Correspondence: Support Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study

Correspondence: Wolves are relative newcomers to Isle Royale, having arrived in the late 1940s by walking across frozen Lake Superior from northeastern Minnesota or Ontario. (A feat unlikely to be repeated in a warmed future.) The island's wolves have been the subject of a long-running study of predator-prey relations, but inbreeding and other factors associated with their isolation have caused the wolf population to steadily decline for many years.

With the wolf population now at only two (!), many are calling for capturing wolves from the mainland and translocating them to the island, where they are likely to suffer the same "inbred and deformed" future as those currently there. The motivations for exiling the mainland wolves to the island are primarily to continue the predator-prey study- -and to satisfy tourist desires to see or hear wolves. There is some concern that Isle Royale's population of moose, the wolves' primary prey, could explode, but moose numbers are declining throughout the upper Midwest to the point they have been proposed for listing as a threatened or endangered species.

The pro-transplant voices ignore the fact that 98 percent of Isle Royale is designated Wilderness, and by law must remain "untrammled" (unmanipulated, untamed, wild) with natural processes unimpeded by managers. In Wilderness, nature calls the shots. Therefore, of all the four alternative plans the NPS is considering, I strongly urge you to follow Alternative A.

Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Correspondence: I think Alternative A would be best. Let nature take it's course. You can learn more by doing nothing and see how nature takes care of it's own.

Correspondence ID: 4106 **Project:** 59316 **Document:** 71605
Received: Jun,28,2016 19:40:49
Correspondence Type: Web Form

Correspondence: With the wolf population now only two, many have called for the capture of wolves from the mainland and translocating them to Isle Royale. However, this logic is flawed because the wolves are likely to suffer the same "inbred and deformed" future as those currently there. I believe proponents of exiling the wolves to the island are pushing for it to serve their own self-interests, including to continue the predator-prey study and to satisfy tourist desire to see and hear wolves. There is some concern that Isle Royales moose population-the wolves primary prey-could explode if wolves aren't relocated from the mainland to boost the population, but moose numbers are declining throughout the upper Midwest to the point they have been proposed for listing as a threatened or endangered species. Furthermore, proponents of translocating wolves to Isle Royale, ignore the fact that 98% o the island is designated a wilderness, and by law must remain unmanipulated with natural processes unimpeded by managers.

I believe that with all of this that Alternative A is the only alternative that honors and upholds Isle Royale's wilderness status. In wilderness, nature calls the shots. Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Islands very long history, but in any event we should let the wolves decide if they want to live there. Finally, even if the current wolf population dies out and no new wolves take up residency, their is much more we can learn by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a natural predator-prey study.

Correspondence: Of the available options put forward regarding the future of the wolf population on this island, I strongly support Option A. Since this is a designated wilderness area, the less we manipulate the wildlife population, the better. Since wolves have already been introduced to that area and the

population has declined, the wolves should be left to determine their own fate and not be further manipulated by humans. Study of an area with an artificial population does not result in meaningful results.

"Aren't humans amazing? They kill wildlife - birds, deer, all kinds of cats, coyotes, beavers, groundhogs, mice and foxes by the million in order to protect their domestic animals and their feed. Then they kill domestic animals by the billion and eat them. This in turn kills people by the million, because eating all those animals leads to degenerative - and fatal - health conditions like heart disease, stroke, kidney disease, and cancer. So then humans spend billions of dollars torturing and killing millions more animals to look for cures for these diseases. Elsewhere, millions of other human beings are being killed by hunger and malnutrition because food they could eat is being used to fatten domestic animals. Meanwhile, few people recognize the absurdity of humans, who kill so easily and violently, and once a year send out cards praying for "Peace on Earth."~ David Coates

Correspondence: I support option A for Isle Royale Wolf Management Although wolves may have migrated there originally, their natural decline over the years shows that this may not be the best environment for them. To transplant new wolves there for the sole purpose of the ongoing study defeats the purpose of the study because they are no longer there as part of a natural migration. To be true to the study, the natural process should play out. Introducing new wolves may, over time, produce the same results with the wolves dying off as a part of natural selection. It is in the wolves best interest to let the study come to a natural end.

Correspondence: As I read the background of this action, I started wondering if this would be beneficial to wolves, humans, the world at large? I envisioned this place, which was not really explained in much detail, with only a small picture showing a lovely lake scene. As the story went on I finally got the picture that the reason the wolves were on an island was because they had migrated there back in the day when the ice was thick enough for them to walk on.

In the years since they arrived, they have been watched by another predator, man, for many years. Much information has been added to our collection of knowledge. It has been a worthy project as revealed in the short article.

My question was forming, "why do they need to move the wolves?" Why not just let nature take it's course? Man monkeys too much with other beings as it is, no matter if it's deemed to be the "humane" thing to do.

I vote to let well enough alone. Wolves are special beings and deserve to make their own choices. If the food runs out, they will go looking for more. If they are so inbred that they can't move on for food, then perhaps they are at the end of their line. Families of all kinds do die out. It's nature and I don't think God wants us to micro-manage creation. Let the wolves do their thing and the scientists can plan other projects as they wrap up this one.

Respectfully,

Rosa [REDACTED]

Correspondence: I support Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Correspondence: Our understanding is tht the National Park Service is considering four alternatives. The one we would support is Alternative A, meaning no action and thus wolves would come and go based on natural migration as they have been in the natural state of the wilderness.

Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Correspondence: The situation on Isle Royal, specifically the dying off of the wolf population, is one that nature alone should address. It is a protected wilderness area to which wolves have migrated occasionally, and they have also migrated away from it. The fact that inbreeding of an isolated population like this one will cause extinction over the long term would seem to indicate that translocating a wolf population from elsewhere would be 1) a waste of

time, and 2) the waste of a number of generations of wolves. If, as I believe, wolves are becoming an endangered species, I certainly don't want to lose any chances for genetic diversity to benefit existing populations by sending them to Isle Royal, which is likely to doom them to a foreshortened future (in that location).

Correspondence: Thank you for allowing public comment. As a supporter of wildlife protection, including those living in our National Parks, I urge you to choose:

Alternative A.

Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Correspondence: I believe the wolves should be allowed to come and go as they please, as Isle Royale is not really their habitat. They should not be brought in to keep a predator/prey study going since they aren't a native species there anyway. The wolves are dying out there for a reason, so bringing in more will have the same affect down the line. And the argument that they need to be there to keep the moose population under control doesn't hold water since the moose are declining due to climate change. Manipulating wolves for human purposes is inhumane and is about as anti-science as you can get.

Therefore, I support Alternative A as it is the only alternative that honors and upholds Isle Royale's Wilderness status.

Correspondence: Thank you for the opportunity to comment.
I am a big fan of wolves and therefore generally support the spread of wolves to any location where they can thrive if left alone. Isle Royale does not fit that description. The wolves are dying out naturally. Therefore I support Alternative A. This is also the only alternative that honors and upholds Isle Royale's Wilderness status.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Correspondence: Wolves are relative newcomers to Isle Royale, having arrived in the late 1940s by walking across frozen Lake Superior from northeastern Minnesota or Ontario. Other wolves have arrived since that time and, conversely, many have also left. The island's wolves have been the subject of one of the longest-running studies of predator-prey relations. But inbreeding and other factors associated with their isolation have caused the wolf population to steadily decline for many years.

With the wolf population now at only two, many are calling for capturing wolves from the mainland and translocating them to the island, where they are likely to suffer the same "inbred and deformed" future as those currently there. The motivations for exiling the mainland wolves to the island are primarily to continue the predator-prey study and to satisfy tourist desires to see or hear wolves. There is some concern that Isle Royale's moose population-the wolves' primary prey-could explode, but moose numbers are declining throughout the upper Midwest to the point they have been proposed for listing as a threatened or endangered species.

The pro-transplant voices ignore that 98 percent of Isle Royale is designated Wilderness, and by law must remain "untrammled" (unmanipulated, untamed, wild) with natural processes unimpeded by managers. In Wilderness, nature calls the shots.

Support Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Correspondence: Regarding the 4 alternatives for managing wolf populations on Isle Royale in Lake Superior, please choose Alternative A: No action. Wolves would come and go based on natural migration. In the unique case of Isle Royale, nature seems to deselect wolves as a viable long-term species on the island due its isolation and resultant limited gene pool. Accidental repopulation may recur by wolves migrating across the ice in winter, and should be allowed to thrive as well as it can, but without human engineering.

Correspondence: Dear National Park Service,

Alternative A seems to be the alternative that is most acceptable for Isle Royale. Wolves should be able to come and go on their own without human interference. This is what keeps wilderness wild. It will still be interesting to study the ecosystem changes whether the wolves are there or not. Since this island was populated with wolves fairly recently, the ecosystem will likely adapt back. Human manipulation, while well-intended, violates the nature of the wilderness designation of Isle Royale.

Thank you,

Correspondence: Hey Good Folks

We all cut our teeth on Mech's Wolves of Isle Royale and learned a lot. But in a historical time frame of any depth, the immigration and breeding wolves for decades on a relatively small island, was the result of unusual circumstances. The presence of wolves was a gift to the public and the moose population for many decades.

As long as natural factors have been the primary cause of the decline of the wolf population on Isle Royale the NPS should stand by, hankies in hand and reluctance to let go understandable, and let nature play out without intervention of any kind whatsoever.

The fact that the vast majority of the island landscape is designated as Wilderness makes the appropriate action abundantly clear and inexpensive. Stewardship not manipulation upon manipulation.

NO ACTION. Waste no more valuable agency resources and public time in analyzing an issue that has only one legal and common sense conclusion.

Please make the NO ACTION alternative the NPS and environmentally preferred alternative that it clearly already was.

Sincerely

Steve [REDACTED]

Correspondence: Leave this beautiful backpacking area alone. You politicians muck up things and screw around with wildlife conservation you know nothing about but are influenced by corporate payoffs. Shame on all of you! Look to science and the data. Every time the government interferes and kills off some wildlife the taxpayers end up footing the bill to reintroduce wolves back to the area. I remember this from the Reagan administration and how they poisoned the wolves to the point where it devastating the balance of nature. And this was the wealthy ranchers and mining corporations that bought out the politicians and the President to do this devastating environmental disaster. Don't make the same mistake in Isle Royale it is too important of a place.

Correspondence: Dear National Park Service,

In the case of the Isle Royale's wolves I believe that the Wilderness natural processes, not human demands, should determine whether predators stay or go. There is much to be learned by studying the ecological responses to the loss of wolves than by artificially adding another wolf population on Isle Royal.

Please implement Alternative A. It is the only alternative that honors and upholds Isle Royale's Wilderness status

Thank You,
Bonnie [REDACTED]

Correspondence: I fully support Alternative A. It is the best possible strategy in keeping with the designation of wilderness. It seems the more good-intentioned humans try to rearrange or "better" the best laid plans of mother nature, the more the environment seems to suffer or diminish. The natural balance of flora and fauna is just that- a balance. Tipping the balance never gives a good result. Take a step back and let nature take its course.

Correspondence: I respectfully urge you to select Alternative A, which would maintain the island's Wilderness character, in which the animals living (or passing through) the wilderness make their own decisions to stay or go. Even if we knew and understood all the factors influencing the animals' health and behavior, the ethical decision should be to allow whatever natural processes are at work to continue without intervention. Only if contagious disease was affecting the wildlife communities would we be justified in taking steps to contain/protect the wild creatures.

Transplanting wolves to the island would be an artificial manipulation of the natural ecosystem, and should not be allowed. As I understand it the wolf population is not declining due to human forces, but because of natural ecosystem processes, and therefore we have no mandate or right to go in and tweak the system just to continue predator-prey studies or ensure that tourists can hear wolves howl. Please let the system regulate itself without heavy-handed human management.

Thank you.

Correspondence: Translocating wolves to Isle Royale is a bad idea, as it interferes with nature's natural process. Forcing wildlife to live anywhere other than in their current natural environment is to rip them from their homes, turning them into wildlife refugees. Whenever mankind messes with nature the result is typically catastrophic.
Leave wild wolf populations as is and let nature run its course. Creating an unnatural environment would most certainly backfire. Mankind interferes with wildlife far too often, and it is always a bad idea.

Correspondence: Dear Madam/Sir:

Please support Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Thank you in advance!

Sincerely,

■■■■

Preservation of wilderness should be the guiding principle. Human interest in seeing or hearing wolves, or in trying to preserve the "balance of nature," are purely secondary and should not govern decision making.

Thank you.

Correspondence: I support Alternative A. The other alternatives would amount to an intervention into natural processes, turning Isle Royale into a managed wildlife preserve rather than a truly natural area.

Artificially relocating wolves to the island would represent a manipulation in order to preserve what is a relatively uncommon status, since wolves are relatively recent newcomers to the island.

Finally, active, interventionist management of the wolf population would compromise the value of continued scientific study of population dynamics on the island.

Correspondence: Hi,

I support Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves should come and go through natural migration. After all 98 percent of Isle Royale is designated Wilderness, and by law must remain "untrammeled" (unmanipulated, untamed, wild) with natural processes unimpeded by managers.

Thank You for allowing me to comment.

Correspondence: For most of my life, my hobbies have centered around observing Nature - - be it taking trail-rides in the High Sierras or visiting coastlines to see & experience different ecosystems and gain knowledge of their varying flora & fauna. Since childhood, I have been a bird-watcher & amateur botanist.

My sister & brother-in-law lived & worked for over 20 years in Canada, & we all shared a love for Nature & studying it outdoors. I was privileged to visit a number of Canada's national preserves both in Ontario and on Canada's West Coast. When I think of the alarming rate at which Earth's living creatures & plant life are disappearing, I hope very much that every country's (including Canada's) national & regional parks will always be protected by their federal & state agencies, so that their citizens may always be able to experience the beauties awaiting them in government-protected natural areas.

Correspondence: It has come to my attention that the current wolves are relative newcomers to Isle Royale, having arrived in the late 1940s by walking across frozen Lake Superior from northeastern Minnesota or Ontario. Other wolves have arrived since that time and, conversely, many have also left. The island's wolves have been the subject of one of the longest-running studies of predator-prey relations. But inbreeding and other factors associated with their isolation have caused the wolf population to steadily decline for many years.

With the wolf population now at only two, many are calling for capturing wolves from the mainland and translocating them to the island, where they are

likely to suffer the same "inbred and deformed" future as those currently there. The motivations for exiling the mainland wolves to the island are primarily to continue the predator-prey study and to satisfy tourist desires to see or hear wolves. There is some concern that Isle Royale's moose population-the wolves' primary prey-could explode, but moose numbers are declining throughout the upper Midwest to the point they have been proposed for listing as a threatened or endangered species.

Please support your Alternative A: No action. Wolves would come and go based on natural migration. It is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

than you for your consideration~

Correspondence: I choose Alternative A. History tells you that there is a reason to the wolves why they don't stay. Why keep repeating this for the sake of tourists. (Poaching comes to mind also. Concentrate on the packs that are being wiped out by hunters needing to kill for their garage brag rights. Especially since this island is not a natural habitat for Wolves.

Plus it looks as if the natural cycle is in action. They leave, period.
Please do not repeat this process over and over. That's brutal and abusive.

Seems to be that the answer is there if you really care about wolves.
Thank you v

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Correspondence: I write as an environmental scientist in training, as well as a trained environmental ethicist.

