| Other                          | 1        | 2        | 1        | 3         | 7         |
| <b>Total</b>                   | <b>5</b> | <b>4</b> | <b>7</b> | <b>14</b> | <b>30</b> |

\* The closed area resulting in a violation at this site is Rodeo Lagoon, which is closed to humans and pets.

### Marin Headlands Trails

The 1979 Pet Policy designated several sections of Marin Headlands trails (Coastal Trail, the Wolf Ridge and Miwok Trail Loop, the Old Bunker Fire Road Loop, and the Coastal Trail from the Golden Gate Bridge to Hill 88, including the Lagoon Loop Trail) as available for on-leash dog walking or dog walking under voice control. Dog walking under voice control is permitted on the Coastal Trail from Hill 88 to Muir Beach, the Batteries Loop Trail, the South Rodeo Beach Trail, the North Miwok Trail, and Country View Road. Dog walking use is low to moderate on these trails (table 9). Park staff estimate that the Coastal Trail is used by about 10 dog walking visitors per week, and use of the Miwok Trail section varies from 1 dog walking visitor per day on weekdays to 25 per day on the weekend.

During the *GGNRA Dog Walking Satisfaction Visitor Study* (NPS 2012a), when dog walkers were asked which GGNRA sites they visited most frequently, 2.5 percent indicated Marin Headlands Trails, making it the sixth most frequently visited site by dog walkers. (NPS 2012a, Appendix A: 6). Marin Headlands Trails was indicated as the third most frequently visited site by non dog walkers during that survey (9 percent) (NPS 2012a, Appendix A: 69).

Compliance with the current dog regulations on the trails in the Marin Headlands is low. The trails in the Marin Headlands are regularly patrolled because much of the site is relatively easily accessed by law enforcement staff. From 2008 through 2011, a total of 269 incidents were reported. The majority of the incidents (195) were for having a dog within an area closed to dogs. A total of 31 off-leash violations were also reported at the site (table 16). The 3 incidents reported as hazardous conditions included dog bites/attacks (table 16).

**TABLE 16. NUMBER AND TYPE OF DOG-RELATED INCIDENTS AT MARIN HEADLANDS TRAILS, 2008–2011**

| Incident Type                  | Year      |           |           |           | Total      |
|--------------------------------|-----------|-----------|-----------|-----------|------------|
|                                | 2008      | 2009      | 2010      | 2011      |            |
| Possessing Pet in Closed Area* | 46        | 66        | 26        | 57        | 195        |
| Off-leash Violation            | 9         | 11        | 4         | 7         | 31         |
| Violation of Closed Area*      | 5         | 0         | 4         | 4         | 13         |
| Hazardous Condition            | 2         | 1         | 0         | 0         | 3          |
| Pet Excrement                  | 0         | 1         | 0         | 0         | 1          |
| Wildlife Disturbance           | 0         | 1         | 0         | 0         | 1          |

| Other                          | 3         | 5         | 5         | 11        | 24         |
| <b>Total</b>                   | <b>65</b> | <b>85</b> | <b>40</b> | <b>79</b> | <b>269</b> |

\* The closed areas resulting in a violation at this site are closed to pets and include Bicentennial Campground, Bobcat Trail, Coastal Trail, Coyote Ridge Trail, Fox Trail, Haypress Campground, Kirby Cove, Marincello Trail, Point Bonita Lighthouse Trail, Rodeo Valley Trail, Tennessee Valley Beach, Tennessee Valley Stables, Tennessee Valley Trail, and Wolfback Ridge. U.S. Park Police and NPS rangers appear to cite these regulations interchangeably on incident reports, and therefore, these incidents were kept separate and not compiled in this table.

**Fort Baker**

Currently, on-leash dog walking is allowed in the Fort Baker area except for the pier and the Chapel Trail. Visitor use at Fort Baker is considered moderate (table 9). Few commercial dog walkers currently use Fort Baker.

Monitoring by law enforcement staff is extensive at Fort Baker, yet park staff estimate that about half the visitors with dogs are in violation of regulations. From 2008 through 2011, a total of 60 dog-related incidents were reported. Of these, 52 incidents were for having dogs off leash (table 17). Dogs have been observed off leash by park staff on the parade ground, Drown Fire Road, the Battery Yates area, and behind the Bay Area Discovery Museum.

**TABLE 17. NUMBER AND TYPE OF DOG-RELATED INCIDENTS AT FORT BAKER, 2008–2011**

| Incident Type                  | Year |      |      |      | Total |
|--------------------------------|------|------|------|------|-------|
|                                | 2008 | 2009 | 2010 | 2011 |       |
| Off-leash Violation            | 12   | 21   | 9    | 10   | 52    |
| Possessing Pet in Closed Area* | 2    | 1    | 0    | 1    | 4     |
| Hazardous Condition            | 0    | 0    | 1    | 0    | 1     |
| Other                          | 0    | 1    | 0    | 2    | 3     |
| Total                          | 14   | 23   | 10   | 13   | 60    |

\* The closed areas resulting in violations at this site include Drown Fire Road, McReynolds Road, and Fort Baker Pier, which are closed to pets.

### Upper and Lower Fort Mason

Currently, on-leash dog walking is required at Fort Mason, but park staff have observed that many dog walkers allow their pets off leash. The park's headquarters is located at Fort Mason and this site receives moderate to high visitor use by walkers, bikers, runners, sightseers, and dog walkers (table 9). In addition, many commercial dog walkers walk to the area from the local neighborhoods. During the *GGNRA Dog Walking Satisfaction Visitor Study* (NPS 2012a), when asked which GGNRA sites they visited most frequently, 6 percent (10 people) of non-dog walkers indicated Fort Mason, making it the second most frequently visited site by that group (NPS 2012a, 29). The paved, multi-use trail along the waterfront (connects San Francisco Maritime National Historical Park to Marina Green through Fort Mason) attracts visitors and cyclists as well as bicycle commuters. The Great Lawn Meadow at Fort Mason is also used for large special events, such as the San Francisco Blues Festival, during which dog walking is restricted to the perimeter of the area.

Currently, compliance with dog walking regulations at Fort Mason is considered low. From 2008 through 2011, a total of 140 dog-related incidents were reported with 129 of these for having dogs off leash (table 18). A total of six incidents were reported involving dog bites/attacks (hazardous condition) (table 18).

**TABLE 18. NUMBER AND TYPE OF DOG-RELATED INCIDENTS AT UPPER AND LOWER FORT MASON, 2008–2011**

| Incident Type          | Year |      |      |      | Total |
|------------------------|------|------|------|------|-------|

### Crissy Field

On-leash dog walking or dog walking under voice control is allowed throughout Crissy Field except for the fenced areas and the WPA, although dog walking under voice control is permitted in the Crissy Field WPA from May 15 to July 1; for the remainder of the year a seasonal leash restriction is in effect in the WPA to protect the federally threatened western snowy plover. The NPS recently installed new fencing,

gates, and signage at the eastern and western boundary of the WPA to better demarcate where dog walking restrictions start. Gates and signage were also installed at trail entry points to the WPA.

People visit Crissy Field as early as 4:00 a.m. and there is moderate to high visitor use throughout the day. Visitors include individual and commercial dog walkers, cyclists, pedestrians, rollerbladers, runners, wind surfers, kite boarders, and sightseers (table 9). Within the WPA, visitor use is low to moderate for walkers, beachgoers, and visitors who walk dogs. Park staff estimates that throughout Crissy Field, there are generally 5 to 10 commercial dog walkers per day (fewer on weekends than weekdays), and typically 3 present with between 4 and 6 dogs each at any given time of the day. These dogs are often off leash, as are many of the dogs walked by dog owners.

As stated previously, park visitation at Crissy Field was analyzed more fully as a result of surveys conducted in November 2008. During these surveys, activities were only summarized for the subset of visitors who access the site via the trail/promenade entrances (IEC 2011, 23). Observers stationed at the parking lot exit lanes focused only on counting visitors. During this survey, some visitors at Crissy Field may have been counted twice if they parked at the main parking lot, walked or ran to another destination outside the park, and then returned to their vehicle at the parking lot. These visitors would be counted on a path or promenade and in the parking lot. Visitation estimates also did not include visitors who only spent time on the Crissy airfield or who remained along Mason Street Bike Path without accessing the Promenade or waterfront area (IEC 2011, 23).

Results of the 2008 survey at Crissy Field indicate that nearly all visitors observed at the trail/promenade entrances were runners/walkers (72 percent), bikers (21 percent), or dog walkers (6 percent) as shown in table 10. These results exclude visitors leaving Crissy Field via the two main parking lots, visitors on the Mason Street Bike Path, and visitors on the airfield (IEC 2011, 9-10). The proportion of dog walkers was larger on weekdays (31 percent) when compared to the weekend (18 percent) (IEC 2011, 13). Interviews were also conducted at the East Beach parking lot, West Bluff parking lot, and the eastern end of the Promenade to obtain more detailed information. Of the 484 interviews completed, 32 percent of people interviewed had dogs with them. The East Beach lot was the most popular for dog walkers (54 percent of the respondents had dogs), followed by visitors at West Bluff (32 percent had dogs), and the east end of the promenade (21 percent had dogs). Approximately half of the visitors indicated that their dog went into the water at the beach, with the majority of these visitors located at East Beach and the West Bluff. With regard to visitor destinations, 86 percent of respondents visited the Promenade, 48 percent went on the sand, and 20 percent visited Torpedo Wharf (IEC 2011, 11-12).

During the *GGNRA Dog Walking Satisfaction Visitor Study* conducted in 2012, when dog walkers were asked which GGNRA sites they visited most frequently, 21 percent indicated Crissy Field, making it the second most frequently visited site by dog walkers. (NPS 2012a, Appendix A: 6). Crissy Field was also indicated as the most frequently visited site by non dog walkers during that same survey (27 percent) (NPS 2012a, 27).

A visitor survey documenting visitor experience for Crissy Field, Ocean Beach, and the Presidio (including some sites in Area B, which are outside of the analysis of this draft plan/SEIS) was conducted in 2008 in two phases. The first phase of the survey found that at Crissy Field, 13 percent of respondents noted dog walking as their primary reason for their visit, the third most cited reason (Tierney et al. 2009, 52). The second phase of the survey (follow-up telephone survey with the same visitors), found that at Crissy Field, 13 percent of respondents mentioned off-leash dogs as a moderate or serious problem associated with their park experience (Nakagawa, Rogers, and Adcock et al. n.d., 48).

Compliance with the current dog walking regulation is low at Crissy Field. A total of 510 incidents were reported from 2008 through 2011 (table 19). The most common incident at Crissy Field is for having off-leash pets within the WPA (283 reported incidents) during the period (July 1–May 15) when dogs must be leashed. Other common incidents include having a dog within a closed area and for having dogs off leash. Particularly on nice days, the moderate to high visitor use and variety of visitor uses have resulted in visitor incidents related to dogs, including intimidation, dogs knocking over people, dog-on-dog fights, and dogs biting people. A total of 17 hazardous conditions which include dog bites/attacks were reported from 2008 through 2011 (table 19). Park maintenance activities are also demanding at this site, including issues related to vandalism of signs as well as dog-related issues such as removal of dog waste and urination on trash cans.

**TABLE 19. NUMBER AND TYPE OF DOG-RELATED INCIDENTS AT CRISSY FIELD, 2008–2011**

| Incident Type                          | Year       |            |           |           | Total      |
|--|------------|------------|-----------|-----------|------------|
|  | 2008       | 2009       | 2010      | 2011      |            |

| Other                                  | 9          | 25         | 7         | 25        | <b>66</b>  |
| <b>Total</b>                           | <b>191</b> | <b>199</b> | <b>44</b> | <b>76</b> | <b>510</b> |

\* This violation is for disobeying the seasonal leash restriction (July 1 through May 15).

\*\* The closed areas resulting in violations at this site include the lagoon (closed to humans and pets) and the WPA (seasonally closed to off-leash dog walking). U.S. Park Police and NPS rangers appear to cite these regulations interchangeably on incident reports, and therefore, these incidents were kept separate and not compiled in this table.

### Fort Point

Currently, on-leash dog walking is allowed on the Fort Point Promenade, the Battery East Trail, and Andrews Road. The Fort Point area, particularly the promenade, can receive moderate to high visitor use by runners, bikers, and walkers.

From 2008 through 2011, a total of 23 dog-related incidents were reported (table 20). The majority of incidents reported were for having dogs off leash (15 incidents) (table 20). Visitor incidents with dogs occur on the promenade along the entrance road because joggers, cyclists, and walkers share this space with dog walking visitors. Of the hazardous conditions reported in 2010, one incident was for a dog bite and one incident was for a dog water rescue (table 20).

**TABLE 20. NUMBER AND TYPE OF DOG-RELATED INCIDENTS AT FORT POINT, 2008–2011**

| Incident Type                  | Year      |          |          |          | Total     |
|--------------------------------|-----------|----------|----------|----------|-----------|
|                                | 2008      | 2009     | 2010     | 2011     |           |

| Other                          | 0         | 0        | 2        | 1        | 3         |
| <b>Total</b>                   | <b>11</b> | <b>3</b> | <b>7</b> | <b>2</b> | <b>23</b> |

\* The closed area resulting in violations at this site includes the Fort Point Pier, which is closed to pets.

**Baker Beach and Bluffs to Golden Gate Bridge**

On-leash dog walking or dog walking under voice control is allowed on Baker Beach north of Lobos Creek. On-leash dog walking is allowed on all trails except the Batteries to Bluffs Trail.

Baker Beach receives low to moderate visitor use by dog walkers and low to moderate visitor use by beachgoers and picnickers on weekends and holidays (table 9). During the November 2008 visitor surveys at Baker Beach, observers counted departing visitors in two locations: at the Gibson Road entrance to the main parking areas and at the Lincoln Boulevard entrance to the Dune Trail. At the Gibson Road location, observers simply counted visitors and did not classify their activities because visitors were already in their vehicles as they were being counted, making it difficult to determine what activity they had been pursuing during their visit (IEC 2011, 6). The sand ladder entrance is a relatively minor pedestrian entrance to the beach and only accounted for 12 percent of the total visitation during the survey. Visitors were not counted at the 25<sup>th</sup> Avenue entrance; therefore overall visitation at Baker Beach may be underestimated (IEC 2011, 23). Since the sand ladder is a pedestrian entrance, the majority of visitors were classified as runners/walkers (87 percent). Dog walking (7 percent), biking (3 percent), and picnicking (2 percent) were also popular at the site (table 10) (IEC 2011, 9-10). The proportion of dog walkers on weekdays (8 percent) is slightly higher when compared to the weekend (6 percent) (IEC 2011, 13). During the *GGNRA Dog Walking Satisfaction Visitor Study* (NPS 2012a), when dog walkers were asked which GGNRA sites they visited most frequently, 1.9 percent indicated Baker Beach, which tied with two other sites as the eighth most frequently visited site by dog walkers (NPS 2012a, Appendix A: 6). When non dog walkers were asked which GGNRA sites they visited most frequently, 2.5 percent indicated Baker Beach, making it the tenth most popular site with non-dog walkers in the survey (NPS 2012a, 29).

At Baker Beach, a total of 86 dog-related incidents were reported from 2008 through 2011. A total of 48 incidents were for having a dog off leash (table 21). Incidents between visitors and dogs sometimes occur; in 2010 and 2011 a total of 6 hazardous condition incidents were reported which included dog bites/attacks (table 21).

**TABLE 21. NUMBER AND TYPE OF DOG-RELATED INCIDENTS AT BAKER BEACH, 2008–2011**

| Incident Type                  | Year     |           |           |           | Total     |
|--------------------------------|----------|-----------|-----------|-----------|-----------|
|                                | 2008     | 2009      | 2010      | 2011      |           |
| Off-leash Violation            | 5        | 36        | 4         | 3         | <b>48</b> |
| Possessing Pet in Closed Area* | 2        | 12        | 5         | 0         | <b>19</b> |
| Unattended Pet                 | 1        | 0         | 0         | 0         | <b>1</b>  |
| Pet Excrement                  | 0        | 1         | 0         | 0         | <b>1</b>  |
| Hazardous Condition            | 0        | 0         | 3         | 3         | <b>6</b>  |
| Violation of Closed Area*      | 0        | 0         | 0         | 1         | <b>1</b>  |
| Other                          | 0        | 3         | 2         | 5         | <b>10</b> |
| <b>Total</b>                   | <b>8</b> | <b>52</b> | <b>14</b> | <b>12</b> | <b>86</b> |

\* The closed areas resulting in violations at this site include the Batteries to Bluffs Trail and Marshall Beach, which are closed to pets. U.S. Park Police and NPS rangers appear to cite these regulations interchangeably on incident reports, and therefore, these incidents were kept separate and not compiled in this table.

### Fort Miley

On-leash dog walking or dog walking under voice control is permitted at both East and West Fort Miley. This area has low use by dog walkers, but moderate use by picnickers (table 9). This site is mostly used by local residents, and no dog-related incidents were reported from 2008 through 2011.

### Lands End

Currently, both on-leash dog walking and dog walking under voice control are allowed at the Lands End site. Since the recent area restorations and upgrades to the Lands End Coastal Trail, visitor use has increased significantly. This site is considered to have low to moderate visitor use by hikers, pedestrians, bikers, and dog walkers (table 9). Because of safety concerns (steep cliffs, poison-oak, ticks, etc.), dog walkers tend to keep their pets on leash, although off-leash dogs have been observed by park staff as well. During the *GGNRA Dog Walking Satisfaction Visitor Study* (NPS 2012a), when dog walkers were asked which GGNRA sites they

**Lands End**  
Credit: NPS

visited most often, 0.7 percent indicated Lands End, which tied with another site as the 13th most frequently visited site by dog walkers (NPS 2012a, Appendix A: 6). When non dog walkers were asked the same question, 3 percent indicated Lands End, making it the ninth most frequently visited site by non-dog walkers responding to the survey (NPS 2012a, 29).

From 2008 through 2011, a total of 10 dog-related incidents were recorded at Lands End (table 22). Incidents included five hazardous conditions which were dog rescues on the Lands End cliffs (table 22).

**TABLE 22. NUMBER AND TYPE OF DOG-RELATED INCIDENTS AT LANDS END, 2008–2011**

| Incident Type       | Year     |          |          |          | Total     |
|---------------------|----------|----------|----------|----------|-----------|
|                     | 2008     | 2009     | 2010     | 2011     |           |
| Hazardous Condition | 2        | 0        | 3        | 0        | 5         |

| Other               | 3        | 0        | 1        | 0        | 4         |
| <b>Total</b>        | <b>5</b> | <b>0</b> | <b>5</b> | <b>0</b> | <b>10</b> |

**Sutro Heights Park**

On-leash dog walking is required throughout Sutro Heights Park. Sutro Heights Park has moderate visitor use, mainly by visitors walking through the garden and attending special events such as weddings.

From 2008 through 2011, a total of 71 dog-related incidents were recorded. The majority of incidents were for having dogs off leash, which suggests that compliance with the current dog walking regulations is low (table 23).

**TABLE 23. NUMBER AND TYPE OF DOG-RELATED INCIDENTS AT SUTRO HEIGHTS PARK, 2008–2011**

| Incident Type                  | Year      |           |          |           | Total     |
|--------------------------------|-----------|-----------|----------|-----------|-----------|
|                                | 2008      | 2009      | 2010     | 2011      |           |
| Off-leash Violation            | 10        | 11        | 3        | 22        | 46        |

| <b>Total</b>                   | <b>17</b> | <b>16</b> | <b>7</b> | <b>31</b> | <b>71</b> |

\* The closed area resulting in violations at this site includes Sutro Park, where pets must be leashed.

**Ocean Beach**

Currently, on-leash dog walking is allowed year-round between Stairwell 21 and Sloat Boulevard; dog walking under voice control is permitted year-round north of Stairwell 21 and south of Sloat Boulevard. In the Ocean Beach SPPA, from Stairwell 21 south to Sloat Boulevard, dog walking under voice control is allowed from May 15 to July 1; the rest of the year, on-leash dog walking is required for the seasonal protection of western snowy plovers.

Ocean Beach is a moderate to high use area for beachgoers, walkers, runners, birdwatchers, picnickers, equestrians, and surfers. Ocean Beach is a low to moderate use area for dog walking (table 9). For birdwatchers, Ocean Beach also offers areas for recreational birdwatching, particularly the Ocean Beach Trail at the seawall that follows the Great Highway along the ocean (Murphy 1996, 4). The SPPA is a moderately used area for dog walkers, beachgoers, and runners.

A visitor survey documenting visitor experience for Crissy Field, Ocean Beach, and the Presidio (including some sites in Area B, which are outside of the analysis of this draft plan/SEIS) was conducted in 2008 in two phases. The first phase of the survey found that at Ocean Beach, 6.7 percent of respondents noted dog walking as their primary reason for their visit (Tierney et al. 2009, 52). The second phase of the survey (follow-up telephone survey with the same visitors), found that at Ocean Beach, 22 percent of respondents mentioned off-leash dogs as a moderate or serious problem associated with their park experience (Nakagawa, Rogers, and Adcock et al. n.d., 48).

During the November 2008 visitor surveys, 46 percent of visitors were placed in the catch-all “Other” category, representing general beach recreation. Additional activities observed at Ocean Beach included running/walking (25 percent), surfing (11 percent), dog walking (9 percent), picnicking (6 percent), and biking (3 percent) (table 10) (IEC 2011, 11). The proportion of dog walkers at Ocean Beach on the weekend (11 percent) is slightly higher than the weekdays (9 percent) (IEC 2011, 13). The Ocean Beach visitation estimates only include visitors who spent time on the beach. They do not include visitors who remained on the boardwalk/promenade, visitors who remained in the parking lot, or visitors who remained on the bluff at Sloat Boulevard and Second Overlook (IEC 2011, 23). During the *GGNRA Dog Walking Satisfaction Visitor Study* (NPS 2012a), when dog walkers were asked which site at GGNRA they visit most, 5.7 percent indicated Ocean Beach, making it the fourth most frequently visited GGNRA site by dog walkers (NPS 2012a, Appendix A: 6). Ocean Beach was also indicated as the second most frequently visited GGNRA site by non dog walkers during the survey (18 percent) (NPS 2012a, Appendix A: 69).

Compliance with the current dog walking regulation at Ocean Beach is low. From 2008 through 2011, a total of 969 dog-related incidents were reported. The majority of the incidents reported were for having an off-leash dog within the SPPA (729 incidents) during the period (July 1 through May 15) when dogs must be leashed (table 24). Other common incidents were for having a dog in a closed area (as described in table 24) and for walking dogs off leash. A total of 22 incidents were for hazardous conditions, which included 21 dog bites/attacks and 1 animal cruelty (table 24). Incidents at Ocean Beach also included dogs disturbing wildlife, including special-status species.

**TABLE 24. NUMBER AND TYPE OF DOG-RELATED INCIDENTS AT OCEAN BEACH, 2008–2011**

| Incident Type                                    | Year       |            |            |            | Total      |

| <b>Total</b>                                     | <b>294</b> | <b>377</b> | <b>143</b> | <b>155</b> | <b>969</b> |

\* This violation is for disobeying the seasonal leash restriction (July 1 through May 15).

\*\* The closed areas resulting in violations at this site include Ocean Beach dunes (closed to humans and pets) and the Ocean Beach SPPA (seasonally closed to off-leash dog walking). U.S. Park Police and NPS rangers appear to cite these regulations interchangeably on incident reports, and therefore, these incidents were kept separate and not compiled in this table.

**Fort Funston**

On-leash dog walking or dog walking under voice control is allowed throughout Fort Funston and on the Fort Funston beach, except for three areas: the 12-acre habitat protection area to protect native plant communities, a voluntary seasonal closure to protect bank swallow habitat, and the north end of the Sunset Trail due to erosion.

Fort Funston is heavily used by multiple user groups including walkers, hang gliders, fishermen, equestrians, birdwatchers, environmental center participants, as well as dog walkers, including commercial dog walkers (table 9). For birdwatchers, Fort Funston offers recreation in the form of birdwatching at both the beach areas along the ocean as well as the dune areas (Murphy 1996, 1). The hang glider platform at Fort Funston provides an excellent view of the ocean, where flocks of feeding birds may be viewed from above (Murphy 1996, 1). Viewing the bank swallows along the cliffs and birdwatching along the Sunset Trail are also favorite areas for bird enthusiasts, including views at both Battery Davis and Skyline Grove (Murphy 1996, 3-4). During the August 2011 visitor surveys, the majority (62 percent) of visitors were dog walkers. Other popular activities included running/walking (25 percent), and hang gliding (1 percent) (table 10) (IEC 2011, 10). The 11 percent of visitors classified as “Other” at Fort Funston were primarily sight-seers who visited the overlook area. Dog walking at Fort Funston was more popular on weekdays (66 percent of visitors) than on weekends (57 percent of visitors) (IEC 2011, 13). During the visitor survey, hanggliders may have been undercounted because many hang gliders gathered at the site past dark to socialize, and therefore were not accounted for because the survey ended prior to these visitors leaving the site. Visitation estimates also excluded visitors entering the site at the John Muir Drive entrance, since this park entrance was not surveyed, except when visitors and dogs were counted at this entrance for 2 hours on Sunday, August 21, 2011 (IEC 2011, 23).

During the *GGNRA Dog Walking Satisfaction Visitor Study* (NPS 2012a), when dog walkers were asked which site at GGNRA they visit the most, 40 percent indicated Fort Funston, making it the most frequently visited GGNRA site at the park by dog walkers (NPS 2012a, Appendix A: 6). Fort Funston was also indicated as the fourth most frequently visited GGNRA site by non-dog walkers during the survey (6 percent) (NPS 2012a, Appendix A: 69).

Park staff has observed commercial dog walkers regularly walking 10 to 12 dogs per visit and generally allowing them to be off leash; park staff has also observed private dog walkers allowing their dogs off leash. During the August 2011 visitor survey, many visitors were observed with large groups of dogs. While some of the visitors may be individuals who own multiple dogs, most were likely professional dog walkers. On weekdays, 50 percent of the dogs observed at Fort Funston were in groups of five or more dogs, with approximately 15 percent in groups of ten or more dogs. In contrast, on the weekends, only 7 percent of the dogs observed were in groups of five or more dogs, and fewer than 2 percent were in groups of ten or more dogs (IEC 2011, 14). These results suggest that many dog owners hire professional dog walkers during the work week when there is a high presence of professional dog walkers at Fort Funston. The high concentration of dog walkers may discourage other users, although some users state that they come to Fort Funston to interact with dogs. Due to the high volume of dogs that visit this site, urination and the associated smell is obvious in areas adjacent to the parking lots.

A total of 172 dog-related incidents were recorded from 2008 through 2011. The majority of incidents recorded were for having a dog off leash and for hazardous conditions. Of the 72 hazardous conditions reported, 41 were for dog bites/attacks, 2 were for verbal assaults, and 29 were for pet rescues at the cliffs of Fort Funston (table 25).

**TABLE 25. NUMBER AND TYPE OF DOG-RELATED INCIDENTS AT FORT FUNSTON, 2008–2011**

| Incident Type                  | Year      |           |           |           | Total      |
|--------------------------------|-----------|-----------|-----------|-----------|------------|
|                                | 2008      | 2009      | 2010      | 2011      |            |
| Hazardous Condition            | 18        | 20        | 16        | 18        | 72         |
| Off-leash Violation            | 6         | 4         | 54        | 5         | 69         |
| General Pet Violations         | 1         | 0         | 1         | 0         | 2          |
| Vegetation Damage              | 1         | 0         | 0         | 0         | 1          |
| Possessing Pet in Closed Area* | 0         | 1         | 0         | 0         | 1          |
| Other                          | 2         | 12        | 2         | 11        | 27         |
| <b>Total</b>                   | <b>28</b> | <b>37</b> | <b>73</b> | <b>34</b> | <b>172</b> |

\* The closed area includes Fort Funston cliffs, which has a voluntary seasonal closure between April 1 and August 15.

### Mori Point

On-leash dog walking is permitted in designated areas as indicated by signage. The site has moderate to high use by visitors and is used primarily by locals for walking, running, and biking. It is also a moderate use area for dog walking (table 9). During the *GGNRA Dog Walking Satisfaction Visitor Study* (NPS 2012a), when dog walkers were asked which site at GGNRA they visit the most, 4.2 percent indicated Mori Point, making it the fifth most frequently visited GGNRA site by dog walkers at the park (NPS 2012a, Appendix A: 6). GGNRA has conducted or sponsored several visitor surveys to determine what activities people participate in on park lands and how satisfied they are with their experience. A small survey (31 respondents) was conducted in 1980 at Mori Point and Sweeney Ridge, which determined that

dog walking was the second most popular reason for visiting the area; 21 percent of respondents walk their dogs in the area. Additionally, 35 percent of respondents ranked dog walking as a “very important” or “extremely important” activity at the site (NPS 1980).

Compliance with the current dog walking regulation at Mori Point is low. From 2008 through 2011, a total of 153 dog-related incidents were reported. Of these incidents, 146 were for having a dog off leash (table 26).

**TABLE 26. NUMBER AND TYPE OF DOG-RELATED INCIDENTS AT MORI POINT, 2008–2011**

| Incident Type             | Year      |           |           |           | Total      |
|---------------------------|-----------|-----------|-----------|-----------|------------|
|                           | 2008      | 2009      | 2010      | 2011      |            |
| Off-leash Violation       | 23        | 52        | 41        | 30        | 146        |
| Hazardous Condition       | 0         | 1         | 1         | 1         | 3          |
| Pet Excrement             | 0         | 1         | 0         | 0         | 1          |
| Violation of Closed Area* | 1         | 0         | 0         | 0         | 1          |
| Other                     | 0         | 0         | 0         | 2         | 2          |
| <b>Total</b>              | <b>24</b> | <b>54</b> | <b>42</b> | <b>33</b> | <b>153</b> |

\* The closed area resulting in violations at this site includes Mori Point Road, which requires dogs to be leashed.

### Milagra Ridge

On-leash dog walking is currently allowed along the trails at Milagra Ridge. The site has moderate visitor use, with mostly local visitation by walkers and hikers and low to moderate use by dog walkers (table 9).

From 2008 through 2011, 39 dog-related incidents were reported. A total of 35 incidents were for having a dog off leash (table 27).

**TABLE 27. NUMBER AND TYPE OF DOG-RELATED INCIDENTS AT MILAGRA RIDGE, 2008–2011**

| Incident Type       | Year     |           |          |           | Total     |
|---------------------|----------|-----------|----------|-----------|-----------|
|                     | 2008     | 2009      | 2010     | 2011      |           |

| Other               | 1        | 0         | 0        | 2         | 3         |
| <b>Total</b>        | <b>6</b> | <b>14</b> | <b>9</b> | <b>10</b> | <b>39</b> |

### Sweeney Ridge/Cattle Hill

On-leash dog walking is allowed on all trails at Sweeney Ridge except the Notch Trail, which is closed to dog walking to protect mission blue butterfly habitat. Sweeney Ridge has low visitor use, consisting mostly of bikers and hikers, and low to moderate use by dog walkers (table 9). Cattle Hill is not currently part of GGNRA. However, Cattle Hill is within the boundary and it is anticipated that the land will transfer to NPS management in the near future. Unrestricted dog walking currently occurs at Cattle Hill, although GGNRA does not have numerical information for this site. GGNRA has conducted or sponsored

several visitor surveys to determine what activities people participate in on park lands and how satisfied they are with their experience. A small survey (31 respondents) was conducted in 1980 at Mori Point and Sweeney Ridge, which determined that dog walking was the second most popular reason for visiting the area; 21 percent of respondents walk their dogs in the area. Additionally, 35 percent of respondents ranked dog walking as a “very important” or “extremely important” activity at the site (NPS 1980).

Currently, compliance with the dog regulations at Sweeney Ridge is low. From 2008 through 2011, a total of 115 dog-related incidents were reported, with 113 of the incidents for having an off-leash dog (table 28).

**TABLE 28. NUMBER AND TYPE OF DOG-RELATED INCIDENTS AT SWEENEY RIDGE/CATTLE HILL, 2008–2011**

| Incident Type                 | Year |      |      |      | Total |
|-------------------------------|------|------|------|------|-------|
|                               | 2008 | 2009 | 2010 | 2011 |       |

| Hazardous Condition           | 0    | 0    | 0    | 1    | 1     |
| Possessing Pet in Closed Area | 0    | 0    | 0    | 1    | 1     |
| Total                         | 18   | 27   | 32   | 38   | 115   |

### **Pedro Point Headlands**

This area is not currently part of GGNRA. However, this land is within the boundary and it is anticipated that the land will pass to NPS management in the near future. Currently, dog walking both on and off leash occurs at this site in low to moderate numbers (table 9). Hiking and horseback riding is also considered a low to moderate use at this site.

### **Rancho Corral de Tierra**

Land within Rancho Corral de Tierra was transferred to the NPS in December of 2011, and has been under the NPS servicewide regulation for dog walking (36 CFR 2.15) since that time. Prior to the transfer, the site was owned by the Peninsula Open Space Trust, and was not formally open to the public. However, to the degree public use occurred under Peninsula Open Space Trust ownership, the San Mateo County general leash requirement applied to the site (see <http://www.animalaw.info/local/louscanmateo.htm#s6.04.070>).

An informal trail use study was conducted in 2010 at Rancho Corral de Tierra in the Montara area, an approximately 127 acre area that is a primary area for visitors (particularly off-leash dog walkers according to information from the Montara Dog Group), to identify current trail users and determine activity on specific trail segments (Bennett 2011). This survey was not peer reviewed, and is not relied upon by NPS for impacts analysis or decision-making, however, this survey is the best available information NPS has showing conditions at Rancho Corral de Tierra before NPS acquired the site. The survey monitored multiple trails from one vantage point over the course of 10 visits during four months. A total of 418 park visitors were observed, 250 of which were characterized as dog walkers (331 dogs were observed), which accounts for 58 percent of total visitor use at that portion of the Rancho site. This is not an unexpected percentage given this area’s identification by the Montara Dog Group as one of two primary areas at Rancho Corral de Tierra used for off-leash dog walking. During this survey, visitors that were observed walking dogs as well as performing other activities were recorded only as walking dogs; all individuals within a group where a dog was present were recorded only as dog walkers. In the overall user categories, dog walking accounted for 58 percent of the total visitor use at the site, with 86 percent of

dog walkers observed walking their dog(s) off leash (Bennett 2011). Casual use of the site accounted for 26 percent. Exercising and biking accounted for 6 and 7 percent of the observed uses of the site, respectively. The 86 percent off-leash dog walking figure is consistent with information shown on maps provided to GGNRA by the Montara Dog Group, which identified the area in which the study took place as one of two primary areas for off-leash dog walking at Rancho Corral de Tierra, as noted above.

No official data have been gathered on visitor use or law enforcement statistics for Rancho Corral de Tierra since NPS acquired the land, although NPS rangers are contacting visitors at the site regarding dog-walking regulations. The information described in this section is based upon observations from staff in the field and anecdotal information provided by adjacent neighbors of the lands and park visitors. The number of visitors to Rancho Corral de Tierra has not increased substantially since the property transferred to the NPS; however, some residents and park staff have noticed that commercial dog walkers have begun to use the site. Visitor use is considered low to moderate with use primarily by local residents. Moderate use is more likely in the Montara and El Granada sections, which are in lower elevations closer to neighborhoods, with lower use in the higher elevations. Dog walking is considered a primary use at this site based on staff experience and public comment. Ranger-led hikes have been low on attendance but increase visibility of the property and have generated some additional visitor use. Compliance with the NPS on-leash dog walking regulation (36 CFR 2.15) is low, with park staff reporting that some visitors refuse to leash their dogs when informed of the leash requirement by non-law enforcement staff.

During the *GGNRA Dog Walking Satisfaction Visitor Study* (NPS 2012a), when dog walkers were asked which site at GGNRA they visit the most, 7 percent indicated Rancho Corral de Tierra, making it the third most visited park site by dog walkers responding to the survey (NPS 2012a, Appendix A: 6). Rancho Corral de Tierra was also indicated as the fifth most frequently visited GGNRA site by non dog walkers during the survey (5 percent) (NPS 2012a, Appendix A: 69). Note, however, that the response rate to this study was extremely low, approximately 13%, despite being sent to every person and organization on the dog management plan/EIS mailing list (approximately 7,000), although the highest percentage of respondents from one zip code (6.25%) were from San Mateo County, specifically Pacifica, the city just north of Rancho Corral de Tierra.

Currently, dog walking on leash is allowed at the site; voice control dog walking is not currently allowed. According to information from the Montara Dog Group and subsequent staff observations, dog walkers, particularly off leash dog walkers, primarily use the lower elevations of the site at both the Montara and El Granada areas. The terrain at El Granada is particularly steep and challenging, thus dog walking use in that area appears to be concentrated mostly in the lower elevations. Although the Montara area is less steep, visitor use there is similarly concentrated in the lower elevations, but some dog walkers in the Montara area do use trails that connect to the top of the Rancho site. Commercial dog walkers have also recently started to use the El Granada area off Coral Reef Avenue; however, commercial dog walking is considered a low use at the site overall.

## **AESTHETICS**

Dogs can also indirectly affect visitors because of dog waste, plastic bags containing waste, or large amounts of dog hair from grooming left on beaches, on trails, or near the park's aquatic resources. Although posted signs indicate that owners are responsible for removing pet waste, this rule is not always followed. Two percent of the ANPR comments noted that off-leash dogs spoil park sites by defecating and urinating and that dog owners sometimes fail to clean up after their dogs (NAU 2002a, 12). Park sites, such as the head of the Alta Trail, Fort Funston, and the areas around the trash receptacles at Crissy Field, that have a high concentration of dog use are prone to a distinct smell of dog urine and solid waste.

## **SOUNDSCAPES**

The natural sounds heard in GGNRA are a positive and valued park resource, as well as an important component of the visitor experience, which dog presence or barking may interrupt. Natural soundscapes are protected under Director's Order #47 (NPS 2000a) because they are vital to the natural function of ecosystems, cultural/historic values, and visitor experience. Soundscapes in the park provide a variety of seasonally changing visitor experiences that are important to some park users as a refuge from the noise of the urban environment. An example is the spring birdsong, which is most prevalent in more remote areas and along riparian and forested habitats. Subtler experiences—lapping waves and frog choruses—may also enrich the visitor experience. Potential disturbances from barking dogs may change the natural character of the area and the overall visitor experience. The raucous sounds of a disturbed wildlife community—birds and small mammals giving alarm calls—also add to the disruption of the visitor's experience of the soundscape. The natural soundscape is also important aside from visitor experience, as wildlife may depend on it for successful communication with others of its species, escape from predators or other dangers, protection of young, or other functions.

## **ENVIRONMENTAL JUSTICE**

Some ethnic or low-income populations may be more negatively affected by off-leash dog walking. The phone survey conducted in 2002 by Northern Arizona University (NAU 2002b, 26) separated data by race and income, as well as other variables, and found slightly lower support from low-income families for allowing off-leash dog walking in GGNRA. The survey indicated that 13.3 percent of respondents with annual incomes lower than \$50,000 strongly supported off-leash dog walking, whereas 21.7 percent of those with incomes from \$50,000 to \$100,000 and 20.4 percent of those with incomes over \$100,000 strongly supported it. Regarding park use by minorities, the elderly, children, and people with special needs, 11 percent of ANPR respondents noted that off-leash dogs discourage park use by these groups. As one respondent said, "They [off-leash dogs] take over the beach from people by intimidating small children" (NAU 2002b, 11). In contrast, 3 percent believed that the presence of off-leash dogs enhanced the experience of these populations. For example, one respondent said, "I have seen many people in wheelchairs walking their dogs. All kinds of people have dogs—with this common bond—we all come together" (NAU 2002a, 20). During the public comment period for the draft plan/EIS, some commenters noted the importance of off-leash dog walking by minority populations at the park. One commenter stated, "It is important to weigh the opinions of the ethnic "minorities" who actually go to the park to enjoy off-leash. The National Parks have a reputation of being unwelcoming to non-white ethnic groups. It would be a challenge to find a recreation that is more diverse than off-leash dog walking. Fort Funston has a better mix of Asians, Black Americans, Pacific Islanders, East Indian, etc. than you are likely to find elsewhere in the parks. Off-leash recreation is a success story in term of the National Parks being welcoming to ethnic minorities." (NPS 2011a, Correspondence 4592).

San Francisco County is a racially diverse area, with minority populations accounting for approximately 51 percent of the population. The largest minority group in the San Francisco area is people of Asian descent (33.3 percent), followed by Hispanic/Latino people (15 percent) (U.S. Census Bureau 2012, 1). San Francisco State University conducted a study of ethnic minority groups (Hispanic/Latino, African American/Black, and Asian/Pacific Islander), using focus group interviews to determine ways to better connect these groups to the park (Roberts 2007, i). While not all participants were familiar with GGNRA, a common theme was identified, as related to dog management in the park: dogs were a problem mentioned by Hispanic/Latino and Asian/Pacific Islander groups (Roberts 2007, iii). Hispanic/Latino people expressed the most concern with dog owners' lack of concern or control over their dogs. For example, participants in the survey noted that dog owners assume that other people will like the owners' dogs as much as they do; dog owners let their dogs approach other people without first asking their permission; and owners do not react to their dogs begging for other people's food. One participant stated,

“Every time we go to picnic the dogs come and eat our food, they wander around, and the owners don’t do anything. The same with their bowel movements! The owners don’t clean after them” (Roberts 2007, 34). Research found that Hispanic/Latino people and Asian/Pacific Islanders mentioned dogs, especially dog waste, as a barrier to park visitation and a constraint to enjoyment of the park (Roberts 2007, 28).

A visitor survey documenting visitor experience for Crissy Field, Ocean Beach, and the Presidio (including some sites in Area B, which are outside of the analysis of this draft plan/SEIS) was conducted in two phases in the summer and fall of 2008. The first phase of the survey involved an intercept survey (personal contact with visitor) to provide a visitor population profile, including a more thorough understanding of who visits the parks, use patterns, their likes and dislikes, and also a preliminary understanding of their visitor experience (Tierney et al. 2009, 1). The second phase of the survey included a follow-up telephone survey with the same visitors interviewed in the first phase to gather more detailed information on visitor experiences, satisfaction, and opinions about park management (Nakagawa, Rodgers, and Adock et al. n.d., 8). In the first phase, questions directed to respondents regarded their background (ethnicity, language spoken at home, state of residence, income), as well as questions on their ease of access to the sites, quality rating of the sites, reasons for visiting the park, what they liked or disliked about the sites, and their suggestions for improving the visitor experience. Both phases of the 2008 study found that frequency of suggestions about keeping dogs on leash and citing off-leash dogs was fairly consistent among Asian and White respondents. Visitors were asked during the survey if they had any suggestions on how their experience at the park site could be improved, allowing for open-ended answers. Of the respondents, 3.3 percent noted that dogs should be kept on leash, visitors should be cited for off-leash dogs, or that there should be no dogs (Tierney et al. 2009, 69). White respondents suggested that dogs be kept on leash 3.4 percent of the time, and Asian respondents suggested this 3.2 percent of the time (Tierney et al. 2009, 75). This concern was not cited by Black/African American, Native Hawaiian, or American Indian respondents who were asked for suggestions on how to improve the park experience (Tierney et al. 2009, 75). In the second phase of the survey (telephone survey), 16 percent of all respondents noted dogs off leash as a “moderate” or “serious” problem associated with the park experience. It was found that 20 percent of Hispanic respondents and 19 percent of Asian respondents cited dogs off leash as a moderate or serious problem at these sites (Crissy Field, Ocean Beach, and the Presidio Area B), while 14 percent of White respondents noted off-leash dog walking as a serious issue (Nakagawa, Rodgers, and Adock et al. n.d., 51). The percentage of respondents who cited dogs as a reason for returning to the park sites (Crissy Field, Ocean Beach, and the Presidio Areas A and B) were similar among different racial and ethnic groups, with White respondents citing dogs 11 percent of the time, and Asian and Hispanic respondents 9 percent of the time (Nakagawa, Rodgers, Adock et al. n.d., 62). Similarly, 7 percent of all respondents mentioned dogs when they were asked to describe special park qualities. The percentage of respondents who mentioned dogs in response to this prompt varied slightly across racial and ethnic groups, with 8 percent of Whites, 9 percent of Hispanics, and 11 percent of Asians noting dogs (Nakagawa, Rodgers, Adock et al. n.d., 67).

In addition to the responses discussed above, household income levels were also included in results of the survey described above. Dog walking at the park sites discussed in the Tierney et al. study does not appear to be a primary activity for those making less than \$25,000 in household income, with only 2.2 percent of these respondents citing dog walking as the primary reason for visiting the sites (Crissy Field, Ocean Beach, and the Presidio Areas A and B). This contrasts with those who had a household income greater than \$150,000, 16.9 percent of whom cited dog walking as their primary reason to visit the park sites (Tierney et al. 2009, 54).

## **PARK OPERATIONS**

Park operations include the time and money resources that the GGNRA staff uses in managing dog walking activities in the park. It includes law enforcement, administration and planning, natural resource management, and maintenance. In addition, community relations and public education are integral components of dog management at GGNRA.

---

*Park operations include the time and money resources that the GGNRA staff uses in managing dog walking activities in the park.*

---

## **BUDGET AND EMPLOYEES**

In fiscal year 2012, the park had an operating budget of approximately \$26.4 million in base operation of national park system funding. In that same year, the park also received approximately \$28 million in operational funding from a variety of sources, including concession fees, recreational fees, leasing income, permit fees, and NPS servicewide special project funding from sources including line item construction, cyclic maintenance, equipment replacement, and repair/rehabilitation. Most of this funding must be used for specific purposes, such as fund-source-specific projects or cost recovery. In fiscal year 2012, GGNRA staffing consisted of 311 employees (198 permanent, 43 term, and 70 temporary employees).

## **COMMUNITY RELATIONS AND PUBLIC EDUCATION**

GGNRA is an acknowledged leader in enlisting organizations for partnerships that leverage the park's ability to preserve resources, educate the public, and provide recreational opportunities for visitors. Many of these partners occupy and maintain park buildings through leases, cooperative agreements, and other legal authorities. Over recent years, the park has worked to improve community relations with regard to dog walking through response to public calls and inquiries, updates of dog walking information on the park web site and information line, outreach efforts by volunteer groups and park stewardship programs, and meetings with dog walking and other user groups. Representatives of dog walking groups were also members of the Negotiated Rulemaking Advisory Committee. The majority of funding for visitor education about dog regulations in recent years has come from the Management Assistant's budget (which had a total budget of \$89,606 in fiscal year 2012), with assistance from the Public Affairs budget (which had a total budget of \$429,700 in fiscal year 2012).

## **LAW ENFORCEMENT**

The mission of GGNRA law enforcement personnel is to protect people, property, and park resources and to ensure that park visitors can enjoy the park without unlawful interference. This mission is achieved through interpretative and educational efforts, community outreach, and enforcement actions appropriate to establishing an effective level of compliance with applicable laws and regulations.

Law enforcement and search and rescue requirements are extensive due to the park's proximity to a large urban area, high visitation, essentially open access, wide range of resources, and wide variety of recreational opportunities. Law enforcement programs at GGNRA operate from three primary locations: Ranger Stations at Building 223 in the Presidio and Building 507 at Fort Baker, and U.S. Park Police San Francisco Field Office Headquarters at Building 1217 at the Presidio. Patrol operations cover all GGNRA lands, with U.S. Park Police operations including San Francisco, southern Marin, and San Mateo counties.

Law enforcement activities pertaining to dog management include resolving conflicts between dog walkers and other user groups, giving written or verbal warnings or issuing citations to dog walkers not

complying with the current regulations, educating the public on dog management regulations, preparing and filing reports related to dog and visitor incidents, performing supervisory review of reports, and appearing in court on dog management–related cases. During the start of seasonal leash regulations in Ocean Beach SPPA and Crissy Field WPA, park law enforcement is present at these sites to educate dog walkers on current leash policies.

