I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,
Dwayne [REDACTED]

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Correspondence: Isle Royale can easily support a population of about 50 wolves. Back in the 1960s, animal behaviourists learned a lot about wolves by being able to study them in the wild, yet in a somewhat contained area such as Isle Royale. It should remain a sanctuary for this very misunderstood species and a living laboratory in which field studies can continue.

Correspondence: Superintendent Green,

With only two wolves left at Isle Royale, I worry about the island's ecosystem. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

Thank you for considering my concerns.

Sincerely,

Amanda [REDACTED]

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,

Ramona [REDACTED]

Isle Royale wolves
Submit Your Comments to Protect Isle Royale's Ecosystem!

(This link will direct you to the Park Service's Planning, Environment & Public Comment website.)

Take Action

Dear [REDACTED]

There were once as many as 50 wolves living at Isle Royale National Park. Now there are only two. For this ecosystem to continue to thrive, we need to bring new wolves to Isle Royale.

We need your help by May 16.

Without wolves, the island's moose population will continue to skyrocket, consuming native plants and eventually running out of food, disrupting the natural stability of the island. It is critical to bring in new wolves to protect the national park.

After gathering extensive public input last summer, the National Park Service has narrowed down their list of management options. The agency is now asking for your input on which option will best manage the wolf and moose populations on the island.

NPCA supports Option C, which requires NPS to bring additional wolves to the park in order to maintain a population of wolves on the island. After many years of consulting scientific experts and reviewing trusted research, we believe this action will best balance the island's delicate environment.

Take Action: Tell Isle Royale National Park Superintendent Phyllis Green and the Park Service to adopt Option C and bring new wolves to Isle Royale. Isle Royale National Park would be a very different place without wolves.

Here's how to submit your comments to the Park Service.

Step 1: Go to <https://parkplanning.nps.gov/commentForm.cfm?documentID=71605> and carefully follow the form instructions.

Step 2: Submit your comments by copying and pasting the sample message below into the "Comments" box on the web form. Remember to personalize your comments by adding observations or stories from your experiences at the park.

Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Correspondence: I have visited Isle Royale and was so impressed by the beauty and wildness of the Green Ridge but was also worried by the large numbers of hoofed animals competing for resources. Importing wolves to the area would restore the ecosystem to its natural balance and would not impose a danger to visitors but would be a feature that would inspire many to visit. Imagine hearing wolves in the wild at night from a tent on the island!

Thank you for your attention to this matter.

Correspondence: This is one of the last truly wild places in the USA. We need to have an ecosystem where all levels are full-filled. From the predators to the prey, I think its very important that this area continue to be as wild and protected as possible for all to survive. Mother nature can attend to most issues, but further research on how global warming is effecting the region and the species that inhabit it. Wolves are an important part of natures role in the environment, but how is global warming changing the health of the environment for the moose and so on. Are insects and other diseases going to affect the populations of the animals that live within the park. All of that needs to be considered in any future plans.

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,

Nicki [REDACTED]

Correspondence: Please act to protect Isle Royale's ecosystem. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience.

Without wolves, the island's moose population will continue to skyrocket, consuming native plants and eventually running out of food, disrupting the natural stability of the island. It is critical to bring in new wolves to protect the national park.

I stand with the National Parks Conservation Association in support of Option C, which requires NPS to bring additional wolves to the park in order to maintain a population of wolves on the island. After many years of consulting scientific experts and reviewing trusted research, we believe this action will best balance the island's delicate environment. Isle Royale National Park would be a very different place without wolves.

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. This is a difficult issue based on the isolated wolf population. The Park Service narrowing the scope of this plan to focus solely on the future of wolves at the park is positive. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I believe the island requires continued reintroduction of wolves. Therefore, I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,

██████████

Correspondence: I support bringing wolves to Isle Royale! As humans, we have disrupted the natural ecosystems in our world for too many years. Thankfully as we study our past mistakes, and continue to learn, we can move forward in a more conscientious manner and strive to do our best in protecting the places we live as they are meant to be. Isle Royale is a special place - it is on my bucket list of places to visit. I wish to see it as it was created, not ruined by the over abundance of plant destroying moose. As I learn more about the Permaculture way of life, the more I understand how each living thing relates to another, and by working together, we can bring about positive changes. We can fix what we have destroyed.

Bring back the wolf!!

Correspondence:

At one point we had as many as 50 wolves living at Isle Royale National Park. Now there are only two. For this ecosystem to continue to thrive in its diversity, we need to bring new wolves to Isle Royale.

The wolves will make sure that the island's moose population will no longer skyrocket, consuming native plants and eventually running out of food, and thus disrupting the natural stability of the island. It is critical to bring in new wolves to protect the national park.

I fully agree with Option C, which would bring new wolves to Isle Royale. Isle Royale National Park would be a very different place without wolves.

I support Alternative C and saving a species that is being persecuted all over the United States!

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone.

This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Correspondence: It is very upsetting that the number of wolves in Isle Royale National Park has been allowed to dwindle to a mere TWO WOLVES! It is your responsibility and moral obligation to protect these animals. As you know, wolves are essential to a healthy ecosystem. I urge you to do what is necessary to replenish their numbers. Please take into consideration the wishes of the many American citizens who enjoy wildlife and who visit our parks and public lands so that wildlife can be viewed. It seems as though only the wishes of hunters and public land welfare ranchers are taken into consideration

when making decisions concerning the fate of wildlife, especially predators. PLEASE REPLENISH THE WOLVES OF ISLE ROYALE BY RELEASING MORE WOLVES. Thank you, Joan [REDACTED]

The health of any ecosystem is only as strong as the health of the climax species...and Isle Royale needs its wolves. The Inuit proverb applies here as well as in the Arctic, "The wolf keeps the caribou strong."

Thank you for considering my concerns.

Sincerely,
Carrington [REDACTED]

Correspondence: Please repopulate Isle Royale with wolves. I have seen first hand here in Washington DC's large Rock Creek Park the destruction caused by overpopulation of deer, and their poor physical condition as they have no predators to thin their numbers. Moose overpopulation of such a restricted ecosystem as Isle Royale will be predictably damaging.

Thank you for your time and effort that you perform as a terribly underfunded government agency.

Correspondence: There should be more wolves than two living. Humans are wrecking the eco system and destroying all the wildlife. What wildlife is left have to find new areas to live. Their forest is being torn down and they have no were to go except closer to humans and we all know what some evil humans do to the wildlife. Let's have some compassion for these. If humans would leave nature alone, nature would take care of itself.

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,
Ilene & Steve [REDACTED]

Correspondence: There were once as many as 50 wolves living at Isle Royale National Park. Now there are only two. For this ecosystem to continue to thrive, we need to bring new wolves to Isle Royale.

Without wolves, the island's moose population will continue to skyrocket, consuming native plants and eventually running out of food, disrupting the natural stability of the island. It is critical to bring in new wolves to protect the national park.
I support Option C, which requires NPS to bring additional wolves to the park in order to maintain a population of wolves on the island. After many years of consulting scientific experts and reviewing trusted research, I believe this action will best balance the island's delicate environment.
ALL animals deserve a right to survive.
Please consider and choose Option C.
Thank you.

Correspondence: Dear Superintendent Green,

After examining the options for the Isle Royale National Park island's ecosystem, without wolves, the moose population will continue to increase and have a disastrous impact on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management to maintain ecological balance on the island.

Thank you for considering my concerns.

Correspondence: Dear Superintendent Green,

I recall reading about the Wolves of Isle Royale National Park, which has inspired an interest in science, ecological networks and the environment, including a wonderful visit several years ago with my children.

I thank you for the opportunity to comment on the management plan for Isle Royale National Park to focus on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding using natural methods and minimize impacts to the native vegetation.

I believe that the National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,

Charleen [REDACTED]

Correspondence: There were once as many as 50 wolves living at Isle Royale National Park. Now there are only two. For this ecosystem to continue to thrive, we need to bring new wolves to Isle Royale.

We need your help by May 16.

Without wolves, the island's moose population will continue to skyrocket, consuming native plants and eventually running out of food, disrupting the natural stability of the island. It is critical to bring in new wolves to protect the national park.

After gathering extensive public input last summer, the National Park Service has narrowed down their list of management options. The agency is now asking for your input on which option will best manage the wolf and moose populations on the island.

NPCA supports Option C, which requires NPS to bring additional wolves to the park in order to maintain a population of wolves on the island. After many years of consulting scientific experts and reviewing trusted research, we believe this action will best balance the island's delicate environment.

Take Action: Tell Isle Royale National Park Superintendent Phyllis Green and the Park Service to adopt Option C and bring new wolves to Isle Royale. Isle Royale National Park would be a very different place without wolves.

Correspondence: I think it is time to bring in wolves to Isle Royale. I realize that is human intervention, but the lack of an ice bridge over the last couple of decades is also human caused. With warming global temperatures, it isn't likely that there will be a lot of chances for wolves from Minnesota or

Canada reaching the island again.

I follow this closely and I have read both sides of the argument and I understand everyone's point of view. But I believe new genes are the best choice. If moose keep breeding at the rate they have been, they are going to run out of food. That is a long, slow death for them. Would Isle Royale be worth visiting after that?

Thank you for considering my comments.

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I have visited Isle Royale several times in the past, having stayed at the lodge, camped at Lane Cove, hiked the many trails, and taken tours of the park. One thing that made Isle Royale was the possibility of seeing or hearing a wolf.

I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park. I have seen in Wisconsin what a burgeoning white-tailed deer population does to the native native flora. It hasn't been good.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Correspondence: Please return the wolves to Isle Royale. It is the only thing that makes sense. Killing the wolves in Minn. is unforgivable. The hunting and trapping is inhumane and bad science. No Moose in Northern Minn, too many wolves, (unproven statistics) no wolves on Isle Royale , too many moose. Do you see a pattern?
If we must manage wild life, let's do the right thing.
Linda and Don [REDACTED]

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Thank you for taking the time to help protect Isle Royale's fragile environment.

My husband and I visited this park when we were younger and although we didn't actually see any wolves, that was the reason we went there and it was exciting just thinking about the possibility of seeing a wolf. I hope that the wolves will be brought back.

Sincerely,

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,
[your name here]

Thank you for taking the time to help protect Isle Royale's fragile environment.

Correspondence: Apparently, the die-off of the wolves is natural...but

The ice that used to be the corridor for new wolves to get onto the island has been melting faster because of climate change. This is causing havoc in so many ways!

The world is anything but natural now. Man has been such a profound mechanism for change, and it has usually caused harm to the natural world including its animals. Maybe its time for mankind to enter artificially and bring back a more natural approach to the ecosystem.

Please bring back some wolves to the island.

Thanks,
Karen

Correspondence: I am one of the National Park System's biggest fans! You guys provide opportunities that can be experienced nowhere else in the world. Thank you!

I have help my own kids, now married adults, and my seven grandchildren to spend time in National Parks across the country. I have funded trips for all of my kids to Yellowstone and to watch my grandchildren's eyes when they see the many wonders makes my life worthwhile.

I have been on Isle Royal and it is one of my fondest memories of my visits to literally dozens of National Parks. When I was last there, the moose population was significant and there were 4 active wolf packs operating in that wondrous environment.

I strongly encourage you to follow the recommendations to re-populate the wolf packs to the extent that they can balance the moose population on Isle Royal.

Thank you for the opportunity for input on this important decision.

Sincerely,

Correspondence: I have followed the Isle Royale Wolf research project for many years and as long as the "balance" was working, even though one population fluctuated then another, I was in favor of a "no intervention" policy, but now that it is clearly NOT working and to do nothing would destroy this amazing National Park for animals and people alike, I am definitely in favor of bringing in some wolves to bring some balance back to the Island. I understand that it was possibly a domestic dog, with undetected Parvo or other canine disease, brought to the Island by some tourists which brought disease to the wolves which had no protective immunity against it, that led to their decline. Since this was unintended "intervention" by humans, it is, I believe, our moral responsibility to set it right, even though the wolves which would be brought in would not be genetically the same as the original ones which came across on the ice. I hoped that when Lake Superior was almost entirely frozen a couple of years ago that that very thing would happen naturally, but alas, it did not. So please, intervene to save this wonderful northern paradise.

Correspondence: Please bring back the wolves to Isle Royale. I would think preserving this ecosystem would be a no brainer. To assume that the two remaining wolves could sustain or increase a healthy population is bad science. We have so little left in any natural space and wilderness that I would hope to introduce more wolves to this wilderness would be an absolute. Allowing the moose population to increase unchecked is not good for the Moose or any of the existing ecosystem.

Wolves are being slaughtered at an alarming rate in so many states and many more such as my state Colorado do not even have any. What a precious gift to be able to reintroduce this top predator to a Wilderness Area that needs them so badly.

Please consider the value of such a reintroduction and bring more wolves to Isle Royale. This world needs a place that is left alone and natural. Please don't let the wolves die out.

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,

Steve [REDACTED]

Correspondence: In theory, periodic ice bridges between Isle Royale and MN allow moose and wolves to have their genetic pools enriched. In the apparent absence of this happening in recent years for wolves, human intervention is needed to provide this essential contribution to ecologic health.

Although I have never visited this park, I have been in Yellowstone National Park and observed how bringing the wolves back to that park has helped the entire ecosystem. I'm sure it will do the same at Isle Royale.

Thank you for considering my concerns.

Sincerely,
Ruth [REDACTED]

Correspondence: We took our grandson to Isle Royale several years ago. The wolf pack had already begun to decline. It is a beautiful island which would be greatly damaged, at least in the short term, by having a massive explosion and die off of the moose population. Their die off would be triggered by over consumption of available vegetation, thus denuding the island to a great extent. The consequence could be a very unpleasant experience for many park visitors.

It seems that a balance of wolves and moose is the best solution. With the inbreeding and various calamities that have befallen the wolf population in recent years and the failure to have ice bridges form most years, there is little hope of a resurgence of the wolf population in a natural way. Since neither animal was native to the island, it is not tampering with the natural order of life there to think of introducing more wolves with diverse blood lines.

I am in favor of adding new wolves or eliminating the moose population as well as the wolves, to avoid dead and sick, tick infested moose all over the island.

Correspondence: I urge you to bring wolves back to Isle Royale! Take some of our Wisconsin wolves before our mighty hunters kill them all! I will never forget my one and only trip to Isle Royale well over 30 years ago - I was so fascinated by the research that had been done on the moose/wolf populations and the crucial balance between them. Without more wolves, Isle Royale will no longer be the fascinating wilderness that has attracted so many for so long. This is an urgent situation that must be corrected as soon as possible. This National Treasure is one of a kind and deserves to stay that way. After all, it is the only place with "the biggest lake on the biggest island in the biggest lake in the world!" I remember that from my wonderful trip there as well. Please bring wolves to Isle Royale!

Correspondence: As a native Michigander, and someone who enjoyed two visits to Isle Royale as a teenager, I strongly encourage support of Proposal C to bring more wolves to Isle Royale National Park. The wolf-moose ratio is totally out of balance and a fresh wolf population is urgently needed to work

towards restoring a balance and making it possible to have viable populations of both wolves and moose on Michigan's only national park. I still remember the excitement I felt at hearing wolves howl at night while I was camping and seeing moose while hiking.

Correspondence: I like to help in any way I can for the sake of the Royale Isles, especially with making sure that no ecosystem falls apart. I strongly support with bringing more wolves into the park. This is just what happened when scientists brought wolves back in Yellowstone. They knew without wolves, the ecosystem was just collapsing as well as for the other native species. By 1995, people knew what they had to for the sake of the environment despite that there would be those who would object it but nevertheless, we know now why it's important to have predators in our natural world. For the wolves of the Royal isles, I strongly support this move for the sake of not only their species but also for the other inhabitants.

Correspondence: Dear Superintendent Green,

Thank you for allow input and comments on the management plan for Isle Royale National Park. I'd prefer that steps be taken to add more wolves, and thus enhance the ability of the two remaining wolves left at Isle Royale to hopefully be able to reliably reproduce and build a healthy pack. Wolves are an essential piece of keeping balance among animals and plants. This has lasting effects on the health and viability of the ecosystem, allowing it to thrive. Less moose means the plant life will not be decimated, and that smaller creatures will also have food sources.

I support Alternative C, bringing new wolves to the island as needed to maintain their population.

I hope the National Park Service can act quickly to bring new wolves to Isle Royale, helping maintain the ecological balance on the island.

I am one of those people who wants to visit a national park to see and hear wildlife, particularly wolves, in their natural state. I have written letters and made calls and donations to protect wolves since the 1970's. Keeping them in a healthy state in our ecosystem is important to me.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns and for taking the time to protect Isle Royale's fragile environment.

Sincerely,

Anne [REDACTED]

Correspondence: With the specter of wolves becoming extinct in the wild it is paramount that every effort be made to reintroduce wolves in as many locations throughout the United States as possible. It would be an absolute travesty if wolves ceased to exist. They are highly intelligent pack animals that have been identified as the precursors and ancestors of the broad group of breeds we now enjoy as dogs (man's best friend). Please ensure that man's best friends early relatives are not driven to extinction! Thank you

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,
Michael [REDACTED]

Correspondence: When first aware of the commentaries, was adamantly against trapping free wolves to sentence them to the inbreeding syndrome they would endure after the 2nd breeding season due to the lack of ingress and egress. The only true resolution would be to build a bridge connected to the mainland. Always will be for a permanent solution. However, in discussing the scenario w/ the networking affiliation I am involved w/. we have tendered a letter to NPS w/ the following suggestion:

We ask NPS to partner w/ USDA's WLS to instead of gunning down "problem" wolves, dart them w/ sedatives so NPS can transport the wolves to Isle Royale. Besides the win, win, win, effect, it also answers the funding questions NPS has in regards of acquiring wolves. The Isle can house about 50 wolves. WLS kills more wolves than 50 in each of 3 states alone. The only cost is transport to NPS as WLS is already being paid to kill the wolves anyway. They are contracted to remove the wolves, not necessarily kill them. Or, WLS can let you have that contract and you dart and confine simultaneously. Incidentally, there are "nuisance" moose in urban locations that could be handled much the same manner. The idea is to alleviate problems and solve the ecosystem structure on the Isle.

Please contact me, [REDACTED] if I can help recruit and generate assistance w/ this proposal. Thank you for your time in this matter.

Correspondence: Dear Superintendent Green,

I grew up in Michigan and still return every year. There is no place in the world that is more beautiful than the Upper Peninsula of Michigan and no place more special than Isle Royale National Park. I am grateful for the opportunity to share my concerns about the declining wolf population and the future of this beautiful ecosystem that needs our help.

Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

In regards to the proposed management plan, I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Correspondence: It is humans' fault that there are only 2 wolves left out of the 50 known. Global warming / climate change is occurring everywhere and on Isle Royale it is causing the water to stay open instead of freezing. I'm not saying that it froze enough for wolves to travel over every year; but from time to time it would freeze enough that wolves would travel; some one way, some likely even left Isle Royale. This is good for both the mainland as well as the island to have even more genetic diversity.

Now with the wolves declining and no natural way for more to come over; the island will soon experience what Yellowstone underwent. In Wyoming with NO wolves for years; the elk took over eating trees and shrubs down to nubs. This effected the song birds, beavers since no trees to cut down, fish since water was warmer. The elk developed such numbers that they over ate...everything. Given enough time, and this is what I think will happen in the MUCH smaller island. The moose will so overgraze everything that it will not only cause the moose to starve but WILL impact much of the rest of the island also with impact birds, reptiles, fish, beavers and on and on.

Now is the time to take a big picture view of what is behind what is happening and realize that if we all, and I DO, want the habitat to stay balanced AND healthy; new wolves need to be imported.

Simple as that; they will keep the balance needed. Please listen as nature can't take care of this on its own now that we have messed it up.

Correspondence: I support Option C, bringing more wolves into the park. Wolves have a dramatic affect on wilderness areas, I'm sure that you are aware of the transformation that occurred in Yellowstone by bringing them back into that park. Everything was wonderfully changed, even the rivers returned to their original pristine condition. All living things there profited from re-introducing wolves. The same thing would happen in Isle Royale were you to choose Option C. Please give this serious thought and be sure to research the places where wolves have been allowed to repopulate. They are amazing animals and need to be given back to all the wild places across this country. Thank you for your consideration.

Correspondence: I support a commitment to bring additional wolves to Isle Royale National Park, Option C in the list of management options under consideration. I believe this new wolf additions would enhance the vitality of the ecosystem helping to sustain ecological balances in that system. I think the current state of the park with only two wolves remaining could lead to future problems such as an abundance of other wildlife that would then place a great burden on the ecosystem, the vegetation. I value very highly the role of our parks in maintaining biodiversity and natural vitality and welcome every opportunity to support that. Thank you for the opportunity to comment.

Correspondence: I understand there are different options being considered concerning how to deal with the wolf population on Isle Royale. This is a subject of which I have been aware for years, and I have attended educational forums discussing how best to address the issue.

I support option C - bringing new wolves to Isle Royale. Without a healthy wolf population the moose on the island will multiply exponentially, but will also become very unhealthy. I am generally opposed to interfering with animal populations, but in this situation option C appears to be the best available method of dealing with the situation.

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

Lucille

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,
Merrick [REDACTED]

Correspondence: Dear Superintendent Green,

I am delighted to have the opportunity to comment on the Park Service's management plan for Isle Royale National Park. It seems to me that The Creator has made a wonderfully balanced ecosystem, and that where we humans get into trouble is when we let it get out of whack. Islands are clearly in need of great care and consideration from the point of view of ecological management. And if you are going to have moose on the island, you need more predators than two wolves. You need enough wolves to keep the moose population in balance, so that the whole ecosystem can work as it is intended. It is clear that if the moose population continues to increase unchecked, this will be disastrous for native plants and other wildlife- -and, no doubt, ultimately, for the moose themselves.

I support Alternative C. Bringing new new wolves to the island will help keep the moose population in balance and minimize impact on the native

vegetation.

I urge the National Park Service to move forward with management option C as expeditiously as possible.

Sincerely,

Correspondence: Without wolves, the island's moose population will continue to skyrocket, consuming native plants and eventually running out of food, disrupting the natural stability of the island. It is critical to bring in new wolves to protect the national park.

After gathering extensive public input last summer, the National Park Service has narrowed down their list of management options. The agency is now asking for your input on which option will best manage the wolf and moose populations on the island.

Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,
[REDACTED]

Correspondence: When I first visited Isle Royal in the early 70's, my main purpose was to hike the Greenstone Ridge Trail. I knew about the wolves and moose, saw some moose, heard the wolves. The same was true on subsequent visits where I put up the tent less and stayed in the shelters, on the shores of the inland lakes, more.

Isle Royal without wolves is frankly inconceivable. Encountering them is one of those things in life one hopes for, and dreads. It is essential to the Park.

Correspondence: Apex predators and the ecosystems that support them need our protection and maintenance. While many ill-informed people are afraid of wolves, they are a necessary and beautiful component of our native landscapes, from the Eastern US to Alaska and Mexico.

Small populations are often susceptible to diseases or other agents that threaten their continued existence. The addition of genetically different individuals mimics the natural population dynamics of the past, when landscapes were not cut up and cut off from each other by human development.

Therefore, sometimes we humans have to step in, and give Nature a helping hand.

Save the wolves. When I camped out on Isle Royal, the very thought of wolves being there made it a magical adventure. Seeing moose and red foxes, and loons, was wonderful, but my stay would have been immeasurably diminished without the wolf.

I hope that you will reintroduce some wolves to Isle Royale. Without wolves to keep their population in check the moose will become overcrowded and unhealthy. With global warming wolves will not be able to cross over to the island on ice. It would be better to have wolves on the island then to allow human hunters to prey on the moose killing some and wounding others.

Submit Your Comments to Protect Isle Royale's Ecosystem!

(This link will direct you to the Park Service's Planning, Environment & Public Comment website.)

Take Action

Dear [REDACTED]

There were once as many as 50 wolves living at Isle Royale National Park. Now there are only two. For this ecosystem to continue to thrive, we need to bring new wolves to Isle Royale.

We need your help by May 16.

Without wolves, the island's moose population will continue to skyrocket, consuming native plants and eventually running out of food, disrupting the natural stability of the island. It is critical to bring in new wolves to protect the national park.

After gathering extensive public input last summer, the National Park Service has narrowed down their list of management options. The agency is now asking for your input on which option will best manage the wolf and moose populations on the island.

NPCA supports Option C, which requires NPS to bring additional wolves to the park in order to maintain a population of wolves on the island. After many years of consulting scientific experts and reviewing trusted research, we believe this action will best balance the island's delicate environment.

Take Action: Tell Isle Royale National Park Superintendent Phyllis Green and the Park Service to adopt Option C and bring new wolves to Isle Royale. Isle Royale National Park would be a very different place without wolves.

Here's how to submit your comments to the Park Service.

Step 1: Go to <https://parkplanning.nps.gov/commentForm.cfm?documentID=71605> and carefully follow the form instructions.

Step 2: Submit your comments by copying and pasting the sample message below into the "Comments" box on the web form. Remember to personalize your comments by adding observations or stories from your experiences at the park.

Step 3: Once you have completed all of the required fields on the form, click the gray "Submit" button at the bottom of the page.

Sample Message/Comments

Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park.

Please choose Alternative C and bring new wolves to the island. They are needed to help keep the moose population in check. This is necessary to prevent devastation of the native vegetation.

There is a lone wolf that crosses our farm once or twice a year, and such majesty is worth preserving. Since a pack of wolves there at Isle Royale National Park can serve to keep nature in balance, their presence will be doubly valuable.

Please adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,

Correspondence: When My grandfather was alive he and my grandma would go to Isle Royale National Park for two weeks. She would stay at the Lodge and he would backpack around the island. He loved the solitude and being one with nature but he always said that as long as there were wolves, the moose population would stay in check - they balanced each other. When the lake would freeze over, the wolves would come across. If the lake is not able to freeze then the wolves cannot get to the Island (thanks to climate change). Another thing he always said about Isle Royle is that Lake Superior never gives up its' dead - Predators are so important in keeping other animal populations in check. The wolves cannot swim over to the island as the water is to cold. If there are only two wolves left on the island, it is imperative that more are brought over to help keep the moose population in check and keep the wolf population healthy with other DNA.

Correspondence: Dear Sirs,

If there are no wolves on Isle Royale to keep the moose population in balance, the moose will kill the plants and then the moose will die. However, releasing new wolves on Isle Royale would also depend on the condition of the moose population there. Are the moose successfully reproducing viable calves or do the calves have birth defects like the moose calves here in Western United States? Do the moose have tick overload on Isle Royale that is killing them? Do the moose have laminitis and lameness on Isle Royale? The birth defects on moose in Glacier National Park and in Yellowstone National Park are not caused by inbreeding by the way. They are caused by epigenetic changes during fetal development. The main birth defects are underbite, overbite, reproductive malformations on the males, heart defects and thymus underdevelopment/inflammation, as well as some with damaged lungs, contracted tendons and herniated umbilicus.