Regarding the question of wolf transplant to Isle Royale National Park and Wilderness in Lake Superior, I support Alternative A, the no-action alternative, which would honor and preserve the area's wilderness character while letting the wolves 'decide' if they want to recolonize Isle Royale.

I know that this is by no means a clear area of environmental management - - it is a tough choice. But given that Isle Royale is designated Wilderness, and that it's not clear whether the artificial intervention of a transplant would be successful, 'A' seems the best choice.

Thank you for your time.

Alternative A: No action. Wolves would come and go based on natural migration.

Protect wolves in Wildernesses across the country, including going to federal court several times to protect them from trapping, shooting, and other forms of harassment. We believe that in Wilderness natural processes, not human demands, should determine whether predators stay or go. For this reason, I support Alternative A, the no-action alternative, which would honor and preserve the area's wilderness character while letting the wolves decide if they want to recolonize Isle Royale.

Correspondence: I have read a brief list of the options for what to do about the declined population of wolves on the island and the desire to augment population for the current study. Clearly the remaining wolves should not have their population artificially augmented. Only wild free roaming wolves that can reach the island without human intervention should be allowed to naturally migrate to the island. This should could as well be a study on the decline of a species and the associated causes. Both wolves and moose I assume are being studied, and if moose populations rebound, that certainly may cause a future rise in wolves migrating to the island in winter. Or at least make it so any wolves coming to the island have an abundant supply of prey. That is a question that needs to be answered. Or if wolves cannot reach the island as easily as once before due to shorter winters and warmer temperatures, possible climate change conditions, that should be observed and studied. The current study being run can still be conducted with decreasing and increasing wolf populations. The study needs to correlate for the extremes, even if that level drops to zero for a time. It then allows your study to see what happens to moose population at that point, and see if other factors affect moose population besides the number of large predators. If you need to study larger populations then do so in open territory or on larger island habitat elsewhere. Nuff said.

Correspondence: Having spent 4 years in Michigan but never gone to Isle Royal, I would think by this time that Humans would have learned to not mess with Mother Nature. It seems, with all due good intentions, that every time humans mess with Mother Nature it turns out bad. Why do humans think that we can control all aspects of nature. I could site thousands of ways man has messed up on this planet, and is currently looking for ways to leave this planet BECAUSE WE HAVE MESSED IT UP. Leave the wolfs to fend for themselves and if they want to live on Isle Royal they will, if they don't so be it. Don't force Mother Nature into something that she has already shown won't really work. If it an't broke leave it alone. I think option A is the best bet. Let the wolfs decide for themselves where they want to be and when.

Correspondence: I support the no-action alternative, which would honor and preserve the area's wilderness character while letting the wolves decide if they want to recolonize Isle Royale. Therefore, I:

â€ Support Alternative A because it honors and upholds Isle Royale's Wilderness status;

â€ Understand that wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's history, but in any event, we should let the wolves decide if they want to live there; and,

â€ Conclude that even if the current wolf population dies out and no new wolves take up residency on Isle royale, we can learn much more by studying the island's ecological responses to the loss of wolves than by artificially inserting another wolf population on the island. That would only continue the furtherance of a "natural" predator-prey study that humans want to conduct, but will not benefit the ecology of the island.

Correspondence:
US Senate:

Senate: Just Say No to Wilderness and Wildlife Destroying Energy Bill!

Clean energy its important, but also maintaining wild lands and it animals it is also important the future of both existence.

June 29, 2016

Wildlife scientist know better and they should stand to keep wild animals weather wolves oand others to keep their future existence moving through decates to come.

Honorees

With sincere respect,Support the true Alternative that honors and upholds Isle Royale's Wilderness status and other lands and islands where the Wild life exist, For decades..

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Please , Stand for the sake of the protection of lands ,ocean, forests and Wild animals.

Today the interest for Protecting them is more important; It was and it is very significant to do so , becoming more responsible and less destructive. Both benefit humans lands , ocean and animal.

The Parks where these wild (Wolves) animals reside honors and upholds Isle Royale's Wilderness status.The Future of all wildlife animals and lands keep that special status of the past and the respect for the same in the future.

Destroying Parks and lands is destroying the Beauty , of Nature's best interest to the places that where created by it to give way to all the animals that that land or area was designated naturally by time , Nature and for decades to come. Forests, wild lands and Parks should be kept for the sake of the Climate, clean air and because they where Gift of heaven to the people ,animals and best interest to all living things .

Wolves are part of the ecology and they serve more than what the eyes meet.They kill or eat the rats and other animals that hurt the land , the animals and the people.Like snakes If wolves would not exist in those areas there would have been no chance to end the population of rats snakes and other destructive and dangerous animals..

I am against the destruction of animals and lands , Which both do work for all.In their own way. Benefiting the air , and the animals doing the job they were born to do.In their own habitats lands.

The future of the Lands ,Parks and Wild life animals are important to the future existence of both.Never destroy a Forest , land and animals that the future will missed in different ways strongly .Because Nature created those lands and the animals there with a Purpose.. And they should be protected not wipe out of this world existence. It is a wrong act against nature; and heaven, beneficial intentions.

Everything was created with a purpose, Giving the back to it is an error.That will be seen near or later in the future.As we have seen today with the Climate and the destruction of lands and forests.I support the Consideration of Environmental Consequences. Because Nature takes its course. And animals are park of nature.They live and die in their own Natures time and conditions.

Sincerely,

Maria [REDACTED]

Correspondence: Take action to protect the Isle Royale Wilderness and the freedom of wolves!
Support Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population onto the island to continue what has been a "natural" predator-prey study.

Thank you for keeping the Isle Royale Wilderness wild and for protecting the autonomy of its wolves!

NPS, considering whether you should transplant wolves to the 133,000-acre Isle Royale National Park and Wilderness in Lake Superior to replace those dying or leaving... It is a challenging question, yet one with a clear answer.

Background

Wolves are relative newcomers to Isle Royale, having arrived in the late 1940s by walking across frozen Lake Superior from northeastern Minnesota or Ontario. Other wolves have arrived since that time and, conversely, many have also left. The island's wolves have been the subject of one of the longest-running studies of predator-prey relations. But inbreeding and other factors associated with their isolation have caused the wolf population to steadily decline for many years.

With the wolf population now at only two, many are calling for capturing wolves from the mainland and translocating them to the island, where they are likely to suffer the same "inbred and deformed" future as those currently there. The motivations for exiling the mainland wolves to the island are primarily to continue the predator-prey study and to satisfy tourist desires to see or hear wolves. There is some concern that Isle Royale's moose population-the wolves' primary prey-could explode, but moose numbers are declining throughout the upper Midwest to the point they have been proposed for listing as a threatened or endangered species.

The pro-transplant voices ignore that 98 percent of Isle Royale is designated Wilderness, and by law must remain "untrammled" (unmanipulated, untamed, wild) with natural processes unimpeded by managers. In Wilderness, nature calls the shots. Wilderness Watch works to protect wolves in Wildernesses across the country, including going to federal court several times to protect them from trapping, shooting, and other forms of harassment. We believe that in Wilderness natural processes, not human demands, should determine whether predators stay or go. For this reason, Wilderness Watch strongly supports Alternative A, the no-action alternative, which would honor and preserve the area's wilderness character while letting the wolves decide if they want to recolonize Isle Royale.

Correspondence: I support Support Alternative! Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status. Ice formation allowed wolves to make the connection from the greater land mass of Canada or MN USA.

The only true upset is the trend to warmer temperatures that hinders long term ice formation between land masses. Hence allowing for wolves to freely move on/off Isle Royale. Study that affect w/o transporting wolves "for human pleasure". The wolf is intelligent but not over bearing. Why is the human "so defining" of what wanted??

NO to Alternatives B, C & D. They are not the natural order of why wolves are on Isle Royale.

Again, I SUPPORT Support Alternative A because it is the ONLY alternative that honors and upholds Isle Royale's Wilderness status.

Correspondence: I believe alternative A is the best response to the wolf question.

To allow nature to work is best in any wilderness area. The wolves arrived naturally and will expire naturally unless others arrive across the ice. It seems this has happened before and will again if the times are right. It may be that the natural instincts of the wolves tell them the time is not right, and

we should not force the issue.
Thank you

Correspondence: Sawhill said: In the end, we be defined not by what we create, but by what we refuse to destroy.

A true and fitting analysis of humans and our inclination to destroy so often and so ruthlessly- -the environment and all that entails. It needs to stop. The wolves were there before us and have as much or more right to retain their rung in this Eco system. Hard as it might seem when money is the god- - but at this point we need to Do the Right Thing.

Correspondence: Hello,

I recently discovered that the National Park Service (NPS) is asking for public comments to consider whether or not to transplant wolves to the 133,000-acre Isle Royale National Park and Wilderness in Lake Superior to replace those dying or leaving.

You have offered three possible scenarios; I am writing you to show my support for Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

I believe that in Wilderness natural processes, not human demands, should determine whether predators stay or go. For this reason, Wilderness Watch strongly supports Alternative A, the no-action alternative, which would honor and preserve the area's wilderness character while letting the wolves decide if they want to recolonize Isle Royale.

Thank you for your consideration of this matter.

Sincerely, Diana [REDACTED]

Correspondence: Alternative A is the only alternative that holds true to Isle Royale and its wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.
We live in a time when science is expanding to understand the needs of all sentient beings whom we share the world with. Please honor that by recognizing that Alternative A is the right choice.

Correspondence: Its time we leave the animals alone. This is their world also. We do not own every single place in the world. We must learn to share our planet with all species.
Are we really so greedy as to remove animals from their home all over the world and displace them ?
If we are we are a trult sad species indeed, and undeserving of God's love... :(

Correspondence: Dear-

Please choose alternative A and let nature take it's course without further intervention from humans. We need to learn to coexist with the rest of the animal kingdom without further diminishing their populations as a result of our actions.

Thank You

Correspondence: Dear Sir / Madam,
I would like to request from the National Park Service to include the following points:

- 1) Support Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status. Alternative A is about taken No action. Wolves would come and go based on natural migration.
- 2) Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.
- 3) Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

I hope you consider the above and I thank you in advance.

Regards,

Correspondence: As Isle Royale is a wilderness area I feel that no action should be taken. Let the wolves come and go as they wish. Deliberately bringing wolves in so that they can suffer the same fate as the ones who arrived on their own doesn't seem to make any sense. Give the place a chance and see if more wolves will move in.

Correspondence: Although wolves have not always been part of the Isle Royale ecosystem, they have been present for more than 65 years, and have played a key role in the ecosystem, affecting the moose population and other species during that time. The average wolf population on the island over the past 65 years has been about 22, but there have been as many as 50 wolves on the island and as few as three. Over the past five years the population has declined steeply.

Correspondence: Alternative B makes the most sense at the current time.

It should be coupled with the complete removal of all domestic dogs from the island or absolute control of Parvo Virus. Parvo Virus has contaminated the ongoing study so results are not totally valid.

A one time adjustment and removal of outside contaminating factors seems the best way to restore some validity to the study and restore the system that had naturally evolved. Wolves on the island may be a recent natural phenomenon, but it was natural, Parvo was not natural and needs to be eliminated.

Thank you for the opportunity to comment.

Correspondence: I feel that this area should be left to its own resources. That is the way of nature. There is no danger of prey overtaking this island as there were no wolves prior to approx. 1940 and the current populations of moose are declining. I agree that we do need to keep a careful eye on the populations of animals on the island, but we need take no action at this time. If the wolves die out on this island, the consequences will be little. If we were to try to manage the population of wolves on this island, it will become a great burden to our rangers and more training will have to occur with the costs related. There is no need for our interference at this time. Please choose to allow nature to take its course for the health of this island. Thank you.

Correspondence: Please honor and uphold Isle Royale's Wilderness status. Let the wolves choose to live on Isle Royale or move on.

Wolves have inhabited Isle Royale for a small fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Thank you for keeping the Isle Royale Wilderness wild and for protecting the autonomy of its wolves!

Correspondence: Good Day to All,

I believe that Action A would be the best course to proceed with. Allowing the natural movements of any eco-system insures that it will adjust according to nature, and not a human induced solution to allowing one or more species to thrive or not. We have seen time and time again, that when we step in to adjust or modify the natural flow of nature it only exasperates the issue along with consequences that we never intended.

I thank you for reading my comments.

Correspondence: Let nature do what nature has to...but while this is happening do NOT approve any development as wolves and other wildlife will end up on the island again over time. To be wild is to be unencumbered by anything except the laws of nature. We as the only species that is constantly trying to destroy nature (even unintentionally) have to stop and do something we rarely do, QUESTION why are we proposing or doing something that is disruptive to nature?

If scientists want to study some wolves then stop the slaughter of wolves by stopping trigger happy ranchers/farmers/"survivalists", this would allow wolves to be more plentiful and therefore more wolves to study.

It isn't "rocket science", we just have to be able to think and employ methods (or stop ourselves from employing methods) without "THOSE ANIMALS ARE VICIOUS", "EASY", "MAKE A DOLLAR", etc. running around our minds.

You always miss something that was always there, BUT once it's gone forever, it's too late.

Correspondence: I support Alternative "A", the only alternative that honors the Wilderness status of Isle Royale. We have no right to manipulate this land for our own prejudices. It is now obvious that Isle Royale is too small to sustain wild wolves forever. Let nature take its course. Last time, wolves were attracted to the scent of dead moose. Let the wolves decide and don't let global warming get in the way of this decision. Stop the manipulation of nature for our own whims and desires. Nature is more resilient and wiser than us.

Correspondence: I support Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Wolves are relative newcomers to Isle Royale, having arrived in the late 1940's by walking across frozen Lake Superior from northeastern Minnesota or Ontario. Other wolves have arrived since that time and, conversely, many have also left.

The island's wolves have been the subject of one of the longest-running studies of predator-prey relations, but inbreeding and other factors associated with their isolation have caused the wolf population to steadily decline for many years.

With the wolf population now at only two, many are calling for capturing wolves from the mainland and trans-locating them to the island, where they are likely to suffer the same "inbred and deformed" future as those currently there.

The motivations for exiling the mainland wolves to the island are primarily to continue the predator-prey study and to satisfy tourist desires to see or hear wolves. There is some concern that Isle Royale's moose population-the wolves' primary prey-could explode, but moose numbers are declining throughout the upper Midwest to the point they have been proposed for listing as a threatened or endangered species.

The pro-transplant voices ignore that 98 percent of Isle Royale is designated Wilderness, and by law must remain "untrammled" (unmanipulated, untamed, wild) with natural processes unimpeded by managers. In Wilderness, nature calls the shots.

Please vote Alternative A. Thank you!

Correspondence: Support Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Correspondence: Considering that we, in the United States, have been fighting air pollution and ground pollution since the 1950's, and then taken on the tasks of cleaning the waterways since the 1960's; it seems to me to be taking a step backwards to allow any mining or drilling for oil on public lands. We do know that these industries causes pollution and no matter how careful an industry is, accidents do happen.

I therefore request that any application for use of public land be denied.

Correspondence: Wolves need protection now. There is no good reason why they are continual targets. They mate for life, co-raise their young, and try to avoid conflict. They are better citizens than most humans! Their habitat is being destroyed and taken over by people and ranchers, who are the real enemies of our health and planet. We need to look at this long term and decide to try to turn our Earth back to the beautiful place it once was before corporate farming/ranching.