Violations are handled using a reasonable enforcement response. Responses can range from a verbal or written warning, relying on education and deterrence to gain compliance, to written citations, up to custodial arrests, as appropriate. Visitor incidents involving dogs and dog walkers are handled by park law enforcement in the same manner as all other violation contacts. Due to the extensive history and changing pet enforcement strategies at GGNRA, law enforcement officers are sensitive to the potential for confusion on the part of the general public and therefore make an effort to achieve compliance through educational contacts. Where conflicts are more pronounced, officers have the discretion to use the range of enforcement actions necessary to achieve visitor safety and compliance.

Rangers and U.S. Park Police will contact dog walkers for the following violations: violations of pet regulations, including the NPS leash law where currently applicable; habitat protection closure violations; harassment of wildlife; and incidents involving visitors and dogs or dog owners. Leash violation citations are assigned a collateral fine of \$50 plus a \$25 processing fee in accordance with the U.S. Magistrate’s uniform bail schedule. Other violations range up to \$500 or mandatory court appearances. Search and rescue teams also perform technical cliff rescues for visitors and dogs when needed; almost all these rescues have been conducted at Fort Funston. Park staff members routinely observe dog owners leashing their pets when law enforcement personnel are noticed in areas of the park where the NPS leash regulation is applicable, which could imply the public has been educated regarding the regulations, but some choose to disregard it unless law enforcement is present.

During the public comment period for the draft plan/EIS, commenters expressed a lack of enforcement under current conditions, and noted unsuccessful attempts to contact park enforcement personnel, resulting in hostility for visitors who tried to address non-compliance on their own. These visitors expressed that presence of rangers in the park was sparse and ticketing and education was uncommon, resulting in more non-compliance. One commenter stated, “I visit the GGNRA parks nearly 3-4 times a week and never see rangers providing education to the public about current park rules and ... enforcing dangerous dog laws, voice control or poop pickup” (NPS 2011a, Correspondence 4181). Law enforcement is responsible for covering approximately 80 miles of separate, non-contiguous park sites. There are approximately nine law enforcement staff members and U.S. Park Police patrolling park sites per shift; therefore, law enforcement must strategize which sites to assign staff to each shift. In addition many law enforcement staff patrol in pairs when monitoring for pet related compliance. Low use sites and small sites are not as regularly patrolled due to staffing limitations. Approximately 1 percent of law enforcement time is devoted to dog management–related issues. Crissy Field and Ocean Beach have historically required the most attention from law enforcement staff. Dog management activities for law enforcement staff include court time for the approximately 10 percent of violators who challenge their tickets. Law enforcement staff spend approximately 5 minutes for each verbal warning and 10 minutes for each written warning given to visitors. Table 5 displays the type of incident and number of incidents documented from 2001 through 2011. As previously noted, a total of 4,932 dog-related incidents were recorded at the park from 2001 through 2011, which represents 11 percent of all violations at GGNRA. The types of dog-related incidents (leash law violations, dog bites, etc.) are further broken down by site from 2008 through 2011 in tables 11 through 28. Although the incident reports include detailed information regarding dogs, they do not include visitor complaints or visitor contacts with dogs that did not result in a written incident report. Pet citations related to wildlife disturbance and citations given in WPAs have also been presented in table 11 through 28. As previously described, a total of 1,537 dog-related incident associated with natural resources occurred at GGNRA from 2008 through 2011.

## **ADMINISTRATION AND PLANNING**

The administrative staff is responsible for management activities that educate visitors on the current dog walking policies. The park posts or updates signs and maps with current dog walking regulations and maintains a list of all restricted areas (NPS 2008b, 19–20), as well as a complete list of areas available for dog walking both on and off leash and those closed to dogs, on its web site. The park also maintains a Dog Management Information Line with the current status of the dog management process, where the public can leave messages for park staff. The line is monitored and calls are responded to daily. The park produced business-style information cards to educate the public on the ANPR and the negotiated rulemaking processes. These cards are available at park visitor centers and are handed out by park staff; NPS rangers and U.S. Park Police hand them out with each pet violation contact and citation issued.

In the wake of the 2005 court decision that again altered dog management policies at certain park sites, law enforcement staff members are educating and warning dog walkers who are in violation of regulations, rather than ticketing them, if they believe the violation is a result of confusion over current policies. The park has encouraged dog walking groups that participated in the Negotiated Rulemaking Advisory Committee to distribute the most current GGNRA dog walking information and regulations through their web sites and information outlets and reminded them that this would be their responsibility once a new regulation was in place. Also, the Snowy Plover Docent Program was established in 2007/2008 to help educate the public about the western snowy plover and the protection areas for the plover established by the park at Ocean Beach and Crissy Field.

## **NATURAL RESOURCE MANAGEMENT**

GGNRA supports numerous programs that enhance and/or restore natural resources in different areas of the park and under different contexts. These park stewardship programs encompass such park-sponsored and volunteer programs as the Site Stewardship Program, the Presidio Park Stewards, the Habitat Restoration Team, the Invasive Plant Patrol, the Trails Forever Program, Golden Gate National Parks Conservancy, the Headlands Institute, and the Presidio Trust.

Natural resource specialists manage and monitor ecosystems and the physical environment in order to preserve and restore healthy systems and populations. Management includes invasive species control, habitat restoration, and threatened, endangered, and candidate species protection. Planning efforts by natural resource staff related to dog management include protecting habitat from dogs, handling complaints concerning dogs, and assisting in preparation of signage and outreach material related to dog use impacts and restrictions. Hydrologists are involved with review of erosion issues associated with dogs. Ecologists at the park, specifically the Crissy Field ecologists, are responsible for restoration areas and fencing in high dog use areas, water quality monitoring, and tracking complaints about dogs. GIS specialists fulfill mapping needs associated with dog management planning for brochures, the park web site, etc. In fiscal year 2012, the natural resources budget was \$1,193,000 and total natural resources volunteer time was 181,349 hours. Approximately 1.5 percent of the natural resources budget was spent on dog management–related activities in 2012.

## **CULTURAL RESOURCE MANAGEMENT**

Cultural resource specialists monitor projects and perform research to ensure the stabilization, preservation, and restoration of historic structures and landscapes and archeological resources.

## MAINTENANCE

Maintenance of the extensive park lands and widespread facilities in Marin, San Francisco, and San Mateo counties is a major, ongoing task and cost for park operations, and is one of the largest budgets in the park. Structures, historic and non-historic, need basic maintenance and repair or rehabilitation; utilities and infrastructure must be maintained; and trails, roadways, and parking lots need rehabilitation and repair. Landscaping and irrigating, pruning trees, repairing and installing fences and gates, cleaning restrooms, and collecting trash are some of the basic activities in the scope of work needed to maintain park facilities and resources at an acceptable level. Maintenance Division facilities are located at Stinson Beach, Fort Cronkhite, and Fort Baker in Marin County, and at Crissy Field, Fort Mason, and Fort Miley in San Francisco County.

Maintenance operations related to dog management include garbage collection, repair of vandalized signs and property, and replacement of garbage receptacles that have been damaged by dog urine. Signs that list dog-related regulations and educational information are frequently vandalized and must be replaced by the maintenance staff. Cleanup of dog waste not properly disposed of is not a regularly scheduled GGNRA maintenance task. Dog walking associations at Fort Funston and Crissy Field hold cleanup days on a regular basis to assist in park cleanup. Maintenance staff is responsible for emptying trash cans throughout the park, which often are filled with dog waste. In areas of heavy dog walking use, trash receptacles are emptied twice as often due to weight of the dog feces, not the volume of the trash cans. Three areas with high maintenance costs due to trash removal include Ocean Beach, Fort Funston, and Lands End/Fort Miley. Maintenance staff is on duty in these areas 7 days per week. Table 29 shows the total number of maintenance hours and labor and costs associated with trash removal in these areas. Total hours for Crissy Field were added for comparison purposes.

**TABLE 29. TOTAL MAINTENANCE AND LABOR HOURS AND COSTS ASSOCIATED WITH TRASH REMOVAL FROM OCTOBER 2006 TO APRIL 2008**

| Site                 | Maintenance Labor Hours | Total Labor and Materials Cost |
|----------------------|-------------------------|--------------------------------|
| Ocean Beach          | 814                     | \$26,102                       |
| Fort Funston         | 1,665                   | \$44,510                       |
| Lands End/Fort Miley | 539                     | \$13,592                       |
| Crissy Field         | 226                     | Not Available                  |

## HUMAN HEALTH AND SAFETY

The health and safety of visitors and park staff, volunteers, and partners are of paramount concern to the NPS. *NPS Management Policies 2006* summarize the commitment of the NPS to providing appropriate, high-quality opportunities for visitors while striving to protect human life and providing for injury-free visits (NPS 2006a, 105).

Existing conditions related to dogs and their management in GGNRA can involve inherent risks to the health and safety of both visitors and staff. These risks vary between park staff and visitors and are addressed separately below. In general, risks include injuries related to aggressive dogs, dog bites (to humans, other dogs, and horses), belligerent dog owners, dog and/or owner rescues, and health issues related to dog waste (water and soil contamination, etc.). Ongoing conditions related to dogs in the park continue to pose health and safety risks to both staff and visitors.

## EXPOSURE TO PATHOGENS FROM DOGS

Wherever dogs swim and run, their feces introduce pathogens into the water, soils, and sand, and also onto vegetation and paved surfaces, possibly elevating the risk of human disease. Infections with these pathogens can take place through ingestion of or contact with contaminated sand, vegetation, or water. Leaving pet waste on the ground can expose children, adults, or other pets to diseases (CRCCD 2009, 1). Park sites that may pose a higher risk of infection from pathogens found in dog waste include heavily used dog walking areas, beach areas where many visitors are barefoot, and sites where children often play. During the public comment period for the draft plan/EIS, some commenters noted the amount of dog waste at GGNRA sites, especially within the beach areas. One commenter stated, “Just yesterday while coming out of the water from surfing I witnessed a woman watch her dog defecate in the shallow water and then just walk away. It happens all the time, virtually every day. I personally have seen dogs run up and pee on innocent bystanders - children even - who just happen to be sitting on the beach” (NPS 2011a, Correspondence 1169).

## VISITORS

Most of the issues related to the health and safety of park visitors are related to the nature of their encounters with unruly/aggressive dogs. The number of visitor incidents related to dog activities is typically low at sites with low visitor use or at sites where dogs are usually walked on leash. Tables 11–28 contain the number of pet-related violations documented at GGNRA sites included in the draft plan/EIS, which is based on the park’s 2008–2011 criminal incident records. Park sites where the number of visitor incidents related to dog activities is highest include the Marin Headlands Trails, Crissy Field, Ocean Beach, and Fort Funston. High numbers of incidents occur at these GGNRA sites because of the large number of people that use the sites at one time and the high number of dogs off leash at the site, the presence of dogs in areas where they are not permitted (such as many of the trails in the park), or the noncompliance by some members of the public with the NPS leash regulation that is applicable in many GGNRA sites. Noncompliance with the NPS leash regulation still applies in many GGNRA sites that were never opened to off-leash dog walking, were not included in the 1979 Pet Policy or where there is a special regulation to protect the federally threatened western snowy plover.

The criminal incident reports for the years 2008 through 2011 recorded violations of 36 CFR 2.34 (a), “hazardous conditions,” related to dog walking in GGNRA. This category includes dog bites and/or dog attacks that have occurred at the park. There were a total of 95 dog bites/attacks at GGNRA sites from 2008 through 2011. Fort Funston had the highest number of reported dog bites/attacks (41), followed by Ocean Beach, which had 21 dog bites/attacks (appendix G). Data collected by the Centers for Disease Control and Prevention show that approximately 4.5 million Americans are bitten by dogs each year, and one in five dog bites results in injuries that require medical attention (Centers for Disease Control and Prevention 2009). Small children are typically the most common victims of dog-related injuries because of their natural behaviors, such as running, yelling, grabbing, or hitting, which may threaten a dog. Children are also more likely than adults to receive medical attention (Centers for Disease Control and Prevention 2009). Elderly people are also considered at a higher risk of complications from dog-related injuries due to their increased susceptibility to bruising, lacerations, or broken/dislocated bones. Additionally, elderly people may have decreased sensory perception, which could result in them not seeing or hearing a dog or could make them unable to escape from an aggressive dog (AVMA Task Force 2001, 1742). Data collected by law enforcement staff as described above indicate that dog bites/attacks have occurred at GGNRA sites, which is a health and safety concern to park visitors.

During the public comment period for the draft plan/EIS, some park visitors described incidents where they came into conflict with unruly or aggressive dogs. The following quotes illustrate the public’s concern: “I’ve been attacked by a dog while riding a bike, and another dog charged 2 of us while on

horseback-causing the person I was with to fall and be injured (NPS 2011a, Correspondence 959).” “My daughter has been jumped by dogs a number of times, being knocked down as well as receiving large scratches on her legs (NPS 2011a, Correspondence 968).” Many visitors have cited concerns about safety of small children when visiting GGNRA and noted that the current atmosphere with off-leash dogs have made visitors avoid the parks with their children or grandchildren. One commenter stated, “It is too dangerous to allow any dog to roam without a leash. One never knows when a dog may bite, especially a child whose face is close to the level of the dog’s mouth.”(NPS 2011a, 4278) The potential for visitors to encounter unruly dogs are higher at sites where visitor use is high and dogs are often off leash, including but not limited to Crissy Field, Ocean Beach, and Fort Funston. As previously discussed, table 9 presents a qualitative estimation (low, moderate, or high) of visitor use at each of the park sites. This visitor use data were based on input from the Negotiated Rulemaking Advisory Committee (NPS 2006g, 1–7) the best professional judgment of the park staff, and visitor use surveys conducted in 2008 and 2011 (at six sites).

From the years 2008 through 2011, a total of 2,775 dog-related incidents were recorded in GGNRA for leash-law violations, dog bites or attacks, hazardous conditions or pet rescues, having dogs in closed areas, and failure to pick up pet excrement (tables 11–28). The number of dog-related incidents in the 2008 through 2011 analysis does not match the number of incidents in the analysis of the overall law enforcement data (1,930 dog-related incidents) in table 5 (which includes incidents not related to dogs) because incident reports may contain more than one violation. This analysis is based on a review of the incident descriptions in each law enforcement report; there were often multiple incidents violations per incident report. Pet-related incidents may include dogs acting aggressively towards visitors, dog and horseback rider incidents, off-leash dogs disrupting picnicking families, visitors being knocked down by dogs, dogs intimidating small children, dog owners refusing to leash their dogs, etc. Injuries to visitors may occur while fleeing from a threatening dog. It is also assumed that a large percentage of visitors that experience incidents with dogs do not report them to park staff. A study of 17 California dog parks conducted by the University of California, Davis, School of Veterinary Medicine, noted that dog bites go unreported if a person does not want to jeopardize off-leash dog walking areas (Foster 2006).

However, some park visitors feel more secure or safe when walking in GGNRA sites with a dog. This is an especially common response from women and women with children. During the public comment period for the draft plan/EIS, one commenter stated, “I have always felt much better, when my wife and children are out enjoying the beach and trails, that they have our dog with them for safety” (NPS 2011a, Correspondence 649).

## **STAFF**

Park staff (particularly law enforcement staff), volunteers, and partners have been targets of physical and verbal abuse by dog owners who have been contacted regarding pet violations in the park. Conflicts typically occur when a dog owner is contacted regarding violation of a pet regulation. Conflicts are more likely in park areas of high use and elevated conflict levels, such as Crissy Field and Ocean Beach. Due to the increase in law enforcement and visitor conflict regarding compliance with pet regulations following the park’s efforts to initiate enforcement of the NPS leash regulation parkwide in 2001 and for safety reasons, rangers now approach visitors in pairs when contacting them about enforcement issues. It is assumed by staff that any contact with a dog owner regarding dog walking regulation compliance will be confrontational, and it is the park’s goal to reduce the number of these conflicts. There has been one reported physical assault of a federal law enforcement officer by a dog owner (no injuries resulted). Conflicts also occur in the form of verbal abuse at public meetings, and through written correspondence. Park administrators, including the superintendent, have been subjected to such abuses. Park staff have also been injured from owners not having complete control of their dog. In August 2012, an off-leash dog began barking at a U.S. Park Police Horse-Mounted Officer near the West Bluff area of Crissy Field. The

dog then attacked the officer and the horse, attempting to bite the officer's leg and then biting the horse's front leg. The horse reared up and then fell, throwing the U.S. Park Police Officer who sustained a head injury. The dog then chased the horse back to and around the U.S. Park Police stables, totaling approximately one mile in distance. After the attack, the horse was found to have multiple wounds on his legs and underbelly. This horse has been restored to limited duty only (San Francisco Police Department 2012, 1).

Park staff members have been involved in rescues of both dogs and visitors from certain areas of the park, particularly from the coastal bluffs at Fort Funston. Rescues have also been performed at Sutro Heights Park and Baker Beach. Rescues sometimes result in injuries to park rangers and other park employees, including lifeguards. A minimum of three people and at least 1.5 hours are necessary for most rescues. In some cases, both dogs and owners require rescue. Such efforts tax staff capabilities when more than one of these occurs in a short time period, placing staff at elevated safety risk. In addition, staff members are redirected from their existing duties to perform rescues, leaving other regularly patrolled park areas unattended.

## **GUIDE DOGS**

Approximately 8,500 people who are blind or visually-impaired partner with guide dogs to increase their ability to move about safely, effectively, and independently (The Seeing Eye Guide 2011, 1). A philanthropic organization known as The Seeing Eye is a leading expert on advocacy issues related to the safe and effective travel of guide dog teams. In 2011, The Seeing Eye designed a 55-question survey related to guide dog handlers' experiences with attacks and interface by aggressive dogs. Survey results indicated that 44 percent of respondents had experienced at least one attack. Of these 58 percent were attacked more than once. A total of 83 percent of respondents had experienced interface by an aggressive dog. The majority of the attacks or interface occurred on a public-right-of-way including sidewalks and roadways. Results showed that 76 percent of dog attacks were from an off-leash dog, 47 percent were from a leashed dog inadequately controlled by the owner, and 13 percent were from a dog that was tied and left unsupervised. Results from this survey are greater than 100 percent because survey respondents who experienced more than one attack were asked to mark all that applied (Kutsch 2011, 4). Similar results were noted for incidents of interference with dogs. Findings revealed that 64 percent of those who experienced an attack did not report the incident to animal control or police because they did not feel the attack was harmful enough or they were unable to identify the dog or owner. Of those attacked, 35 percent reported changes in their dog's behavior towards other dogs including becoming distracted, aggressive towards other dogs, and fearful of other dogs. During and following an attack, dog handlers can incur physical injuries, become disoriented in their surroundings, and become anxious (Kutsch 2011).

Guide dogs that have been attacked may be unable to work following an attack or may be permanently retired. In the more severe attack cases included in the survey, 16 percent of the guide dogs that were attacked were temporarily unable to work and 2 to 3 percent were retired from service (Kutsch 2011, 6). The costs associated with retiring a guide dog or taking them out of service due to an attack is approximately \$50,000 (Kutsch 2011, 2). This includes costs incurred by the guide dog school to breed, raise, and train a replacement dog and instruct the blind person to work with the new dog. Other costs associated with guide dog attacks include veterinary or medical expenses, lost wages, and unexpected transportation costs for the blind person (Kutsch 2011, 2).

During the public comment period for the draft plan/EIS, members of the public described the effects that off-leash dogs can have on guide dogs. One commenter stated, "An unleashed dog rushing the guide dog team can make the guide dog skittish and afraid. That puts the guide dog team at risk. If the guide dog is more worried about being rushed by another dog, that guide is not doing its job and injury to both the guide dog and guide dog user could occur" (NPS 2011a, Correspondence 277).

## NEARBY DOG WALKING AREAS

As noted previously, NPS conducted a survey in the summer of 2012, the *GGNRA Dog Walking Satisfaction Visitor Study* (NPS 2012a) to evaluate the perception of and satisfaction with the current dog walking policies, and the potential for redistribution of use based on access changes resulting from implementation of a new dog management regulation for GGNRA. The survey was conducted to respond to public comments received on the draft plan/EIS. Of the approximately 7,000 individuals contacted for the survey, 897 responded, an extremely low response rate. Respondents included 662 dog walkers, 20 commercial dog walkers, and 212 individuals who do not walk dogs at the park. Nearly half of the respondents indicated that their round trip travel to their favorite GGNRA sites is up to 10 miles.

General satisfaction with the visitor's park experience was captured in the survey using the following categories: "not at all satisfied," "slightly satisfied," "moderately satisfied," "very satisfied," and "completely satisfied" (NPS 2012a, 10). Of the dog walkers who responded to the survey, 431 individuals (64 percent) indicated that they were "not at all satisfied," "slightly satisfied," or "moderately satisfied," with on-leash dog walking opportunities at the park (NPS 2012a, 10). These same respondents were then asked if they would go (inside or outside GGNRA) somewhere else as an alternative site. The five most popular alternative sites for on-leash dog walking included four San Francisco park sites, Pine Lake / Stern Grove, Golden Gate Park (all areas), McLaren Park, and Alta Plaza, and one GGNRA site, Marin Headlands Trails (NPS 2012a, 19-21). The Presidio (Area B) was the tenth most popular alternative site for on-leash dog walking, with 1.75 percent (7 respondents) stating that they would choose to visit this site if on-leash dog walking was limited at GGNRA. Regarding satisfaction of off-leash dog walking, 659 respondents (98 percent) stated they would be moderately satisfied or less if they were not able to walk their dogs off leash at the sites they frequent now (NPS 2012a, 17). When asked if they would go somewhere else to walk dogs off leash, the five most popular alternative sites indicated by those respondents for off-leash dog walking included four San Francisco park sites Pine Lake/Stern Grove, Golden Gate Park (all areas), McLaren Park, Alta Plaza, and one GGNRA site, Ocean Beach (NPS 2012a, 13-15). These "alternative sites" are referred to as "nearby dog walking areas" to reduce confusion in the draft plan/SEIS. After reviewing results of the survey, a list of nearby dog walking areas was created for each GGNRA site. Some of the nearby dog walking areas include other GGNRA sites, and some include areas outside of GGNRA. For example, if on-leash dog walking is limited at Crissy Field, based upon the ranks of the alternative sites in the survey and the driving distance of the alternative site to Crissy Field, visitors may choose to visit (in order of preferred choice in the survey) Alta Plaza Park, Golden Gate Park, Ocean Beach, Baker Beach, or the Presidio (Area B). Similarly, if off-leash dog walking is limited at Crissy Field, the alternative sites in the survey and the driving distance of the alternative site to Crissy Field visitors may choose to visit are (in order of preferred choice in the survey and taking into account immediately adjacent parks) Ocean Beach, Golden Gate Park, Alta Plaza Park, Fort Mason, or Mountain Lake Park. Limitations to this survey included a small sample size of respondents; less than 13 percent of individuals who were contacted responded to the survey. In addition, a high number of answers to the survey questions asking about alternative sites for dog walking recreation were "I don't know," which may support GGNRA's earlier premise that understanding potential redistribution is speculative, a conclusion other non-federal jurisdictions regulating dog walking, such as the City of San Francisco, have reached (NPS 2012a, 13, 19; SFPD 2011, 262).

Table 30 describes the alternative sites considered in this draft plan/SEIS. Generally, these alternative sites either ranked high (top ten) in the survey, or were identified in the survey but at a low frequency and are parks located immediately adjacent to GGNRA sites that offer a similar dog walking experience. There are other parks that allow dog walking located outside but near GGNRA sites that are not included in this table because these parks were identified at an extremely low frequency (1 or 2 respondents) or not at all by survey respondents as alternatives sites they would visit. A short description of each of the areas

follows that table and includes natural resources present, the location of the area, the size of on-leash and off-leash areas, amenities (if any) present, and recreational opportunities.

The following paragraphs describe the nearby dog walking areas identified in the *GGNRA Dog Walking Satisfaction Visitor Study* (NPS 2012a) and are discussed by county then by study ranking.

**TABLE 30. NEARBY DOG WALKING AREAS IDENTIFIED AS ALTERNATIVE SITES IN THE GGNRA DOG WALKING SATISFACTION VISITOR STUDY (NPS 2012A)**

| Name   | Park Management*               | Location   | Size of Park   | Frequency in GGNRA survey (NPS 2012a)   | Notes   |
|--|--------------------------------|--|--|---|---|
| <b>Marin County Nearby Dog Walking Areas (in order of study ranking)</b>         |                                |  |  |   |   |
| Upton Beach  | Marin County                   | Adjacent to Stinson Beach  | 4 acres  | 8th preferred choice for off leash (2.4%)   | Beach is on-leash dog walking only, but off-leash dog walking may occur here.   |
| Camino Alto Open Space Preserve  | Marin County                   | Mill Valley; Escalon Rd.   | 170 acres  | 22nd preferred choice for on leash (1.0%); 19th preferred choice for off leash (0.80%)  | Dogs on leash on all trails; dogs off leash on all fire roads under voice command.  |
| Blithedale Summit Open Space Preserve  | Marin County                   | Mill Valley; Glen Dr.  | 899 acres  | 23rd preferred choice for on leash (0.75%)  | Dogs on leash on all trails; dogs off leash on all fire roads under voice command.  |
| Mt. Tamalpais State Park   | CDPR                           | Mill Valley  | 6,300 acres  | 24th preferred choice for on leash (0.75%)  | Dogs on leash only in picnic areas and camping areas. No dogs allowed on trails, fire roads, or undeveloped areas.  |
| Bolinas Beach  | Marin County and Private Lands | Olema Bolinas Road, off Highway 1  | Unknown  | Not included as a response in the study   | Dogs allowed off leash.   |
| <b>San Francisco County Nearby Dog Walking Areas (in order of study ranking)</b> |                                |  |  |   |   |
| Pine Lake/Stern Grove  | SFRPD                          | Wawona neighborhood; Stern Grove is at 19th Ave. and Wawona; Pine Lake at Wawona Way and Crestlake | 3.3 acres (Pine Lake DPA); 0.20 mile trail; 0.7-acre (Stern Grove DPA) | 1st preferred choice for on leash (12.47%); 1st preferred choice for off leash (14.76%) | Off-leash areas in two DPAs and along the 0.2 mile Stern Grove Trail; this trail connects Pine Lake Meadow to Stern Grove on the north side of the park.  |
| Golden Gate Park (all areas)   | SFRPD                          | Sunset neighborhood; between Sunset and Richmond   | 1,017 acres; 8.6 acres off-leash DPAs                                  | 2nd preferred choice for on leash (9.24%); 2nd preferred choice for off leash (7.2%)    | There are four distinct DPA areas in the park (southeast, northeast, south central, and north central) where dogs are allowed off leash. Outside of the DPAs, dogs are allowed on leash, and can be walked on trails at the site. |
| McLaren Park   | SFRPD                          | Bayview neighborhood; Shelly Dr. and Mansell St  | 59.9 acres off-leash DPA   | 3rd preferred choice for on leash (3.49%); 3rd preferred choice for off leash (4.80%)   | Two separate DPAs: (1) 59-acre area bounded by Shelly Drive with fence along roadway (2) 0.9 acre adjacent to natural area with fence along roadway.  |

| Name   | Park Management*                     | Location   | Size of Park                        | Frequency in GGNRA survey (NPS 2012a)   | Notes   |

| Pacifica State Beach (at Linda Mar)  | City of Pacifica                     | Pacifica; along Highway 1  | Unknown                             | Last preferred choice for on leash (0.25%)  | Dogs allowed on leash on the beach.   |

\*Notes: SFRPD = San Francisco Recreation and Parks Department; DPA = dog play area; CDPR = State of California Department of Parks and Recreation

## MARIN COUNTY PARKS

**Upton Beach**—Upton Beach is a 4-acre county-managed beach that is north of the GGNRA portion of the NPS section of Stinson Beach. The beach is popular for sunbathing, fishing, picnicking, and surfing, as well as other beach activities. Kayaking, swimming (but no lifeguard on duty), and dog walking are other activities allowed at the park. The site is frequently used by hang gliders who take off from Mt. Tamalpais. Parking is either at Stinson Beach, or on Calle del Arroyo (Marin County Parks 2012a, 1). Dogs are allowed on leash on Upton Beach, but no dogs are allowed at the adjacent Stinson Beach. The dog leash must not exceed 6 feet in length.

**Camino Alto Open Space Preserve**—The Camino Alto Open Space Preserve is located in Marin County, and runs from Mt. Tamalpais towards the bay, and branches off south toward Mill Valley. The preserve is predominantly on a west-facing slope, and is well forested, with shady ridgeline access (Marin County Parks 2012b, 1). Vegetation along the fire roads and trails at the Camino Alto Open Space Preserve include coast live oak, California bay, toyon, madrone, coyote brush, monkeyflower, hazelnut, redwoods, buckeye, thimbleberry, and invasive broom. Some portions of the fire roads are lined with patches of buckwheat, and purple coyote mint (Bay Area Hiker 2002, 1). This site provides habitat to support the northern spotted owl, a special-status species. The site also includes ample parking. Many of the fire roads found within the Camino Alto Open Space Preserve are popular, and are used by hikers, bicyclists, and equestrians. The fire roads offer a relatively level trail, and have views of Mt. Tamalpais as well as San Francisco. Dogs are allowed at Camino Alto Open Space Preserve and are allowed to be off leash under voice command on all fire roads. Dogs are also allowed on leash on open space lands unless signed otherwise (Marin County Parks 2012b). Visitors are not allowed more than three dogs per person, and must have a leash for each dog. The leash must not exceed six feet in length. Commercial dog walkers require a permit. Fire roads include the Escalon Fire Road, Del Casa Fire Road, Marlin Fire Road, Camino Alto Fire Road, Octopus Access Fire Road, Middle Summit Fire Road, and Lower Summit Fire Road. There is also the Harvey Warne Trail (Marin County Parks 2012b, 1).

**Blithedale Summit Open Space Preserve**—Blithedale Summit is an 899-acre open space preserve in Marin County. Resources at the site include a diverse variety of habitats, such as chaparral and forested areas, including redwood groves. The redwood groves provide habitat for the endangered northern spotted owl, as well as other wildlife species. Activities permitted at the site include hiking, horseback riding, and mountain biking (Marin County Parks 2012c). Blithedale Summit has several trails and fire roads. The fire roads are generally steep and rocky along the ridgelines, but trails and roads at the site pass through a variety of habitats. Dogs are allowed at Blithedale Open Space Preserve. Dogs are allowed to be off leash under voice command on all fire roads. Visitors are not allowed more than three dogs, and must have a leash for each dog that must not exceed 6 feet in length. Commercial dog walkers require a permit. Dogs are also allowed on leash on all trails (Marin County 2012c). Fire roads include the South Marin Line Fire Road, the Madera Ridge Fire Road, Glen Fire Road, Elinor Fire Road, the Blithedale Ridge Fire Road, and H Line Fire Road. Trails include the Corte Huckleberry Trail, Piedmont Trail, Warner Canyon Trail, Tartan Trail, and Maytag Trail (Marin County Parks 2012c).

**Mt. Tamalpais State Park**—This park is located in Marin County, just north of the Golden Gate Bridge. Mt. Tamalpais has over 50 miles of trails connecting to a network of over 200 miles of trails. The park provides trails for hiking and biking, and some trails for horseback riding. The park contains redwood groves and oak woodlands, and a great diversity of plant life because of the varied habitats, topography, and soils. Hikers are able to pass through grasslands, chaparral, oak woodlands, as well as redwood groves and Douglas fir stands. Serpentine habitat is also located at this park, which supports a number of special-status plant species, including the federally and state-threatened Marin dwarf flax (*Hesperolinon congestum*), the federally and state-endangered white-rayed pentachaeta (*Pentachaeta bellidiflora*), and the federally and state-endangered showy Indian clover (*Trifolium amoenum*) (USFWS 2011b). This site

also provides habitat to support three special-status species: the federally threatened northern spotted owl in terrestrial forested areas, and the federally threatened coho and steelhead salmonids in streams. Dogs are allowed only on leash in the camping and picnic areas, except for the Environmental Campground, and are prohibited from the trails, fire roads, or undeveloped areas (California State Parks 2010, 4).

**Bolinas Beach**—Bolinas Beach is located in the small, unincorporated West Marin town of Bolinas, famous for a history of removing road signs towards the town. The beach has calm water with a sand bar. Fishing and camping are allowed at the site, and surfing is a popular activity. Dogs are allowed off leash but under control at Bolinas Beach (Dogtrekker 2012a).

## SAN FRANCISCO COUNTY

**Pine Lake/Stern Grove**—Pine Lake Park and Stern Grove Park constitute a total of 64 acres of park land managed by the San Francisco Recreation and Parks Department (SFRPD). The eastern edge of Pine Lake abuts the Stern Grove Park Recreation Area. The Pine Lake Natural Area (8.4 acres) is located in Pine Lake Park (30.3 acres). The area is located in the neighborhood of Wawona in San Francisco County and bounded by Wawona Way on the north and Crestlake Drive on the west and south sides. The Stern Grove area is bounded by 19th Avenue and Wawona way. Riparian habitats and several different types of wetlands are present including open water, willow scrub, and freshwater marsh (SFPD 2011, 286). In general, Pine Lake Park/Stern Grove provides a mosaic of habitats that are accessible to mobile wildlife species, particularly birds that forage, nest, and roost in these habitats (SFPD 2011, 290). There are picnic tables, horseshoe courts, walking trails, and the area is surrounded by fir, redwood, and eucalyptus trees. There is parking along the road and a parking lot within the park. Drinking fountains for visitors and dogs are provided in the park. A designated 3.3 acre unfenced DPA exists in a meadow to the east of the natural area in Pine Lake (SFPD 2011, 141). The DPA is located on the second terrace of the park contiguous to Stern Grove and next to a parking lot at Crestlake and Vale streets. This park also includes the 0.2 mile Stern Grove Trail as an off leash area that connects the Pine Lake Meadow DPA to Stern Grove. Stern Grove also includes a 0.7 acre DPA. This DPA is not within a natural area. The SNRAMP does not propose to reduce the size of the DPAs at this park or the trail that allows off-leash dog walking.

**Golden Gate Park**—Golden Gate Park is a 1,017-acre, landscaped park that includes playgrounds, lakes and picnic areas. There are four DPAs in Golden Gate Park that total 8.6 acres. The first is the southeast section bounded by Lincoln Way, King Dr., and 5th and 7th Avenues. This site is approximately 2.6 acres, and is near a natural area. The second DPA is in the northeast section at Fulton and Willard, within a natural area. It is 0.2 acres. The third is the south central DPA bounded by King Dr., Middle Dr., and 34th and 38 Avenues. It is approximately 4.4 acres. The last DPA in Golden Gate Park is in the north central area, near 38th Avenue and Fulton. It is a fenced training area approximately 1.4 acres. All DPAs allow off-leash dogs (SFRPD 2005, 1). Dogs are allowed elsewhere in the park on leash.

**McLaren Park**—This 312-acre park is managed by the SFRPD and is located in San Francisco's Bayview neighborhood. Numerous freshwater sources, including Gray Fox Creek and associated riparian habitats that consist of willow scrub are present within the park (SFPD 2011, 214). Other habitat present includes wildflower meadows (SFPD 2011, 114), a wet meadow, and a freshwater marsh (SFPD 2011, 286). In general, McLaren Park provides a mosaic of habitats that are accessible to mobile wildlife species, particularly birds that forage, nest, and roost in these habitats (SFPD 2011, 290). There is parking along Shelley Drive and a parking lot located near the reservoir. The park includes two DPAs, one within a natural area and one adjacent to a natural area. The DPA within the natural area is a 59-acre hill top area bounded by Shelly Drive (a fence is present at the roadway) and includes trails, open lawn areas, and a reservoir. The DPA adjacent to a natural area is located at the south entrance of the park, in the 1600 block of Geneva. This DPA includes 0.9 acres of open lawn area and a fence along the roadway. The SNRAMP proposes to reduce the size of the DPA at McLaren Park from 61.7 acres to 53.4 acres (a

reduction of 8.3 acres, approximately 13 percent of total DPA area) (SFPD 2011, 114). The SNRAMP also proposes to restrict dogs from sensitive habitat areas at McLaren Park, including approximately 0.6 acre of Gray Fox Creek (SFPD 2011, 138) and would monitor dog use and impacts on small wildflower meadows in McLaren Park (SFPD 2011, 114).

**Alta Plaza Park**—This 11.89-acre park is located in the Pacific Heights neighborhood between Steiner and Scott, Clay and Jackson Streets. Originally a rock quarry, the land was terraced and planted with lawn, and has 5 large staircases. The park also contains several paved walking trails, lawns, and benches throughout (San Francisco Parks Alliance 2012, 1). The off-leash area (DPA) is on the east side of the park, and includes the second terrace on Clay Street between Scott and Steiner Streets. It is approximately 0.5 acres. The rest of the park is on leash. Commercial dog walkers are allowed at the park, (City and County of San Francisco Parks and Recreation Department n.d., 1-2; SFRPD 2005, 1).

**Glen Canyon Park**—This 70-acre park is managed by the SFRPD and located between the Diamond Heights and Miraloma neighborhoods in an area known as San Miguel Hills. Vegetation at the park includes native plants within the grasslands, sensitive species, scrub-covered western slopes, a riparian corridor, a free-flowing creek, and urban forest (SFPD 2011, 125-126; 286). Glen Canyon Park serves as an important wildlife corridor (SFPD 2011, 290). Recreation facilities in Glen Canyon Park include a day camp, a community recreation center, ball fields, playgrounds, and formal and informal trails. In San Francisco, the majority of Islais Creek has been piped into an underground culvert except for an open water stretch in Glen Canyon Park and the bay outfall at Third Street. The Glen Canyon Park reach of Islais Creek is an intermittent stream but supports willows and other riparian vegetation. The creek enters a 5-foot-diameter underground culvert at the lower end of Glen Canyon Park (SFPD 2011, 355). The park has wooded canyon trails along both sides of a creek, rock outcroppings, and a wide variety of native vegetation throughout the site. There are several side trails that climb in elevation and narrow to the top of a hill then loop back down the hill. The SNRAMP proposes to “monitor the dog impact on wetlands and Islais Creek channel and consider appropriate restrictions (including fencing) to keep dogs out of the creek channel and wetlands” (SFPD 2011, 127). The SNRAMP also proposes to protect sensitive habitats and prevent erosion by closing and revegetating social trails in sensitive areas of the Glen Canyon Park, including the social trails at the northwestern rock outcrop (SFPD 2011, 126) and next to or crossing Islais Creek (SFPD 2011, 128). There is no parking lot for the park, only street parking. The park includes a 60-acre natural area (Glen Canyon Park Natural Area) that allows on-leash dog walking. There are no DPAs within Glen Canyon Park.

**Bernal Heights**—This 24.3-acre park is managed by the SFRPD and is located in the Bernal Heights neighborhood in central San Francisco. The slopes of Bernal Hill support native grasslands and sensitive species while other portions of the site support urban forest (SFPD 2011, 117). The DPA is located in a grassy area with a few scattered trees and scrub vegetation (SFPD 2011, 117). In general, Bernal Hill provides a mosaic of habitats that are accessible to mobile wildlife species, particularly birds that forage, nest, and roost in these habitats (SFPD 2011, 290). There are two main entrances to the park and a large paved path connects a closed utility road. Apart from the paved path, a network of social trails traverses the hill area. There are parking spaces provided and the park includes a designated DPA within a natural area (Bernal Hill Natural Area) above Bernal Heights Boulevard. The Significant Natural Resource Areas Management Plan (SNRAMP) proposes to retain on- and off-leash dog use of the entire natural area but to limit off-leash activities to the relatively flat areas to avoid sensitive plant species (SFPD 2011, 118). The SNRAMP proposes to reduce the size of the DPA at Bernal Hill from 21 acres to 15 acres (a reduction of 6 acres, approximately 29 percent of total DPA area) (SFPD 2011, 114). Additionally, the SNRAMP proposes to “encourage people and dogs to stay on designated trails and discourage them from climbing the steep slopes and causing erosion on the north side of the Natural Area” (SFPD 2011, 118).

**Presidio (Area B)**—The Presidio (Area B) is managed by The Presidio Trust. The site includes miles of hiking and biking trails, several restaurants, hotel, several neighborhoods, and offices. The Presidio also contains hundreds of listed historic properties. It provides a campground, golf course, bowling center, playgrounds, athletic fields, a trampoline park, rock climbing gym, swimming facilities, gymnastics facilities, four parade grounds, and a visitor center (Presidio Trust 2012a, 1). The park has abundant wildlife and plant communities and supports numerous special-status plant species. Rare plant communities that have disappeared in the rest of the San Francisco peninsula survive within the Presidio; these remnant native plant communities preserve rare and endangered plant species and provide valuable wildlife habitat (Presidio Trust 2002, 1: 7). The Presidio supports water features as well as wetland, riparian, and upland plant communities. Water features present at the Presidio (Area B) include Dragonfly Creek, Tennessee Hollow Creek, and El Polin Spring (Presidio Trust 2002, 1:91). The following wetland and riparian plant communities are present at the Presidio (Area B):

- **Coastal freshwater marsh**—This herbaceous community dominated by emergent wetland plants occurs in areas with perennial inundation or soil saturation in the root zone. It makes up 1.8 acres at the Presidio, including emergent and aquatic vegetation that grow along the edges of Mountain Lake in the South Hills Planning District (Presidio Trust 2002, 1: 88).
- **Freshwater seeps**—These areas are composed of wetland vegetation and occur at sites with seasonal or perennial soil saturation resulting from groundwater seepage. At the Presidio, small seeps and springs occur in northern coastal scrub and on permanently moist or wet soils in the South Hills Planning District and within the East Housing District. The special-status Franciscan thistle occurs only in this community (Presidio Trust 2002, 1:88).
- **Riparian communities**—This community is dominated by native plants, such as willows and alders, that are adapted to moist growing conditions along streams and other drainages (Presidio Trust 2002, 1:88) At the Presidio, riparian vegetation is represented by three native plant communities, including the central coast live oak riparian forest, central coast arroyo willow riparian forest, and the central coast riparian scrub (Presidio Trust 2002, 1:93).

The following upland plant communities are present at the Presidio (Area B):

- **Bluff scrub**—At the Presidio this community is relatively continuous along the steep bluffs facing the ocean from Battery Crosby to south of Fort Point, and along the bayshore from Fort Point to west of Crissy Field (Presidio Trust 2002, 1:93).
- **Northern coastal scrub**—This community occurs at a slightly higher elevation on adjacent gentle slopes and inland areas. Coastal scrub extends inland of bluff scrub from Battery Crosby to west of Crissy Field, and in the south-central portion of the Presidio in the Main Post and residential Planning Districts. The majority of the community mapped as coastal scrub occurs on serpentine soils and could support inclusions of serpentine scrub (Presidio Trust 2002, 1:93).
- **Central dune scrub**—This community includes inland sand dunes dominated by shrubs and annual and perennial wildflowers. The largest remaining patches of dune scrub occur on the bluffs below Lincoln Boulevard south of Battery Crosby, between Lincoln Boulevard and Washington Boulevard, on the restored Lobos Creek dunes north of Lobos Creek, and on sites east of the Public Health Service Hospital (PHSH) north parking lot (Presidio Trust 2002, 1:93). Several special-status plant species, including San Francisco champion, San Francisco wallflower, San Francisco spineflower, dune gilia, and San Francisco lessingia, are found in association with this community (Presidio Trust 2002, 1:94).
- **Serpentine scrub (chaparral)**—This community intergrades with serpentine grassland and serpentine barrens. Small patches of serpentine scrub occur on well-developed serpentine soils

southwest of Crissy Field in the Main Post Planning District, south of the WW II Memorial on either side of Lincoln Boulevard in Area A, and the South Hills Planning District (Presidio Trust 2002, 1:94).

- **Serpentine bunchgrass grassland (prairie)**—This community is dominated by sensitive grass- and herbs and restricted to well-developed serpentine soils in more protected, drier, less windy, and more sunny uplands. On the Presidio, the serpentine bunchgrass community occurs within the South Hills Planning District (Presidio Trust 2002, 1:94).
- **Coast live oak woodland**—This community develops in moist, sheltered sites away from the immediate coast. Only small, scattered stands of coast live oaks with an understory of shrubs or grass occur on the Presidio (Presidio Trust 2002, 1:94).

A total of 10 special-status plant species are known to occur on the Presidio (Area B) in the plant communities described above, including dunes, dune scrub, coastal scrub, bluff scrub, serpentine scrub, serpentine barrens, and serpentine grasslands (Presidio Trust 2002, 1:96). Four federally listed plants occur on the Presidio (Area B), including the federally endangered Raven’s (Presidio) manzanita, Presidio clarkia, and San Francisco lessingia; one federally threatened plant species, the Marin dwarf-flax also occurs on the Presidio (Presidio Trust 2002, 1:94). A large area in the southwestern portion of Area B is designated as a San Francisco lessingia recovery zone. The site also contains high ecological value forest stands and a 300-acre forest of eucalyptus, cypress, and pine. Although not native to the area, this forest was planted at the end of the 19th century. Other historic gardens are also found in the park.

Hundreds of wildlife species use habitat in the park (Presidio Trust 2012b, 1). Common mammals such as opossums, skunks, and raccoons as well as numerous species of bats have been recorded at the Presidio (Presidio Trust 2002, 106). There is also a mapped occurrence of the federally threatened California red-legged frog at Mountain Lake. GGNRA has developed plans to restore several areas for the federally listed frog, including Mountain Lake in the Presidio (USFWS 2002, 32). Common amphibians and reptiles at the Presidio (Area B) include the non-native red-eared slider and the bullfrog (Presidio Trust 2002, 106). The lands at the Presidio also support a wide variety of avian species. The waterbody known as Mountain Lake in Area B supports shorebirds such as terns, kingfishers, ducks, and gulls as well as neotropical migrants such as songbirds, swallows, and flycatchers (Presidio Trust 2002, Figure 22). The more wooded portions of Area B support hawks, vultures, flycatchers, owls, swallows, songbirds, and woodpeckers; the open portions (scrub and lawn areas) of Area B support flycatchers, songbirds, quails, and swallows (Presidio Trust 2002, Figure 22). The Presidio provides an important refuge for the California quail because it is a small, non-contiguous parcel where quail numbers had historically declined. The Presidio currently supports a breeding population of California quail, which is mostly found in coastal scrub areas, in forests, lawns, and areas of ornamentals.

In terms of dog use, the rules of the Presidio state that dogs are allowed on leash in nearly all areas (Presidio Trust 2012a, 1). The Presidio Trust has specifically stated in a public comment letter on the draft plan/EIS that Area B contains approximately 20 miles of trails and 685 acres of developed areas available for on-leash dog walking. The Presidio Trust also indicates that the following trails in Area B have a high percentage of use by dog walkers (visitors walking dogs is greater than 30 percent): Mountain Lake Trail (Arguello Blvd. to Mountain Lake), Ecology Trail (near the South Hills housing), West Pacific Trail (Broadway Gate to Arguello Gate), the Lombard Gate Lawn, and the Bay Area Ridge Trail (Spire to Rob Hill Campground). Trails at the Presidio that have a moderate percentage of use by dog walkers (visitors walking dogs is between 10 and 30 percent) include: El Polín Spring (near East housing), Park Trail (bisects the site from the Public Health Service District to Cavalry Stables), Fort Scott Ball Field and Parade Ground (in the northwestern portion of the site), Lobos Valley Connector and South Baker Beach Apartments Social Trails (Wedemeyer St. to Lincoln Blvd.), and the Public Health Service District/Hospital Cemetery (in the southwestern portion of the site). The remaining trails/areas within

Area B have a low percentage of use by dog walkers (visitors walking dogs is less than 10 percent). In November 2012, the Presidio Trust released a Notice of Proposed Rulemaking to limit the number of dogs walked by visitors in Area B of the Presidio. This limit would require any person walking four or more dogs at one time to have a permit for commercial dog walking. These permits would be available from the City and County of San Francisco. The proposed rulemaking would also require that all pet walkers in the Presidio Area B remove pet excrement and deposit waste in refuse containers.