If the moose population is thriving on Isle Royale and the newborns do not have such birth defects then new wolves should be released on Isle Royale as soon as possible. With warming temperatures, there is not likely to be enough ice for wolves to cross to Isle Royale for many years. Thus, I am in favor of releasing new wolves if the moose population is healthy and growing. Since I live in Montana, I can't track birth defects on moose or other wild ungulates in Eastern United States. Thank you for your consideration of this issue.

Sincerely,
Judy [REDACTED]

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,
Larry [REDACTED]

Correspondence: Dear Superintendent Green,

It has been proven in Yellowstone and other wild places that wolves restore and prop up the entire balance of nature. Other species- -plant and animal- - flourish when wolves are present. I am pleased to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

Wolves also bring tourists to view and photograph them, and this would produce a positive economic benefit to the local community.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my comment.

Sincerely,
David [REDACTED]

Correspondence: I am in favor of a combination of B & D. I would like to see a diverse collection of mating pairs delivered to the island, followed by setting parameters as mentioned in plan D for both moose and vegetative guidelines. The Park Service could then closely monitor the wolf/moose population to understand whether these introduced pairs would suffer the same fate as the previous pack. If they did, then further introductions would be futile until the reason for the reduction is understood fully.
There was a reason that the population dwindled to the remaining two and it would be important to understand why this occurred, given that there is no hunting on the island. Since the wolf has no predator, other than man, the usual reason for a dwindling population is lack of food; famine induced sterility.

Correspondence: It can be sad to even think about happening. It can be the last thing one would ever imagine to see. I know I don't want watch. Nature can be cruel...but humans can be even more cruel. Nature needs balance. The world gets out of whack and everyone suffers-even those humans who just can't understand the need.
Wolves were made to be top predators-to keep populations below them on the food chain under control to keep the food web in balance. Moose will populate too much without wolves and will not only do great harm to their ecosystem but to themselves. Moose will become sickly.
We humans can be at the top of the food chain because of our brains so lets use our brains and bring wolves to Isle Royale National Park to keep the moose healthy and their habitat in check. Thank you for your time.

Submit Your Comments to Protect Isle Royale's Ecosystem!

(This link will direct you to the Park Service's Planning, Environment & Public Comment website.)

Take Action

Dear [REDACTED]

There were once as many as 50 wolves living at Isle Royale National Park. Now there are only two. For this ecosystem to continue to thrive, we need to bring new wolves to Isle Royale.

We need your help by May 16.

Without wolves, the island's moose population will continue to skyrocket, consuming native plants and eventually running out of food, disrupting the natural stability of the island. It is critical to bring in new wolves to protect the national park.

After gathering extensive public input last summer, the National Park Service has narrowed down their list of management options. The agency is now asking for your input on which option will best manage the wolf and moose populations on the island.

NPCA supports Option C, which requires NPS to bring additional wolves to the park in order to maintain a population of wolves on the island. After many years of consulting scientific experts and reviewing trusted research, we believe this action will best balance the island's delicate environment.

Take Action: Tell Isle Royale National Park Superintendent Phyllis Green and the Park Service to adopt Option C and bring new wolves to Isle Royale. Isle Royale National Park would be a very different place without wolves.

Here's how to submit your comments to the Park Service.

Step 1: Go to <https://parkplanning.nps.gov/commentForm.cfm?documentID=71605> and carefully follow the form instructions.

Step 2: Submit your comments by copying and pasting the sample message below into the "Comments" box on the web form. Remember to personalize your comments by adding observations or stories from your experiences at the park.

Step 3: Once you have completed all of the required fields on the form, click the gray "Submit" button at the bottom of the page.

Sample Message/Comments

Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,

Correspondence: Isle Royale National Park's wolf population has dwindled down to two individuals, whereas it has been as high as 50 wolves. The ecosystem needs more wolves to control the moose population; out of control moose will decimate native plants and eventually will starve when they run out of food.

I support Option C, which requires NPS to bring additional wolves to the park in order to maintain a population of wolves on the island; this action - supported by scientific experts and research - is the best alternative offered to balance the island's delicate environment.

Correspondence: Wolves were close to extinction, were brought back and released in the wild. Now people are trying to kill them off faster than they can multiply. I understand it can be a problem with ranchers but I would think a occasional loss would be worth the benefit wolves are to the environment. This is a proven benefit and should be considered when a wolf is killed (murdered).

Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Correspondence: Dear Superintendent Green,

The presence of only two wolves raises doubts about the future of the island's ecosystem. Without wolves, the moose population will continue to increase, eating until the food sources are gone, with terrible effects on plants and animals. This will have disastrous impacts on native plants and other wildlife in the park.

I support introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for your attention.

Sincerely,
Susan ■

Correspondence: Option C requires the National Park Service to bring additional wolves to Park Royale in order to maintain a population of wolves on the island. After many years of consulting scientific experts and reviewing trusted research, this action seems best to balance the island's delicate environment.

Without wolves, the island's moose population will continue to skyrocket, consuming native plants and eventually their running out of food, disrupting the natural stability of the island. It is critical to bring in new wolves to protect the national park.

Thank you for following this option.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island. Any ecological system requires a balance of different species of plants and animals. More wolves are needed to restore that balance at Isle Royale. Ultimately, without the wolves, the moose population itself will be in danger for lack of food, and the native vegetation will likewise have been destroyed. Option C is the best way to restore ecological balance to Isle Royale by bringing back the wolf population.

Thank you for considering my concerns.

Sincerely,

Correspondence: bringing some more wolves be nice unless what happens when save them like in Florida now they butchered most the poor bears they brought back instead of accepting the non-violent solution the residents were happy with they used the bears as an excuse to kill the poor things against as I said the residents preferences so maybe it would be better not help them as Yellowstone park is another one that prefers to kill instead of protecting their animals. They murdered a poor mother bear and dump her cubs in a lousy zoo.They need to hire new people at Yellowstone the currents ones are thoughtless assholes, It was not the mother bears fault some asshole did not follow the rules and got killed he asked for it.if he had not gone off on his own he would be alive today.So who do the jerks they punish 3 innocent animals suffer due to some jerk. I would rather not see anymore animals brought back just to be killed later.

Correspondence: Dear Superintendent Green,

It's great to see that the Park Service narrowing the scope of this plan to focus solely on the future of wolves at the park. The future of the island's ecosystem, as well as the visitor experience, is at risk with only two wolves on the island. Without this large predator, the moose population will continue to increase. We've seen this before at Yellowstone, although there it was the elk which were overgrazing native vegetation. Not only is this bad for preserving native flora, it also negatively impacts other native wildlife. It also undermines the natural experience for visitors.

I strongly support Alternative C: introducing new wolves to the island as needed to maintain their population and curtail the moose herd. This is a sound, scientific approach reflecting the research that has already been conducted by NPS on the predator/prey relationship and it's dynamic, ecological role.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my comments.

Correspondence: I feel that wolves are an important part of the ecosystem and should not have been hunted down to where they could not sustain their population, making it necessary, as it was in Florida regarding the Florida Panther, to import wolves to make the population viable again. Wolves do much more than kill ungulates, they help all parts of the ecosystem remain healthy and viable, without wolves, the environment decays, the rivers get choked with vegetation, the beavers do not build dams, the forests wither and die, and the ungulates die also from lack of vegetation to browse upon. Wolves help the ecosystem by keeping the numbers of prey animals in check so that they do not overbreed and harm the ecosystem and themselves, wolves left alone do not overbreed either-their numbers are regulated by the number of prey animals available-in lean years, the wolves do not reproduce, or have smaller litters, in years where the prey is overabundant the wolves have large litters to control those numbers. The ecosystem manages itself with out man's interference. Please increase the Isle Royale wolves to the point that they are once again a viable population.

Correspondence: I strongly support option C - - bringing in new wolves to stabilize the Isle Royale ecosystem. When the apex predator is missing from the equation the prey population will overpopulate and their food supply will be over-grazed with resulting starvation of the moose and other herbivorous species.

With little to no chance of enough ice forming to provide a pathway for more wolves to reach Isle Royale, option C provides the best chance to restore the balance of the ecosystem and prevent it's destruction.

Correspondence: Isle Royale needs more wolves if it is to continue having Moose. Without wolves, its moose population will continue to increase dramatically, and those additional moose will eat far too many of the island's native plants. Eventually, they'll run out of food and some will starve, while at the same time too many moose will disrupt the natural stability of the island. Thus, it is essential that the National Park Service bring in new wolves to protect the national park.

I understand that you are considering several options, and that it is Option C that I think will, for the reasons I've stated, best manage the wolf and moose populations on the island as well as best balance the island's delicate environment. Isle Royale National Park would be a very different place, less complete and less natural, without its wolves.

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,
Lora [REDACTED]

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. Isle Royale is a remote wilderness island, located in Lake Superior with a population of wolves and moose. It is believed that wolves came to the island from mainland sources, over ice bridges that are becoming less common in a warming climate. Over the years, moose and wolf populations fluctuated but were always entwined and the moose-wolf-vegetation food web was tightly coupled. However with the lack of new wolves migrating to the island, genetic diversity declined. The latest survey shows the wolf population has declined to only 2. These remaining wolves are 6 & 8 years old. This is the lowest level since studies began in 1959. Meanwhile the moose population is increasing at a rate of about 22% (population now estimated to exceed 1300).

With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

Wolves are the only predators of moose on Isle Royale. Bringing new wolves to the island is the fastest way to restore the predator population to a level of health that can exert effective control over an expanding moose population. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population, and increase the genetic diversity. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Correspondence: I think that it is very important to reestablish the wold population at Isle Royale as they are a very important part of the predator/prey balance of the park. Because this is an island habitat with a limited genetic pool in the wolf population it is probably insufficient to merely support the protection of the existing wolves on the island. By introducing new animals into the park from another area it should help the Isle Royale wolf population develop more genetic rigor which should help create a more stable future wolf population.

Correspondence: I am against the inclusion of any predators into the environment unless needed for some emergency management then they should be removed after the emergency has ended, by any means necessary.

The inclusion of wolves into my region has only decimated deer herds, turned them nocturnal, nearly absent during hunting season, unless you walk upon them sleeping.

I don't know who thought of the idea of introducing wolves across America unless you think they will hunt animals that eat our produce, if so, you failed to remember that they will eat our livestock, and the animals we prey on for sustenance...

And for someone to make claim that only 2 are left, how many do you see on your own walking when there are 10 or 100s around, they do not wish to be seen, they stalk us in the background and stay out of our view, for all the person claiming 2 knows is that there are a dozen there now, unless you donated a satellite to watch for weeks on end infrared monitoring and spending million in public funds finding out this exact number...

Did they task a satellite?

Please stop introducing wolves, if issue was put to national or regional vote, I am certain you would be in the minority with your logic...

Offer the public a moose hunt instead, if you are afraid of overgrazing or over population...

No one I know kills wolves to eat for food, and then the anti-fur groups made it so you can't sell their pelts or wear their furs in public.

They forget where we came from and how our ancestors lived...

I encourage a moose hunt with lottery system instead.

You could likely make money this method and keep hunters happy.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

I first went to Isle Royale in 1955 as a Boy Scout. In my 40 year absence from the island, I read much of its history and the ecological balance between wolves and moose. When I returned to the island in 1995 I thrilled at the numerous moose sightings and the night time howls of the wolves. I have worried about the dwindling wolf population in recent years and understand very well the danger this portends for moose overgrazing the vegetation and ruining this National Park gem.

Please implement the introduction of new wolves to the island to enhance the wolf gene pool and maintain an ecological balance on this island paradise.

Thank you for considering my concerns.

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,

Liz [REDACTED]

Correspondence: http://earthsky.org/earth/overgrazing-by-deer-is-changing-the-face-of-u-s-forests?utm_source=EarthSkyNews&utm_campaign=2a1b8f0bbc-EarthSky_News&utm_medium=email&utm_term=0_c643945d79-2a1b8f0bbc-393635897

The attached link briefly mentions how the decreasing number of wolves, among other factors, has led to a huge increase in the number of deer across the country. I believe this is very pertinent, considering the ecological/environmental damage over-populous deer are and will continue to cause. Soon, the same will happen with moose on Isle Royale. You're a scientist, an expert on this, I'm sure you know the results of removing an apex predator from the food chain. Per Wikipedia "The removal of top-level predators, often recently through human agency, can radically cause (or disrupt) trophic cascades. A commonly cited example of apex predators affecting an ecosystem is Yellowstone National Park. After the reintroduction of the gray wolf in 1995, researchers noticed drastic changes occurring in the Greater Yellowstone Ecosystem. Elk, the primary prey of the gray wolf, became less abundant and changed their behavior, freeing riparian zones from constant grazing. The respite allowed willows, aspens, and cottonwoods to grow, creating habitat for beaver, moose, and scores of other species. In addition to the effects on prey species, the gray wolf's presence also affected the park's grizzly bear, a vulnerable species. The bears, emerging from hibernation, chose to scavenge off wolf kills after fasting for months. They can also eat wolf kills in autumn to prepare for hibernation. As grizzly bears give birth during hibernation, a greater food supply may improve the mothers nutrition and increase the number of cubs. Dozens of other species, including eagles, ravens, magpies, coyotes, and black bears, have been documented scavenging from wolf kills. " There appears to be many various benefits to having a robust wolf population versus the absence of wolves. Because there are only two remaining wolves on Isle Royale, for this ecosystem to continue to thrive, it is imperative to bring in new wolves. Without wolves, the islands moose population will continue to skyrocket, consuming native plants and eventually running out of food, disrupting the natural stability of the island. It is critical to bring in new wolves to protect the national park. Thank you very much.

Correspondence: This is in regard to the wolf management plan for Isle Royale National Park. I am glad to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. There are only two wolves left at Isle Royale, which greatly impacts the ecosystem and the visitor experience. The moose population will greatly increase and soon there will be no food left for other wildlife and will have a harmful impact.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. This will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This management option needs to be adopted quickly to maintain ecological balance on the island.

Thank you for your consideration in this important matter.

Correspondence: Thank-you for this opportunity to comment on the plan for Isle Royale National Park. With the focus narrowed to only the future of wolves in the park, I'm concerned that other wildlife populations are likely to get out of control. Moose, for example, would flourish, resulting in more vegetation destruction & possible starvation as food sources are exhausted. For a park like this to remain viable, the entire ecosystem should be considered, rather than being shortsighted by tunnel vision.

Again, thank-you for your overseeing our wonderful park system to balance interests of park visitors as well as wildlife residents.

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,

Michele [REDACTED]

Correspondence: In 1975, when I was young, 29, I arrived with my then husband and son who was 8 yrs old. We had driven from Pennsylvania for our planned backpacking trip of the Isle from one end to the other. We left the boat and walked to the first campground and set up for beginning our trip the next day. We attended the ranger program that evening and planned the hike. As we walked from one end to the other, we saw wolf tracks on the trail, but never saw the wolves. Still we were quite aware that they were there. We saw moose, a few times and thoroughly enjoyed our 5 day hike and 6 day stay. I think of it often and would love to return, this time to stay in the hotel.

What will happen to the Isle without wolves? You MUST import some new wolves!

Correspondence: This is a prime example of what happens when man interferes with nature. Wolves are one of only two predators that is able to bring down a moose. When the wolf population is decimated like it currently is on Isle Royale, too many moose survived and destroy natural vegetation on the Isle. You need to increase the wolf population so that the balance of nature can return to normal.

Correspondence: Wolves are essential to all the ecosystems they patrol, but hugely more important to Isle Royale than most because of its closed nature. In a closed system like this island, wolves are the only thing between disaster for the moose and the endangered plants in the Isle Royale ecosystems.

All the wolves that ever lived on Isle Royale came from outside the park. It is essential for new genetic stock to be imported again. If this is not done the essentials of this beautiful park will collapse.

It is incumbent upon us, the guardians of this resource to take the only actions that will protect it, and this means, balancing out the moose/wolf relationship. Please authorize these preservative measures, today!

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,

[your name here]

Correspondence: Dear Superintendent Green,

I am feeling hopeful that the future of wolves at the park has become a primary focus of the welfare of the park. I am concerned, however, about the future of the island's ecosystem and visitor experience because there are only two wolves left at Isle Royale. The ecosystem is out of balance without more wolves. The moose population will continue to increase, depleting the food sources. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

I urge the National Park Service to adopt and implement this management option as soon as possible to maintain ecological balance on the island.

Thank you.

Correspondence: I would like to express my encouragement in the plan to focus on the reintroduction of wolves to Royale Isle. I would like to encourage option C. The reintroduction will only strengthen the ecosystem of the area as well as the visitor experience. With only 2 wolves left they cannot keep moose population in check nor have any genetic diversity. I implore you to bring wolves back to the area and put a mandatory hunting ban in place.

Correspondence: Without wolves, the island's moose population will continue to skyrocket, consuming native plants and eventually running out of food, disrupting the natural stability of the island. It is critical to bring in new wolves to protect the national park.

Clearly, something needs to be done to safeguard this ecosystem.

With NPCA I support Option C which requires NPS to bring additional wolves to the park in order to maintain a population of wolves on the island. After many years of consulting scientific experts and reviewing trusted research, I believe this action will best balance the island's delicate environment.

I have visited Isle Royale and appreciate the quiet forest. Please preserve this so that others may experience it.

Correspondence: Thank you for the opportunity to comment on the revised range of alternatives for the Isle Royale Wolves EIS. I strongly support alternative C, bringing wolves to the island as often as needed for at least the next 20 years. I believe that the NPS should work to maintain a population of wolves on Isle Royale as a means to maintain a stable, healthy population of moose and to thereby better manage vegetation. I also think Isle Royale represents an important opportunity to allow large predator/prey relationships to flourish, as well as to allow visitors to observe that relationship. And I think it is important to do what we can to improve the survivorship and distribution of wolves, who have been vilified, lost much of their habitat/range, and whose populations have dwindled sharply over the last hundred or so years. The conservation of predators is an important (and too often overlooked) part of conservation, and I believe Isle Royale has an important role to play in that conservation.

Sincerely,

Amy [REDACTED]

Correspondence: Dear Superintendent Green-

It is with great sincerity and hope that I write to you asking for your help in re-establishing the wildlife that must be part of Isle Royales as Nature had intended. And of course, that being reintroducing the wolf population. I truly feel our American natural heritage is on the brink of grave danger as the agencies that were placed in positions to protect and conserve these areas are obviously at the opposite end of the spectrum. It is so wrong and inane to think they are there to do what they want rather than what is right for our wilderness and wildlife.

This is a wonderful opportunity to stand up and allow Nature to care for itself without human destruction or interference. These magnificent animals are a treasure to the ecosystems and play a vital part in the chain/balance of life. They have been under siege and only someone with the intelligence to turn the tide can be the Isle's savior.

Thanking you for your help and kindness. Most sincerely, Mary [REDACTED]

Correspondence: Phyllis Green, Isle Royale National Park Superintendent:

Without wolves, Isle Royale's moose population will continue to skyrocket, consuming native plants and eventually running out of food, disrupting the natural stability of the island. It is critical to bring in new wolves to protect the national park.

As you consider your management options, please know that I support Option C, which requires NPS to bring additional wolves to the park in order to maintain a population of wolves on the island. After many years of consulting scientific experts and reviewing trusted research, I believe this action will best balance the island's delicate environment.

Correspondence: I am planning a first-ever trip to Isle Royale this September. I had always heard of the healthy moose and wolf populations on Isle Royale and was looking forward to the opportunity for hearing a wolf's haunting howl. But now, after reading about the crashing wolf population on the island, I'm dismayed that the wolf/moose population dynamics have been thrown out of balance and my chances of hearing a wolf are slim-to-none. How did this happen?

I urge the park service to consider the introduction of new wolves to Isle Royale. We, the people, can't let wolves disappear from our north woods wilderness areas. Can we?

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

The sooner this happens, the better!

Thank you for considering my concerns.

Sincerely,
Michelle [REDACTED]

Correspondence: Dear Superintendent Green,

I have seen a summary of the management plan for Isle Royale National Park. I believe Alternative C, bringing new wolves to the island as needed to maintain a wolf population, is the best option. Without wolves to keep them in check, moose will destroy the ecological balance on the island, by overeating native vegetation and destroying habitat for other inhabitants.

Thank you for considering my concerns.

Sincerely,

Sharon [REDACTED]

Correspondence: Isle Royale has offered respite for gray wolves, their species having been vanquished and extirpated all around the area of Isle Royale. It is for this reason that healthy wolves need to be reestablished on Isle Royale. There they will be safe from harassment and eradication- -something unheard of east of the Mississippi and scarce in the areas where they've recently repopulated.

Of course this would be a special reintroduction, medical monitoring necessary for maintaining the health of the animals. As happens with us, genetic mutations weaken survival chances. (Duh!) It's just that we can move, select new mates, keep a gene pool healthy. They haven't been able to, of course, and climate change is a major reason. Thus this reintroduction would be another opportunity to demonstrate the effects of climate change.

I also maintain that the NPS reconsider reintroducing wolves into Olympic National Park. It would seem a perfect match for wolves, for NPS PR, and for visitors to the park (never mind problems associated with mountain goats). Wolves may occasionally be known to take calves and sheep. They certainly don't take trees, and the larger numbers of first nation people living nearby would probably be more tolerant than are European settlers (us) who invented the Big Bad Wolf myths.

I'm speaking for wolves. They can howl but not speak for themselves. And so I'll always try to speak for them.

Correspondence: I support Option C, which requires NPS to bring additional wolves to the park in order to maintain a population of wolves on the island.

There were once as many as 50 wolves living at Isle Royale National Park. Now there are only two. For this ecosystem to continue to thrive, we need to bring new wolves to Isle Royale.

Without wolves, the island's moose population will continue to skyrocket, consuming native plants and eventually running out of food, disrupting the natural stability of the island. It is critical to bring in new wolves to protect the national park.

Correspondence: Wolves are some of nature's most intelligent animals and deserve to be protected against human incursions which would ultimately adversely affect their environments. Isle Royale is a perfect place to ensure their survival. With only two wolves remaining on the island their long term survival is dangerously imperiled. and when they are gone...then what? Ensure that healthy, robust band of wolves enjoy the protection and well being the island will provide.

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has

narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Respectfully,

Margaret [REDACTED]

With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I have not traveled on Isle Royale, though I was once given an opportunity to apply for an internship there. I know about the island from my undergraduate studies in ecology. The famed wolf - moose studies made a big impression on me, and just last year I enjoyed reading Nevada Barr's murder mystery set on the island. So, I have somewhat of a connection to the place.

While I understand that even a famed long term study does not guarantee nature remaining unchanged forever, I think it's worthwhile to manage the ecosystem in a way that restores healthy balance.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

On a personal note, my wife and I spent our honeymoon on Isle Royale in 1972 and it will always be one of my most cherished memories. I would venture to say there is nowhere left on the planet that is removed enough from human development that can sustain a natural ecosystem as does the Isle. I hope my daughter and her future children can experience the specialness of this place if they so choose.

Thank you for considering my concerns.

With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

It has already been proven that reintroduction of an apex predator like the wolf, brought the exploding population of elk under control at Yellowstone allowing the aspens to grow properly and thus saved an entire Eco and riparian system from total collapse,(which it appears is happening at Isle Royale).

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the

moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,

Michael [REDACTED]

Correspondence: Please consider adding new wolves to Isle Royale. There is a need to improve the genetic diversity and, with global warming there is little chance of ice bridges forming in the future. These are important predators of their prey the moose which provides for the natural world to remain in balance. I know that we as humans do not like to interfere with nature, but this is a special place that deserves to have a bit of assistance in order to keep the predator-prey balance. Thank you, Sue

Correspondence: I support Option C, which requires NPS to bring additional wolves to the park in order to maintain a population of wolves on the island. After many years of consulting scientific experts and reviewing trusted research, the consensus is that this action will best balance the island's delicate environment.

Therefore, I strongly urge Isle Royale National Park Superintendent Phyllis Green and the Park Service to adopt Option C and bring new wolves to Isle Royale. Isle Royale National Park would be a very different place without wolves.

Correspondence: I understand that wolves migrated over the frozen waters from Canada to Isle Royale when Lake Superior froze over back in the 1960's. When I visited Isle Royale as a backpacker in the 1970's, the wolf pack was approximately 8 wolves. I would not like to see the Park Service bring too many wolves to Isle Royale. You currently have 2 wolves in the Park. I believe bringing in 8 more wolves would suffice.

Correspondence: Dear Superintendent Green:

I appreciate the opportunity to weigh in on the Wolf Management Plan for Isle Royale National Park. I believe that wolves are an integral part of our environment and we should do what we can do manage them, especially in the interest of saving them in their natural habitats.

I have lived in Northern Minnesota my entire life and witnessed our wolf population decline drastically. I remember as a child seeing wolves and moose frequently when visiting state parks and forests. However, in the past twenty years, sightings of these animals are few and far between. It seems, in general, that Minnesota's wolf population is declining state-wide. While wolves were not always part of Isle Royale, they have been a part of Minnesota and do have access to the island in the winter months. Wolves likely have used the island for ages, even just for a food source. I would love to see the wolves continue to be part of our ecosystem.

I recently read a novel (The Wolves of Alaska by Jim Rearden) regarding this exact issue for the state of Alaska. I've learned of the many aspects to be considered when approaching wildlife management. Not only must we consider the predators, but also the prey and their food sources. With fewer wolves, Alaska experienced a rise in Moose and Caribou population, but reduction of too many wolves resulted in an abundance of Moose and Caribou and who struggled to find food. There is a balance to nature and if we are able to assist in that balance I believe we should. Not everyone will be pleased, and not everyone will be open-minded to fact based decisions, but I believe option C is a sound strategy that will support our wolf population in a practical and scientific manner.

I would like to continue to see wolves in Isle Royal and Northern Minnesota. They are an animal that has existed here for centuries, but is now facing a steady decline. If we can assist with the balance of the Wolves, Moose, Deer, and other animals, I think we can ensure the success of these National Parks for years to come.

Thank you for your consideration.

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service is specifically addressing the issue of the future of wolves at the Park. I am a large mammal predator ecologist who has studied predator-prey systems in the U.S. and Mexico. My years of experience have taught me the extreme importance of maintaining viable large predator populations on the landscape. This is especially true in our National Parks where, as the Isle Royale AND Yellowstone examples have demonstrated, the lack of wolves had led to runaway large ungulate populations that threaten ecosystem integrity. The return of wolves to both these parks has brought those populations back into ecological balance. Now, with only two wolves left, Isle Royale is faced with the prospect of returning to those days of uncontrolled moose numbers with serious consequences to both moose and the habitat of the Park. Thus both professionally and personally, I am writing in support of Alternative C, the bringing of new wolves to the Island to maintain the population. New wolves will return the wolves to their ecological capacity to again maintain the ecological balance of the Park.