Correspondence: As the number of moose has plummeted and taking into account the complicated nature of how wolves' packs develop, and the law insisting on no intervention on that island, it seems to me to contradict nature and the law by planting wolves on the island. Since their numbers have also diminished, it would be nice to know that they as other wildlife will not have an on and off the endangered list over the coming years.

Finally, if wolves are moved on to that island, will there be an open season declared on them in the future by lunatics hell-bent on killing...for "trophies", etc.?

It is frustrating to know that every time people fiddle around with wildlife that their good intentions often backfire.

Correspondence: My opinion is that you leave Isle Royale to nature. The Park Service does nothing. I believe that to your 'option A'. Isle Royale is a designated Wilderness zone, correct? Which technically means by law, it can't be corrected by humans. If nature hasn't put wolves in the island yet in big enough numbers to support an 'exploding' moose population, it will in time. Mother Earth has been getting it right for half a billion years, I think she'll figure this out.
As a Michigan resident, I'd prefer the state leave their damn hands off of all things nature. Hunting wolves is a mistake. And having moose on the island would be an awesome sight.

The Park Service should do nothing about the wolf population.

Thank you.

Correspondence: There's a programme on British Television at the moment I believe it might be on Spike at 9pm on a Tuesday. It's called Zoltan the Wolf man. It's about a Hungarian man who has about 100 animals and he keeps and trains packs of wolves, a few bears and other animals. He loves these animals and he trains some of them up to be in the movies. What he has done with these wolves is amazing. It will change a lot of people's minds about wolves to see this program.

He carried these wolves around like carrying dogs and they let him. He gets in small cages with a pack and he has become pack leader. Even wolves he has never met before he has the ability to understand them and is immediately accepted as pack leader.

It's one of the best programmes on the TV at the moment I would ask anyone to watch it as you will see these wolves are every loyal to him and he is kind to all of his animals.

Correspondence: In order to keep Isle Royale a Wilderness I support the following:

☞ Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

☞ Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

☞ Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

☞ 98 percent of Isle Royale is designated Wilderness, and by law must remain "untrammeled" (unmanipulated, untamed, wild) with natural processes unimpeded by managers. Let nature take its course with no interference from man.

Alternative A is the only way to maintain Wilderness status and artificially boosting the population of wolves does not help their current situation.

Thank you for your consideration.

Correspondence: Support Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

How is it that we as a species have not learned from the many thousands of experiments we've tried in this area that when it comes to maintaining wilderness and ecosystem balance there is only one positive action human beings can take: stay out!!

Correspondence: Alternative A is the only option that makes any sense with regard to the wolf population at Isle Royale. Attempting to MANAGE the wilderness is a huge mistake, as has been demonstrated so many times in the past. Leave the "wilderness" untrammled, and let nature takes its due course.

Attempting to TRANSPLANT wolves there will only result in the population again becoming inbred and is a cruel and unnecessary course of action. Wilderness should never be MANAGED!

Correspondence: I think nature should decide whether or not wolves inhabit Isle Royale. On my island of Vashon (in the Pacific Northwest), once in a while a bear will swim over. He will be spotted, and usually swim off after a few weeks or months. Lately, we have an increasing population of coyotes. There is a certain ebb and flow of wildlife here. Our deer population fluctuates year to year. There is not much interference from the humans. There is a hunting season, but relatively few deer are shot as opposed to those killed by cars. What I am saying in too many words, is that I feel that importing wolves to study nature, is not studying nature. It is managing nature, which is not the goal here, is it? The wolves will come on their own, or not. That is studying nature. From what I understand, they are not endemic to the island; only being there for a relatively short period of time. And then, once there, they are slowly dying out. That sounds like the normal ebb and flow of species in particular areas.
I think you should enact your Plan A. Do nothing.

Correspondence: I support Alternative A, which is the only alternative that honors and upholds Isle Royale's Wilderness status.

The current state of the world is changing very quickly. Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island may be more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there in these uncertain times.

Even if the current wolf population dies out and no new wolves take up residency, much more can be learned by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Thank you for requesting comments and including the above in your consideration.

Correspondence: Thank you for permitting me to comment on the proposals regarding the Wolf population.

I support Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

98 percent of Isle Royale is designated Wilderness, and by law must remain "untrammeled" (unmanipulated, untamed, wild) with natural processes unimpeded by managers. In Wilderness, nature calls the shots. It seems that too often, when humans get in the way and try to "control" a natural process, then nature is harmed.

I believe that natural processes, not human demands, should determine whether predators stay or go.

Thank you!

Correspondence: Wolves Forever

In all respects the Wolf deserves his place because of his link with humanity through out known history both written and spoken. The wolf was in fact man in the Northeast's hunting partner as both human and wolf assisted each other in surviving the conditions of life and the quest for food to live.

Any habitat that maintains this great animal totem where sightings or their howls may be experienced would surely benefit the soul of man, which through his impacts on nature has changed the face of nature to the point where real nature is perhaps no more and gods remaining gifts totally depend upon mankind as the steward of the earth.

The wolf by its presence and life would define "wilderness" itself. Like for example in New Jersey Delaware Water Gap National Recreation Area despite all its negative impacts; eagles and bears bring a sense of instance time travel to a "wilderness" sense tangible or intangible; how much more so in the Michigan Landscapes..

Back in 1999 in the Alligator National Forest of North Carolina i had a wolf experience with the red wolf calling it in and was answered back on a thick

humid August night hearing it answer was quite a deal especially for the others in company. Like a forgotten Citizens of this land let them be recognized and given their place; continue the good work in the Isle Royale.

Correspondence: Be it lack of food, disease, an invasion species, or pollution, only AFTER you have thoroughly studied why wolves of Isle Royal took a nose dive, and why some wolves are simply leaving, should you then, yes, re-establish the population using immigrant wolves. Wolves as a whole are not so far off the endangered species list that they can't leap right back on overnight. Taking wolves from another area where they are threatened and using them to repopulate Isle Royal is better than letting "sportsmen" hunt them for trophies.

Correspondence: It has come to my attention that the National Park Service is considering the possibility of capturing wolves and relocating them to Isle Royale for the purpose of extending a study focused on the relationship of wolves to moose.

Whereas wolves, and moose before them, are recent migrants to the island, it stands to reason that the decline of both species including the demise of the wolf population leaves the study much to analyze. Introducing a foreign population of wolves will not teach us anything about natural relationships.

It is my understanding that Isle Royale National Park is a designated wilderness area. Preservation of wilderness relies on our willingness to allow nature to take its course unimpeded.

Given these facts, it seems the only logical course is alternative A. Respect natural process.

Please implement Alternative A as listed in the Moose-Wolf-Vegetation Management Plan and Environmental Impact Statement (EIS) for Isle Royale National Park.

Thank you for your attention to this matter.

Sincerely,

Richard ████████

Correspondence: I will be visiting Isle Royele in August and it would be my ultimate privilege and pleasure to see the wolves, but I believe we should let nature take its course and not interfere with the decline of the wolves. They were not there originally and we do not need to continue to "manage" them by reintroducing them to the island. I know the reintroduction of wolves to Yellowstone National Park was instrumental in resurrecting ecological equilibrium, but this is a different situation and I believe it would be best to let them die naturally and then not replace them. There is wisdom in nature and not interfering is the best approach.

Correspondence: Isle Royal is a designated wilderness. As such there should be no human action taken to alter the natural order of the island. The changing climate will cause additional stress without adding more wolves. I am old enough to remember when the Wolverine state actually had Wolverines. We at one time had to chase deer out of the yard to hang up our washing to dry. I saw the last bear in our neighborhood in the early '40s. Civilization is is oversold. A birch tree on our lakefront property was killed when a Detroit tourist cut off a strip of bark for a souvenir. My first school was the [REDACTED] township one room schoolhouse.

Correspondence: Wolves are relative newcomers to Isle Royale, having arrived in the late 1940s by walking across frozen Lake Superior from northeastern Minnesota or Ontario. Other wolves have arrived since that time and, conversely, many have also left. The island's wolves have been the subject of one of the longest-running studies of predator-prey relations. But inbreeding and other factors associated with their isolation have caused the wolf population to steadily decline for many years.

With the wolf population now at only two, many are calling for capturing wolves from the mainland and translocating them to the island, where they are likely to suffer the same "inbred and deformed" future as those currently there. The motivations for exiling the mainland wolves to the island are primarily to continue the predator-prey study and to satisfy tourist desires to see or hear wolves. There is some concern that Isle Royale's moose population-the wolves' primary prey-could explode, but moose numbers are declining throughout the upper Midwest to the point they have been proposed for listing as a threatened or endangered species.

The pro-transplant voices ignore that 98 percent of Isle Royale is designated Wilderness, and by law must remain "untrammled" (unmanipulated, untamed, wild) with natural processes unimpeded by managers. In Wilderness, nature calls the shots.

The National Park Service is considering four alternatives:

Alternative A: No action. Wolves would come and go based on natural migration.

Alternative B: NPS would engage in a one-time (over three years) translocation of wolves to extend their longevity on the Island.

Alternative C: NPS would translocate wolves as often as needed over the long-term to maintain a wolf population on the Island.

Alternative D: NPS would continue current management of allowing natural processes to control, but could bring wolves to the Island in the future if certain conditions related to prey or vegetation are met.

It is my belief that in Wilderness natural processes, not human demands, should determine whether predators stay or go. For this reason, I strongly support Alternative A, the no-action alternative, which would honor and preserve the area's wilderness character while letting the wolves decide if they want to recolonize Isle Royale.

Correspondence: Growing up in Michigan (Alpena), I was able to visit Isle Royal more than once. This beautiful wilderness, in my opinion, needs to remain free of human intervention. If wolves choose to migrate here that would be wonderful but forcing them to live here would be a sad mistake.

As wolf populations dwindle in our country from ranchers and government killing, there are still areas out west to study those wolves that are left. Uprooting packs for transport to the Island is wrong. Haven't humans done enough to kill off so many species already?

Please leave wolves alone to do what they wish to do. To make their own decision where to live and breed.

Thank you.

Correspondence: I am writing to encourage you to take effective measures to protect and nurture the wolf population in the Isle Royale Wilderness. Wolves are relative newcomers to Isle Royale, having arrived in the late 1940s by walking across frozen Lake Superior from northeastern Minnesota or Ontario. Other wolves have arrived since that time and, conversely, many have also left. The island's wolves have been the subject of one of the longest-running studies of predator-prey relations. But inbreeding and other factors associated with their isolation have caused the wolf population to steadily decline for many years.

With the wolf population now at only two, many are calling for capturing wolves from the mainland and translocating them to the island, where they are likely to suffer the same "inbred and deformed" future as those currently there. The motivations for exiling the mainland wolves to the island are primarily to continue the predator-prey study and to satisfy tourist desires to see or hear wolves. There is some concern that Isle Royale's moose population-the wolves' primary prey-could explode, but moose numbers are declining throughout the upper Midwest to the point they have been proposed for listing as a threatened or endangered species.

The pro-transplant voices ignore that 98 percent of Isle Royale is designated Wilderness, and by law must remain "untrammled" (unmanipulated, untamed, wild) with natural processes unimpeded by managers. In Wilderness, nature calls the shots.

I ask you to Support Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Thank you.

Correspondence: I believe the only solution is one that honors and upholds Isle Royale's Wilderness status.

I understand that wolves have only inhabited Isle Royale for a number of decades which constitutes a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

With reference to studies that are being conducted, even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

I hope you will take these comments as a serious concern from a citizen who is dedicated to all environmental and animal welfare issues, and who has taken the time to inform herself of the situation at hand and arrived at what seems to be the best and most objective conclusion.

Thank you for your time and consideration.

Correspondence: Plan "A" would appear to uphold the official and true meaning of Isle Royale Wilderness Area best. While predator-prey studies can be useful....don't believe this "island" area is the place for it....particularly since wolves have only recently been there. I suspect with nature taking her course....over the coming decades, with climate change factors, they will eventually vanish from Isle Royale. Should the moose population become problematic....at that time NPS can deal with several options currently available.

Correspondence: To the National Park Service:

As someone who feels strongly about preserving areas free of human intervention in wildlife populations, I urge you to choose Alternative A in the debate about transplanting wolf populations to Isle Royale. I agree with others who believe that this the only alternative that honors and upholds Isle Royale's Wilderness status- and the future of wolves both on the mainland and the island.

Wolves decide to live on Isle Royale, and only wolves, or natural selection, should determine if they continue to do so.

Human manipulation of wildlife populations (other than to protect habitat and minimize human predation) is misguided, particularly when the goal is to cater to human, rather than wolf, interests.

Thank you for the opportunity to comment.

With the wolf population now at only two, many are calling for capturing wolves from the mainland and translocating them to the island, where they are likely to suffer the same "inbred and deformed" future as those currently there. The motivations for exiling the mainland wolves to the island are primarily to continue the predator-prey study and to satisfy tourist desires to see or hear wolves. There is some concern that Isle Royale's moose population-the wolves' primary prey-could explode, but moose numbers are declining throughout the upper Midwest to the point they have been proposed for listing as a threatened or endangered species.

The pro-transplant voices ignore that 98 percent of Isle Royale is designated Wilderness, and by law must remain "untrammled" (unmanipulated, untamed, wild) with natural processes unimpeded by managers. In Wilderness, nature calls the shots.

The National Park Service is considering four alternatives:

Alternative A: No action. Wolves would come and go based on natural migration.

Alternative B: NPS would engage in a one-time (over three years) translocation of wolves to extend their longevity on the Island.

Alternative C: NPS would translocate wolves as often as needed over the long-term to maintain a wolf population on the Island.

Alternative D: NPS would continue current management of allowing natural processes to control, but could bring wolves to the Island in the future if certain conditions related to prey or vegetation are met.

Correspondence: I would like to voice my support for Alternative A in the NPS plan for the Isle Royale Wolves Wilderness site.

Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

I believe the benefits of allowing nature to take its course outweighs those of introducing more wolves to the area, which will serve mostly as a tourist attraction and most likely lead to having to make a decision like this again down the line as the same events play out.

Thank you for considering my comment.

Correspondence:

I urge support for Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of its post-glacial history. Their recent presence on the Island is an anomaly more than it is the norm in the Island's very long history. It would be much more natural to let them arrive again on the island by chance.

If the current wolf population dies out and no new wolves take up residency, we can learn much by studying the ecological responses to the loss of wolves. Artificially introducing another wolf population on the island to continue the current predator-prey research would make this a manipulated man-made mesocosm study. It's likely the introduced wolves would meet the same fate as the previous isolated wolves. The wolf population should not be manipulated for the sake of tourism or to continue the predator-prey research. I support Alternative A.

Respectfully,
Julia [REDACTED]

Correspondence: To Whom It May Concern:

Wolves are relative newcomers to Isle Royale, having arrived in the late 1940s by walking across frozen Lake Superior from northeastern Minnesota or Ontario. Other wolves have arrived since that time and, conversely, many have also left. The island's wolves have been the subject of one of the longest-running studies of predator-prey relations. But inbreeding and other factors associated with their isolation have caused the wolf population to steadily decline for many years.