**Mountain Lake Park**—This 14-acre park is managed by the SFRPD and located in the Richmond neighborhood of San Francisco at 12th and Lake Avenue. Mountain Lake Park is located next to Mountain Lake, which is part of the Presidio and is managed by the Presidio Trust. The park has two meadows; the large meadow is generally used for picnics and sports. Several trails can be accessed from the area. Dog walking, picnicking, and hiking are popular activities in the park (The Presidio Trust 2012c, 3). The park provides opportunities for visitors to walk or jog along the lake, although the lake is technically part of the Presidio (Area B). The Presidio Trust noted in a public comment letter to the draft plan/EIS that the Mountain Lake Trail and the Ecology Trail at the park are frequently used by dog walkers (NPS 2011b, Presidio Trust). There is also a built-in fitness circuit along the trails in the park. Mountain Lake contains wetland areas, and provides habitat for wildlife, though many of the species currently found are non-native (The Presidio Trust 2012c, 3). On-leash dog walking is allowed in the park and off-leash dog walking is allowed in the 0.4 acre, unfenced DPA located at the northeast end of the Park, which is a combination of grass and woodchips (SFRPD 2005, 1; FMLP 2012, 1).

## SAN MATEO COUNTY

**Montara State Beach (includes McNee Ranch)**—Montara State Beach is in San Mateo County in the community of Montara. The beach at Montara is wide and sandy, and is about 0.8 mile long. Montara Beach has two steep access points (California State Parks 2012, 1). While there are diverse tidepools on the southern end of the beach, they are largely inaccessible. Seals occasionally haul out at Montara State Beach (CSPA 2012, 1). Montara Mountain (also known as McNee Ranch), is also within this state park. McNee Ranch is located across Highway One from the beach, on the west side of Montara Mountain. It features the only undisturbed coastal mountain habitat found on over 100 miles of coastline, and provides a rich diversity of flora and fauna. The site offers hiking, biking, horseback riding, and walking trails (CSPA 2012, 1). Dogs are allowed on leash on the beach, but must be controlled with a leash of no more than six feet. They are also allowed on leash on the trails at McNee Ranch (CSPA 2012, 1).

**Quarry Park, El Granada**—Quarry Park is a 40-acre community park in El Granada, south of San Francisco. The site is adjacent to the Wicklow open space area, and many of the trails at Quarry Park connect to this area. Trails provide a hike through the old quarry, and some vistas of the surrounding area and Princeton Harbor. The trail is open to horses, hikers, and bicyclists (County of San Mateo 2012, 1). Dogs are allowed on leash at Quarry Park (County of San Mateo 2012, 1).

**Half Moon Bay (Surfers Beach)**—Surfers Beach, or El Granada beach, is located across from the town of El Granada. It is a popular surfing beach, with easy access and good waves (HiddenSF.com 2012, 1). However, in recent years this beach has seen severe erosion that threatens to undermine highway 1, and severely limits recreational activities at the beach (CSMW 2012, 1). The plant communities of Half Moon Bay are not as diverse as they were when the coast was pristine due to the introduction of non-native plant species such as sea fig, cape ivy, New Zealand spinach and poison hemlock; these non-native plants have affected the survival of native plants and animals (California State Parks 2005, 4). The most common birds at Half Moon Bay Beach are migratory and resident water-associated birds such as western snowy plovers (which are known to nest at Half Moon Bay); western California and glaucous-winged gulls; brown pelicans; and sanderlings (California State Parks 2005, 4). Dogs are allowed on leash at Surfers beach (California State Parks n.d., 1).

**Sharp Park**—This 411-acre park is managed by the SFRPD and located in the town of Pacifica in San Mateo County. The park borders the Pacific Ocean, is bisected by Highway 1 and is surrounded by significant open spaces. GGNRA areas adjacent to Sharp Park are Mori Point on the southwestern edge and Sweeney Ridge on the southeastern and eastern edges. The dominant vegetation at Sharp Park includes invasive forest and maintained lawns associated with a golf course, but the park also contains significant areas of wetlands and scrub vegetation associated with Sanchez Creek and Laguna Salada near the Pacific Ocean (SFPD 143). Several different types of wetlands are present including free-flowing creeks, open water, wet meadow, willow scrub, and freshwater marsh (SFPD 2011, 286). The wetland habitats of Sharp Park support several sensitive species including common yellowthroats, black-crowned night herons (*Nycticorax nycticorax*), California red-legged frog, San Francisco garter snakes (*Thamnophis sirtalis elegans*), and San Francisco fork-tailed damselfly. Because Sharp Park is bordered by or adjacent to undeveloped areas, including Sweeney Ridge, Mori Point, and Milagra Ridge, it serves as a relatively undisturbed corridor for wildlife, particularly birds (SFPD 2011, 290). Sharp Park's connectivity to high-quality natural habitats also allows it to support medium size and large mammals, including numerous general wildlife species, such as the black-tailed deer (*Odocoileus hemionus columbianus*), bobcat (*Lynx rufus californicus*), common porcupine (*Erethizon dorsatum*), coyote (*Canis latrans*), and mountain lion (*Puma concolor californicus*) (SFPD 2011, 290). On-leash dog walking is allowed at the park; there are no off-leash dog areas within Sharp Park. This park was identified as an alternative site for on-leash dog walking, although at a very low frequency (NPS 2012a, Attachment B). Because Sharp Park does not include a DPA, acreage of DPAs would not be reduced in the SNRAMP, but signs and barriers would be installed and maintained to prevent disturbance of sensitive habitat in Horse Stable Pond and Laguna Salada by “dogs or other possible nuisances” (SFPD 2011, 144).

**Pacifica State Beach**—The Pacifica State Beach, also known as Linda Mar Beach, operated by the City of Pacifica, is located south of San Francisco in Pacifica. The beach is located off of Highway 1 in downtown Pacifica. Amenities at Pacifica beach include a recreational trail system along the water, surfing and surf camps, as well as parking, showers, and restrooms (City of Pacifica 2012, 1). Pacifica Beach is home to large numbers of shorebirds, including the federally threatened western snowy plover. There is also a small wetland on the southern portion of the beach that provides wildlife habitat, and the beach is listed as habitat for the western snowy plover in the USFWS recovery plan (Pacific Shorebird Alliance 2012, 1). Dogs must be on leash at this beach (City of Pacifica 2012, 1).

Environmental  
Consequences

## CHAPTER 4: ENVIRONMENTAL CONSEQUENCES

This chapter describes the potential environmental consequences of implementing any of the alternatives being considered. It is organized by resource topic and provides a standardized comparison among alternatives based on topics described in chapter 1 and further described in chapter 3. In accordance with the *National Environmental Policy Act of 1969* (NEPA), impacts are described in terms of context, intensity, and duration; cumulative impacts and mitigating measures for adverse impacts are also described. The analysis for each impact topic includes the methods used to assess the type and relative level of impact. In addition to determining the environmental consequences of implementing the preferred and other alternatives, National Park Service (NPS) *Management Policies 2006* (Section 1.4) requires analysis of potential effects to determine whether or not proposed actions would impair a park's resources and values.

### INTRODUCTION: GENERAL METHODOLOGY FOR ANALYZING IMPACTS

Potential impacts or effects are described in terms of type, context, duration, and intensity, which are generally defined below, while more specific impact thresholds are given for each resource at the beginning of each resource section. A threshold is the point that must be exceeded to begin producing a given effect or result or to elicit a response. For the analysis, context, duration, and intensity have been categorized into negligible, minor, moderate, and major and are defined in more detail in each resource section. Negligible impacts are neither adverse nor beneficial, nor long-term or short-term. No impacts to a resource may also be applicable for some alternatives and sites if dogs are prohibited.

**Type of Impact**—Impacts can be either beneficial or adverse. A beneficial impact would be a positive change in the condition or appearance of the resource. An adverse impact would be a change that would detract from its appearance or condition.

**Context**—Context describes the area or location (site-specific, local, parkwide, or regional) in which the impact would occur. Site-specific impacts would occur at the location of the action, local impacts would occur within the general vicinity of the study area, parkwide impacts would affect a greater portion of the park, and regional impacts would extend beyond park boundaries, which in coastal Golden Gate National Recreation Area (GGNRA or park) sites extend beyond the tideline.

**Duration**—Duration describes the length of time an effect would occur, either short term or long term. Long term impacts are described as those persisting for the life of the plan/environmental impact statement (EIS) (the next 20 years). At the beginning of the plan's implementation, a 1- to 3-month period of public education would occur to implement the proposed action followed by a 1- to 3-month period testing the compliance-based management strategy. At the beginning of the education and enforcement period, short-term impacts on all resources would occur, regardless of the alternative chosen. During this period, impacts would be similar to the current conditions and would be short-term. Following the education period, monitoring for compliance would begin and it is expected that compliance with the dog walking regulations and associated adverse impacts would improve gradually and the impacts would then become long term, as described below for each resource and alternative.

**Intensity**—Intensity describes the degree, level, or strength of an impact. Because definitions of intensity vary by resource topic, intensity definitions are provided separately for each impact topic.

## Chapter 4: Environmental Consequences

**Direct and Indirect Impacts**—NPS policy requires that direct and indirect impacts including cumulative be considered in the analysis of alternatives, but the impacts do not have to be specifically identified as either direct or indirect. A direct effect would occur at the same time and place as the action. An indirect effect would be caused by an action but would be later in time or farther removed in distance, but would still be reasonably foreseeable.

**Law Enforcement Data**—Law enforcement data from 2001 through 2011, presented in the “Visitor Use and Experience” section in chapter 3, was used to demonstrate the types of noncompliance documented at each site. Table 5 shows the yearly and cumulative number of dog incidents at the park compared to other park incidents or violations. These data were taken from the annual summary reports for each year. From 2001 through 2011, a total of 4,932 dog-related incident reports were filed. Dog-related incident reports comprised 11 percent of the total number of incident reports filed for incidents on GGNRA lands between 2001 and 2011. Park incidents are undercounted in some categories, including dogs-related incidents, because the annual summary report does not account for incident reports that may include more than one violation. Incident reports related to dogs for the years 2008 through 2011 were reviewed to determine the type and number of dog incidents at each site. As noted previously, some of the incident reports documented multiple violations (e.g., unleashed dog in a closed area) or documented violations by more than one individual. Tables 11–28 show the types of dog incidents at each site per year; these data include the multiple violations contained in some of the dog-related incident reports.

After the 1979 Pet Policy was declared contrary to the NPS leash regulation (36 CFR 2.15(a)(2)) in 2001, law enforcement staff regularly enforced the NPS leash law regulation between 2002 to 2005. Following the 2005 court order affirming that GGNRA cannot enforce the NPS-wide regulation requiring on-leash walking of pets (36 CFR 2.15(a)(2)) in areas that were included in the 1979 Pet Policy, dog incidents and violations decreased due to the confusion over the pet policy, but increased again following the emergency restrictions and then the promulgation of a special regulation to protect the western snowy plover.

Law enforcement is responsible for covering approximately 80 miles of separate, non-contiguous park sites in three counties. There are approximately nine law enforcement staff and U.S. Park Police monitoring sites per shift; therefore, law enforcement must strategize which sites to assign staff to each shift. Low use sites and small sites are generally not heavily patrolled due to staff limitations. For these reasons, it is likely that if more staff were available there would be an increase in the number of incidents and violations at the park. While GGNRA cannot provide an exact number of incidents that go unreported, even if law enforcement data undercounts incidents, the data substantiates a need to regulate dog walking to protect resources, diverse visitor experiences, and health and safety.

### CUMULATIVE IMPACT SCENARIO

The Council on Environmental Quality (CEQ) regulations that implement the provisions of NEPA require that cumulative impacts be assessed in the decision-making process for federal projects. Cumulative effects are defined by the CEQ regulations as “the impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (federal or non-federal) or person undertakes such other actions” (40 CFR 1508.7). Cumulative effects can result from individually negligible (or minor), but collectively significant, actions taking place over a period of time. The cumulative impact analysis includes actions both inside and outside the boundary of the park. Cumulative impacts were determined by combining the impacts of each alternative with other past, present, and reasonably foreseeable future actions within the park and outside the boundary of the park.

A list of past, present, and reasonably foreseeable future actions, projects, and programs within the park and outside the boundary of the park were compiled for consideration in the cumulative impact analysis. This list is included in appendix K. The list is organized by plans and projects that have been completed, current projects that are underway, long term projects, and future projects. From this list projects and actions were pulled out and discussed as applicable under each resource and site. The park stewardship programs are incorporated in this list and include programs performed by the Trails Forever Program and volunteer programs.

The lands in San Francisco known as the “Presidio” are managed by both the NPS and the cooperating agency for this plan, the Presidio Trust. Congress established the Presidio Trust in 1996, which together with the NPS manages the Presidio lands. The Presidio Trust manages the interior 80 percent of the Presidio (known as Area B) and the NPS manages the Presidio’s coastal areas (known as Area A). This chapter considers direct impacts to Area A Presidio lands managed by NPS. This chapter also considers indirect impacts of the alternatives on adjacent lands in the cumulative impacts scenario, including Area B Presidio lands managed by Presidio Trust.

### **Interim Compendium Amendment**

The NPS is planning to issue an interim compendium amendment requiring commercial dog walkers in San Francisco and Marin counties to obtain a permit if walking more than three dogs on GGNRA lands. This interim change is being considered in light of the City of San Francisco’s 2012 ordinance requiring commercial dog walkers to obtain a permit, which would limit them to no more than eight dogs, and the Presidio Trust’s proposed rule requiring commercial dog walkers on Presidio lands to have a San Francisco commercial dog walking permit and abide by all the permit conditions, including the maximum of eight dogs. GGNRA’s proposed interim amendment is not part of the dog management plan/EIS, and would remain in place only until a final rule, which would address commercial dog walking, is issued.

This proposed interim change is being evaluated in this Draft Dog Management Plan / Supplemental Environmental Impact Statement (plan/SEIS) as a reasonably foreseeable cumulative effect. If issued, this change may cause adverse effects on nearby dog walking areas if commercial dog walkers who want to walk more than six dogs choose to go to areas outside GGNRA. However, given that nearby jurisdictions that allow commercial dog walking require permits, and limit the maximum number of dogs per dog walker to either six or eight dogs, there may be little effect on other areas. Without this proposed interim action, GGNRA lands, where there is currently no permit required and no limit on the number of dogs walked by commercial dog walkers, would be more likely to be adversely impacted, as commercial dog walkers wanting to walk more than six to eight dogs would likely increase on GGNRA lands. If GGNRA does issue an interim compendium change prior to the final rule, it will likely preserve the current distribution of commercial dog walking, although the number of dogs per commercial dog walker would be reduced for those currently walking more than six dogs at a time on GGNRA lands. While the redistributive effect of requiring permits for commercial dog walkers is somewhat speculative, an interim compendium amendment is more likely to preserve the current visitor experience, or possibly improve it by reducing the number of dogs per commercial dog walker.

### **Increasing Visitation**

The temporal scope of this draft plan/SEIS has been defined as twenty years. As previously discussed in chapter 3, visitation to GGNRA is not expected to experience a significant increase in visitation over the next 20 years given the overall visitation trends to the park. Assuming there are no major changes in park boundaries or facilities, park visitation would range between 12.6 million to 15.9 million people annually, similar to how it has been operating over the previous 20 years. Therefore increased visitation to GGNRA should not result in cumulative impacts to GGNRA resources.

### IMPACTS ON NEARBY DOG WALKING AREAS OUTSIDE OF GGNRA BY ALTERNATIVE

Under this draft plan/SEIS, there are several potential impacts to resources that would occur as a result of projected increases in dog walking at nearby dog walking areas outside of GGNRA. Impacts to natural resources, visitor experience, visitor safety, and park operations (maintenance and cost) are expected to occur and are generally discussed in the paragraphs that follow and in more detail by each alternative below. This analysis is not repeated for each site and resource topic, but these impacts were considered when the cumulative effects were analyzed in resource sections.

It is very likely that an increase in the level of recreational use by private and commercial dog walking will occur at nearby dog walking areas outside of GGNRA as a result of this draft plan/SEIS. However, it is speculative to precisely identify all potential impacts from redistribution related to the implementation of this draft plan/SEIS in combination with other projects. For example, the reductions in off-leash areas proposed by the Significant Natural Resource Areas Management Plan (SNRAM), the changes in commercial dog walking proposed under this draft plan/SEIS, the possible future changes in the City of San Francisco and The Presidio (Area B), and the existing restrictions to commercial dog walking in Marin County Open Space lands. Therefore, it is unknown exactly where the redistribution of visitors would occur if dog walking opportunities are limited at GGNRA sites under this draft plan/SEIS. To reduce this speculation, the NPS tailored a survey (*GGNRA Dog Walking Satisfaction Visitor Study* (NPS 2012a)) to collect current and detailed information regarding visitor use of the park by dog owners, and to determine where visitors would otherwise likely go given different levels of restrictions. This survey specifically targeted dog walkers and other visitors that would be affected by this draft plan/SEIS. Unfortunately the survey had a low response rate. Of the approximately 7,000 individuals contacted, only 897 individuals responded to the survey. Respondents included 662 dog walkers, 20 commercial dog walkers, and 212 individuals who do not walk dogs at the park (NPS 2012a, 6). As noted, limitations to this survey included a small sample size of respondents; less than 13 percent of individuals who were contacted responded to the survey. In addition, a high number of answers to the survey questions asking about alternative sites for dog walking recreation were “I don’t know.” This response demonstrates that even individuals affected were unable to identify where they might otherwise go for on-leash or off-leash dog walking opportunities. Nonetheless, this draft plan/SEIS did use the results of this survey in the redistribution analysis as the best available information, because the survey targeted affected visitors of the GGNRA. But as noted, even many of the affected visitors who responded to the survey did not know exactly how this draft plan/SEIS will affect them in the future and where they will go as a result. Numerous factors are difficult to presume, including human behavior, level of restrictions within and outside GGNRA lands, and physical factors such as driving distances. These statements describe GGNRA’s premise that understanding potential redistribution is speculative, a conclusion that other non-federal jurisdictions regulating dog walking, such as the City of San Francisco, have reached as well (NPS 2012a, 13, 19; SFPD 2011, 262). That said, GGNRA used the best available data to determine where GGNRA visitors may go as a result of this draft plan/SEIS and the impacts associated with this redistribution analysis, including evaluating other nearby dog walking areas outside of GGNRA where dog walkers may be more likely to relocate. The paragraphs below summarize some of the general impacts associated with the redistribution. A detailed impacts analysis follows by alternative.

Increased visitation at nearby dog walking areas could degrade natural resources, such as causing vegetation trampling by dogs, resulting in damaged plant and root systems. Damaged vegetation may cause bare areas and increase the potential for erosion during rain events. Wildlife associated with habitat at these areas would be adversely impacted from an increase in disturbance from greater numbers of dogs and visitors at these areas. An increase in dogs may lead to a greater number of incidents of wildlife being chased, disturbed, or injured. Some of these areas also contain sensitive species that may be adversely impacted from the higher number of dogs and dog walkers at these sites. At these areas, dogs are not allowed in wetlands or waterbodies (such as streams or lakes), but there would likely be more dog waste

with the increased visitation, which would have adverse impacts on health, visitor experience, aesthetics, and on the natural resources at the site. If waste is not properly collected, rain events could wash pet waste into adjacent waterbodies and affect water quality. Therefore, increased maintenance at these areas may be necessary for control of additional dog waste. In Marin County and San Francisco County, there are no comparable, off-leash beaches at non-GGNRA areas. Therefore, the lack of off-leash beaches at nearby dog walking areas would adversely impact the visitor experience for some visitors. Overcrowding due to dog walkers moving to off-leash areas in general can degrade visitor experience and jeopardize visitor safety. During the public comment period for the draft plan/EIS, many commenters noted that crowding dogs into smaller areas for off-leash dog walking would result in more dog aggression, with more dogfights and altercations. An increase in dog walking use would also create parking issues, since some areas do not have designated parking lots, but street parking options only. The availability and maintenance of other amenities may also be an issue, such as public restrooms or water fountains. Maintenance in general and law enforcement issues could also arise at nearby dog walking areas as a result of increased use, adversely affecting the operations of these parks.

Under this draft plan/SEIS, commercial dog walking would be allowed under alternative B, but dog walkers may not have more than three dogs. Under alternative D, no commercial dog walking would be allowed and no permits would be available for application. Under alternatives C, E, and F, commercial dog walking would be allowed, and dog walkers, both commercial and private, would be able to apply for a permit to walk up to six dogs at the following seven GGNRA sites: Alta Trail, Rodeo Beach, Fort Baker (excluding Drown Fire Road), Fort Mason, Crissy Field, Baker Beach, and Fort Funston. In Marin County, the GGNRA proposed limit on the number of dogs able to be walked at one time by a dog walker is the same as the dog walking permit limit imposed by the Marin County Open Space District (except that only three of the six dogs are allowed off-leash in permitted off-leash areas), so no redistribution to nearby areas is anticipated. However, commercial dog walkers who currently use GGNRA lands in San Francisco may choose to walk dogs on land owned by the City of San Francisco and possibly the Presidio Trust. The City of San Francisco currently allows and will continue to allow commercial dog walkers on their lands. However, in 2012, the San Francisco Board of Supervisors passed an ordinance that, starting in 2013, will require commercial dog walkers to obtain a permit to walk four or more dogs, with a limit of eight, on City of San Francisco park property (including some lands managed by the Port of San Francisco and by the San Francisco Public Utilities Commission). This maximum number of eight dogs is higher than the proposed limit of six dogs at selected GGNRA sites under this draft plan/SEIS. In addition, it is possible that the Presidio Trust will also adopt the San Francisco commercial dog walking limits for Area B. In the Federal Register, the Presidio Trust recently published a proposed public use limit rule requiring commercial dog walkers to have a license from the City of San Francisco to walk more than three dogs, with a limit of eight dogs, at one time in Area B of the Presidio (Presidio Trust 2012d, 69785). Therefore, the commercial dog walking limits proposed under this draft plan/SEIS, being lower than the maximum number of dogs allowed in San Francisco and, potentially in Area B of the Presidio, would possibly result in the movement of commercial dog walkers in San Francisco from GGNRA lands to other nearby dog walking areas, although the Presidio Trust may consider lowering their commercial dog walking limit to the limit proposed by GGNRA once the new GGNRA dog management regulation is in place. Additionally, the NPS is planning to implement an interim compendium agreement that would require that commercial dog walkers at GGNRA sites obtain a permit to walk more than three dogs, with a limit of six dogs. This would alleviate any movement of commercial dog walkers to GGNRA as a result of increased restrictions under San Francisco's recent ordinance and Presidio's proposed rule, but may possibly increase impacts at the Presidio and other dog walking areas in proximity to the GGNRA. Thus under alternatives B through F, the GGNRA proposed rule may result in additional impacts on natural resources, visitor use and experience, and park operations at nearby dog walking areas in San Francisco.

## Chapter 4: Environmental Consequences

In addition to the GGNRA proposed limits on commercial dog walking, implementation of the proposed SNRAMP (SFPD 2011) may further restrict dog access and off-leash areas in San Francisco, including Lake Merced and other natural areas. The SNRAMP proposes to permanently close the Lake Merced dog play area (DPA) (loss of 5 acres) and reduce the size of the DPAs at Bernal Hill (by 6 acres) and McLaren Park (by 8.3 acres) (SFPD 2011, 114). A total of 19.3 acres of off-leash areas would be lost as a result of the SNRAMP, though on-leash dog walking would still be allowed. There are 95.2 acres of existing DPAs in San Francisco and the SNRAMP would reduce this total by over 20 percent, leaving 75.9 acres of DPAs (SFPD 2011, 463). In addition to restricting and closing DPAs, the San Francisco Recreation and Park Commission has directed that no new DPAs are to be established until system-wide DPA planning is completed (SFPD 2011, 105). The combined reductions in off-leash areas proposed by both the SNRAMP and this draft plan/SEIS could result in an increase in dog use at the remaining DPAs managed by San Francisco Recreation and Parks Department (SFRPD), as well as other dog walking areas.

### IMPACT THRESHOLDS

Impacts to nearby dog walking areas were determined by examining the potential effects of how this draft plan/SEIS would cause dog walkers to relocate and use other, non-GGNRA dog walking areas. The impacts of these dog walking activities were conducted through a qualitative analysis of changes to natural resources, visitor use and experience, visitor safety, and park operations (including maintenance and cost) at the nearby dog walking areas. The thresholds that have been applied to these individual resource sections have been used in this analysis of impacts to the nearby dog walking areas. The intensity of each adverse impact is judged as having a minor, moderate, or major effect. Negligible impacts are neither adverse or beneficial. No impact on nearby dog walking areas may also be applicable, as noted. Detailed impacts on natural resources, visitor use and experience, and park operations at each of the nearby dog walking areas are described the first time the park is introduced but referenced to thereafter to reduce redundancy.

### NEARBY DOG WALKING AREAS IMPACT ANALYSIS BY ALTERNATIVE

**Alternative A: No Action.** Under alternative A, dog walking (both on-leash and under voice and sight control) would remain the same at all GGNRA sites. Visitors who currently walk their dogs or use regulated off-leash areas (ROLAs) at GGNRA sites would have no reason to move to nearby dog walking areas under alternative A. As a result, alternative A would have no impact on the natural resources, visitor use and experience, or health and safety at these nearby dog walking areas.

**Alternative B: NPS Leash Regulation.** Alternative B represents the NPS-wide approach to dog walking, with no ROLAs being proposed at any of the GGNRA sites. It also includes the closure of a few sites to both on and off-leash dog walking. The GGNRA sites that are currently most heavily used for off-leash dog walking are Alta Trail (high commercial use), Muir Beach, Rodeo Beach, Crissy Field, Baker Beach, Ocean Beach, and Fort Funston. Under alternative B, off-leash dog walking would not be allowed at these sites. It is possible that some visitors who currently walk their dogs off leash at these sites would continue to use these same sites for dog walking, but would leash their dogs. However, it is more likely that visitors would take their dogs to nearby off-leash dog areas. The following paragraphs describe impacts to these nearby dog walking areas as a result of changes proposed under this draft plan/SEIS for alternative B. The GGNRA sites are discussed below in order of geographic location (north to south) and only when redistribution is anticipated.

In Marin County, at Alta Trail/Orchard Fire Road/Pacheco Fire Road and Oakwood Valley, only on-leash dog walking would be allowed under alternative B. At Alta Trail and Oakwood Valley, off-leash dog walking would no longer be allowed. Commercial dog walkers that use Alta Trail in particular may move

to other lands in Marin County. Additionally, no dogs would be allowed at Marin Headlands under this alternative. As a result of alternative B, it is anticipated that visitors at these sites would go to Camino Alto Open Space Preserve and Blithedale Summit Open Space Preserve for off-leash dog walking. These preserves allow on-leash dog walking on trails, and off-leash on fire roads in Marin County. Both of these areas offer extensive trail and road systems, but overcrowding could occur, depending upon day and use time. At Camino Alto, vegetation communities along fire roads include grasslands, bay and oak woodlands, and redwood and Douglas fir forests. Blithedale Summit contains chaparral and forested habitat, including redwood groves. Adverse impacts on the natural resources at these sites would occur from physical deterioration due to this increased use by dog walkers. The mature, forested vegetation such as the redwoods would be less susceptible to trampling compared to the grassy areas and sensitive special-status plant species. Similar to the discussion at GGNRA lands, dogs could affect vegetation and soils at these sites by trampling and digging. Also, when visitors fail to comply with pet excrement removal requirements, dog waste can accumulate in the soils and affect the vegetation. At Blithedale Summit, the redwood groves provide habitat for the endangered northern spotted owl and other wildlife species. Similar to impacts stated at GGNRA, impacts to the owl would be unlikely since dogs are required to be on leash at this park. On-leash dog walking restrictions physically restrain dogs, reducing direct impacts on wildlife and wildlife habitat, and should eliminate potential chasing after wildlife. The movement of visitors to these sites for off-leash dog walking would result in overcrowding and would have a negative effect on visitor experience at these sites. Potential impacts to resources at these sites include impacts to native vegetation and endangered species habitats as stated above.

Since there would be no ROLA at Muir Beach under alternative B, it is possible that visitors from Muir Beach would go to Camino Alto Open Space Preserve (8.5 miles) or Blithedale Summit Open Space Preserve (7.3 driving miles). Similarly, visitors from Rodeo Beach may go to Camino Alto Open Space Preserve (10.6 driving miles) or Blithedale Summit Open Space Preserve (11.3 driving miles) to walk dogs off leash, thus adding to the previously described adverse impacts on the natural resources and visitor experience at these nearby dog walking areas.

Crissy Field dog walkers who want an off-leash experience would likely relocate to Alta Plaza Park (1.8 driving miles away), Golden Gate Park (5.8 driving miles away), or Mountain Lake Park (3.1 driving miles away). These sites have DPAs that would be impacted by increased visitation, affecting the visitor experience and causing natural resource degradation. Alta Plaza Park has large grassy areas within the DPA. The DPAs at Golden Gate Park encompass forested habitat (including a DPA within a natural area that contains oak woodland) and lawn areas. Mountain Lake Park contains wetland areas and wildlife habitat, but the DPA at this site is in an area of lawn and woodchips. Increased visitation from off-leash dog walking in the DPAs noted above would likely adversely impact natural resources. The grassy areas at Alta Plaza Park, Mountain Lake Park, and Golden Gate Park could be trampled due to overcrowding. These areas would become trampled and could become muddy in the winter rainy season, which may cause erosion during rain events. The more mature forested vegetation at Golden Gate Park would be less susceptible to trampling compared to the grassy areas, and monitoring of the oak woodlands would occur, as noted above (SFPD 2011, 114). Because there are no parking lots at Golden Gate and Mountain Lake Parks, finding street parking could negatively affect visitor experience, depending upon day and use times. Based on the public comments on the draft plan/EIS, visitors expressed concern with the impacts of visitors from Crissy Field going to nearby dog walking areas, such as Golden Gate Park, Alta Plaza Park, and Mountain Lake Park. Commenters noted that these nearby areas would be overcrowded, and are not viable alternatives to Crissy Field (NPS 2011a, Correspondences 4602, 1642).

Under alternative B, restrictions on off-leash dog walking could result in not only the impacts discussed at the parks above, but adverse impacts on the Presidio Area B, lands managed by the Presidio Trust that are adjacent to Crissy Field. The Presidio Trust only allows on-leash dog walking in Area B; no off-leash dog walking is allowed. The Presidio Trust has collected data regarding Area B trail use by dog walkers. This

## Chapter 4: Environmental Consequences

section describes plant communities and listed wildlife along high-use and moderate-use dog walking areas of the Presidio (Area B) that may be affected by redistribution under alternative B. Similar to GGNRA sites, since dog walkers may walk along the edge of roads or trails in the Presidio (Area B), dogs would then have access to the adjacent land in all directions, resulting in a limit of disturbance (LOD) area for vegetation and soils that would extend out from the edges of the road or trails. The following trails in Area B have a high percentage of use by dog walkers (the percentage of visitors walking dogs is greater than 30 percent): Mountain Lake Trail (Arguello Blvd. to Mountain Lake), Ecology Trail (near the South Hills housing), West Pacific Trail (Broadway Gate to Arguello Gate), the Lombard Gate Lawn, and the Bay Area Ridge Trail (Spire to Rob Hill Campground). The high-use portions of both the Mountain Lake Trail and the West Pacific Trail (with the exception of the trail around the lake) are located along developed roadways (West Pacific Avenue) and therefore support very few native plant communities. The trail around Mountain Lake supports wetlands, including an arroyo willow riparian forest, classified as an ecological forest stand of high value. The federally threatened California red-legged frog has been mapped at Mountain Lake Park in the lake area. The Lombard Gate Lawn supports grassy areas but does not contain any sensitive resources or native plant communities. Portion of the Bay Area Ridge Trail either bisect or are adjacent to ecological forest stands of high value and rare plants, including the San Francisco lessingia (federally endangered) recovery zones in the dune scrub native plant community.

Trails at the Presidio that have a moderate percentage of use by dog walkers (visitors walking dogs is between 10 and 30 percent) include El Polín Spring (near East housing), Park Trail (bisects the site from the Public Health Service District to Cavalry Stables), Fort Scott Ball Field and Parade Ground (in the northwestern portion of the site), Lobos Valley Connector and South Baker Beach Apartments Social Trails (Wedemeyer St. to Lincoln Blvd.), and the Public Health Service District/Hospital Cemetery (in the southwestern portion of the site). The trail near El Polín Spring supports perennial and seasonal wetlands as well as rare plants and forest stands of high ecological value. In the vicinity of this area, a native serpentine prairie plant community also exists. The Park Trail bisects forest stands of high ecological value (including live oak woodlands) and is located adjacent to communities of rare plants and native dune scrub communities. The Fort Scott Ball Field and Parade Ground contains no native plant communities, but is mapped as a propagule collection area by the Presidio Trust. A propagule is a vegetative structure that can become detached from a plant and give rise to a new plant, such as a seed. The Presidio of San Francisco Native Plant Nursery produces native plants from locally collected propagules for habitat restoration projects. Therefore, this area is important in the long-term success of local restoration projects. The Lobos Valley Connector and South Baker Beach Apartments Social Trails are located just north of a waterbody named Lobos Creek. The majority of these trails are located within the native dune scrub plant community and supports rare plants, including the San Francisco lessingia (federally endangered) recovery zones, as well as ecological forest stands of high value. The Public Health Service District/Hospital Cemetery is located within a native dune scrub plant community that supports rare plants, including the San Francisco lessingia (federally endangered) recovery zones as well as a small stand of live oaks. A portion of this area is mapped as a propagule collection area by the Presidio Trust.

Adverse impacts on the plant communities (and soils) along trails that are both highly and moderately used by dog walkers would occur from physical deterioration such as trampling in adjacent areas of trails/roads due an increase in use by dog walkers. When dogs are on a leash (as required throughout Area B), it is unlikely that digging or bed-making would occur due to proximity to the owner and the physical restriction of the leash. The mature, forested vegetation such as the live oaks and willows would be less susceptible to trampling compared to the grassy areas and sensitive special-status plant species (such as San Francisco lessingia) in the dune scrub plant communities. The recovery strategy for San Francisco lessingia is based on not only protecting and expanding the existing populations but also the “active reintroduction and expansion of San Francisco lessingia in unoccupied, restored or enhanced habitat within its historic range” (USFWS 2003, 51). The Presidio (Area B) supports habitat for the San

Francisco lessingia, including a small portion of the recovery zones that are located within on-leash dog walking areas (Public Health Service District, Bay Area Ridge Trail, and Lobos Valley). An increase in dog walkers within these recovery zones of Area B may reduce the potential for reintroductions of the San Francisco lessingia, but the extent of these impacts are relatively unknown. Another special-status species, the federally threatened California red-legged frog, has been mapped at Mountain Lake. However, impacts to the frog at this park would be unlikely since dogs are required on leash at this park and dogs are not allowed in the lake. The grassy areas at sites such as the Lombard Gate Lawn as well as the Fort Scott Ball Field and Parade Ground could be subjected to trampling as a result of overcrowding. These areas would become muddy in the winter rainy season which may cause erosion during rain events. Also, when visitors fail to comply with pet excrement removal requirements, dog waste can accumulate in the soils and affect the vegetation. This could occur throughout the Presidio (Area B). The on-leash dog walking restrictions that are in place at the Presidio (Area B) would physically restrain dogs, reducing direct impacts on wildlife and wildlife habitat, and should also eliminate any potential chasing after wildlife. Because of mobility, wildlife can usually avoid areas with dogs present during peak activity or habituate to these activities, but the displacement of wildlife from high quality habitat and preferred habitat that is degraded by the presence of dogs would indirectly affect wildlife. If dogs are physically restrained on leash, wildlife would be protected and it would reduce chasing after birds, but on-leash dogs would still be able to disturb wildlife and/or cause a flight response through their presence and by lunging/barking at birds. This could especially occur along the trail at Mountain Lake, where shorebirds such as terns, kingfishers, ducks, and gulls could be affected as well as neotropical migrants such as songbirds, swallows, and flycatchers (Presidio Trust 2002, Figure 22). It is possible that birds in the wooded portions of Area B such as hawks, vultures, flycatchers, owls, swallows, songbirds, and woodpeckers may be affected by on-leash dogs, but the availability of tree cover and the leash requirement should reduce these impacts. The open portions (scrub and lawn areas) of Area B support flycatchers, songbirds, quails, and swallows (Presidio Trust 2002, Figure 22), which may also be affected by dogs, but the leash requirements should not allow dogs to chase or capture ground-dwelling birds in these habitats.

In a May 25, 2011 letter, the Presidio Trust expressed concerns that a reduction in off-leash areas under the draft plan/EIS may increase [illegal] off-leash activity in the Presidio Area B, even though off-leash dog walking is not allowed in Area B. The Presidio Trust was concerned that dog walkers from GGNRA may seek off-leash dog walking in more secluded areas within the Presidio to avoid overcrowding and to be less visible to law enforcement staff. If this occurs, it is possible that an increase in Presidio park operations may be required to enforce compliance with the on-leash requirements, thus negatively affecting the Presidio's annual budget.

Visitors to Crissy Field, including commercial dog walkers, may take dogs to the Presidio Area B due to the restrictions on the number of dogs (maximum of three for all dog walkers, including commercial dog walkers) at Crissy Field under alternative B. This impact from commercial dog walkers could change when new and/or proposed rules are implemented. In 2012, the San Francisco Board of Supervisors passed an ordinance that, starting in July 2013, will require commercial dog walkers to obtain a permit to walk four or more dogs, with a limit of eight, on City of San Francisco park and port property. The Presidio Trust issued a proposed rule for public comment in November 2012 that would require all commercial dog walkers on Trust-managed land (Area B of the Presidio) to have a San Francisco City permit, and comply with all the permit conditions, including the upper limit of eight dogs (Presidio Trust 2012d, 69785).

Under alternative B, GGNRA would allow all dog walkers, commercial and private, to walk up to three dogs without a permit in all park areas open to dog walking, including Crissy Field, Fort Point and Baker Beach – all adjacent to Area B of the Presidio. Under the proposed regulation for commercial dog walking recently issued for public comment by the Presidio Trust, dog walkers in Area B of the Presidio

## Chapter 4: Environmental Consequences

would be limited to eight dogs (although the Presidio Trust may also consider adopting a six dog limit when GGNRA implements the dog management plan). Because the number of dogs allowed under the proposed restriction on commercial dog walkers on lands managed by the Presidio Trust is higher than the proposed limit of three dogs at Crissy Field in alternative B, commercial dog walkers with more than three dogs may go to Area B. An increase in commercial dog walkers with more than three dogs at Area B could result in adverse impacts to vegetation, water quality, special-status species, soils, and visitor experience at this site.

Similar to the impacts discussed above, non-commercial dog walkers may also go the Presidio Area B in order to walk more than three dogs. Visitors from other nearby GGNRA sites that want to walk more than three dogs may also go to the Presidio Area B, particularly visitors from the sites adjacent to Area B - Crissy Field, Fort Point, and Baker Beach. An increase in visitation at the Presidio Area B could result in adverse impacts to vegetation, water quality, special-status species, soils, visitor experience, and park operations at this site.

Because there would not be a ROLA at Baker Beach under alternative B, visitors wanting to walk their dogs off leash are likely to go to Golden Gate Park (2.2 driving miles) and Mountain Lake Park (1.4 driving miles), thus further exacerbating impacts on the natural resources and visitor experience at these nearby dog walking areas as described above for Crissy Field. Similar to the impacts discussed above, visitors to Baker Beach may also go to the Presidio Area B in order to walk more than three dogs, the limit for dog walkers at GGNRA sites under alternative B. An increase in visitation at the Presidio Area B would result in impacts to natural resources at the site as previously described.

Dog walking would not be allowed at Fort Miley under alternative B (alternative A allows off-leash dog walking), so it is likely that visitors would take their dogs to adjacent or nearby GGNRA sites, or possibly to nearby off-leash dog walking areas (Alta Plaza Park, Glen Canyon, and Mountain Lake Park). As a result of this redistribution, adverse impacts may occur to natural resources at nearby dog walking sites. Resource impacts as a result of overcrowding and increased dog walking include impacts to wetlands, native vegetation communities, and riparian habitat. On- and off-leash dog walking is available at these nearby dog walking sites, but only on-leash dog walking is allowed in areas with sensitive resources, reducing the potential impacts to these resources.

Visitors who prefer to walk their dogs off-leash at Ocean Beach would be likely relocate to Pine Lake/Stern Grove (3.9 driving miles away) under alternative B. This would further exacerbate impacts on the natural resources and visitor experience described at these nearby dog walking areas, particularly due to the high number of visitors that currently use Ocean Beach. The meadow plant community within the DPA at Pine Lake/Stern Grove may be adversely affected through trampling and dog waste due to increased use. However, as stated in the SNRAMP, the SFRPD would monitor dog use and impacts on the wildflower meadows in McLaren Park (SFPD 2011, 114), which should limit the extent of impacts to this plant community. Other communities that may be negatively affected by increased dog use at Pine Lake/Stern Grove include wetlands such as open water, willow scrub, and freshwater marshes. Plant communities such as riparian habitats would be less affected by dog use compared to wetlands due to the mature nature of trees associated with this habitat. Wildlife that use the open water and wetland habitats would be affected by increased dog use. This wildlife includes mobile wildlife species, particularly birds that forage, nest, and roost in the habitats at Pine Lake/Stern Grove. Because of mobility, wildlife can usually avoid areas with dogs present during peak activity or habituate to these activities, but the displacement of wildlife from high-quality habitat and preferred habitat that is degraded by the presence of dogs would indirectly affect wildlife. In addition, because Pine Lake/Stern Grove has off-leash areas available for dogs, the lack of physical restraint (leash) may allow dogs to chase and/or capture small mammals or ground-dwelling birds. At Pine Lake/Stern Grove, there is a parking lot along the road and a lot at the park. Visitor experience would be negatively affected under alternative B if street parking

cannot be found or if the parking lot is full due to the increase in dog walkers that would be redistributed to this area. As stated in public comments to the draft plan/EIS, “If use by off-leash voice-controlled dogs is drastically restricted at Ocean Beach, the DPA at Stern Grove, an area we utilize, will be very adversely impacted. Such an event happened recently when the tsunami warning closed Ocean Beach for several days. The use of the dog off-leash area at Stern Grove more than quadrupled during that time” (NPS 2011a, Correspondence 4556). It is expected that the movement of visitors to other dog parks as a result of alternative B would not have the same level of impact on nearby dog walking areas as the recent tsunami, since these sites would not be completely closed, but open to on-leash dog walking. However, because alternative B would not allow ROLAs at any of the GGNRA sites, overcrowding at Pine Lake/Stern Grove and issues with parking would be expected. Additionally, visitors may go to one of the four DPAs in Golden Gate Park (2.5 driving miles). Those DPAs may be impacted by the increased visitation in a number of ways. There are no parking lots; visitors would need to find street parking. The DPAs at Golden Gate Park encompass forested habitat as well as lawn areas. One of the DPAs at Golden Gate Park is within a natural area that contains oak woodland habitat; increased off-leash dog walking would be likely to have an adverse effect on natural resources at all of the Golden Gate DPAs. At Golden Gate Park, the grassy areas at this site could be trampled due to overcrowding, but the DPAs found in areas with more mature forested vegetation would be less susceptible to this trampling. Additionally, the SFRPD would monitor dog use and impacts on the oak woodland habitat that includes a DPA at Golden Gate Park (SFPD 2011, 114).

Under alternative B, dog walkers who currently visit Fort Funston would likely take their dogs to the DPAs at Pine Lake/Stern Grove (3.3 driving miles away), McLaren Park (6.4 driving miles away), or Bernal Heights (7.9 driving miles away) for an off-leash experience. These nearby sites would likely be the most impacted from the movement of visitors in terms of increased visitation and natural resource degradation. Specific impacts to Pine Lake/Stern Grove have been described above for Ocean Beach. Plant communities present at McLaren Park that could be adversely affected by increased dog use at the park include freshwater sources, including Gray Fox Creek, wet meadows, and a freshwater marsh, as well as associated riparian habitats (willow scrub) and wildflower meadows (SFPD 2011, 114: 214). The DPA at McLaren Park is a 59-acre hill top park within a natural area, and may become overcrowded, thus affecting open lawn areas and the nearby reservoir (although dogs are not allowed in the waterbody). The other DPA at McLaren Park may be adversely affected as well as the open lawn areas within the DPA. The lawn areas at these two DPAs could be trampled and may ultimately become muddy in the winter rainy season, which may cause erosion during rain events. The steep slopes at the hill-top park DPA may be particularly affected by erosion and runoff. Based on public comments on the draft plan/EIS, visitors may take their dogs to Bernal Hill if off-leash dog walking is reduced at Fort Funston (NPS 2011a, Correspondence 4575). The plant communities within the DPA at Bernal Hill that may be affected by increased dog use include grassy areas, scattered trees, and scrub vegetation (SFPD 2011, 117). The network of social trails that traverses the hill area would have increased use, thus further exacerbating impacts to the plant communities adjacent to the trails. Additionally, native grasslands and sensitive plant species may also be affected, although it is less likely that the urban forest at the site would be affected due to the established nature of mature trees. As a result of increased dog use at these parks under alternative B, adverse impacts would occur from physical deterioration of natural resources at Pine Lake/Stern Grove, McLaren Park, and most likely at Bernal Hill. Bernal Hill and Pine Lake are both designated as natural areas by SFRPD; Pine Lake has undergone native plant restoration. These natural areas and the restoration areas may be negatively affected under alternative B of the draft plan/SEIS. At the three sites discussed above, the existing habitats are accessible to mobile wildlife species, particularly birds that forage, nest, and roost in these habitats, which may be negatively affected by increased dog use of the sites. Because of mobility, wildlife can usually avoid areas with dogs present during peak activity or habituate to these activities, but the displacement of wildlife from high quality habitat and preferred habitat that is degraded by the presence of dogs would indirectly affect wildlife. In addition, because McLaren Park, Bernal Hill, and Pine Lake/Stern Grove have off-leash areas available for dogs, the lack of

## Chapter 4: Environmental Consequences

physical restraint (leash) may allow dogs to chase and/or capture small mammals or ground-dwelling birds. At McLaren Park, there is parking along Shelley Drive and a parking lot located near the reservoir; there are parking spaces at Bernal Hill, and at Pine Lake/Stern Grove there is a parking lot at Crestlake and Vale streets next to the DPA. Therefore, visitor experience would be negatively affected under alternative B if street parking cannot be found or if the parking lots are full due to the increase in dog walkers that would be redistributed to these sites. The SNRAMP proposes to reduce the size of the DPA at both McLaren Park and Bernal Hill; the SNRAMP does not propose to reduce the size of the DPAs at Pine Lake/Stern Grove (SFPD 2011, 114). The McLaren Park DPA will be reduced from 61.7 acres to 53.4 acres (a reduction of 8.3 acres, approximately 13 percent of total DPA area), and the Bernal Hill DPA will be reduced from 21 acres to 15 acres (a reduction of 6 acres, approximately 29 percent of total DPA area) (SFPD 2011, 114). These reductions would further crowd dogs and dog walkers into a reduced space and would result in a reduced visitor experience. In addition, commercial dog walking is considered high use at Fort Funston. Under alternative B, GGNRA would allow all dog walkers, commercial and private, to walk up to three dogs without a permit at Fort Funston. Under alternative B, no permits would be issued allowing dog walkers to have more than three dogs. This may result in an increase in commercial dog walkers with more than three dogs at the sites listed above, which could further exacerbate impacts on the natural resources and visitor experience at these nearby dog walking areas.