I encourage the National Park Service to adapt this plan as soon as possible to maintain the ecological integrity of Isle Royale National Park

Thank you for considering my comments.

Sincerely,

Correspondence: I am frustrated OFTEN by the inability for NPS to #1: fight the damned ranchers & other rapists of the land who think their interests/livestock/hunting privileges are what must triumph over everything else!

#2: I had one fabulous trip nearly 10 yrs ago to Natl Parks in the West, in the Fall. I was literally up close- -in the 2nd car to stop- - w/ buffalo crossing a road in NE corner of Yellowstone. Rolled down my windows to hear them snort & softly bellow, watched w/ awe while females & babies went first before the males. The road actually shook & dust was everywhere. I was mesmerised, & have never forgotten that time&place. Then saw antelope in another spot (not sure what kind), & elk were in mating season & all over the road at Crystal Mountain; quite entertaining to watch the pursuits!
To think of YET ONE MORE SPECIE being eradicated is disgraceful!! Especially wolves! They are AMAZING creatures; devoted to family & pack members. Their social skills are highly programmed, & to be admired.
When are we going to learn, and follow, that ALL BEINGS have a purpose?!

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,
Adriene [REDACTED]

Correspondence: Dear Superintendent Green:

I am writing to thank you for the opportunity to comment on the management plan for Isle Royale National Park. It is encouraging to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, the future of the island's ecosystem and the visitor experience are at risk. Without wolves, the moose population will continue to increase and will eventually consume all the park's food sources. This will have disastrous impacts on native plants and other wildlife in the park.

For these reasons, I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

I ask that the National Park Service adopt and implement this management option quickly in order to maintain ecological balance on the island.

Thank you for considering my comments.

Sincerely,
[your name here]

After gathering extensive public input last summer, the National Park Service has narrowed down their list of management options. The agency is now asking for your input on which option will best manage the wolf and moose populations on the island.

NPCA (and I) supports Option C, which requires NPS to bring additional wolves to the park in order to maintain a population of wolves on the island. After many years of consulting scientific experts and reviewing trusted research, we believe this action will best balance the island's delicate environment.

Correspondence: Wolves have the right as any other species, especially humans, to live where they once were and anywhere they decide to go, as we do. They have the right to live out there lives, have families, and not have to worry who is after them to kill them. All ares should have wolves and/or any other animals to keep animal populations at bay. If not, some species can get way over populated and there will have to be killings of wildlife which is completely inhumane. Please think about what you are going to do, weigh the pros and cons, but consider having a place where wildlife can share its beauty like GOD intended.

Thank You

Correspondence:
Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns and I hope that you can take action on this situation quick..

Sincerely,

██████████

Please do not delay in your decision making. Moose are decimating the Island.
The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.
Maybe AZ Game and Fish would consider letting you some of the 100 wolves they keep in captivity because they do not have the academic intelligence to recognize inbreeding in the field. And think of the restocking savings. Just transport. And the wolves would get to live free on Isle Royale. WIN WIN

Correspondence: Dear Superintendent Phyllis Green and Park Service,

As you know, the ratio of wolves to moose is crucial to the balance of the ecosystem of Isle Royale National Park. You need to supply the Park with more wolves to keep the number of moose under control.

I hiked alone in the Park at the end of August, 1993 on a day where the temperature was 90 degrees. I was determined to hike until I saw a moose, and I did. After circa 28 miles when I was running out of water I finally saw three of them. Several miles later I crashed at 3-Mile-Point, where I was visited at night by a moose.

I fully intend to return to Isle Royale one day and camp on the other side in order to hear the wolves. Isle Royale is a magical place, a place which people from different parts of the world love. It would be a great tragedy if it were destroyed by not having enough wolves.

I am a retired opera and concert singer, a soprano.

Best regards,

Lesley [REDACTED]

Correspondence: Without wolves, the island's moose population will continue to skyrocket, consuming native plants and eventually running out of food, disrupting the natural stability of the island. It is critical to bring in new wolves to protect the national park.

NPCA supports Option C, which requires NPS to bring additional wolves to the park in order to maintain a population of wolves on the island. After many years of consulting scientific experts and reviewing trusted research, we believe this action will best balance the island's delicate environment.

I am requesting that Isle Royale National Park Superintendent Phyllis Green and the Park Service adopt Option C and bring new wolves to Isle Royale. Isle Royale National Park would be a very different place without wolves.

Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

Thank you for your consideration,

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Correspondence: Dear Superintendent Green, dear National Parks Service,

As you know, there has to be the proper ration of wolves to moose in order to protect the ecosystem in Isle Royale National Park. I back-packed there alone in late August, 1993, and fully intend to return in order to hear the wolves. It is a magical place, a place I treasure, and a destination which many others visit. It is a magnet. Therefore, why not bring in more wolves to save the park from destruction!

I am a retired opera and concert singer, a soprano.

Best regards,

Lesley [REDACTED]

Submit Your Comments to Protect Isle Royale's Ecosystem!

(This link will direct you to the Park Service's Planning, Environment & Public Comment website.)

Take Action

Dear [REDACTED]

There were once as many as 50 wolves living at Isle Royale National Park. Now there are only two. For this ecosystem to continue to thrive, we need to bring new wolves to Isle Royale.

We need your help by May 16.

Without wolves, the island's moose population will continue to skyrocket, consuming native plants and eventually running out of food, disrupting the natural stability of the island. It is critical to bring in new wolves to protect the national park.

After gathering extensive public input last summer, the National Park Service has narrowed down their list of management options. The agency is now asking for your input on which option will best manage the wolf and moose populations on the island.

NPCA supports Option C, which requires NPS to bring additional wolves to the park in order to maintain a population of wolves on the island. After many years of consulting scientific experts and reviewing trusted research, we believe this action will best balance the island's delicate environment.

Take Action: Tell Isle Royale National Park Superintendent Phyllis Green and the Park Service to adopt Option C and bring new wolves to Isle Royale. Isle Royale National Park would be a very different place without wolves.

Here's how to submit your comments to the Park Service.

Step 1: Go to <https://parkplanning.nps.gov/commentForm.cfm?documentID=71605> and carefully follow the form instructions.

Step 2: Submit your comments by copying and pasting the sample message below into the "Comments" box on the web form. Remember to personalize your comments by adding observations or stories from your experiences at the park.

Step 3: Once you have completed all of the required fields on the form, click the gray "Submit" button at the bottom of the page.

Sample Message/Comments

Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Correspondence: Dear Superintendent Green,

I appreciate this opportunity to comment on the management plan for Isle Royale National Park. I like the fact that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem. More wolves are needed to naturally control the moose population in the park. An overpopulation of moose will negatively impact native plants and other wildlife in the park if left uncontrolled.

I support Alternative C, bringing new wolves to the island as needed to maintain their population.

I hope the National Park Service will adopt and put this option into effect quickly.

Thank you for your consideration.

Correspondence: Despite the constant drumbeat of folks who think that the only good wolves are dead wolves, the reality - - the scientifically measured and proven reality - - is that wolves are a vital component of healthy ecosystems like the one in Isle Royale. There is no natural alternative - - and as advocates have argued, this is actually not simply a more balanced plan, but a more humane one long term for countless other elements of the natural world on Isle Royale.

I urge, with so many others who are doing the same, the NPS to make the right call here.

Many thanks for considering my comments.

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Years ago I read a story about researchers on the island thought it was funny to go out and howl at the wolves at night. At first the wolves howled back, then they went silent. I was concerned that would not end well. Apparently this is not ending well whether the howling or lack of howling had anything to do with it no one will ever know. But researchers need to have more respect for the creatures they are "researching" and I hope this will be promoted. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation. The island seems a perfect place for wolves to live without undue interference from humans. It would be a shame to not utilize it for such. When wolves were first introduced to the island, it was feared they would wipe out the moose population. Apparently that has not happened.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Correspondence: Dear Superintendent Green,

Many years ago my wife and I backpacked Isle Royale National Park, an experience whose memories we have treasured ever since. Among those memories was the ecological interaction between the resident wolf and moose populations there. We did not actually see the wolves, but evidence of their

presence (scats, gnawed moose bones, etc.) was unmistakable. We were thus deeply saddened to learn of the decline of the wolf pack, presumably as a result of the genetic effects of unavoidable inbreeding.

I thus welcome the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged that the Park Service has wisely narrowed the scope of that plan to focus solely on the future of wolves at the park. Clearly, in the absence of wolves the moose population will continue to increase, devouring their food sources until none are left. The impact of that on the native plants and other wildlife in the park will be disastrous.

I therefore support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding, will replenish the gene pool, and will minimize impacts to the native vegetation. I strongly oppose the alternative option of allowing human culling of the moose population by hunters, as I believe such human interference would conflict with basic park values and would endanger the lives of other park visitors.

I urge that the National Park Service adopt and implement Alternative C quickly in order to maintain ecological balance on the island.

Thank you very much for considering my views.

Sincerely, [REDACTED]

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,

Carolyn [REDACTED]

Correspondence: My wife and I camped for a week in Isle Royal (all parts of the Park) in 2008, and we were enchanted by the wild life, including flora and fauna. Our visit coincided with the 50th anniversary of the research on the re-introduction of the wolf. We saw plenty of moose on regular basis, but only wolf prints and scat. We believe that maintaining the balance between predator and prey is important, for I.R. especially keeping diversity in the gene pool of wolves. I was [REDACTED] NPCA for [REDACTED] years, although our visit to I. R., was not in an official capacity. I remain an active member of NPCA, and a strong believer in NPS.

Correspondence: Without wolves, the island's moose population will continue to skyrocket, consuming native plants and eventually running out of food, disrupting the natural stability of the island. It is critical to bring in new wolves to protect the national park. Once there were as many as 50 wolves and now there are only two left. The wolves are necessary to control the proliferation of moose and other animals that would threaten the available natural vegetation, and the over-all balance of the island ecosystem.

I agree with the National Park Conservation Association, which supports Option C, which requires NPS to bring additional wolves to the park in order to maintain a population of wolves on the island. After many years of consulting scientific experts and reviewing trusted research, we believe this action will best balance the island's delicate environment.

Submit Your Comments to Protect Isle Royale's Ecosystem!

(This link will direct you to the Park Service's Planning, Environment & Public Comment website.)

Take Action

Dear [REDACTED]

There were once as many as 50 wolves living at Isle Royale National Park. Now there are only two. For this ecosystem to continue to thrive, we need to bring new wolves to Isle Royale.

We need your help by May 16.

Without wolves, the island's moose population will continue to skyrocket, consuming native plants and eventually running out of food, disrupting the natural stability of the island. It is critical to bring in new wolves to protect the national park.

After gathering extensive public input last summer, the National Park Service has narrowed down their list of management options. The agency is now

asking for your input on which option will best manage the wolf and moose populations on the island.

NPCA supports Option C, which requires NPS to bring additional wolves to the park in order to maintain a population of wolves on the island. After many years of consulting scientific experts and reviewing trusted research, we believe this action will best balance the island's delicate environment.

Take Action: Tell Isle Royale National Park Superintendent Phyllis Green and the Park Service to adopt Option C and bring new wolves to Isle Royale. Isle Royale National Park would be a very different place without wolves.

Here's how to submit your comments to the Park Service.

Step 1: Go to <https://parkplanning.nps.gov/commentForm.cfm?documentID=71605> and carefully follow the form instructions.

Step 2: Submit your comments by copying and pasting the sample message below into the "Comments" box on the web form. Remember to personalize your comments by adding observations or stories from your experiences at the park.

Step 3: Once you have completed all of the required fields on the form, click the gray "Submit" button at the bottom of the page.

Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island. It would be sad for the population to go to zero living on the Park

I live in the area where red wolves live. They have been struggling and they have been protected for a number of years. There are about 50 still living in the area. At one time they lived along a large area of the East Coast. It is important that these animals don't become extinct.

Thank you for considering my concerns.

Sincerely,
[your name here]

Correspondence: Without wolves, the island's moose population will continue to skyrocket, consuming native plants and eventually running out of food, disrupting the natural stability of the island. It is critical to bring in new wolves to protect the national park.

I support Option C, which requires NPS to bring additional wolves to the park in order to maintain a population of wolves on the island. After many years of consulting scientific experts and reviewing trusted research, we believe this action will best balance the island's delicate environment.

Correspondence: Wolves need to be protected. They keep to themselves. They are good for environment and part of heritage and don't kill people or farm animals if allowed to form pack. When people start killing parts of pack and have a single male then they may have to kill to survive. After all wolves have been here for centuries we are the ones that domesticated them to dogs and then now we want to kill them all because hunters don't want them to kill deer and caribou. We need to study them not kill them. We can learn to live together.

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. Having read David Mech and Rolf Peterson books on the wolves and moose there, I feel attached to the interplay between these two species...that is I'd hate to see it become only moose, or I suppose, only wolves. I'm sorry there's no real information about why this imbalance has occurred, but I feel in any case the balance should be restored. Whether it will remain restored or not it will be interesting to see.

So, I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

Thank you for considering my concerns.

Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

To effectively judge the impact of the wolf population, you should read the 44 year long study, ISLE ROYALE WOLF STUDY. This classic study carefully documents the position of wolves in the ecological system. The study was carried out by the Canadians and is in book form available on

amazon.com.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am very encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. As you are well aware, wolves are a top tier predator and they play an extremely important role in the balance of an ecosystem. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the genetic issues to the wolf population with such a small number. We know from experience that without wolves, the moose population will increase to an unhealthy level, eating until the food sources are gone and starvation/malnutrition set in. This will have disastrous impacts on native plants and other wildlife in the park as well as with visitor experience.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation. In addition, the wolves will continue to represent to all visitors what a healthy ecosystem should look like and preserve our natural heritage without human manipulation of culling or other means to control prey species numbers.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island and ensure a positive role model for the park visitors.

Thank you for considering my concerns.

Sincerely,

In regard to the Isle Royale situation, with the current number of wolves down to 2:

The best management option is option C, adding more wolves. This would bring about a natural means of controlling the overpopulation of moose, rather than letting moose increase to the point where they destroy the habitat and subsequently suffer and starve.

Please choose option C. Thank you

Correspondence: I believe the people who spend the time and do the studies are in fact the one whom should make the decisions. Having studied wildlife management at Northland College in WI and visited Isle Royale on two occasion for studies I know this is a tiny ecosystem which requires constant monitoring. 40 years ago when I last visited moose were certainly not an issue not even sure they existed but wolves did. I have seen what moose can do in northern Maine and their reach is incredible. If it is believed that more wolves will help maintain a healthy moose herd then bring them in. Certainly follow up surveys should be made for at least 3yrs following an increase and I am sure the park service could find volunteers from Northland College that would jumb on the opportunity.

I have never visited Isle Royale but want to, and I don't live far from it. I would love to know that there are wolves there and that they are healthy and useful, balancing the moose population. Only two wolves sounds very lonely, and no doubt inbreeding would happen, weakening them further. Please put more wolves on the island.

Thank you for considering my concerns.

Sincerely,

Correspondence: While I understand the sense of urgency as the wolf population dwindles on the island, I also want to reflect on the fact that the first wolves came to the island entirely on their own, compelled by the sometimes mysterious, to us at least, sense that wolves have about where the food is.

I think beyond pointing wolves in the right direction and hoping there will be adequate ice coverage to support their winter forays off the mainland, there is probably little left to do about the situation, unless we want to get caught in a cycle of artificially building and maintaining what we consider to be a balanced ecosystem.

Our ideas about how to intervene in the Great Lakes systems to keep them healthy have been notoriously misbegotten in spite of being full of good intention. There are always surprises when things are left to their own devices.

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,

Steven [REDACTED]

Wolves are being persecuted in most areas of the lower 48. The usual reason given is fear that they will kill wildlife. This cannot happen on an Island National Park. For this reason, I favor restocking wolves on Isle Royale, as sort of a biological genetic bank.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment. I strongly support restoring a functional wolf population to Isle Royale. There is no doubt that the two remaining wolves will not be able to repopulate the park. Further, they really are not able to meaningfully contribute to the ecosystem. A healthy, intact wolf pack is the only way to keep moose numbers at sustainable levels (unless there are plans to allow hunting in the park, which I and others would vehemently oppose). I took my daughter to Isle Royale last summer, as it is her goal to visit every national park before going to college. She was anxious to hear a wolf howl. I, for awhile, let her think that the sounds of the loons echoing off the hills were wolves. Sadly, I revealed the truth, and she added to her list yet another problem in our national parks that she is determined to rectify. Please, choose option C and fix this problem now - there are plenty of others that she can work on when she receives her degree. Thank you.

Sincerely,

Joe [REDACTED]

Correspondence: I am writing to respectfully ask that you consider Option C which will require the National Park Service to bring additional wolves to Isle Royale in order to maintain a population of wolves on the island. These wolves will serve a pivotal role in ensuring that the ecosystem is healthy and balanced. Option C is the best option because without wolves, there would be no natural predators to manage the moose population on the island. The moose population can be naturally controlled with the presence of wolves. It is imperative to manage the moose population because their consumption of native plants will eventually eliminate what growth is left. When food supplies run out, the natural stability of the island is at stake.

Option C has been explored by scientific experts. The results of their studies have shown that Option C will best offer options to balance the island's fragile environment.

I thank you for taking the time to read my comments.

Correspondence: I am in favor of option C. Active wolf management over time on Isle Royale, introducing new wolves as need be to keep the population robust. Since human enhanced climate change is partially responsible for the failure to freeze over of Lake Superior, it seems a responsible thing to do. Also, allowing the moose population to swell without wolf predation will lessen the health and vitality of the moose herd, and may imperil the rich, diverse wetland flora on the island. Also, part of the allure and mystique of Isle Royale is entwined with the presence of wolves there.

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,

[your name here]

Thank you for taking the time to help protect Isle Royale's fragile environment.

Sincerely,

Paul [REDACTED]

Correspondence: Superintendent Green,

I appreciate the opportunity to comment on the management plan for Isle Royale National Park, which I hope to visit some day. I hope you will implement Alternative C, which will involve introducing new wolves onto the island.

It's not just about the wolves - it's about the amazing Isle Royale environment, of which wolves are a major part. In order to maintain a wolf population, and for the health of the ecosystem this appears to be the best course of action.

Thank you,
Lynne [REDACTED]

Correspondence: Dear Superintendent Green,
during this years Detroit Free Press Film festival, I heard with alarm that the wolfs on Isle Royal are fading away as a result of a limited gene pool giving way to an ever growing moose population. Even though I am all for keeping nature to it's own devices, it appears that global warming and the associated lesser Ice cover has forced excessive inbreeding in the pack.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,

Bradley [REDACTED]

Correspondence: I have been to almost every NP in the country as well as many of the national seashores and wilderness areas. I love them all for many different reasons. It is for this reason that I weep for the future of Isle Royal NP in Michigan. With the wolf pack down to just two, the elk/deer population will have no natural enemies and will continue in their devastation of the Flora/vegetation thus destroying further, the balance of the natural chain. I believe that this destruction could be halted by the introduction of new wolves to the island and, as happened in Yellowstone, I think scientific studies there proved that the ecological structure was dramatically improved after their intro there several years ago. I trust that you will consider the positive impact of a growing wolf pack and not be swayed by the politics of a few people that object to the natural processes of life.

Correspondence: Dear Superintendent Green,

In 1982, as a young adult, I had the wonderful opportunity to backpack with friends on Isle Royale. Seeing moose in the woods and hearing wolves at night were thrills that I will never forget. I was also inspired to read and keep informed of the unique ecosystem balance that has existed on the island for many years. Therefore I was quite concerned to learn of the demise of the wolf population there.

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Correspondence: This is a very difficult problem (Dietz 2016). Over the last century, the Park Service has often adopted the admirable view of being stewards of ecological, evolutionary and biogeophysical processes that are unfolding "naturally." But in many ways anthropogenic climate change means, as McKibben has put it, the "end of nature" (McKibben 1989). So ethical choices are difficult. I would argue in favor of options B or C. I note that B is in some sense embedded within C in that once a wolf-reintroduction begins, it can be continued or discontinued based on sound adaptive risk management. I would argue against option D in that, with the wolf population already at two, and with no clear indication yet of the indicators and thresholds that would be used for management under this option, it could be sometime before wolves were reintroduced. By that time the system could have undergone irreversible change. With regard to Option A and indeed the use of the phrase "natural processes" in option D, I note that in all probability the reasons the wolf population has dropped to such low levels is the lack of formation of an ice bridge which in turn can plausibly attributed to climate change. Since current climate change is almost entirely anthropogenic, the term "natural" seems inappropriate. As with all policy decisions, once the best science has been deployed there are still value judgements or ethical considerations that ultimately guide the decision. In my view, the most appropriate action as the Park Service struggles with its stewardship in the age of global environmental change is, in this case, to follow options B or C and reintroduce wolves in a timely way to reduce the risk of irreversible changes to the ecosystem over at least the moderate term.

Correspondence: Dear Superintendent Green:

Please accept Alternative C, which will bring the definitely needed additional wolves to the island. With only two wolves left, an increased population to a very sustainable level is needed as soon as possible.

The moose population is already way too high. Without additional wolves there will be too many moose. Hunting to reduce the number of moose is most certainly not the answer. A sustainable wolf population will naturally bring the number of moose to a normal sustainable level.

The National Park Service should adopt and implement this management option as quickly as possible so that the ecological balance on the island is regained.

Thank you for the opportunity to comment on this very important matter.

Correspondence: Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Correspondence: Wolves are a vital part of the ecosystem. Without their presence, coyotes as well as prey species like moose and deer proliferate, increasing to unsustainable levels. Since wolves were originally present on Isle Royal, I urge you to support their re-introduction now that their numbers have severely diminished.

There were once as many as 50 wolves living at Isle Royale National Park. Now there are only two. For this ecosystem to continue to thrive, we need to bring new wolves to Isle Royale.

Without wolves, the island's moose population will continue to skyrocket, consuming native plants and eventually running out of food, disrupting the natural stability of the island. It is critical to bring in new wolves to protect the national park.

Correspondence: Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I had the pleasure of visiting Isle Royale in 2011 and thoroughly enjoyed backpacking in such a unique ecosystem. Although I did not spot any wolves during my visit their presence was obvious. The decline of the Isle Royale wolf population began with the introduction of a canine parvovirus and has been compounded by climate change; because humans are responsible for the decline I believe it is paramount that we take action to restore balance to the Isle Royale ecosystem.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Correspondence: Dear Gentlemen:

When one hears of two wolves living on an island, it seems like a small amount. Knowing also that there is a thriving moose populations there, it seems that bringing more wolves in to balance population is not harmful to the animals, but brings on natural selection. It is not easy to say this, but sometimes the weakest who may become ill could be diminished. This would help the forest and environment without bringing in other man made means. I applaud bringing in sets of wolves.

Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I strongly support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation. It would also be just, as the lack of winter lake ice, most likely caused by climate change, is what is preventing the natural immigration of new wolves to the island.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

We are a leading nation, and must challenge ourselves to put forth a greater effort and to push ourselves to meet our goals while taking care to not destroying the things that cannot be replaced. There are ways to have both; the things that we need and still allow us to protect the worlds systems that support us.

Bring back the wolves of Isle Royale. Put things back in their place and let stand the natural order.

I urge you to not let this government undermine our irreplaceable world wealth for short term profits and industrial convenience. A whale population of fewer than 280 individuals is all that stands between a unique species and the eternal nonexistence of extinction and. DON'T let this loss be our legacy, one we have to explain to our children, as they ask why we did nothing.

Regards,

Correspondence: Please bring new wolves to Isle Royale.

Without wolves, the island's moose population will continue to skyrocket, consuming native plants and eventually running out of food, disrupting the natural stability of the island. It is critical to bring in new wolves to protect the national park.

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,

Jin [REDACTED]

Correspondence: I am submitting a comment regarding the management plan for Isle Royale National park.

There were once as many as 50 wolves living at Isle Royale National Park; now there are only two. For this ecosystem to continue to thrive, we need to bring new wolves to Isle Royale. Without wolves, the island's moose population will continue to skyrocket, consuming native plants and eventually running out of food, disrupting the natural stability of the island. It is critical to bring in new wolves to protect the national park.

I support Option C, which requires NPS to bring additional wolves to the park in order to maintain a population of wolves on the island. It seems this option will best maintain the ecological balance of the island.

Thank you.

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the wildlife management plan for the park. I am concerned about the impact to Isle Royale's ecosystem without a sufficient number of wolves on the island. I support alternative C, which will bring new wolves to the park as needed to maintain a predator-prey balance. With only two wolves left on the island, an expeditious implementation of the plan may be warranted.

Again, thank you,
-Todd [REDACTED]

Correspondence: I have visited Isle Royale a number of times when my parents volunteered during the summer over number of years. I always wanted to see a wolf but only heard them from a distance. With climate change there is little chance for ice bridges to form to allow crossings from the mainland. For the sake of the islands ecosystem to flourish there must be predators to keep the moose population in check or the island's trees and shrubs will be eaten down to nothing. Also, one of the great tourist attractions on Isle Royale has been the wolf. Usually I don't think we humans should interfere with nature, but this is different. Please introduce several pairs of wolves, enough to have gene diversity, onto Isle Royale as soon as possible.

Wolves are very important to a balanced environment and are very shy of humans. Please reintroduce wolves now.

Correspondence:

Dear Superintendent Green,

Isle Royale is a very unique place that is being impacted by climate change. Because of the change, the population of wolves on the island is threaten. Humans are the main reason that the island's environment is on a precipice. We can save the ecosystem on Isle Royal through Alternative C. Every winter I follow the wolves lives by watching the online project blog, and I would love to do so for many years to come.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Correspondence: The wolves have been a vital and integral part of the Isle Royale ecosystem, allowing the vegetation communities to flourish under a tolerable and manageable population of moose. The long geological history of the island very likely includes the presence of predators, replenished whenever ice bridges were durable enough to facilitate migration, long before the colonization of recent history in 1949. However, due to anthropogenic climate influence toward less winter ice in the Great Lakes and fewer wolves in the surround parts of US and Canada, such migration is unlikely to occur again naturally in the Anthropocene. The predator-prey relationship on Isle Royale has become an iconic textbook example of such relationships taught in high-school biology. If wolves are allowed to die, an outstanding northern mixed-hardwood forest will suffer excessive, unsustainable grazing pressure, and become more akin to the over-grazed, predator-free lands that characterize much the urbanized, fragmented eastern US. I urge the Park Service to transplant a new founder group of wolves from the nearest convenient population.

Correspondence: Isle Royale National Park Superintendent Phyllis Green and the Park Service please adopt Option C and bring new wolves to Isle Royale. Isle Royale National Park would be a very different place without wolves. Without wolves, the island's moose population will continue to skyrocket, consuming native plants and eventually running out of food, disrupting the natural stability of the island. It is critical to bring in new wolves to protect the national park. Thanks for your consideration.

Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation. This is a natural way to solve the problem without a lot of dangerous chemicals or invasive species. If the transplanted wolf population is kept relatively small it should balance the moose problem without become a problem in turn. It is certainly less costly in terms of consequences of traps, chemicals, or dangerous hunting practices.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I grew up on the north shore of Lake Superior and have always been intrigued by Isle Royale. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm very concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park. I have seen the sad effects of overgrazing by deer and elk in Colorado where I now live. predators are absolutely necessary for a healthy ecosystem.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,

I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,

Sharrel [REDACTED]

Isle Royale wolves

Submit Your Comments to Protect Isle Royale's Ecosystem!

(This link will direct you to the Park Service's Planning, Environment & Public Comment website.)

Take Action

Dear [REDACTED]

There were once as many as 50 wolves living at Isle Royale National Park. Now there are only two. For this ecosystem to continue to thrive, we need to bring new wolves to Isle Royale.

We need your help by May 16.

Without wolves, the island's moose population will continue to skyrocket, consuming native plants and eventually running out of food, disrupting the natural stability of the island. It is critical to bring in new wolves to protect the national park.

After gathering extensive public input last summer, the National Park Service has narrowed down their list of management options. The agency is now asking for your input on which option will best manage the wolf and moose populations on the island.

NPCA supports Option C, which requires NPS to bring additional wolves to the park in order to maintain a population of wolves on the island. After many years of consulting scientific experts and reviewing trusted research, we believe this action will best balance the island's delicate environment.

Take Action: Tell Isle Royale National Park Superintendent Phyllis Green and the Park Service to adopt Option C and bring new wolves to Isle Royale. Isle Royale National Park would be a very different place without wolves.

Here's how to submit your comments to the Park Service.

Step 1: Go to <https://parkplanning.nps.gov/commentForm.cfm?documentID=71605> and carefully follow the form instructions.

Step 2: Submit your comments by copying and pasting the sample message below into the "Comments" box on the web form. Remember to personalize your comments by adding observations or stories from your experiences at the park.

Step 3: Once you have completed all of the required fields on the form, click the gray "Submit" button at the bottom of the page.

Sample Message/Comments

Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely, Richard and Nancy [REDACTED]

Correspondence: Please introduce more wolves to Isle Royale. The wolf population has been reduced to only two, which is not a sustainable population. Formerly, there were as many as 50 wolves on Isle Royale. Wolves are an important contributor to a healthy eco-system. Their lack is crucial! Please allow the re-introduction of more wolves as quickly as possible!

Correspondence: I support bringing additional wolves to check the over population of moose on the island. The remaining 2 lone wolves is not enough to keep the moose population in check. My husband, son and I visited Isle Royale and truly enjoyed our fantastic experience. We saw quite a few moose, but no wolves. We didn't hear any either. Without the moose population in check, the island vegetation will be in peril as well as the moose population due to lack of food. Please add more wolves to the island. I'm so grateful you are thinking about Isle Royale. It's one of the lesser National Parks and not visited by nearly the amount of people like the larger parks. Nevertheless it is one of the best unspoiled jewels of the Park system. I want to see it thrive and remain viable to its wildlife. The trip out to Isle Royale by ferry from Copper Harbor was wonderful as Lake Superior was calm that day. We hiked and saw moose, fox, and birds along with breath taking scenery. We rented a motor boat and explored the other nearby islands and lighthouse. We took the boat tour, canoed, and enjoyed the rustic cabin we stayed in. It was an unforgettable experience. I want to return again this summer, especially on the National Parks 100th anniversary. Please do all that you can to help Isle Royale stay healthy. Thank you.

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,
Pat [REDACTED]

Correspondence: There were once as many as 50 wolves living at Isle Royale National Park. Now there are only two. For this ecosystem to continue to thrive, there is a need to bring new wolves to Isle Royale.

Without wolves, the island's moose population will continue to skyrocket, consuming native plants and eventually running out of food, disrupting the natural stability of the island. It is critical to bring in new wolves to protect the national park.

I support Option C, which requires NPS to bring additional wolves to the park in order to maintain a population of wolves on the island. I believe this action will best balance the island's delicate environment.

Bring new wolves to Isle Royale. Isle Royale National Park would be a very different place without wolves.

Correspondence: Dear NPS and Superintendent Green,

As an American who loves our national parks and our nation's wildlife, I thank you for allowing me the opportunity to comment on the management plan for Isle Royale National Park. I applaud the Park Service for having narrowed the scope of the plan to focus on the future of wolves at the park. Having learned that there are just two wolves left at Isle Royale, I am very concerned about the future of the island's ecosystem and its visitor experience. Without wolves, the moose population likely will continue to increase, eating until the food sources have been depleted. This would have disastrous impacts on native plants and other wildlife in the park. Also, without a substantial population of wolves on Isle Royale, visitors will miss out on the opportunity to view and hear these rare and majestic animals.

I strongly support Alternative C, which would bring new wolves to the island as needed to maintain a healthy population. Introducing new wolves to the island would not only help keep the moose population from rapidly expanding and impacting native vegetation, it would add to the visitor experience and help attract more tourists to the park and region.

I hope that the National Park Service will adopt and implement this management option quickly to maintain ecological balance on the island and improve the park.

Thank you for considering my comments.

Sincerely,

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. With only two wolves left at Isle Royale, I believe the future of the island's ecosystem is at risk. Without wolves, balance in the local ecosystem will become unstable and fall apart. By introducing new wolves we could prevent disastrous impacts on native plants and other wildlife in the park.

Sincerely,

Michael [REDACTED]

Correspondence: I strongly support and urge you to adopt Option C. Without adding new wolves to Isle Royale and Isle Royale National Park, the moose population on the island will quickly overwhelm the ecosystem by devouring native vegetation and affecting other wildlife. More wolves are needed (to sustain their numbers) and to keep the moose population in check, thus saving the flora and enhancing visitor experience. Please adopt this management option quickly to maintain the ecological balance of this island. Thank you for taking my comments into consideration.

Correspondence: Dear Superintendent Green,

I am encouraged to see the Park service focussing on the future of wolves at Isle Royale. The park needs wolves to keep the moose population in check and

keep the ecosystem in balance. If the wolves die out, the moose population will grow beyond capacity, ravaging the native plant species on the island and harming other species of wildlife in the park.

I strongly support Alternative C, introducing new wolves to the island to keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,

Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I share the concern about the future of the island's ecosystem, and for the continued survival of the wolf population. An important part of the experience of wilderness at Isle Royale is

being able to still here the howl of a wolf in the distance.

Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation. A well maintained wolf population in balance with a well maintained moose population is a very important element of land management at the Park.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island, and to not loose the wolf which is so important to the character of the Park.

Thank you for considering my concerns.

Sincerely,
Bernard [REDACTED]

Correspondence: Dear Superintendent Green,

I appreciate the opportunity to comment on the management plan for Isle Royale National Park. I have read the Public Scoping Newsletter carefully. I am deeply concerned that there are now only two wolves left in the park: I am aware how important a healthy population of top predators is to the ecosystem. I have seen how the reintroduction of wolves to Yellowstone National Park has re-established a more balanced ecosystem there. We are on the brink of losing our last chance of re-establishing the fortunate balance of the ecosystem in Isle Royale. Doing nothing, allowing the moose population to boom, would be disastrous for native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population for at least the next twenty years. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation. Alternative C's emphasis on using the best available science and professional judgment to determine the wolf population range and number of breeding pairs to be maintained is eminently wise

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Although I am a Texan, my father was born in Superior, Wisconsin; and my mother's Cajun family largely came from the other side of Lake Superior in Canada. I love this part of the world. Isle Royale is a jewel in the crown of the National Park Service. Please opt for Alternative C so that it can remain so.

With thanks in advance for your kind attention to my concerns,

Yours sincerely,

Helen [REDACTED]

Correspondence: Dear Superintendent Green,

Thank you for the oppportunity to comment on the pending management plan for Isle Royale National Park and I appreciate the narrowing of the scope of this plan to focus solely on the future of wolves at the park.

It is quite clear to me as a forestry professional that, with only two wolves left at Isle Royale,there should be a great deal of concern as to the future of the island's ecosystem and the visitor experience. Wolves are a critical predator with the Isle Royale ecosystem and without them, the moose population will continue to increase, ravaging the landscape until the food sources are gone and with that the flora / fauna balance critical to an fragile ecosystem.

As a result of my concerns, I am in support of Alternative C, which would bring new wolves to the island as needed to maintain the population. Introducing new wolves to the island will restore predator / prey balance and help keep the moose population from rapidly expanding, thus minimizing impacts on native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Correspondence: I am writing this email to encourage the Park Service to reinstate healthy and diverse wolves to the Isle Royale National Park asap. Presently there is no balance to nature on the island with only the two remaining inbred wolves and multiplying moose population. To continue this present situation would mean that the island would be devastated by an overpopulation of moose. Wolves only prey on the weak and elderly moose as a healthy moose is too strong for wolves. Wolves are nature's way of maintaining balance therefore I vote (C) to reinstate wolves to Isle Royale.

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,

Russ [REDACTED]

Correspondence: NPCA supports Option C, which requires NPS to bring additional wolves to the park in order to maintain a population of wolves on the island. After many years of consulting scientific experts and reviewing trusted research, we believe this action will best balance the island's delicate environment.

I also support Option C. Please implement this plan.

Sincerely,

Tammy [REDACTED]

Correspondence: Dear Park Service,

I have read about the situation at Isle Royale NP. I am glad you are considering the future of the park ecosystems. Thank you for the chance to comment on the options. I favor option C, returning a healthy wolf population to the park. It has been shown over and over that a system without predators is a system out of balance and that it will self destruct. I live in Bucks county PA where our deer population is out of control and it has devastated our forests. We have no understory and no regeneration. We probably can't bring back large predators in our area but you have the chance to keep your system whole and in balance. Please take that chance and bring in the wolves necessary to keep the system in balance. Thank you. Diane [REDACTED]

Correspondence: Wolves do something few humans do anymore. They mate for life, co-raise their offspring, and avoid conflict. Unfortunately, they have been pushed out of most of their natural territory, hunted unmercifully, and maligned for doing what they do naturally: take care of their families. It's time to show some respect for these amazing animals and give them some breathing room.

I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,
Penelope [REDACTED]

Correspondence: Please restore a healthy wolf population to Isle Royale. All healthy ecosystems, whether land, sea, or air, need top predators to ensure balance. The return of wolves to Yellowstone was proof of that. Not only did the health of the elk herds improve, but plants returned to stream and river beds, which improved water quality which in turn improved the health of fish and other water life.

Correspondence: I loved our visit to Isle Royale several years back, OK... about 13 years ago. We had 3 generations (myself and my husband, his Mother and his Grandparents). Now that my children are almost old enough for us to take them I'm excited to show them the jewel of the park system that is right here in Michigan.

I didn't get to see any of the wolves while there last time and don't think I will see them the next time either, but I want to know they are there so I support Alternative C, bringing new wolves to the island as needed to maintain their population. I would also like to know why the wolf population has decreased so rapidly. I don't want a death sentence to the new wolves if at all possible. The balance between the wolves and moose should be as natural as possible but I understand that sometimes we must be a positive influence instead of just letting things progress.

Thank you for this opportunity to voice my "vote" regarding Isle Royale. This years NP trip is to Alaska but next year is either the Grand Canyon or Isle Royale. Love the National Parks!!

Angelique

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I strongly support Alternative C, i.e., bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island. Without the presence of a viable and reproducing population of wolves, the island's moose population will continue to skyrocket, consuming native plants and eventually running out of forage, thus dooming themselves and the other herbivores on the island to a slow death through starvation and diseases. This uncontrolled moose population will also disrupt the natural stability of the island. Thus, the introduction of new wolves to the island is critical if the goal is to preserve the national park as a functioning ecosystem.

Thank you for considering my concerns.

Sincerely,

John [REDACTED]

Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Correspondence: Wolves are an essential part of any ecosystem in which they were once indigenous. With only two wolves left on Isle Royale there is no genetic diversity and inbreeding is the only possible result. More wolves are needed to offset the consequences of inbreeding and add the diversity wolves need to survive and thrive. It is time we learn as a nation to coexist with predators, not just for the sake of the wolves, but, ultimately, for the sake of us all.

Correspondence: Dear Superintendent Green,

I appreciate the opportunity to comment on the management plan for Isle Royale National Park.

I am pleased to see that the Park Service is focusing on the future of wolves at the park. With only two wolves left, the future of the island's ecosystem and the visitor experience are at stake.

Without a diverse genetic pool of wolves, the moose population will continue to grow, eating until the food sources are gone. This will have disastrous

impacts on native plants and other wildlife in the park.

I support Alternative C, bringing genetically diverse groups of wolves to the island to see if that will allow them to maintain their population. While this is a human intervention, humans already have intervened on a much larger scale with global warming now changing how wildlife populations had been able to save themselves.

Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize the impacts to the native vegetation. A diverse genetic group may give wolf generations a chance to adapt to a changing world.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,
Maureen [REDACTED]

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,
Laura [REDACTED]

I am a frequent visitor to National Parks. I live in northern Michigan and value the current state of nature on Isle Royale. The total animal and plant community could be irreversibly disrupted if new wolves are not introduced. I support Alternate C.

Correspondence: It is no longer possible to let Isle Royale evolve without human interference.

For example:

1. Due to climate change; Lake Superior isn't freezing over and creating an ice bridge for wolves to get over to Isle Royale.
2. Also canine parvovirus caused the wolf population to crash when humans inadvertently introduced it to the island by bringing a dog to the island.

Therefore I believe that wolves should be returned to Isle Royale.

Correspondence: I have been to Isle Royale about 20 times since about 1974. I am a retired college biology professor.

The choices for the wolves of Isle Royale are all with problems. I believe option C, the reintroduction of some new wolves, to be the best option. If we leave things alone, the wolf population will soon go to zero. Then the moose population will "explode", followed by severe forest degradation, and then lots of dead moose due to starvation. Then a "new" forest will "recover" and some sort of forest - moose cycle will happen. The presence of wolves would help ameliorate this wild cycle.

Correspondence: Science has proven what happens when wolves are eliminated from the eco-system. The study in Yellowstone showed that when wolves were taken out of the biosystem, the elk and deer caused erosion by not moving and grazing in the same place. Rivers and lakes were polluted. Other animals were brought back when the wolf was re-introduced. We need to do much more study before we do something that can't be recalled.

My granddaughter (an Environmental Engineering student at [REDACTED]) and I visited Isle Royale last summer and were so impressed with the beauty and uniqueness of the Park. But we were saddened to learn of the decline of the wolf population and how devastating that will be for the ecosystem. Please do not let this happen. We feel bringing in new wolves from various locations introducing new genetics would go a long ways in bringing back a healthy wolf/moose balance.

Thank you for considering my concerns.

Correspondence: In mythology and stories, the wolf has been maligned. Ranchers and farmers have blamed them for attacks. Hunters think they're 'ruining their fun'. It's time to realize that wolves play an important part in our ecology - - weaning out the sick and controlling for overpopulation which brings about disease and death to animal populations.

There needs to be more protection of livestock owned by humans in order to keep from killing off wolves. Cooperation between environmental and human populations seem to be the answer.

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park.

I was saddened to find that we only had two remaining wolves left at Isle Royale. As with the Grand Canyon, when the predators were eliminated on the north rim, the deer exceeded the carrying capacity of the land and thus eventually ate themselves "out of house and home". I feel that the same thing will happen to the moose population on Isle Royale. This will have disastrous impacts on native plants and other wildlife in the park. In addition, the moose themselves are large animals known for their volatile disposition. An increased population could provide a more dangerous situation for those who hike the island.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns and option C.

Sincerely,

Nancy [REDACTED]

Correspondence: Without wolves, the island's moose population will continue to skyrocket, consuming native plants and eventually running out of food, disrupting the natural stability of the island. It is critical to bring in new wolves to protect the national park. Please support Option C, which requires bringing additional wolves to the park in order to maintain a population of wolves on the island. After many years of consulting scientific experts and reviewing trusted research, we believe this action will best balance the island's delicate environment.

Correspondence: The wolves are under attack in many locales. this ecosystem is a safe site for wolves if it is protected from developmental encroachment. This habitat is even more precious than 20 years ago. We need to make this a priority, before it is lost. Wolves are one of our great species in North America. Let us give them a chance to survive and thrive here. My home state is Montana, so I know both the difficulties and joys of sharing land with wolf packs. They remain an important par of the American landscape, and add to our ecosystem.

Correspondence: Several years ago I listened to an NPR program about the wolves on Isle Royale. The researchers stated that because the ice in winter wasn't freezing allowing free passage for wolves the pack was becoming inbred.

Climate change is harming more than people. It is devastating wild life. Wolves, as you know, help ecosystems to thrive and keep other wildlife in check. If we want to continue to enjoy Isle Royale we need to protect these wolves and introduce new blood on the Isle.

Please do all you can to see that these remaining wolves thrive and reintroduce new blood by bringing other wolves from other locations onto Isle Royale.

Thank you for considering my comments.

Correspondence: Dear Superintendent Green:

Thank you for the opportunity to comment on the management plan, Alternative C regarding wolves, for Isle Royale National Park. I support Alternative C, bringing new wolves to the island as needed to increase and maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

There were once about 50 wolves living at Isle Royale National Park. Now there are only two. For this ecosystem to continue to thrive, we need to bring new wolves to Isle Royale. I am encouraged to see that the Park Service has narrowed the scope of its plan to focus solely on wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

The National Park Service should adopt and implement this management option Alternative C quickly to return to and maintain ecological balance on the island.

Thank you for considering my concerns.

Very truly yours,

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,

Dorothy [REDACTED]

Correspondence: As I posted in an earlier comment period, I support Alternative C, that is, bringing new wolves to the island as needed to maintain their population. Alternative C replicates the natural immigration that characterized the Isle Royale population in the past. Sadly, global warming has probably prevented future immigration by reducing lake ice. To compensate, we must mimic these immigration events with introductions. Introductions will enable the wolf population to avoid inbreeding (the current problem), help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Correspondence: Dear Superintendent Green,

My name is Emily [REDACTED] and I am in 7th grade. We have been researching the current situation on Isle Royale involving the wolves and moose in my science class at [REDACTED] and I would like to share my input with you to help you make the right decision regarding this issue. I think you should choose Alternative D.

I think you should choose Alternative D because it doesn't involve a lot of human interference, so nature wouldn't be as affected by humans. The humans wouldn't interfere unless the wolf population died out or came close, they would only interfere to save the ecosystem and it wouldn't happen right away if at all, so you couldn't really argue humans have completely changed the Isle Royale ecosystem. Another reason you should choose Alternative D is because you're only putting in wolves if the ecosystem needs it, and when you do put in wolves, it's to kill off some moose so they don't become overpopulated and eat away all the vegetation, so nothing would have food which would collapse the whole ecosystem for all animals. So adding in wolves if needed at all will save the ecosystem. My final reason why you should choose Alternative D is because it's a solid compromise of all the other options. It will let nature take its course if the ecosystem can survive that way but if it can't, then we would only step in to put in wolves as needed to save the ecosystem from overpopulation or depletion of producers. So if we interfered, we would only be doing it to save the ecosystem from losing the balance the wolves provide it, which is why I think you should go with Alternative D.

So overall, I believe you should go with Alternative D because it would preserve nature unless the ecosystem collapses, in which point humans would interfere but only enough to save the ecosystem that we have been studying for years and have learned so much from. This option is like a compromise and parts of this can satisfy everyone. Thank you for listening to my opinion and I hope you will consider my ideas.

Sincerely,
Emily [REDACTED]

Correspondence: Dear Superintendent Green,

I appreciate the chance to comment on the management plan for Isle Royale National Park.

I was shocked to learn that there are only two wolves left at Isle Royale. Last I heard, I thought there were three packs! I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.
The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you so much for hearing me out.

Sincerely,

Correspondence: We support bringing the wolves back to numbers that will sustain them, and again have parks and forests that can create living conditions for all the other wild live as well.

As we grew up in our family, camping and finding new parks was one of the ways we could take a vacation. It still brings back many memories to me.

My husband and I have been to most all of them, and want them to be available to all people.

Correspondence: I strongly support Plan C for the introduction of additional wolves to Isle Royale National Park. Just two wolves on the island is not sufficient to control the population of Moose and will result in a collapse of the ecosystem there.

When I lived in Michigan, I always enjoyed an occasional visit to Isle Royale and felt richly rewarded when I chanced upon a wolf or moose. Others should be able to continue to have that experience. With the implementation of Plan C, that will happen.

Thank you for allowing my input.

Correspondence: As someone who has had the extraordinary privilege of visiting Isle Royale numerous times, including backpacking the Greenstone, I simply cannot even imagine an Isle Royale without wolves. In addition, the long-running and important study of the wolf-moose relationship will obviously have been all for naught if wolves are allowed to just die off. All across the US wolves are once again being vilified and hounded, so the opportunity to both protect endangered wolves AND rebuild the population on Isle Royale seems like a no-brainer to me.

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,

Linda ■■■■

Correspondence: Dear Superintendent Green,

I appreciate the opportunity to comment on the management plan for Isle Royale National Park.

I support introducing new wolves to the island to help with the control of the moose population. I have personally experienced what happens when natural predators are removed from an ecosystem and naturally controlled populations grow out of control.

Sincerely,

Correspondence: Dear Superintendent Green,

I am writing to comment on the management plan for Isle Royale National Park. I am happy that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. Because the island has two wolves left, I'm concerned that the moose population will continue to increase, eating until the food sources are gone. This would be disastrous for all plants and animals in the park.

I support Alternative C, which allows us to bring new wolves to the island, keeping the moose population from rapidly expanding and minimizing impacts to the native vegetation. Adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you.

Sincerely,

Patrick

In my younger days I was [redacted] in then Mt. McKinley N.P. I had the good fortune to meet Adolph Murie [redacted] [redacted] [redacted] during his last trip to the park. His studies have convinced me and many others that wolves are an essential part of a balance ecosystem, especially in Isle Royale where they have co-existed with moose for eons.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Correspondence: Dear Sir;

I am writing to express my deep concern over the condition of the remaining wolves on Isle Royale. 2 wolves can not possibly hope to sustain a viable healthy population. The Park needs to import wolves quickly or the damage of an unchecked moose population with no natural predators will certainly lead to the eventual destruction of the ecosystem of one of the last truly wild places in the MidWest. While the wolf population is under constant threat, especially in our western states and their wholesale slaughter is committed on a daily basis in many areas of the country, could not Isle Royale offer a much needed refuge to at least some of these magnificent creatures. Many people I know have spent their whole lives yearning to see these shy, elusive animals in the wild and have budgeted many of their recreation dollars in the attempt. Isle Royale is one of the few remaining national parks, in the Tri-State area where that dream has any chance of being realized. If compassion can not motivate, what about self interest. Scientific studies have proved over and over that the big predators are fundamental to health of the natural environment. One only has to look at the Yellowstone success story to see the beneficial presence of wolves. Please, I beg you, act with all dispatch to reinvigorate the wolf population of Isle Royale, the people's park!

Correspondence: Dear Superintendent Green,

I was born and raised in Michigan, and though I now reside in New York, Michigan and its unusual beauties is always in my mind. And, having had the good fortune to visit Isle Royale (only once, but still memorable,) I am compelled to submit my comments regarding the wolves there. Though we had hoped to at least hear the wolves at night, throughout our visit we saw neither hide nor hair of them. So, wolves cannot be a threatening presence to anyone and people with a modicum of ecological intelligence understand the importance of wolves.

I am encouraged to see that the Park Service focusing on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support your Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Correspondence: I agree with National Parks Conservation Association:

NPCA supports Option C, which requires NPS to bring additional wolves to the park in order to maintain a population of wolves on the island. After many years of consulting scientific experts and reviewing trusted research, I believe this action will best balance the island's delicate environment.

There were once as many as 50 wolves living at Isle Royale National Park. Now there are only two. For this ecosystem to continue to thrive, we need to bring new wolves to Isle Royale.

Without wolves, the island's moose population will continue to skyrocket, consuming native plants and eventually running out of food & then starving to death, disrupting the natural stability of the island. It is critical to bring in new wolves to protect the national park.

Correspondence: We haven't heard any details or seen a report from NPS as to what happened to the wolves which were living on Isle Royale. That there are only 2 remaining leads us to believe that the habitat may not provide everything they need to thrive. However of the choices about what to do now, if the facts don't indicate that they will not do well again, we think to try adding a population of wolves again is the best option.

We wonder if too many visitors are being allowed in the limited space of Isle Royale to allow wolves to have the habitat and wilderness area which they require? Perhaps less park visitors is indicated.

We haven't been able to discover whether wolves have lived on Isle Royale for all the years it has been separated from the mainland? We will continue to look for this and other information.

Thank you for considering our ideas.

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,
[REDACTED]

Correspondence: First, Isle Royale existed for centuries without wolves. How were the moose limited then? Ecosystems change naturally. Second, I do not mind if Isle Royale is stocked or not stocked with wolves, but I do not think it is necessary. Third, I think that the Park Service is best situated and educated to make this decision.

Correspondence: Dear Superintendent Green,

I was shocked to read there are only 2 wolves left.
For some reason there seems to be a fear of wolves and a line of thinking that they should be eliminated.
I think adding wolves is a far better idea and will balance out the whole ecosystem far better. Two wolves is not enough.
It is good to hear there is a plan to increase the wolf population and have them help maintain other animal populations in a more naturally balanced way.

thank you,
Peter [REDACTED]

Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I have backpacked on Isle Royale three times. On one of my earlier trips, I heard wolves howling at night. That was such a cool experience! Wolves are a necessary part of Isle Royale and I cannot imagine the island without them.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Correspondence: Please consider introducing additional wolf genes on Isle Royale. I backpacked on the Isle a few times in the early '70's and had the opportunity to visit again last summer. Changes are to be expected, but I was alarmed at the difference the reduction in wolf population has made. It is fun to see moose, but the increase in population means more vegetation is foraged and more suffering for the moose. What happens if deer make their way to the island and there aren't predators?

Isle Royale continues to be a special place, but additional wolves would make a big difference in once again putting it into balance. Thank you

Greetings Superintendent Green,

Hello. My name is Joseph [REDACTED] I'm in [REDACTED] grade, and learning about Isle Royale, and the predator/prey relationship with the wolves and the moose. I'm concerned about it, and I would appreciate it if you heard my input on the matter. Personally, I think ALternative C (bringing wolves to Isle Royale as needed) is best, and here's why:

If we wait for the wolves to miraculously come back somehow, by ice bridge, breeding, or some other way, as in A and D, the they, most likely, will become extinct on the island. If the wolves don't come back, then the moose population will obviously increase. If the moose population increases, then they'll consume more vegetation on Isle Royale. Eventually, it'll be gone, and the insects' and moose population will decrease. By then, the wolves and moose extinct on the island, due to lack, or even extinction, of vegetation, on Isle Royale. Eventually, it might grow back, but by then, Isle Royale will be a deserted land mass, forgotten in some lake in the U.S.