With the wolf population now at only two, many are calling for capturing wolves from the mainland and translocating them to the island, where they are likely to suffer the same "inbred and deformed" future as those currently there. The motivations for exiling the mainland wolves to the island are primarily to continue the predator-prey study and to satisfy tourist desires to see or hear wolves. There is some concern that Isle Royale's moose population-the wolves' primary prey-could explode, but moose numbers are declining throughout the upper Midwest to the point they have been proposed for listing as a threatened or endangered species.

The pro-transplant voices ignore that 98 percent of Isle Royale is designated Wilderness, and by law must remain "untrammled" (unmanipulated, untamed, wild) with natural processes unimpeded by managers. In Wilderness, nature calls the shots.

The National Park Service is considering four alternatives.

Wilderness Watch works to protect wolves in Wildernesses across the country, including going to federal court several times to protect them from trapping, shooting, and other forms of harassment. We believe that in Wilderness natural processes, not human demands, should determine whether predators stay or go. For this reason, Wilderness Watch strongly supports Alternative A, the no-action alternative, which would honor and preserve the area's wilderness character while letting the wolves decide if they want to recolonize Isle Royale: Alternative A: No action. Wolves would come and go based on natural migration. Please support Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Correspondence: I support alternative A, when people try to alter the course of nature bad things happen. I can understand if man was responsible for the Wolf population declining, undoing what man has done. Nature takes care of it own, Man does not belong to nature and does not understand nature. This is why man keeps trying to alter nature, generally for his own selfish purposes, usually with disastrous out comes.

The problem with us humans is that most of us do not see our own short comings, we don't see that what we do is take from nature and return garbage. Their is a constant attack on nature from people who just like to kill anything they see, people that kill for enjoyment called hunting and to make sure everyone knows their is nothing wrong with killing animals for fun, they somehow manage to call it a sport, as if it were Baseball, football, or Hockey.

Man is hard wired to control and change everything, the Wilderness and wildlife are being destroyed every day by Hunters, the cattle industry, Fossil Fuel Industry, Ranchers, Developers, factory farms, and homeowners. The USFWS kills off millions of Wildlife and peoples pets, because they take bribes from the cattle Industry and others who have an unfounded fear of predators killing their cattle. So if people want to help wildlife put pressure on the government to stop killing off our Wildlife and put more animals with declining populations on the endangered species list.

Correspondence: I believe that the National Park Service should allow the wolf population on Isle Royal to succumb to nature. It is difficult to let the wolves die off. However, their fate on Isle Royal is stunted at best. Even if the NPS transplants new wolves, they will eventually become inbred and weak. Perhaps wolves will once again migrate, but humans should back off and let nature take its course. Scientists will be able to study other animal populations- -particularly moose- -without wolves as their top predator. This could provide valuable information for species recovery plans and provide strong support for sustaining wolf populations in other areas. I love wolves and it is difficult to allow them to disappear from anywhere, but perhaps they will one day migrate back to Isle Royal. If they do, it should be on their terms, rather than due to human desires.

Correspondence: As a National Park enthusiast, supporter ([REDACTED]), and even more, a lover of wildlife and freedom to all, option A is the ONLY answer for the Isle Royale Wolves.

I'm sure the NPS feels the same admits pressure that could seem as helpful to repopulate, but if the wolves chose to migrate there and it sure sounds like they made a mistake in doing so. Mainland wolves should not be stolen from their natural habitat for any human experiment like this on at Isle Royale even when it seems helpful in this situation.

All my best and thanks for protecting our National Parks and greatest treasures.

Correspondence: Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Correspondence: I grew up and went to school (through post grad at Michigan) in the Great Lakes State and I can tell you I was thrilled, and awed by the first wolf I saw. Granted, it was in an educational setting, but the wolf's handler gave an excellent presentation on the role of the wolf in certain ecosystems as well as on wolf habitat.

When I visited Isle Royale I did not see or hear any wolves. It was altogether a rather sparsely visited area, as far as I could tell though that was some time ago. I keep wondering why there should be any objection to wolf populations on Isle Royale. Wolves could be a boon to both the U.S. as well as Canada. I should think even hunters would welcome the strong moose population that could come from a predator culling out the sick or weak.

More to the point, with climate change affecting all wildlife, this could be one of the last and best places to maintain and strengthen this predator's existence in the overall ecosystem. It's clear that man is most destructive when it comes to wolf habitat, and if that was the only stressor (a top predator seeking another kind of predator) the wolf might have a chance. But when one throws climate change into the mix that other predator (wolf, bear whatever) will be on the losing end. Though I live in NY now, I still return "home" to Michigan frequently. Empirical observation shows me the tremendous changes that have resulted along shorelines as a result of man and climate change. It rests with biologists and scientists to stand up for and to those who are ignorant of wolves' importance to Michigan.

Correspondence: I am writing to share my view in support of taking no action with the wolves of Isle Royale. The Isle Wilderness is, and by law must remain, "untrammeled" (unmanipulated, untamed, wild) with natural processes unimpeded by managers. In Wilderness, nature calls the shots.

I fully support what I believe you call Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Thank you for considering my opinion.

Correspondence: Dear NPS

Background

Wolves are relative newcomers to Isle Royale, having arrived in the late 1940s by walking across frozen Lake Superior from northeastern Minnesota or Ontario. Other wolves have arrived since that time and, conversely, many have also left. The island's wolves have been the subject of one of the longest-running studies of predator-prey relations. But inbreeding and other factors associated with their isolation have caused the wolf population to steadily decline for many years.

With the wolf population now at only two, many are calling for capturing wolves from the mainland and translocating them to the island, where they are likely to suffer the same "inbred and deformed" future as those currently there. The motivations for exiling the mainland wolves to the island are primarily to continue the predator-prey study and to satisfy tourist desires to see or hear wolves. There is some concern that Isle Royale's moose population-the wolves' primary prey-could explode, but moose numbers are declining throughout the upper Midwest to the point they have been proposed for listing as a threatened or endangered species.

The pro-transplant voices ignore that 98 percent of Isle Royale is designated Wilderness, and by law must remain "untrammled" (unmanipulated, untamed, wild) with natural processes unimpeded by managers. In Wilderness, nature calls the shots.

Recommendation

Support Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Thank you

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Correspondence: Dear National Park Service,

Thank you for considering my comments about the Isle Royale Wolves EIS. I support Alternative A: No Action. If wolves temporarily walked across a rancher's land and somebody watched them and took pictures, when they left would a project be initiated to forcibly repopulate them there? No. It's an extreme example, but a good thought experiment to clarify the logical issues here.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

The only alternative that makes sense is Alternative A: No Action. It also saves scarce resources for other productive work by your important agency.

thank you for your consideration,

Correspondence: I support alternative A: No action. Wolves should come and go based on natural migration.

I understand the concern about the possibility of a moose population explosion, but such an explosion would likely encourage wolves to return to Isle Royale naturally. Observation of such a return or non-return would support studies of predator-prey relations, as well as other natural ecological mechanisms that are intended to stay unimpeded by managers in Wilderness Areas such as that encompassing almost all of Isle Royale.

Thank you.

Correspondence: Support Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Correspondence: National Park Service - I am a retired Ecology Professor from [REDACTED] and I have used Isle Royale as an example of predator/prey interactions for 32 years. Wolves were not endemic to the island but self introduced sometime in the 40's by crossing the frozen Lake Superior. The relationship between the wolves and moose has been studied and quoted over and over in Ecology classes. The populations change through time in a time lag sequence without human intervention and it seems to work out quite well except for maybe baby moose. I favor the adoption of "A" alternative, do nothing and let Nature take its course.

Thank you,
[REDACTED]

Correspondence: I think NPS should pursue Option D - take no action at present, but reserve the option to take action based on new data. My reasoning is as follows:

- Wolves are a relatively recent arrival on the island. Population numbers have varied from 50 to 3 since their arrival. As a relatively inbred population, these wolves will always be more vulnerable to disease, and as a small population, at increased risk of losing significant numbers to random events.
- In the absence of predators, the expectation is that the moose population would increase beyond carrying capacity, with island vegetation suffering as a result, and a possible population crash following. However, moose populations in the upper Great Lakes appear to be declining generally. Absent evidence that the island is overgrazed, overpopulation does not appear to be a significant issue at this time.
- The recent trend toward shorter, milder winters and fewer years where Lake Superior freezes over decreases the likelihood of wolves or moose repopulating from the outside. Without action by managers, these populations are likely to be the working material for whatever interactions occur in the next decades.

So, at present the island ecological balance does not appear in danger from large increases in moose numbers due to reduced predator numbers. Wolf numbers have varied widely over the last several decades (since the last introduction). It's possible that wolves have always been transient visitors because of island area or the natural issues with smaller isolated populations. However, things could change. Therefore, let natural processes play out while reserving the option of reintroducing wolves if the island ecology appears to be suffering from their absence.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there. Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Correspondence: In 2006, I had the privilege of backpacking on Isle Royale for 6 days. It is an uncommon oasis of wilderness in the midst of the surrounding developed land and population.

To the question of whether of the National Park Service (NPS) ought to transplant wolves to Isle Royale given their dwindling numbers, I support the notion that nature should be allowed to take its course. Alternative A among the four on how to address this situation is the most humane and wise for the long term.

I agree with the following statements on this issue:

-Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

-Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Please plan to go forward with the no-action alternative, which would honor and preserve the area's wilderness character while letting the wolves decide if they want to recolonize Isle Royale.

Thank you for your consideration.

Correspondence: It strikes me that our efforts would be far better spent by expanding protections for wolves everywhere else and letting nature take its course on the island..however, as it appears we are allowing hunting and trapping of wolves elsewhere and removing protections elsewhere, then I favor doing whatever it takes for as long and often as it takes to establish wolves at this location assuming we never let them be hunted there , ever. At least in this manner they will have a sanctuary free from human carnage and we can study them genetically to ensure their survival.

Correspondence: Wolves are relative newcomers to Isle Royale, having arrived in the late 1940s by walking across frozen Lake Superior from northeastern Minnesota or Ontario. Other wolves have arrived since that time and, conversely, many have also left. The island's wolves have been the subject of one of the longest-running studies of predator-prey relations. But inbreeding and other factors associated with their isolation have caused the wolf population to steadily decline for many years.

With the wolf population now at only two, many are calling for capturing wolves from the mainland and translocating them to the island, where they are likely to suffer the same "inbred and deformed" future as those currently there. The motivations for exiling the mainland wolves to the island are primarily to continue the predator-prey study and to satisfy tourist desires to see or hear wolves. There is some concern that Isle Royale's moose population-the wolves' primary prey-could explode, but moose numbers are declining throughout the upper Midwest to the point they have been proposed for listing as a threatened or endangered species.

The pro-transplant voices ignore that 98 percent of Isle Royale is designated Wilderness, and by law must remain "untrammled" (unmanipulated, untamed, wild) with natural processes unimpeded by managers. In Wilderness, nature calls the shots.

Correspondence: They said it better than I can:

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Correspondence: With the wolf population now at only two, many are calling for capturing wolves from the mainland and translocating them to the island, where they are likely to suffer the same "inbred and deformed" future as those currently there. The motivations for exiling the mainland wolves to the island are primarily to continue the predator-prey study and to satisfy tourist desires to see or hear wolves. There is some concern that Isle Royale's moose population-the wolves' primary prey-could explode, but moose numbers are declining throughout the upper Midwest to the point they have been proposed for listing as a threatened or endangered species. The pro-transplant voices ignore that 98 percent of Isle Royale is designated Wilderness, and by law must remain "untrammled" (unmanipulated, untamed, wild) with natural processes unimpeded by managers. In Wilderness, nature calls the shots. I believe that in Wilderness natural processes, not human demands, Therefore I strongly supports Alternative A, the no-action alternative, which would honor and preserve the area's wilderness character while letting the wolves decide if they want to recolonize Isle Royale.

Correspondence: Officers of the National Park Service.

Please let Isle Royale's Wolf population follow it's natural course. Since it is reduced to only two animals due to isolation triggered inbreeding, reestablishing the population will have to be an ongoing human intervention, countermanding the intention of the Wilderness designation, only for the benefit of tourists to Isle Royale who come there just to see Wolves.

Thank you for considering my concern about the human need for truly Wild Country, as well as my concerns about having to artificially maintain an animal population which would otherwise follow the same course.

Correspondence: Support Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Correspondence: I'm urging the NPS to relocate wolves to Isle Royale to replace the dwindling island population of wolves. With a reduction in ice forming allowing mainland wolves the opportunity to walk the island, relocation is necessary to keep this population viable. 98% o the Island is wilderness. I've been to Isle Royale and although I didn't see any wolves, it sure made the trip to hear wolves there.

Correspondence: I write to ask that you protect the Royal Isle Wilderness and the freedom of its wolves. I've read about the four alternatives for managing the area and its wolves, and I'm convinced that Alternative A is the best: No action. Wolves would come and go based on natural migration.

I realize wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Thanks for considering my views.

Sincerely,
Judith [REDACTED]

Correspondence: Hello,

I am writing in regards to the consideration of transplanting wolves to the Isle Royale National Park and Wilderness in Lake Superior to replace those dying or leaving.

I urge you to support Alternative A and take no action on this matter. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

I think that we need to learn and accept that things change in the wilderness and that even though we have the ability to control nature to an extent, that doesn't mean we should. Yes, wolves symbolize so many amazing things and they are amazing creatures to see and hear, but if nature is deciding that they shouldn't be at Isle Royale, we should listen. Humans should accept that nature determines balance, and we far too often disrupt the delicacy of that balance.

Additionally, although I am not an expert on wolves, it is my understanding that wolves live in packs which are basically like close-knit families. To disrupt these packs and choose certain wolves to transplant into a new location is not acceptable in my mind. It would be unnatural to break apart these packs.

Please just let it be. People rely on the National Park Service to preserve what is natural so we can leave the inane busyness of our daily lives and go out and appreciate the beauty and peacefulness of untrammled environments. Then let's educate future visitors on how there used to be wolves there - why there were there, and why they disappeared. Let's not teach future generations about how humans have further disrupted nature's decisions. No action is the best course of action here.

Thank you.

Correspondence: I'm pretty sure I've signed a petition to support introducing more wolves to genetically diversify the population. However, my philosophy possibly follows Alternative A (take no action). Basically, I feel we need to support nature following the track it should be on if man weren't interfering. But it's hard to find places we haven't altered and interfered with.

So, please do what's best for ecosystems and all its inhabitants - - not some political reaction or payback.

Correspondence: As someone who resides in a wooded garden community of historic value, I am firm in my conviction that National Parks must be preserved and undeveloped by industry. Our clean air depends on trees. We need to shift away from fossil fuels and mount a program of building LFTRs liquid Thorium Reactors to supply clean, cheap, non proliferating nuclear energy, which would for the cost of one year's defense budget supply over 1000 years of electricity through modular reactors buried 100 meters below ground making them not vulnerable to sabotage. Such a program would as an adjunct support the enjoyment of national parks by American citizens and visitors from other lands.

Correspondence: As a taxpayer, a wilderness camper, landscape architect and natural resource manager, I urge the National Park Service to implement Option A leaving the island to exist as is, letting the current study come to a close. As users and interlopers into the resource processes of the island, we have decades of research results to tell us that isolation ruthlessly alters species in terms of species health, existence and genetic diversity. Moose populations have been tremendously negatively impacted by global climate change and the subsequent explosion in tick populations. We will see what the future brings for their population and health.