Under alternative B, impacts to nearby dog walking areas in San Mateo County may occur from a reduction in dog walking trails at Mori Point, Milagra Ridge, Pedro Point, and Rancho Corral de Tierra; dogs would be prohibited at Sweeney Ridge/Cattle Hill. As a result of these changes, some visitors may walk their dogs on-leash at Pacifica State Beach, Montara State Beach (including McNee Ranch), and at Sharp Park. Natural resources that may be affected by an increase in dog walking at Pacifica Beach include a wetland that provides wildlife habitat and the beach, which is home to large numbers of shorebirds, including the federally threatened western snowy plover. This beach is listed as habitat for the western snowy plover in the U.S. Fish and Wildlife Service (USFWS) recovery plan (Pacific Shorebird Alliance 2012, 1). Although off-leash dog walking is not allowed at this site, even leashed dogs on the beach could bark and/or lunge at feeding and roosting shorebirds and western snowy plovers, resulting in disturbance and/or harassment. The reproductive success of individuals of the species would not likely be affected, but the use of preferred habitat by the western snowy plover may be limited. Natural resources that may be affected by an increase in dog walking at Montara State Beach (including McNee Ranch) include a beach where seals occasionally haul out, tidepools, as well as undisturbed coastal mountain habitat. At this site, on-leash dog walking would restrain or prevent access to stranded marine mammals and marine mammals that haul out. However, even leashed dogs may disturb and cause additional stress to marine mammals as well as shorebirds that use the beach, as described above for the plover. Sweeney Ridge, Mori Point, and Milagra Ridge all border the edge of Sharp Park. Therefore, redistribution at this nearby dog walking area would be expected due to its close proximity to these GGNRA sites, even though this park was identified as an alternative site for on-leash dog walking at a very low frequency (NPS 2012a, Attachment B). On-leash dog walking is allowed at Sharp Park; there are no off-leash dog areas or DPAs within this park. Sharp Park supports numerous habits, such as wetlands and scrub vegetation and invasive forests and maintained lawns associated with a golf course. The federally endangered San Francisco garter snake and the threatened California red-legged frog both potentially occur at Sharp Park (SFRPD 2011, 37). However, the physical restraint of dogs on leash within the entire site, as well as the proposed signs and barriers at sensitive habitat should protect wetlands, waterways, the frog, and the snake at areas such as the Horse Stable Pond and Laguna Salada. Because Sharp Park is bordered by undeveloped GGNRA sites, it serves as a relatively undisturbed corridor for wildlife, particularly birds (SFPD 2011, 290). Sensitive avian species that use wetland habitats at Sharp Park, such as common yellowthroats and black-crowned night herons, should be protected by the leash requirement, even through leashed dogs can affect wildlife as previously discussed in this chapter. In addition, mammals that are known to use Sharp Park including black-tailed deer, bobcat, common porcupine, coyote, and mountain lion would also be protected by the leash requirement. Additionally, when dogs

scent mark with urine, this could either attract wildlife or cause avoidance of an area by wildlife. Finally, an increase in visitation at Pacifica State Beach, Montara State Beach (including McNee Ranch), and Sharp Park may result in overcrowding that would reduce the overall visitor experience and cause adverse impacts to natural resources as described above.

Overall, alternative B is anticipated to have long-term, moderate adverse impacts on nearby dog walking areas as a result of this draft plan/SEIS. Under alternative B, on-leash dog walking is reduced, no ROLAs are proposed, and three GGNRA sites (Marin Headlands, Fort Miley, and Sweeney Ridge/Cattle Hill) would completely prohibit dogs. Compared to alternative A, alternative B would reduce the available on-leash dog walking on trails/roads/beaches by approximately 3.37 miles and in other areas by 14.03 acres; off-leash dog walking would not be available under alternative B, reducing off-leash trails/roads/beaches by approximately 33.21 miles and other areas by 139.78 acres. Visitors who currently use GGNRA sites for off-leash dog walking would likely find other places to walk their dogs off-leash in nearby areas. The movement of these visitors, particularly from those sites that are heavily used for off-leash dog walking, would result in overcrowding at nearby parks, and would cause the physical deterioration of natural resources at these sites. These impacts would likely be most concentrated within the DPAs, which make up between 1 percent and 62 percent of each of the total park sites, as shown in table 31. The mileage of off-leash dog walking on fire roads at sites in Marin County was not readily available, and is therefore not listed in table 31.

**TABLE 31. DOG PLAY AREAS IN NEARBY DOG WALKING AREAS**

| Nearby Dog Walking Area | Total Size of Park (acres) | Size of DPA (acres) | DPA % of Total Area |
|-------------------------|----------------------------|---------------------|---------------------|
| Alta Plaza Park         | 11.9                       | 0.5                 | 4                   |
| Pine Lake/Stern Grove   | 64                         | 4                   | 6                   |
| McLaren Park            | 312                        | 59                  | 19                  |
| Bernal Heights          | 24.3                       | 15                  | 62                  |
| Mountain Lake Park      | 14                         | 0.4                 | 3                   |
| Golden Gate Park        | 1,017                      | 8.6                 | 1                   |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C provides a balance of different dog walking opportunities in all three counties. Of the sites that currently have high levels of dog walking, Rodeo Beach, Crissy Field, Ocean Beach, and Fort Funston would still have ROLAs available under alternative C, but there would be a decrease in the size of these areas compared to alternative A. It is likely that many visitors would continue to walk their dogs off-leash at these areas, but some visitors may choose to visit sites with larger, off-leash areas. Under alternative C, there would be no off-leash walking at Muir Beach and Baker Beach. It is possible that some visitors who currently walk their dogs off-leash at these sites would continue to use these same sites for dog walking, but would leash their dogs. However, it is more likely that visitors would take their dogs to nearby off-leash dog areas. The following paragraphs describe impacts to these nearby dog walking areas as a result of changes proposed under this draft plan/SEIS for alternative C. The GGNRA sites are discussed below in order of geographic location (north to south) and only when redistribution is anticipated.

Because there would not be a ROLA at Muir Beach under alternative C, it is possible that dog walkers would go to Camino Alto Open Space Preserve (8.5 miles) or Blithedale Summit Open Space Preserve (7.3 driving miles) for an off-leash (although non-beach) experience in a large area, or Rodeo Beach for an off-leash beach experience. Impacts from increased visitation would be similar to those discussed for alternative B under Muir Beach. Dog walkers using Rodeo Beach are likely to continue to use Rodeo

## Chapter 4: Environmental Consequences

Beach for off-leash and on-leash dog walking, since the ROLA under this alternative includes the entire main beach.

Under alternative C, dogs would not be allowed off-leash at Marin Headlands or Alta Trail/Orchard Fire Road/Pacheco Fire Road. Commercial dog walkers that use Alta Trail in particular, may move to other lands in Marin County. Impacts to nearby dog walking areas (Camino Alto Open Space Preserve and Blithedale Summit Open Space Preserve) are anticipated to be similar to those discussed under alternative B, though impacts may be lessened because dog walkers at Oakwood Valley are not expected to go to nearby dog walking sites as off-leash dog walking would still be allowed.

For Crissy Field, it is most likely that visitors would continue to use the site for off-leash dog walking, despite the decrease in area available for off-leash dog walking (ROLAs). However, some visitors may choose to go to other sites for off-leash dog walking. Dog walkers from Crissy Field preferring off-leash dog walking would most likely relocate to Alta Plaza Park (1.8 driving miles away), Golden Gate Park (5.8 driving miles away), and Mountain Lake Park (3.1 driving miles away). Impacts to these sites are listed above under alternative B, but impacts are anticipated to be reduced under alternative C, since fewer visitors would come to these sites from Crissy Field. Under alternative C, visitors would be allowed to walk up to three dogs without a permit, but could apply for a permit to walk up to six dogs at several sites, including Crissy Field. As discussed for alternative B, restrictions on off-leash dog walking could result in adverse impacts on the Presidio Area B, lands managed by the Presidio Trust. The Presidio Trust expressed concerns that a reduction in areas available for dog walking could result in an increase in noncompliant off-leash dog walkers in the Presidio Area B, particularly in more secluded areas. Additionally, visitors to Crissy Field, including commercial dog walkers, may take dogs to the Presidio Area B (the Presidio Trust has proposed adopting the City of San Francisco's permit for commercial dog walking, which has a limit of eight dogs, but the Presidio Trust may also consider adopting a lower limit once the GGNRA plan/SEIS is finalized) due to the restrictions on the number of dogs at Crissy Field under alternative C (a limit of six dogs is proposed). An increase in commercial dog walkers with more than six dogs at Area B could result in adverse impacts to vegetation, soils, wildlife, special-status species, visitor experience, and park operations at this site. Impacts would be similar to those described in detail for alternative B, although impacts would be reduced since off-leash dog walking would be allowed under alternative C. Non-commercial dog walkers who wish to walk more than six dogs may go to the Presidio Area B, including visitors from other GGNRA sites near Area B, such as Baker Beach, Crissy Field, and Fort Point. As stated in alternative B, the Presidio Trust expressed concerns that a reduction in off-leash areas under the draft plan/EIS may increase [illegal] off-leash activity in the Presidio Area B, even though off-leash dog walking is not allowed in Area B (May 25, 2011 letter). The Presidio Trust was concerned that dog walkers from GGNRA may seek off-leash dog walking in more secluded areas within the Presidio to avoid overcrowding and to be less visible to law enforcement staff. If this occurs, it is possible that an increase in Presidio park operations may be required to enforce compliance with the on-leash requirements, thus negatively affecting the Presidio's annual budget.

For Baker Beach, where off-leash dog walking would not be allowed under alternative C, dog walkers who want an off-leash experience would likely relocate to Mountain Lake Park (1.4 driving miles) or Golden Gate Park (2.2 driving miles). These sites have DPAs that would be impacted from the movement of visitors in terms of increased visitation and natural resource degradation, as mentioned under alternative B. Increased visitation from off-leash dog walking in these DPAs would likely adversely impact natural resources.

At Fort Miley, off-leash dog walking would be restricted to on-leash in one trail corridor under alternative C. It is anticipated that some visitors, particularly those who prefer to walk their dogs off-leash, may go to nearby dog walking areas that provide an off-leash dog walking experience, including Alta Plaza Park, Golden Gate Park, Glen Canyon, and Mountain Lake Park. All of these sites have DPAs for off-leash dog

walking. Resource impacts as a result of overcrowding and increased dog walking, include impacts such as trampling, digging and dog waste in the native vegetation communities and riparian habitat at the DPAs listed above. Both on-leash and off-leash dog walking is available at these nearby dog walking sites, but only on-leash dog walking is allowed in areas with sensitive resources, reducing the potential impacts to these resources. Impacts to resources would be similar to those described in detail by area under alternative B. Visitors preferring to walk their dogs on leash may not relocate to nearby dog walking areas under alternative C because Fort Miley would allow some on-leash dog walking under this alternative, thus reducing the potential adverse impacts.

Under alternative C, some visitors who walk their dogs off leash at Ocean Beach may go to Pine Lake/Stern Grove (3.9 driving miles away). However, it is expected that most visitors would continue to use Ocean Beach for off-leash dog walking under alternative C, since it is likely that they prefer a beach experience. If visitors move to Pine Lake/Stern Grove, it would further exacerbate impacts on the natural resources and visitor experience. Visitors from Ocean Beach may go to one of the four DPAs at Golden Gate Park (2.5 driving miles away) for an off-leash experience. The impacts resulting from increased visitation at Golden Gate Park would be similar to the impacts described under alternative B, but these impacts would be reduced under alternative C, since fewer visitors would go to these sites from Ocean Beach. At Golden Gate Park, there are no parking lots, so visitors would need to find street parking. The DPAs at Golden Gate Park encompass forested habitat and lawn areas. One of the DPAs at Golden Gate Park is within a natural area that contains oak woodland habitat; increased off-leash dog walking would be likely to have an adverse effect on natural resources at all of the Golden Gate DPAs. At Golden Gate Park, the grassy areas could be trampled due to overcrowding, but the DPAs in areas with more mature forested vegetation would be less susceptible to trampling.

Visitors who currently visit Fort Funston would likely continue to take their dogs to Fort Funston for off-leash dog walking, despite the decrease in the size of the area open to off-leash dog walking (ROLA). However, some visitors may choose to visit nearby dog walking sites for off-leash dog walking under alternative C. Those visitors would likely go to the DPAs at Pine Lake/Stern Grove, McLaren Park, or Bernal Heights for an off-leash experience in a large area, even though these sites would not offer a beach experience. Impacts at these sites would be the same as those listed under alternative B, but would be reduced under alternative C, since fewer visitors from Fort Funston are anticipated to go to these sites and there would be less overcrowding. However, commercial dog walking is considered a high use at Fort Funston. Under alternative C, commercial dog walkers with a permit are limited to six dogs. This limit would result in an increase in commercial dog walkers at the sites listed above where commercial dog walkers would be allowed to have up to eight dogs. That additional relocation could further exacerbate impacts on the natural resources and visitor experience at these nearby dog walking areas.

Overall, alternative C is anticipated to have long-term, minor to moderate adverse impacts on nearby dog walking areas as a result of this draft plan/SEIS. Impacts to these areas under alternative C are expected to be reduced compared to alternative B, since on-leash and off-leash dog walking would still be available at GGNRA sites, but reduced in total mileage/acreage. Only a very small number of sites would be closed to dogs under alternative C, and this alternative establishes ROLAs at several sites. Compared to alternative A, alternative C would reduce the available on-leash dog walking on trails/roads/beaches by approximately 1.76 miles and in other areas by approximately 40.81 acres; off-leash dog walking would be reduced on trails/roads/beaches by approximately 30.1 miles and in other areas by approximately 110.66 acres. Visitors who currently use GGNRA sites for off-leash dog walking would most likely continue to walk their dogs at GGNRA sites that with ROLAs for off-leash dog walking. However, some visitors may find other places to walk their dogs off-leash in nearby areas. The movement of these visitors, particularly from those sites that are most heavily used for recreation but no longer allow for off-leash dog walking, would result in overcrowding at nearby parks. This would likely cause physical

## Chapter 4: Environmental Consequences

deterioration of natural resources at these sites and would have impacts to the visitor experience. These impacts would likely be most concentrated within the DPAs.

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Alternative D is the alternative that is most protective of resources and visitor safety. Of the sites that currently have high levels of dog walking, Crissy Field and Fort Funston, would still have ROLAs under alternative D, but there would be a noticeable decrease in the size of these areas. It is likely that many visitors would continue to walk their dogs off leash at these areas, but some visitors may choose to visit sites with larger off-leash areas. Baker Beach, Rodeo Beach, Ocean Beach, and Muir Beach would no longer allow for off-leash dog walking under alternative D. It is possible that some visitors who currently walk their dogs off leash at these sites would continue to use these same sites for dog walking, but would leash their dogs. However, it is possible that visitors would take their dogs to nearby off-leash dog areas. The following paragraphs describe impacts to these nearby dog walking areas as a result of changes proposed under this draft plan/SEIS for alternative D. The GGNRA sites are discussed below in order of geographic location (north to south) and only when redistribution is anticipated.

Under alternative D, off-leash dog walking would be prohibited at Oakwood Valley, and no dogs would be permitted at Marin Headlands, Alta Trail, Orchard Fire Road, or Pacheco Fire Road. Commercial dog walkers that use Alta Trail in particular would likely move to other lands in Marin County. Impacts to nearby dog walking areas (Camino Alto Open Space Preserve and Blithedale Summit Open Space Preserve) are anticipated to be similar to those under alternative B. However the sites may experience higher visitation under alternative D because the Marin Headlands and Alta Trail sites would not allow dogs. This may slightly increase adverse impacts at nearby dog walking areas described under alternative B.

Because there would not be a ROLA at Muir Beach under alternative D, it is possible that visitors would go to Camino Alto Open Space Preserve (8.5 miles) or Blithedale Summit Open Space Preserve (7.3 driving miles). Similarly, Rodeo Beach would not have a ROLA and visitors would likely go to Camino Alto Open Space Preserve (10.6 driving miles) or Blithedale Summit Open Space Preserve (11.3 driving miles) to walk dogs off leash, which could result in overcrowding depending upon day and use time. An off-leash beach experience similar to Muir Beach and Rodeo Beach is not available in Marin County. The increased use predicted at Camino Alto and Blithedale Summit would likely result in adverse impacts to these sites from the physical deterioration of natural resources and visitor experience, as described for alternative B.

Under alternative D at Crissy Field, it is most likely that visitors would continue to use the site for off-leash dog walking, despite the noticeable decrease in off-leash dog walking areas (15.4 acres of ROLAs exist under alternative D at Crissy Field, which is a decrease of 23.2 acres compared to alternative A). However, some visitors may instead choose to go to other sites for off-leash dog walking. Visitors would most likely relocate to Alta Plaza Park (1.8 driving miles away), Golden Gate Park (5.8 driving miles away), and Mountain Lake Park (3.1 driving miles away). Impacts to these sites are listed under alternative B would be elevated under alternative D, since additional dog walkers may relocate to these sites from Crissy Field. Similar to alternative B, visitors would be able to walk up to three dogs without a permit at Crissy Field under alternative D, but no commercial dog walking would be allowed. Visitors from Crissy Field who wish to walk more than three dogs may go to the Presidio Area B. Additionally, commercial dog walkers may take dogs to the Presidio Area B (a limit of eight dogs is proposed, but the Presidio Trust may consider ultimately adopting a lower limit as a result of no commercial dog walking proposed at GGNRA under alternative D). As a result of these changes, an increase in noncompliant off-leash dog walking at the Presidio Area B could occur, particularly in more secluded areas. An increase in commercial dog walkers at Area B could result in adverse impacts to vegetation, water quality, special-status species, soils, and visitor experience at this site. Non-commercial dog walkers who wish to walk

more than three dogs may go to the Presidio Area B, including visitors from other GGNRA sites adjacent to Presidio Area B such as Baker Beach, Crissy Field, and Fort Point.

At Baker Beach, visitors who want an off-leash experience would likely relocate to Mountain Lake Park (1.4 driving miles) and Golden Gate Park (2.2 driving miles). These sites have DPAs that would be impacted from the movement of visitors in terms of increased visitation and natural resource degradation, as mentioned in alternative B. Increased visitation from off-leash dog walking in the DPA would be likely to adversely impact natural resources. Similar to the impacts discussed above, visitors may go to the Presidio Area B in order to walk more than three dogs, the limit for dog walkers under alternative D. Visitors from other nearby GGNRA sites that want to walk more than three dogs may go to the Presidio Area B, including visitors from Crissy Field and Fort Point. An increase in visitation at the Presidio Area B would result in impacts to natural resources at the site.

Under alternative D, dog walking would no longer be allowed at Fort Miley, and it is likely that visitors would take their dogs to nearby GGNRA sites or to nearby dog walking areas outside of GGNRA, such as the DPAs at SFRPD sites, Golden Gate Park, Alta Plaza Park, Glen Canyon, and Mountain Lake Park. As a result of this redistribution, adverse impacts may occur to natural resources at nearby dog walking sites. Impacts would be similar to those described under alternative B.

Some visitors who prefer to walk their dogs off leash at Ocean Beach would likely go to the DPAs in Pine Lake/Stern Grove (3.9 driving miles away) under alternative D. This site has DPAs that would be impacted from increased visitation and natural resource degradation, as mentioned in alternative B. Increased visitation from off-leash dog walking in the DPAs would likely adversely impact natural resources found at Pine Lake/Stern Grove. Visitors from Ocean Beach may go to DPAs in Golden Gate Park (2.5 driving miles away). The impacts of overcrowding in the DPAs at this site are anticipated to be similar to the impacts discussed in alternative B. Under alternative D, some visitors would likely continue to take their dogs to Fort Funston for off-leash dog walking, but with the noticeable reduction of area open to dog walking under voice control at that site, other visitors may choose to visit nearby dog walking sites for off-leash dog walking. These visitors would likely go to the DPAs mentioned under alternative B: Pine Lake/Stern Grove, McLaren Park, or Bernal Heights. Impacts at these sites would be similar to those listed under alternative B, but would be somewhat reduced under alternative D, as fewer visitors from Fort Funston are anticipated to go to these sites because a ROLA would be available under alternative D. In addition, commercial dog walking is considered high use at Fort Funston. Under alternative D, no commercial dog walking would be allowed. This would result in an increase in commercial dog walkers at the sites mentioned above, which would further exacerbate impacts on the natural resources and visitor experience at these nearby dog walking areas.

In San Mateo County, alternative D would result in impacts to nearby dog walking areas. Under alternative D, dog walking would only be allowed at Rancho Corral de Tierra. Dogs would be prohibited at all other GGNRA sites in San Mateo County. Visitors that use these San Mateo sites (Mori Point, Milagra Ridge, Sweeney Ridge and Cattle Hill, and Pedro Point Headlands) are anticipated to walk their dogs at Rancho Corral de Tierra or other nearby dog walking areas. Although visitation at most of these GGNRA sites is low, impacts may occur at the following sites: Pacifica State Beach, Montara State Park (including McNee Ranch), Sharp Park, and Half Moon Bay (Surfers Beach and the volunteer-run dog park in Half Moon Bay). An increase in visitation at these sites under alternative D may result in adverse impacts as a result of physical deterioration of natural resources as previously described with the exception of Half Moon Bay. Adverse impacts at Pacifica State Beach, Montara State Park (including McNee Ranch), and Sharp Park would be similar to impacts described under alternative B at these three sites. Natural resources that may be affected by an increase in dog walking at Half Moon Bay include beach habitat, which is home to large numbers of shorebirds, including the federally threatened western snowy plover as well as western, California, and glaucous-winged gulls; brown pelicans; and sanderlings

## Chapter 4: Environmental Consequences

(California State Parks 2005, 4). Although off-leash dog walking is not allowed at this site, even leashed dogs on the beach could bark and/or lunge at feeding and roosting shorebirds and western snowy plovers, resulting in disturbance and/or harassment; the reproductive success of individuals of the species would not likely be affected, but the use of preferred habitat by the western snowy plover may be limited. The plant communities of Half Moon Bay Beach include many non-native plant species (California State Parks 2005, 4) that would not likely be affected by dogs on the beach due to the leash requirement. In addition, an increase in visitation at Half Moon Bay, Pacifica State Beach, Montara State Beach (including McNee Ranch), and Sharp Park may result in overcrowding that would reduce the overall visitor experience and cause adverse impacts to natural resources as described in alternative B.

Overall, alternative D is anticipated to have long-term, moderate to major adverse impacts on nearby dog walking areas as a result of this draft plan/SEIS. Under alternative D, on-leash dog walking is reduced, the number and size of ROLAs are reduced, and nine GGNRA sites (Stinson Beach, Alta Trail, Marin Headlands, Fort Miley, Sutro Heights, Mori Point, Milagra Ridge, Sweeney Ridge/Cattle Hill, and Pedro Point) would completely prohibit dogs. Compared to alternative A, alternative D would reduce the available on-leash dog walking on trails/roads/beaches by approximately 20.09 miles and in other areas by approximately 62.72 acres; off-leash dog walking would be reduced on trails/roads/beaches by approximately 33.21 miles and in other areas by approximately 117.2 acres. Under alternative D, commercial dog walking would not be allowed, so these dog walkers would relocate to other nearby dog walking areas, including the City of San Francisco and the Presidio Area B. As a result, this alternative could have up to major, adverse impacts to nearby dog walking areas. Visitors and commercial dog walkers who currently use GGNRA sites for off-leash dog walking would most likely find other places to walk their dogs off-leash in nearby areas. The movement of private and commercial dog walkers, particularly from those GGNRA sites that are most heavily used for dog walking, would likely result in overcrowding at nearby parks, and would cause the physical deterioration of natural resources at these sites. Overcrowding would also have impacts on the visitor experience at these sites. These impacts would likely be most concentrated within the DPAs.

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E offers the most dog walking access to GGNRA areas, while still providing protection for natural and cultural resources, and recreational experiences for all user groups. The area available for walking dogs off-leash at Muir Beach would be significantly reduced under alternative E. It is possible that some visitors who currently walk their dogs off-leash at Muir Beach would continue to use this site for dog walking, but with the reduced area, it is also likely that some visitors would take their dogs to the nearby off-leash dog areas described in more detail in the paragraphs that follow. Of the sites that currently have high levels of dog walking, Rodeo Beach would have the same access as is currently available under alternative A. It is anticipated that there would be no change in dog walking visitation related to this site. Crissy Field, Fort Funston, Baker Beach, and Ocean Beach would all have ROLAs under alternative E, but there would be some decrease in size of these off-leash areas compared to alternative A. It is most likely that many visitors would continue to walk their dogs off-leash at these areas, but some visitors may choose to visit sites with larger off-leash areas. The following paragraphs describe impacts to these nearby dog walking areas as a result of changes proposed under this draft plan/SEIS for alternative E. The GGNRA sites are discussed below in order of geographic location (north to south) and only when redistribution is anticipated.

Off-leash dog walking would not be permitted at Alta Trail, Orchard Fire Road, Pacheco Fire Road, or Marin Headlands Trails under alternative E, but the miles available for on-leash dog walking would increase. Commercial dog walkers that use Alta Trail in particular may move to other lands in Marin County. It is anticipated that visitors who want an off-leash dog walking experience would relocate to Camino Alto Open Space Preserve or Blithedale Summit Open Space Preserve for off-leash dog walking.

Impacts to natural resources at these sites as a result of increased visitation and overcrowding are anticipated to be similar to the impacts described under alternative B.

Under alternative E, since the area available for off-leash dog walking at Muir Beach ROLA would be significantly reduced, it is anticipated that visitors wishing to walk their dogs off leash would go to the larger off-leash areas Camino Alto Open Space Preserve (8.5 miles) and Blithedale Summit Open Space Preserve (7.3 driving miles). Impacts at these sites from increased visitation are expected to be the same as impacts discussed under alternative B.

It is most likely that visitors would continue to use Crissy Field for off-leash dog walking, despite the decrease in size of the area available for off-leash dog walking (ROLAs). However, some visitors may choose to go to other sites for off-leash dog walking. Visitors would most likely relocate to Alta Plaza Park (1.8 driving miles away), Golden Gate Park (5.8 driving miles away), and Mountain Lake Park (3.1 driving miles away), although these areas do not provide a beach experience. Impacts to these sites are listed under alternative B, but impacts under alternative E are anticipated to be less adverse than under alternative B because fewer visitors would likely relocate to these sites from Crissy Field. Under alternative E, private and commercial dog walkers would be allowed to walk up to three dogs without a permit, but could apply for a permit to walk up to six dogs at seven park sites, including Crissy Field. As discussed under alternative B, restrictions on off-leash dog walking could result in adverse impacts on the Presidio Area B, lands managed by the Presidio Trust. Adverse impacts on the plant communities (and soils) within the Presidio Area B along trails that are both highly and moderately used by dog walkers would occur from physical deterioration such as trampling in adjacent areas of trails/roads due an increase in use by dog walkers. Also, when visitors fail to comply with pet excrement removal requirements, dog waste can accumulate in the soils and affect the vegetation. The mature, forested vegetation such as the live oaks and willows would be less susceptible to trampling compared to the grassy areas and sensitive special-status plant species in the dune scrub plant communities in Area B. An increase in dog walkers within the recovery zones for the San Francisco lessingia of Area B may reduce the potential for reintroduction of the San Francisco lessingia, but the extent of this impact is relatively unknown. Impacts to the federally threatened California red-legged frog would be unlikely since dogs are required on leash at this park and dogs are not allowed in the lake where the frog occurs. The grassy areas at sites such as the Lombard Gate Lawn and the Fort Scott Ball Field and Parade Ground could be subjected to trampling as a result of overcrowding. These areas would become muddy in the winter rainy season which may cause erosion during rain events. This could occur throughout the Presidio (Area B). The on-leash dog walking restrictions that are in place at the Presidio (Area B) would physically restrain dogs, reducing direct impacts on wildlife and wildlife habitat, and should also eliminate potential chasing after wildlife, but on-leash dogs would still be able to disturb wildlife and/or cause a flight response through their presence and by lunging or barking at birds.

As stated previously, the Presidio Trust expressed concerns that a reduction in off-leash areas under the draft plan/EIS may increase [illegal] off-leash activity in the Presidio Area B, even though off-leash dog walking is not allowed in Area B (May 25, 2011 letter). The Presidio Trust was concerned that dog walkers from GGNRA may seek off-leash dog walking in more secluded areas within the Presidio to avoid overcrowding and to be less visible to law enforcement staff. If this occurs, it is possible that an increase in Presidio park operations may be required to enforce compliance with the on-leash requirements, thus negatively affecting the Presidio's annual budget. Additionally, private and commercial dog walkers wanting to walk more than six dogs may relocate to the Presidio Area B or other SFRPD DPAs (which would allow up to eight dogs) due to the limit on the number of dogs allowed per dog walker under alternative E. This could result in adverse impacts to vegetation, water quality, special-status species, soils, and visitor experience in Area B of the Presidio. Private and commercial dog walkers currently using Baker Beach who wish to walk more than six dogs may also go to the Presidio Area B.

## Chapter 4: Environmental Consequences

It is likely that visitors would continue to walk their dogs off-leash at Baker Beach, despite the decrease in the area available for off-leash dog walking (ROLA). Some visitors may choose to go to other sites for off-leash dog walking. These visitors would likely relocate to Mountain Lake Park (1.4 driving miles) and Golden Gate Park (2.2 driving miles). These sites have DPAs that would be impacted from the movement of visitors in terms of increased visitation and natural resource degradation, as mentioned above in alternative B, but impacts are expected to be less adverse under alternative E because fewer visitors would be likely to go to these sites. Similar to Crissy Field, private and commercial dog walkers wanting to walk more than six dogs at Baker Beach may relocate to SFRPD DPAs (which would allow up to eight dogs), or possibly Area B to illegally walk off-leash dogs, which may impact park operations and negatively affect the Presidio's annual budget.

Under alternative E, off-leash dog walking would no longer be permitted at Fort Miley, and it is anticipated that visitors may go to nearby dog walking areas to walk their dogs off leash. Impacts from an increase in visitors at nearby parks (Golden Gate Park, Alta Plaza Park, Glen Canyon, and Mountain Lake Park) are anticipated to be similar to those discussed under alternative C.

Availability of off-leash dog walking on Ocean Beach would be reduced, but dog walking on leash would be allowed in a large area. Some visitors who walk their dogs off-leash at Ocean Beach may also go to Pine Lake/Stern Grove (3.9 driving miles away), though most dog walkers currently using Ocean Beach are anticipated to continue to use Ocean Beach for off-leash dog walking under alternative E. If visitors choose to go to Pine Lake/Stern Grove, it would further exacerbate impacts on the natural resources and visitor experience. Impacts from the increase in visitation at these sites would be similar to the impacts listed above for Fort Funston. Dog walkers from Ocean Beach may also go to Golden Gate Park (2.5 driving miles away). The impacts resulting from increased visitation at Golden Gate Park would be similar to the impacts described under alternative B, but these impacts would be less adverse under alternative E because fewer visitors from Ocean Beach are anticipated to find dog walking elsewhere.

Under alternative E, visitors who currently visit Fort Funston would likely continue to take their dogs to Fort Funston for off-leash dog walking, although the area open to off-leash dog walking (ROLAs) would be somewhat reduced. However, some visitors may choose to visit nearby dog walking sites for off-leash dog walking under alternative E as well. These visitors would likely go to the DPAs at Pine Lake/Stern Grove (3.3 driving miles away), McLaren Park (6.4 driving miles away), or Bernal Heights (7.9 driving miles away) for an off-leash experience. Impacts at these sites would be the same as those listed under alternative B, but would be less adverse under alternative E because fewer visitors from Fort Funston are anticipated to relocate under this alternative. Commercial dog walking is considered high use at Fort Funston. Under alternative E, commercial and private dog walkers would be limited to six dogs under the permit required to walk more than three dogs. This limit may result in an increase in commercial dog walkers at the sites listed above, where the limit of dogs is higher (eight), which could further exacerbate impacts on the natural resources and visitor experience at these nearby dog walking areas.

Overall, alternative E is anticipated to have long-term, minor adverse impacts on nearby dog walking areas as a result of this draft plan/SEIS. None of the sites would be entirely closed to dogs under alternative E, all of the sites would allow on-leash dog walking, and many sites would have ROLAs. Commercial dog walking and permits to allow commercial and private dog walkers to have up to six dogs would be allowed under alternative E. Compared to alternative A, alternative E would increase the available on-leash dog walking on trails/roads/beaches by approximately 22.7 miles but would decrease on-leash dog walking in other areas by approximately 49.92 acres; off-leash dog walking would be reduced on trails/roads/beaches by approximately 29.71 miles and in other areas by approximately 86.42 acres. Most visitors who currently use GGNRA sites for off-leash dog walking would continue to walk their dogs at the GGNRA sites, while some may find other places to walk their dogs off-leash in the few nearby areas that have more off-leash acreage. The movement of these visitors, particularly from those

sites that are most heavily used for recreation, would result in some overcrowding at nearby parks, and would cause some physical deterioration of natural resources at these sites. These impacts would likely be most concentrated within the DPAs. However, the movement of visitors is anticipated to be low, since most GGNRA sites would provide sizeable amounts of off-leash dog walking. Thus, the level of impacts would be less than other action alternatives and a negligible to long-term, minor adverse impact is appropriate.

**Alternative F: Preferred Alternative.** Alternative F is the preferred alternative, and was developed in part in response to public comments received on the draft plan/EIS and consideration of additional data and studies. The preferred alternative includes balanced visitor use by county for dog walkers (provides on-leash dog walking areas and dog walking under voice and sight control in ROLAs) as well as providing for protection of natural resources and visitor safety. Of the sites that currently have high levels of dog walking, Crissy Field, Fort Funston, Ocean Beach, and Rodeo Beach all would still have off-leash dog walking (in ROLAs), but these off-leash areas would be reduced in size. Muir Beach and Baker Beach would no longer have off-leash dog walking under the preferred alternative. It is possible that some dog walkers who currently walk their dogs off-leash at these sites would continue to use these same sites for dog walking, but would leash their dogs. However, it is also possible that visitors would take their dogs to nearby off-leash dog areas. The following paragraphs describe impacts to these nearby dog walking areas as a result of changes proposed under this draft plan/SEIS for the preferred alternative. The GGNRA sites are discussed in order of geographic location (north to south) and only when redistribution is anticipated.

Under the preferred alternative, off-leash dog walking would not be permitted at Alta Trail, Orchard Fire Road, Pacheco Fire Road, Oakwood Valley, or Marin Headlands Trails; except for Marin Headlands Trails, the available on-leash dog walking would increase at these sites. Commercial dog walkers that use Alta Trail in particular may move to other lands in Marin County. It is anticipated that dog walkers who wanted an off-leash dog walking experience would go to Camino Alto Open Space Preserve, or Blithedale Summit Open Space Preserve for off-leash dog walking. Impacts to natural resources at these sites as a result of increased visitation and overcrowding are anticipated to be similar to, or somewhat less than, the impacts described under alternative B since the preferred alternative allows dogs at Marin Headlands.

Because there would not be a ROLA at Muir Beach under the preferred alternative, it is anticipated that dog walkers preferring an off-leash site would go to Camino Alto Open Space Preserve (8.5 miles) and Blithedale Summit Open Space Preserve (7.3 driving miles) for a non-beach experience in a large area, or dog walkers would go to Rodeo Beach for an off-leash beach experience. Impacts at these non-GGNRA sites from increased visitation are expected to be less than the impacts discussed under alternative B because the increase in visitation is not expected to be high. Under the preferred alternative there would be a large ROLA at this site and at other GGNRA sites further south whereas there would be no ROLAs at any GGNRA sites under alternative B. Dog walkers using Rodeo Beach are likely to continue to use Rodeo Beach for off-leash and on-leash dog walking, since the ROLA under this alternative includes the entire main beach.

For Crissy Field, it is most likely that visitors would continue to use the site for off-leash dog walking, despite the decrease in the area available for off-leash dog walking compared to alternative A. However, some visitors may choose to go to other sites for off-leash dog walking. Visitors would most likely relocate to Alta Plaza Park (1.8 driving miles away), Golden Gate Park (5.8 driving miles away), and Mountain Lake Park (3.1 driving miles away). Impacts to these sites are listed under alternative B, but impacts under alternative F are anticipated to be less adverse than under alternative B because fewer visitors would relocate to these sites from Crissy Field. Under the preferred alternative, both private and commercial dog walkers would be allowed to walk up to three dogs without a permit, but could apply for

## Chapter 4: Environmental Consequences

a permit to walk up to six dogs at seven park sites, including Crissy Field. As discussed under alternative B, restrictions on off-leash dog walking could result in adverse impacts on the Presidio Area B, lands managed by the Presidio Trust. The Presidio Trust expressed concerns that a reduction in areas available for dog walking could result in an increase in noncompliant off-leash dog walkers at the Presidio Area B, particularly in more secluded areas. Additionally, private and commercial dog walkers wanting to walk more than six dogs may take dogs to the Presidio Area B (a limit of eight dogs is proposed, but the Presidio Trust may consider adopting a lower limit once the GGNRA final regulation for dog walking is in place) due to the restriction of no more than six dogs, with a permit, under the preferred alternative. These dog walkers could relocate from GGNRA sites near Presidio Area B, including Crissy Field, Fort Point, and Baker Beach. An increase in dog walkers with more than six dogs at Area B could result in adverse impacts to vegetation, water quality, special-status species, soils, and visitor experience at this site. As stated previously, the Presidio Trust expressed concerns that a reduction in off-leash areas under the draft plan/EIS may increase [illegal] off-leash activity in the Presidio Area B, even though off-leash dog walking is not allowed in Area B (May 25, 2011 letter). The Presidio Trust was concerned that dog walkers from GGNRA may seek off-leash dog walking in more secluded areas within the Presidio to avoid overcrowding and to be less visible to law enforcement staff. If this occurs, it is possible that an increase in Presidio park operations may be required to enforce compliance with the on-leash requirements, thus negatively affecting the Presidio's annual budget.

Under the preferred alternative, there would not be a ROLA at Baker Beach, although on-leash dog walking would be allowed at a large section of the beach. Thus dog walkers may choose to continue to use Baker Beach, but with their dogs on-leash, or they may go to other sites for off-leash dog walking. These visitors would likely relocate to Mountain Lake Park (1.4 driving miles) and Golden Gate Park (2.2 driving miles). These sites have DPAs that would be impacted from the relocation of visitors in terms of increased visitation and natural resource degradation, as mentioned in alternative B. These impacts are expected to be reduced under the preferred alternative (compared to alternative B) because fewer visitors would be likely to go to these sites, since under the preferred alternative there would be ROLAs at other GGNRA sites but there would not be ROLAs at any GGNRA sites under alternative B.

Under the preferred alternative (alternative F), off-leash dog walking would not be permitted at Fort Miley, and it is anticipated that visitors may go to nearby dog walking areas for off-leash dog walking. Impacts from an increase in visitors at nearby parks (Golden Gate Park, Alta Plaza Park, Glen Canyon, and Mountain Lake Park) are anticipated to be similar to those discussed under alternative C.

Under the preferred alternative, there would be a ROLA at Ocean Beach, but the area would be reduced from the current area allowed for off-leash use. Although many dog walkers will likely continue to use Ocean Beach for walking their dogs without a leash, some may also go to Pine Lake/Stern Grove (3.9 driving miles away). If visitors choose to go to Pine Lake/Stern Grove, it would further exacerbate impacts on the natural resources and visitor experience. Impacts from the increase in visitation at these sites would be similar to the impacts listed below for Fort Funston. Visitors from Ocean Beach may go to Golden Gate Park (2.5 driving miles away). The impacts resulting from increased visitation at Golden Gate Park would be similar to the impacts described under alternative B, but these impacts would be less adverse under the preferred alternative since under the preferred alternative there would be ROLAs at Ocean Beach and other GGNRA sites, whereas there would be no ROLAs under alternative B.

Visitors who currently visit Fort Funston would likely continue to take their dogs to Fort Funston for off-leash dog walking, despite the decrease in the area available for off-leash dog walking, compared to alternative A. However, some visitors may choose to visit nearby dog walking sites for off-leash dog walking, likely the DPAs at Pine Lake/Stern Grove (3.3 driving miles away), McLaren Park (6.4 driving miles away), or Bernal Heights (7.9 driving miles away) for an off-leash experience. Impacts at these sites would be the same as those listed under alternative B, including impacts to natural areas. However, the

impacts would be less adverse under the preferred alternative because fewer visitors from Fort Funston are anticipated to relocate to these sites. However, commercial dog walking is considered high use at Fort Funston. Under the preferred alternative, commercial dog walkers with a permit are limited to six dogs. This limit would result in an increase in commercial dog walkers at the sites listed above, which are managed by SFRPD and where the limit on commercial dog walkers is eight dogs per person. The additional increase of commercial dog walkers could further exacerbate impacts on the natural resources and visitor experience at these nearby dog walking areas.

Overall, the preferred alternative is anticipated to have long-term, minor to moderate adverse impacts on nearby dog walking areas as a result of this draft plan/SEIS. Most visitors who currently use GGNRA sites for off-leash dog walking would likely continue to walk their dogs at the GGNRA sites where they currently walk, while some may decide to walk their dogs off-leash in nearby areas. There would be ROLAs at five GGNRA sites, including a newly established ROLA at Fort Mason. None of the GGNRA sites evaluated in this draft plan/SEIS would prohibit dogs under the preferred alternative and commercial dog walking, and permits for commercial and private dog walkers to have up to six dogs would be allowed, as previously discussed. Compared to alternative A, the preferred alternative would increase the available on-leash dog walking on trails/roads/beaches by approximately 3.17 miles but would decrease on-leash dog walking in other areas by approximately 26.67 acres; off-leash dog walking would be reduced on trails/roads/beaches by approximately 30.9 miles and in other areas by approximately 107 acres. The movement of some visitors to nearby dog walking areas, particularly those sites that are most heavily used for recreation, would result in overcrowding that would affect visitor experience as described above, and would cause the physical deterioration of natural resources at these sites. However the movement of visitors under the preferred alternative is anticipated to be low, since five GGNRA sites would still provide off-leash dog walking in ROLAs, all the sites considered for dog walking would allow areas for on-leash dog walking, and none of the sites would prohibit dogs. These impacts would likely be most noticeable within DPAs managed by SFRPD, which make up between 1 percent and 62 percent of the total area, as shown in table 31.

## **SUMMARY OF BACKGROUND INFORMATION USED TO DETERMINE IMPACTS TO NATURAL RESOURCES**

### **VEGETATION AND SOILS**

Site-specific, peer-reviewed studies have not been conducted at the GGNRA sites for the sole purpose of documenting impacts to vegetation or soils from dogs. While it is generally accepted and well documented that the presence of dogs in natural areas can result in disturbance to wildlife (as described in detail in the “Wildlife” section), specific published and peer-reviewed studies regarding impacts on soils and vegetation as a result of dogs are not as widely available as other studies documenting impacts as a result of domestic dogs. During the past six years, park staff has amassed scientific and technical information that is available on dog management–related topics. Data and information related to dog impacts on soils and vegetation, including waste issues, were collected from a variety of sources, including published journal articles and organizations that have conducted applicable studies. This section provides a general summary of the literature review conducted to determine the associations between dogs, soils, and vegetation, which are used for the purposes of the impacts analysis presented in this chapter. The potential disturbance from dogs to soils and vegetation at GGNRA is discussed in this section based upon the review and extrapolation of results from published and peer-reviewed studies. The results of this literature review therefore provide a general nexus for dog-related impacts to soils and vegetation. The existing credible scientific literature is discussed in detail below and the potential impacts to vegetation and soils are described as a result of this information.

## Chapter 4: Environmental Consequences

It has been documented that recreational activities can affect vegetation and soils, resulting in damage to plant communities (Cole 1978, 281; Douglass et al. 1999, 9.2). In recreational/park settings, domestic dogs and people are generally not mutually exclusive and it is therefore difficult to isolate the impacts and effects of dogs alone on soils and vegetation. It is important to note that dogs are viewed as a contributing factor to impacts associated with soils and vegetation, but the total elimination of dogs in the park would not eliminate effects on soils and vegetation, because visitors without dogs would continue to visit the park and use the trails/roads at GGNRA. Disturbance by all manner of visitors as well as by dogs has occurred and currently occurs in GGNRA as an existing condition. However, visitors with dogs could impact natural resources to a greater extent than visitors without dogs.

Soils and vegetation can be both indirectly and directly affected by recreational activities. Vegetation can be affected indirectly by trampling through the consolidation of the soil and directly by treading upon the plant itself (Bates 1935, 476). Trampling, which initially bends and weakens leaves and branches, can ultimately cause breaking and injury to the plant (Douglass et al. 1999, 9.3; Bates 1935, 476). Some plant species can be damaged and completely destroyed by the action of treading, while other species are comparatively immune to harm of this kind (Bates 1935, 476). Vegetation along trails is particularly vulnerable to damage (Cole 1978, 281). Sensitive environments can be subject to physical disturbance by dogs (through digging or bed-making), and dogs could damage vegetation and soils, with resulting influences on vegetation, soils, and wildlife such as small mammal populations (Sime 1999, 8.9). “High foot traffic (both people and dogs) resulting from an off-leash area would result in trampling and disturbance of vegetation” (Andrusiak 2003, 5). In addition, heavy off-leash dog use increases deterioration of native dune communities (Shulzitski and Russell 2004, 5). As cited in Andrusiak (2003, 3.2), the Greater Vancouver Regional District collected observational data on dog walkers and dogs in individual regional parks and observed dogs in the water and uprooting beach and dune vegetation by digging. Both dog and human traffic compact the soil and crush vegetation and dogs can dig in the soils; this is unlikely to have significant effects on the unvegetated areas, but could contribute to degradation of vegetated areas (Andrusiak 2003, 3.2).

The preservation of natural resources is addressed in 36 CFR 2.1. Vegetation damage is described in 36 CFR 2.1 (a) (1) (ii). The following is applicable to vegetation and soils, and is prohibited: possessing, destroying, injuring, defacing, removing, digging, or disturbing from its natural state. NPS rangers have recorded damages to vegetation from dogs at GGNRA that are in violation of the above regulation. Dog-related incidents were recorded at GGNRA using law enforcement’s criminal incident records. From 2001 through 2011, a total of 4,932 dog-related incident reports were filed at the park, which represents 11 percent of all incident reports filed during that period at GGNRA.

Trailside plant communities usually contain locally occurring species and invaders from other sources, which are favored by the environmental conditions adjacent to trails (Cole 1978, 282). Dogs (as well as horses and hikers) may also alter dispersal of native and non-native plants along trail corridors, as seeds that adhere to their paws and fur are then transported to other locations, possibly resulting in the spread and establishment of new populations of invasive and/or non-native plants (Sime 1999, 8.9-8.10). Park staff have observed the creation of social trails by dogs and dog walkers also increases erosion, damages root systems, further fragments habitat, and can alter reproductive success by isolating plants, thus reducing the opportunities for cross-pollination and effective seed dispersal. However, this has not been documented in peer-reviewed studies.