One of my friends thinks Alternative D is most suitable, and it is, but it isn't taking immediate action. He wants to wait and see if the wolves will come back by themselves. One point he argued in a debate in science class was, "I think we shouldn't do anything to 'help' the wolves. Everything has to have an end. The Civil War ended. After all, nature has always, eventually, balanced itself out. Why can't it do it again? I think we should let nature take it's course." Now, if we let nature 'take its course', then who knows what'll happen? We need to take the opportunity to help the wolves, and even the entire ecosystem, not harm it by letting it spin out of control, even if it will balance out. Although I think that Alternative D is good, I still think Alternative C is better.

Another reason is that the study will be able to continue. This study is about learning how prey and predators alike live together in the wilderness. If we, or you don't help them, then not only are you letting animals die, not just the wolves, but you're also damaging the ecosystem of Isle Royale. If you won't do anything about this, then a precious setting of Isle Royale to study, and really get to know how animals work with each other.

Well, that is all I have. Thank you so much for listening, considering, and hopefully, deciding with the influence of my thoughts what to ultimately do. I appreciate being able to give you some suggestions. And thank you for the work that you do to maintain and protect Isle Royale.

Sincerely,

Joseph [REDACTED]

Correspondence: This is a great idea. Almost all wildlife "management" takes the form of killing; to supposedly protect live stock or provide hunters with more animals to kill or whatever. Here is a chance to do real management.

Wolves have been a part of Isle Royal's ecosystem for as long as I can remember. Replenishing by introducing a pack or even a few females and a male would restore the predator/prey relationship and, because it is on an island, would be easy to monitor.

Also, this would be an opportunity to remove wolves from areas where their numbers are becoming too high or where they are not wanted at all. The alternative is to hunt and kill them. Relocation, even of a few, is preferable.

Correspondence: We in Montana have lived with wolves for a long time and value their contribution to fully functioning ecosystems. We so enjoy seeing wild wolves. Isle Royale would be a far different place without wolves. Basically this is a closed ecosystem. The moose and wolves that originally came over on the ice have made the island a wildlife lover's paradise. Ecological balance is key and is why we support Alt. C.

Moose and wolves ideally exist in a predator-prey balance so that the moose don't overbrowse and the wolves don't eat too many moose. Even though moose have been having a hard time because of climate change, they still need to be kept in check. Wolves have been susceptible to disease, so both have existential problems. With only 2 wolves left on Isle Royale this pack needs a boost.

We hope to get to Isle Royale soon and hope to see both wolves and moose. Please do the right thing and select Alt. C. Thanks for caring for our precious national parks.

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating vegetation until the food sources necessary for other herbivores are gone. That outcome would be disastrous for other wildlife in the park, as well as for native plants. And destruction of vegetation can also have a negative impact on any fresh water sources as soil erosion will increase in the absence of adequate vegetative cover.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation. Years ago, as a college student majoring in biology, I wrote a paper on the dynamics of the wolf pack on Isle Royale, based on the observations of wildlife biologist David Mech. Although I have not yet had the chance to visit the Park myself, I hope to do so in the next year or so. My primary reason for visiting Isle Royale would be gone if the wolves were no longer living there.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,

Ruth

Reference: The United States Postal Service (USPS) official's illicit denial, property mail delivery service, is being done without due process of law, such USPS aberrant actions are grossly wrong, and warrant your attention.

Dear Congressman Thompson:

As a result of USPS officials returning [REDACTED]'s mail to its senders, property owner, [REDACTED], files this mail fraud complaint against USPS. Since USPS officials are fraudulently returning his mail to its senders, he submits this letter, for a copy of the evidence used to authorize returning his mail to its senders.

Nonetheless, they are repudiating his rights and privileges to receive their mail delivery services. Hence, USPS officials denied him, his rights and his privileges, without granting him, his requested hearings. Since they are criminally proscribing their mail delivery services to his property, he requests a criminal and a civil investigation into their banning of his USPS' property mail delivery service to [REDACTED]. Why are [REDACTED] First-Class Mail subjected to USPS personnel's impeding whims? Hence, USPS officials took the aforesaid denial of services without due process of law. However, such USPS activities' malfesances are a blatant illustration, an unashamed example, and a heinous instance of a USPS kakistocracy. Why are kakistocrtaical USPS' officials decreed the perpetual banning of all First-Class Mail delivery services to [REDACTED] Especially; while, and they deny his requests for evidence, and they deny his entreaties for an impartial hearing. However, it is a crime of fraud; USPS officials' unceasing abridgment of property owner [REDACTED] right to receive property mail delivery services. Please provide the lawful reasons that USPS officials are rebuffing this party's application for a copy of their lawful rationalizations and their legitimate justification, for their denial of property mail delivery services. Yes, the USPS officials' decisions, to return [REDACTED] mail to its senders, are a gross wrong and a travesty of justice.

Fait justitia ruat caelum,

[REDACTED]

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

I trust natural interaction to best restore a balance of animal populations. Scientists recognize that wolf restorations not only directly impacts the presence of healthy herbivores like moose, but many other species. Controlling predation by moose and deer allows saplings to grow into forests, undergrowth to provide habitat for small animals and birds, etc.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,

Ruth [REDACTED]

Correspondence: I was privileged to visit Isle Royale National Park last August for three days. What a beautiful place! I stayed in the Lodge, hiked, and saw some birds, as well as a family of loons in the water, but did not go far enough to see either elk or wolves. I did see quite a bit of vegetation, including thimbleberry bushes.

Only after my visit have I been motivated to study the plight of wolves in general, and their positive contribution to American ecosystems.

People younger and fitter than I am derive so much pleasure from their longer hikes and their camping. The beauty plus the history of the island are both remarkable. Since both the elks and the wolves seem to have arrived by walking on the frozen winty Lake Superior, which unfortunately is no longer an option, I think it makes perfect sense to reintroduce wolves to keep the elk population at a sustainable level and preserve the park the way it is today as reasonably as possible. Even if wolves need to re-re-introduced a few decades into the future, this seems like a desirable and relatively natural way to preserve the island's value for us all.

Correspondence: It's very important that more wolves are released onto the royal isles to help not only their species but the other inhabitants. Those from the tiny shrew to the mighty moose. I am personally an animal lover and I believe that it's important that we all need to do what's right for our environment because we can't deny that our planet is a beautiful place and that we should fight to protect and preserve it as much as we can.

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service must adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,
mae [REDACTED]

Correspondence: Dear sir,

Thank You for allowing me to input on the Wolf debate that is currently being held. Having visited Isle Royal National Park many times and following the research I think new wolves need to be introduced to Isle Royal. I am a Hunter and conservationist. In any environment we must have hunters and pray. Without either the population becomes out of balance. There have been large die off of moose in the past. The population of moose will be held in place by a healthy population of wolves. Please bring back the wolves.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

In similar situations, the reintroduction of wolves into an ecosystem had an enormously positive impact on the entire ecosystem - plants, birds, small mammals, grazing mammals and other carnivores species. A healthy wolf population will assist in creating a healthy wilderness area.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Correspondence: Some times nature knows better than we do. Isle Royale needs its wolves to control its moose population. To let the moose propagate in an unnatural manner is very dangerous for them and for the isle. AND PLEASE DON'T OPEN IT TO HUNTERS to cull the herd which would be dangerous and irresponsible. The wolf and other predators have a place and purpose in nature. Hollywood has demonized the wolf and many look upon them unfavorably, but they're just trying to survive and fulfill their purpose in life. Let them do what they were meant to do and bring more of them to the Isle. The Isle will be better for it, believe me.

Correspondence: One would think restoring and maintaining an ecosystem would mean the Whole system, including the wolves and other top predators. Otherwise, we end up with some cozy, orchestrated hybrid of a park and a zoo that is a man-made arrangement and bears no relation to the much-touted concept of a natural eco-system. At least one should be honest about what the goals are.

Correspondence: Isle Royale wolves are important for improving the health of the ecosystem and balance of species, both flora and fauna. You should assert every means possible to support wolf populations and to provide substantial habitat protection. The predator prey relationship is best characterized in Where the Wild Things Were, by Stolzenberg. The Yellowstone wolf project produced very positive results in the improvement of flora and fauna. The lessons learned there could greatly benefit Isle royale.

We owe future generations and well protected environment which includes natural inhabitants such as wolves and other predators. Don't refrain from providing for future generations. The loss of a single species can have damaging impacts throughout the ecosystem.

Correspondence: It's man's intervention under the guise of so called "wildlife management" that has created this tragedy. If we can intervene for "science", we can intervene to actually HELP the whole ecosystem and the unique wolves that inhabit this tiny island!!I support Alternative C, and I sincerely and strongly urge you to support it as well. It's the right thing to do for both Isle Royale, and all those who call it home...

*****Alternative C The NPS would bring wolves to Isle Royale as often as needed in order to maintain a population of wolves on the island for at least the next 20 years, which is the anticipated life of the plan. The wolf population range and number of breeding pairs to be maintained on the island would be determined based on best available science and professional judgment. This action would occur as soon as possible following a signed record of decision.

*****NWC: We support this option as it allows for maximum flexibility. Evidence suggests that the few wolves on the island will not be able to keep moose populations in check which will further degrade the island's vegetation.

Correspondence: I think it's a great idea to reintroduce wolves to Isle Royale. They can control the ungulate population and enhance the ecosystem. Also, they'll be protected there (I hope) and can live peacefully for generations to come. Please do the right thing this time and don't abandon them.

In my opinion, new wolves should've been introduced after the ice bridge melted. This would've kept the population healthy. So, this is a second chance to make it right.

Thank you,

Karin [REDACTED]

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Correspondence: All wolves need our protection. They are essential to the health and future of earth's ecosystems. No one needs to "manage" them, because they do well enough managing themselves in their wolfpack families. No one needs to trap, snare, poison, and helicopter hunt wolves. Ranchers and farmers should come up with alternative solutions to manage their herds. No one needs to harvest, trade, and sell wolf pelts. It's time to educate everyone, particularly children, on the essentiality and gentleness of wolves in our world. Wolves need human protection and preservation in the 21st Century.

Correspondence: Please re-introduce wolves on Isle Royale. Without the wolf, there is no check to balance the moose population. The moose increased population due to lack of predation by wolves, has lead to a decrease in vegetation on the island which will only increase with time. The beaver is also effected by the loss of wolves which leads to moose and beaver in direct competition for the same food source with the beavers being the losers.

In short, please re-introduce the wolf to level the playing field again.

Thank you for considering my comments.

I feel that Alternative C is the best option for the wolf population to maintain on the land. It creates a balance between the predator and prey relationship on Isle Royale. This option wouldn't let one of the most important keystone species on the land die out, it would keep the moose population down also and create more vegetation.

The food web is reliant on a constant balance between the wolves and moose population, because other animals are also affected with the wolf population falling. The wolves and moose are dependent on each other for survival, with the wolf population decreasing it will influence the rest of the ecosystem.

With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,
Maureen [REDACTED]

Correspondence: To whom it may concern;

Please stop the slaughter of Isle Royal Wolves. The loss of these top level predators will be tragic. Wolves are vital to a healthy ecosystem.

Without a healthy wolf population the deer population will explode, wolves also keep moose population in check. Please do not let the wolves die out.

Warmest regards,

Dawn [REDACTED]

Correspondence: I live far from Isle Royale and will probably never see it in my lifetime. However, just as a citizen of the earth, connected to all living things, I am concerned about this issue. Isle Royale cannot escape its dependence on natural laws. If there are no predators there, the moose and other species will overpopulate and eat everything green in sight. It will cause the destruction of Isle Royale. We need balance in nature--in Isle Royale, here in New Jersey, and all over the earth we all share. Wolves will help supply this balance and should be returned to Isle Royale to insure its survival.

Correspondence: A forest without wolves is an unbalanced forest- -every animal has a purpose in the environment, especially the larger predators. The U.S. has a major problem with far too many deer and coyotes both of which create many issues- -this would not have occurred if the wolf population around the country had not been decimated. Man seems to never learn or to learn very slowly that when the balance of nature is disturbed, we all pay for the negative consequences. Wolves are very necessary-our Creator put them here for a reason.

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

My opinion is based both on the expertise of wildlife biologists and scientists, my belief in the NPCA, its mission and staff, as well as my own novice observations and values. Some of the greatest experiences in my life include weeks spent in the backcountry canoeing through the Boundary Waters and hiking through Yellowstone and Grand Tetons National Parks. It seems that the reintroduction of the wolf to Yellowstone has played a key role in its ecosystem and provides visitors a special experience of "traveling back in time" when greater wild wolf populations existed and even potentially spot a wolf or evidence of its presence. The wolf population in northern WI also plays an important role in our ecosystem as the past migration of the timber wolf luckily led to a revived WI population. I am a National Park and wildlife lover and have recently moved my family back home to Wisconsin from Colorado. I hope to make multiple trips to Isle Royale National Park in the future. I have a vested interest in the well-being of this ecosystem.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Correspondence: I believe that either Option B or C would be the best route. The concern is the length of time it will take to make a final decision. With only two wolves reported left on the island, if no decision is made until winter 2016-2017, there might not be any wolves left for a period of time before new wolves are brought in. As previously stated, with the large number of wolves here in Wisconsin and in Minnesota, I would think entire packs (or pack) could be relocated to the island in a short period of time.

Correspondence: I encourage you to bring wolves to Isle Royale. They are a keystone species; their presence keeps the moose population in check so they don't overgraze. They are also a special part of Isle Royale. Hearing the wolves howl and the pups yip along while I was backpacking on Isle Royale years ago is a memory I will treasure all my life. Unlike Yellowstone, there is little to no chance of wolves leaving the park to threaten livestock. Isle Royale can be a last holdout where wolves are safe. Thank you.

Correspondence: First, here's my background related to Isle Royale, ecology, wilderness, and NPS.
--Grew up in Michigan. As a young teen, visited the park to backpack with a friend in the mid-70s. That visit changed my life.
--Returned several times to backpack or canoe with friends or family members.
--Worked and played in wild areas throughout North America during formative years.
--Seasonal ISRO employee, late 1980's.
--BA in Biology, MS in Biology-Ecology, BLA in Land Resource Planning.
--25 years as a National Park Service professional (left the NPS in 2013)
--Worked on general management plans/wilderness studies for [REDACTED] Led general management plan/wilderness studies for [REDACTED]
--Member of the [REDACTED] that developed the recently-released handbook, "[REDACTED]".
--With interest and passion, followed the dynamics of the Isle Royale wolf and moose populations for 40 years.
--I hope more wolves migrate to the island. But if not, my personal and professional opinion is that we should let nature take its course, for the following reasons:
ISRO is a wilderness park. Congress intended wilderness to be "untrammelled," meaning unmanipulated by humans (or as close as possible to that). For decades, including in ISRO interpretive programs, in college courses and seminars, in books, and at scientific conferences, I learned that ISRO is "nature's laboratory," where we watch and learn. Our daughter is learning the same in her college courses today. So let's watch and learn. Maybe nature will surprise us in a year. Or in 50 years. Or 100 years. Or 1000 years. Change in ecological systems and communities is natural and expected. It is arrogant and anthropocentric to think that change happening in our lifetime is critical or catastrophic because we happen to be alive and paying attention. When it comes to natural communities and human intervention, our actions- however well intended- often have unpredictable, unfortunate consequences. The truth is- no disrespect intended- we are not smart enough and don't understand nature well enough to "play God" in a situation such as this. Isle Royale wolf researchers cannot be considered impartial on this issue. They have a professional interest in keeping a viable population of wolves on the island.
We cannot hope to manage wildlife "ahead" of climate change. Not only are we not smart enough, we're not fast enough.
The wolf population in the Upper Midwest is healthy. The wolves of Isle Royale are not key to survival of the Upper Midwest population, nor to the survival of the species.
I love Isle Royale. I love its water, wolves, moose, and sunsets more than you can imagine. Let's let nature continue to rule here.
Sincerely,

[REDACTED]

Correspondence: There are currently only two wolves living at Isle Royale National Park. Without wolves, the island's moose population will continue to grow, consuming the native plants until they are gone and disrupting the natural ecosystem of the island. It is critical to bring in new wolves to protect the national park.

Correspondence: Dear NPS,

I am writing to express my support of bringing more wolves to Isle Royale National Park in accordance with the provisions of Preliminary Alternative C.

Certainly, there is a lot more to balancing an ecosystem than reintroducing an apex predator. But what's at risk as we continue to debate the role of wolves in Isle Royale's ecosystem is the transformation of that very ecosystem due to browsing damage from the booming moose population.

Typically, wolf reintroduction eventually brings the wolves into conflict with expanding human territory. Not so on an uninhabited island. At IRNP we have a unique opportunity to study how wolves interact with the rest of the ecosystem. What more might we learn about the effects of a keystone predator on Isle Royale's ecosystem? What changes occur over time? Do these changes have anything to do with the wolf reintroduction?

Reintroducing wolves to IRNP will enable biologists to learn the answers to these and other questions. The more we learn, the better we can bring

ecological science and conservation ethics into alignment and the more empowered we become as stewards of our national parks.

Thank you for your consideration.

Sincerely,

Karen [REDACTED]

Dear Superintendent Green,

i believe that the course of action you should take regarding the wolf population on isle royale is you should bring in other wolves as needed. I believe this is the correct choice because with all the other solutions you are taking unneeded risks when with this you can simply fix the problem without any risk only success.

Another reason this is the correct choice is because it could end up making the wolf population go up by a lot. If you bring a lot of wolves to isle royale it will completely eliminate the chance and worry of wolf extinction.

My final reason you should bring wolves to isle royale is because with the addition of wolves to the island would be good for tourism purposes many more people would want to come see the wolves bringing up profit for the island from tourists.

In conclusion the addition of more wolves to the island has great benefits with large impact and only a few minor cons making it in my opinion the best option for the island

Sincerely,

Jake [REDACTED]

I remember that in my youth, how exciting it was to view the news media coverage of wolves tracking their way 'cross ice pack to/from the islands, and how gratifying it was to observe them in their island habitat when I visited in the warmer months. You have the opportunity to balance and preserve that habitat by taking action to repopulate the islands.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

Correspondence: Please accept this email as my comments on the proposed Moose-Wolf-Vegetation Management Plan/EIS for Isle Royale National Park. I am somewhat familiar with the issues involved in this proposed management plan as I have followed The Wolves and Moose of Isle Royale study and website maintained by Dr. Rolf Peterson of Michigan Technological University. I have been interested in the wolf population in the United States and efforts to control it, reintroduce it, and manage it for many years, and I used to think of Isle Royale as a safe haven for a stable wolf population. Not anymore.

My reaction to the issues that have arisen on Isle Royale regarding the diminishing wolf population, the increasing moose population, and the effects of both on the vegetation of Isle Royale is WHERE HAVE YOU BEEN? These issues have been known for some time, and it seems that the position of the National Park Service (NPS) was to do nothing - maybe it was bureaucratic inaction or maybe it was deliberate non-action, or maybe somewhere in-between, but, whatever it was, the Isle Royale wild animal population has and will suffer more due to the inaction. And by doing NOTHING, the NPS has greatly affected what could have been done to help the island successfully recuperate from the imbalance that has developed between the wolf and moose/predator and prey relationship. And it will get worse before it gets better, no matter what plan of action is chosen.

Considering that there are 2 wolves left on Isle Royale and 1,200 - 1,500 moose, it is very clear that action should be taken AS SOON AS POSSIBLE. The timetable for any action plan has actually been insulting, considering that the NPS knew and knows that the 2 vulnerable wolves left on the island may not survive for long and, thereafter, and the moose population will simply continue to multiply, badly affecting the island's vegetative health.

Timetables must be greatly shortened and action must be taken AS SOON AS POSSIBLE (ASAP) to reintroduce wolves onto Isle Royale, as I believe both US senators, Senator Debbie Stabenow and Senator Gary Peters, from Michigan have requested. I supposed that Option C is the best alternative that NPS is considering at this point. However, perhaps an "ASAP" plan will allow emergency action to take place to begin to stabilize what has been and is happening and will continue to happen that worsen conditions on the island. Wolves need to be reintroduced RIGHT NOW. It cannot be that difficult or catastrophic

to introduce wolves back onto the island (especially considering that there is a healthy population in the Upper Peninsula of Michigan due to successful reintroduction).

I think the slow and plodding NPS action on behalf of the wolf population has clearly affected, probably ended, the 50-year Michigan Tech study of Isle Royale predator-prey relationship between wolves and moose. The lack of NPS action shows wanton disregard - maybe outright disrespect - for the long-standing and greatly respected study. I think that the scientists involved in that study at this point have concluded that the timeframe for a wolf genetic rescue plan for the study has most likely passed, a real scientific shame.

My reaction to any proposal to reduce the overpopulation of moose (culling of moose) on Isle Royale by use of mechanized equipment, such as helicopters, is that that course of action is NOT AT ALL ACCEPTABLE. I believe that this means hunters will fly around in helicopters and shoot moose from the air. ABSOLUTELY NOT. Find a way to get natural predators onto the island before this is necessary. It is so frustrating to think that NPS knew what was going to happen on the island as the wolves died off, did nothing, and has suggested that it may be necessary to shoot moose from helicopters to reduce their numbers to an acceptable population for the island. Have the big game hunters decided they need some fun on little Isle Royale? I suppose if the only way to control the starvation of moose on the island is to artificially reduce their numbers, that not even a healthy pack of wolves introduced on the island could help the moose overpopulation now, I would rather the moose die very quickly and painlessly by gunshot rather than starve to death, but I would be so disappointed and disillusioned that NPS would allow the situation to reach that point. It is terrible neglect, and it is guilt by omission.

So, in a nutshell, and with respect, I encourage the NPS to MOVE IT! NOW! Get wolves introduced onto Isle Royale RIGHT NOW, through emergency temporary action, if possible, and then implement Option C. The long-term plan should maintain a healthy wolf-moose-vegetative relationship for a very long time, even if it means bringing in wolves, moose, and vegetation from the outside (but they must match as closely as possible the conditions on the island that will sustain a healthy relationship - if moose eat balsam fir, dont replant decimated forests with lodge pole pine, replant them with balsam fir).

Isle Royale is in the middle of Lake Superior where almost nothing else lives except the underwater aquatic life, and there appears to be no viable reason why the wolf-moose-vegetation world on Isle Royale cannot be re-established and sustained and studied for decades and decades. There don't appear to be any other human or natural populations that might be disturbed. If the anti-wolf faction is griping about "more wolves," they are utterly delusional and paranoid. If there are people who are voicing a desire to allow nature to take its course (which in this case would seem to result in a destroyed Isle Royale - no wolves, starving moose overpopulation, and devastated vegetation), I think that they should consider the fact that human behavior has and will greatly redefine what is considered natural on our planet. Almost nothing is natural anymore. Isle Royale is a tiny microcosm of the Earth's natural world. It can and should be protected, and proper and TIMELY human thought and action can and should make sure that this happens. In conjunction with its own expertise, the NPS should access and be grateful for the highly professional guidance and advice that can be accessed through the Wolf-Moose of Isle Royale study maintained by Dr. Rolf Peterson and his colleagues and students at Michigan Technological University.

ACT NOW TO SAVE ISLE ROYALE AND MAINTAIN A NATURAL WELL-BALANCED ENVIRONMENT OF WOLVES, MOOSE, AND ISLAND VEGETATION. DO THE RIGHT THING RIGHT NOW.

Thanks very much for considering my views.

Old time, "Thou shalt not kill."

Leviticus 24:21

"And he-anyone) that kill a beast-animals, he-anyone) shall restore it: and he-person) that kill a man-anyone), he-person) shall be put to death."-Hell) (only judge by God Heavenly Father-Jesus Christ Amen!!!) Eye of the God!

In Jesus's Name Amen!!!

Philippians 3:20

"For our conversation is in heaven; from whence also we look for the Saviour, the Lord Jesus Christ:"

John 10:38

"But if I do, though ye believe not me, believe the works: that ye may know, and believe, that the Father is in me, and I in him."

John 10:35

"If he called them gods-devil), unto whom the word-scripture) of God-Heavenly Father) came, and the scripture-Jesus Christ) cannot be broken;" John 10:35

Matthew 24:35

"Heaven-sky) and earth-world) shall pass away, but my words-scriptures) shall not pass away."

Romans 1:20

"For the invisible things of him from the creation of the world are clearly seen, being understood by the things that are made, even his eternal power and Godhead; so that they are without excuse:"

Jeremiah 10:10

"But the LORD is the true God, he is the living God, and an everlasting king: at his wrath the earth shall tremble, and the nations shall not be able to abide his indignation."- (anger)

See your own eyes that world goes doom for many reason.. Sadness!!!

Stay away from evils now therefore the world is fullest of sins but go to priests or else that

would not be save because it must only by Jesus Christ John 14:6 that one can remove the

sins. Simple looks up but Mostly hate King James Version Bible therefore not believing it

but God did not author confuse but saints=1Corinthians 14:33.

1Thessalonians 2:13=Which ye heard of us, ye received it not as the world of men, but as it is

in truth the word of God.

Do not fail God's test. 1Corinthians 3:13 The fire shall try=(test)

John 10:35 The scriptures cannot be broken

Acts 1:11 same Jesus but Psalms 9:17 The wicked shall turned into hell and all the nations that

forgot God.. Sadness!!!

In the Name of Jesus Amen!!!

In the Name of the Lord Amen!!!=Genesis 1:21 God created great whales and every living creature-animals) Amen!!! : (

Now another problems that go around and never solve it but yes

Animals care who worked hard to restored all the animals who

are in injury, damage by inhumanity killing, abused and threat also

many more evils of doing to all kind animals. Animals would have

gone lots of wondering about why humans kill me. That is sadness!

God created all creature(all kind animals) and living things.-

Proverbs 12:10

"A righteous man regardeth the life of his beast:-animals) but the tender mercies of the wicked are cruel."

Genesis 9:2

"And the fear of you and the dread of you shall be upon every beast of the earth, and upon every fowl of the air, upon all that moveth upon the earth, and upon all the fishes of the sea; into your hand are they delivered."-(respect)

Ezekiel 34:19

"And as for my flock,-(a number of animals)

they eat that which ye have trodden with your feet; and they drink that which ye have fouled with your feet."-(animals desire clean, foods, water)

Joel 2:22

"Be not afraid, ye beasts-(an animals,a large four footed one-creatures) of the field: for the pastures of the wilderness do spring,-(descended from God's animals kingdom) for the tree beareth her fruit, the fig tree and the vine do yield their strength."-(authority)

Exodus 20:13

(God said) Thou shalt not kill.