I do not support bringing a healthy wolf pack to be subject to the dire results we have already witnessed. Please implement Option A

Sincerely,

Correspondence: It is well-known that wolves are relative newcomers to Isle Royale, having arrived in the late 1940's by walking across frozen Lake Superior from northeastern Minnesota or Ontario. Additional wolves have arrived since that time and, conversely, many have also left, as conditions permit. I understand that the island's wolves have been the subject of one of the longest-running studies of predator-prey relations. But inbreeding and other factors associated with their isolation have caused the wolf population to steadily decline for many years.

In reviewing the facts, I support Alternative A, as it is the only alternative that honors and upholds Isle Royale's Wilderness status. Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event the wolves should decide if the island is ideal for their habitation, not human manipulation.

Furthermore, if the current wolf population dies out and no new wolves take up residency, much more can be learned by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Correspondence: Regarding Isle Royale National Park and Wilderness, wilderness is defined as "a tract or region uncultivated and uninhabited by human beings (2) : an area essentially undisturbed by human activity together with its naturally developed life community."

You have four proposals regarding wolf populations on Isle Royal National Park and Wilderness, and I heartily recommend Alternative A: no intervention. While I care deeply for wolves and have fought hard to protect them, particularly because of their positive trophic cascade effect in wilderness areas, I believe in this instance there should be no human intervention. Were this breed of wolves threatened with extinction, I would feel differently.

The 2006 National Park Services Management Policies state: The National Park Service will preserve and protect the natural resources, processes, systems, and values of units of the nation park system in an unimpaired condition to perpetuate their inherent integrity, and to provide present and future generations with the opportunity to enjoy them." Evolution itself is a process worthy of protection one worth leaving alone and the importation of wolves to the island would be an act of human intervention in this evolutionary process.

Let the wolves decide if they want to live on the island. They have only inhabited Isle Royale for a tiny fraction of post glacial time. If prey numbers increase, it is possible they may return. If prey numbers dwindle such as the island is now experiencing, wolves would have no motivation to return.

Ice bridges have started reoccurring on Lake Superior and it is my understanding that two wolves did migrate to the island during the 2015 winter. However, within a week they returned to the mainland, and one female recently left the island. These are natural processes and should be honored.

Respectively,

JoAnne [REDACTED]

Correspondence: Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Correspondence: Support Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

We are sending our comments by July 6. Thank you for keeping the Isle Royale Wilderness wild and for protecting the autonomy of its wolves!

Correspondence: Wolves are relative newcomers to Isle Royale, having arrived in the late 1940s by walking across frozen Lake Superior from northeastern Minnesota or Ontario. Other wolves have arrived since that time and, conversely, many have also left. The island's wolves have been the subject of one of the longest-running studies of predator-prey relations. But inbreeding and other factors associated with their isolation have caused the wolf population to steadily decline for many years.

With the wolf population now at only two, many are calling for capturing wolves from the mainland and translocating them to the island, where they are likely to suffer the same "inbred and deformed" future as those currently there. The motivations for exiling the mainland wolves to the island are primarily to continue the predator-prey study and to satisfy tourist desires to see or hear wolves. There is some concern that Isle Royale's moose population-the wolves' primary prey-could explode, but moose numbers are declining throughout the upper Midwest to the point they have been proposed for listing as a threatened or endangered species.

The pro-transplant voices ignore that 98 percent of Isle Royale is designated Wilderness, and by law must remain "untrammled" (unmanipulated, untamed, wild) with natural processes unimpeded by managers. In Wilderness, nature calls the shots.

The National Park Service is considering four alternatives:

Alternative A: No action. Wolves would come and go based on natural migration.

Alternative B: NPS would engage in a one-time (over three years) translocation of wolves to extend their longevity on the Island.

Alternative C: NPS would translocate wolves as often as needed over the long-term to maintain a wolf population on the Island.

Alternative D: NPS would continue current management of allowing natural processes to control, but could bring wolves to the Island in the future if certain conditions related to prey or vegetation are met.

Wilderness Watch works to protect wolves in Wildernesses across the country, including going to federal court several times to protect them from trapping, shooting, and other forms of harassment. We believe that in Wilderness natural processes, not human demands, should determine whether predators stay or go. For this reason, Wilderness Watch strongly supports Alternative A, the no-action alternative, which would honor and preserve the area's wilderness character while letting the wolves decide if they want to recolonize Isle Royale.

Support Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Correspondence: Please support Option A. The entire premise of the Isle Royale study has been to evaluate the NATURAL predator-prey relationships that exist there. If ANY wolves are TRANSPORTED to the island (even if human intentions are "good"), that action totally negates the NATURAL environmental relationships that are supposed to be in place. The long-term study WILL BE compromised if HUMANS interfere at all. As biologists who respect the natural order of predator/prey relationships, you should already know that. Again, I respectfully request that you support Option A.

Correspondence: I support Option C: translocating wolves as necessary to revive the struggling population. I was shocked to learn that there are only two wolves left on Isle Royale! I had always thought of this as a place where people could go to see wolves.

Since wolves are so heavily persecuted and lack meaningful protection across much of their range, refugia in National Parks are necessary to keep the species safe, even if that means human interference to move animals in. I also believe that the continued presence of wolves would keep local ungulate populations healthy and prevent overpopulation, in turn helping a host of smaller species which are negatively affected by over-browsing. Lastly, the local communities benefit from ecotourism, and a lot more people will come to see a healthy wolf population than will visit if no wolves are present.

I would also support the establishment of wildlife corridors, involving cooperation between various governmental agencies and private landowners, so that

wolves and other species can naturally move around the landscape and establish themselves on the island and elsewhere.

Thank you for considering my thoughts.

Please support Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Thank you,
Ryan

Correspondence: While I no longer believe in humans allowing the processes of Nature to continue without intervention - ridiculous, considering how our lifestyles are the most invasive and destructive of all possible "interventions" - because our beneficial intervention may save species threatened with extinction, nonetheless I strongly support NOT capturing and transporting wolves from the mainland to Isle Royale. They will most probably suffer the fate of the wolf population of the Isle that has died out over the years. If wolves migrate to the Isle on their own over the frozen lake, so be it. But, in this instance - stay out of it. You'll be taking a species from a viable habitat to one that has proven not viable in the longer term. As for studying wolves - GMAB. There are alternate ways of continuing the study without isolating captured wolves.

It is my belief that in the wilderness natural processes, not human demands, should determine whether predators stay or go. For this reason, I strongly support Alternative A, the no-action alternative, which would honor and preserve the area's wilderness character while letting the wolves decide if they want to recolonize Isle Royale.

Correspondence: The earth's wild places are the most beautiful parts of the world we will ever see. The creatures who live there are wonderful to behold. Wild animals have a right to live in peace in their homes just as we do. Yet most humans don't seem to respect that. They think it's all right to go onto areas where wild animals live, hunt them down, and kill them. Humans think it's their right to take all wild habitat for their own needs, such as lumber, mining, and water use. They build homes and then feel offended if wild animals return to search for the home that was paved over. The humans always win.

It's time for the animals and wilderness to win. It's time to respect wildlife habitat, green spaces, and their vegetation. We need living trees and greenery or we as a species will find ourselves withering away. We need to respect the beauty and fragility of our Earth's wilderness, from the smallest ant to the grizzly bear. All of them live in harmony with each other. We need to give back to them. Animals should not have to live in cages and zoos in order to survive. We as people wouldn't like that. The animals deserve their freedom, as they once had before we invaded their homes.

Correspondence: I don't understand why a comment is necessary. Fracking has proven to be dangerous, and it is clear from the widespread devastation to natural environments all over the US that mining, drilling, excavating and digging for coal, oil and other minerals is detrimental to the environment. Of all places our natural reserves need to be protected.

Correspondence: I support Resolution A, which allows wolves to migrate freely in and out of Isle Royale National Park and Wilderness. The population there is already endangered. Doing anything other than allowing the wolf to enter and roam freely, breeding, and replenishing the moose population, which is the Isle Royale Wolf's prime prey, would replenish the wolf population without any interference from the National Park Service.

I urge you to adopt Resolution A so that another animal species rescue can be claimed.

Thank you for your time and attention!

Correspondence: Please Support Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Thank you for your consideration.

Correspondence: I agree with the Alternative A, let nature take it's course; if wolves make their way to the island, so be it, but transplanting them on the island for the sake of satisfying tourist interest or to manipulate the current population, which is not historically native to the island, is kind of ridiculous. And bringing in more wolves doesn't guarantee a successful population as well as perhaps harming other prey populations there that are somewhat limited in numbers.

I recall being young and just out of college residing in an apartment community along the man made canals in █████ Texas. In order to provide a more natural way of trimming the greenery the city imported Nutria to gnaw. The Nutria were not native to the area and continue to snatch people's small animal companions for a snack. Ouch - unintended consequences I say.

Again, I urge you to just let nature decide the fate.

Correspondence: As a supporter of wilderness and someone who spends a great deal of time engaging in primitive recreational activities on our awesome public lands, I write to you with concern about the wolves of Isle Royale. I would ask the NPS to choose Alternative A. While it may seem controversial, these wolves colonized this area on their own, without human help, and they should either survive or not by their own accord. Artificially adding wolves to help the pack is bad science. If the pack fails and then wolves one day come back, we would learn a lot more than by forcing survival on them.

Seeing a wolf in the wild is one of the most amazing things for anyone who loves wild creatures and open spaces. But they should occupy those spaces because of their own natural intentions and inclinations, not ours. If the wolves were being decimated because of trapping, like the wolves of Denali National Park, or aerial gunning or annual hunts, my standing would most probably be different. But they aren't. This is natural selection in action.

Thank you for taking the time to listen to my concern.

Correspondence: Across the world now there is lost habitat for many species bringing many to the brink of extinction. This is a hard lesson for mankind as we destroy habitat for greed. To have a successful wilderness area you need to maintain and protect the environment for animals. You need to protect the predators like the wolves who are an integral part of the ecosystem. Everything in nature has a balance and man can harm or protect that balance. There is a tipping point where animals and even the land and water are destroyed. I am on the side of maintaining our wild places, the animals and I ask you to protect this ecosystem as a whole.

Correspondence: Thanks to Wilderness Watch's help, I submit the following:

Please support Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Thank you for your attention,

Rebecca [REDACTED]

Correspondence: I support Alternative A for the Isle Royale wolf relocation. Since Isle Royale is designated as wilderness, the wolf population should fluctuate on its own, just as the wolves found their way to the island in the 1940s on their own. The low population and inbreeding in the wolf pack is a natural process for this isolated pack. Allow the wilderness to exist without human intervention. Thank you for considering my comments.

Correspondence ID: 5520 **Project:** 59316 **Document:** 71605

Correspondence: I urge you to support Alternative A. While I understand the desire to maintain a wolf population at Isle Royale, introducing wolves into the park would not be in keeping with its status as wilderness. In addition, it would likely not be successful for the same reasons that the wolf population there has been declining over the last few decades.

Correspondence: I support Alternative A: No action. I understand that the wolves made their way to Isle Royale naturally, but genetic isolation has made their natural survival impossible. For an island w/98% dsignated Wilderness, introducing more wolves is inappropriate and will likely result in eventual degradation of the gene pool, once again. Not a pleasant option.

Correspondence: Life on this planet is very interconnected. We need to protect our environment and the wildlife it supports, because if we fail in our duty, our children will suffer and their future will be bleak, and most likely unsustainable. Although a few wolves may seem insignificant, they're not. They're an important part of animal population control in our forest and woodland environments that now typically lack sufficient natural predators because of human intervention.

Please support Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Correspondence: I urge the National Park Service to implement Alternative A as the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves are relative newcomers to Isle Royale, having arrived in the late 1940s by walking across frozen Lake Superior from northeastern Minnesota or Ontario. Other wolves have arrived since that time and, conversely, many have also left. The island's wolves have been the subject of one of the longest-running studies of predator-prey relations. But inbreeding and other factors associated with their isolation have caused the wolf population to steadily decline for many years.

With the wolf population now at only two, many are calling for capturing wolves from the mainland and translocating them to the island, where they are likely to suffer the same "inbred and deformed" future as those currently there. The motivations for exiling the mainland wolves to the island are primarily to continue the predator-prey study and to satisfy tourist desires to see or hear wolves. There is some concern that Isle Royale's moose population-the wolves' primary prey-could explode, but moose numbers are declining throughout the upper Midwest to the point they have been proposed for listing as a threatened or endangered species.

The pro-transplant voices ignore that 98 percent of Isle Royale is designated Wilderness, and by law must remain "untrammled" (unmanipulated, untamed, wild) with natural processes unimpeded by managers. In Wilderness, nature calls the shots.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Correspondence: Having considered the differing options, I believe that Option A: Take no action and allow nature to run its course, is the best option. It seems to me that if the wolves are leaving the island, then there's a good reason for them to do so. Whether that reason is inbreeding, lack of food, the conditions just make for an unhealthy territory, or for some other unnoticed reason, the wolves seem to feel it's time to leave.

Correspondence: Let the wolves do what they want, however, if it would be healthier from them to be with other wolves, and the "land bridge" is gone now, it is a nice thought to move them on over. My only concern is that they would be ostracized from any other local pack anyway and that would cause more stress. I think you need to carefully consider wolf behavior in this decision - what will be the best breeding conditions for them? Where will the pups be safer? Wolves don't kill more than can eat, usually, so I really doubt the local moose population will suffer. It is more likely that climate change and man are the causes of the moose decline.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Correspondence: As to the proposed alternatives that the National Park Service has suggested for the attrition of wolves on The Isle Royale Wilderness:

I am in favor of Alternative "A". Ninety-eight percent of the Isle Royal is, by law, deemed wilderness and must remain wild. This means that there should be no manipulation of the wildlife on this Isle. The Isle Royale wolves have been the topic of one of the longest running studies of predator-prey relations. Therefore, if the current wolf population (which is at present, two) should die out, the study would be much more effective by learning about the ecological response as to why this occurred. Transporting and manipulations of the wolf population at Isle Royale would put uncalculated variables in the study making all of that significant work invalid.

In closing, I believe the wolves must decide if they want to live there or not.

Thank you for reading my comment.

Correspondence: I am writing in support of "Alternative A," the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of the Island's very long history, their recent presence on the Island more an anomaly than the norm. However, they should control their own destiny, rather than us manipulating them.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Please apply "Alternative A" and allow the wolves to determine their own fate, and teach us how they do it in the process.

Correspondence: I support option A. It is up to the wolves to decide, not humans. Keep the wild, wild. Wolves should be left to come and go as they please. If the wolves die off, that is part of nature and a new study could be initiated as to the affects of no remaining predators on the island.

Humans need to let wolves be. Wolves are hunted in the West by totally inhumane ways, and what we humans should be doing is, just let these majestic creatures be!!!!

Correspondence: It is not wildness nor wilderness, created, supported and sustained by all wild, native species of tree, plants, birds and animals, scientifically, biological diversity and bio means, "life". It is planet Earth, the very Earth that generates and delivers every single lifeline mankind requires for life itself, scientifically, ecological, "life-supporting services".