The primary detrimental soil impacts from recreation are loss of productivity, erosion, compaction, rutting, and displacement (Douglass et al. 1999, 9.5). Impacts to soils can generally result in impacts to vegetation. For example, the changes in soils as a result of trampling and compaction can affect plant growth and survival, although the effects are highly variable and dependent upon existing conditions (Kuss 1986, 643 and 647). Park users can also damage and destroy vegetation and create soil compaction,

which reduces infiltration of moisture into the soil and increases the volume of runoff and the potential for loss of topsoil (Douglass et al. 1999, 9.3). Sources of soil disturbance in the park include natural forces, such as wind and weather, and human disturbance, such as development, stream diversion, road or trail creation for cars, bicycles, hiking, running, or horseback riding, and dog walking. Trampling and digging by dogs can lead to accelerated erosion of cliffs and dunes at GGNRA, which can also be exacerbated by high visitor traffic. Heavy dog use can cause soil compaction or erosion. Although this has not been documented in peer-reviewed studies, these affects have been observed by park staff at GGNRA and are visible from aerial photography of Fort Funston. In areas with unconsolidated or unvegetated surficial deposits, dog traffic can physically move the soil, but other factors also influence soils such as human traffic, wind, and storm events. Dog traffic can compact the soil, which could kill vegetation and expose the soil to erosion although this has not been documented in peer-reviewed studies. Soil compaction is common along social trails that have been created by—and are heavily used by—bikers, hikers, runners, and dog walkers. Dogs and dog walkers as well as hikers and equestrians that do not stay on designated trails and venture off trail create social trails that become denuded of vegetation and result in increased soil compaction at GGNRA. This has occurred at Homestead Valley, Alta Trail, Oakwood Valley, Marin Headlands, Baker Beach, Lands End, Fort Funston, Mori Point, Sweeney Ridge/Cattle Hill, and Pedro Point Headlands.

Dog waste contains nutrients and can increase the amount of nitrogen and phosphorus in the soil (CRCCD 2009, 1). Soils and vegetation can be affected by dogs through defecation and urination, although this has not specifically been documented in peer-reviewed studies. The act of “marking” (scent marking with urine) could also affect vegetation by concentrating nutrients in particular areas. Although nitrogen and phosphorus are nutrients required for plant growth, dog waste could increase the amount of nutrients in the soil above natural levels; dog urine could increase the natural salinity of soil. An increase in nutrients from dog excrement in concentrated areas could result changes in plant species and distribution as well as changes in soil organisms. Nutrient addition to nutrient-poor serpentine soils can alter soil chemistry, which may result in changes to the plants that occur in these soils (USFWS 1998a, I-12). At sites with serpentine soils, adding nutrients could change soil composition and eventually cause detrimental effects on sensitive plant species adapted to serpentine soils.

At GGNRA, it is required by law that people clean up dog fecal matter, as stated in the GGNRA Compendium (appendix B). Violations have been written for park visitors at GGNRA who have not cleaned up after their dogs, under 36 CFR 2.34(a)(4), creating a “physically offensive condition” and 36 CFR 2.15 (a) (5), “failing to comply with pet excrement disposal conditions established by the superintendent.” When visitors fail to comply with pet excrement removal requirements, dog waste can accumulate in the soils and affect the vegetation. The total amount of waste can become substantial in certain areas, depending on the number of dog owners in the area and their frequency of use of the area as observed by park staff at GGNRA. Natural nutrient levels in the soils in the park can also be altered by dog waste (NPS 1999, 40).

In conclusion, very little peer-reviewed literature exists documenting disturbance to vegetation and soils specifically as a result of domestic dogs in recreational/park settings. However, NPS rangers have observed dogs affecting soils and vegetation at GGNRA sites. Dogs could affect vegetation and soils by trampling and digging. When dogs are on a 6-foot leash, it is unlikely that digging or bed-making would occur due to proximity to the owner and the physical restriction of the leash. When visitors fail to comply with pet excrement removal requirements, dog waste can accumulate in the soils and affect the vegetation. Management suggestions such as physically restraining dogs (on a leash), fencing sensitive areas, and prohibiting dogs from certain areas would protect vegetation and soils, similar to management suggestions included in the recently released *Environmental Impact Report: Significant Natural Resource Areas Management Plan* (SNRAMP) (SFPD 2011).

### WILDLIFE

Very few site-specific, peer-reviewed studies have been conducted at GGNRA for the purpose of documenting impacts to wildlife as a result of dogs. Numerous other studies from outside the park have documented disturbance to wildlife species as a result of domestic dogs in similar habitats, with similar species, or with similar conditions that occur in the park. During the past six years, park staff have collected available scientific and technical information on dog management–related topics. Types of information collected include dog management policies from other jurisdictions, shorebird data from scientists and organizations that monitor San Francisco Bay Area shorebird populations, and other topics including dog interactions with wildlife, diseases, and waste issues. The existing credible scientific literature is discussed in detail below and the potential impacts to wildlife were described as a result of this information.

This section provides some excerpts from recent incident records at the park regarding disturbances to wildlife followed by a general review and summary of the literature. The literature review was conducted to document associations between dogs, wildlife, and diseases associated with wildlife. The information has been used to supplement other information in the impacts analysis.

At GGNRA, 36 CFR 2.2 covers the protection of wildlife. Wildlife disturbance is described in 36 CFR 2.2 (a) (2) and the following is prohibited: feeding, touching, teasing, frightening or intentional disturbing of wildlife nesting, breeding or other activities. Dog-related incidents were recorded at GGNRA using law enforcement’s criminal incident records. From 2001 through 2011, a total of 4,932 dog-related incident reports were filed at the park, which represents 11 percent of all the incident reports filed for GGNRA.

Numerous studies have documented disturbance to wildlife species as a result of domestic dogs in recreational/park settings (Burger et al. 2004, 287; Davidson and Rothwell 1993, 101; George and Crooks 2006, 14; Kirby et al. 1993, 55; Lafferty et al. 2006, 2222; Lenth et al. 2008, 223; Miller et al. 2001, 131, 118; Smit and Visser 1993, 10; Thomas et al. 2003, 69; Yalden and Yalden 1990, 249). In recreational/park settings, domestic dogs and people are generally not mutually exclusive and it is therefore difficult to isolate the impacts and effects of dogs alone on wildlife. It is important to note that dogs are viewed as a contributing factor to impacts associated with wildlife, and the total elimination of dogs in the park would not eliminate effects on wildlife, because visitors without dogs would continue to visit the park and use the trails/roads at GGNRA. Disturbance by all manner of visitors and any associated recreation equipment as well as by dogs has occurred and currently occurs in GGNRA as an existing condition. Studies have shown that people with dogs disturb wildlife more than people alone (Yalden and Yalden 1990, 248-249) and that dogs may pose a different kind of threat compared to a pedestrian (Miller et al. 2001, 130). Studies have also suggested that dogs, particularly while off leash, increase the radius of human recreational influence or disturbance beyond what it would be in the absence of dogs (Banks and Bryant 2007, 2; Sime 1999, 8.4; Miller et al. 2001, 125; Lafferty 2001b, 318). For example, golden plovers (Yalden and Yalden 1990), marmots (Mainini et al. 1993, 162), mule deer (Miller et al. 2001, 131), squirrels, and rabbits (Lenth et al. 2008, 218) exhibited a greater response or reduced levels of activity when human hikers were accompanied by a dog compared to hikers without a dog. “Authors of many wildlife disturbance studies concluded that dogs with people, dogs on leash, or loose dogs all provoked the most pronounced disturbance reactions from their study animals” (Sime 1999, 8.2). Animals most often affected by disturbance from dogs include deer, small mammals, and birds (Denny 1974), although larger mammals such as bobcats and coyotes can also be affected by disturbance (George and Crooks 2006, 14-15).

The majority of domestic dogs in the United States are pets that have their food requirements met at home, thus allowing them ample energy to interact with wildlife (Lenth et al. 2008, 218). Domestic dogs behave as carnivores and at some level, still maintain instincts to hunt and/or chase (Sime 1999, 8.2) and

are capable of catching and killing prey species (Lenth et al. 2008, 218). Dogs may disturb wildlife either accidentally or deliberately through chase (Andrusiak 2003). “Even if the chase instinct is not triggered, dog presence in and of itself may be an agent of disturbance or stress to wildlife” (Sime 1999, 8.3; Lenth et al. 2008, 218). “The response of animals to predation risk is exactly the same as the response to disturbance; a species with suitable habitat nearby may avoid disturbance simply because it has alternative sites to go to...By contrast, animals with no suitable habitat nearby will be forced to remain despite the disturbance, regardless of whether or not this will affect survival or reproductive success” (Gill et al. 2001, 266).

Potential direct impacts to wildlife as a result of interactions with or disturbance from domestic dogs are broadly classified into three categories: harassment, injury, or death. Secondary or indirect impacts include displacement, avoidance, abandonment of areas and habitat, physical alteration of habitat, and potential disease transmission. Harassment is defined as the disruption of normal maintenance activities, such as feeding, resting, or grooming and can include disrupting, alarming, or even chasing after wildlife. If dogs chase or pursue wildlife, injuries to wildlife could be sustained directly or indirectly as a result of accidents that occur during the chase rather than direct contact with the dog (Sime 1999, 8.4). Injuries sustained may result in death or may compromise the animal’s ability to carry on other necessary life functions resulting in eventual death, or reduced reproductive success (Sime 1999, 8.4). Dogs on leash disturb wildlife less frequently than dogs off leash, but actual direct injury or mortality to wildlife by dogs in either situation is rare (Andrusiak 2003).

The type and intensity of disturbance to wildlife by dogs is based upon many factors, including the type and sensitivity of wildlife species; environmental and seasonal conditions; individual animal experience and body condition; habitat type; type, level and regularity of visitor use; among other various factors. 2008, 222; Banks and Bryant 2007, 2-3). The modification of normal behaviors such as feeding, nesting, grooming, and resting can occur through repeated disturbance and wildlife may relocate from preferred habitat to other areas to avoid harassment (Sime 1999, 8.4). Additionally, wildlife behavioral responses to disturbance may include reduced prey intake rates, increased vigilance levels, reduction in levels of parental care, or increased time spent in flight, all of which have the potential to affect survival or fecundity, which could possibly affect overall population size (Gill et al. 2001, 266). From a population viewpoint, species most likely to be adversely affected by disturbance include wildlife with high fitness costs (Gill et al. 2001, 266), which influences the ability to survive and reproduce. The type and intensity of disturbance to wildlife by dogs is based upon many factors, including type of wildlife species (mammals versus shorebirds), habitat type (coastal habitat versus grassland), type of study (on-trail versus off-trail), among other various factors. Dog presence has been correlated with altered patterns of habitat use for wildlife species (Lenth et al. 2008, 222). The modification of normal behaviors such as feeding, nesting, grooming, resting can occur through repeated disturbance and wildlife may relocate from preferred habitat to other areas to avoid harassment, including the displacement of wildlife from public to private lands (Sime 1999, 8.4). Reactions are most often short term but may result in responses that range from direct and obvious (flight, confrontation) to covert and physiological (loss of energy, stress), which complicates the documentation of disturbance to wildlife from the presence of dogs (Sime 1999, 8.4). Although disturbances are generally nonlethal and temporary, the cumulative effects of disturbance may be significant, particularly to sensitive species (Lafferty et al. 2006, 2217). Chronic, cumulative disturbance could ultimately reduce shorebird reproduction and survivorship (Lafferty 2001a, 1949). Additionally, wildlife behavioral responses to disturbance may include reduced prey intake rates, increased vigilance levels, reduction in levels of parental care, or amount of time spent in flight, all of which have the potential to affect survival or fecundity, which could possibly affect overall population size (Gill et al. 2001, 266). From a population viewpoint, species most likely to be adversely affected by disturbance include wildlife with high fitness costs but little excess habitat available; these species are thus constrained to stay in disturbed areas and to suffer the costs in terms of reduced survival or reproductive success (Gill et al. 2001, 266).

## Chapter 4: Environmental Consequences

Peer-reviewed literature has documented disturbance to wildlife species as a result of domestic dogs in recreational/park settings. Wildlife species have different threshold responses to disturbance (Pfister et al. 1992, 118), and therefore, a more detailed discussion of dog impacts to wildlife were separated into the following categories for this section: shorebirds, landbirds (or songbirds), land mammals, and marine mammals.

### Birds (Shorebirds and Landbirds)

Birds usually are more sensitive to the approach of dogs than to the approach of human beings (Andrusiak 2003, ES) and the “presence of dogs may intensify bird responses to pedestrians” (Sime 1999, 8.10). Disturbance by dogs generally occurs when unleashed dogs chase feeding and roosting birds; however, birds can also be disturbed by the physical proximity of on-leash dogs and/or by barking (Andrusiak 2003, ES). It has been shown that birds react when dogs accompany walkers and that even dogs restrained on leashes can disturb birds sufficiently to induce displacement and cause a decrease in local bird fauna (Banks and Bryant 2007, 2). Although leashing makes it difficult for pets to chase birds and reduces the probability of disturbance and the number of birds impacted per disturbance, leashed pets still disturb birds (Lafferty 2001a, 1955). “Dogs can disrupt habitat use, cause displacement responses, and injure or kill birds” (Sime 1999, 8.10). In addition, the predictability of disturbance is reduced when dogs are off leash. Dogs that are off leash in natural areas during the breeding season can result in a higher level of disturbance to wildlife, including ground-nesting or colonially nesting birds (Andrusiak 2003, 20; Sime 1999, 8.4, 8.9). Birds may not habituate to dog disturbance because it is unpredictable and represents an actual physical threat (Andrusiak 2003, 3.2). Some studies have shown that local wildlife does not become habituated to continued disturbance by dogs (Banks and Bryant 2007, 2). Because shorebird species have different threshold responses to disturbance (Pfister et al. 1992, 118), the discussion of impacts to shorebirds was separated from impacts to landbirds (or songbirds) in this section as described in the paragraphs that follow.

### Shorebirds

Beach nesting bird species are presumed to be the most sensitive species to disturbance, particularly several coastal plovers in the genus *Charadrius* that are endangered or threatened (Lafferty 2001b, 315) and are very likely to leave an area altogether if disturbed (Kirby et al. 1993, 56-57). Shorebirds such as the sanderling, long-billed curlew, marbled godwit, and elegant tern are considered watch list species that are sensitive to disturbance. One of the reasons that shorebirds are so vulnerable to disturbance is the lack of cover available along open beaches and shorelines, compared to more vegetated habitats that support dense cover (Andrusiak 2003, ES). Beach areas are susceptible to the usual beach activities, such as walking, jogging, fishing, and dog walking (Burger et al. 2004, 284) which can also affect shorebirds. Besides people, domestic dogs, equestrians, crows, and other birds have also been observed disturbing shorebirds (Lafferty 2001b, 318). Additional sources of disturbance to shorebirds on GGNRA beaches include aircraft, kite flying, hawks and falcons, equipment on the beach, and beach patrols. The presence of people on beaches where shorebirds congregate in foraging flocks is likely to be disruptive (Burger et al. 2004, 284) and some studies have suggested that the birds are not habituating to the presence of people (Burger et al. 2004, 286).

Although a variety of factors, including humans, cause disturbance, numerous studies have shown that shorebirds are particularly sensitive to dogs and have documented disturbance to shorebirds as a result of dogs at recreational/park settings (Kirby et al. 1993, 55; Smit and Visser 1993, 10; Yalden and Yalden 1990, 248-249; Thomas et al. 2003, 69; Lafferty 2001b, 318; Lafferty et al. 2006, 2222; Burger et al. 2004, 287; Davidson and Rothwell 1993, 101; Lafferty 2001a, 1955-1956). The sensitivity of shorebirds to disturbance by dogs may result from previous experiences of being chased or because birds instinctively view dogs as predators (Gabrielsen and Smith 1995). In a study of waterfowl and shorebirds,

Davidson and Rothwell (1993) conclude that, on tidal flats, moving people and animals (especially dogs) generally creates greater disturbance than sedentary people (Davidson and Rothwell 1993, 101). Lafferty (2001a, 1958) states that in general, shorebirds at a Santa Barbara, California, beach study were very sensitive to dogs on the beach and some dogs may actively chase birds for prolonged periods (Lafferty 2001a, 1950). In a study conducted by Kirby et al. (1993) on sandy beaches with recreational activities, it was documented that shorebirds are disturbed by both walkers and dogs, with dogs responsible for 27 to 72 percent of actual disturbances and walkers responsible for 20 to 34 percent of disturbance to shorebirds (Kirby et al. 1993, 55). The same study recorded that the most common response of shorebirds to disturbances by dogs was to take flight but then return to the area once the disturbance had passed (Kirby et al. 1993, 56-57). A study by Smit and Visser (1993) observed that dogs running around on tidal flats are “very disturbing” to shorebirds (Smit and Visser 1993, 9-10). In Burger et al. (2004), research indicated (J. Burger, unpublished data 2002) that dogs are currently the prime and most important factor disturbing the shorebirds at protected beaches along Delaware Bay (Burger et al. 2004, 287). The effect of humans and dogs on the beaches can be disruptive, especially when human activity is intense, or people are on the beaches for long periods of time (Burger et al. 2004, 287). Although walking dogs on leash makes it difficult for dogs to chase birds and reduces the probability and the number of disturbances to birds, dogs walked on leash still disturb birds (Lafferty 2001a, 1955).

Dogs can disrupt habitat use, cause displacement responses, and possibly injure or kill birds (Sime 1999, 8.10), although as stated above, direct injury or mortality is rare (Andrusiak 2003). Migrating species, especially shorebirds, use stopover areas to rest and feed, replacing energy consumed between stops (Burger et al. 2004, 287; Pfister et al. 1992, 115). Dogs disturbing foraging birds may diminish a bird's foraging time and can result in a loss of energy required to migrate, and can significantly affect their survival during migration (Andrusiak 2003). Even if dogs do not directly affect habitat or kill birds, disturbances cause birds to suspend feeding and/or expend energy in flight, movement, or vigilance (Lafferty 2001a, 1950). Shorebirds are known to have relatively high metabolic rates compared to other bird species and use more energy than other non-passerine birds of their size (Kersten and Piersma 1987, 182, 185). Therefore, even short-term disturbances to feeding and migration behavior could affect energy expenditure in shorebirds (Kersten and Piersma 1987, 182, 185).

Bird responses to “danger” through disturbance may involve becoming immobile or crouching down, rushing for cover, or even approaching the predator in a distraction display when defending young (Davidson and Rothwell 1993, 97). Many anti-predator responses, however, involve taking flight, which is a costly activity in terms of energy expenditure (Davidson and Rothwell 1993, 97). Waterfowl, especially on nonbreeding grounds, mostly live in open habitats and generally use flight as a response to being disturbed. Flying is a major natural element in the life of birds, but it uses a lot of energy and the increased need in order to fly to escape disturbance could affect survival (Davidson and Rothwell 1993, 97). Specifically, foraging can be disrupted by the presence of people and dogs on foraging beaches, and shorebirds respond by flying away (Burger et al. 2004, 287). It has been suggested that when migrant shorebirds have a limited period of time at a stopover place, with limited foraging space, behavioral disruptions during foraging have consequences in terms of needed weight gain (Burger et al. 2004, 287). Therefore, in response to flying away, shorebirds could either increase their energy intake at their present (disturbed) feeding sites when undisturbed, or move to an alternative feeding site (Davidson and Rothwell 1993, 97). An alternative feeding site may not necessarily be preferred habitat of the disturbed shorebirds. Shorebirds roosting or feeding in areas accessible to on-leash or off-leash dogs may relocate to areas of the beach where dogs are prohibited, or may use areas only when dogs are absent (Andrusiak 2003, ES). This relocation could use energy that birds require to survive during migration (Andrusiak 2003, ES). Therefore, any overall reduction in their energy balance as a result of these responses is the impact of disturbance on energy reserves and ultimately survival (Davidson and Rothwell 1993, 97). Studies have shown that disturbance at high tide resting areas at a coastal barrier beach displaced shorebirds and seemed to cause long-term declines in abundance (Pfister et al. 1992, 115). The most serious disturbance

## Chapter 4: Environmental Consequences

in a study conducted by Pfister et al. in 1992 was likely caused by pedestrians and dogs, but it is important to note that a vehicle count was used in this study as an index of disturbance (Pfister et al. 1992, 118). Disturbance has contributed to the decline in a number of shorebird species, including two species studied by Pfister et al. (1992), the red knot and short-billed dowitcher (Pfister et al. 1992, 123). Disturbances as a result of domestic dogs can also affect shorebird survival during the nesting period. Dogs can cause temporary abandonment of shorebird nests containing eggs or young, as well as crushing eggs or preying on young (USFWS 2007a, K-7). If a parent shorebird is forced away from a nest, its eggs may die due to exposure or predation (Lafferty 2001b, 315). Shorebird studies have also indicated that front-beach or low beach (near the water's edge) species are more severely affected by disturbance than back-beach (or upper beach) species (Pfister et al. 1992, 123; Lafferty 2001a, 1960). Front-beach species are exposed to more direct human disturbance because recreational activities are concentrated on the front side of the beach.

Surveys conducted during the years 1993 through 2006 show that sanderlings are the most common shorebird on all beaches at GGNRA (Beach Watch 2006, 10). A study conducted by Thomas et al. (2003) in Monterey on the Central California coast found that the number of people, type of human activity, and the presence of free running dogs had a significant effect on the foraging time of sanderlings (Thomas et al. 2003, 69). Although the sample size was low, the most significant negative factor was the presence of free running dogs on the beach (Thomas et al. 2003, 67). At the study sites, leash laws were in existence, but the majority of people still let their dogs run free (Thomas et al. 2003, 71).

### Landbirds (Songbirds)

This category encompasses landbird species such as songbirds in grasslands, forested lands, shrublands, and other non-coastal habitats. In a study of forested areas by Banks and Bryant (2007), ground-dwelling birds were the most affected by dogs (Banks and Bryant 2007, 2). This study suggested that birds were seeking refuge away from the immediate vicinity of the threat from dog walking and confirmed that birds responded uniquely and additively when dogs accompany walkers (Banks and Bryant 2007, 2). Even dogs restrained on leash can disturb birds sufficiently to induce displacement and cause a decrease in local bird fauna (Banks and Bryant 2007, 2). However, other studies conducted in grasslands for vesper sparrows (*Poocetes gramineus*) and western meadowlarks (*Sturnella neglecta*) have shown that the smallest area of influence, the shortest flush distance, and the shortest distance moved resulted from the dog-alone treatment, and that these responses were greater for the pedestrian-alone and dog-on-leash treatments (Miller et al. 2001, 124). Even though the dog-alone treatment resulted in the smallest area of influence for grassland birds in the study, the authors state that the area of influence will increase if recreationists allow their dogs to roam away from a trail (Miller et al. 2001, 131). This study also stated that either dogs were not viewed as a threat to songbirds or that dogs may have posed a different type of threat in which the birds responded by holding their position until the last moment, trying to remain undetected (Miller et al. 2001, 129-130). One shortcoming of the study was that the authors did not stop and view the subjects for extended periods of time (Miller et al. 2001, 131). For American robins (*Turdus migratorius*) in the forested habitat, the area of influence, flush distance, and distance moved did not generally differ between the pedestrian-alone and dog-on-leash treatments (Miller et al. 2001, 130). This is possibly due to the fact that the domestic dog is not typically considered a significant predator on songbirds and these bird species may not have perceived dogs as a threat (Miller et al. 2001, 130). Another songbird study to document the effects as a result of on-leash and off-leash dog areas was completed by Forrest and St. Clair (2006) in deciduous, coniferous, and grassland communities of an urban park. The songbird species black-capped chickadee was the most abundant species observed in the study, accounting for 30 percent of all observations. Other common species, each accounting for at least 5 percent of all observations, were the least flycatcher, red-eyed vireo, red-breasted nuthatch, and yellow warbler (Forrest and St. Clair 2006, 55). The data showed no difference in the diversity and abundance of birds within on-leash and off-leash areas (Forrest and St. Clair 2006, 55). The results of this study

concluded that off-leash dogs have no impact on the diversity or abundance of birds because these species are fairly tolerant of moderate levels of human activity (Forrest and St. Clair 2006, 61). In conclusion, it is possible that dogs can disturb landbirds such as songbirds, although ground-dwelling birds may be particularly affected by dogs (Banks and Bryant 2007, 2), while other songbirds may be more tolerant to disturbance by dogs (Forrest and St. Clair 2006, 55).

## Land Mammals

As stated above, domestic dogs behave as carnivores (Lenth et al. 2008, 218) and animals that are prey of wild canids (carnivorous mammals of the family *Canidae*, which includes dogs, wolves, foxes, coyotes, and jackals) may perceive dogs as predators and may be subject to nonlethal, fear-based alterations in physiology, activity, and habitat use (Lenth et al. 2008, 218). When dogs participate in “marking” (scent marking with urine), it could also attract wildlife or cause wildlife to avoid an area. The “impacts of dogs on native carnivores are not well understood, but may include disruption of carnivore behavior through chasing after, barking, and scent marking via urine and scat” (George and Crooks 2006, 14). As cited in Lenth et al. (2008, 223), the City of Boulder Open Space and Mountain Parks has noted that dogs often defecate very soon after arriving at a trail, and many visitors do not walk dogs much beyond the trailhead. Recreational trails with abundant dog scent could appear to carnivores to be linear dog territories, necessitating increased vigilance and activity (Lenth et al. 2008, 219). In a study conducted by George and Crooks (2006, 14-15), coyotes specifically showed a trend of temporal displacement in response to dogs, and bobcats were also affected by the presence of dogs. These inverse correlations of dog and native carnivore activity in areas that allow dogs indicate that native carnivores may be avoiding trailheads where dog activity is concentrated (Lenth et al. 2008, 223). Lenth et al. (2008, 223) also found that wildlife species that are preyed upon by native canids demonstrated sensitivity to the presence of domestic dogs (Lenth et al. 2008, 223). Reed and Merenlender (2008 and 2011) studied the impacts of recreation on native and non-native carnivores (including domestic dogs) using scat samples from 28 parks and preserves in northern California (Reed and Merenlender 2008, 1; Reed and Merenlender 2011, 504). In the 2008 study, domestic dogs were detected (through scat samples) more frequently and in much greater densities than other carnivores in the recreation areas, but there was no evidence to suggest that native carnivores avoided recreational trails (Reed and Merenlender 2008, 7). The 2008 study concluded that native carnivore density was much higher in protected areas compared to areas with recreation (Reed and Merenlender 2008, 1). Similarly, the 2011 study found that native carnivore species richness was greater and the relative abundances of native coyotes (*Canis latrans*) and bobcats (*Lynx rufus*) were greater in the sites that did not allow human visitors or dogs (Reed and Merenlender 2011, 504). However, abundances of bobcats and all carnivores declined as the number of visitors increased (Reed and Merenlender 2011, 504). One shortcoming of the Reed and Merenlender studies was that the 2008 study did not describe how human recreation disturbs wildlife (Reed and Merenlender 2008, 7) and the 2011 study did not separate the effects of humans from the effects of dogs (Reed and Merenlender 2011, 513). Additionally, scat may be an unreliable indicator for sites that allow dogs, since dogs can eat or roll in scat of other wildlife.

In addition to affecting carnivore behavior, dogs can physically damage burrows used by ground-dwelling mammals (squirrels, pocket gophers, chipmunks, and other rodents) by digging up or collapsing the burrows. Although not occurring in GGNRA, a study of marmots by Mainini et al. (1993) provides some indication of potential responses of ground-dwelling mammals to the presence of dogs and/or people. This study showed that the reaction of marmots was least when hikers remained on trails and greatest from hikers with a free-running dog (Mainini et al. 1993, 163). With trail hikers and no dogs, the marmots hardly ever took refuge in the burrows; this happened more often in the experiments when these hikers had a leashed dog and with cross-country hikers (Mainini et al. 1993, 163). Even more animals took to their burrows in the experiments with burrow hikers (people walking off the trail and across the marmot burrow) or hikers with free-running dogs (Mainini et al. 1993, 163). A free-running dog elicited more

## Chapter 4: Environmental Consequences

whistles and more animals retreated into their burrows than in the experiments with a leashed dog on the trail, which shows that a free-running dog represents a greater risk than a leashed dog (Mainini et al. 1993, 164). Marmots observed were located in the vicinity of frequently used trails; comparison studies of marmots living in more remote areas had even stronger reactions (Sime 1999, 8.11). Other studies have shown that small mammals, including squirrels (*Sciurus* spp.) and rabbits (*Sylvilagus* spp.) have exhibited reduced levels of activity within 50 meters of trails in areas that allowed dogs when compared with areas without dogs (Lenth et al. 2008, 218).

In conclusion, dogs behave as carnivores (Lenth et al. 2008, 218) and could affect wildlife such as small mammals through chasing and occasionally capturing individuals as well as digging and collapsing burrows. Dogs have the potential to encounter larger mammals such as deer, bobcats, or coyotes and may either displace these larger mammals from high quality habitat that is degraded by the presence of dogs (George and Crooks 2006, 14-15) or cause increased vigilance or activity (Lenth et al. 2008, 219).

### Marine Mammals

There is documentation of marine mammal strandings as well as healthy animals hauling out on the GGNRA beaches or intertidal, rocky areas (MMC 2010, 1). Marine mammals that strand on beaches or other shoreline areas are often injured or ill, and additional stress from disturbance, such as dogs biting, barking at, or climbing on the animals, can occur from unleashed dogs in a ROLA or noncompliant dogs. Healthy marine mammals can also haul out on GGNRA beaches, and at most haul-out sites consistently used at GGNRA, dogs cannot gain access to marine mammals. At the beach in the Crissy Field Wildlife Protection Area (WPA), three elephant seals (a fully protected species in California) hauled out at different times in December of 2009 and January of 2010. Off-leash dogs detected the scent of the stranded elephant seals and moved toward the seals on the beach. Stranded marine mammals and marine mammals that have hauled out on GGNRA beaches often attract the attention of dogs and people. The Marine Mammal Center data indicate that marine mammals are often harassed by dogs. Dogs have been observed surrounding marine mammals, chasing them back to the water, and in one case, attacking a California sea lion (MMC 2012a, 1). Depending on the circumstance, the NPS may temporarily fence, sign, and close areas where marine mammals are hauled out, particularly where visitor use is more moderate as opposed to areas of intense use during good weather. On-leash dog walking would restrain or prevent access to stranded marine mammals and marine mammals that haul out on GGNRA beaches and rocky, intertidal habitat. However, even leashed dogs may disturb and cause additional stress to marine mammals. It is important to note that all marine mammals in GGNRA are protected by the *Marine Mammal Protection Act*, and any disturbance to a marine mammal would be in violation of this act. The impacts on hauled out marine mammals may be different from those on stranded marine mammals, and include harassment to the extent that they are flushed back into the water and do not return to the beach, which could inhibit establishment of new haul-out sites and/or breeding and pupping sites as marine mammal populations expand.

In conclusion, marine mammals that haul out or strand at GGNRA could be affected by dogs as has been previously demonstrated through dogs approaching, biting, barking at, or climbing on/surrounding the mammals, or even chasing hauled out mammals back into the water (MMC 2010).

### Disease

Domestic dogs that are not vaccinated can potentially introduce diseases (distemper, parvovirus, and rabies) and transport parasites from, or transmit diseases to, wild animals or wildlife habitats (Sime 1999, 8.2), although the role of dogs in wildlife diseases is not well understood (Sime 1999, 8.4). While dogs can be vaccinated against many of these diseases, adherence to recommended vaccination schedules is necessary for even adult dogs to maintain immunity (Sime 1999, 8.12). Domestic dogs can be vectors for

transmission diseases as canine distemper, which can affect wild carnivore species (Sime 1999, 8.9). Viruses related to the canine distemper virus have been documented in the deaths of a wide variety of wild animals from seals, dolphins (Delphinidae), and porpoises (Phocoenidae) in Russia to lions in Africa, but there are fewer documented instances of deaths caused by canine distemper in areas where domestic animals are regularly vaccinated (Mills 1999). Dog feces have been implicated in the transmission of muscle cysts (*Sarcocystis* spp.), which can infect a variety of ungulate species, including mule deer and white-tailed deer. Dogs may also introduce diseases or parasites to small mammals. While dog impacts on wildlife likely occur at the individual scale, the results may still have important implications for wildlife populations (Sime 1999, 8.4). Rabies is a preventable viral disease transmitted in the saliva of infected mammals and is the most common source of infection for humans and domestic animals such as dogs (City and County of San Francisco 2010, 1). More than 90 percent of all animal rabies cases reported to the Centers for Disease Control and Prevention (CDC) each year occur in wild animals like raccoons, skunks, bats, and foxes (City and County of San Francisco 2010, 1). In California, domestic animals, farm animals, and pets such as dogs, cats, and cattle account for approximately 3 percent of the reported rabies cases (City and County of San Francisco 2010, 1). In San Francisco, all animal rabies cases in the past 60 years occurred in bats, recently at a rate of one to five confirmed cases per year from 2004 through 2009 (City and County of San Francisco 2010, 1). Studies by Riley et al. show that proximity to urban areas (which describes the situation for wildlife in GGNRA lands) or contact with humans and their pets can increase the risk of disease exposure for wild carnivore populations (e.g., canine parvovirus in foxes and feline calicivirus in bobcats) (Riley et al. 2004, 12, 18). However, the collection of dog waste and reducing feral and unaccompanied domestic animals in parks could help reduce the risk of transmission of many diseases (Riley et al. 2004, 19).

## Conclusion

In summary, peer-reviewed literature has documented disturbance to wildlife species as a result of domestic dogs in recreational/park settings (Burger et al. 2004, 287; Davidson and Rothwell 1993, 101; George and Crooks 2006, 14; Kirby et al. 1993, 55; Lafferty et al. 2006, 2222; Lenth et al. 2008, 223; Miller et al. 2001, 131; Smit and Visser 1993, 10; Thomas et al. 2003, 69; Yalden and Yalden 1990, 249). Each of the wildlife species discussed in detail above, including shorebirds, landbirds (songbirds), land mammals, and marine mammals have different threshold responses to disturbance (Pfister et al. 1992, 118). Management actions such as closing or limiting areas to people and/or dogs have been suggested to reduce disturbance to wildlife species as demonstrated in studies discussed above (Banks and Bryant 2007, 2; George and Crooks 2006, 14; Lafferty et al. 2006, 2224; Miller et al. 2001, 131; Reed and Merenlender 2011, 513). Similarly, management actions such as enforcing or requiring leash laws have also been suggested to reduce impacts to wildlife as a result of domestic dogs (Burger et al. 2004, 287; Lenth et al. 2008, 223; Miller et al. 2001, 131; Thomas et al. 2003, 71). Because recreational activities that occur on trails can be defined as frequent and spatially predictable, animals may habituate to these activities, though some more sensitive species may not. However, off-trail recreation can be both infrequent and unpredictable; animals are not accustomed to activity in these areas, resulting in a greater area of influence, flush distance, and distance moved (Miller et al. 2001, 130). Specifically, the spatial behavior of off-leash dogs is unpredictable; and when dogs wander off trails, they are more likely to elicit flushing responses (Miller et al. 2001, 130; Lenth et al. 2008, 223). Some studies have shown that “local wildlife does not become habituated to continued disturbance” by dogs (Banks and Bryant 2007, 612).

When compliance is assumed, management alternatives that would prohibit dogs from accessing wildlife habitats would eliminate disturbance to wildlife from dogs chasing after wildlife and barking at wildlife, as well as potential direct or indirect mortality as a result of dog/wildlife encounters. Prohibiting dogs from areas also prevents habitat degradation and loss of species that are sensitive to the presence of dogs. On-leash dog walking restrictions would physically restrain dogs, reducing direct impacts on wildlife and wildlife habitat, and should also eliminate any potential chasing after wildlife. Additionally, dog waste,

## **Chapter 4: Environmental Consequences**

nutrient addition, trampling, digging, or spread of invasive species would either be reduced or eliminated if dogs were prohibited or leashed in certain areas. Because of mobility, wildlife can usually avoid areas with dogs present during peak activity or habituate to these activities, but the displacement of wildlife from high quality habitat and preferred habitat that is degraded by the presence of dogs would indirectly affect wildlife. On-leash dog walking restrictions would physically restrain dogs, which would protect wildlife and reduce chasing after shorebirds and marine mammals on the beach, but on-leash dogs would still be able to disturb wildlife and/or cause a flight response through their presence on the beach and by lunging/barking at roosting, resting, and feeding birds. This could cause birds to flee or relocate, using energy reserves unnecessarily, and could result in the loss of preferred habitat. Disease transmission that results from direct contact between dogs and wildlife, especially canids such as coyotes, would also be reduced but not necessarily eliminated as a result of dog waste removal requirements in this draft plan/SEIS. Management alternatives requiring on-leash dog walking on beaches would still result in impacts as a result of disturbance to resting and feeding shorebirds, waterfowl, and stranded marine mammals. Proposed ROLAs would result in the loss of habitat for wildlife species and may result in the temporary or permanent displacement of wildlife species from those areas. The ROLA may also lead to avoidance of the surrounding area by wildlife due to the concentration of dogs and noise, as well as the elevated amount of dog waste and scent marking. However, the concentration of off-leash dog use in a ROLA would reduce the likelihood of off-leash dogs disturbing wildlife or wildlife habitat outside of ROLAs when compliance is assumed.

### **VEGETATION AND SOILS**

As stated in chapter 3, GGNRA supports a rich assemblage of plants in the parks' grasslands, coastal scrub, wetlands, and forests that compose the coastal ecosystem. Approximately 80 vegetation alliances (or plant communities) have been documented at GGNRA. These alliances were then grouped into general vegetation communities at GGNRA for the purposes of analysis. In this section, impacts on these identified natural vegetation communities are analyzed for each alternative presented. The impact analysis described in this section also includes plant species of interest or management concern. Species of interest include plants that are not federally or state listed, but have status or ranking through the California Native Plant Society (CNPS). The NPS conducts its actions in a manner consistent with relevant state laws and regulations. As a result, this section analyzes impacts on plant species included on lists produced by the CNPS. Impacts on plant species that are federally or state listed as threatened, endangered, or candidate species are described in the section "Special-status Species." Because soils have been dismissed as a stand-alone section in this document, discussions of soil types and impacts resulting from soil compaction and subsequent changes to soils are included in this vegetation section of chapter 4.

This "Vegetation and Soils" section also provides an overview of the guiding policies and regulations, describes the study area, includes a definition of duration, details the assessment methodology, and defines the impact thresholds for vegetation as well as soils.

### **GUIDING POLICIES AND REGULATIONS**

#### **NPS Natural Resource Policies and Guidelines**

The NPS has developed specific guidelines for the management of natural resources (NPS 2006a). The guidelines provide for the management of native and non-native plant (and animal) species. They are designed to assist parks in developing resource management plans and action plans for specific park programs in all park management zones: natural, cultural, park development, and special use zones as described in the NPS *Management Policies 2006* (NPS 2006a) and articulated in each park's general management plan (GMP).

The NPS *Management Policies 2006* state that the NPS “will maintain as parts of the natural ecosystems of parks all plants and animals native to park ecosystems. The term “plants and animals” refers to all five of the commonly recognized kingdoms of living things and includes such groups as flowering plants, ferns, mosses, lichens, algae, fungi, bacteria, mammals, birds, reptiles, amphibians, fishes, insects, worms, crustaceans, and microscopic plants or animals.” The NPS will achieve this by:

- preserving and restoring the natural abundances, diversities, dynamics, distributions, habitats, and behaviors of native plant and animal populations and the communities and ecosystems in which they occur;
- restoring native plant and animal populations in parks when they have been extirpated by past human caused actions; and
- minimizing human impacts on native plants, animals, populations, communities, and ecosystems, and the processes that sustain them (NPS 2006a, Section 4.1).

*Management Policies 2006* also states that the NPS “will inventory, monitor, and manage state and locally listed species in a manner similar to its treatment of federally listed species to the greatest extent possible. In addition, the “Service will inventory other native species that are of special management concern to parks (such as rare, declining, sensitive, or unique species and their habitats) and will manage them to maintain their natural distribution and abundance” (NPS 2006a, Section 4.4.2.3).

NPS *Management Policies 2006* requires the NPS “to understand and preserve the soil resources of parks, and to prevent, to the extent possible, the unnatural erosion, physical removal, or contamination of the soil or its contamination of other resources.” “Management action will be taken by superintendents to prevent or at least minimize adverse, potentially irreversible impacts on soil” (NPS 2006a, Section 4.8.2.4, 56).

Additionally, the *Organic Act* of 1916 (16 USC 1) directs national parks to conserve wildlife unimpaired for future generations and is interpreted to mean that native animal life is to be protected and perpetuated as part of a park unit’s natural ecosystem. Parks rely on natural processes to control populations of native species to the greatest extent possible; otherwise, they are protected from harvest, harassment, or harm by human activities.

## Species Designations

As described in chapter 3, other species of interest at GGNRA include plants that are not federally or state listed but have status or ranking through either the Department of Fish and Wildlife or the CNPS. The impact analysis for these plant species considered as other species of interest is included in this “Vegetation” section. Federally and state-listed plant species are discussed in detail in the “Special-status Species” section. These species all require consideration by the NPS when management actions are taken to ensure that actions do not harm the species or their habitats.

**California Native Plant Society.** The CNPS maintains a list of species in California that are considered rare or endangered according to CNPS criteria. The list contains plants of special concern in California, including species, subspecies, or varieties that are considered to be extinct (list 1A); species that are rare, threatened, or endangered in California and elsewhere (list 1B); species that are rare, threatened, or endangered in California but are more common elsewhere (list 2); species that are potentially endangered but additional information on rarity and endangerment is needed (list 3); and species that have a limited distribution, but are not currently endangered (list 4).

**California Department of Fish and Wildlife.** The Department of Fish and Wildlife maintains an informal list of native plant and wildlife species of special concern because of population declines and

## **Chapter 4: Environmental Consequences**

restricted distributions, and/or because they are associated with habitats that are declining in California. The Department of Fish and Wildlife considers all plants listed by the CNPS as “special plants” and recommends that impacts on plants on lists 1 and 2 be considered during project analysis. Legal protection is afforded to plant species listed under the California *Endangered Species Act* (ESA) by the Fish and Game Commission of the Department of Fish and Wildlife.

### **STUDY AREA**

The geographic study area for vegetation and soils includes the individual sites of GGNRA under consideration for the dog management plan/EIS that could be impacted by dog management activities including new lands. There are 22 individual sites relevant to this project, which have been previously described in detail in chapter 3. Not all communities present at GGNRA will be affected by this project; therefore, this section only analyzes impacts on the vegetation, soil, and plant communities at GGNRA affected by dog management activities.

### **DURATION OF IMPACT**

Duration describes the length of time an effect would occur, either short term or long term. Long term impacts to vegetation and soils are described as those persisting for the life of the plan/EIS (the next 20 years). After the implementation of the plan, a 1- to 3-month period of public education would occur to implement the proposed action followed by a 1- to 3-month period testing the monitoring-based management strategy. At the beginning of the education and enforcement period, short-term impacts on all natural resources would occur, regardless of the alternative chosen. During this period, impacts on vegetation and soils would be similar to the current conditions and would be short-term. Following the education period, monitoring for noncompliance and impacts to resources would begin, and it is expected that compliance with the dog walking regulations and associated adverse impacts would improve gradually and the impacts on vegetation and soils would then become long term, as described below for each alternative.

### **ASSESSMENT METHODOLOGY**

Maps showing vegetation cover in GGNRA and consultations with NPS staff were used to identify baseline conditions in the study area, along with available information on the condition and composition of the vegetation in the park. The analysis of vegetation considered that changes in the plant community size, integrity, or continuity could occur as a result of the implementation of various management activities.

Overall, impacts on vegetation were analyzed qualitatively, and as a result, acreages of impacts on specific types of vegetation were not completed as part of this project. The information in this analysis was obtained through best professional judgment of park staff and experts in the field, as well as supporting literature (as cited in the text). Data on frequency of disturbance of closed areas (specific habitat types, such as creeks, lagoons, and cliffs) in a particular park site, if available, have been incorporated with relevant scientific literature to predict the impact of dog management activities on vegetation. Where data on the frequency of disturbance are not available, information from park staff and visitors on the relative intensity of use by visitors and the relative number of dogs both on and off leash has been used to predict impacts.

In addition to vegetation, this analysis considers the changes in rates of erosion, soil composition, or soil function that would occur as a result of the implementation of the various management activities. The analysis of soils began with the existing condition of the soil. Natural soil function has been lost in areas that have been converted to urban uses or compacted by use (e.g., parking lots, picnic areas, and trails).

Impacts on soil resources as a result of dogs were analyzed qualitatively due to a lack of site-specific scientific data regarding the effects of dogs on soils at GGNRA. Best professional judgment, from experts in the field and at the park, and other supporting literature (as cited in the text) were used in determining impact categories.

## VEGETATION AND SOIL IMPACT THRESHOLDS

Vegetation impacts were determined by examining the potential effects of dog walking activities on the plant community, including plant structure and abundance as well as distribution, quality, and quantity of the habitat in a park site. Soil impacts were determined by examining the potential effects of dog walking activities on soils or soil function, as well as distribution, quality, and quantity of soils within a park site. For the action alternatives, on-leash dog walking impacts were based on an allowed 6-foot dog leash. Since dog walkers may walk along the edge of the fire road or trails, dogs would then have access to the adjacent land 6 feet in all directions, resulting in a LOD area for vegetation that would extend 6 feet out from the edges of the fire road or trails. In ROLAs, the guidelines require that dogs under voice and sight control must stay within the boundaries of the ROLA, limiting the LOD to the ROLA itself. The intensity of each adverse impact is judged as having a minor, moderate, or major effect. Negligible impacts are neither adverse or beneficial, nor long term or short term. A beneficial impact would be a positive change in the condition or appearance of the resource. No impact on vegetation or soils may also be applicable for some alternatives and sites if dogs are prohibited. The following impact thresholds were established to describe the effects on vegetation and soils under the various alternatives being considered.

*Beneficial* A beneficial impact is a beneficial change from the current conditions and is a relative indicator of progress compared to the no-action alternative. In general, a beneficial impact to vegetation would include an increase in the abundance as well as distribution, quality, and quantity of the vegetation. For soils, a beneficial impact would include increases to the natural soil function or soil/geologic composition, or a decrease in soil erosion.

*Negligible* Impacts to vegetation would result in no measurable or perceptible changes in the plant community, including plant structure and abundance as well as distribution, quality, and quantity of the habitat in a park site. For soils, impacts would be at such low levels of detection that there would be no discernible effect on soils or soil function. Negligible is also appropriate at park sites where natural soil function or vegetation has been converted previously due to development or use (parking lots, roads, compacted trails, picnic areas, lawn areas).

*Adverse* **Minor.** Effects would be measurable and perceptible, but would be localized in a relatively small area. The overall integrity of the plant community, including plant structure and abundance as well as distribution, quality, and quantity of the habitat in a park site, would not be affected and, if left alone, would recover. For soils, impacts would be detectable, but they would not be large enough to cause changes in soils or soil function at a park site.

**Moderate.** Effects would be measurable and perceptible over a relatively large area, and would affect the overall integrity of a plant community, including plant structure and abundance as well as distribution, quality, and quantity of the habitat. For soils, impacts would be long term and readily apparent, and cause noticeable changes in soils or soil function at a park site.

## Chapter 4: Environmental Consequences

**Major.** Effects would be readily apparent over the majority of the study area and would affect the integrity of the plant community, including plant structure and abundance as well as distribution, quality, and quantity of the habitat. Impacts to soils or soil function at a park site would be substantial, highly noticeable, and permanent.

### Detailed Description of Impact Analysis

At GGNRA, the management of vegetation is primarily focused on research, monitoring, and actively restoring habitat for threatened, endangered, and unique plant species. Restoration efforts at GGNRA have included decompacting soils, removing non-native and invasive plant species, and planting listed and unique plant species. At GGNRA, for properties recently acquired or soon to be acquired by the park (Cattle Hill, Pedro Point Headlands, and Rancho Corral de Tierra), detailed inventorying of vegetation, including listed plant species, is currently ongoing. Therefore, mapped occurrences as well as potential habitat are identified at these sites because site-specific data collection was still occurring at the time of publication.