Matthew 5:21

(Jesus Christ said) Old time, Thou shall not kill

Leviticus 24:18

"And he that killeth a beast shall make it good; beast-animals) for beast."-animals)

Leviticus 24:21

"And he that killeth a beast, he shall restore it:

Genesis 1:24 Creature

Genesis 2:7 Soul-in itself or soul, in the sense of conscious life an animal also has a soul. See- Genesis 1,26,27

Once they are gone

They are lost forever

Have a soul as just alike human

Both are four footed

Same in pains and warm blood spilling out

Both has a same feeling.

Both has a eyes , nose , mouth and breathing, has a soul

Both need be in caring and the love and family

Once been in shot, both are same cries and death

Both sad feeling of lost family or parent

Both created by Authority Universe Heavenly Father Jesus Christ Amen!!!

Ephesians 3:9

"And to make all men see what is the fellowship of the mystery, which from the beginning of the world hath been hid in God, who created all things by Jesus Christ:"

Romans 1:20

"For the invisible things of him from the creation of the world are clearly seen, being understood by the things that are made, even his eternal power-(universe the Scripture the Jesus Christ)

and Godhead-(father, son, holy ghost three are in one that Jesus Christ); so that they are without excuse:"

John 10:34

"Jesus answered them, Is it not written in your law, I said, Ye are gods"?(the devil)

John 10:35

"If he called them gods-(devil) unto whom the word of God-(Heavenly Father) came, and the scripture-(Jesus Christ) cannot be broken;"

Psalms 14:2

"The LORD looked down from heaven-(sky) upon the children of men,-(people) to see if there were any that did understand, and seek God".-(Heavenly Father)

Deuteronomy 13:18

"When thou shalt hearken to the voice of the LORD thy God, to keep all his commandments which I command thee this day, to do that which is right in the eyes of the LORD-(Jesus Christ) thy-(your) God.-(Heavenly Father)

Acts 1:11

"Which also said, Ye men of Galilee, why stand ye gazing up into heaven?-(sky) this same Jesus, which is taken up from you into heaven-(sky), shall so come in like manner as ye have seen him go into heaven."-(sky)

King James Version (KJV)-The Truth Bible the scripture is Jesus Christ)

In Jesus Name Amen!!!

In the Blood of Jesus Amen!!!

Stop Killing Wildlife Animals, Remember Leviticus 24:21 (restore the animals)

In the Name of the Lord Amen!!!

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

As a resident of Arizona, I am only too familiar with the plight of wolves whose populations have fallen to dangerously low levels. The Mexican Gray wolf is very much endanger of extinction once again.

Thank you for considering my concerns.

Sincerely,

Susan [REDACTED]

Correspondence: Isle Royale is the perfect laboratory for scientists to study the effects of wolf and Moose populations. The fragility of the Wolf population on Isle Royale cannot be understated. Isle Royale Wolves were nearly wiped by a single domesticated dogs carrying the Parvovirus to which Wolves have no resistance. The balance of nature is so tenuous on this magnificent island if the Wolves are completely wiped out the Moose population may well damage and possibly destroy the very habitat that sustains them.

I don't know the answer to this incredible balance of nature on the Isle. If wolves of divergent blood lines are brought in again will they survive? and for how long? I believe we must try to repopulate Wolves on the Isle. We must continue to learn more about how to maintain their survival and that of the Moose and the wildlife and habitat of Isle Royale as a whole.

Correspondence: I am submitting comments in favor of "Alternative C" in which the NPS would bring wolves to Isle Royale as often as needed in order to maintain a population of wolves on the island for at least the next 20 years (anticipated life of the plan). The wolf population range and number of breeding pairs to be maintained on the island would be determined based on best available science and professional judgment. Since this action would occur as soon as possible following a signed record of decision it would expedite a viable solution to the current dilemma. Unfortunately, the option to genetically rescue the wolves of Isle Royale has passed.

This option provides for maximum flexibility and provides for a plan that will address not only the crashed wolf population on the island, but also the need for the predator/prey balance between wolves and the moose of the island to ensure the moose population stays in check and does not further degrade the vegetation on the island.

Correspondence: Nature has a balance - humans are destroying that balance, usually for greed, but in doing so we are destroying our planet and ourselves. All is in a delicate balance.

They want wolves OUT of the west - but, according to Carl Safina in "Beyond Words: What Animals Think and Feel", wolves eat approximately \$90,000 in livestock (often the old and infirm) but people coming to Yellowstone want to see WOLVES (bears are everywhere) and they bring \$34,000,000 - wolves are fine animals and without them the elk ate every twig for miles - so they were reintroduced.

"If a man aspires to a righteous life, his first act of abstinence is from injury to animals" Albert Einstein

Correspondence: Re-establishing a healthy wild wolf population in Isle Royale will help to maintain a healthy balance of the large prey herbivores, which would, with no controls, destroy vegetation and degrade the habitat.

I see what the overpopulation of white-tailed deer has messed up our forestland in upstate NY and CT. Lack of regeneration of native shrubs and seedling trees, just hay-scented ferns that no one eats, and noxious plants like barberry and other junk. The coyotes help some, but are not enough, and our hunters want bucks. Move some of the wolves from the states that do not want them.

Thank you for listening to my comments.

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,
Carol [REDACTED]

Correspondence: There were once as many as 50 wolves living at Isle Royale National Park. Now there are only two. For this ecosystem to continue to thrive, we need to bring new wolves to Isle Royale.

Without wolves, the island's moose population will continue to skyrocket, consuming native plants and eventually running out of food, disrupting the natural stability of the island. It is critical to bring in new wolves to protect the national park. Bringing wolves back to balance an ecosystem has already been a tried and proven management tool.

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park.

Every animal has a purpose in nature. Some animals are more cute and cuddly and therefore more easily loved. But cute or not, every animal has a purpose. Someone must step in and do the right thing. It is therefore up to the NPS to stand strong and protect the wolf before it is too late. Extinction is forever!

I am very happy to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for allowing me to comment.

Correspondence: Thank you for considering this comment and for taking action to protect this special ecosystem. I support Alternative C. It seems less and less likely that wolves will have natural migration opportunities to recolonize the island in the future, and allowing the moose population to grow unchecked is simply setting the island up for a crash at some point. I would rather see the agency take an active role and introduce wolves to the island now and in the future if deemed necessary.

Sincerely,

██████████

Correspondence: Dear Superintendent Green,
I believe the National Park Service should choose to take no action in intervening in the wolf population of Isle Royale (Alternative A). While this alternative will mean changes for the park's ecosystem and character, the park should not function as an ecosystem museum, preserving an arbitrarily chosen 'best' suite of flora and fauna. Instead the park, in its role as a wilderness, should use this opportunity to continue to study this unique case study of island biogeography. The wolf and moose populations of the island exist only by chance, and taking action to bolster wolf populations is a direct contradiction of the Wilderness Act: "A wilderness, in contrast with those areas where man and his own works dominate the landscape, is hereby recognized as an area where the earth and its community of life are untrammelled by man, where man himself is a visitor who does not remain."
Please consider the decades of well-intentioned, but ultimately flawed, management of wildfires in this country. That history illustrates the hubris of attempting to reverse or alter a natural process on the landscape, a choice that will often lead to unintended consequences. This decision should be made based on science and law, not emotion, and that is why I support Alternative A.

Thank you for your time,
Joseph ██████████

Correspondence: I am pleased to see that the culling of moose on Isle Royale has been dropped from consideration. While I support Alternative C to bring wolves to Isle Royale as often as needed in order to maintain a population of wolves on the island for at least the next 20 years, I have concerns. Under Alternative C, the wolf population range and number of breeding pairs to be maintained on the island would be determined based on best available science and professional judgment.

It is no secret that researchers/biologists have disagreed with NPS with the restoration of wolves on Isle Royale to the point that the time for generic rescue has passed. How will conflicts in the future be resolved? What role will the 50 years of research have in the decision making process? Hopefully, these issues can be addressed during the next phase of this project.

Correspondence: I am encouraged you have studied the situation related to wolves on Isle Royale. It is a jewel that we need to protect.

I urge you to adopt option C and bring new wolves to the island as needed to restore the ecosystem that existed until recent years. The interdependence of the wolves, moose and environment of the island is well documented.

The work that Dr. Peterson and others have done on the island has provided

the basis for understanding the interrelationship of the flora and fauna on Isle Royale. Wolves are a natural part of that equation. Let us keep it so.

Remember what happened in Yellowstone when the wolves were reintroduced. Reduced grazing by the elk had a huge impact on the ecosystem, allowing insects, birds, mammals, etc to return. The rivers were healthier. A natural trophic cascade was once again established.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,
Sandy [REDACTED]

Correspondence: Please strongly consider Option C for the repopulation of Royale Isle wolves. Do not allow the balance of the ecosystem to be destroyed by permitting the already- dwindled wolf count go down to zero. We cannot afford to allow the delicate biomes that currently exist to be permanently damaged or extinct due to our lack of care, consideration, or neglect. Humans have already obliterated too many species, habitats and food sources and have severely endangered ourselves and posterity in the bargain. Restore the wolf population by exercising Option C!
Thank you in advance for your time and attention to my request.

Correspondence:

Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,
[your name here]

Thank you for taking the time to help protect Isle Royale's fragile environment.

Sincerely,

Eric [REDACTED]

Correspondence: My wife and I hiked 70 miles on Isle Royale in the 1970s and I have followed events on the island since the 1960s. A point I hope is remembered is that the wolf/moose dynamics have been intensely studied for a long time and the intent was always to let events play out without intervention. The result has been a great deal of knowledge, but also a seriously inbred wolf population that is simply no longer sustainable. If intervention is to begin and the "hands off" policy to end, I hope that the plan will include bringing in wolves on an ongoing basis to maintain the genetic health of the population. I think the "hands off" policy has been a good one from a research perspective, but, without introducing new wolves to the island, the future of the moose population can easily be predicted. I support bringing a new population of wolves to the island to re-establish a healthy wolf/moose ecosystem with provisions for occasional introduction of new wolves to maintain genetic diversity.

Correspondence: Dear Superintendent Green,

I support Alternative A, "The NPS would not intervene and would continue current management. Wolves may come and go through natural migration, although the current population of wolves may die out". I believe there are other alternatives to help keep the moose population from rapidly expanding and ways to minimize their impact to native vegetation. For example, it may be possible to manage the moose population through hunting when the island is closed for visitation. The sale of hunting permits also represents a possible source of revenue. All things considered, I am in favor of removing moose from the island entirely and encourage reintroduction of lynx and caribou.

If the the National Park Service is going to intervene, I would prefer restoration to a more natural state. At this time, the National Park Service should not not intervene and continue current management.

Thank you for considering my concerns.

Sincerely,

Joseph [REDACTED]

Correspondence: Dear Superintendent Green,

Thank you for prioritizing in your thinking about Isle Royale my comments, as well as those of so many others who want to see the management plan for Isle Royale National Park zero in on the plight of the two remaining wolves and the wonderful opportunity the Park Service has to reintroduce and reestablish a healthy wolf population in this unique location where wolves have historically helped to balance the ecosystem and moose population. Isle Royale is famous as a unique scientific study environment, and with the Park Service's intelligent assistance, it will remain an important location for studies by working ecologists, biologists, botanists, and range management folks, not to mention the great benefits that introducing more wolves to Isle Royale will create for interested vacationers, parks lovers, and animal aficionados - - really for all who will have the fortune to enjoy and study the wolves and the beautiful island landscapes and ecosystems that are home to a beautiful variety of native plants, animals, and avian species. The health and well being of all the creatures and living forms on Isle Royale depend on a balanced circle of life on the island. Focusing on the future of wolves at the park is critical to all these interests.

For this reason, I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. I agree with the National Parks Conservation Association, which asserts that with only two wolves left at Isle Royale, there is grave concern about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns, and keep up the good work.

Very best regards,

Correspondence: Dear Superintendent Green,

I support bringing new wolves back to Isle Royale. When my wife and I backpacked at Isle Royale there was a much healthier wolf population though Parvo was apparently a problem in the population and lack of genetic diversity was hurting the pack. However, they did a good job culling the weaker moose and keeping the moose population strong. In fact, we came to hike there simply because we knew there were wolves and moose there and although we heard them one morning we did not see them. If there is a reasonable way to reintroduce new wolves to the island and allow them to have a broad genetic spectrum with healthy individuals, I feel that it would be best for the Island's eco system; otherwise it may be disaster for the moose and the eco tourism as well. Isle Royale has always been a special place because the moose and wolves are interwoven. Their absence would be tragic.

Thanks,

Tom [REDACTED]

Correspondence: I strongly voice my support for Alternative C, which would maintain healthy wolf populations at Isle Royale NP through multiple introductions. Wolves are an integral component of healthy ecosystems in the northern Great Lakes states. Although not always present on the island in the past century, wolves are keystone predators whose presence has been shown to have cascading effects on herbivore populations and vegetation dynamics and plant community structure. The history of human presence and activity on Isle Royale (as well as on mainland MN), with its impacts on the island's natural resources, has likely played a factor in periods of time where wolf populations were not present on the island. This does not serve as any justification for not actively managing the natural resources of the park by maintaining predator populations. Furthermore, climate change has likely increased the stressors on this ecosystem (heat stress, increased invasive species, etc), and will continue to do so into the foreseeable future. These stressors, combined with heavy herbivore pressures from expanded moose populations, could result in surpassing a threshold whereby native plant communities are reduced opening up new habitat for aggressive invasives. Furthermore, large moose populations increase the risks of moose population crashes due to pests and parasites.

Climate Change impacts will likely mean fewer winters where ice forms allowing individuals to leave or migrate onto the island, making active management increasingly necessary. The other alternatives likely leave the wolf populations at risk for either the immediate or medium-term future, which could have large negative effects on moose and plants, as just described. To deal with these negative effects, park resources would be stretched even thinner than they already are, requiring many more staff hours and funds. Although there are no guarantees that this would occur, it would be a shame to risk this happening. The NPS is tasked with managing the natural and cultural resources of the park, not only does it make sense from a natural resource management perspective, but I feel there is also a fiscal and moral responsibility to manage the park in order to maintain ecosystems that are diverse and healthy. Everything we know about the ecosystem of this region suggests that wolves are a part that picture.

Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the

moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

PLEASE PROTECT ISLE ROYALE'S ECOSYSTEM!!

Thank you for considering my concerns.

Thank you for taking the time to help protect Isle Royale's fragile environment.

Sincerely,

Linda [REDACTED]

Correspondence: There were once as many as 50 wolves living at Isle Royale National Park. Now there are only two. For this ecosystem to continue to thrive, we need to bring new wolves to Isle Royale.

Without wolves, the island's moose population will continue to skyrocket, consuming native plants and eventually running out of food, disrupting the natural stability of the island. It is critical to bring in new wolves to protect the national park.

To do otherwise is NOT the Change that I voted for...twice!

Correspondence: It is our responsibility to help re-establish the Isle Royale wolf population. It was our mistreatment of the environment which has led to the disappearance of the wintertime ice-bridges, that inhibit wolves from crossing to the mainland, thus keeping a diverse genetic gene pool among their population. Thus it's our responsibility to correct the problem by importing more wolves onto the island.

Correspondence: I can not believe that negligent mismanagement of the area has been allowed to decrease the wolf population from 50 to 2 animals. How in the hell do you expect a species to survive. Too bad we are not talking about the human species rather than wolves or any animal. You must allow zoos to help replace the wolf population, you must allow any country, or any source to help repopulate the wolf species and to increase the bloodline so they do not interbreed causing a weaker breed of wolf. The predator of any area must survive to keep the prey from overpopulating!!!!!!!!!!!!!! This includes bears, coyotes, cougars, jaguars, lions, snakes, etc.

So try to get some intelligence about this matter or get out and let someone better do this job.

Correspondence: Dear:
Isle Royale National Park
Superintendent Phyllis Green
and The National Park Service

Please adopt Option C and bring new wolves to Isle Royale. Isle Royale National Park would be a very different place without wolves.

Without wolves, the island's moose population will continue to escalate, consuming native plants and eventually running out of food, disrupting the natural stability of the island. It is critical to bring in new wolves to protect the National Park and nature's intended balance of ecosystems.

After gathering extensive public input last Summer, the National Park Service has narrowed down their list of management options. The NPS agency is now asking for our input. Our input is as follows:

We actively support Option C, which requires the National Park Service to bring additional wolves to Isle Royal National Park in order to maintain a population of wolves on the island. After many years of consulting scientific experts, allied associations and reviewing trusted research, we believe this action will best balance the island's delicate environment.

Thank you for reading our views,
and we appreciate your consideration.

Sincerely

Correspondence: I do feel that bringing new wolves to the island will help restore the natural balance.

Too many moose is going to kill the island.

People in the UP of Michigan don't want wolves, so why not capture some of them and relocate to the island. It would be a win win solution, without having to kill any of them.

The 2 lone wolves left will have some new genes to mate with, that's if they survive long enough for you to make a decision. Decision making at times is far too long drawn out.

We the people want more wolves on the island.

Diane ██████████

Correspondence: After decades of study, we understand the crucial role that wolves and moose play in their mutual success.

If the wolves are allowed to die out, we know that the moose population will increase dramatically. The plant life will then be ravaged, which in turn will lead to food shortages and the subsequent plummeting of the moose population.

If the results are predictable, continuing the study through a non-interference policy serves no purpose.

Lack of genetic diversity among the wolves is directly attributable to manmade climate change and the lack of any winter ice bridge to the island year after year. The least we as a species owe to the isolated island moose, wolf and plant species on this very special island is to import wolves. We can provide the "bridge" that allows new wolves to come to the island as they always have, and renew their gene pool.

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park. You need predators to keep a balanced ecosystem.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,
Jacqueline [REDACTED]

Correspondence: To The National Park Service,

I am glad to have the opportunity to comment on the management plan for the Isle Royal National Park, as I am passionate about conservation of our lands.

With only two wolves left on Isle Royale, the future of the island's ecosystem is in jeopardy.

I support Alternative C - bringing in new wolves to the Island as needed to maintain their population. This will keep the moose population from expanding and destroying native vegetation and close the door to the public who want to see and save this beautiful, treasured Island and Park.

Thank you for keeping my comment in mind.

Correspondence: Without wolves, the island's moose population will continue to skyrocket, consuming native plants and eventually running out of food, disrupting the natural stability of the island and changing its structure due to erosion, reducing the population of small animals dependent on plants, as well as affecting the health of the insect population. It is critical to bring in new wolves to protect the national park.

Correspondence: I support Alternative C.

Let's bring wolves to the island as often as needed. I understand the other alternatives, or just doing an EIS first. I believe we need to help support the health of the entire island and moose population NOW. This involves wolves. I don't want to see culling of moose and the aversive actions that will be involved with this including bringing helicopters, four wheelers and more killing by us. We can help to prevent overgrazing and the collapse of the island by bringing in wolves as the apex predators here. They will have a positive effect on other species, vegetation, etc. This is a situation where humans can "interfere" by bringing in wolves and I believe this will be a positive thing for the island.

Correspondence:

The wolf/moose situation should be allowed to play itself out without human interference, because Isle Royale is largely designated wilderness, and the moose and wolves cannot be confined to those lands on the island(s) not designated as wilderness.

The management-goal definition of wilderness as "untrammled" means just that, recent interagency science protocols to the contrary. The protocols will not stand up in court because the legislative history of the 1964 Act is too clear on how wilderness, once designated, should be "managed."

Adolph Murie was prescient in the 1930s on the fact of Isle Royale being distinctive as a wilderness park. He and Olaus, as you know, were prominent players in the re-valuation of predator/prey relationships. The management decision at Isle Royale should be based on a clear reading of the National Wilderness Preservation System Act and not the wishful thinking of science theories.

As British writer Jeanette Winterson rightly notes, every fact is also an act of desire. What wilderness stewardship needs is a career path that honors a "watch and learn" approach to learning from wilderness. By the canons of legislative history, the word "untrammled" cannot be adjudged poetry. Human desire should not be projected onto wilderness. Such projection trammels wildness. Witness the Jeffersonian rationalist grid system projected onto the American West. Our generation's problems with wild lands - fire and predator/prey relations - result from the best science of the past.

Human knowing is temporal and provisional. As such, as William Bronk has written, "We live in the permanence of ignorance." That is why we need to learn from wilderness, not project our desires onto it. I encourage you to decide in favor of wilderness and wildness and not to tamper with the wolves and moose.

Best regards, Ed [REDACTED]

Correspondence: We, my husband and I, support option C, to intervene in the population decline of wolves on Isle Royale. We have followed the issue closely for the last couple of years and were hopeful that a male wolf would have crossed the ice from Canada during the cold winter of 2013-2014. Sadly, that has not happened. We are normally not in favor of intervening in the natural order of things but I cannot help but believe that we have caused this in some way in the past and it is our duty to make it right. Also, the alternatives of "managing" the moose population and/or the environment of the island seem like opportunities to over-correct the problem with too much room for error. We are hoping that a little nudge in the right direction will have the desired outcome.
We feel that the NPS has done a commendable job of monitoring this situation and offering solutions for the public to decide on. Michigan's NPS is an example of how to include public opinion in decisions regarding wildlife management, especially wolves, that Arizona and New Mexico could learn from in their issues with the Mexican Grey Wolf population.

Re: Wolf Management Plan/EIS, Revised Public Scoping

Dear Superintendent Green:

On behalf of the National Parks Conservation Association (NPCA), we thank you for the opportunity to comment on the Wolf Management Plan/EIS, Revised Public Scoping document.

We've reviewed the proposed alternatives in the revised scoping newsletter and support Alternative C as the preferred management alternative.

NPCA Recommendation: Adopt Alternative C

Alternative C: The NPS would bring wolves to Isle Royale as often as needed in order to maintain a population of wolves on the island for at least the next 20 years, which is the anticipated life of the plan. The wolf population range and number of breeding pairs to be maintained on the island would be determined based on best available science and professional judgement. This action would occur as soon as possible following a signed record of decision.

We support Alternative C because it is closely aligned with our previous recommendations during the initial scoping phase and incorporates language necessary to carry out this management decision.

In our comments submitted on August 28, 2015, we recommended that NPS bring new wolves to the island as needed to reestablish the population and ecological function on the island. We provided extensive analysis in support of our position that relied on NPS laws and policies as well as sound science and research. We reaffirm our position and analysis as previously stated in support of Alternative C.

The following is a summary of our comments in support of reintroducing wolves to reestablish their population:

- Wolves are essential for maintaining the ecosystem health given they are the only apex predator on the island and a keystone species;
- The island is 99 percent designated wilderness, and NPS has acknowledged that wolves embody the essence of wilderness there, so action to protect wolves helps preserve the wilderness character of the park;
- In the absence of wolves, actions would be necessary to manage the moose population and/or undertake revegetation of balsam fir, which are both much more intrusive actions than wolf introduction and could undermine the wilderness designation;
- The park's stated purpose and significance statements, as well as the International Biosphere Reserve designation, specifically note the importance of providing the opportunity for scientific study and recognize the world-renowned Isle Royale wolf/moose study;
- Healthy ecosystems are more resilient to the effects of climate change;
- NPS management policies support the restoration of native species and the natural ecological functions in an ecosystem; and
- There is precedence for augmenting species on public lands.

We also support Alternative C because it specifically incorporates language from our previous comments and recommendation. Notably, Alternative C recognizes there may be a need to bring new wolves to the island more than once. The previous alternatives in the original scoping document only considered bringing new wolves as a one-time event meant to mimic natural migration. Given the uncertainty of a successful outcome, we suggested in our comments that this action not be limited to one time and instead be done "as needed to re-establish their population and ecological function on the island" (NPCA Comments, p. 2).

While "as needed" is without definition in Alternative C, we are aware that NPS has assembled a group of scientists and researchers who are well qualified to provide guidance on the frequency and the method of augmentation/reintroduction. We anticipate that the draft EIS will include these details for review. We recommend that this team provide guidance in a manner that will allow the park service to expedite the action of bringing new wolves to the park upon completion of the planning process.

In that regard, we support Alternative C because it specifically notes that the action would occur as soon as possible once a decision becomes finalized, recognizing the need to act quickly. We previously emphasized the urgency of the situation and the need to expedite the decision-making process (NPCA Comments, p. 8).

Finally, we support Alternative C as it notes that the wolf reintroduction would be undertaken pursuant to the best available science and professional judgment. This is an essential part of an effective management plan and should be language that is officially incorporated into the final decision.

Reject Alternatives A, B and D

We appreciate NPS narrowing the list of alternative management actions, but assert that the other alternatives listed in the scoping document should be rejected. Alternative A is the no action alternative, and for the aforementioned reasons and those previously submitted, we urge NPS to take action here and bring new wolves as needed.

Alternative B suggests bringing new wolves as a one-time event, but does not recognize the uncertainty in a positive outcome from a one-time introduction.

Finally, Alternative D is essentially taking no action and kicking the can down the road even further. NPS has been studying this issue for several years, has initiated a planning process to address the crisis facing these wolves, and should make a decision in the coming months that will result in action, not a list of thresholds and indicators for future action.

NPS should adopt Alternative C to restore wolves and maintain the ecosystem at this iconic national park. We thank you for the opportunity to submit comments.

Sincerely,

Correspondence: I strongly urge the NPS to bring more wolves ASAP to Isle Royale. Wolves are being hunted and killed in the Upper Peninsula. Relocate some of these wolves to the island. The natural environment of the island (as throughout the state) has already been altered by the presence of humans. I am tired of hearing about money being spent on study after study without any action being taken. Wolves were introduced successfully in Yellowstone. Do it again on Isle Royale.

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park, an amazingly unique jewel in the NPS system. I am

encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants, other wildlife in the park, and eventually the moose population itself.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns and thank you for helping protect Isle Royale's fragile environment. I appreciate the effort involved in gathering extensive public input last summer and narrowing down the list of viable management options. I am convinced NPS option C will best manage the wolf and moose populations on the island.

Sincerely,
James [REDACTED]

Correspondence: To whom it may concern,

I urge you to introduce more wolves to Isle Royale so that the ecosystem can again be balanced with a healthy predator/prey relationship. The wolf re-introduction into Yellowstone National Park and the control of Elk was a compelling argument to maintain a viable population of wolves that will keep the moose population at a healthy and sustainable level which in turn affect the vegetation and other animals on the island.

The option to not introduce more wolves is not a viable option as the growing moose population will not be sustainable, and eventually crash due to overgrazing, then starvation.

Allowing hunting is a poor management tool with hunters killing the biggest and healthiest animals, whereas wolves take the less hardy animals. Additionally, the presence of human hunters, sport hunters or sharp-shooters, entirely changes the wildness and enjoyment of this very special island.