A decade ago, scientists stated, each day, Earth becomes more like Mars. A skinned, paved, gouged, denuded and deforested Earth is another Mars. Mankind's "land-use changes" are killing planet Earth and his "life-supporting services". Also, ecological devastation also chances releasing new and deadly human viruses, the number one killer of mankind. Upon ecological destruction, viruses "behave like rats, jumping off a sinking ship.

"In Wildness is the salvation of the Earth and the preservation of all life, long known among wolves and planet Earth, but seldom perceived by man."

Correspondence: I strongly support Alternative B, the importation of wolves, on a one time basis, to replenish the stock and continue to support a complete ecological balance. Visitor enjoyment would be substantially enhanced. The thrill seeing and hearing these animals makes importation worthwhile.

Additionally, I urge that the wolves be "imported" from the State of Idaho where wolf hatred and loathing is so great that the state has made wolf slaughter a government sanctioned program. With over a 1,000 wolves killed in the past few years, removing even a few them from Idaho would be a blessing and probably save their lives.

I also urge that the park service contract with the Wildlife Services Agency, well known for its needless slaughter of wolves and other wildlife, to trap the wolves for transport to Isle Royal National Park. Since the agency is so good at killing wildlife, I can presume that they are also capable of live trapping.

It would be far more humane to gradually die out on an island than be hunted and slaughtered simply because of who they are! Further, I firmly believe that Idaho Governor Otter would be so pleased to get rid of a few of those "pests" he would offer state funds (or his own personal funds) to remove them from his state.

Wolves need a safe and secure environment where they can survive and thrive without the conflicts with livestock or people, which will cause their unfortunate demise. Isle Royal National Park is such a place.

Correspondence: The DDCS says they MUST operate a restaurant, gift shop, catering and meeting facilities in the DDC in order to make ends meet. This is clearly stated in DDCS' Statement of Qualifications, presented by DDCS to the City staff in obtaining their no-bid contract to manage the DDC project in the Spring of 2015.

"The DDC will require funding sources beyond admission fees, activity/event charges and memberships in order to reach financial self-sufficiency. Proceeds from food service retail, facility rentals and other sources, plus donations and grants all are vital for success. These must be allowed at the DDC." (page 13).

and

"Like virtually every other similar facility, in order to be self-sufficient the DDC must offer a mixture of revenue-generating options to supplement entrance fees, memberships and donations. These include retail (a DDC shop and retail website), food service (a cafe or restaurant serving alcohol), rental space for meetings and special events including catering and other revenue-generating facilities and activities, such as fee-based educational offerings for children and adults." (page 14).

This commercialism is fundamentally at odds with the Preserve Ordinance, the Preserve mission, the nature of the Gateway facility, and the character of the surrounding neighborhoods. Without commercializing the Preserve, DDC will be a money-losing burden on the taxpayers.

Please stop the DDC project, it is flawed in relying on commercializing the Preserve in order to make ends meet.

Correspondence: I echo these sentiments..

I Support Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey relationship

Correspondence: Wolves are relative newcomers to Isle Royale, having arrived in the late 1940s by walking across frozen Lake Superior from northeastern Minnesota or Ontario. Other wolves have arrived since that time and, conversely, many have also left. The island's wolves have been the subject of one of the longest-running studies of predator-prey relations. But inbreeding and other factors associated with their isolation have caused the wolf population to steadily decline for many years.

With the wolf population now at only two, many are calling for capturing wolves from the mainland and translocating them to the island, where they are likely to suffer the same "inbred and deformed" future as those currently there. The motivations for exiling the mainland wolves to the island are primarily to continue the predator-prey study and to satisfy tourist desires to see or hear wolves. There is some concern that Isle Royale's moose population-the wolves' primary prey-could explode, but moose numbers are declining throughout the upper Midwest to the point they have been proposed for listing as a threatened or endangered species.

The pro-transplant voices ignore that 98 percent of Isle Royale is designated Wilderness, and by law must remain "untrammled" (unmanipulated, untamed, wild) with natural processes unimpeded by managers. In Wilderness, nature calls the shots.

The National Park Service is considering Alternative A: No action. Wolves would come and go based on natural migration.

Correspondence: Re-introducing wolves to an island where they did not appear until the 1940's strikes me as an inappropriate action. They are dying off by attrition - inbreeding being one of the causes - and they should exist there as they did originally by crossing ice in the winter. Moose are declining across the midwest and it is doubtful there will be an explosion of their population on the island. My vote is to leave Isle Royale pristine wilderness - i.e , no manipulation by humans.

We need to protect every single species on our planet. Each species represents part of Earth's ecosystem "web."

As Earth's ecosystem weakens, it loses its ability to continue providing our human civilization with the clean air, clean water, and healthy food upon which we depend. Our civilization is therefore dependent on the continued survival of each species.

Correspondence: What has been determined to be the cause of the decline in the wolf population on the island? Without the answer to this, I don't see how the NPS can formulate a plan to remedy the declining wolf population. I have read some speculative reports that point to a parvovirus carried by dogs that are brought to the island by tourists. If this is indeed the case, then this should be addressed before more wolves are brought to the island. In any case, determining the cause of the population drop is the first priority.

Correspondence: Gentle Ones:

As a former resident of Michigan, I care a great deal about the status of wilderness in the U.P.

It seems to me that the best alternative is "A," allowing nature to take its course and honoring the "wilderness" part of Isle Royale's status.

The fact that the wolf population has not sustained itself on the island due to inbreeding creating weaknesses is itself a reason not to bring more wolves in to suffer the same fate. It seems to me that would defeat the purpose of a predator-prey study when you artificially manipulate the population.

Since wolves have only been on the island less than a century, it has clearly not been an established habitat on this continent.

I say let the wolf population establish its own living arrangements with no interference from humans' desire!

Correspondence: Wilderness Watch alerted me to this opportunity to comment in your scoping of interests regarding wolves in the Isle Royale Park. I agree with Wilderness Watch that as a wilderness area, man's management should be extremely limited and science should follow the changes, rather than inducing them. Still, as an agency continually exposed to public scrutiny and concern, including those of us who believe wolves need continuing protection, you'll need to make your own decisions on nature vs nurture of wildlife in wilderness areas. Perhaps you must wait until it's all but obvious that the wolves are going to exit the island, and thus be prepared to consider reintroduction in the future, if there's a good case to be made. Otherwise, I suggest Alternative A must guide you for now.

Correspondence: Wolves have inhabited Isle Royale for a short time, and their recent presence on the Island is rather an anomaly. The wolves, not people, should decide whether they will remain there. Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially planting another wolf population on the island to continue what has been a "natural" predator-prey study. ALTERNATIVE A IS THE ONLY ALTERNATIVE THAT HONORS AND UPHOLDS ISLE ROYALE'S WILDERNESS STATUS.

Correspondence: I don't believe that adding new wolves to a dying couple will improve the

stock because they cannot choose wolves other than their own bloodline to mate with. The wolves do not always stay on the Isle for a reason. They should choose whether to stay or go. They must want to mate with new stock to improve their dna and strength as a pack. I choose A and hope that you too will consider that choice for the remaining wolves. Our American wolves are having a hard life in America with habitat loss, food loss and ranchers and farmers considering them pests. Magnificent animals, the parental line of every dog breed in America today, I believe wolves deserve more respect and a chance to make their choices.

respectfully yours,

Correspondence: I support proposition A, which will leave the wolves on Isle Royals alone to prosper or die out. The wolves were not native to Isle Royale but came across the lake on their own and if they cannot maintain themselves on Isle Royale then they should not be there. I have been to Isle Royale and seen the moose and wolves and hate to see the wolves be gone, but I strongly believe that we should leave what nature put on the island alone even if it means the wolves dying out.

Please consider my opinion when making your decision. Isle Royals is a beautiful, natural place with and without wolves. The fact that the wolves got to the island on their own is what makes their being there so important. We do not want to manage nature here.

Correspondence: Background

Wolves are relative newcomers to Isle Royale, having arrived in the late 1940s by walking across frozen Lake Superior from northeastern Minnesota or Ontario. Other wolves have arrived since that time and, conversely, many have also left. The island's wolves have been the subject of one of the longest-running studies of predator-prey relations. But inbreeding and other factors associated with their isolation have caused the wolf population to steadily decline for many years.

With the wolf population now at only two, many are calling for capturing wolves from the mainland and translocating them to the island, where they are likely to suffer the same "inbred and deformed" future as those currently there. The motivations for exiling the mainland wolves to the island are primarily to continue the predator-prey study and to satisfy tourist desires to see or hear wolves. There is some concern that Isle Royale's moose population-the wolves' primary prey-could explode, but moose numbers are declining throughout the upper Midwest to the point they have been proposed for listing as a threatened or endangered species.

The pro-transplant voices ignore that 98 percent of Isle Royale is designated Wilderness, and by law must remain "untrammled" (unmanipulated,

untamed, wild) with natural processes unimpeded by managers. In Wilderness, nature calls the shots.

The National Park Service is considering four alternatives:

Alternative A: No action. Wolves would come and go based on natural migration.

Alternative B: NPS would engage in a one-time (over three years) translocation of wolves to extend their longevity on the Island.

Alternative C: NPS would translocate wolves as often as needed over the long-term to maintain a wolf population on the Island.

Alternative D: NPS would continue current management of allowing natural processes to control, but could bring wolves to the Island in the future if certain conditions related to prey or vegetation are met.

Wilderness Watch works to protect wolves in Wildernesses across the country, including going to federal court several times to protect them from trapping, shooting, and other forms of harassment. We believe that in Wilderness natural processes, not human demands, should determine whether predators stay or go. For this reason, Wilderness Watch strongly supports Alternative A, the no-action alternative, which would honor and preserve the area's wilderness character while letting the wolves decide if they want to recolonize Isle Royale.

Support Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Correspondence: I believe we should let the wolves that reside on Isle Royal to decide what they would do. I think if we interfere, it may not be the correct decision. It isn't really normal for them to be there in the first place.

It seems that if this population died off, much could be learned from them; how ecologically the results are for what they do and have done. If another wolf population is brought to the island, it would not seem natural. Wilderness Watch strongly supports alternative A and I agree with this vote. They would continue to honor and preserve this area.

Correspondence: I believe that since 98% o Isle Royale is designated wilderness that no wolves should be brought in but you should just let the ones there come and go based on natural migration. The definition of wilderness says the area must remain unmanipulated so nature is left to call the shots with no interference in natural processes by managers. Inbreeding of wolves has historically in this place been causing many deformities amongst them and that seems to be the reason the population was decimated to such a low count to begin with so it would be terrible to keep causing those problems. And even if the wolves die out, we can learn much more by studying the ecological responses to the loss of wolves there rather than studying the prey-predator relationship.

Correspondence: Support Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Correspondence: The question of managing wolves on Isle Royale is a tough one, but of all the alternatives you posit, the most appropriate, in this day and age of advanced ecological knowledge, is the only alternative that honors and upholds Isle Royale's Wilderness status - A.

Wolves chose to cross a frozen Lake Superior to the Island very recently in its geological history. They thrived there for a while, but as any ecologist can attest, small is not good in terms of island biogeography and isolated populations. With inbreeding comes physiological problems, and this is precisely the trajectory of this wolf population, unfortunately.

At this juncture, if there is an ecological niche to occupy, wolves will again traverse the ice to establish residency and breeding packs. Perhaps the outcome will be the same, but the other possibility is routinized genetic outflow and inflow that enables a robust population to persist. This, then, should be the model studied, not an artificially induced one where wolves are translocated.

Correspondence: The National Park Service is asking for public comments as it considers whether it should transplant wolves to the 133,000-acre Isle Royale National Park and Wilderness in Lake Superior to replace those dying or leaving.

The National Park Service is considering four alternatives:

1. Alternative A: No action. Wolves would come and go based on natural migration.
2. Alternative B: NPS would engage in a one-time (over three years) translocation of wolves to extend their longevity on the Island.
3. Alternative C: NPS would translocate wolves as often as needed over the long-term to maintain a wolf population on the Island.
4. Alternative D: NPS would continue current management of allowing natural processes to control, but could bring wolves to the Island in the future if certain conditions related to prey or vegetation are met.

Please support Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Correspondence: Please SUPPORT Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

In Wilderness natural processes, not human demands, should determine whether predators stay or go. The pro-transplant voices ignore that 98 percent of Isle Royale is designated Wilderness, and by law must remain "untrammled" (unmanipulated, untamed, wild) with natural processes unimpeded by managers. In Wilderness, nature calls the shots.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Correspondence: I agree with letting nature take its course. If the current wolf population dies off in the wilderness, then that is what should happen. It is not for humans to decide where and when any creature should live. ALL creatures should be left to evolve or die as nature intends. Humans should not interfere AND should not kill them off just because humans don't like a species. Wolves are on this earth to keep balance in the ecosystem. If humans interfere in any way, that is just not right. Please do not introduce any more wolves to this region by interfering. Let them migrate to this region on their own.
Thank you.

Correspondence: Without wolves on Isle Royale, the moose will completely change the island ecologically. With the Island being one of the few National Parks that has such a delicate balance, wolves are needed. Wolves have been brought onto the island before by man, and it should be done again. Establishing a viable wolf population to counter the rapid growth of the moose population is going to be difficult at this late date. The situation should have never gotten to this point if the advise from experts was taken. Many people come to Isle Royale to get a chance to see not only the wolves but also the moose. Also the research that has been gained by studying the Island is very valuable.

Sad that things continue to move so slowly to solve the problem. Every time this site is checked the deadline is extended. One can only guess why.

Don't let this beautiful, unique island be destroyed by the moose, have a plan for the future, not a short sighted plan that doesn't .

Correspondence: I favor Alternative A - No Action for the Isle Royal management.
The NPS will not intervene and would continue current management. Wolves may come and go through natural migration, although the current population of wolves may die out.

From the information provided about voluntary wolf departures it appears that wolves do not wish to live there.
Thank your for the opportunity to comment.

Correspondence: Re: Isle Royale Management Plan

I write to encourage the National Park Service to adopt Alternative A, the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves alone to decide if they want to live there. Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Manipulation of Isle Royale's wolf population is not in accord with the current working definition of 'wilderness', which as I understand it requires minimal human interference with the functioning of the wilderness ecology.

Please adopt Alternative A, and as the cliché goes, 'Let Nature take its course.'

Thank you for your consideration.

Sincerely,

██████████

Correspondence: Please go with Alternative A. It should be up to the wolves to decide if Isle Royal is a suitable habitat. I believe wildlife should be just that...wild. And since there is not a long history of wolves in that area, there is no reason for humans to move them there. Let them move there themselves if they so wish.

Correspondence: I support Option A- the wolves have inhabited Isle Royale for a relatively short time, and the resulting isolation and inbreeding that resulted has played out. To keep relocating more wolves there will, in my opinion, repeat the scenario over and over. I believe, in this case that letting nature take it's course is the best option for the wolves. As humans, we tend to shortsightedly see a situation when we intervene, even with the best intentions, and later only in retrospect, do we understand all the ramifications of our interference in nature's ways. Let us not do that again. Thank you for allowing a simple RN and horsewoman (who happens to love the sound of wolves in upstate NY) speak her mind on this issue.