### CUMULATIVE NATURAL RESOURCE IMPACTS COMMON TO ALL ALTERNATIVES

Urban development and loss of habitat continuity, as well as the establishment and overall dominance of areas by non-native and/or invasive plant species, are the primary past actions that have influenced vegetation at the sites in GGNRA in this study area. In addition, fire suppression efforts beginning in 1870 and extending into recent years have resulted in a twofold increase in oak pollen and oak density, perhaps facilitating the spread and effect of the non-native sudden oak death pathogen (NPS 2005b, 321) and allowing the unnatural buildup of both dead and live fuels. The use of fire may help manage both the forest structure and potentially stall or inhibit the effects of sudden oak death; recent studies suggest fire can be used to manage the spread of sudden oak death, and may kill off fungal spores (NPS 2005b, 197).

Prior to the park's establishment, urban development and related activities immediately adjacent to park boundaries has contributed to changes in composition and density of key species. For example, coastal redwood forest is estimated to have covered 1.98 million acres across its range 200 years ago. Today, approximately 85,000 acres (4 percent) are left. Monterey pine, Monterey cypress, and eucalyptus have all been imported by European-American settlers for lumber or other purposes and, as non-native species, have competed with and replaced native species, resulting in altered vegetation communities inside and outside GGNRA. Conversion of land to impervious surfaces has increased soil erosion, and overuse of areas has increased soil compaction; both erosion and compaction have resulted in further loss of native vegetation communities from altered soil characteristics and direct loss of soils. Disturbed areas provide opportunities for colonization by non-native invasive plant species. Coastal scrub habitat is present over about 15 percent of its former range in California, primarily because of land conversion to agricultural, industrial, and residential development. Grasslands in California have been invaded by non-native species in part because non-native plant species are better adapted to areas grazed by the livestock that have displaced the native tule elk, as well as areas disturbed by clearing and plowing for agriculture. Highly invasive species that occur in grasslands and coastal scrub in the park, such as Scotch and French broom, are escaped ornamental shrubs brought from Europe, and most of the park's non-native grasses are imported from Eurasia. All are adapted to the area's Mediterranean climate (NPS 2005b).

In addition to urban development outside and adjacent to GGNRA sites, actions such as the establishment of "social trails" made by dogs and humans traversing park sites off official trails can result in GGNRA sites becoming fragmented into islands of intact habitat surrounded by infrastructure and associated non-native species. Populations of plants have become isolated from each other, which decreases opportunities

for cross-pollination or seed movement. This gradually causes a reduction in the overall adaptability or elasticity of populations to respond to changing environmental conditions, resulting in long-term adverse impacts on population sizes and overall species survival. It then becomes imperative for the NPS to provide protection to remaining habitat and ensure that the quality of habitats in GGNRA is maintained.

Throughout GGNRA, the NPS and groups such as the Golden Gate National Parks Conservancy are attempting to reduce the impacts of prior and adjacent development, fire suppression, erosion, and soil damage through a variety of management projects that will benefit native vegetation communities and special-status plant species. Restored and revitalized vegetation communities in GGNRA will, in turn, provide additional improved habitat for wildlife. Completed, current, and future project activities that will have a beneficial cumulative impact on vegetation in the GGNRA sites discussed in this draft plan/SEIS include the following:

- The GGNRA GMP, which provides for resource protection in the park.
- The GGNRA *Fire Management Plan*, which provides guidance for the protection of natural resources through the use of prescribed burns, fire protection measures, and the reduction of fuel hazards.
- Native plant habitat restoration projects that occur throughout the park and are conducted through park stewardship programs led by GGNRA Natural Resources staff (Habitat Restoration Team), the Presidio Park Stewards, and the Golden Gate National Parks Conservancy site stewardship programs. These projects include invasive species removal and/or native plant restoration projects to restore and enhance natural terrestrial plant communities in GGNRA and will beneficially affect coastal vegetation communities at GGNRA. Since 2003, the Conservancy site stewardship programs have worked with the NPS to control invasive plant species and restore natural plant species throughout the park, resulting in the restoration or enhancement of over 1,000 acres of trailside habitat in sites such as the Marin Headlands Trails and Lands End.
- The NPS inventory and monitoring program aims to improve park management through greater reliance on scientific knowledge, including collecting, organizing, and making available natural resource data, such as invasive plant species. Specifically, the inventory and monitoring program includes early detection of invasive plant species, described as a protocol to help find and map the most invasive plant species as they enter sensitive areas of the park to protect the most critical places.
- The *Mori Point Restoration and Trail Plan*, which will restore the ecological integrity of existing habitats and restore native plant communities.
- Restoration of native vegetation as part of the *Lower Easkoot Creek Restoration Plan*.
- The *Muir Beach Wetland and Creek Restoration Project*, which will restore riparian habitat; proposed fencing will protect wetland plant communities; habitat will be created for threatened and endangered species like coho salmon, steelhead trout, and California red-legged frogs.
- Fencing installed at Rodeo Beach/South Rodeo Beach as part of the *Marin Headlands Trails/Fort Baker Improvement and Transportation Management Plan/EIS*, which will protect sensitive coastal dune and wetland communities.

The proposed GGNRA interim compendium amendment would require that commercial dog walkers in San Francisco and Marin counties obtain a permit to walk more than three dogs at GGNRA sites, and would limit commercial dog walkers to no more than six dogs. This would have beneficial impacts on natural resources at GGNRA sites. The proposed interim compendium amendment would reduce overcrowding, lessening dog disturbance on natural resources. Although the proposed interim

## Chapter 4: Environmental Consequences

compendium amendment is directly related to dog management and would have overall beneficial cumulative impacts, these impacts are not expected to be great enough to alter the intensity of the expected impacts from the implementation of the alternatives on natural resources.

In addition to the GGNRA-sponsored projects discussed above, the SNRAMP will also be included in the cumulative impacts analysis. Fragments of unique plant and animal habitats within San Francisco and Pacifica, known as Significant Natural Resource Areas (natural areas), have been preserved within the parks that are managed by the San Francisco Recreation and Park Department (SFRPD). The SNRAMP is intended to guide natural resource protection, habitat restoration, trail and access improvements, other capital projects, and maintenance activities over the next 20 years (SFPD 2011, 1). The scope of the SNRAMP analysis includes natural areas managed by the SFRPD in San Francisco and Pacifica and addresses dog walking (including on-leash dog walking and off-leash DPAs) in these areas (SFPD 2011, 261-262). The SNRAMP will protect natural resources, but will affect recreation resources.

The SNRAMP would have an overall beneficial impact on biological resources over the long term. Habitat types within the natural areas include grassland, wetland, coastal scrub, dune scrub, riparian, and native forest, as well as numerous areas of non-native vegetation (SFPD 2011, 285). The natural areas provide a mosaic of habitats that are accessible to mobile wildlife species, particularly birds, including foraging, nesting, and roosting habitats (SFPD 2011, 290). Project activities included in the SNRAMP would protect and enhance special-status species habitat, riparian habitat, wetlands, migratory wildlife habitat, nursery sites, and other sensitive habitats in the natural areas (SFPD 2011, 292), and would include the following:

- Maintain viable populations of all special-status species;
- Maintain and enhance native plant and animal communities;
- Maintain and enhance local biodiversity;
- Reestablish native community diversity, structure, and ecosystem function where degraded;
- Improve natural area connectivity; and
- Decrease the extent of invasive exotic species cover.

The San Francisco Recreation and Park Department's dog policy excludes dogs (on- and off-leash) from sensitive habitat areas, such as sensitive wildlife areas (e.g., breeding habitat for birds), sensitive remnant native plant communities (e.g., wetlands), sensitive plant populations (e.g., locally rare wildflower species), and high erosion prone areas, and excludes them temporarily from restoration areas (SFPD 2011, 156). The SNRAMP, authored by the San Francisco Planning Department will guide natural resource protection and habitat restoration, among other activities over the next 20 years in natural areas of San Francisco and Pacifica managed by SFRPD (SFPD 2011, 1). The scope of the SNRAMP analysis includes natural areas managed by the SFRPD in San Francisco and Pacifica and addresses dog walking (including on-leash dog walking and off-leash DPAs) in these areas (SFPD 2011, 261-262), including:

- "Limit off-leash activities to the relatively flat areas to avoid sensitive plant species" (SFPD 2011, 118).
- "Monitor the dog impact on wetlands and [creeks] and consider appropriate restrictions (including fencing) to keep dogs out of the creek channel and wetlands" (SFPD 2011, 127).
- "Install and maintain signs and barriers to prevent disturbance of sensitive habitat in Horse Stable Pond and Laguna Salada by dogs or other possible nuisances" (SFPD 2011, 144).

- “Make 33.3 acres of Arrowhead Pond, Laguna Salada, and Horse Stable Pond off limits to dogs to prevent access to sensitive habitats; if this is not effective, use fencing to close social trails in these areas” (SFPD 2011, 145).

The combined reductions in off leash areas proposed by both the SNRAMP and this draft plan/SEIS could result in an increase in dog use at the remaining natural areas managed by SFRPD as well as GGNRA sites. An increase in dog use at the natural areas could accelerate the physical deterioration of those DPAs and the natural areas in general. DPAs within the natural areas would continue to be evaluated in accordance with the SFRPD’s Dog Policy; the SFRPD would monitor DPAs for their effects on the natural areas and develop solutions to any identified issues. In this section, the SNRAMP will be discussed as a project with cumulative impacts for GGNRA sites within San Francisco that have coastal scrub/chaparral/grassland vegetation, riparian vegetation, and wetland vegetation. Once implemented, the SNRAMP would improve plant communities and would have an overall beneficial impact on vegetation over the long term.

Adverse impacts could occur as a result of development projects both in the park and adjacent to park boundaries, including the various transportation and trail plans, such as the *Marin Headlands Trails and Fort Baker Transportation Infrastructure and Management Plan Final Environmental Impact Statement*. These efforts will involve ground-disturbance activities that could add to or exacerbate existing non-native plant problems along road and trail corridors. However, ongoing efforts to identify mitigation measures for these projects, such as pre-project weed control, post-project planting and weeding, and use of weed-free products (soils, fill material, and equipment), would reduce the potential for these types of impacts. These projects would have a beneficial impact on vegetation as a whole (NPS 2005b). Projects would also focus on the elimination of excess or unofficial social trails, reducing habitat fragmentation and associated infiltration of weed species into intact habitat areas.

The following paragraphs describe impacts on vegetation by habitat type, alternative, and applicable site.

## **IMPACTS TO COASTAL COMMUNITIES BY SITE AND ALTERNATIVE**

The coastal communities at GGNRA include habitats such as coastal dunes, beaches, adjacent open water, and rocky intertidal areas, of which only the coastal dune habitat supports terrestrial plant communities that could be affected by dog activities. In the study area at GGNRA, coastal dune habitat is found at Stinson Beach, Muir Beach, Rodeo Beach/South Rodeo Beach, Crissy Field, Baker Beach and Bluffs to Golden Gate Bridge, Ocean Beach, and Fort Funston. Coastal dune plant species are very sensitive and easily disturbed by trampling, digging (from off-leash dogs), and other activities, and may not recover due to their sensitive nature, which may create opportunities for the establishment of non-native and/or invasive plant species. CNPS-listed plant species at GGNRA that occur in coastal dune habitat are included in the impacts analysis of this section as applicable. The following areas in the dog management planning areas at GGNRA have beach habitat: Muir Beach, Rodeo Beach/South Rodeo Beach, Crissy Field, Baker Beach and Bluffs to Golden Gate Bridge, Ocean Beach, Fort Funston, and Mori Point; dogs are currently allowed access to these beaches or portions of these beaches. As applicable, these beach areas are discussed in more detail in the following paragraphs. Many of the coastal sites in GGNRA have rocky intertidal areas and cliffs, including Muir Beach, Rodeo Beach, Fort Baker, Fort Mason, Baker Beach, Bluffs to the Golden Gate Bridge, Lands End, Fort Funston, Mori Point, and Pedro Point. However, these areas are not the dominant habitat type at the site or are generally not accessible to visitors therefore, are not discussed further in this draft plan/SEIS.

### MARIN COUNTY SITES

#### Stinson Beach

**Alternative A: No Action.** Under current conditions at Stinson Beach, dogs and dog owners are restricted to having dogs on leash in the parking lot and picnic areas since dogs are not allowed on the beach because it is a swimming beach. Currently, there is low compliance with the no-dog walking restriction on the beach; there were over 70 recorded incidents of dogs in a closed area in 2008 through 2011 (table 11). Compliance is considered good in the parking lots and picnic areas, with only 4 off-leash violations recorded (table 11). The integrity of the plant community is already affected by human use. In general, the dune communities are not in areas where dogs are allowed on leash under alternative A, and the majority of vegetation that could be affected by dogs on dunes (at the north parking lot) is non-native vegetation. However, visitors (both humans and dogs) currently access the adjacent county beach, Upton Beach, where dogs are allowed from the north end of Stinson. This access point to Upton Beach from the north Stinson Beach parking lot is located within coastal dune communities and dune erosion is currently occurring along the northern end of the parking lot, resulting in seasonal flooding of adjacent properties and the parking lot. Therefore, a long-term minor adverse impact would occur to the coastal community as a result of continued use of the area to access Upton Beach by visitors of all kinds.

Under alternative A, no permit system exists for dog walking. At Stinson Beach, commercial dog walking is uncommon. Therefore, commercial dog walking would have negligible impacts on the coastal foredune plant community.

**Cumulative Impacts.** Projects and actions in and near Stinson Beach were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or have the potential to have effects on coastal dune vegetation at or in the vicinity of this site.

Park stewardship programs provide indirect benefits to coastal vegetation communities by activities such as controlling invasive plant species, supporting coastal habitats, and restoring habitats. Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs initiative projects provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils. Ongoing parkwide restoration and enhancement efforts, such as GGNRA natural resource stewardship programs and the *Marin Countywide Plan* (County of Marin 2007), can also beneficially affect habitat at GGNRA park sites such as Stinson Beach. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance. Habitat restoration and the implementation of projects funded by the Wildland/Urban Interface Initiative on private lands could also impact Stinson Beach. The *Lower Easkoot Creek Restoration Project* at Stinson Beach has restored native vegetation (NPS n.d.d). The Gulf of the Farallones National Marine Sanctuary has proposed the *Bolinas Lagoon Ecosystem Restoration Project*, located near Stinson Beach, in partnership with Marin County Open Space District and the U.S. Army Corps of Engineers (GFNMS Working Group 2008). This project will restore natural sediment transport and ecological functions of Bolinas Lagoon, and identify and manage introduced species in the Bolinas Lagoon watershed.

Additional actions have had, are currently having, or have the potential to have adverse impacts on vegetation at or in the vicinity of Stinson Beach. Development or construction actions at or in the vicinity of GGNRA sites have had or may have the potential to have adverse impacts on coastal communities. Even though these efforts both within and beyond park boundaries would affect vegetation, mitigation for these projects would reduce the potential for impacts.

The long-term minor adverse impacts from dogs at Stinson Beach on coastal dune vegetation under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from the restoration projects provided by the park stewardship programs combined with the negligible impacts from any development or construction actions and the long-term minor adverse impacts on coastal dune vegetation from alternative A would result in negligible cumulative impacts on coastal dune vegetation.

**STINSON BEACH ALTERNATIVE A CONCLUSION TABLE**

| <b>Coastal Community Impacts</b> | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|----------------------------------|--|---|-------------------------------|
| Long-term minor adverse impacts  | Dune communities are generally not in areas where dogs would be allowed on leash and the majority of vegetation on the dunes is non-native species where dogs can affect dunes; however, dogs are allowed on the path to Upton Beach which may cause continued dune erosion in this area | N/A   | Negligible cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** As in alternative A, on-leash dog walking would be allowed only in the parking lot and picnic areas of Stinson Beach. Dogs would not be allowed on the beach itself, because it is a designated swimming beach. Assuming compliance, alternative B would produce no impact on coastal dunes at Stinson Beach because dune communities are not in areas where dogs would be allowed.

Since dune communities are not in areas where dogs would be allowed there would be no impact on coastal dunes at Stinson Beach from commercial dog walkers.

**Cumulative Impacts.** The lack of impacts on coastal dune vegetation from dogs at Stinson Beach under alternative B were considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the restoration projects provided by the park stewardship programs combined with the negligible impacts from any development or construction actions and the lack of impacts from alternative B would result in beneficial cumulative impacts on coastal dune vegetation.

**STINSON BEACH ALTERNATIVE B CONCLUSION TABLE**

| <b>Coastal Community Impacts</b> | <b>Rationale</b>                                 | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|----------------------------------|--|---|-------------------------------|
| No impact, assuming compliance   | Dogs would not be allowed on the beach or trails | Beneficial, assuming compliance                     | Beneficial cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C dog walking restrictions for Stinson Beach would be the same as alternative B; therefore, there would be no impact on coastal dune communities under alternative C, assuming compliance.

#### Chapter 4: Environmental Consequences

Since dune communities are not in areas where dogs would be allowed there would be no impact on coastal dunes at Stinson Beach from commercial dog walkers.

**Cumulative Impacts.** Under alternative C, the cumulative impacts would be the same as those under alternative B: beneficial cumulative impacts on coastal dunes at this park site.

**STINSON BEACH ALTERNATIVE C CONCLUSION TABLE**

| Coastal Community Impacts      | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--------------------------------|--|--|-------------------------------|
| No impact, assuming compliance | Dogs would not be allowed on the beach or trails | Beneficial, assuming compliance              | Beneficial cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Under alternative D, dogs would not be allowed at this site. Assuming compliance, no impact on vegetation from dogs would occur at this site because dog walking would be eliminated from the site.

Since dogs would not be allowed at Stinson Beach, there would be no impact from commercial dog walkers on the coastal community vegetation.

**Cumulative Impacts.** The lack of impacts on coastal dune vegetation from dogs at Stinson Beach under alternative D was considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the restoration projects provided by the park stewardship programs combined with the negligible impacts from any development or construction actions and the lack of impacts on coastal dune vegetation from alternative D would result in beneficial cumulative impacts on coastal dune vegetation.

**STINSON BEACH ALTERNATIVE D CONCLUSION TABLE**

| Coastal Community Impacts      | Rationale                            | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--------------------------------|--------------------------------------|--|-------------------------------|
| No impact, assuming compliance | Dogs would be prohibited at the site | Beneficial, assuming compliance              | Beneficial cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would have the same dog walking restrictions as alternative B, and impacts on vegetation would be the same, assuming compliance: no impact.

Since dune communities are not in areas where dogs would be allowed there would be no impact on coastal dunes at Stinson Beach from commercial dog walkers.

**Cumulative Impacts.** Under alternative E, the cumulative impacts on vegetation at this park site would be the same as those under alternative B: beneficial cumulative impacts.

STINSON BEACH ALTERNATIVE E CONCLUSION TABLE

| Coastal Community Impacts      | Rationale                                       | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--------------------------------|---|--|-------------------------------|
| No impact, assuming compliance | Dogs would be prohibited on the beach or trails | Beneficial, assuming compliance              | Beneficial cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative would allow on-leash dog walking in the parking lot and picnic areas of Stinson Beach and on the path to Upton Beach from the north parking lot. Dogs would not be allowed on the beach itself, because it is a designated swimming beach. The on-leash path or corridor to be built from the north parking lot of Stinson Beach would provide legal access to Upton Beach the Marin County-managed beach where dog walking is allowed. This access trail would include fencing or a barrier to separate this trail from the GGNRA beach where dogs are prohibited. This proposed path is located within coastal dune communities and dune erosion is currently occurring at the northern end of the parking lot, resulting in flooding of adjacent properties and the parking lot. Therefore, a long-term minor adverse impact would occur to the coastal community as a result of formalized access to Upton Beach by visitors of all kinds (both humans and dogs). However, the park would determine the most appropriate location for the access route to reduce the potential for added dune erosion at this location and would consider restoration of the dunes in this area in the future. At Stinson Beach, commercial dog walking is uncommon. Therefore, commercial dog walking would have negligible impacts on the coastal foredune plant community.

**Cumulative Impacts.** Projects and actions in and near Stinson Beach were considered for the cumulative impacts analysis (appendix K). The following is a discussion of projects that have had, are currently having, or will have the potential to have effects on coastal dune vegetation at or in the vicinity of this site.

Park stewardship programs provide indirect benefits to coastal vegetation communities by activities such as controlling invasive plant species, supporting coastal habitats, and restoring habitats. Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils. Ongoing parkwide restoration and enhancement efforts, such as GGNRA natural resource stewardship programs and the *Marin Countywide Plan* (County of Marin 2007), can also beneficially affect habitat at GGNRA park sites such as Stinson Beach. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance. Habitat restoration and the implementation of projects funded by the Wildland/Urban Interface Initiative on private lands could also impact Stinson Beach. The *Lower Easkoot Creek Restoration Project* at Stinson Beach has restored native vegetation (NPS n.d.d, 1). The Gulf of the Farallones National Marine Sanctuary has proposed the *Bolinas Lagoon Ecosystem Restoration Project*, located near Stinson Beach, in partnership with Marin County Open Space District and the U.S. Army Corps of Engineers (GFNMS Working Group 2008). This project will restore natural sediment transport and ecological functions of Bolinas Lagoon, and identify and manage introduced species in the Bolinas Lagoon watershed.

Additional actions have had, are currently having, or have the potential to have adverse impacts on vegetation at or in the vicinity of Stinson Beach. Development or construction actions at or in the vicinity of GGNRA sites have had or may have the potential to have adverse impacts on coastal communities. Even though these efforts both within and beyond park boundaries would affect vegetation, mitigation for these projects would reduce the potential for impacts.

## Chapter 4: Environmental Consequences

The long-term minor adverse impacts on coastal dune vegetation from dogs at Stinson Beach under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from the restoration projects provided by the park stewardship programs combined with the negligible impacts from any development or construction actions and the long-term minor adverse impacts on coastal dune vegetation from the preferred alternative would result in negligible cumulative impacts on coastal dune vegetation.

**STINSON BEACH PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| Coastal Community Impacts       | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---------------------------------|--|--|-------------------------------|
| Long-term minor adverse impacts | Dogs would be prohibited on the beach or trails but would be allowed on the path to Upton Beach which may cause further dune erosion | No change, assuming compliance               | Negligible cumulative impacts |

### Muir Beach

**Alternative A: No Action.** At Muir Beach, dune communities, including a dune restoration area, are located adjacent to the beach, which is open to dogs under voice control. This site has high visitor use and a total of 24 dog-related violations were reported from 2008 through 2011 (table 14). The most common violations were for having dogs off-leash (9 violations) and having dogs within closed areas (4 violations) (table 14). The dune communities at Muir Beach are not well protected. Ineffective post-and-cable fencing at Muir Beach discourages visitors from entering the dune restoration area; other dune areas are unfenced and would not physically exclude dogs. As a result, alternative A would have continued long-term moderate adverse impacts on coastal dune plant species because the integrity of the plant community could be negatively affected by dogs through trampling, digging, and dog waste.

Under alternative A, no permit system exists for dog walking. At Muir Beach, commercial dog walking is uncommon. Therefore, commercial dog walking would have negligible impacts on dune communities.

**Cumulative Impacts.** Projects and actions in and near Muir Beach were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs initiative projects provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils. Ongoing parkwide restoration and enhancement efforts, such as GGNRA natural resource stewardship programs and the *Marin Countywide Plan* (County of Marin 2007), can also beneficially affect vegetation at GGNRA park sites such as Muir Beach. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance. Habitat restoration and the implementation of projects funded by the Wildland/Urban Interface Initiative on private lands could also impact Muir Beach. The *Lower Redwood Creek Floodplain and Salmonid Habitat Restoration* restored channel function to reduce flooding and reconnect the creek to its floodplain as well as expanding riparian vegetation at the Banducci site (NPS 2010b). The *Dias Ridge Restoration and Trail Improvement Project* is currently realigning trail segments and restoring degraded areas on Dias Ridge above Muir Beach (NPS 2009i). Additional vegetation benefits would be expected from wetland and creek restoration at the tidal lagoon, which would reduce flooding on Pacific Way. The *Muir Beach Wetland and Creek Restoration Project* is restoring and enhancing ecological processes near the mouth of Redwood Creek, contributing to the quality of habitat, particularly as a result of restoration and enhancement of habitat and improvement of erosion and sedimentation conditions (NPS 2007b; NPS

2009j). The park stewardship programs initiative at Pirates Cove, just south of Muir Beach, included efforts to control invasive non-native plants, such as pampas grass, to support the dense and relatively undisturbed coastal scrub, prairie, and riparian habitats (GGNPC 2010a). The Pirates Cove project disturbed a large area of soil and vegetation and resulted in a short-term adverse impact, but these impacts were offset by the long-term, beneficial impacts on soils and vegetation resources.

Additional actions have had, are currently having, or have the potential to have adverse impacts on vegetation at or in the vicinity of Muir beach. Development or construction actions at or in the vicinity of GGNRA sites have had or may have the potential to have adverse impacts on coastal communities. Even though these efforts both within and beyond park boundaries would affect vegetation, mitigation for these projects would reduce the potential for impacts.

The long-term moderate adverse impacts on the coastal dune plant community from dogs at Muir Beach under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from the many habitat restoration projects at and near Muir Beach should reduce some of the adverse impacts from this alternative on the coastal dune plant community. Therefore, cumulative impacts on the coastal dune plant community under this alternative would be expected to be negligible to long term, minor, and adverse.

**MUIR BEACH ALTERNATIVE A CONCLUSION TABLE**

| <b>Coastal Community Impacts</b>   | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>                                |
|------------------------------------|--|---|--|
| Long-term moderate adverse impacts | Dune communities are not well protected, are adjacent to off-leash areas, and are subject to impacts by dogs through trampling, digging, and dog waste | N/A   | Negligible to long-term minor adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking in the parking area, bridge, path to the beach, the proposed Muir Beach Trail, and the beach. The dune communities located adjacent to Muir Beach would be generally protected by physically restraining dogs. Coastal dune vegetation located in the 6-foot area adjacent to the beach (LOD area) would receive long-term minor adverse impacts from dogs trampling vegetated areas; nutrient addition from dog waste would also occur.

The long-term minor adverse impacts from dogs on the trails and in the LOD area would occur in a relatively small area compared to the site as a whole. Physically restraining dogs would protect vegetation and habitat off trail. Therefore, the overall impact on vegetation under alternative B would be negligible because no measurable or perceptible changes in the dune plant community would occur; plant structure, abundance, and distribution (both quality and quantity) of the coastal community would not measurably change.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is not common at Muir Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have negligible impacts on vegetation.

**Cumulative Impacts.** The negligible impacts on the coastal dune plant community from dogs at Muir Beach under alternative B were considered together with the effects of the projects mentioned above

## Chapter 4: Environmental Consequences

under alternative A “Cumulative Impacts.” The beneficial effects from the many habitat restoration projects at and near Muir Beach combined with the negligible impacts from any development or construction actions and the negligible impacts from this alternative on the coastal dune plant community would result in beneficial cumulative impacts.

**MUIR BEACH ALTERNATIVE B CONCLUSION TABLE**

| Coastal Community Impacts                       | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect dune vegetation; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance              | Beneficial cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Because alternative C would have the same dog walking restrictions as alternative B, the impacts on dune communities would also be the same, assuming compliance: long term, minor, and adverse in the LOD area and negligible overall.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Muir Beach is not one of the sites where permits would be issued allowing individual or commercial dog walkers to walk more than three dogs. Impacts to the coastal dunes by commercial dog walkers would be prevented by requiring dogs to be on a leash resulting in no impact on vegetation.

**Cumulative Impacts.** Under alternative C, the cumulative impacts on vegetation at this park site would be the same as those under alternative B: beneficial cumulative impacts.

**MUIR BEACH ALTERNATIVE C CONCLUSION TABLE**

| Coastal Community Impacts                       | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect dune vegetation; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance              | Beneficial cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** In the vicinity of Muir Beach, alternative D would allow on-leash dog walking in the parking area and on the proposed Muir Beach Trail. The boardwalk/path to the beach and the beach itself would be closed to dogs; the tidal lagoon and Redwood Creek, which are currently closed to dogs, would remain so. Assuming compliance, no impact on vegetation (in or beyond LOD area) would occur as a result of alternative D because trampling and nutrient addition in coastal dunes would be prevented by on-leash dog walking since dogs would not be allowed on the beach, the boardwalk, or path near dune communities.

No commercial dog walking would be allowed and no permits to walk more than three dogs would be issued under alternative D; therefore, commercial and permitted dog walking would have no impact on coastal dune vegetation.

**Cumulative Impacts.** Under alternative D, the lack of impacts on the coastal dune plant community from dogs was considered together with the effects of the projects mentioned above under alternative A

“Cumulative Impacts.” The beneficial effects from the many habitat restoration projects at and near Muir Beach combined with the negligible impacts from any development or construction actions and the lack of impacts from this alternative on the coastal dune plant community would result in beneficial cumulative impacts.

**MUIR BEACH ALTERNATIVE D CONCLUSION TABLE**

| Coastal Community Impacts      | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--------------------------------|--|--|-------------------------------|
| No impact, assuming compliance | Dogs would not be allowed on the beach or boardwalk/path near dune communities | Beneficial, assuming compliance              | Beneficial cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** In the vicinity of Muir Beach, the parking area, the proposed Muir Beach Trail, and the bridge and path to the beach would be open to on-leash dog walking. The portion of Muir Beach south of the access path would be a designated ROLA open to dogs under voice and sight control. Dogs would be prohibited on the remainder of the beach north of the access path. The ROLA designated as part of this alternative is located immediately adjacent to the fenced dune restoration area. The dunes would not be able to expand naturally beyond the fencing because of dog use, due to continued trampling and dog waste. Therefore, impacts in the LOD area and the ROLA would be long term, moderate, and adverse because the effects would be measurable and perceptible over a relatively large area and would affect the overall integrity of a plant community.

The long-term moderate adverse impacts in the ROLA and the LOD area would occur in a relatively small area compared to the site as a whole, and physically restraining dogs would protect dune vegetation, including the restored dunes. However, the dunes would not be able to expand naturally because the ROLA would be located immediately adjacent to the fenced dune restoration area. Therefore, the overall impact on dune vegetation under alternative E would be long term, minor, and adverse because effects would be measurable and perceptible, but would be localized in a relatively small area.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Muir Beach is not an area where permits for walking more than three dogs would be issued, so individual and commercial dog walkers would only be allowed to walk a maximum of three dogs either on leash or under voice and sight control per person. Since commercial dog walking is not common at Muir Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on coastal dune vegetation.

**Cumulative Impacts.** The long-term minor adverse impacts on coastal dune communities from dogs at Muir Beach under alternative E were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the many habitat restoration projects at and near Muir Beach should reduce the adverse impacts from this alternative to the coastal dune plant community. Therefore, cumulative impacts on the coastal dune plant community under this alternative would be expected to be negligible.

MUIR BEACH ALTERNATIVE E CONCLUSION TABLE

| Coastal Community Impacts                                    | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|--|--|-------------------------------|
| Overall long-term minor adverse impacts, assuming compliance | Physically restraining dogs would protect dune vegetation; dunes would not be able to expand naturally | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative would allow on-leash dog walking on the beach, bridge and path to the beach, and the proposed Muir Beach Trail. Fencing would be installed along the dunes and lagoon as needed. The tidal lagoon and Redwood Creek, which are currently closed to dogs, would remain so. Assuming compliance, no impact on vegetation (in or beyond LOD area) would occur as a result of the preferred alternative because trampling, digging, and nutrient addition in coastal dunes would be prevented by on-leash dog walking since off-leash dogs would not be allowed on the beach, the bridge, or path near dune communities.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Muir Beach is not an area where permits for walking more than three dogs would be issued, so individual and commercial dog walkers would only be allowed to walk a maximum of three dogs on leash per person. However, impacts to the coastal dunes by commercial dog walkers would be prevented by the requirement, resulting in no impact on vegetation.

**Cumulative Impacts.** Projects and actions in and near Muir Beach were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs initiative projects provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils. Ongoing parkwide restoration and enhancement efforts, such as GGNRA natural resource stewardship programs and the *Marin Countywide Plan* (County of Marin 2007), can also beneficially affect vegetation at GGNRA park sites such as Muir Beach. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance. Habitat restoration and the implementation of projects funded by the Wildland/Urban Interface Initiative on private lands could also impact Muir Beach. The *Lower Redwood Creek Floodplain and Salmonid Habitat Restoration* restored channel function to reduce flooding and reconnect the creek to its floodplain, as well as expanding riparian vegetation at the Banducci site (NPS 2010b, 1). The *Dias Ridge Restoration and Trail Improvement Project* is currently realigning trail segments and restoring degraded areas on Dias Ridge above Muir Beach (NPS 2009i, 1). Additional vegetation benefits would be expected from wetland and creek restoration at the tidal lagoon, which would reduce flooding on Pacific Way. The *Muir Beach Wetland and Creek Restoration Project* is restoring and enhancing ecological processes near the mouth of Redwood Creek, contributing to the quality of habitat, particularly as a result of restoration and enhancement of habitat and improvement of erosion and sedimentation conditions (NPS 2009j, 1). The park stewardship programs initiative at Pirates Cove, just south of Muir Beach, included efforts to control invasive non-native plants, such as pampas grass, to support the dense and relatively undisturbed coastal scrub, prairie, and riparian habitats (GGNPC 2010a, 1).

Additional actions have had, are currently having, or have the potential to have adverse impacts on vegetation at or in the vicinity of Muir Beach. Development or construction actions at or in the vicinity of GGNRA sites have had or may have the potential to have adverse impacts on coastal communities. Even though these efforts both within and beyond park boundaries would affect vegetation, mitigation for these projects would reduce the potential for impacts.

The lack of impacts on the coastal dune plant community from dogs at Muir Beach under the preferred alternative was considered together with the effects of the projects mentioned above. The beneficial effects from the many habitat restoration projects at and near Muir Beach combined with the negligible impacts from any development or construction actions and the lack of impacts from this alternative on the coastal dune plant community would result in beneficial cumulative impacts.

**MUIR BEACH PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| Coastal Community Impacts      | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--------------------------------|--|--|-------------------------------|
| No impact, assuming compliance | Physical restraint of dogs would protect dune vegetation; trails and the LOD area are a small portion of the entire site | Beneficial, assuming compliance              | Beneficial cumulative impacts |

### Rodeo Beach/South Rodeo Beach

**Alternative A: No Action.** Under current conditions, dogs are allowed under voice control on Rodeo Beach and South Rodeo Beach. On-leash dog walking is allowed on the footbridge and access trail to the beach. Coastal dune habitat at Rodeo Beach/South Rodeo Beach is generally located between the crest of the beach and the lagoon and along the south side of the lagoon inlet west of the pedestrian bridge, and is in the area where dogs are currently allowed under voice control. Both Rodeo Lagoon and Rodeo Lake are currently closed to dogs for overall resource protection. A total of 30 dog-related incidents were reported with 9 off-leash violations and 7 incidents involving pets within closed areas from 2008 through 2011 (table 15). Park staff, some in offices overlooking the beach and lagoon, have estimated that they observe dogs in the lagoon at least once a week, and on a daily basis during good weather. Therefore, alternative A would result in continued long-term moderate adverse impacts on the coastal dune plant community, including fenced dunes, because dune areas could be negatively affected by dogs through trampling, digging, and dog waste. Effects would be measurable and perceptible and may affect the overall integrity of a plant community.

Under alternative A, no permit system exists for dog walking. At Rodeo Beach/South Rodeo Beach, commercial dog walking is uncommon. Therefore, commercial dog walking would have negligible impacts on vegetation.

**Cumulative Impacts.** Projects and actions in and near Rodeo Beach/South Rodeo Beach were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs initiative projects provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils. Ongoing parkwide restoration and enhancement efforts, such as GGNRA natural resource stewardship programs and the *Marin Countywide Plan* (County of Marin 2007), can also beneficially affect vegetation at GGNRA park sites such as Rodeo Beach/South Rodeo Beach. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance. Habitat restoration and the implementation of projects funded by the Wildland/Urban Interface Initiative on private lands could also impact Rodeo Beach/South Rodeo Beach.

Additional actions have had, are currently having, or have the potential to have adverse impacts on vegetation at or in the vicinity of Rodeo Beach/South Rodeo Beach. Development or construction actions at or in the vicinity of GGNRA sites have had or may have the potential to have adverse impacts on

## Chapter 4: Environmental Consequences

coastal communities. Even though these efforts both within and beyond park boundaries would affect vegetation, mitigation for these projects would reduce the potential for impacts.

The long-term moderate adverse impacts on the coastal dune plant community from dogs at Rodeo Beach/South Rodeo Beach under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from the park stewardship programs and other restoration projects near Rodeo Beach/South Rodeo Beach should reduce some of the adverse impacts from this alternative on the coastal dune plant community. Therefore, cumulative impacts on the coastal dune plant community under this alternative would be expected to be long term, minor, and adverse.

**RODEO BEACH/SOUTH RODEO BEACH ALTERNATIVE A CONCLUSION TABLE**

| Coastal Community Impacts          | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts                         |
|------------------------------------|---|--|--|
| Long-term moderate adverse impacts | Dune communities, including fenced dunes, are in the area where dogs would be allowed under voice control and would be subject to impacts by dogs trampling, digging, and dog waste | N/A  | Long-term minor adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking on Rodeo Beach and South Rodeo Beach, the footbridge, and access trail to the beach. Under alternative B, on-leash dog walking would not allow dogs to roam freely along the beach. The dune communities located on the beach would be protected by physically restraining dogs; however, some individuals may still walk their dogs through this sensitive area. Vegetation located in this area and in the 6-foot area adjacent to the beach and trails (LOD area) would receive long-term minor adverse impacts from dogs trampling the vegetation. Nutrient addition from dog waste would also occur. Adverse impacts from dogs in the LOD area would occur in a relatively small area compared to the site as a whole. On-leash dog walking restrictions would physically restrain dogs, which would protect vegetation and habitat off trail at this site, but even on-leash dogs could trample unfenced dune vegetation at this site. Therefore, assuming compliance, the overall impact on coastal dune vegetation under alternative B would be negligible to long term, minor, and adverse because measurable or perceptible changes in the dune plant community could occur, but would be localized in a relatively small area.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking is not common at Rodeo Beach/South Rodeo Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have negligible impacts on vegetation.

**Cumulative Impacts.** The negligible to long-term minor adverse impacts on the coastal dune plant community from dogs at Rodeo Beach/South Rodeo Beach under alternative B were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the park stewardship programs and other restoration projects near Rodeo Beach/South Rodeo Beach should reduce some of the adverse impacts from this alternative on the coastal dune plant community. Therefore, cumulative impacts on the coastal dune plant community under this alternative would be expected to be negligible.

**RODEO BEACH/SOUTH RODEO BEACH ALTERNATIVE B CONCLUSION TABLE**

| Coastal Community Impacts  | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts           |
|--|--|--|------------------------------|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs would protect dune vegetation, but even on-leash dogs could trample unfenced dune vegetation | Beneficial, assuming compliance              | Negligible cumulative impact |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would establish a ROLA on Rodeo Beach that includes areas of vegetated coastal foredunes within the ROLA extending from the crest of the beach east to the lagoon and south to the ridge on the beach north of South Rodeo Beach. The installation of a post-and-cable fence along the west end of Rodeo Lagoon would discourage visitors from accessing the lagoon, but would not physically exclude dogs from this area. A fence more impervious to dogs in this area is not feasible because winter storm waves wash over the entire beach, and wind-driven litter and debris would be trapped in the fence. In the ROLA at Rodeo Beach, dogs would create long-term moderate adverse impacts on coastal foredune vegetation due to the large size of the ROLA and the vegetation within this off-leash area. Dogs would run/play through the foredune areas, potentially trampling and digging up vegetation and adding nutrients through dog waste.

The long-term moderate adverse impacts from dogs in the LOD area would occur in a large area compared to the site as a whole. Physically restraining dogs with a leash in other areas of the site outside of the ROLA would protect vegetation and habitat, but most dune vegetation is in the ROLA and would be affected by dogs. Therefore, assuming compliance, the overall impact on vegetation under alternative B would be long term, minor to moderate, and adverse because measurable or perceptible changes in the dune plant community would occur, and the integrity of the plant community could be negatively affected by dogs through trampling, digging, and dog waste.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. In a ROLA, permit holders may walk one to six dogs off leash and the permit may restrict use by time and area. Permits would be allowed at Rodeo Beach/South Rodeo Beach. Impacts on vegetation from permit holders with four to six dogs off leash would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is not common at Rodeo Beach/South Rodeo Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on coastal dune vegetation.

**Cumulative Impacts.** The long-term minor to moderate adverse impacts on the coastal dune plant community from dogs at Rodeo Beach/South Rodeo Beach under alternative C were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the park stewardship programs and other restoration projects near Rodeo Beach/South Rodeo Beach should reduce some of the adverse impacts from this alternative on the coastal dune plant community. Therefore, cumulative impacts on the coastal dune plant community under this alternative would be expected to be long term, minor, and adverse.

RODEO BEACH/SOUTH RODEO BEACH ALTERNATIVE C CONCLUSION TABLE

| Coastal Community Impacts  | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts                           |
|--|---|--|--|
| Overall long-term minor to moderate adverse impacts, assuming compliance | Physically restraining dogs in some areas and fencing would protect dune vegetation, but dune vegetation is also in ROLA and subject to impacts from dogs | Beneficial to no change, assuming compliance | Long-term, minor, adverse cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Under alternative D, restricting dogs to on leash only on the footbridge and on Rodeo Beach north of the footbridge, and prohibiting dog walking on the rest of Rodeo Beach, South Rodeo Beach, and the connecting paths would provide additional protection to the vegetated foredunes along the crest of the dunes, but the vegetated foredunes along the lagoon inlet west of the pedestrian bridge would still be open to on-leash dog walking. There are no obvious trails in this location and no fencing planned, since the beach topography near the inlet is dynamic in the winter months. The dune communities located on the beach would be protected by physically restraining dogs on a leash; however, some individuals may still walk their dogs through this sensitive area. Coastal dune vegetation located in this area and in the 6-foot area adjacent to the beach and trails (LOD area) would receive long-term minor adverse impacts from dogs trampling the vegetation. Nutrient addition from dog waste would also occur.

The long-term minor adverse impacts from dogs in the LOD area would occur in a relatively small area compared to the site as a whole because dogs would be prohibited on the southern portion of Rodeo Beach, on the access trail to South Rodeo Beach, and on South Rodeo Beach. Physically restraining dogs with a leash would generally protect vegetation and habitat at the site. Therefore, the overall impact on vegetation under alternative D, assuming compliance, would be long term, minor, and adverse because measurable or perceptible changes in the dune plant community would occur, but would be localized in a relatively small area.

No commercial dog walking would be allowed and no permits to walk more than three dogs would be issued under alternative D; therefore, commercial and permitted dog walking would have no impact on coastal dune vegetation.

**Cumulative Impacts.** The long-term minor adverse impacts on the coastal dune plant community from dogs at Rodeo Beach under alternative D were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the park stewardship programs and other restoration projects near Rodeo Beach should reduce some of the adverse impacts from this alternative on the coastal dune plant community. Therefore, cumulative impacts on the coastal dune plant community under this alternative would be expected to be negligible.

RODEO BEACH/SOUTH RODEO BEACH ALTERNATIVE D CONCLUSION TABLE

| Coastal Community Impacts                                    | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Overall long-term minor adverse impacts, assuming compliance | Physically restraining dogs would protect dune vegetation, but vegetated foredunes along the lagoon inlet would still be open to on-leash dog walking | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Under alternative E, dog walking under voice and sight control would be allowed in a ROLA on Rodeo Beach and South Rodeo Beach. On-leash dog walking would be allowed on the footbridge and access trail to the beach. The ROLA includes some areas of coastal dune habitat, including the foredune area east of the crest of the dune. Dogs would run/play through the foredune area, potentially trampling and digging up vegetation and adding nutrients through dog waste. Impacts in the ROLA would be long term, would be readily apparent, and would cause noticeable changes in coastal dune vegetation. Vegetation located in the 6-foot area adjacent to the on-leash portion of the beach and the trails (LOD area) would also be affected by dogs. In the ROLA and the LOD area, long-term moderate adverse impacts on vegetation from dogs through trampling and digging would occur; nutrient addition from dog waste would also occur. The long-term moderate adverse impacts from dogs in the LOD area would occur in a large area compared to the site as a whole. Physically restraining dogs with a leash in the areas outside of the ROLA would protect the majority of dune vegetation and habitat off trail, but some dune vegetation is in the ROLA and would be affected by dogs. Therefore, assuming compliance, the overall impact on vegetation under alternative E would be long term, minor to moderate, and adverse because measurable or perceptible changes in the dune plant community would occur, and the integrity of the plant community could be negatively affected by dogs through trampling, digging, and dog waste.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. In a ROLA, permit holders may walk one to six dogs off leash and the permit may restrict use by time and area. Permits would be allowed at Rodeo Beach/South Rodeo Beach. Impacts on vegetation from permit holders with four to six dogs off leash would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is not common at Rodeo Beach/South Rodeo Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on vegetation.

**Cumulative Impacts.** The long-term minor to moderate adverse impacts on the coastal dune plant community from dogs at Rodeo Beach/South Rodeo Beach under alternative E were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the park stewardship programs and other restoration projects near Rodeo Beach/South Rodeo Beach should reduce some of the adverse impacts from this alternative on the coastal dune plant community. Therefore, cumulative impacts on the coastal dune plant community under this alternative would be expected to be long term, minor, and adverse.

RODEO BEACH/SOUTH RODEO BEACH ALTERNATIVE E CONCLUSION TABLE

| Coastal Community Impacts  | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts                           |
|--|---|--|--|
| Overall long-term minor to moderate adverse impacts, assuming compliance | Fencing and physical restraint of dogs would protect some dune vegetation, but a large amount of dune vegetation is within the ROLA | Beneficial, assuming compliance              | Long-term, minor, adverse cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative would establish a ROLA on Rodeo Beach that includes areas of vegetated coastal foredunes within the ROLA extending from the crest of the beach east to the lagoon and south to the sea stacks that divide the main beach from South Rodeo Beach. The installation of a post-and-cable fence along the west end of Rodeo Lagoon would discourage visitors from accessing the lagoon, but would not physically exclude dogs from this area. A fence more impervious to dogs in this area is not feasible because winter storm waves wash over the entire beach, and wind-driven litter and debris would be trapped in the fence. In the ROLA at Rodeo Beach/South Rodeo Beach, dogs would create long-term moderate adverse impacts on coastal foredune vegetation due to the large size of the ROLA and the vegetation within this off-leash area. Dogs would run/play through the foredune areas, potentially trampling and digging up vegetation and adding nutrients through dog waste. The adverse impacts from dogs in the LOD area would occur in a large area compared to the site as a whole. Physically restraining dogs with a leash in the areas outside of the ROLA would protect vegetation and habitat off trail, but some dune vegetation is in the ROLA and would be affected by dogs. Therefore, the overall impact on vegetation under the preferred alternative would be long term, minor to moderate, and adverse because measurable or perceptible changes in the dune plant community would occur, and the integrity of the plant community could be negatively affected by dogs through trampling, digging, and dog waste.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. In a ROLA, permit holders may walk one to six dogs off leash and the permit may restrict use by time and area. Permits would be allowed at Rodeo Beach/South Rodeo Beach. Impacts on vegetation from permit holders with four to six dogs off leash would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is not common at Rodeo Beach/South Rodeo Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have negligible impacts on vegetation.

**Cumulative Impacts.** Projects and actions in and near Rodeo Beach/South Rodeo Beach were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs initiative projects provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils. Ongoing parkwide restoration and enhancement efforts, such as GGNRA natural resource stewardship programs and the *Marin Countywide Plan* (County of Marin 2007), can also beneficially affect vegetation at GGNRA park sites such as Rodeo Beach/South Rodeo Beach. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance. Habitat restoration and the implementation of projects funded by the Wildland/Urban Interface Initiative on private lands could also impact Rodeo Beach/South Rodeo Beach.