As a recent visitor (back packed the length), I sincerely hope that you will make the choice to re-introduce a viable wolf population so that people who value wilderness can return and enjoy this very special, beautiful and wild island.

Thank you for your consideration.

Correspondence: I strongly support re-introduction of wolves to the Island - and I think a one-time event is too short-sighted. Therefore, I would favor Alternative C.

I really don't think we can count on wolves introducing themselves to the Island anymore because the likelihood of conditions which would allow that to happen are getting more and more slim - esp. with the effects of climate change (fewer ice bridges) and increasing development of areas from which the wolves might cross over - should an ice bridge form.

Without wolves, the moose population will continue to explode. They will overbrowse - changing, perhaps forever, the ecology of the island, and when the food is gone, their numbers will crash. The Island will no longer be the magical wilderness it once was.

I realize a 'true wilderness' area is pretty much left untouched. But it seems that we as a species have already 'touched' the island with our introduction of canine parvovirus and our significant contributions toward climate change. To "let nature take its course" and let the wolves die out, the moose population skyrocket, and the island vegetation be forever altered (along with all the animals, insects, and birds that depend on that vegetation) seems to me like somewhat of a cop-out. One with tragic consequences. It doesn't take a rocket ecologist to know that a healthy environment NEEDS predators to maintain balance. The Island is losing the one predator that can effectively sustain that balance. Please do the right thing - and bring that predator back. Without the wolf - Isle Royale will most certainly lose its status as one of the jewels in the National Parks System.

Correspondence: This document was brought up in an environment biology classroom discussion and after considering the following alternatives; C would seem to fit the best IF keeping animals and populations stable is the main concern. Letting nature take its course seems the most reasonable reason in my and many of my classmates opinions, however; considering Isle Royale is an island with harsher conditions eventually both populations of moose and wolves would dwindle causing changes in other populations than as well. The reason behind choosing C is acknowledging the fact that the food web on Isle Royale is rather small to begin with. The only animal that can prey on the moose is the wolf (keystone species of the island). Due to the decline of the wolf population there's nothing to regulate the rapid growth of the moose's causing a trophic cascade. Without the wolves the moose will over graze vegetation and eventually run into starvation, therefore their population falls as well. Bringing wolves over as a one time event will fix the population problem for a period of time but depending on weather and occurrence of the ice bridge in the winter there's no guarantee it will last (the other alternatives result in inevitable change in population). So, IF the main concern is keeping the species alive and their populations active than C would seem to qualify best.

Correspondence: Dear Superintendent Green,
I believe that the best course of action would be to do nothing now, but monitor. The reason why I believe this is because we:
Avoid unnecessary changes to the environment of Isle Royale
Isle Royale is an island that is one of the ones in America that aren't affected by humans as much as the other islands. We can keep it this way by not doing much, and only adding or changing things as absolutely needed. We need to keep an island like this one, for as long as possible, for us to be proud of to have.
Avoid damaging the environment by interfering with nature's course
Of course, changing factors in an environment can be risky. There's a chance that it can throw off the cycle of life on that island, and there is a chance that it can put it back on its feet. Which is why we should only take this risk when it's necessary.
There is still a chance that wolves can naturally migrate to the island.
There is always a chance that wolves will naturally migrate to the island, and the thing that would be good about that would be that we wouldn't have to interfere with anything, and they would get there themselves. I'm sure that if they were able to do it before, they can do it now.
In conclusion, we need to choose option #4 because it is more safe, and less threatening to the environment that is unaffected by humans. This great island we call Isle Royale needs to be preserved for as long as possible.
Sincerely, Josiah [REDACTED]

I love the idea of having more wolves on Isle Royale. I was there this last summer hiking across the island and enjoying the incredible beauty there. Many of us talked about how exciting it was to see the moose as they grazed near our trail, and seeing the wolf tracks on the island was just as thrilling. After talking to one of the forest rangers, we learned that, due to biodiversity, the moose won't survive without the wolves to control their population. If wolves can make a go of it without continuous human intervention, I think we should give them a shot.

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park, one of Michigan's greatest and most beautiful assets. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. I am extremely concerned that, without a robust compliment of wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,
Rick [REDACTED]

Correspondence: The National Park Service Act authorizes parks to "conserve the scenery and the natural and historic objects and the wildlife therein and to provide for the enjoyment of the same in such manner and by such means as will leave them unimpaired for the enjoyment of future generations." Furthermore, several parks are designated under the national wilderness preservation system. The Wilderness Act identifies areas where management (or lack thereof) aims to preserve primitive landscapes primarily shaped by natural processes.

Wilderness National Parks serve several important social and ecological roles. They simultaneously act as a reserve for natural ecological processes whilst providing the public with opportunities to enjoy the manifestation of those processes without impairing their integrity. Meeting this goal is particularly challenging in Isle Royale National Park, where the best available science suggests that wolves will be extirpated within a very short period of time. What should we do?

There is no scientific or social consensus surrounding the definition of "ecosystem integrity" however, if asked, most people will describe something to do with community composition, ecological processes, and system stability. One could argue that, because immigration and extinction are natural processes, humans should not intervene on wolves' behalf. However one counter argument is that immigration and emigration have been negatively affected by humans via climate change (the ice bridge used by wolves has become less common in recent decades). Thus it is possible that we have impaired the integrity of the park and have an ethical obligation under the Act to intervene. This line of questioning is philosophically engaging but I am not convinced that it is useful. Some evidence suggests that moose were introduced to the island a century ago. Older evidence indicates that local Aboriginal Nations hunted woodland caribou on the island. Should we remove moose? Should we reintroduce caribou and permit a limited hunt? How far back do we go? The problem with basing management decisions on ecological states (e.g., community composition) is that states are inherently dynamic. Thus we must arbitrarily decide what ecological state we value.

Rather than focus on any single entity (i.e., wolves) let us focus for a moment on the entire community. Most scientific literature supports the understanding that apex predators such as wolves play a disproportionately important role on basic ecological function (Estes et al. 2011 Science 333: 301-306). Although moose populations within the park are influenced by bottom-up forces such as climate and forage (Vucetich and Peterson 2004 Proc. R. Soc. Lond. 271: 183-189), the best available science indicates that wolf predation is a key ecological process. Removing predation would almost certainly have major consequences for plant communities (primarily mediated via moose and beaver browsing). The resulting consequences for wildfire, disease, soil, water, and biodiversity are difficult to predict but there is evidence that community processes themselves could change dramatically as moose and beaver populations expand with no local predators. Assuming that we wish to maintain Isle Royale National Park as an example of a transitional boreal forest there is little choice but to intervene on behalf of apex predators.

It is also valuable to consider the social roles of wolves independent of their ecological role. Isle Royale National Park is a beacon for many people worldwide. The park inspires people that have never visited because it is one of the few locations east of the prairies where boreal predator-prey dynamics are untrammelled by industry or consumptive recreation (e.g., hunting). It evokes Henry Thoreau and Sigurd Olson in ways that few places can - providing educational, spiritual, and philosophical opportunities that transcend the need to maintain a pure management philosophy. Choosing to let an apex predator die out will impair "the enjoyment of future generations" and runs counter to the overarching purpose of our national park system.

There is no perfect management alternative in this situation. In an ideal world, we would not require resource management. Unfortunately this world is not ideal. As an ecologist, conservationist, and citizen I believe that Isle Royale National Park must intervene on behalf of apex predators. It is in the best interest of the ecosystem and of the public.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation. There have been many studies on the carrying capacity and fecundity rates correlating with a balance of wolves and moose on the Isle.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,

Correspondence: The island was a self sustaining ecosystem. Wolves kept the moose numbers in balance. Moose ate vegetation which was a sustaining loop. It can remain in balance if humans stop meddling. The prey population rises and falls with the predator population behind - wolves are a vital to a healthy system. Leave it alone

Correspondence: Dear Superintendent Green,

You may remember I have communicated with you in the past about this issue. I am hoping this time you will make the right decision for the island and the animals as quickly as possible. I had the privilege to visit the Island in August 2014. The wolf population had diminished greatly at that point. It is a rare and very special place on our planet.

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I will continue to send messages as I have done in past to have wolves reintroduced to the island before it is too late for either wolves or moose and the island.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,

[REDACTED]

Correspondence: Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park, an amazing and unique, special, place in the NPS system. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants, other wildlife in the park, and eventually the moose population itself.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns and thank you for helping protect Isle Royale's fragile environment. I appreciate the effort involved in gathering extensive public input last summer and narrowing down the list of viable management options. I am convinced NPS option C will best manage the wolf and moose populations on the island.

Sincerely,
josie [REDACTED]

Submit Your Comments to Protect Isle Royale's Ecosystem!

(This link will direct you to the Park Service's Planning, Environment & Public Comment website.)

Take Action

Dear [REDACTED]

There were once as many as 50 wolves living at Isle Royale National Park. Now there are only two. For this ecosystem to continue to thrive, we need to bring new wolves to Isle Royale.

We need your help by May 16.

Without wolves, the island's moose population will continue to skyrocket, consuming native plants and eventually running out of food, disrupting the natural stability of the island. It is critical to bring in new wolves to protect the national park.

After gathering extensive public input last summer, the National Park Service has narrowed down their list of management options. The agency is now asking for your input on which option will best manage the wolf and moose populations on the island.

NPCA supports Option C, which requires NPS to bring additional wolves to the park in order to maintain a population of wolves on the island. After many years of consulting scientific experts and reviewing trusted research, we believe this action will best balance the island's delicate environment.

Take Action: Tell Isle Royale National Park Superintendent Phyllis Green and the Park Service to adopt Option C and bring new wolves to Isle Royale. Isle Royale National Park would be a very different place without wolves.

Here's how to submit your comments to the Park Service.

Step 1: Go to <https://parkplanning.nps.gov/commentForm.cfm?documentID=71605> and carefully follow the form instructions.

Step 2: Submit your comments by copying and pasting the sample message below into the "Comments" box on the web form. Remember to personalize your comments by adding observations or stories from your experiences at the park.

Step 3: Once you have completed all of the required fields on the form, click the gray "Submit" button at the bottom of the page.

Sample Message/Comments

Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Correspondence: Dear Sir

I would like to thank you first of all for allowing concerned people to express their opinion regarding wolves in Isle Royale National Park.

I support alternative C as the best course of action/management to repopulate and support the last two remaining wolves located within the park boundaries. As you are well aware, when wolves were reintroduced into Yellowstone National Park after 100 years, the environment rebounded there and was restored to its former state of well-being that is critical for a healthy and well balanced Eco-system. It is crucial that we ensure that apex predators be allowed to flourish and protect them when they have not been. The only way back to a healthy Eco-system in Isle Royale National Park is to ensure that the wolf population be able to "reintroduced" as they were in the very successful Yellowstone project.

Thank you again for letting us express our concerns and comments

Sincerely

Correspondence: I support Alternative C "bring wolves to Isle Royale as often as needed in order to maintain a population of wolves on the island for at least the next 20 years, which is the anticipated life of the plan. The wolf population range and number of breeding pairs to be maintained on the island would be determined based on best available science and professional judgment. This action would occur as soon as possible following a signed record of decision." This option allows for maximum flexibility. Evidence suggests that the few wolves (only 2 at the present) will not be able to keep moose populations in check which will further degrade the island's vegetation. Ecosystems work best when there is a balance and wolves are needed to restore the balance. Absent wolf immigration, which no one can predict, there is no likelihood of having a wolf population without human action.

Correspondence: After reviewing the plan options, I believe the NPS should implement option C and bring additional wolves to Isle Royale for the next 20 years as needed to stabilize the population.

I believe the wolves, while not native to the island, play a role in the maintenance of the moose population. Overpopulation of the moose will have a significant impact on the foliage and plant life impacting the ecology of the island. Having to relocate significant moose to prevent this as considered in a different plan alternative could be costly, much more costly than re-populating the the wolves.

I also believe we bear a responsibility for the decline in the wolf population after the impact of the parvo outbreak and more recently the mine shaft that ended the life of a wolf, along with the radio collared wolf that left the island and was subsequently shot. Since man can be directly attributed to the decline of the population, I believe we bear a responsibility to provide the opportunity for the population to recover.

Each time I visit the island, I am in awe of its natural beauty. As a tourist and camper, I take care to observe the rules and leave as little evidence of my travels as possible. I firmly believe that both the wolf and moose contribute to the continuation of the island's beauty.

I would hate to have this not be available to future visitors because of planning decisions tied entirely to a policy of non-interference and the fact that wolves are not native to the island.

I sincerely hope that my next island visit will occur with the knowledge that wolves are once more thriving in a place of awe inspiring nature.

Correspondence: National Park Service Moose-Wolf-Vegetation Management Plan and Environmental Impact Statement (EIS) for Isle Royale National Park
- revised and narrowed scope -
Public Consultation, June 2016

Alternative A No intervention
Alternative B Introduce new wolves as a one-time event
Alternative C Maintain ongoing wolf population with ongoing introductions
Alternative D No immediate action: develop and implement trigger-threshold for the re/introduction of wolves as per B or C

Introducing myself

I am delighted and honoured to have this opportunity for my views to be recorded and considered. I am not a scientist, but my views are the result of long study and deep thought on Isle Royale and its place in the world. I first came across references to the IR Moose-Wolf Research Study as a teacher in 1989. Since 1995 I have visited and camped on the island many times, up to two weeks at a time, hiking alone or with a group, in rain and shine, sun and snow. I would visit more often if I could easily afford the added expense of travel costs from the UK. I try to keep in touch and up to date, and have read books on Isle Royale history and ecology, each Annual Report of the Moose/Wolf research, regular copies of the magazine 'International Wolf', books 'Of Wolves and Men' by Barry Lopez, 'The Wolves of Isle Royale' by David Mech, and 'A Broken Balance' by Rolf Peterson, a variety of on-line material including watching 2013s forum at Northland College, and cuttings regularly sent to me from friends in Minnesota and Boston. I hope my views can thus be considered fairly well informed for a lay-person.

Considering the Alternatives Now Offered

Alternative A

With only two wolves believed to remain on the island by the time of this consultation, and in any case these unlikely to be available for any natural or management-led 'genetic rescue option, for all practical purposes this Alternative has already been achieved (and if not by the time of this consultation, then in the very near future). It is perhaps, therefore, best considered in the light of this being the present situation, from which point we are considering the way forward: continue with A, or choose one of the other Alternatives.

Alternative B

Whilst this would result in a population of wolves being part of the island ecosystem at least in the immediate future, it would now be extremely unlikely to increase the longevity of the wolf gene pool which has long been recorded and studied on the island. It can only really be considered as a re-introduction, a new population, even if any period with no wolves at all was kept to an absolute minimum. There are many questions to be asked regarding how this would be done, to provide the greatest benefit to the island and allow the most useful continuance of its long-running and internationally-valued scientific study.

Alternative C

Firstly, it is not clear whether the ongoing management of a wolf population would be along the lines of 'continued genetic rescue (introducing further wolves over time, to supplement the new genetic pool on the island), or to follow an 'extinction-reintroduction pattern as currently the case. Each of these would have a significantly different impact. Secondly, the 'life of the plan (at the stated 20 years) is of course infinitesimal in terms of the cycles of the natural environment, and does not seem an appropriate limit to thinking and planning - would not a better aim be 'ongoing or 'for the foreseeable future? Also, frequently-repeated acts of intervention would certainly devalue, if not actively prevent, the ongoing science (which has hitherto benefitted from a fixed gene pool) and could quickly become more typical of zoo or wildlife-park management.

Alternative D

Any 'resource indicators and thresholds which might be developed and applied to the situation on the island would surely need to be sensible, practical, simple, and easily discernible. Perhaps the current situation, together with the many years of past scientific learning, both on the island and elsewhere, would suggest that any such indicators are already adequately shown, and indeed any valid threshold has already been crossed. Is that not why we are here today, needing to seek the best way forward?

NB

There is some noticeable over-lap between Alternatives B and C. Perhaps indeed they may be in many ways seen as different degrees of the same Alternative - a valuable view-point:

Considering Alternatives B and C together

If B, and eg. the re-introduced wolves left the island on an ice-bridge the next winter, the NPS would be faced with the decision process all over again. If B was the Alternative decided upon, would there be no revision? Would the 'one-off decision be upheld regardless? Or would a further re-introduction then need to be properly considered? making it more like Alternative C.

If C, with ongoing introductions of wolves to maintain a wolf presence, presumably within clearly specified parameters, once may prove to be sufficient - making it more like Alternative B.

B and C would thus appear as opposite ends of the same scale, from least intervention through to maximum/unlimited intervention. If a one-off reintroduction was sufficient to last the 20 years projected, or indeed longer, no further management would be necessary in that time; however, if it failed for whatever reason (whether quickly or after some longer period), what then?

Also, if the decision is made now for either B or C, then it would imply the acknowledgement of a definite value in having a population of wolves on the island; in either case it would thus require a major change of opinion (and further consultation/decision) to later reject that value and leave the island without wolves, at any point in the future.

If either Alternative B or C is decided upon, by implication valuing a wolf population on the island, perhaps we should consider how that value may be determined and measured. From what I understand, the presence of a constant pack of wolves on the island is valued in terms of:

1. Science

Its not just any science, nor even just any vegetation-moose-wolf science, its the continuation of the long-running current study that is of such importance. That the study on Isle Royale has been of tremendous value both nationally and internationally cannot be in doubt. It would be madness indeed if it could not be of benefit to Isle Royale itself at this crucial decision time. The length of data-collection for this research makes it entirely unique in the world, and thus of greater value than the sum of multiple shorter studies, for the depth of knowledge and understanding gained. Such depth of knowledge and understanding is surely needed today, and for the future of the planet as a whole; too late at some point in the future to realise the loss is a sorry mistake. Only on Isle Royale could such a study take place, for its findings to be applied to so many other predator/prey situations around the planet.

I can think of two additional reasons which can only increase the importance of this unique island 'laboratory' far into the future. First, might ongoing Isle Royale moose/wolf research not prove of high value and, at the same time, of low risk, for understanding how we can help other 'islanded' ecosystems cope and remain in sufficient natural balance for a sustained future? Throughout the world one of the biggest threats to biodiversity is the increasing incidence of 'islandisation', as human demands on the environment lead to the fragmentation of natural ecosystems and their subsequent collapse. Second, would there not be an important role for the island with its moose/wolf study, in the emerging scientific field of neuroconservation, the investigation of how natural environments could be essential for human well-being?

2. Wilderness

The attraction of the Park to most, if not all, visitors (including myself, and the people I have met there) is its wilderness status - that is its intrinsic value to us. The more man-managed is the Park, the less it can be seen as 'wilderness, and the less unique and attractive it will seem. To turn the island into just another wildlife park would be to devalue, or lose entirely, its uniqueness, its real worth. A crucial part of the setting of Isle Royale is its being a place where humans can truly experience living with and being a part of a complete and viable wilderness. Perhaps this is the greatest lesson the island can teach us, and the most important lesson we need to learn, for the widest benefit to the entire planet and to the human race:- humans too are part of nature, and must find a way to live within it, not assume we know best and should expect to be able to control it.

3. Public enjoyment

A great part of the publics enjoyment of the Park is its wilderness status, as mentioned above. Its visitors - notably, of which more are returning visitors than in any other US National Park, which should tell us something important - will not all be able to hike into the remoter areas or sleep far away from the hubs of more civilised support. But all can enjoy experiencing the benefits of life at a slower pace and with different priorities than they may know back home, all can witness the strength of a natural ecosystem that has full integrity, all can see the order and balance that life continuously moves toward. And everyone with whom I can ever recall sharing my time on the island enjoys (feels intrigued by, involved with, and enriched by) the moose-wolf study as it has developed over the years.

4. Education

The opportunities for education have been rich indeed over the past many years, and it would be a sad loss if these were to be diminished by changed management priorities. We have been able to observe the natural balance of a wilderness ecosystem, nature existing in a more complete, properly functioning and balanced way than we are generally privileged enough to witness; to sense our own involvement in science, no matter how small a part we play; to think of ourselves as part of the natural world and to meet personal challenges in the remote wilderness; to experience an ecosystem with every trophic level represented, and a top carnivore in control.

Uniquely on this island over the past 50 years, such rich educational experiences have been accessible to all who visit - to so many people from all walks of life, not just to a highly privileged few. Its through education, the sharing of such an experience, that people may begin to know the importance of wilderness, and by knowing its importance begin to care about, and act on behalf of, its future. On Isle Royale, we learn to see 'luxury in the smallest of benefits, to appreciate what we have, to not waste our planet, and to not take for-granted the ease with which we currently live our daily lives. Some come here expecting these experiences, many come specifically to repeat them, and some are drawn into them without realising. All are on a level playing-field: we walk the same trails, cross the same swamps, shelter under the same trees, drink from the same lakes and sleep on the same ground as the wolves - this teaches us much about ourselves, about how we too are 'natural', just one part of an environment upon which we have such a critical impact.

5. Prioritising ecological integrity

There are so few places on the planet where this is truly achievable, never mind happening: can we really afford to shift our focus? We need ecosystems that already have integrity (quality and completeness), as on Isle Royale. If this is as important an aim for Isle Royale, as much as for any other National Park, clearly the time-scale of any intervention is crucial. Already time has been lost through the process of consultation and weighing of all the odds before making a decision. Unfortunately, SO much time has been lost that the possibility of other, perhaps more beneficial or simpler or less expensive Alternatives to preserve the islands ecological integrity, has now been lost along the way.

Much of its ecological integrity comes from the uniquely-natural balance of the islands life, and the opportunity this offers to study and learn the processes of natures forces - between predator, prey and vegetation, rather than the more usual way through a false balance intimately managed and rigidly imposed by humans.

These 5 aspects would appear to be as closely interconnected and as critically interdependent as any of natures own systems: we lose the balance at OUR peril.

Taking all this into considered account, my choice is for

Alternative B

partly because it offers the best possibility for the quickest action, which has already been too-long coming, and also because it offers the best remaining opportunity for the scientific study on the island to continue, since there is now no possibility of a genetic rescue alternative (which was my choice in the

previous consultation round).

However, I would like to add the proviso that, if a one-off reintroduction should fail at any time (either quickly, or over a longer time period) that the ongoing scientific study of the moose and wolves on the island, with those scientists it involves, should form the basis for the further decision-making, perhaps moving some degree further along the 'scale towards Alternative C.

I believe that whatever action is taken, whichever Alternative is decided upon, the best outcome will result from considering what would offer the greatest benefit and cause least detriment to the continuance of the islands existing Moose/Wolf study. This science and its scientists, are clearly best-placed to lead the consideration of environmental consequences, and to fulfil the responsibility of the NPS to prioritise the ecological integrity of the island in its role as an area of wilderness.

Thank you very much for this opportunity to contribute my response.

Please will you carefully consider my views, as stated here, before coming to your decision on the future management of Isle Royale.

Thank you.

Dear Superintendent Green,

I am [REDACTED] grade student at [REDACTED] MN. Me and my classmates have been doing a lot researching on Isle Royale and we were researching on the wolf and Moses populations. I was worried about the loves their.

I think that you guys should not do anything for know but keep on watching them to see if they get better or worse because it could get a lot better.

That is what I think what you guys should do, I hope you guys make a good choice.

Sincerely,

Correspondence: Nature needs a balance of animal population in any natural environment. In my opinion option "C" is the best workable option. Wolves play a very important part in balancing animal population - of one or the variety of animal species living in the natural environment, food supply- more animals of one species eating multiple plant variety will deplete food supplies for other animals sharing the same environment with the same plant diet, therefore causing starvation and desolation of that particular environment. That's when humans need to step in and save animals from starving. Having wolves in the environment takes care of prevention of natural food stocks and avoid human intervention.

Correspondence: I and four of my children were privileged to enjoy the pristine beauty of Isle Royale in the summer of 2013 when we hiked across the Island on the Greenstone Ridge Trail. Preserving the beauty of that untouched wilderness should be the primary objective of the National Park Service.

A proper wolf/moose balance is necessary to ensure that the vegetation and forest cover on the island are not severely impacted by the foraging of an unchecked moose population. This ensures, in turn, the stability of the Island's ecosystem.

Currently, there are only two wolves on the island. They are old and severely inbred. It is almost a certainty that, without intervention, the wolf population will become extinct. Therefore, I believe it is necessary to introduce new wolves to the island. I prefer a one-time intervention (Alternative B), as that is most consistent with the National Park's policy of minimal intervention. Hopefully, a thoughtful intervention will be enough to perpetuate a wolf presence on the Island. Perhaps we will get some colder winters that create ice bridges which would allow additional wolves to migrate to the Island.

The argument against introducing wolves is that we should "let nature take its course". This argument, however, is specious: Perhaps the major reason that the wolf population faces extinction today is because of a human action from the early 1980s - a disease that the wolves caught from a pet dog brought to the Island by a visitor. To quote from the Moose-Wolf Study website:

The next two years were dramatic. Wolves plummeted from 50 to 14. Canine parvovirus, a disease inadvertently introduced by humans, was largely to blame for the decline . With only 14 wolves, extinction was a real concern.

Thus introducing wolves to the island would only be offsetting the deleterious effects of an earlier human action. I urge the National Park Service to take this responsible step as soon as possible, so that future visitors will be able to enjoy Isle Royale in the same way that our family did.

Correspondence: I chose alternative D which is to let nature take its path. Bring more wolves when the two wolves on Isle Royale die. I like alternative D because there will be a perfect amount of wolves, cause the might mate. If you chose alternative C there will be to many wolves, and the wolves will probably mate and make even more wolves. You shouldn't choose A either, because you don't want them to die and not put more wolves in Isle Royale. B is a bad idea also, because there will only be a little amount of wolves. That's how I feel about the wolves situation.

Correspondence: I Picked Alternative C because if the wolves keep dying we just need to keep bringing in wolves so the moose population goes down and the herbivores will have enough plants to eat. So after 20 years the wolves can survive longer and breed. Also, the reason why I didn't pick Alternative A is because you can't let the wolves die out because studying of Isle Royale will end. Alternative B is just bringing in wolves once which could also end studying. Alternative D is like what B is. That's why I didn't pick Alternative A,B,or D,And why I picked Alternative C.

Correspondence:

I think we should bring wolves and keep bringing them for the next 20 years so there won't be inbreeding.If there is inbreeding then the wolves will keep dying. There is no Isle Royale without the wolves. People won't come if there are no wolves. If they leave it alone the wolves will die. There won't be 2 wolves but there will be zero wolves. I want wolves on Isle Royale . I didn't choose the other choices because if they do the other choices, they will die and be gone forever.

Correspondence: On Isle Royale National Park the wolves had been deformed so, their bones were bad. I pick Alternative D because I want to wait and see what will happen to the wolves on Isle Royale and if something happens to the wolves on Isle Royale I will pick Alternative C because the moose are eating all of the plants. So, this is why we should introduce new wolves as needed for the next 20 yrs. I didn't pick the other ones because I don't want to leave the wolves alone on the Isle Royale so they can die. I don't want to introduce wolves for a one time deal. This is why we should bring some more wolves in to Isle Royale.