Correspondence: I support Alternative C: (NPS would translocate wolves as often as needed over the long-term to maintain a wolf population on the Island). Global warming has reduced the frequency of ice bridge to Canada, so there is nothing "natural" about letting the current wolf population (of 2) die out. Think of translocation as a kind of wildlife corridor. In addition, the population could be seeded with rouge wolves from the mainline that are accused of killing sheep or cattle. If the wolf population on Isle Royale gets too large, then some of them could be relocated to other isolated areas that need genetic variability, making the "corridor" as two-way street.

I support Alternative A as it is the only alternative that honors and upholds Isle Royale's Wilderness status.

Preserving Wilderness status is sometimes difficult, but we should definitely not succumb to the whims of tourists who like to hear wolves howl. That would be turning the area into a zoo.

We should not rush in to disturb this wilderness area and add something that does not belong. Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Sincerely,
Jenny [REDACTED]

Correspondence: I lived in Michigan until recently. I have read that the wolf population of Isle Royale is dying out and you are considering whether or not to transplant more from other locations. My understanding is that the current wolf population is the result of some wolves traveling across winter ice from the mainland in the 1940's and that there were none before that. With Isle Royale being a designated Wilderness, I believe that transplanting new wolves would violate the concept of Wilderness, much as it would seem "nice" to do it.

Correspondence: We have to stop tinkering with nature. Surely the moose population is just as important to protect as any other species. With the absence of wolves the study can watch nature recover and determine what species return to the area when the dominant predator moves on. Wolves may be exiting for reasons we are not aware of. Climate change and inbreeding may well be a couple of them.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Correspondence: As a member of Wilderness Watch, Defenders of Wildlife, the Sierra Club and other environmental and animal rights organizations I urge you to please implement Alternative A considering the Isle Royale Wolves. Since this is a Wilderness area and should not be manipulated or altered by man, I believe that nature and the wolves should be allowed to regulate and manage themselves without man's interference.

If the wolves want to travel to this Island, then they should do so on their own, nature will balance its self out just fine without man's influence. Please implement Alternative A and keep the Isle of Royale a TRUE wilderness area!

Correspondence: As someone who both admires wolves and appreciates wilderness, not only for its scientific value but also for personal recreation, the question of whether to augment artificially the declining Isle Royale wolf population is a bit of a dilemma. Bringing in additional wolves would no doubt please some recreationists who visit, but pleasing tourists should have little weight in determining the best management practice for this unique wilderness resource. While I appreciate the benefit of restocking wolves to the ongoing moose/wolf study, I think a greater benefit to science might accrue from a long term study of the natural decline of moose and wolves and the migration of both to Isle Royale. Moreover, the management of wilderness dictates that it is not to be manipulated by human managers.

For these reasons, I urge the National Park Service to adopt Alternative A.

Thank you for considering my views.

Correspondence: I am from Michigan and now live in California. Wildlife is under siege everywhere, and wolves particularly are in peril. They have a right to survive and as a species, we are putting extreme stress and population reduction on them and other wild animals. We have to strive for healthy populations of wild species and Isle Royale can provide the help wolves need to continue to live on this continent. I DO NOT however wish to provide gun happy hunters to take part in destroying the rehabilitation of wolves.

As a taxpayer and citizen of this country, I think it is important to get off the march to just kill wildlife and overrun their habitats, ending up with a world devoid of animal diversity. A planet with no wild animals and just more and more humans is a nightmare scenario. Let's not go there. Think and help wolves now.

Correspondence: I urge you to support Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

As a biologist/ecologist I appreciate how various species interact with each other in predator-prey and altruistic relationships, and how they interact with the abiotic elements in their ecosystem. Balance is always key in maintaining sustainability. Wolves are not native to Isle Royale. The population that transplanted itself there is small and consequently it inbred during its history, consequently weakening over time. Only a few remain. Artificially transplanting more wolves on Isle Royale to perpetuate their presence for reasons not favoring their sustainability will result in the same fate as the original population. It's important to allow an ecosystem to evolve naturally without the interference of humans in order to maintain balance and sustainability. We humans think we can control everything to satisfy our own desires which may not be in the best interest of the species we wish to control. Let's let the wolves decide whether they want to live on Isle Royale. We may be surprised by what happens if they choose to stay or leave. Both alternatives will have valid ecological consequences.

Thank you.

Correspondence: I support Alternative A which honors Isle Royale's Wilderness status.

Wolves have only recently populated Isle Royale and they should be allowed to decide whether they want to live there or not.

The ecological response to the loss of the wolves should be studied if they die out rather than transplanting another group of wolves to the island.

Its a wilderness and it only makes sense to allow nature to take its course rather than to interfere with it, especially for the sake of tourism.

Correspondence: Please consider this reason when making your decision,

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss

of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Thank you for reading my request.

Sincerely,

Kyle [REDACTED]

Correspondence:

When it comes to wilderness, I think that speaks for itself. Manipulating wilderness for a plan or some grand scheme is NOT keeping it wild. Having said that, returning areas to natural condition is admirable on a case by case basis.

Putting wolves into an area for 'study' or entertainment of visitors does not satisfy the case by case evaluation because it is not returning them to a native area. In fact impact of wolves on moose populations demands that evaluation of BOTH dictates that the wolves should not be manipulated.

Correspondence: The island's wolves have been the subject of one of the longest-running studies of predator-prey relations. Inbreeding and other factors associated with their isolation have caused the wolf population to steadily decline for many years.

With the wolf population now at only two, many are calling for capturing wolves from the mainland and translocating them to the island, where they are likely to suffer the same "inbred and deformed" future as those currently there. The motivations for exiling the mainland wolves to the island are primarily to continue the predator-prey study and to satisfy tourist desires to see or hear wolves. There is some concern that Isle Royale's moose population-the wolves' primary prey-could explode, but moose numbers are declining throughout the upper Midwest to the point they have been proposed for listing as a threatened or endangered species.

Please take no action as the wolves will come and go through natural migration just as they have proven in the past.

Correspondence: Alternative A. Leave the wolves alone.

Why do you always have to "maintain", "manage" and control-freak wolves and otehr predators.

Leave the wolves alone. They are essential. We have murdered, snared, maimed, trapped and harassed millions of wolves. For what? For NO reason.

Stop bending over for the ranchers. Eating animals and destroying thousands of acres for grazing and growing animal feed must end NOW.

Leave teh wolves alone. Let them migrate and do whatever they do naturally.

Correspondence: I am writing to comment on the wolf management alternatives being considered by the National Park Service (NPS) and the Environmental Impact Statement (EIS) for Isle Royale National Park.

There are at least three examples of past actions by humans that have led to the decimation of the wolf population on Isle Royale. First, the exposure of the population to canine parvovirus, caused by humans bringing a diseased dog to the park, a violation of park rules. Second, the death by drowning of three wolves, one of them an alpha male, in an abandoned mine pit. And third, the changes to the climate that scientists around the world overwhelmingly agree are caused by human actions and that have led to conditions that now prevent an ice bridge from reliably forming between the island and the mainland.

Because human actions have adversely affected the wolf population on Isle Royale, and because the health of the moose population on Isle Royale is dependent on having a healthy wolf population to act as a predator so that the moose do not wipe out the vegetation they depend on as a food source (which would most likely result in other adverse effects on the island's ecosystem), I believe humans, the NPS, should take immediate action to restore the wolf population on Isle Royale and should choose Alternative C as the means to doing so.

I also believe restoring the wolf population on Isle Royale can only enhance the quality of the island's wilderness character, not detract from it.

By restoring the wolf population on Isle Royale the NPS would be correcting an imbalance caused by humans, one of the signs of a healthy ecosystem being balance between its many elements.

Part of the mission statement of the NPS says that the fundamental purpose of the parks "is to conserve...the wildlife therein and to provide for the enjoyment of the same in such manner and by such means as will leave them unimpaired for the enjoyment of future generations." I believe the NPS has failed its mission with regards to the wolves on Isle Royale and must act to correct that failure.

Wilderness Watch, a group which acts to safeguard wilderness, acknowledges that, at times, human actions such as wildlife transplants, endangered species management, and predator control take place in wilderness areas despite these actions not falling within the statutory intent of the Wilderness Act. Surely, restoring balance to a wilderness ecosystem should be seen as a benefit to Isle Royale National Park.

Correspondence: Please Support Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Correspondence: I support Alternative A.

While I value the presence of wolves in our natural areas, and support their re-introduction in areas where they were earlier eliminated by bounty hunting and such practices, I don't like the "lab experiment" regulation of the Isle Royale population. The decimation of the population that has happened over the last decade or so, should indicate that natural forces are at work. If they get back there, let them stay. Otherwise....

I have camped on the Isle, loved hearing the wolves, been chased by a moose, "swung" the birches, and greatly appreciate the care that has been taken to preserve the natural integrity of the place. I think a wolf population needs more geography than this to stay healthy.

Correspondence: While I understand the importance of safety for citizens and children especially, I also am concerned that we not relegate our living heritage for our children to an island that is remote and will likely result in smaller herd numbers for the wolves. We need to examine how we can live sensibly and safely with wolves in the wild, rather than coralling them into a "reserve" (much like the reservations we used for Native Americans in the 19th century.) Wolves are not livestock and need space to roam freely and without penalty. They have played an important role in the return of herds to the Yellowstone National Forest, as well as the maintenance of waterways, and many other attributes that keep our National Park system healthy and vital.

Correspondence: Alternative A: No action. Wolves would come and go based on natural migration.

Alternative B: NPS would engage in a one-time (over three years) translocation of wolves to extend their longevity on the Island.

Alternative C: NPS would translocate wolves as often as needed over the long-term to maintain a wolf population on the Island.

Alternative D: NPS would continue current management of allowing natural processes to control, but could bring wolves to the Island in the future if certain conditions related to prey or vegetation are met.

Wilderness Watch works to protect wolves in Wildernesses across the country, including going to federal court several times to protect them from trapping, shooting, and other forms of harassment. We believe that in Wilderness natural processes, not human demands, should determine whether predators stay or go. For this reason, Wilderness Watch strongly supports Alternative A, the no-action alternative, which would honor and preserve the area's wilderness character while letting the wolves decide if they want to recolonize Isle Royale.

Correspondence: Dear NPS,

I am a great supporter of our national parks and I writing regarding my concern regarding the relocation of wolves to Isle Royale.

I believe that natural processes, not human demands, should determine whether predators stay or go. For this reason, please consider no action as wolves should come and go based on natural migration.

Pro-transplant voices ignore that 98 percent of Isle Royale is designated Wilderness, and by law must remain "untrammled" (unmanipulated, untamed, wild) with natural processes unimpeded by managers.

Respectfully,
Catherine [REDACTED]

Correspondence: I STRONGLY SUPPORT Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status!!!!!!

Every animal has a purpose in nature. Some animals are more cute and cuddly and therefore more easily loved.

But cute or not, every animal has a purpose.

What has been done to wolves in this country is a travesty.

The cruelty, the downright animosity is unbelievable.

We cannot let a few vocal anti-wolf lobbyists do any further damage to the wolf population.

Someone must step in and do the right thing. It is therefore up to the NPS to stand strong and protect the wolf just as it should be protecting every other animal!!!!

The world has been up and down in terms of protecting animals. Some great things have been done recently for them, but plenty of threats still remain.

So many of our waters, public lands, forests, and open spaces have already been ruined by development, drilling, OTV/ATV use, and man. The animals are running out of places to live and be safe. Our wildlife are under threat from so many angles. They desperately need to be protected, mainly from humans.

Life is hard enough for people, let alone the animals.

Can't we please offer the WOLVES some much needed help?!

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Correspondence: One of my very first backpacking trips was on Isle Royale circa 1971 at the age of 16. For 45 years now I have visited both National Parks and designated Wilderness areas. I am keen on the two designations, that we may learn to appreciate nature while providing places for nature to run free. In considering the proposal to bring wolves to Isle Royale I write to express my strong support for Alternative A, do nothing, which preserves the Wilderness designation that applies to some 98% of the island. Over time, wolves may choose to return to Isle Royale or they may not. Populations will ebb and flow at a timeline that is not of man's making. Please make your ruling to preserve the Wilderness status of the island.

Correspondence: Protect the Isle Royale Wilderness and the freedom of wolves.

I Support Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

There is some concern that Isle Royale's moose population-the wolves' primary prey-could explode, but moose numbers are declining throughout the upper Midwest to the point they have been proposed for listing as a threatened or endangered species.

So once again, I support Alternative A and not exile other wolves to the Island merely to extend a study on predatory and prey behavior.

Thank you.

Correspondence: Dear Sirs:
Since wolves are recent inhabitants of Isle Royale, it seems to me that alternative A is the best course of action. Nature will take care of balancing the ecosystem, provided people don't interfere. If the moose population begins to increase beyond the ability of the area to feed them, consider moving the moose to another ecosystem where they are declining.
Maybe the rest of the inhabitants of the island could be studied to see if there is another reason for the decline of the wolf population. Moose aren't the only prey wolves eat. What else is happening on the Isle?

Correspondence: Wolves are relative newcomers to Isle Royale, having arrived in the late 1940s by walking across frozen Lake Superior from northeastern Minnesota or Ontario. Other wolves have arrived since that time and, conversely, many have also left. The island's wolves have been the subject of one of the longest-running studies of predator-prey relations. But inbreeding and other factors associated with their isolation have caused the wolf population to steadily decline for many years.

With the wolf population now at only two, many are calling for capturing wolves from the mainland and translocating them to the island, where they are likely to suffer the same "inbred and deformed" future as those currently there.

The pro-transplant voices ignore that 98 percent of Isle Royale is designated Wilderness, and by law must remain "untrammled" (unmanipulated, untamed, wild) with natural processes unimpeded by managers. In Wilderness, nature calls the shots.

I urge you to:

Support Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Correspondence: How many times does the American People have to be bothered by this form of barbaric legislation from Capitol Hill calling for an unwanted energy bill that threatens to destroy our wilderness and environment? Well the American People are not going to take this horrific excuse anymore and we have just had it up to the here (the razor's edge) with the same old childish behavior still coming from the Republicans and special interests groups. America has finally put it's foot down on the continuing threats made on our national parks, rich wilderness heritage, government lands and environment, which means that a full majority of Americans will do their best to defend our rich wildlife heritage and environment while making sure are national parks remains as free from any type of development. In recent memory, I have never heard this type of adult-oriented childish behavior taken to the extreme in my life, and many Americans must be just as deeply offended as I am. Now that the Republicans, the fossil fuel industry and special interests groups have acted like "mentally-disturbed big babies" since the 1980's, they need to start growing up and face up to the fact that we are in an international climate crises and that we need to find a series of hard solutions that will lower the world's temperatures to normal rates and successfully turn back the clock on climate change before it finally gets the best of us. We all know that childish behavior never amounts to any-thing, we need to keep using our common sense and rely on the best technology that will successfully eradicate the climate crises so that we can have a safe and prosperous future that everyone can really look forward to. We all know that a solution against climate change can be successfully made, we just need to make it become a landmark life-saving reality as quick as possible.

Correspondence: I am writing in strong support of Option A, to take no action on wolves on Isle Royale. The wolf population came to Isle Royale relatively recently, by natural means, and it does not seem justifiable to intervene with human action to increase the population. Wolves have their own social structures and ranges; whether the population Isle Royale dies out or increases by natural means, there is no reason to disturb another population of wolves to artificially populate Isle Royale. Observing natural behavior in this situation seems to be the most valuable course of action rather than introducing human-driven factors that negate or at least severely impact natural phenomena. Thank you for your consideration.