Additional actions have had, are currently having, or have the potential to have adverse impacts on vegetation at or in the vicinity of Rodeo Beach/South Rodeo Beach. Development or construction actions at or in the vicinity of GGNRA sites have had or may have the potential to have adverse impacts on coastal communities. Even though these efforts both within and beyond park boundaries would affect vegetation, mitigation for these projects would reduce the potential for impacts.

The long-term minor to moderate adverse impacts on the coastal dune plant community from dogs at Rodeo Beach/South Rodeo Beach under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from the park stewardship programs and other restoration projects near Rodeo Beach/South Rodeo Beach should reduce some of the adverse impacts from this alternative on the coastal dune plant community. Therefore, cumulative impacts on the coastal dune plant community under this alternative would be expected to be long term, minor, and adverse.

**RODEO BEACH/SOUTH RODEO BEACH PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| <b>Coastal Community Impacts</b>   | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>                    |
|--|---|---|--|
| Overall long-term minor to moderate adverse impacts, assuming compliance | Physically restraining dogs in some areas and fencing would protect dune vegetation, but dune vegetation is also in the ROLA and subject to impacts from dogs | Beneficial to no change, assuming compliance        | Long-term, minor, adverse cumulative impacts |

## **SAN FRANCISCO COUNTY SITES**

### **Crissy Field**

**Common to All Action Alternatives.** Impacts from dogs as a result of the two different definitions of the Crissy Field WPA (the 36 CFR 7.97(d) definition for alternative A and the Warming Hut to approximately 900 feet east of the former Coast Guard Pier definition for alternatives B–E) will be the same for all alternatives. Even though the WPA would be expanded for alternatives B–E, this change would not influence the overall impacts analysis at this site because it would neither increase nor decrease the impacts at Crissy Field described in the paragraphs that follow. Further explanation of these two definitions can be found in the “Current Regulations and Policies” section of chapter 2.

**Alternative A: No Action.** Dogs are currently allowed under voice control throughout Crissy Field except for the WPA (which has a seasonal leash restriction), the tidal marsh (which is closed to dogs), and the parking and picnic areas (which allow on-leash dog walking only). This site has documented moderate to high visitor use and compliance with dog walking regulations is low. From 2008 through 2011, a total of 510 incidents were reported. Of the 510 incidents, 283 incidents were for having dogs off leash within the Crissy Field WPA when the seasonal leash restriction was in effect (table 19). Other common incidents include violation of a closed area (58 incidents), having dogs off leash (65 incidents), and possession of a pet in a closed area (15 incidents). Violations have been issued for having pets in the Crissy Field marsh, which is closed to both humans and pets. There is currently considerable access to dune habitat at Crissy Field, although the restored dune areas are fenced. In the restored dune areas, the shifting sand buries the fences, and dogs have accessed dune areas; there are also sparsely vegetated foredunes that have formed in the WPA that are frequently trampled by dogs.

## Chapter 4: Environmental Consequences

Therefore, alternative A would result in continued long-term moderate adverse impacts on the coastal dune vegetation in the Central and East beach areas and the WPA. Impacts would result from trampling, digging, and dog waste from dogs. Effects on the coastal community would be measurable and perceptible over a relatively large area, and would affect the overall integrity of the plant community. Additionally, the restoration areas at Crissy Field, which have been planted with CNPS-listed species such as San Francisco dune gilia and San Francisco spineflower, would continue to be at risk.

Under alternative A, no permit system exists for dog walking. However, commercial dog walking at Crissy Field occurs regularly. Commercial dog walking would continue to contribute to the long-term moderate adverse impacts on the coastal dune vegetation. Commercial dog walkers with multiple dogs under voice control would impact vegetation through dogs trampling, digging, and depositing dog waste.

**Cumulative Impacts.** Projects and actions in and near Crissy Field were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils. Ongoing parkwide restoration and enhancement efforts can also beneficially affect vegetation at GGNRA park sites such as Crissy Field. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance, which can beneficially affect vegetation at park sites such as Crissy Field. Beginning in 1997, efforts to remediate and restore Crissy Field included the removal of hazardous waste and the re-creation of a tidal marsh and dune habitat. The subsequent 5-year monitoring program included tracking of hydrology and geomorphology, water quality, soils and sedimentation, vegetation, fish, invertebrates, and birds (NPS 2010a, 1–2).

For the lands managed by the Presidio Trust, the Presidio Trust Management Plan (PTMP) was adopted in 2002 and includes the preservation of the Presidio's cultural, natural, scenic, and recreational resources in Area B, managed by the Presidio Trust. The PTMP focuses on the long-term preservation of the park, including replacing pavement with green space, improving and enlarging the park's trail system, restoring stream corridors and natural habitats, and reusing historic structures (Presidio Trust 2002, 3). Management objectives in the PTMP that are applicable to vegetation include identifying and protecting sensitive wildlife species, and restoring and maintaining their habitats. The PTMP also preserves, enhances, and increases natural habitats managed by the Presidio Trust. For example, historic forest is being rehabilitated, wetlands are being enhanced, and native plant and wildlife species are being protected (Presidio Trust 2002, ii). As a result, the PTMP has beneficial impacts on vegetation at or in the vicinity of Crissy Field.

Development or construction actions at or in the vicinity of GGNRA sites have had or may have the potential to have adverse impacts on coastal communities. The Doyle Drive project required the Crissy Field Center to move to a new location during the project construction. That resulted in a newly constructed facility at East Beach in late 2009 to house the Crissy Field Center environmental programs (GGNPC 2010b). Even though these efforts both within and beyond park boundaries would affect vegetation, mitigation for these projects would reduce the potential for impacts.

The long-term moderate adverse impacts on the coastal dune plant community from dogs at Crissy Field under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from the park stewardship programs, the PTMP and the past re-creation of a tidal marsh and dune habitat at Crissy Field should reduce some of the adverse impacts from this alternative on the coastal dune plant community. Therefore, cumulative impacts on the coastal dune plant community under this alternative would be expected to be long term, minor, and adverse.

CRISSY FIELD ALTERNATIVE A CONCLUSION TABLE

| Coastal Community Impacts          | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts                         |
|------------------------------------|---|--|--|
| Long-term moderate adverse impacts | Restored dune areas are fenced, but there is considerable access to dune habitat, which is also present in the WPA and subject to impacts by dogs through trampling, digging, and dog waste | N/A  | Long-term minor adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking on the promenade, Crissy Airfield, East and Central beaches, paths leading to Central Beach, trails and grassy areas near East Beach, around the Old Coast Guard Station, and on the Mason Street Bike Path. Having dogs on leash throughout the site would restrict dogs from going into the fenced dune habitat. However, some individuals may still allow their dogs to enter this sensitive area. The impacts from dogs on coastal dune vegetation adjacent to the trails and on-leash portions of the beach (LOD area) would be long term, minor, and adverse due to trampling and dog waste.

The adverse impacts from dogs in the LOD area would occur in a relatively small area compared to the site as a whole. Overall, assuming compliance, negligible impacts on coastal dune vegetation would occur as a result of this alternative. Physically restraining dogs would protect dune vegetation, and the WPA, which supports dunes, would be closed to dogs. No measurable or perceptible change in coastal dune vegetation or CNPS-listed plant species in coastal dune habitat would be expected.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since the percentage of commercial dog walkers is considered high at Crissy Field, dogs walked by commercial dog walkers would contribute to a portion of the adverse impacts on vegetation from dogs at the site. Overall impacts on vegetation from dogs walked by both commercial dog walkers and private individuals are summarized above.

**Cumulative Impacts.** The negligible impacts on the coastal dune plant community from dogs at Crissy Field under alternative B were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the park stewardship programs, the PTMP, and the past re-creation of a tidal marsh and dune habitat at Crissy Field combined with the negligible impacts from any development or construction actions and the negligible impacts from this alternative would result in beneficial cumulative impacts.

CRISSY FIELD ALTERNATIVE B CONCLUSION TABLE

| Coastal Community Impacts                       | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect dune vegetation; trails and the LOD area are a small portion of the site; the WPA (which supports dunes) would be closed to dogs | Beneficial, assuming compliance              | Beneficial cumulative impacts |

## Chapter 4: Environmental Consequences

**Alternative C: Emphasis on Multiple Use – Balanced by County.** The addition of one ROLA on Central Beach and one at Crissy Airfield in alternative C would allow dogs under voice and sight control. On-leash dog walking would be allowed in the remainder of the site, except for East Beach, the fenced areas, and the WPA, where dogs would not be allowed. Having dogs on leash in the designated areas would restrict dogs from going onto the beach and into the fenced dunes habitat. Restoration areas at Crissy Field that have been planted with CNPS-listed species such as San Francisco dune gilia and San Francisco spineflower would be protected by leash requirements as part of alternative C. The impacts on coastal dune vegetation adjacent to the trails and on-leash portions of the beach (LOD area) and the Central Beach ROLA would be long term, minor, and adverse due to trampling, digging, and dog waste (nutrient addition would occur).

The long-term minor adverse impacts from dogs in the LOD area and the Central Beach ROLA would occur in a relatively small area compared to the site as a whole. Physically restraining dogs would protect vegetation and habitat off trail, and the WPA, which supports dunes, would be closed to dogs. Therefore, assuming compliance, the overall impacts on coastal dune vegetation under alternative C would be negligible because no measurable or perceptible changes in the dune plant community would occur: plant structure, abundance, and distribution (both quality and quantity) of the coastal community would not measurably change.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. In a ROLA, permit holders may walk one to six dogs off leash, and the permit may restrict use by time and area. Permits would be allowed at Crissy Field. Impacts on coastal dune vegetation from permit holders with four to six dogs off leash would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is common at Crissy Field, impacts on coastal dune vegetation would be expected from this user group. Impacts on vegetation from commercial dog walkers would be similar to impacts from other dog walkers, as summarized above in overall impacts; therefore, impacts from commercial dog walking would be negligible.

**Cumulative Impacts.** The negligible impacts on the coastal dune plant community from dogs at Crissy Field under alternative C were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the park stewardship programs, the PTMP, and the past re-creation of a tidal marsh and dune habitat at Crissy Field combined with the negligible impacts from any development or construction actions and the negligible impacts from this alternative would result in beneficial cumulative impacts.

**CRISSY FIELD ALTERNATIVE C CONCLUSION TABLE**

| Coastal Community Impacts                       | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect dune vegetation in restored dune areas; trails, LOD area, and ROLAs are a small portion of the site; the WPA (which supports dunes) would be closed to dogs | Beneficial, assuming compliance              | Beneficial cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Alternative D would prohibit dogs on all beaches, but would establish a ROLA on the western section of Crissy Airfield. On-

leash dog walking would be allowed in all other areas of Crissy Field, except for the fenced areas and the beach. The ROLA does not contain any dune vegetation, but this community does exist adjacent to the trails. The impacts on coastal dune vegetation adjacent to the trails (LOD area) would be long term, minor, and adverse as a result of trampling and dog waste.

The long-term minor adverse impacts from dogs in the LOD area would occur in a relatively small area compared to the site as a whole, and the ROLA does not contain any dune vegetation. Physically restraining dogs would protect vegetation and habitat off trail, and the WPA, which supports dunes, would be closed to dogs. Therefore, assuming compliance, the overall impacts on coastal dune vegetation under alternative D would be negligible because no measurable or perceptible changes in the dune plant community would occur: plant structure, abundance, and distribution (both quality and quantity) of the coastal community would not measurably change.

No commercial dog walking would be allowed and no permits to walk more than three dogs would be issued under alternative D; therefore, commercial and permitted dog walking would have no impact on coastal dune vegetation.

**Cumulative Impacts.** The negligible impacts on the coastal dune plant community from dogs at Crissy Field under alternative D were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the park stewardship programs, the PTMP, and the past re-creation of a tidal marsh and dune habitat at Crissy Field combined with the negligible impacts from any development or construction actions and the negligible impacts from this alternative would result in beneficial cumulative impacts.

**CRISSY FIELD ALTERNATIVE D CONCLUSION TABLE**

| <b>Coastal Community Impacts</b>                | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect dune vegetation; LOD area is a small portion of the entire site; the WPA (which supports dunes) would be closed to dogs | Beneficial, assuming compliance                     | Beneficial cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Under alternative E, on-leash dog walking would be allowed on the promenade and the paths to Central Beach, in the WPA, on East Beach, on the trails and grassy areas near East Beach and around the former U.S. Coast Guard station, and on the Mason Street Bike Path. Two ROLAs would be established at the site, one on Crissy Airfield and one on Central Beach. Having dogs on leash in the designated areas would restrict dogs from entering the fenced dunes habitat. The impacts on coastal dune vegetation adjacent to the trails and on-leash portions of the beach (LOD area, including the WPA) as well as the Central Beach ROLA would be long term, minor, and adverse due to trampling, digging, and dog waste (nutrient addition would occur). The dune vegetation in the WPA would also experience long-term minor adverse impacts as a result of on-leash dogs.

Even though the long-term minor adverse impacts from on-leash dog walking in the Central Beach ROLA and the LOD area would affect only a small portion of the site, the overall impacts on dune vegetation at Crissy Field would also be long term, minor, and adverse, assuming compliance. Physically restraining dogs would protect dune vegetation in restored dune areas, but the WPA, which supports dunes, would be

## Chapter 4: Environmental Consequences

open to on-leash dogs as discussed in the LOD area above. Effects on coastal dune vegetation as a result of dogs would be measurable and perceptible, but would be localized in a relatively small area.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. In a ROLA, permit holders may walk one to six dogs off leash and the permit may restrict use by time and area. Permits would be allowed at Crissy Field. Impacts on coastal dune vegetation from permit holders with four to six dogs off leash would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is common at Crissy Field, impacts on vegetation would be expected from this user group. Impacts on vegetation from commercial dog walkers would be similar to impacts from other dog walkers, as summarized above in overall impacts; therefore, impacts from commercial dog walking would be long term, minor, and adverse.

**Cumulative Impacts.** The long-term minor adverse impacts on the coastal dune plant community from dogs at Crissy Field under alternative E were considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the park stewardship programs, the PTMP, and the past re-creation of a tidal marsh and dune habitat at Crissy Field should reduce some of the adverse impacts from this alternative on the coastal dune plant community. Therefore, cumulative impacts on the coastal dune plant community under this alternative would be expected to be negligible.

**CRISSY FIELD ALTERNATIVE E CONCLUSION TABLE**

| <b>Coastal Community Impacts</b>                             | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|--|---|-------------------------------|
| Overall long-term minor adverse impacts, assuming compliance | Physically restraining dogs would protect dune vegetation in restored dune areas; trails, LOD area, and ROLAs are a small portion of the site; the WPA (which supports dunes) would be open to on-leash dogs | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** A ROLA on Central Beach and in the eastern section of Crissy Airfield in the preferred alternative would allow dogs under voice and sight control. On-leash dog walking would be allowed in the remainder of the site, except for East Beach and the fenced areas and the WPA, where dogs would not be allowed. Having dogs on leash in the designated areas would restrict dogs from going onto the beach and into the fenced dunes habitat. Restoration areas at Crissy Field that have been planted with CNPS-listed species such as San Francisco dune gilia and San Francisco spineflower would be protected by leash requirements as part of the preferred alternative. The impacts on coastal dune vegetation adjacent to the trails and on-leash portions of the beach (LOD area) and the Central Beach ROLA would be long term, minor, and adverse due to trampling, digging, and dog waste (nutrient addition would occur).

The long-term minor adverse impacts from dogs in the LOD area and ROLAs would occur in a relatively small area compared to the site as a whole. Physically restraining dogs would protect vegetation and habitat off trail, and the WPA, which supports dunes, would be closed to dogs. Therefore, assuming compliance, the overall impacts on vegetation under the preferred alternative would be negligible because no measurable or perceptible changes in the dune plant community would occur: plant structure, abundance, and distribution (both quality and quantity) of the coastal community would not measurably change.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. In a ROLA, permit holders may walk one to six dogs off leash, and the permit may restrict use by time and area. Permits would be allowed at Crissy Field. Impacts on coastal dune vegetation from permit holders with four to six dogs off leash would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is common at Crissy Field, impacts on coastal dune vegetation would be expected from this user group. Impacts on coastal dune vegetation from commercial dog walkers would be similar to impacts from other dog walkers, as summarized above in overall impacts; therefore, impacts from commercial dog walking would be negligible.

**Cumulative Impacts.** Projects and actions in and near Crissy Field were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs initiative projects provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils. Ongoing parkwide restoration and enhancement efforts can also beneficially affect vegetation at GGNRA park sites such as Crissy Field. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance, which can beneficially affect vegetation at park sites such as Crissy Field. Beginning in 1997, efforts to remediate and restore Crissy Field included the removal of hazardous waste and the re-creation of a tidal marsh and dune habitat. The subsequent 5-year monitoring program included tracking of hydrology and geomorphology, water quality, soils and sedimentation, vegetation, fish, invertebrates, and birds (NPS 2010a, 1-2).

For the lands managed by the Presidio Trust, the PTMP was adopted in 2002 and includes the preservation of the Presidio's cultural, natural, scenic, and recreational resources in Area B, managed by the Presidio Trust. The PTMP focuses on the long-term preservation of the park, including replacing pavement with green space, improving and enlarging the park's trail system, restoring stream corridors and natural habitats, and reusing historic structures (Presidio Trust 2002, 3). Management objectives in the PTMP that are applicable to vegetation include identifying and protecting sensitive wildlife species, and restoring and maintaining their habitats. The PTMP also preserves, enhances, and increases natural habitats managed by the Presidio Trust. For example, historic forest is being rehabilitated, wetlands are being enhanced, and native plant and wildlife species are being protected (Presidio Trust 2002, ii). As a result, the PTMP has beneficial impacts on vegetation at or in the vicinity of Crissy Field.

Development or construction actions at or in the vicinity of GGNRA sites have had or may have the potential to have adverse impacts on coastal communities. The Doyle Drive project, which resulted in a newly constructed facility at East Beach in late 2009 to house the environmental programs of the Crissy Field Center (GGNPC 2010b, 1), is one example of such a project. Even though these efforts both within and beyond park boundaries would affect vegetation, mitigation for these projects would reduce the potential for impacts.

The negligible impacts on the coastal dune plant community from dogs at Crissy Field under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from the park stewardship programs, the PTMP, and the past re-creation of a tidal marsh and dune habitat at Crissy Field combined with the negligible impacts from any development or construction actions and the negligible impacts from this alternative would result in beneficial cumulative impacts.

CRISSY FIELD PREFERRED ALTERNATIVE F CONCLUSION TABLE

| Coastal Community Impacts                       | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|--|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect dune vegetation in restored dune areas; trails, LOD area, and ROLAs are a small portion of the entire site; the WPA (which supports dunes) would be closed to dogs | Beneficial, assuming compliance              | Beneficial cumulative impacts |

### Baker Beach and Bluffs to Golden Gate Bridge

**Alternative A: No Action.** Coastal dune scrub habitat at Baker Beach and Bluffs to Golden Gate Bridge is one of the few remaining intact stands of this vegetation type in central California. In coastal dune scrub habitat at Baker Beach and Bluffs to Golden Gate Bridge, restoration for pink sand-verbena has occurred, as well as restoration for the CNPS-listed species San Francisco dune gilia and San Francisco spineflower. Other documented CNPS-listed plant species at Baker Beach and Bluffs to Golden Gate Bridge include the Mission Delores (San Francisco) campion, dune tansy, Indian paintbrush, and San Francisco wallflower (USFWS 2003). In some areas at this site, dogs and their owners/walkers have created a myriad of social trails in coastal dune vegetation. This site has documented low to high visitor use (varies depending on weather, holidays, and weekend use), and dog walking use is considered low to moderate (table 9).

Under alternative A, dogs would be allowed under voice control on the beach north of Lobos Creek and would be required to be on leash along trails, except the Batteries to Bluffs Trail, where dogs would not be allowed. A total of 86 dog-related incidents were reported between 2008 and 2011; the majority of incidents were for having dogs off-leash or within a closed area (table 21). As suggested by Shulzitski and Russell (2004, 5), heavy off-leash dog use increases deterioration of native dune communities. Although the dunes nearest the beach, which are actively planted and maintained by the park’s resource stewardship programs, are fenced, dogs under voice control would have access to adjacent, undisturbed areas that support the growth of dune vegetation. Digging in dunes destabilizes the dunes, making it difficult for plants to establish in this habitat. Therefore, alternative A would result in continued long-term moderate adverse impacts on coastal dune vegetation at this site because the effects would be measurable and perceptible over a relatively large area, and would affect the overall integrity of a plant community.

No permit system exists for dog walking under alternative A. At Baker Beach and Bluffs to Golden Gate Bridge, commercial dog walking is uncommon. Therefore, commercial dog walking would have negligible impacts on coastal dune vegetation.

**Cumulative Impacts.** Projects and actions in and near Baker Beach and Bluffs to Golden Gate Bridge were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils. Ongoing parkwide restoration and enhancement efforts can also beneficially affect vegetation at GGNRA park sites such as Baker Beach and Bluffs to Golden Gate Bridge. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance, which can beneficially affect vegetation at park sites such as Baker Beach and Bluffs to Golden Gate Bridge. Between August and November of 2007, 73,000 tons of landfill debris was unearthed by excavators at Baker Beach and

Bluffs to Golden Gate Bridge and conveyed to the top of the cliffs as part of a remediation and restoration effort (Presidio Trust 2010a). The *Lobos Creek Valley Dune Restoration* project near Baker Beach and Bluffs to Golden Gate Bridge involved efforts to restore the coastal scrub and help increase the population of the listed San Francisco lessingia (NPS 2010c).

Additional actions have had, are currently having, or have the potential to have adverse impacts on vegetation at or in the vicinity of Baker Beach and Bluffs to Golden Gate Bridge. Development or construction actions at or in the vicinity of GGNRA sites have had or may have the potential to have adverse impacts on coastal communities. Even though these efforts both within and beyond park boundaries would affect vegetation, mitigation for these projects would reduce the potential for impacts.

The long-term moderate adverse impacts on dune vegetation from dogs at Baker Beach and Bluffs to Golden Gate Bridge under alternative A were considered together with the effects of the projects mentioned above. The beneficial effects from the rehabilitation projects provided by the park stewardship programs and the *Lobos Creek Valley Dune Restoration* project should reduce some of the adverse impacts on the coastal dune plant community from alternative A. Therefore, cumulative impacts on dune vegetation under this alternative would be expected to be long term, minor, and adverse.

**BAKER BEACH AND BLUFFS TO GOLDEN GATE BRIDGE ALTERNATIVE A CONCLUSION TABLE**

| <b>Coastal Community Impacts</b>   | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>                  |
|------------------------------------|---|---|--|
| Long-term moderate adverse impacts | Dogs and their owners/walkers have created social trails in coastal dune habitat, which would be subject to impacts from dogs through trampling, digging, and dog waste | N/A   | Long-term minor adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking except on the Batteries to Bluffs Trail and the Battery Crosby Trail, where dogs are not allowed. In addition, dogs would not be allowed on South Beach. In general, impacts would be limited to the existing trail and the 6-foot corridors immediately adjacent to the trails. Vegetation in areas adjacent to the trails (LOD area) would be affected by dogs through trampling and dog waste (nutrient addition would occur). Impacts on dune vegetation along the trails would be long term, minor, and adverse. Impacts would be detectable, but not large enough to create a measurable or perceptible change in the dune plant community at this site.

When considering the entire site of Baker Beach, the long-term minor adverse impacts from dogs in the LOD area would affect only a small portion of the entire site. Therefore, the overall impact on coastal dune vegetation from on-leash dog walking at Baker Beach and Bluffs to Golden Gate Bridge would be negligible, assuming compliance. Physically restraining dogs would protect dune vegetation, and the use of social trails at this site would be reduced.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking activity is not common at Baker Beach and Bluffs to Golden Gate Bridge, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have negligible impacts on dune vegetation.

## Chapter 4: Environmental Consequences

**Cumulative Impacts.** The negligible impacts on the coastal dune plant community from dogs at Baker Beach and Bluffs to Golden Gate Bridge under alternative B were considered together with the effects of the projects mentioned above under alternative A “Cumulative Impacts.” The beneficial effects from the rehabilitation projects provided by the park stewardship programs and the *Lobos Creek Valley Dune Restoration* project combined with the negligible impacts from any development or construction actions and the negligible impacts from this alternative on the coastal dune plant community would result in beneficial cumulative impacts.

**BAKER BEACH AND BLUFFS TO GOLDEN GATE BRIDGE ALTERNATIVE B CONCLUSION TABLE**

| Coastal Community Impacts                       | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect dune vegetation; trails and the LOD area are a small portion of the site; use of social trails would be reduced | Beneficial, assuming compliance              | Beneficial cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Under alternative C, dog walking restrictions would be the same as those under alternative B, and impacts on coastal dune vegetation at this park site would also be the same, assuming compliance: long term, minor, and adverse in the LOD area and negligible overall.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs; permits could restrict use by time and area. Permits would be allowed for Baker Beach. Impacts on coastal dune vegetation from permit holders with four to six dogs would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is not common at Baker Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on coastal dune vegetation.

**Cumulative Impacts.** Under alternative C, the cumulative impacts on coastal dune vegetation at this park would be the same as those under alternative B: beneficial cumulative impacts.

**BAKER BEACH AND BLUFFS TO GOLDEN GATE BRIDGE ALTERNATIVE C CONCLUSION TABLE**

| Coastal Community Impacts                       | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect dune vegetation; trails and the LOD area are a small portion of the site; use of social trails would be reduced | Beneficial, assuming compliance              | Beneficial cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Alternative D would allow on-leash dog walking on the section of Baker Beach south of the north parking lot and on all trails leading

to that section of beach, as well as on the Coastal Trail. Dogs would be prohibited in the section of beach north of the north parking lot, approximately half of the beach, the trails leading to the northern section of the beach, and the Batteries to Bluffs and Battery Crosby Trails. Vegetation in areas adjacent to the trails (LOD area) would be affected by dogs through trampling and dog waste. Impacts on dune vegetation along the trails would be long term, minor, and adverse. Impacts would be detectable, but not large enough to create a measurable or perceptible change in the dune plant community at this site.

When considering the entire site of Baker Beach, the long-term minor adverse impacts from dogs in the LOD area would affect only a small portion of the entire site. Therefore, the overall impact on coastal dune vegetation from on-leash dog walking at Baker Beach and Bluffs to Golden Gate Bridge would be negligible, assuming compliance. Physically restraining dogs would protect dune vegetation, and the use of social trails at this site would be reduced.

No commercial dog walking would be allowed and no permits to walk more than three dogs would be issued under alternative D; therefore, commercial and permitted dog walking would have no impact on coastal dune vegetation.

**Cumulative Impacts.** The negligible impacts on the coastal dune plant community from dogs at Baker Beach and Bluffs to Golden Gate Bridge under alternative D were considered together with the effects of the projects mentioned above under alternative A “Cumulative Impacts.” The beneficial effects from the rehabilitation projects provided by the park stewardship programs and the *Lobos Creek Valley Dune Restoration* project combined with the negligible impacts from any development or construction actions and the negligible impacts from this alternative on the coastal dune plant community would result in beneficial cumulative impacts.

**BAKER BEACH AND BLUFFS TO GOLDEN GATE BRIDGE ALTERNATIVE D CONCLUSION TABLE**

| <b>Coastal Community Impacts</b>                | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect dune vegetation; trails and the LOD area are a small portion of the site; use of social trails would be reduced | Beneficial, assuming compliance                     | Beneficial cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would allow on-leash dog walking on the northern portion of the beach and on all trails in the vicinity of Baker Beach except the Batteries to Bluffs Trail and the Battery Crosby Trail. A ROLA would be established on the southern portion of the beach, south of the north parking lot. In general, impacts would be limited to the ROLA, existing trails, and the 6-foot corridors immediately adjacent to the trails. Vegetation in areas adjacent to the trails (LOD area) and in the ROLA (which would experience concentrated use) would be affected by dogs through trampling, digging, and dog waste. Impacts on dune vegetation in the LOD area and in the ROLA would be long term, minor, and adverse.

The long-term minor adverse impacts from dogs in the LOD area and ROLA would result in overall long-term minor adverse impacts on the coastal dune vegetation, assuming compliance. Physically restraining dogs would protect dune vegetation, and the unfenced dunes would not be affected in this alternative. The use of social trails would be reduced, but a measurable or perceptible change in the dune plant community would occur as a result of disturbance from dogs, although this effect would remain relatively localized.

## Chapter 4: Environmental Consequences

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. In a ROLA, permit holders may walk one to six dogs off leash, and the permit may restrict use by time and area. Permits would be allowed for Baker Beach. Impacts on coastal dune vegetation from permit holders with four to six dogs off leash would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is not common at Baker Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on coastal dune vegetation.

**Cumulative Impacts.** The long-term minor adverse impacts on dune vegetation from dogs at Baker Beach and Bluffs to Golden Gate Bridge under alternative E were considered together with the effects of the projects mentioned above under alternative A. The beneficial effects from the rehabilitation projects provided by the park stewardship programs and the *Lobos Creek Valley Dune Restoration* project should reduce some of the adverse impacts on the coastal dune plant community from alternative E. Therefore, cumulative impacts on dune vegetation under this alternative would be expected to be negligible.

**BAKER BEACH AND BLUFFS TO GOLDEN GATE BRIDGE ALTERNATIVE E CONCLUSION TABLE**

| Coastal Community Impacts                                    | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|--|---|--|-------------------------------|
| Overall long-term minor adverse impacts, assuming compliance | Physically restraining dogs would protect dune vegetation; no unfenced dunes would be affected; the ROLA, trails, and LOD area are a small portion of the site; use of social trails would be reduced | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative D and would allow on-leash dog walking on the section of Baker Beach south of the north parking lot and on all trails leading to that section of beach, as well as on the Coastal Trail. Dogs would be prohibited in the section of beach north of the north parking lot (approximately half of the beach), on the trails leading to the northern section of the beach, and on the Batteries to Bluffs Trail and the Battery Crosby Trail. Vegetation in areas adjacent to the trails (LOD area) would be affected by dogs through trampling and dog waste. Impacts on dune vegetation along the trails would be long term, minor, and adverse. Impacts would be detectable, but not large enough to create a measurable or perceptible change in the dune plant community at this site.

The long-term minor adverse impacts from dogs in the LOD area would affect only a small portion of the site. Therefore, the overall impacts on coastal dune vegetation from on-leash dog walking at Baker Beach and Bluffs to Golden Gate Bridge would be negligible, assuming compliance. Physically restraining dogs would protect dune vegetation and the use of social trails at this site would be reduced.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs on Baker Beach with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs; permits could restrict use by time and area. Impacts on coastal dune vegetation from permit holders with four to six dogs would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is not common at Baker Beach, it is likely that this alternative would not have an impact on the number of dog walkers.

Therefore, commercial dog walking under the preferred alternative would have negligible impacts on coastal dune vegetation.

**Cumulative Impacts.** Projects and actions in and near Baker Beach and Bluffs to Golden Gate Bridge were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs initiative projects provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils. Ongoing parkwide restoration and enhancement efforts can also beneficially affect vegetation at GGNRA park sites such as Baker Beach and Bluffs to Golden Gate Bridge. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance, which can beneficially affect vegetation at park sites such as Baker Beach and Bluffs to Golden Gate Bridge. Between August and November of 2007, 73,000 tons of landfill debris was unearthed by excavators at Baker Beach and Bluffs to Golden Gate Bridge and conveyed to the top of the cliffs as part of a remediation and restoration effort (Presidio Trust 2010a). The *Lobos Creek Valley Dune Restoration* project near Baker Beach and Bluffs to Golden Gate Bridge involved efforts to restore the coastal scrub and help increase the population of the listed San Francisco lessingia (NPS 2010c, 1).

Additional actions have had, are currently having, or have the potential to have adverse impacts on vegetation at or in the vicinity of Baker Beach and Bluffs to Golden Gate Bridge. Development or construction actions at or in the vicinity of GGNRA sites have had or may have the potential to have adverse impacts on coastal communities. Even though these efforts both within and beyond park boundaries would affect vegetation, mitigation for these projects would reduce the potential for impacts.

The negligible impacts on the coastal dune plant community from dogs at Baker Beach and Bluffs to Golden Gate Bridge under the preferred alternative were considered together with the effects of the projects mentioned above. The beneficial effects from the rehabilitation projects provided by the park stewardship programs and the *Lobos Creek Valley Dune Restoration* project combined with the negligible impacts from any development or construction actions and the negligible impacts from this alternative on the coastal dune plant community would result in beneficial cumulative impacts.

#### BAKER BEACH AND BLUFFS TO GOLDEN GATE BRIDGE PREFERRED ALTERNATIVE F CONCLUSION TABLE

| Coastal Community Impacts                       | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect dune vegetation; trails and the LOD area are a small portion of the site; use of social trails would be reduced | Beneficial, assuming compliance              | Beneficial cumulative impacts |

### Ocean Beach

**Alternative A: No Action.** Ocean Beach has a designated Snowy Plover Protection Area (SPPA) from Stairwell 21 south to Sloat Boulevard, which was implemented to protect the western snowy plover when it is present during the nonbreeding season. Under current conditions, the seasonal restriction continues to be implemented and requires dogs to be walked on leash from July 1 through May 15. Dogs are allowed under voice control in the SPPA from May 15 through July 1. This site has documented high visitor use, and compliance with the current regulations at Ocean Beach is considered poor; 969 dog-related incidents were reported from 2008 through 2011. The majority of the incidents reported were for having a dog off

## Chapter 4: Environmental Consequences

leash within the Ocean Beach SPPA (729 recorded incidents, table 24) during the period when dogs must be leashed (July 1 through May 15). Other violations were recorded, including off-leash violations (89) and violation of a closed area (75) (table 24). The NPS has observed that nearly 60 percent of dogs continue to be off-leash in the SPPA even after the seasonal leash restriction was implemented in the SPPA as a result of 36 CFR 7.97(d) (Hatch et al. 2007b, 3). In addition, dogs are allowed under voice control both north of Stairwell 21 and south of Sloat Boulevard to Fort Funston. There are no coastal dune communities located north of Stairwell 21 or south of Sloat Boulevard. Between Stairwell 21 and Sloat Boulevard, the majority of the extensive dune system along portions of Ocean Beach is comprised of the non-native European beachgrass that was previously planted to stabilize the sand on the beach, while the sparsely vegetated foredunes consist of native dune vegetation. Alternative A would result in continued long-term minor adverse impacts on coastal dune plant species because the integrity of the plant community inhabiting dune areas could be negatively affected by dogs through trampling, digging, and dog waste, although the majority of the dune system is vegetated with non-native European beachgrass.

Under alternative A, no permit system exists for dog walking. At Ocean Beach, commercial dog walking is uncommon; therefore, commercial dog walking would have negligible impacts on coastal dune vegetation.

**Cumulative Impacts.** Projects and actions in and near Ocean Beach were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of vegetation communities. Ongoing parkwide restoration and enhancement efforts can also beneficially affect vegetation at GGNRA park sites such as Ocean Beach. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance, which can beneficially affect soils at park sites such as Ocean Beach. The *Ocean Beach–Great Highway Erosion Control Project* is developing long-term solutions to beach and coastal bluff erosion problems at Ocean Beach along the Great Highway (Highway 1) consistent with the enhancement of natural processes (City and County of San Francisco 2008, 3, 7). The *Ocean Beach Master Plan* includes plans to restore habitat at Ocean Beach, resulting in beneficial impacts on coastal communities.

Additional actions have had, are currently having, or have the potential to have adverse impacts on vegetation at or in the vicinity of Ocean Beach. Development or construction actions at or in the vicinity of GGNRA sites have had or may have the potential to have adverse impacts on coastal communities. Even though these efforts both within and beyond park boundaries would affect vegetation, mitigation for these projects would reduce the potential for impacts.

The long-term minor adverse impacts on the coastal dune plant community from dogs at Ocean Beach under alternative A were considered together with the effects of the actions mentioned above. The benefits to vegetation from the park stewardship programs and from the erosion control project would not be expected to reduce the adverse impacts of this alternative; therefore, the cumulative impacts analysis for this park site will focus on the results of the impact analysis for this alternative. The beneficial effects from the park stewardship programs and from the erosion control project combined with the long-term minor adverse impacts from alternative A would result in long-term minor adverse cumulative impacts.

**OCEAN BEACH ALTERNATIVE A CONCLUSION TABLE**

| <b>Coastal Community Impacts</b> | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>                  |
|----------------------------------|--|---|--|
| Long-term minor adverse impacts  | The majority of the dunes along portions of Ocean Beach are comprised of the non-native European beachgrass, while the sparsely vegetated foredunes consist of native dune vegetation; these areas would be subject to impacts from dogs through trampling, digging, and dog waste | N/A   | Long-term minor adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking on the Ocean Beach Trail along the Great Highway, as well as on the beach north of Stairwell 21 and south of Sloat Boulevard. Dogs would not be allowed on the beach in the SPPA. In general, impacts would be limited to the existing trail and the 6-foot corridors immediately adjacent to the trail (LOD area). In the LOD area, impacts on the coastal dune vegetation would be long term, minor, and adverse because the integrity of the plant community inhabiting dune areas could be negatively affected by dogs through trampling and dog waste, although the majority of the dunes are vegetated with non-native European beachgrass.

The long-term minor adverse impacts on dune vegetation adjacent to the trail would occur in a relatively small area compared to the site as a whole. Physically restraining dogs on leash would protect dune vegetation, even though the majority is non-native European beachgrass. Therefore, assuming compliance, the overall impact on coastal dune vegetation at Ocean Beach would be negligible. Impacts would be detectable, but not large enough to create a measurable or perceptible change in the dune plant community at this site.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking activity is not common at Ocean Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have negligible impacts on coastal dune vegetation.

**Cumulative Impacts.** The negligible impacts on the coastal dune plant community from dogs at Ocean Beach under alternative B were considered together with the effects of the actions mentioned above under alternative A. The beneficial effects from the park stewardship programs and from the erosion control project combined with the negligible impacts from alternative B would result in negligible cumulative impacts.

**Chapter 4: Environmental Consequences**

**OCEAN BEACH ALTERNATIVE B CONCLUSION TABLE**

| <b>Coastal Community Impacts</b>                | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--|---|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect dune vegetation even though the majority is non-native grass; the trail and the LOD area are a small portion of the site | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would not allow dogs on the beach in the SPPA, but would allow on-leash dog walking on the Ocean Beach Trail east of the dunes adjacent to the Great Highway and would allow dog walking under voice and sight control in a ROLA on the beach north of Stairwell 21. No dune communities are located in the ROLA north of Stairwell 21. Under alternative C, impacts would be limited to the existing trail and the 6-foot corridors immediately adjacent to the trail (LOD area). In the LOD area, impacts on the coastal dune vegetation would be long term, minor and adverse because the integrity of the plant community inhabiting dune areas could be negatively affected by dogs through trampling and dog waste, although the majority of the dunes are vegetated with non-native European beachgrass. Because there are no dune communities in the ROLA north of Stairwell 21, no impact would occur in the ROLA.

The long-term minor adverse impacts on vegetation in the LOD area would occur in a relatively small area compared to the site as a whole. Physically restraining dogs would protect dune vegetation, even though the majority is non-native grass. Therefore, assuming compliance, the overall impact on coastal dune vegetation at Ocean Beach would be negligible because no measurable or perceptible change in the plant community would be expected.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Ocean Beach is not one of the park sites where permits would be issued allowing dog walkers to have more than three dogs. Since commercial dog walking activity is not common at Ocean Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on coastal dune vegetation.

**Cumulative Impacts.** The negligible impacts on the coastal dune plant community from dogs at Ocean Beach under alternative C were considered together with the effects of the actions mentioned above under alternative A. The beneficial effects from the park stewardship programs and from the erosion control project combined with the negligible impacts from alternative C would result in negligible cumulative impacts.

**OCEAN BEACH ALTERNATIVE C CONCLUSION TABLE**

| <b>Coastal Community Impacts</b>                | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect dune vegetation, even though the majority is non-native grass; the trail and the LOD area are a small portion of the site | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Alternative D would generally have the same dog walking restrictions as alternative B, except dogs would not be allowed on the beach south of Sloat Boulevard, and impacts would be the same: long term, minor, and adverse in the LOD area and negligible overall.

No commercial dog walking would be allowed and no permits to walk more than three dogs would be issued under alternative D; therefore, commercial and permitted dog walking would have no impact on coastal dune vegetation.

**Cumulative Impacts.** The negligible impacts on the coastal dune plant community from dogs at Ocean Beach under alternative D were considered together with the effects of the actions mentioned above under alternative A. The beneficial effects from the park stewardship programs and from the erosion control project combined with the negligible impacts from alternative D would result in negligible cumulative impacts.

**OCEAN BEACH ALTERNATIVE D CONCLUSION TABLE**

| <b>Coastal Community Impacts</b>                | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|--|---|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect dune vegetation, even though the majority is non-native grass; the trail and the LOD area are a small portion of the entire site | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would allow on-leash dog walking all year on the beach in the SPPA and south of Sloat Boulevard. Dog walking under voice and sight control would be allowed in a ROLA north of Stairwell 21. The ROLA north of Stairwell 21 does not contain coastal dunes. However, on-leash dog walking would create impacts on dune vegetation because coastal dunes are located in the SPPA. On-leash dog walking would also be allowed on the Ocean Beach Trail along the Great Highway. In general, impacts would be limited to the existing trail and the 6-foot corridors immediately adjacent to the trails (LOD area). In the LOD area, impacts on the coastal dune vegetation would be long term, minor, and adverse because the integrity of the plant community inhabiting dune areas could be negatively affected by dogs through trampling and dog waste, although the majority of the dunes are vegetated with non-native European beachgrass. Because there are no dune communities in the ROLA north of Stairwell 21, there would be no impact in the ROLA.

The impacts on coastal dune vegetation in the SPPA would occur in a relatively large area of the site. In the coastal dunes of the SPPA, there are some areas of sparsely vegetated foredunes, but the majority of the dune vegetation consists of the non-native plant species European beachgrass; in some areas this species has been removed and native dune vegetation has been planted. Therefore, assuming compliance, the overall impacts from dogs on the coastal dune vegetation at this site would range from negligible to long term, minor, and adverse.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Ocean Beach is not one of the park sites where permits would be issued allowing dog walkers to have more than three dogs. Since commercial dog walking activity is not common at Ocean Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on coastal dune vegetation.

## Chapter 4: Environmental Consequences

**Cumulative Impacts.** The negligible to long-term minor adverse impacts on the coastal dune plant community from dogs at Ocean Beach under alternative E were considered together with the effects of the actions mentioned above under alternative A. The benefits to vegetation from the park stewardship programs and from the erosion control project would not be expected to reduce the adverse impacts of this alternative; therefore, the cumulative impacts analysis for this park site will focus on the results of the impact analysis for this alternative. The beneficial effects from the park stewardship programs and from the erosion control project combined with the negligible to long-term minor adverse impacts from alternative E would result in negligible to long-term minor adverse cumulative impacts.

**OCEAN BEACH ALTERNATIVE E CONCLUSION TABLE**

| Coastal Community Impacts  | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts                                       |
|--|--|--|--|
| Overall negligible to long-term minor adverse impacts, assuming compliance | Physically restraining dogs would protect dune vegetation, even though the majority is non-native grass; the trail and the LOD area are a small portion of the site but the impact on vegetation in the SPPA would occur in a relatively large area of the entire site | Beneficial to no change, assuming compliance | Negligible to long-term minor adverse cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative would not allow dogs on the beach in the SPPA, but would allow on-leash dog walking on the Ocean Beach Trail east of the dunes adjacent to the Great Highway and would allow dog walking under voice and sight control in a ROLA on the beach north of Stairwell 21. No dune communities are located in the ROLA north of Stairwell 21. Under the preferred alternative, impacts would be limited to the existing trail and the 6-foot corridors immediately adjacent to the trail (LOD area). In the LOD area, impacts on the coastal dune vegetation would be long term, minor, and adverse because the integrity of the plant community inhabiting dune areas could be negatively affected by dogs through trampling and dog waste, although the majority of the dunes are vegetated with non-native European beachgrass. Because there are no dune communities in the ROLA north of Stairwell 21, no impact would occur in the ROLA.

The long-term minor adverse impacts on coastal dune vegetation in the LOD area would occur in a relatively small area compared to the site as a whole. Physically restraining dogs on leash would protect dune vegetation, even though the majority is non-native grass. Therefore, assuming compliance, the overall impact on coastal dune vegetation at Ocean Beach would be negligible because no measurable or perceptible change in the plant community would be expected.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Ocean Beach is not one of the park sites where permits would be issued allowing dog walkers to have more than three dogs. Since commercial dog walking activity is not common at Ocean Beach, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have negligible impacts on coastal dune vegetation.

**Cumulative Impacts.** Projects and actions in and near Ocean Beach were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs initiative projects provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of vegetation communities. Ongoing parkwide restoration and enhancement efforts can also beneficially

affect vegetation at GGNRA park sites such as Ocean Beach. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance, which can beneficially affect soils at park sites such as Ocean Beach. The *Ocean Beach–Great Highway Erosion Control Project* is developing long-term solutions to beach and coastal bluff erosion problems at Ocean Beach along the Great Highway (Highway 1) consistent with the enhancement of natural processes (City and County of San Francisco 2008, 3, 7). The *Ocean Beach Master Plan* includes plans to restore habitat at Ocean Beach, resulting in beneficial impacts on coastal communities.

Additional actions have had, are currently having, or have the potential to have adverse impacts on vegetation at or in the vicinity of Ocean Beach. Development or construction actions at or in the vicinity of GGNRA sites have had or may have the potential to have adverse impacts on coastal communities. Even though these efforts both within and beyond park boundaries would affect vegetation, mitigation for these projects would reduce the potential for impacts.

The negligible impacts on the coastal dune plant community from dogs at Ocean Beach under the preferred alternative were considered together with the effects of the actions mentioned above. The beneficial effects from the park Stewardship Programs and from the erosion control project combined with the negligible impacts from the preferred alternative would result in negligible cumulative impacts.

**OCEAN BEACH PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| Coastal Community Impacts                       | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect dune vegetation, even though the majority is non-native grass; the trail and the LOD area are a small portion of the site | Beneficial, assuming compliance              | Negligible cumulative impacts |

## Fort Funston

**Alternative A: No Action.** Fort Funston contains the last remnant of the expansive coastal dune complex that once covered the entire western portion of San Francisco. The habitat has been adversely affected by the site's development as a military site in the 1930s and use of non-native ice plant to stabilize the sand around the military facilities. Dogs are currently allowed under voice control on the beach and throughout upper Fort Funston (including a habitat corridor of coastal dune habitat along the Sunset Trail), with the exception of a the 12-acre fenced Habitat Protection Area closure in upper Fort Funston and the voluntary seasonal closure (April 1–August 15) for bank swallow protection on a section of beach extending 50 feet from the base of the coastal bluff below the bank swallow habitat areas (GGNRA Compendium; appendix B). Fort Funston has documented high visitor use (table 9), and a total of 172 dog-related incidents were recorded from 2008 through 2011. The majority of incidents recorded were for hazardous conditions (72 incidents, 29 of which were pet rescues on the cliffs at Fort Funston) and having a dog off-leash (69 incidents), although an incident was recorded for damage to vegetation at Fort Funston (table 25). Disturbance of the cliffs in most instances would potentially contribute to cliff erosion since the cliffs are very unstable, which may be a contributing factor that results in the need for dog rescues at this site.