Correspondence: I think we should bring wolves as needed over the next 20 years. I want to save the wolves. They are dying of inbreeding. If we bring fresh wolves to Isle Royale it could save future wolves and fix the low population of wolves. Wolves are an important species of animals. They should not die just because of us not bringing in fresh wolves. Also, only bringing fresh wolves once could probably not save them. We should not let nature take it's course because we need wolves on Isle Royale. Bringing in wolves from other places needs to happen. There are only two wolves in Isle Royale. There could soon be only one wolf. Now is the time to bring in fresh wolves. We need to bring in fresh wolves to Isle Royale as needed over the next 20 years.

Correspondence: Bring wolves as needed over the next 20 years- soon even though the whole point of Isle Royale is to let mother nature take its course; we are a part of mother nature. So let us bring in more wolves. If you don't, what is the whole point? If we leave Isle Royale alone the wolves would die and the moose would start eating everything. If we wait and see, it would be too late. If we bring some wolves and then stop, it's only a one time deal.

Correspondence ID: 3861 **Project:** 59316 **Document:** 71605

Received: May,25,2016 12:12:42

Correspondence Type: Web Form

Correspondence: I want to bring wolves in over the next 20 years. We could bring 5 wolves in every 4 years for 20 years or more wolves every year for 20 years. The moose are eating all of the vegetation. That is affecting the wolves' way of life. Almost every winter, an ice bridge forms which some wolves try to cross. The fastest and closest way is to Canada. Some wolves don't make it to Canada or where they want to go and some do.

Isle Royale is the longest ever study in the world. People have studied Isle Royale for over 40 years. People think we should leave the island alone and let nature take its course. But there are only two wolves left.... We have to do something.

The wolves have been inbreeding, or mating with their relatives and siblings. So, when the females have their babies, the babies come out deformed or born with bad spines. Some wolves can die of that also.

Wolves at Isle Royal are dying out and we are their only hope. We need to help them.

Submit Your Comments to Protect Isle Royale's Ecosystem!

(This link will direct you to the Park Service's Planning, Environment & Public Comment website.)

Take Action

Dear [REDACTED]

There were once as many as 50 wolves living at Isle Royale National Park. Now there are only two. For this ecosystem to continue to thrive, we need to bring new wolves to Isle Royale.

We need your help by May 16.

Without wolves, the island's moose population will continue to skyrocket, consuming native plants and eventually running out of food, disrupting the natural stability of the island. It is critical to bring in new wolves to protect the national park.

After gathering extensive public input last summer, the National Park Service has narrowed down their list of management options. The agency is now asking for your input on which option will best manage the wolf and moose populations on the island.

NPCA supports Option C, which requires NPS to bring additional wolves to the park in order to maintain a population of wolves on the island. After many years of consulting scientific experts and reviewing trusted research, we believe this action will best balance the island's delicate environment.

Take Action: Tell Isle Royale National Park Superintendent Phyllis Green and the Park Service to adopt Option C and bring new wolves to Isle Royale. Isle Royale National Park would be a very different place without wolves.

Here's how to submit your comments to the Park Service.

Step 1: Go to <https://parkplanning.nps.gov/commentForm.cfm?documentID=71605> and carefully follow the form instructions.

Step 2: Submit your comments by copying and pasting the sample message below into the "Comments" box on the web form. Remember to personalize your comments by adding observations or stories from your experiences at the park.

Step 3: Once you have completed all of the required fields on the form, click the gray "Submit" button at the bottom of the page.

Sample Message/Comments

Dear Superintendent Green,

Thank you for the opportunity to comment on the management plan for Isle Royale National Park. I am encouraged to see that the Park Service has narrowed the scope of this plan to focus solely on the future of wolves at the park. With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,

Brittany [REDACTED]

Correspondence: I think we should go with plan c . Plan c is where you bring more wolves in as needed over the next 20 years.C is because if the wolves died out the spirt of the wolves will be gone. Do you really want that. WE should not go with plan A B or C because A is where you leave it alone the means DON'T TOUCH IT . Plan b is you bring wolves in 1 time . ITS A 1 TIME THING. Plan d is to wait and see if the moose eat everthing . If the moose eat everthing they will go with plan b or c . Plan c is best for Isle Royal wolves and moose. That is why need yo go with plan c.

Correspondence: The wolves and moose on Isle Royale should be alternative "A" we should leave them alone. I know that if we leave them alone we will be able to learn about our environment and what we are doing to it. In Dec. in 2010 to Jan. 2011 only two pups survived their first winter. There were 3-5 female wolves and on Isle Royale in 2012. There were also nine wolves in all at that time. In 2013 there eight wolves on the island. There were 975 moose and six moose were killed that year. In the year of 2014 there were nine wolves. In 2015 there were 1,250(est) moose! In Feb. 2016 there were only two wolves on the island which were one male and one female. They were father and daughter and brother and sister! I didn't choose alternative "B" or "C" because if we bring wolves on the island we will ruin the study. Also, if we choose alternative "B" or "C" and have it be a one time deal the wolves might die out and the exp. will be ruined. I picked alternative "A" because I think we will be able to learn more about Earth. Like, we are putting pollution in our atmosphere, and making it warmer which is why the ice bridges aren't forming. I hope you understand why I chose alternative "A".

Correspondence: Wolves do not need to be introduced to Isle Royale. I prefer the Alternative A solution. Let wolves migrate there naturally. Then you can figure out how to control them. Look at Yellowstone and the problems they are having with stakeholders in the community and wolves infringement on the property of ranchers and population in the area. A problem would just be created where there was not one previously, do not introduce wolves into the park it will cause problems.

With only two wolves left at Isle Royale, I'm concerned about the future of the island's ecosystem and the visitor experience. Without wolves, the moose population will continue to increase, eating until the food sources are gone. This will have disastrous impacts on native plants and other wildlife in the park.

I support Alternative C, bringing new wolves to the island as needed to maintain their population. Introducing new wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The National Park Service should adopt and implement this management option quickly to maintain ecological balance on the island.

Thank you for considering my concerns.

Sincerely,

Carlin [REDACTED]

Correspondence: The wolves and moose should be alternative "D," to wait and see what happens. If things get too over whelming and if moose start to eat the entire island, and if there are no more wolves left, we can transfer about twenty wolves to the island by boat for now. If moose are still over populated on Isle Royale, I think it would be a good choice if we send hunters to kill a little fraction of the moose on the island.

We should not choose alternative "A" because if we don't interfere and let nature take its course an ice bridge may never form again. The wolves on Isle Royale may be extinct, while the island is disappearing from the moose multiplying too fast and eating too much.

Correspondence: Without wolves, the island's moose population will continue to skyrocket, consuming native plants and eventually running out of food, disrupting the natural stability of the island. It is critical to bring in new wolves to protect the national park.

After gathering extensive public input last summer, the National Park Service has narrowed down their list of management options. The agency is now asking for your input on which option will best manage the wolf and moose populations on the island.

NPCA supports Option C, which requires NPS to bring additional wolves to the park in order to maintain a population of wolves on the island. After many years of consulting scientific experts and reviewing trusted research, we believe this action will best balance the island's delicate environment.

Correspondence: I think the Park Service should reintroduce wolves to Isle Royale. They will stabilize the moose population and prevent destructive overgrazing of the forest. Plus, the wolf / moose relationship is an iconic part of Isle Royale. I also don't think we should worry that human introduction is a serious intrusion on the wilderness aspect of the park. The reality is that North America and the rest of the world are already irretrievably changed by human civilization so restoring the top predator to the island should not be considered an unacceptable intrusion by human beings.

Correspondence: Have followed the wolf/moose story for the past 20 years and Isle Royale has always been a place I wanted to visit because of the interaction between these two species. I was fortunate enough to visit the park last year and found it to be beautiful. While we did not see any moose or wolves (since there were only 3), I enjoyed visiting the moose/wolf study center and learning first hand what life was like for these two animals. The islands without the wolves and moose (together) would not be as appealing and I truly believe the overall landscape would dramatically change (due to overeating by the moose) and less appealing to visitors. You have a special thing going at this park. Introducing new wolves as needed (option C) is the right call. Remember, they did this at Yellowstone and it has finally brought the park's wildlife system back to where it is supposed to be.

Correspondence: Isle Royale is an amazing place that holds great natural beauty but also great insight into population dynamics. The declining wolf population and increasing moose population presents some thought provoking questions about management of natural resources. The big questions of 'do we need to manage our natural resources?' and 'what circumstances require us to manage our natural resources?' are not easily answered. The contributions of every biologist who took part in the wolf/moose study is worth while and I'm sure influences the decisions of the National Park Service. I feel that any of these choices the Park Service has offered weren't come to lightly. My comment is that Isle Royale has my unwavering support. To manage a piece of land is to love and respect it. How we love and respect our land is where this debate lies.

Correspondence: National Park Service has been receiving comments for a long time, the majority of which favor reintroducing wolves to Isle Royale. So far, however, the Park Service has chosen to dither and effectively chosen the do-nothing option. I question why the Park Service chooses to receive comments and then disregard them without explanation. If there was a question of what would happen to the wolves and moose on Isle Royale without intervention, that is no longer an issue as that is what we are currently witnessing. It is far past time to either reintroduce wolves to the island or accept that it will continue to be overpopulated with moose.

Correspondence: I am in favor of no action. Allow nature to take it's course. Wolves came to this island by natural means, and, by most part, have come to the brink of extirpation by natural means. An absence of wolves and a build up of moose may lead to a more tempting call for more wolves to cross a future ice bridge naturally. Interfering with natural process would be a violation of what the national park service stands for. The only justification that I can see to taking action is the fact that mankind allowed the parvovirus to decimate a large portion of the wolves years ago. However, if that were the call to action, I feel that action should have been taken years ago to replenish the existing population, but that action was not taken. Other than that, I do not agree with the rationalization that scientists use about gaining more knowledge or perpetuating an experiment, nor do I agree with the reasoning of humans impacting climate change, thus justifying intervention. I believe that is far-fetched. I also do not agree with the rationalization that the park needs wolves to be in equilibrium or to keep the island "enjoyable." Again, a synthetic means of doing that is a violation of what the NPS stands for, which is precious. I favor no intervention on the island itself to implant wolves. If anything, take further action to support wolf populations surrounding the park in Minnesota and Michigan, thus fostering the natural immigration of wolves back to the island.

Correspondence: The choice is between a complete ecosystem, with wolves maintaining the health of the moose and forest, and a wilderness (a place where people don't manage the wildlife.) I vote for a healthy ecosystem, managed by wolves. One really neat possibility, the genetic rescue of the Isle Royale wolves, was lost because of the slow process by which the NPS makes resource management decisions, at least in this case. Someone should look into this so that others can learn from the mistakes made at Isle Royale.

Correspondence: After spending 8 days in Isle Royale National Park, attending three public talks about the wolf and moose populations there, reading two books about the park and the wildlife, talking with friends, and reflecting on these experiences, I believe that Alternative C would be the best plan. At the heart of my recommendation is the conviction that wolves are an important part of what makes Isle Royale a wilderness. Indeed, without their presence, the sense of wildness is missing from this park.

Furthermore, based on my 20 years of living in Alaska, and another 15 out west, it is clear that wolves do not have it easy in most other places. Isle Royale is a place where they can be their wild selves without serious repercussions from humans.

Now that I am a resident of the Midwest, my spirit longs for wilderness experiences. Isle Royale National Park is one of the few places that nourishes my spirit. The wolf presence on the island is essential to that feeling. Since humans are partly to blame for the demise of the wolf on the island (through global warming, introduction of disease, and failure to cover mine pits), it is fitting that humans take action to repopulate the island with wolves.

As a former employee of the [REDACTED], I know that human action can help wild species to make a comeback, and this is a similar case where human action is necessary.

Finally, as a person with an indigenous genotype, I do not see myself as separate from wilderness, but a part of it, so to bring wolves to Isle Royale is consonant with my worldview.

Correspondence: I support taking no action of any kind that will trammel the natural ecosystem processes of Isle Royale. The wolves should be left to come and go through natural migration even though they may die out. Untrammled is arguably the primary quality of wilderness character and a central tenet of federally designated wilderness.

I'm concerned about federal agencies particularly the National Park Services' trend in trying to preserve the natural quality of wilderness character at the expense of the untrammled quality. I'm aware of the "improved" ecosystem functioning due to a trophic cascade when wolves were reintroduced to Yellowstone. However, there are two major differences between some place like Yellowstone and Isle Royale: 1) Yellowstone is not designated wilderness; 2) Yellowstone is not an island. It is well known that island biogeography can create some "oddities" compared to ecosystems that are more connected. Thus another argument is that leaving Isle Royale untrammled presents a unique scientific opportunity.

Please know I am not anti-wolf by any means. I oppose aerial wolf shooting, liberal limits on hunting and trapping wolves, etc (of which there is too much of in Alaska). I love wolves and wildness and wilderness, but there just needs to be some places in this country where we leave things be and see what happens. Those places are designated wilderness. Thank you for considering my comments.

Correspondence: Please put new wolves onto Isle Royale. This 50 year study should not be ended so terribly. The wolves keep the moose to a reasonable population and do not kill "for fun". If you don't have wolves here, then in a few years you will be faced with an over population of moose, who will then destroy the parts of the natural forests & trees, some of which will become extinct in their own right. The knowledge gained from these studies is invaluable. The Nps has intervened in other ways in "wilderness" so to add a few new wolves to the island is not a terrible intervention. It should have been done a few years ago when it was becoming obvious there was a genetic problem. An over population of moose creates so many more problems. Put new wolves onto Isle Royale!

Correspondence: I have been following the incredibly sad story of the Isle Royale wolves. With the politicians justifying wolf hunting under many disguises, I do not understand why it is so difficult to decide whether to save wolves doomed to die regardless of which side of the water they are on. If there is an abundance of prey in the park, why would authorities who are responsible for our national parks let the park literally disintegrate. Please give serious consideration to capturing and moving a pack of wolves to restore the population on Isle Royale and improve the ecosystem there. If necessary, research what has happened in Yellowstone since reintroduction of wolves in 1995. Thank you for your consideration.

Correspondence: I think it is clear that the problem with the wolves on ISRO is the National Park Service. Your planning process is unable to deal with the rapidly changing problems caused by man's current influence on the planet. You allowed man-made events to affect the balance of nature on the island. You requested comments and waited and the wolves are now gone. Next we will see the over population of Moose and the decimation of the ecosystem.

Management plays games with the designations of wilderness and non-wilderness to a truly absurd degree. You can have a 200 hp motor here but step over this line and you can't have any wheels. This is wilderness but right over there is not. We can not introduce wolves to protect the balance of the park ecosystem but we can have firefighting crews and replace toilet paper in wilderness outhouses with a helicopter. Have you had Karl Rove do an upper management seminar on spin doctoring?

The Park Service has failed!

The Park service is unable to meet their responsibility to protect the resource. The problem is the process and it needs to be changed or given to another agency who can respond in the time-frames needed to prevent catastrophic destruction to the island.

The NPS is not qualified.

Correspondence: I Support Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Correspondence: I urge you to adopt Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Thank you for your consideration.

Correspondence: When in doubt let nature rule itself. As much as I love the natural world and wolves who bring the trophic cascade; I am opposed to importing wolves onto Isle Royale. I have backpacked on Isle Royale and knowing wolves lived there in a proper order was exhilarating. Human intervention of wolf habitat on Isle Royale is a mistake. For one thing the Congress of the USA is about to pass yet another anti-wilderness bill for oil and gas production among other things. This bill at present also includes the delisting of wolves as endangered specifically in MI. (I believe Wisconsin was also included) How will the delisting of wolves along with their reintroduction to Isle Royale affect the park itself. That of course is a loaded question and I will not address all those facets here. I think it's best to leave Isle Royale to its own natural devices. Alternative A.

Correspondence: Wolves are relative newcomers to Isle Royale, having arrived in the late 1940s by walking across frozen Lake Superior from northeastern Minnesota or Ontario. Other wolves have arrived since that time and, conversely, many have also left. The island's wolves have been the

subject of one of the longest-running studies of predator-prey relations. But inbreeding and other factors associated with their isolation have caused the wolf population to steadily decline for many years.

With the wolf population now at only two, many are calling for capturing wolves from the mainland and translocating them to the island, where they are likely to suffer the same "inbred and deformed" future as those currently there. The motivations for exiling the mainland wolves to the island are primarily to continue the predator-prey study and to satisfy tourist desires to see or hear wolves. There is some concern that Isle Royale's moose population-the wolves' primary prey-could explode, but moose numbers are declining throughout the upper Midwest to the point they have been proposed for listing as a threatened or endangered species.

The pro-transplant voices ignore that 98 percent of Isle Royale is designated Wilderness, and by law must remain "untrammled" (unmanipulated, untamed, wild) with natural processes unimpeded by managers. In Wilderness, nature calls the shots.

The National Park Service is considering four alternatives:

Alternative A: No action. Wolves would come and go based on natural migration.

Alternative B: NPS would engage in a one-time (over three years) translocation of wolves to extend their longevity on the Island.

Alternative C: NPS would translocate wolves as often as needed over the long-term to maintain a wolf population on the Island.

Alternative D: NPS would continue current management of allowing natural processes to control, but could bring wolves to the Island in the future if certain conditions related to prey or vegetation are met.

Wilderness Watch works to protect wolves in Wildernesses across the country, including going to federal court several times to protect them from trapping, shooting, and other forms of harassment. We believe that in Wilderness natural processes, not human demands, should determine whether predators stay or go. For this reason, Wilderness Watch strongly supports Alternative A, the no-action alternative, which would honor and preserve the area's wilderness character while letting the wolves decide if they want to recolonize Isle Royale.

Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Correspondence: I am concerned about the welfare of Isle Royale, and its remaining wolves. I also remain deeply disturbed with the ongoing persecution of wolves in our country. It seems our government is becoming less concerned with protecting wildlife due to ongoing pressure from ranchers, hunters, Big Ag and Oil. This includes the few remaining wolves in Isle Royale. I have reviewed the National Park Service's four alternatives, and the only one that makes sense is Alternative A. We need to allow nature to keep more areas in wilderness "mode". We have already lost too much wilderness and wildlife to human greed and ignorance. Ecosystems and Mother Nature need to be in control of this area, not humans. We should study the effects of the region's loss of the wolves, if it happens, rather than relocating wolves from other territories.

Correspondence: The National Park Service (NPS) is asking for public comments as it considers whether it should transplant wolves to the 133,000-acre Isle Royale National Park and Wilderness in Lake Superior to replace those dying or leaving. It is a challenging question, yet one with a clear answer.

Background

Wolves are relative newcomers to Isle Royale, having arrived in the late 1940s by walking across frozen Lake Superior from northeastern Minnesota or Ontario. Other wolves have arrived since that time and, conversely, many have also left. The island's wolves have been the subject of one of the longest-running studies of predator-prey relations. But inbreeding and other factors associated with their isolation have caused the wolf population to steadily decline for many years.

With the wolf population now at only two, many are calling for capturing wolves from the mainland and translocating them to the island, where they are likely to suffer the same "inbred and deformed" future as those currently there. The motivations for exiling the mainland wolves to the island are primarily to continue the predator-prey study and to satisfy tourist desires to see or hear wolves. There is some concern that Isle Royale's moose population—the wolves' primary prey—could explode, but moose numbers are declining throughout the upper Midwest to the point they have been proposed for listing as a threatened or endangered species.

The pro-transplant voices ignore that 98 percent of Isle Royale is designated Wilderness, and by law must remain "untrammelled" (unmanipulated, untamed, wild) with natural processes unimpeded by managers. In Wilderness, nature calls the shots.

The National Park Service is considering four alternatives:

Alternative A: No action. Wolves would come and go based on natural migration.

Alternative B: NPS would engage in a one-time (over three years) translocation of wolves to extend their longevity on the Island.

Alternative C: NPS would translocate wolves as often as needed over the long-term to maintain a wolf population on the Island.

Alternative D: NPS would continue current management of allowing natural processes to control, but could bring wolves to the Island in the future if certain conditions related to prey or vegetation are met.

Wilderness Watch works to protect wolves in Wildernesses across the country, including going to federal court several times to protect them from trapping, shooting, and other forms of harassment. We believe that in Wilderness natural processes, not human demands, should determine whether predators stay or go. For this reason, Wilderness Watch strongly supports Alternative A, the no-action alternative, which would honor and preserve the area's wilderness character while letting the wolves decide if they want to recolonize Isle Royale.

☞ Support Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

☞ Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

☞ Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Correspondence: For once, in this specific situation, Let Nature Take Its Course.

Please respect that the wolves which are there migrated themselves.

There should be NO human interference in this natural process and NO ACTION should be taken to intrude in this population in any way.

As wolves have only inhabited Isle Royale for a tiny fraction of post-glacial time, it is not for Man (for whatever possible reason) to interfere in their lives on the Island. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study. .

The Island is supposed to be a Wilderness Area and the fact that scientists have 'used' this unusual wolf population for studies should in NO WAY justify human 'meddling' in the wolf's existence in the unique context. There is no reason to add to their numbers for gawking tourists nor for well meaning scientists.

Please do NOT do anything.

Thank you for showing respect for nature however cruel it may seem there is no 'intention' of cruelty as there is for many human interactions often based on well meaning interference.
If someone wants to continue wolf populations this should be done in places where they have a longer 'history' of habitat but widespread slaughter in the name of saving livestock seems to be the norm. Don't make the Island a wolf ghetto for 'study' in the name of perpetuating wolf populations nor for the 'pleasure' of visitors to see wolves up close and personal.

Correspondence: I strongly urge you to adopt Alternative A and let Nature decide whether wolves belong on Isle Royale. The very fact that the breeding success of those wolves who crossed over the ice in the 1940s to colonize the island has been marred by inbreeding and inherited mutations would strongly suggest that any wolf colony there is not going to survive for long term. Wolves need huge ranges and opportunities to travel far distances to find mates of a different genetic background. It is cruel to trap wolves on the island, even as large an island as Isle Royale.

As a scientist, I sympathize with the researchers who wish to continue their studies on predator-prey relationships, but in truth, this colony is an artificial construct and the research may be flawed simply due to genetic drift and isolation. Studying cells in dishes and animals in cages is often done in laboratories, and in fact, that is how much of our progress in Genetics and the search for disease-causing mutations in humans has been made. But studying a wild animal who is NOT well-adapted to its habitat (as judged by its inability to survive and maintain its numbers) may reveal only artifact.

Please do not sacrifice any more wolves to this study. Support Alternative A and keep the island natural. If any wolves travel to reside there, fine, but do not bring them in on purpose, let Nature decide.

Thank you.

Correspondence: I support Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Thank you for your time and consideration of these comments.

I wish you the best of luck with this project.

Sincerely,
Joe [REDACTED]

Correspondence: The National Park Service is considering four alternatives:

Alternative A: No action. Wolves would come and go based on natural migration.

Alternative B: NPS would engage in a one-time (over three years) translocation of wolves to extend their longevity on the Island.

Alternative C: NPS would translocate wolves as often as needed over the long-term to maintain a wolf population on the Island.

Alternative D: NPS would continue current management of allowing natural processes to control, but could bring wolves to the Island in the future if certain conditions related to prey or vegetation are met.

Wilderness Watch works to protect wolves in Wildernesses across the country, including going to federal court several times to protect them from trapping, shooting, and other forms of harassment. We believe that in Wilderness natural processes, not human demands, should determine whether predators stay or go. For this reason, Wilderness Watch strongly supports Alternative A, the no-action alternative, which would honor and preserve the area's wilderness character while letting the wolves decide if they want to recolonize Isle Royale.

Correspondence: National Park Service (U.S. Department of the Interior)

Thank you for the opportunity to provide input on the habitation of Isle Royale's Wilderness status. As an environmentalist involved in maintaining our American Natural Wilderness, Supporting Alternative A is the only proposal that honors and upholds Isle Royale's Wilderness status....allowing nature to take it's course.

Please note that Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial period. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history. The current situation, in nature's way, has set the situation where we should let the environmental conditions create the ability to have wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study. That manipulation would be artificial and continue man's intervention to produce artificial wildlife and an imbalanced environment. That would not solve the problem of the wolf population....solving nothing.

Accept Alternative A, collecting scientific data to determine the status that limited the number of wolves on Isle Royale's Wilderness, would best serve our public agency and the environment. Such research could possible assist in providing more information for our wilderness areas in other locations.

Thank You,

Correspondence: Wolves are relative newcomers to Isle Royale, having arrived in the late 1940s by walking across frozen Lake Superior from northeastern Minnesota or Ontario. Other wolves have arrived since that time and, conversely, many have also left. The island's wolves have been the subject of one of the longest-running studies of predator-prey relations. But inbreeding and other factors associated with their isolation have caused the wolf population to steadily decline for many years.

With the wolf population now at only two, many are calling for capturing wolves from the mainland and re-locating them to the island, where they are likely to suffer the same "inbred and deformed" future as those currently there. The motivations for exiling the mainland wolves to the island are primarily to continue the predator-prey study and to satisfy tourist desires to see or hear wolves. There is some concern that Isle Royale's moose population-the wolves' primary prey-could explode, but moose numbers are declining throughout the upper Midwest to the point they have been proposed for listing as a threatened or endangered species.

The pro-transplant voices ignore that 98 percent of Isle Royale is designated Wilderness, and by law must remain "untrammled" (unmanipulated, untamed, wild) with natural processes unimpeded by managers. In wilderness, nature calls the shots.

Given the above realities, I urge you to support ALTERNATIVE A, which would allow wolves to freely move about based on natural migration patterns. Also, Alternative A is the ONLY one that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Please do the right thing and support ALTERNATIVE A. Thank you.

Correspondence: My first backpacking trip was on Isle Royale when I was 10- -I will turn 60 this year. That trip and subsequent trips into wilderness areas and national parks around the country shaped much of how I see the natural world, including time working as a ranger at the Olympic National Park. I have been a college professor now for over 25 years, and teach a course in environmental writing, in which we study how one would go about writing environmental impact statements, among other things. Thus, I was fascinated to learn of the Isle Royale Wolves EIS scoping process.

I strongly support Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is an anomaly in the Island's long history. Ultimately, we should let the nature decide if wolves can still flourish there- -that would be the only true "wilderness" approach to managing the wolf population.

Even if the current wolf population dies out, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

The loss of wolves on Isle Royale is, perhaps, a consequence of global warming as there will likely be no ice strong enough for new wolves to naturally migrate to the Island. For people like me with memories of wolves there that is sad. Though I am also grieved by the dramatic retreat of glaciers in North Cascade National Park. It is best that we understand these changes for what they are, and not intervene to maintain a situation that is no longer viable in order to suit our own particular sensibilities or research interests.

Thank you for considering my input.