Visitors can access areas surrounding the bluffs from above the beach at the Funston Beach Trail North. Signs and fencing (currently partially buried) along the bluff edge and along the beach below the colony have been installed to restrict access to these areas by visitors. During the monthly bird surveys at Fort

## Chapter 4: Environmental Consequences

Funston, dogs were recorded in the 12-acre Habitat Protection Area, which is closed to public access; on many occasions, dogs and humans were observed inside this area (Shulzitski and Russell 2004). Commercial dog walking is also popular and is considered a high use activity at this site. Current heavy use by recreationists affects the native dune vegetation by trampling, thereby weakening plant root systems. Dogs and their owners/walkers have created a myriad of social trails in coastal dune vegetation between the parking lot and the Sunset and Chip trails. The NPS has implemented dune restoration at Fort Funston, and has planted the native foredune species pink sand-verbena (also a CNPS-listed plant species) and dune tansy in a 12-acre Habitat Restoration Area. The restoration area is enclosed by fencing to protect it from recreational activity; however, dogs have accessed the restoration areas at Fort Funston despite the fencing. The majority of Fort Funston is undeveloped and denuded of vegetation as a result of direct impacts from dogs through trampling, digging, and dog waste. This site would have the potential to be restored to native plant habitat and is part of the recovery area in the *Recovery Plan for Coastal Plants of the Northern San Francisco Peninsula* (USFWS 2003), but restoration is precluded by unmanaged (or unrestricted) dog use at the site; the level of trampling and nutrient input may inhibit the ability of the NPS to restore the area. Restoration currently can only be carried out in the 12-acre closed area, as dogs and visitors have accessed all other portions of the site, including the bluff tops.

Under alternative A, dogs would continue to access the remnant coastal dune habitat, resulting in long-term major adverse impacts on coastal dune vegetation, including pink sand-verbena, and on restoration areas at Fort Funston because the integrity of the plant community inhabiting dune areas would continue being negatively affected by dogs through trampling, digging, and dog waste; restoration at the site would be precluded by dogs.

Under alternative A, no permit system exists for dog walking. However, commercial dog walking regularly occurs at Fort Funston. Commercial dog walking would continue to contribute to the long-term major adverse impacts on vegetation. Dune habitat would be impacted by dogs through trampling, digging, and dog waste.

**Cumulative Impacts.** Projects and actions in and near Fort Funston were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance, which can beneficially affect vegetation at park sites such as Fort Funston. The City of Daly City is preparing the *Vista Grande Drainage Basin Alternatives Analysis* to develop and evaluate alternatives that will reduce or eliminate flooding, reduce erosion along Lake Merced, and provide other potential benefits such as habitat enhancement and lake level augmentation (City of Daly City 2010a, 1).

Additional actions have had, are currently having, or have the potential to have adverse impacts on vegetation at or in the vicinity of Fort Funston. For example, the NPS is planning to construct new restroom and maintenance facilities at Fort Funston, which has the potential to have an adverse impact on vegetation in the area (NPS 2010d, 1). The Vista Grande portion of Daly City's stormwater collection system includes an underground collection system that routes storm flows northwest to the Vista Grande canal and tunnel for discharge to an outfall structure at the beach below Fort Funston (City of Daly City 2010b, 3). This system has the potential to adversely affect vegetation in the area of Fort Funston.

The long-term major adverse impacts on the coastal dune plant community from dogs at Fort Funston under alternative A were considered together with the effects of the projects mentioned above. There would be a combination of adverse and beneficial actions in and around Fort Funston; when combined, these actions would balance out, resulting in negligible impacts. Therefore, the cumulative impacts

analysis for this park site will mainly focus on the results of the impact analysis for each alternative. Cumulative impacts on the coastal dune plant community from dogs under this alternative would be expected to be long term, major, and adverse.

**FORT FUNSTON ALTERNATIVE A CONCLUSION TABLE**

| Coastal Community Impacts       | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts                         |
|---------------------------------|--|--|--|
| Long-term major adverse impacts | The majority of the site is undeveloped and denuded of vegetation as a result of unmanaged (or unrestricted) dog use at the site; the level of trampling and nutrient input may preclude (or inhibit) restoration at the recovery area; there is high visitor use and moderate to high levels of incidents related to dog activities at the site | N/A  | Long-term major adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Under alternative B, on-leash dog walking would be allowed on the beach and trails that are not closed to dogs. Closed areas include a 12-acre habitat protection area that restricts visitors and dogs to protect bank swallow habitat and native plant communities, improve public safety, and reduce impacts to the coastal bluffs and dunes; a section of the beach that has a seasonal closure (April 1–August 15) for the protection of the bank swallow colony; and a section of the Sunset Trail in the northern portion of Fort Funston, which is closed due to erosion. Dog walking under voice control would not be allowed under this alternative. Coastal dune habitat north of the Funston Beach Trail North and west of the Sunset Trail in Fort Funston would remain closed for habitat protection; additional restored habitat between the Sunset Trail and Skyline Boulevard would also be closed to visitors. These closures allow for better protection of restoration sites and the potential recovery of the native *San Francisco lessingia*. In general, impacts on the coastal dune vegetation of Fort Funston would be limited to the 6-foot corridors immediately adjacent to the trails. Impacts in areas adjacent to the trails (LOD area) would be long term, minor, and adverse. Dogs could enter coastal dune habitat and affect it through trampling and dog waste. While dogs would cause impacts on the dunes, most of the vegetation accessible to dogs under alternative B in the coastal dune habitat in Fort Funston is non-native; therefore, the impacts would not be considered greater than minor and adverse.

The long-term minor adverse impacts on coastal dune vegetation adjacent to the trails would occur in a relatively small area compared to the site as a whole. Physically restraining dogs on leash would protect dune vegetation, the site could potentially be restored, and the habitat corridor at the site (coastal dune habitat along the Sunset Trail) would be protected. Therefore, assuming compliance, the overall impacts on coastal dune vegetation at Fort Funston would be negligible because no measurable or perceptible change in the coastal dune community would be expected as a result of alternative B.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since the percentage of commercial dog walkers is considered high at Fort Funston, dogs walked by commercial dog walkers would cause the majority of the adverse impacts on coastal dune vegetation from dogs at the site. Overall impacts on coastal dune vegetation from dogs walked by both commercial dog walkers and private individuals are summarized above.

## Chapter 4: Environmental Consequences

**Cumulative Impacts.** The negligible impacts on the coastal dune plant community from dogs at Fort Funston under alternative B were considered together with the effects of the projects mentioned above under alternative A. There would be a combination of adverse and beneficial actions in and around Fort Funston; when combined, these actions would balance out, resulting in negligible impacts. Therefore, cumulative impacts on the coastal dune plant community from dogs under this alternative would be expected to be negligible.

**FORT FUNSTON ALTERNATIVE B CONCLUSION TABLE**

| <b>Coastal Community Impacts</b>                | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|---|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect dune vegetation; trails and the LOD area are a small portion of the entire site; site could potentially be restored and habitat corridor would be protected | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would allow on-leash dog walking on all trails north of the parking lot (except the Sunset Trail from the parking lot to the junction with the Chip Trail, and the Funston Horse Trail, which would be closed to dogs), and the Funston Beach Trail South (sand ladder) and Sunset Trail south of the main parking lot. Dog walking under voice and sight control would be allowed in two ROLAs: one on the beach and another adjacent to the parking lot. The upland ROLA is in existing coastal dune vegetation (which includes the non-native ice plant) that has been fragmented by a myriad of social trails made by dogs and humans traversing the area under current conditions. Through concentrated dog use in this designated ROLA, the coastal vegetation would degrade and the potential for restoration of this remnant coastal dune habitat would be limited. In addition to impacts in the ROLAs, impacts on the coastal dune vegetation would also occur in the 6-foot corridors immediately adjacent to the trails (LOD area). Dogs could enter coastal dune habitat and affect it through trampling, digging and dog waste. In the LOD area and ROLAs, impacts on coastal dune vegetation would be long term, moderate, and adverse. However, designation of ROLAs could lead to greater compliance and reduced impacts in other (non-ROLA) areas of the site. While dogs would cause impacts on the dunes, most of the vegetation accessible to dogs under alternative C in the coastal dune habitat in Fort Funston is non-native; therefore, the impacts would not be considered greater than moderate and adverse.

Assuming compliance, alternative C would result in an overall long-term minor to moderate adverse impact on coastal dune habitat because the beach ROLA is located in coastal dune habitat that would degrade, but the area in the ROLA is only a small portion of the entire site. Physically restraining dogs would protect dune vegetation and reduce social trails at this site, but dog use would still limit potential restoration even though the habitat corridor would be protected.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. In a ROLA, permit holders may walk one to six dogs off leash, and the permit may restrict use by time and area. Permits would be allowed for Fort Funston. Impacts on coastal dune vegetation from permit holders with four to six dogs off leash would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is common at Fort Funston, impacts on coastal dune vegetation would be expected from this user group. Impacts on coastal dune vegetation from commercial dog walkers would be similar to impacts from other dog walkers, as summarized above

in overall impacts; therefore, impacts from commercial dog walking would be long term, minor to moderate, and adverse.

**Cumulative Impacts.** The long-term minor to moderate adverse impacts on the coastal dune plant community from dogs at Fort Funston under alternative C were considered together with the effects of the projects mentioned above under alternative A. There would be a combination of adverse and beneficial effects from actions in and around Fort Funston; when combined, these actions would balance out, resulting in negligible impacts. Therefore, the cumulative analysis for this park site will mainly focus on the results of the impact analysis for this alternative. Cumulative impacts on the coastal dune plant community from dogs under this alternative would be expected to be long term, minor to moderate, and adverse.

**FORT FUNSTON ALTERNATIVE C CONCLUSION TABLE**

| <b>Coastal Community Impacts</b>   | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>                              |
|--|--|---|--|
| Overall long-term minor to moderate adverse impacts, assuming compliance | Physically restraining dogs would protect dune vegetation and reduce social trails; the upland ROLA could support dune vegetation that would be affected but potential for restoration would be limited, although the habitat corridor would be protected and restored | Beneficial, assuming compliance                     | Long-term minor to moderate adverse cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Dog walking restrictions and impacts for alternative D would be similar to those described above for alternative C, although there would be on-leash dog walking instead of a ROLA on the beach and the upland ROLA would be located adjacent to the Sunset Trail, in coastal dune habitat. The proposed ROLA, which would be fenced, would also be in an area that has been heavily affected by social trails. The vegetation would further degrade through concentrated use in this designated ROLA, and the potential for restoration of this remnant coastal dune habitat would be limited. In addition to impacts in the ROLA, impacts on the coastal dune vegetation would also occur in the 6-foot corridors immediately adjacent to the trails (LOD area). Dogs could enter coastal dune habitat and affect it through trampling, digging, and dog waste. In the LOD area and ROLA, impacts on coastal dune vegetation would be long term, moderate, and adverse. However, designation of a ROLA could lead to greater compliance and reduced impacts in other (non-ROLA) areas of the site. While dogs would cause impacts on the dunes, most of the vegetation accessible to dogs under alternative D in the coastal dune habitat in Fort Funston is non-native; therefore, the impacts would not be considered greater than moderate and adverse.

Assuming compliance, alternative D would result in overall long-term minor to moderate adverse impacts on coastal dune habitat because the ROLA is located in coastal dune habitat that would degrade, but the area in the ROLA is only a small portion of the entire site. Physically restraining dogs on leash would protect dune vegetation and reduce social trails at this site, but dog use would still limit potential restoration even though the habitat corridor would be protected.

No commercial dog walking would be allowed and no permits to walk more than three dogs would be issued under alternative D; therefore, commercial and permitted dog walking would have no impact on coastal dune vegetation.

## Chapter 4: Environmental Consequences

**Cumulative Impacts.** The long-term minor to moderate adverse impacts on the coastal dune plant community from dogs at Fort Funston under alternative D were considered together with the effects of the projects mentioned above under alternative A. There would be a combination of adverse and beneficial effects from actions in and around Fort Funston; when combined, these actions would balance out, resulting in negligible impacts. Therefore, the cumulative analysis for this park site will mainly focus on the results of the impact analysis for this alternative. Cumulative impacts on the coastal dune plant community from dogs under this alternative would be expected to be long term, minor to moderate, and adverse.

**FORT FUNSTON ALTERNATIVE D CONCLUSION TABLE**

| <b>Coastal Community Impacts</b>   | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>                              |
|--|---|---|--|
| Overall long-term minor to moderate adverse impacts, assuming compliance | Physically restraining dogs would protect dune vegetation and reduce social trails; however, the ROLA supports dune vegetation that would be affected, limiting potential restoration | Beneficial, assuming compliance                     | Long-term minor to moderate adverse cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would allow on-leash dog walking on all trails except the Funston Horse Trail, which is closed to dogs, and the northern end of the Sunset Trail, which is closed due to erosion. Dog walking under voice and sight control would be allowed in two ROLAs. One ROLA would be on the beach south of the Funston Beach Trail North to the Fort Funston southern boundary. The second (“upland”) ROLA would extend north from the main parking lot. This ROLA corridor would extend from just north of the new trail to be built along the northern edge of the parking lot that extends to and includes the Funston Beach Trail North. The ROLA corridor includes the Chip Trail and sections of the Sunset Trail, Funston Road, and Battery Davis Trail, all north of the parking lot. The ROLA also extends into the disturbed area across from the Funston Beach Trail North. The upland ROLA would be in existing coastal dune vegetation that has been fragmented by a myriad of social trails made by dogs and humans traversing the area under current conditions. Through concentrated dog use in this designated ROLA, the vegetation would degrade and the potential for restoration of this remnant coastal dune habitat would be limited. In addition to impacts in the ROLA, impacts on coastal dune vegetation would also occur in the 6-foot corridors immediately adjacent to the trails (LOD area). Dogs could enter coastal dune habitat and affect it through trampling, digging, and dog waste. In the LOD area and ROLA, impacts on coastal dune vegetation would be long term, major, and adverse. However, designation of a ROLA could lead to greater compliance and reduced impacts in other (non-ROLA) areas of the site. While dogs would cause impacts on the dunes, most of the vegetation accessible to dogs under alternative E in the coastal dune habitat in Fort Funston is non-native; therefore, the impacts would be considered major and adverse because of the large size of the two ROLAs proposed as part of alternative E.

Assuming compliance, alternative E would result in an overall long-term moderate adverse impact on coastal dune habitat because the upland ROLA corridor is in coastal dune vegetation and encompasses a large portion of coastal dune habitat, which would continue to degrade. In other areas, physically restraining dogs would protect dune vegetation, but restoration potential is limited at this site due to disturbance of vegetation by dogs.

Under alternative E, all dog walkers at Fort Funston, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. In a ROLA, permit

holders may walk one to six dogs off leash, and the permit may restrict use by time and area. Impacts on coastal dune vegetation from permit holders with four to six dogs off leash would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is common at Fort Funston, impacts on coastal dune vegetation would be expected from this user group. Impacts on coastal dune vegetation from commercial dog walkers would be similar to impacts from other dog walkers, as summarized above in overall impacts; therefore, impacts from commercial dog walking would be long term, moderate, and adverse.

**Cumulative Impacts.** The long-term moderate adverse impacts on the coastal dune plant community from dogs at Fort Funston under alternative E were considered together with the effects of the projects mentioned above under alternative A. There would be a combination of adverse and beneficial effects from actions in and around Fort Funston; when combined, these actions would balance out, resulting in negligible impacts. Therefore, the cumulative analysis for this park site will mainly focus on the results of the impact analysis for this alternative. Cumulative impacts on the coastal dune plant community from dogs under this alternative would be expected to be long term, moderate, and adverse.

**FORT FUNSTON ALTERNATIVE E CONCLUSION TABLE**

| <b>Coastal Community Impacts</b>                                | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>                     |
|---|--|---|---|
| Overall long-term moderate adverse impacts, assuming compliance | The large, upland ROLA corridor is in coastal dune vegetation; in other areas, physically restraining dogs would protect dune vegetation; trails and the LOD area are a small portion of the site but ROLA corridor is large; restoration potential is limited | Beneficial, assuming compliance                     | Long-term moderate adverse cumulative impacts |

**Alternative F: Preferred Alternative.** On-leash dog walking would be allowed on all trails north of the parking lot that are outside the ROLA, except for the Funston Horse Trail, which would be closed to dogs and the northern end of the Sunset Trail, which is closed due to erosion. On-leash dog walking would also be allowed on the Funston Beach Trail South (sand ladder) and Sunset Trail south of the main parking lot. Dog walking under voice and sight control would be allowed in two designated ROLAs, one on the beach south of the Funston Beach Trail North and a second (“upland” ROLA) north of the main parking lot, the same as in alternative E. The “upland” ROLA would extend into the disturbed area across from the Funston Beach Trail North. In addition, the Chip Trail would be hardened to improve accessibility. The upland ROLA is in existing coastal dune vegetation (which includes the non-native ice plant) that has been fragmented by a myriad of social trails made by dogs and humans traversing the area under current conditions. Through concentrated use in this designated ROLA, the coastal dune vegetation would degrade and the potential for restoration of this remnant coastal dune habitat would be limited. In addition to impacts in the ROLAs, impacts on the coastal dune vegetation would also occur in the 6-foot corridors immediately adjacent to the trails (LOD area). Dogs could enter coastal dune habitat and affect it through trampling, digging, and dog waste. In the LOD area and ROLAs, impacts on coastal dune vegetation would be long term, moderate, and adverse. However, designation of ROLAs could lead to greater compliance and reduced impacts in other (non-ROLA) areas of the site. While dogs would cause impacts on the dunes, most of the vegetation accessible to dogs under alternative F in the coastal dune habitat in Fort Funston is non-native; therefore, the impacts would not be considered greater than moderate adverse.

Assuming compliance, the preferred alternative would result in overall long-term minor to moderate adverse impacts on coastal dune habitat because the upland ROLA is located in previously disturbed

## Chapter 4: Environmental Consequences

coastal dune habitat that would continue to degrade, but the area in the ROLA is only a small portion of the entire site. Hardening the Chip Trail would also adversely affect coastal dune vegetation, but this area has been previously disturbed due to off-leash use on the entire site, especially around existing trails. Physically restraining dogs on leash would protect dune vegetation and reduce social trails at this site, but dog use would still limit potential restoration even though the habitat corridor would be protected.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs. In a ROLA, permit holders may walk one to six dogs off leash, and the permit may restrict use by time and area. Permits would be allowed for Fort Funston. Impacts on coastal dune vegetation from permit holders with four to six dogs off leash would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is common at Fort Funston, impacts on coastal dune vegetation would be expected from this user group. Impacts on coastal dune vegetation from commercial dog walkers would be similar to impacts from other dog walkers, as summarized above in overall impacts; therefore, impacts from commercial dog walking would be long term, minor to moderate, and adverse.

**Cumulative Impacts.** Projects and actions in and near Fort Funston were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs initiative projects provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance, which can beneficially affect vegetation at park sites such as Fort Funston. The City of Daly City is preparing the *Vista Grande Drainage Basin Alternatives Analysis* to develop and evaluate alternatives that will reduce or eliminate flooding, reduce erosion along Lake Merced, and provide other potential benefits such as habitat enhancement and lake level augmentation (City of Daly City 2010a, 1).

Additional actions have had, are currently having, or have the potential to have adverse impacts on vegetation at or in the vicinity of Fort Funston. For example, the NPS is planning to construct new restroom and maintenance facilities at Fort Funston, which has the potential to have an adverse impact on vegetation in the area (NPS 2010d, 1). The Vista Grande portion of Daly City's stormwater collection system includes an underground collection system that routes storm flows northwest to the Vista Grande canal and tunnel for discharge to an outfall structure at the beach below Fort Funston (City of Daly City 2010b, 3). This system has the potential to adversely affect vegetation in the area of Fort Funston.

The long-term minor to moderate adverse impacts on the coastal dune plant community from dogs at Fort Funston under the preferred alternative were considered together with the effects of the projects mentioned above. There would be a combination of adverse and beneficial effects from actions in and around Fort Funston; when combined, these actions would balance out, resulting in negligible impacts. Therefore, the cumulative analysis for this park site will mainly focus on the results of the impact analysis for this alternative. Cumulative impacts on the coastal dune plant community from dogs under this alternative would be expected to be long term, minor to moderate, and adverse.

**FORT FUNSTON PREFERRED ALTERNATIVE F CONCLUSION TABLE**

| <b>Coastal Community Impacts</b>   | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>                              |
|--|--|---|--|
| Overall long-term minor to moderate adverse impacts, assuming compliance | Physically restraining dogs would protect dune vegetation and reduce social trails; the upland ROLA supports dune vegetation that would be affected and limits potential restoration, although habitat corridor would be protected | Beneficial, assuming compliance                     | Long-term minor to moderate adverse cumulative impacts |

### **IMPACTS TO COASTAL SCRUB, CHAPARRAL, AND GRASSLAND COMMUNITIES BY SITE AND ALTERNATIVE**

Coastal scrub, chaparral, and grassland plant communities are found to some extent at many of the GGNRA sites considered in this draft plan/SEIS, but at the more developed sites in San Francisco County, only small remnants may be found (Crissy Field, Fort Point Promenade/Fort Point National Historic Site (NHS) Trails, Baker Beach and Bluffs to Golden Gate Bridge, Lands End). As a result, only impacts in largely undeveloped park sites containing intact acreage of coastal scrub/chaparral/grassland are analyzed. Because these three communities form a vegetation mosaic along the coast, they are discussed together in this section. In general, there is little site-specific documentation that dogs have either directly or indirectly affected coastal scrub/chaparral/grassland habitat at GGNRA. However, park staff have observed noncompliant dogs in unprotected areas due to ineffective or missing fencing. As described in chapter 3, the coastal scrub/chaparral/grassland communities provide habitat for many CNPS-listed plant species. Also occurring at the grasslands in this community is silver-leaf lupine, the primary host plant for the federally endangered mission blue butterfly; both species are discussed in more detail in the “Special-status Species” section.

#### **MARIN COUNTY SITES**

##### **Homestead Valley**

**Alternative A: No Action.** Under current conditions, dogs are allowed under voice control or on leash throughout the site. Even though this site has low visitor use (see table 9), physical damage and nutrient addition from dogs is assumed to be currently happening along the fire road/trails and in off-trail areas throughout the site. Due to their nature, dogs are not expected to stay on the fire road/trails. Since dogs are currently allowed under voice control at the site, there is a higher likelihood that dogs would go off trail than if they were on leash, creating impacts on vegetation communities in the adjacent, undisturbed areas located along the fire road/trails. Impacts on vegetation in these adjacent areas would include physical damage, and would create opportunities for invasive plants to establish. The creation of social trails could further affect the coastal scrub, chaparral, and grassland vegetation by increasing fragmentation. The Oakland mariposa lily occurs in the grasslands of Homestead Valley and is an example of a rare plant with limited distribution that could be susceptible to impacts from dog activities.

The impacts on vegetation at this park site under alternative A would be considered long term, minor, and adverse because effects would be measurable and perceptible, but would be localized in a relatively small area.

## Chapter 4: Environmental Consequences

Under alternative A, no permit system exists for dog walking. At Homestead Valley, commercial dog walking is uncommon. Therefore, commercial dog walking would have negligible impacts on vegetation.

**Cumulative Impacts.** Projects and actions in and near Homestead Valley were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of the park stewardship programs provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils. Ongoing parkwide restoration and enhancement efforts, such as the GGNRA natural resource stewardship programs and the *Marin Countywide Plan* (County of Marin 2007), can also beneficially affect vegetation at GGNRA park sites such as Homestead Valley. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance. Projects funded by the Wildland/Urban Interface Initiative on private lands and habitat restoration could also impact Homestead Valley.

Additional actions have had, are currently having, or have the potential to have adverse impacts on the coastal scrub, chaparral, and grassland communities at or in the vicinity of Homestead Valley, such as development or construction actions. Coastal scrub habitat in California is threatened by habitat loss, fragmentation, and degradation (USDA 2005, 613). Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts.

The long-term minor adverse impacts on the coastal scrub, chaparral, and grassland communities from dogs at Homestead Valley under alternative A were considered together with the effects of the actions mentioned above. The benefits to the coastal scrub, chaparral, and grassland communities from the park stewardship programs would not be expected to reduce the adverse impacts of this alternative; therefore, the cumulative analysis for this park site will focus on the results of the impact analysis for this alternative. The beneficial effects from the park stewardship programs combined with the long-term minor adverse impacts from alternative A would result in long-term minor adverse cumulative impacts.

**HOMESTEAD VALLEY ALTERNATIVE A CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Impacts | Rationale  | Impact Change Compared to Current Conditions | Cumulative Impacts                           |
|---|--|--|--|
| Long-term minor adverse impacts                 | Impacts on vegetation from dogs would be caused through physical damage such as trampling, digging, and dog waste; these effects, as well as fragmentation, could lead to the spread of invasive plant species | N/A  | Long-term, minor, adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking on Homestead Fire Road and on neighborhood connector trails (Homestead Trail and Homestead Summit Trail) that would be designated in the future. In general, impacts on vegetation would be limited to the 6-foot corridors immediately adjacent to the trails/fire road. Impacts on vegetation could include physical damage from trampling as well as nutrient addition from dog waste and urine. Therefore, impacts in areas adjacent to the trail (LOD area) would be long term, minor, and adverse since this area supports the growth of native vegetation, some of it rare, such as the Oakland mariposa lily. Impacts would be measurable and perceptible, but would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area would occur in a relatively small area compared to the site as a whole. Therefore, assuming compliance, the overall impact on coastal scrub/chaparral/grassland vegetation from on-leash dog walking at Homestead Valley would be negligible because impacts would result in no measurable or perceptible changes in these plant communities.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking in Homestead Valley is uncommon, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have negligible impacts on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** The negligible impacts on vegetation from dogs at Homestead Valley under alternative B were considered together with the effects of the projects mentioned above under alternative A “Cumulative Impacts.” Cumulatively, alternative B would have negligible impacts on the coastal scrub/chaparral/grasslands at this site when added to the effects from these projects.

**HOMESTEAD VALLEY ALTERNATIVE B CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would have the same dog walking restrictions as alternative B, and the impacts on coastal scrub/chaparral/grassland vegetation would be the same, assuming compliance: long term, minor, and adverse in the LOD area and negligible overall.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Homestead Valley is not one of the park sites where permits would be issued allowing dog walkers to have more than three dogs. Since commercial dog walking is not common in this area, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative C would have negligible impacts on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** Under alternative C, the cumulative impacts on the vegetation at this park site would be the same as those under alternative B: negligible cumulative impacts on the coastal scrub, chaparral, and grassland communities.

**HOMESTEAD VALLEY ALTERNATIVE C CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance              | Negligible cumulative impacts |

## Chapter 4: Environmental Consequences

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Under alternative D, on-leash dog walking would be allowed only along the Homestead Fire Road; dogs would be prohibited in other areas of the site. Impacts on vegetation could include physical damage from trampling as well as nutrient addition from dog waste and urine. Impacts in areas adjacent to the fire road (LOD area) would be long term, minor, and adverse, since this habitat supports the growth of native vegetation, some of it rare, such as the Oakland mariposa lily. Impacts would be measurable and perceptible, but would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area would occur in a relatively small area compared to the site as a whole. Therefore, assuming compliance, the overall impact on coastal scrub/chaparral/grassland vegetation from on-leash dog walking at Homestead Valley would be negligible, because impacts would result in no measurable or perceptible changes in these plant communities.

No commercial dog walking would be allowed and no permits to walk more than three dogs would be issued under alternative D; therefore, no impact would occur as a result of commercial and permitted dog walking.

**Cumulative Impacts.** The negligible impacts on the coastal scrub/chaparral/grassland communities from dogs at Homestead Valley under alternative D were considered together with the effects of the projects mentioned above under alternative A “Cumulative Impacts.” Cumulatively, alternative D would have negligible impacts on the coastal scrub/chaparral/grassland communities at this site when added to the effects from these projects.

**HOMESTEAD VALLEY ALTERNATIVE D CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance        | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would have the same dog walking restrictions as alternative B, and the impacts on vegetation would be the same, assuming compliance: long term, minor, and adverse in the LOD area and negligible overall.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Homestead Valley is not one of the park sites where permits would be issued allowing dog walkers to have more than three dogs. Since commercial dog walking is not common in this area, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative E would have negligible impacts on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** Under alternative E, the cumulative impacts on the coastal scrub/chaparral/grassland communities at this park site would be the same as those under alternative B: negligible cumulative impacts on the coastal scrub/chaparral/grassland communities.

**HOMESTEAD VALLEY ALTERNATIVE E CONCLUSION TABLE**

| Coastal Scrub, Chaparral, and Grassland Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative B, allowing on-leash dog walking on Homestead Fire Road and on neighborhood connector trails (Homestead Trail and Homestead Summit Trail) that would be designated in the future. In general, impacts on vegetation would be limited to the 6-foot corridors immediately adjacent to the trails/fire roads. Impacts on vegetation could include physical damage from trampling, as well as nutrient addition from dog waste and urine. Therefore, impacts in areas adjacent to the trail (LOD area) would be long term, minor, and adverse, since this habitat supports the growth of native vegetation, some of it rare, such as the Oakland mariposa lily. Impacts would be measurable and perceptible, but would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area would occur in a relatively small area compared to the site as a whole. Therefore, assuming compliance, the overall impact on coastal scrub/chaparral/grassland vegetation from on-leash dog walking at Homestead Valley would be negligible because impacts would result in no measurable or perceptible changes in these plant communities.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Homestead Valley is not one of the park sites where permits would be issued allowing dog walkers to have more than three dogs. Since commercial dog walking is not common in this area, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under the preferred alternative would have negligible impacts on vegetation.

**Cumulative Impacts.** Projects and actions in and near Homestead Valley were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of the park stewardship programs initiative projects provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils. Ongoing parkwide restoration and enhancement efforts, such as the GGNRA natural resource stewardship programs and the *Marin Countywide Plan* (County of Marin 2007), can also beneficially affect vegetation at GGNRA park sites such as Homestead Valley. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance.

Additional actions have had, are currently having, or have the potential to have adverse impacts on vegetation at or in the vicinity of Homestead Valley, such as development or construction actions. Coastal scrub habitat in California is threatened by habitat loss, fragmentation, and degradation (USDA 2005, 613). Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts.

The negligible impacts on the coastal scrub/chaparral/grassland communities from dogs at Homestead Valley under the preferred alternative were considered together with the effects of the projects mentioned above. Cumulatively, the preferred alternative would have negligible impacts on the coastal scrub/chaparral/grassland communities at this site when added to the effects from these projects.

HOMESTEAD VALLEY PREFERRED ALTERNATIVE F CONCLUSION TABLE

| Coastal Scrub, Chaparral, and Grassland Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance              | Negligible cumulative impacts |

**Alta Trail/Orchard Fire Road/Pacheco Fire Road**

**Alternative A: No Action.** Under current conditions, dogs are allowed under voice control or on leash on the trails and roads from Marin City to Oakwood Valley. These areas experience high use by commercial dog walkers (table 9), with typically 5 to 12 dogs under voice control per commercial walker.

Under alternative A, physical damage to vegetation from dogs through trampling, digging, and dog waste would continue to occur since dogs would be allowed under voice control and there is a higher likelihood of dogs going off the trail and fire roads than if they were on leash. Continued impacts in these areas could prevent the growth of vegetation or allow the establishment of non-native invasive species. These impacts would be considered long term, minor, and adverse due to the high use by commercial dog walkers and because effects would be measurable and perceptible, but would be localized in a relatively small area.

No permit system exists for dog walking under alternative A. However, commercial dog walking at Alta Trail, Orchard Fire Road, and Pacheco Fire Road is common, with commercial dog walkers having 5 to 12 dogs under voice control at one time. Commercial dog walking would continue to create long-term minor adverse impacts on vegetation, as described above. Dogs under voice control would continue to disturb the vegetation through digging, trampling, and dog waste.

**Cumulative Impacts.** Projects and actions in and near Alta Trail, Orchard Fire Road, and Pacheco Fire Road were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils. Ongoing parkwide restoration and enhancement efforts, such as GGNRA natural resource stewardship programs and the *Marin Countywide Plan* (County of Marin 2007), can also beneficially affect vegetation at GGNRA park sites such as Alta Trail, Orchard Fire Road, and Pacheco Fire Road. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance. Habitat restoration and the implementation of projects funded by the Wildland/Urban Interface Initiative on private lands could also impact Alta Trail/Orchard Fire Road/Pacheco Fire Road.

Additional actions have had, are currently having, or have the potential to have adverse impacts on vegetation at or in the vicinity of Alta Trail/Orchard Fire Road/Pacheco Fire Road, such as development or construction actions. Coastal scrub habitat in California is threatened by habitat loss, fragmentation, and degradation (USDA 2005, 613). Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts

The long-term minor adverse impacts on the coastal scrub, chaparral, and grassland communities from dogs at Alta Trail, Orchard Fire Road, and Pacheco Fire Road under alternative A were considered together with the effects of the actions mentioned above. The benefits to vegetation from the park

stewardship programs and other restoration projects in the area of this site would not be expected to reduce the adverse impacts of this alternative; therefore, the cumulative analysis for this park site will focus on the results of the impact analysis for this alternative. The beneficial effects from the park stewardship programs and other restoration projects combined with the long-term minor adverse impacts from alternative A would result in long-term minor adverse cumulative impacts.

**ALTA TRAIL/ORCHARD FIRE ROAD/PACHECO FIRE ROAD ALTERNATIVE A CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Impacts</b> | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>                    |
|--|--|---|--|
| Long-term minor adverse impacts                        | Impacts on vegetation from dogs would be caused through physical damage such as trampling, digging, and dog waste; these effects, as well as fragmentation, could lead to the spread of invasive plant species | N/A   | Long-term, minor, adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Alternative B would allow on-leash dog walking on the Alta Trail to Orchard Fire Road and on Orchard and Pacheco fire roads. Impacts in areas adjacent to the trail (LOD area) would be long term, minor, and adverse since this habitat supports the growth of native vegetation, some of it rare. Impacts on vegetation could include physical damage from trampling as well as nutrient addition from dog waste and urine. Impacts would be detectable, but not large enough to cause a measurable or perceptible change in the coastal scrub/chaparral/grassland communities.

The long-term minor adverse impacts from the high level of dog use in the LOD area would occur in a relatively reduced area compared to the site as a whole. Therefore, assuming compliance, the overall impact on coastal scrub/chaparral/grassland vegetation from on-leash dog walking on the Alta Trail, Orchard Fire Road, and Pacheco Fire Road would be negligible because impacts would result in no measurable or perceptible changes in the plant communities.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since the percentage of commercial dog walkers is considered high at Alta Trail/Orchard Fire Road/Pacheco Fire Road, dogs walked by commercial dog walkers would cause the majority of the adverse impacts on vegetation from dogs at the site. Overall impacts on vegetation from dogs walked by both commercial dog walkers and private individuals are summarized above.

**Cumulative Impacts.** The negligible impacts on the coastal scrub, chaparral, and grassland communities from dogs at Alta Trail, Orchard Fire Road, and Pacheco Fire Road under alternative B were considered together with the effects of the actions mentioned above in alternative A. The benefits to vegetation from the park stewardship programs and other restoration projects in the area of this site combined with the negligible impacts from alternative B would result in negligible cumulative impacts.

**Chapter 4: Environmental Consequences**

**ALTA TRAIL/ORCHARD FIRE ROAD/PACHECO FIRE ROAD ALTERNATIVE B CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance        | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative C: Emphasis on Multiple Use – Balanced by County.** Alternative C would have the same dog walking restrictions as alternative B, and impacts would be the same, assuming compliance: long term, minor, and adverse in the LOD area and negligible overall.

Under alternative C, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs; permits may restrict use by time and area. Permits would be allowed for Alta Trail/Orchard Fire Road/Pacheco Fire Road. Impacts on vegetation from permit holders with four to six dogs would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is common at Alta Trail/Orchard Fire Road/Pacheco Fire Road, impacts on vegetation would be expected from this user group. Impacts on vegetation from commercial dog walkers would be similar to impacts from other dog walkers, as summarized above; therefore, impacts from commercial dog walking would be negligible.

**Cumulative Impacts.** Under alternative C, the cumulative impacts on the coastal scrub/chaparral/grassland communities at this park site would be the same as those under alternative B: negligible cumulative impacts on the coastal scrub/chaparral/grassland communities.

**ALTA TRAIL/ORCHARD FIRE ROAD/PACHECO FIRE ROAD ALTERNATIVE C CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance        | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative D: Most Protective of Resource Protection and Visitor Safety.** Under alternative D, dogs would not be allowed at this site. Therefore, no impact on vegetation from dogs would occur at this site.

Since dogs would not be allowed at Alta Trail, Orchard Fire Road, and Pacheco Fire Road, there would be no impact from commercial dog walkers on the coastal scrub, chaparral, and grassland vegetation communities.

**Cumulative Impacts.** The lack of impacts on the coastal scrub/chaparral/grassland communities from dogs at Alta Trail, Orchard Fire Road, and Pacheco Fire Road under alternative D was considered together with the effects of the projects mentioned above in alternative A. The beneficial effects from the park stewardship programs and other restoration projects combined with the lack of impacts on the coastal scrub/chaparral/grassland communities from alternative D would result in beneficial cumulative impacts.

**ALTA TRAIL/ORCHARD FIRE ROAD/PACHECO FIRE ROAD ALTERNATIVE D CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Impacts</b> | <b>Rationale</b>                     | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|--------------------------------------|---|-------------------------------|
| No impact, assuming compliance                         | Dogs would be prohibited at the site | Beneficial, assuming compliance                     | Beneficial cumulative impacts |

**Alternative E: Most Dog Walking Access / Most Management Intensive.** Alternative E would allow on-leash dog walking on the Alta Trail to the junction with the Morning Sun Trail, and on Orchard and Pacheco fire roads. While the mileage open to dog walking would be greater than that described for alternative B, the impacts would be similar, assuming compliance: long term, minor, and adverse in the LOD area and negligible overall.

Under alternative E, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs; permits could restrict use by time and area. Permits would be allowed for Alta Trail. Although dog walkers with three or fewer dogs would be able to go as far as the intersection of Alta and Morning Sun Trails, permit holders would be allowed only as far as the Orchard Fire Road. Impacts on vegetation from permit holders with four to six dogs would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is common at Alta Trail/Orchard Fire Road/Pacheco Fire Road, impacts on vegetation would be expected from this user group. Impacts on vegetation from commercial dog walkers would be similar to impacts from other dog walkers, as summarized above; therefore, impacts from commercial dog walking would be negligible.

**Cumulative Impacts.** The negligible impacts on the coastal scrub, chaparral, and grassland communities from dogs at Alta Trail, Orchard Fire Road, and Pacheco Fire Road under alternative E were considered together with the effects of the actions mentioned above in alternative A. The benefits to vegetation from the park stewardship programs and other restoration projects in the area of this site combined with the negligible impacts from alternative E would result in negligible cumulative impacts.

**ALTA TRAIL/ORCHARD FIRE ROAD/PACHECO FIRE ROAD ALTERNATIVE E CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Impacts</b> | <b>Rationale</b>  | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>     |
|--|---|---|-------------------------------|
| Overall negligible impacts, assuming compliance        | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance                     | Negligible cumulative impacts |

**Alternative F: Preferred Alternative.** The preferred alternative is the same as alternative E, allowing on-leash dog walking on the Alta Trail to the junction with the Morning Sun Trail and on Orchard and Pacheco fire roads for dog walkers with up to three dogs. Permit holders would be allowed only as far as the Orchard Fire Road. Impacts in areas adjacent to the trail (LOD area) would be long term, minor, and adverse since this habitat supports the growth of native vegetation, some of it rare. Impacts on vegetation could include physical damage from trampling as well as nutrient addition from dog waste and urine. Impacts would be detectable, but not large enough to cause a measurable or perceptible change in the coast scrub/chaparral/grassland plant communities.

## Chapter 4: Environmental Consequences

The long-term minor adverse impacts from the high level of dog use in the LOD area would occur in a relatively reduced area compared to the site as a whole. Therefore, assuming compliance, the overall impact on coastal scrub/chaparral/grassland vegetation from on-leash dog walking on the Alta Trail, Orchard Fire Road, and Pacheco Fire Road would be negligible because impacts would result in no measurable or perceptible changes in the plant communities.

Under the preferred alternative, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs with no permit required. Any dog walker, commercial or private, could obtain a permit to walk more than three dogs on leash, with a limit of six dogs; permits could restrict use by time and area. Permits would be allowed for Alta Trail/Orchard Fire Road/Pacheco Fire Road. Impacts on vegetation from permit holders with four to six dogs would be expected to increase under this alternative; however, impacts would not be expected to increase enough to cause a change in the threshold level. Since commercial dog walking is common at Alta Trail/Orchard Fire Road/Pacheco Fire Road, impacts on vegetation would be expected from this user group. Impacts on vegetation from commercial dog walkers would be similar to impacts from other dog walkers, as summarized above in overall impacts; therefore, impacts from commercial dog walking would be negligible.

**Cumulative Impacts.** Projects and actions in and near Alta Trail, Orchard Fire Road, and Pacheco Fire Road were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs initiative projects provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils. Ongoing parkwide restoration and enhancement efforts, such as GGNRA natural resource stewardship programs and the *Marin Countywide Plan* (County of Marin 2007), can also beneficially affect vegetation at GGNRA park sites such as Alta Trail, Orchard Fire Road, and Pacheco Fire Road. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance. Habitat restoration and the implementation of projects funded by the Wildland/Urban Interface Initiative on private lands could also impact Alta Trail, Orchard Fire Road, and Pacheco Fire Road.

Additional actions have had, are currently having, or have the potential to have adverse impacts on vegetation at or in the vicinity of Alta Trail, Orchard Fire Road, and Pacheco Fire Road, such as development or construction actions at or in the vicinity of GGNRA sites. Coastal scrub habitat in California is threatened by habitat loss, fragmentation, and degradation (USDA 2005, 613). Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts.

The negligible impacts on the coastal scrub, chaparral, and grassland communities from dogs at Alta Trail, Orchard Fire Road, and Pacheco Fire Road under the preferred alternative were considered together with the effects of the actions mentioned above. The benefits to vegetation from the park stewardship programs and other restoration projects in the area of this site combined with the negligible impacts from the preferred alternative would result in negligible cumulative impacts on the coastal scrub, chaparral, and grassland communities.

### ALTA TRAIL/ORCHARD FIRE ROAD/PACHECO FIRE ROAD PREFERRED ALTERNATIVE F CONCLUSION TABLE

| Coastal Scrub, Chaparral, and Grassland Impacts | Rationale   | Impact Change Compared to Current Conditions | Cumulative Impacts            |
|---|---|--|-------------------------------|
| Overall negligible impacts, assuming compliance | Physically restraining dogs would protect vegetation off trail; trails and the LOD area are a small portion of the site | Beneficial, assuming compliance              | Negligible cumulative impacts |

## Oakwood Valley

**Alternative A: No Action.** Currently, dogs are allowed under voice control on Oakwood Valley Fire Road and on Oakwood Valley Trail from the junction with the fire road to the junction with Alta Trail. On-leash dog walking is allowed on Oakwood Valley Trail from the trailhead to the junction with Oakwood Valley Fire Road. These areas experience high use by hikers, runners, bicyclists, and horseback riders and moderate use by dog walkers (table 9). In addition, this area contains mission blue butterfly habitat and host plants.

Under alternative A, physical disturbance from dog activities would continue to occur along the fire road and trail and in off-trail areas throughout the site. Due to their nature, dogs are not expected to stay on the fire road/trail. Since dogs would be allowed under voice control in some areas of the site, there is a higher likelihood that dogs would go off trail than if they were on leash, creating impacts on coastal scrub, chaparral, and grassland vegetation in adjacent areas. Therefore, these impacts would be considered long term, minor, and adverse because effects would be measurable and perceptible, but would be localized in a relatively small area.

No permit system exists for dog walking under alternative A. At Oakwood Valley, commercial dog walking is uncommon; therefore, commercial dog walking would have negligible impacts on vegetation.

**Cumulative Impacts.** Projects and actions in and near Oakwood Valley were considered for the cumulative impacts analysis (appendix K). Long-term parkwide projects such as trail rehabilitation performed as part of park stewardship programs provide improvements and enhancements that reduce erosion, improving conditions for vegetation and wildlife habitat and contributing to the quality of soils. Ongoing parkwide restoration and enhancement efforts, such as GGNRA natural resource stewardship programs and the *Marin Countywide Plan* (County of Marin 2007), can also beneficially affect vegetation at GGNRA park sites such as Oakwood Valley. The GGNRA Maintenance Division conducts many ongoing operations throughout GGNRA that include but are not limited to road, trail, and stormwater system maintenance. Habitat restoration and the implementation of projects funded by the Wildland/Urban Interface Initiative on private lands could also impact Oakwood Valley.

Additional actions have had, are currently having, or have the potential to have adverse impacts on vegetation at or in the vicinity of Oakwood Valley, such as development or construction actions. Coastal scrub habitat in California is threatened by habitat loss, fragmentation, and degradation (USDA 2005, 613). Generally, construction projects that affect this community require project-specific mitigation measures to address impacts; therefore, these projects would have negligible cumulative impacts.

The long-term minor adverse impacts on the coastal scrub/chaparral/grassland communities from dogs at Oakwood Valley under alternative A were considered together with the effects of the actions mentioned above. The benefits to vegetation from the park stewardship programs and other restoration projects in the area of this site would not be expected to reduce the adverse impacts of this alternative; therefore, the cumulative analysis for this park site will focus on the results of the impact analysis for this alternative. The beneficial effects from the park stewardship programs and other restoration projects combined with the long-term minor adverse impacts from alternative A would result in long-term minor adverse cumulative impacts.

**Chapter 4: Environmental Consequences**

**OAKWOOD VALLEY ALTERNATIVE A CONCLUSION TABLE**

| <b>Coastal Scrub, Chaparral, and Grassland Impacts</b> | <b>Rationale</b>   | <b>Impact Change Compared to Current Conditions</b> | <b>Cumulative Impacts</b>                    |
|--|--|---|--|
| Long-term minor adverse impacts                        | Impacts on vegetation from dogs would be caused through physical damage such as trampling, digging, and dog waste; these effects, as well as fragmentation, could lead to the spread of invasive plant species | N/A   | Long-term, minor, adverse cumulative impacts |

N/A = not applicable.

**Alternative B: NPS Leash Regulation.** Under alternative B, on-leash dog walking would be allowed on the Oakwood Valley Fire Road and the Oakwood Valley Trail to the junction of the trail and fire road in the lower section of the site. No dogs would be allowed above the junction of the fire road and trail. Impacts in areas adjacent to the trail would be long term, minor, and adverse since these areas support existing vegetation that would be affected by trampling and dog waste. Impacts on vegetation would be measurable and perceptible, but would be localized in a relatively small area.

The long-term minor adverse impacts from dogs in the LOD area would occur in a relatively small area compared to the site as a whole. Physically restraining dogs on leash would protect vegetation off trail. Therefore, assuming compliance, the overall impacts on coastal scrub/chaparral/grassland vegetation from on-leash dog walking at Oakwood Valley would be negligible because impacts would result in no measurable or perceptible changes in these plant communities.

Under alternative B, all dog walkers, including commercial dog walkers, would be allowed to walk one to three dogs per person with no permit required. Since commercial dog walking activity is not common at Oakwood Valley, it is likely that this alternative would not have an impact on the number of dog walkers. Therefore, commercial dog walking under alternative B would have negligible impacts on coastal scrub/chaparral/grassland vegetation.

**Cumulative Impacts.** The negligible impacts on the coastal scrub/chaparral/grassland communities from dogs at Oakwood Valley under alternative B were considered together with the effects of the projects mentioned above under alternative A. Cumulatively, alternative B would have negligible impacts on the coastal scrub/chaparral/grassland communities at this park site when added to the effects from these projects.