Correspondence: Dear Sir:

Thank you very much for the oppportunity to respond regarding this important issue. As a wilderness and wild animal lover, I strongly support Alternative A.

I support Alternative A for some of the following reasons:

* Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

* Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there. No human intervention.

* Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

We need to support Alternative A and let nature take its natural course.

Thank you again for the opportunity to respond.

Correspondence: I hope to visit Isle Royale this summer in order to experience a wilderness as I have other wilderness areas. It would be nice to see wild wolves but "Wilderness" is the key word and I am a strong supporter of The Wilderness Act. Therefore I respectfully request that you follow Alternative A, No Action, of the EIS Scoping document. This is in keeping with the admonition of the Wilderness Act to let nature take its course.

I am an former NPS employee and frequent visitor to the Parks. We need to let nature have its say. Besides, when the last two wolves depart, then your biologists can study the affect of predator disappearance on the moose population. That would be a good thing.

Thank you,

/s/

Let this course play out. Let's study them, understand ecology and species migration, daily living and evolution. Let's study the surrounding environment from species to plants and NOT exterminate wolves.

Thank you for listening to my comments

Correspondence: I am writing in strong support of Alternative A, to ensure Isle Royale maintains its unique role as a designated Wilderness, untrammelled, and free from human manipulation.

I grew very fond of Isle Royale during my time as an undergrad at [REDACTED] Wisconsin [REDACTED]. At the same time that my love of the Island was maturing, my understanding of designated Wilderness was also maturing. I ended up graduating with a degree in Environmental Studies with an emphasis in Wilderness Philosophy. Shortly thereafter, I moved to Southeast Alaska to work on Wilderness stewardship. Southeast AK is a land of islands and its own unique wolf population, the Alexander Archipelago wolf. I've spent many hours protecting these wolves on their native islands. I mention this to express my passion for both wolves and Wilderness where appropriate (i.e. where their natural succession pattern is respected).

Since then, I followed both of those passions. I received a Masters degree studying population ecology from [REDACTED], and am currently working toward my PhD in the same field at the [REDACTED]. Concurrently, I helped [REDACTED] and have served almost 6 years as a Board Member. I mention all of this simply to highlight that I have thought and studied deeply in both Wilderness policy and philosophy and wildlife population ecology. It is clear to me that Isle Royale presents the field of ecology an unparalleled dataset and test case in successional island biogeography and population dynamics. It would be absurd for the Park to take an objective action, counter to its Wilderness mandate, only to sabotage such an incredible opportunity to study ecological change in the current climate context.

Please fulfill the mandate of the Wilderness Act and select Alternative A.

Best,

[REDACTED]

Correspondence: Isle Royal should remain wild, without human intrusion into the natural processes that take place in this wilderness. Wolves should not be artificially reintroduced if the present population dies out or migrates. Instead, the natural processes should be studied so that we can better understand those processes.

Wolves are a recent addition to the Isle Royal Wilderness. They migrated across the frozen lake to the island and were trapped there when the lake thawed. They then established family units. Since then some wolves have migrated back across the frozen lake while others have perished by natural forces.

To maintain Isle Royal as the law dictates, we must only observe the forces at work on the isle not interfere. Therefore, I respectfully ask that "alternative A" be implemented by the Park Service.

Correspondence: I believe that Option A is the only viable choice for the wolves as there is no future for them on the island if they are unable to sustain their population naturally. Factors are making their future on the island impossible. It's a death sentence to move wolves from the mainland knowing they cannot survive on the island. Someone should have determined before the population was down to two wolves what the factors were that brought about their demise. Now it's too late. Let the wolves move about as they see it. It is after all their own destiny, not ours.

Correspondence: To Whom it May Concern,
After reading your report I have come to the conclusion that Alternative C is the best choice for wolf management on Isle Royale with one caveat. I list my reasons below and suggestion at the end.

Reason one is that The island has been occupied by wolves for many decades and the wolves found there way there. Although trans-locating more wolves to the island may not be a natural process, it has proven to be a viable environment for them. Since their ability to freely migrate rate to and from the mainland has been curtailed they can not leave and hopefully a full healthy and breeding population will come of this.

Reason two is that wolves ARE an endangered species and should be listed as so and remain so. They need to be protected to the fullest extent of the law. One of the best ways to do that is to have more habitat for them to live free. Isle Royale gives them one more place to call home.

My caveat to your plan is to not only trans-locate wolves TO the island, but also trans-locate wolves FROM the island so that inbreeding would be minimized.

Please choose alternative C and consider my suggestion. Please allow these noble, beautiful and intelligent animals to live wild and free lives on Isle Royale.

Thank You,

Correspondence: The most natural way to manage this area is to allow it to be managed by the natural forces at play. If wolves want to colonize the island let them, but don't force them into a niche where they cannot thrive. I believe that letting nature take it's course is the best option here. Thank you.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Correspondence: PLEASE TAKE NO ACTION. WOLVES SHOULD COME AND GO BASED ON NATURAL MIGRATION

Wolves are relative newcomers to Isle Royale, having arrived in the late 1940s by walking across frozen Lake Superior from northeastern Minnesota or Ontario. Other wolves have arrived since that time and, conversely, many have also left. The island's wolves have been the subject of one of the longest-running studies of predator-prey relations. But inbreeding and other factors associated with their isolation have caused the wolf population to steadily decline for many years.

With the wolf population now at only two, many are calling for capturing wolves from the mainland and translocating them to the island, where they are likely to suffer the same "inbred and deformed" future as those currently there. The motivations for exiling the mainland wolves to the island are primarily to continue the predator-prey study and to satisfy tourist desires to see or hear wolves. There is some concern that Isle Royale's moose population-the wolves' primary prey-could explode, but moose numbers are declining throughout the upper Midwest to the point they have been proposed for listing as a threatened or endangered species.

The pro-transplant voices ignore that 98 percent of Isle Royale is designated Wilderness, and by law must remain "untrammelled" (unmanipulated, untamed, wild) with natural processes unimpeded by managers. In Wilderness, nature calls the shots.

THANK YOU

Correspondence: Dear NPS,

It should be a clear indication that this location is not a suitable environment for sustaining wolf populations by the fact that existing wolves are declining. Relocating wolves to this island would ultimately end in their demise. If we truly wish to enhance wolf populations, then they should be kept in their natural habitats. I find the Isle Royale proposal to be ill-conceived. It should not be implemented. Thank you.

But inbreeding and other factors associated with their isolation have caused the wolf population to steadily decline for many years.

With the wolf population now at only two, many are calling for capturing wolves from the mainland and translocating them to the island, where they are likely to suffer the same "inbred and deformed" future as those currently there. The motivations for exiling the mainland wolves to the island are primarily to continue the predator-prey study and to satisfy tourist desires to see or hear wolves. There is some concern that Isle Royale's moose population-the wolves' primary prey-could explode, but moose numbers are declining throughout the upper Midwest to the point they have been proposed for listing as a threatened or endangered species.

The pro-transplant voices ignore that 98 percent of Isle Royale is designated Wilderness, and by law must remain "untrammelled" (unmanipulated, untamed, wild) with natural processes unimpeded by managers. In Wilderness, nature calls the shots.

Therefore, I strongly urge the NPS to take NO action. Wolves would come and go based on natural migration. This is the only alternative that honors and upholds Isle Royale's Wilderness status.

In the Wilderness natural processes, not human demands, should determine whether predators stay or go. Let the wolves decide if they want to recolonize Isle Royale.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Superintendent Phyllis Green
Isle Royale National Park
Attention: Wolf Management Plan/EIS
800 E Lakeshore Drive
Houghton, Michigan 49931

Re: Revised Scope of the Wolf Management Plan/EIS, Isle Royale National Park

Dear Superintendent Green:

On behalf of our supporters of The Humane Society of the United States (HSUS), we submit these comments regarding the National Park Service (NPS) notice of a revised scope for an Environmental Impact Statement (EIS) for wolf management at Isle Royale National Park, Michigan, and incorporate by reference our previous comments submitted on August 28, 2015 (attached). The HSUS is thankful that the NPS has chosen not to cull the moose at this time and is now focused on managing the wolf population at the park. The HSUS supports the Revised Preliminary Draft Alternative C which recognizes that re-establishing a population needs to be based on the best available science, could involve more than one translocation event, and is a long-term commitment by NPS to manage this population.

As a procedural matter, the timeline provided by NPS with the Record of Decision (ROD) being issued in the fall/winter of 2017, most likely will mean that none of the current wolf population at Isle Royale will be present on the island when measures are taken. As the NPS stated, the wolf population is in steep decline over the past five years with only three wolves documented in March of 2015 and two wolves in February of 2016. By delaying its decision to translocate wolves to Isle Royale, the NPS has essentially written off the current population of wolves. This is unacceptable. As we did in our previous comments, we urge the NPS to move swiftly to finalize the ROD.

Implementing Alternative C as quickly as possible will be the best option for the wolves and for the Park. By reestablishing and maintaining an ecologically functional wolf population, Alternative C will allow for the natural processes of the predator-prey relationship to continue-to the benefit of the entire biological community in the Park. Alternative C will also provide Park visitors the opportunity to experience Isle Royales special wilderness with wolves, moose, and a thriving forest. That those visitors will continue to come to the Park, in part because of the wolves and the special wilderness created by their presence, will contribute significant income to Upper Peninsula gateway communities. The long-term timeframe for translocating wolves and maintaining their population on the island under this Alternative is the most appropriate as the Park will accrue these ecological and social benefits for the foreseeable future.

Additional Considerations for NPS to evaluate in the alternatives put forth in the Draft EIS:

As the NPS moves forward in drafting the EIS, the agency should address the following considerations with regards to each alternative proposed in the EIS:

" Ecosystem services that wolves provide: Wolves significantly influence biological diversity and ecosystem function on Isle Royale including limiting moose populations and indirectly protecting forests and other ecosystems in the park. NPS must explicitly analyze this issue in the Plan/EIS.

" Ethics: NPS must address the ethics of the alternatives and of its final decisions in the Plan/EIS including the ethics of failing to maintain the wolf population in the face of human-caused climate change.

" Value of research: The NPS needs to address the impact each alternative concept would have on the research relating to predator-prey relationships taking place on Isle Royale, a unique ecosystem, and perhaps the only remaining place on earth where together wolves and moose are not hunted and forests are not logged. The value added and knowledge gained from continuing this long running study is invaluable to the scientific community and wildlife managers.

" Social impacts: Social impacts beyond just the impacts on park visitors need to be addressed. National Parks belong to all Americans, who fund their operation through tax dollars. UP communities benefit from tourist travel to Isle Royale and will be impacted by NPS actions taken as a result of the Plan/EIS.

All impacted stakeholders, including these, should be considered in the analysis.

The Plan/EIS Should Include Analysis of the Ecological Importance of Wolves

From the study of predator-prey relationships conducted at Isle Royale for more than 50 years, we know that wolves provide remarkable benefits by limiting prey populations, culling very young or old or sick animals, and indirectly protecting forests and ecosystem function in the park (Peterson 1977; Brandner, et al., 1990; McInnes, et al., 1992; McLaren & Peterson, 1994; Vucetich & Peterson 2004a; Vucetich & Peterson, 2004b; Vucetich & Peterson, 2013). While several factors influence moose numbers on Isle Royale, the wolves have been recognized as the primary one (Peterson, 1977; Vucetich & Peterson, 2004). Moose, in turn, exert a major influence over the composition of the parks plant communities. Dramatic changes in vegetation have been documented due, in large part, to moose (McInnes, et al., 1992; McLaren & Janke, 1996; McLaren & Peterson, 1994; Paster, et al., 1998; Risenhoover & Maass, 1987; Snyder & Janke, 1976; Brandner, et al., 1990).

Wolves significantly influence biological diversity and ecosystem function wherever they are found (Hebblewhite et al. 2005, Beschta and Ripple 2006, Ripple and Beschta 2007, Beschta and Ripple 2009, Ritchie and Johnson 2009, Estes et al. 2011). Ecologically-functioning populations of wolves have been instrumental in restoring biological diversity in the Northern Rocky Mountains, including increasing the number of song birds, pronghorn, lynx, and other species, while simultaneously improving the ecology of vital riparian systems (e.g., Smith et al. 2003, Fortin et al. 2005, Berger et al. 2008, Beschta and Ripple 2009, Ripple et al. 2011). More recently, researchers found that wolves in the Great Lakes region have the same trophic-cascading effects on their ecosystems (Callan et al. 2013, Peterson et al. 2014). Wolves contribute to scavengers (Wilmers and Getz 2005, Stahler et al. 2006, Constible et al. 2008), check the effects of mesopredators (e.g., Berger et al. 2008, Ritchie and Johnson 2009, Estes et al. 2011, Ripple et al. 2011), and even affects soil nutrients, soil microbes, and plant quality (Flagel et al. 2015, Bump et al. 2009). Small populations of wolves, however, cannot affect ecological function (Belant and Adams 2010); wolves therefore need to be restored to ecologically-functional population sizes sufficient to influence ecosystems.

Wolves create the well-documented ecology of fear that keeps their prey constantly on the move and prevents overbrowsing, thus allowing greater ecosystem function and biological diversity (e.g., Ripple and Beschta 2012). Also, unlike humans with guns, wolves kill sick, weak, and old animals making the herd more vital (Vucetich et al. 2005, Wright et al. 2006, Darimont et al. 2015).

Whereas hunters typically kill prime age, breeding adults rather than calves and older adults resulting in a different age structure (Kunkel et al. 1999, Wright 2006) and human selection can even influence wild preys genetic traits due to selective pressure (Darimont et al. 2009, Darimont et al. 2015). Hunter-killed carcasses are more concentrated in time and location than wolf-killed carcasses, resulting in differences in the scavenger species benefiting (Wilmers et al. 2003a, 2003b), and will not have the same beneficial effects to soils, and ultimately to plant communities (Bump et al. 2009).

The end of wolves on Isle Royale will be followed by an increase in moose numbers to the point that significant harms to the forest will result, including a loss of biological diversity. There are many other places where the absence of predators has led to large numbers of herbivores-moose, elk, or deer. We already have plenty of such places, but we have very few places like Isle Royale (Previant, et al., 2013).

If wolves are present in ecologically functional populations, they can mediate ungulate populations, which then confers greater biological diversity and function to ecosystems. Additionally, wolves indirectly benefit numerically rare species in the face of climate change. Wolves are a critical component to ecosystem health. Because of wolves enormous effects on their ecosystems from trophic cascades, the Plan/EIS must acknowledge and incorporate the best available science about the benefits wolves confer on their ecosystems and to biological diversity.

With merely two known wolves on the island, wolves are not acting in an ecologically-functional manner to control the moose population. They desperately need augmentation in order to fulfill this vital role. Such a population should be restored as swiftly as possible.

NPS Should Analyze the Ethics of its Decision in the Plan/EIS

The ethics of the human relationship to wolves should be addressed by NPS in the EIS. Typically, current discussions about wolf management are flawed by bias toward overrepresentation of the natural sciences and underrepresentation of the social sciences and ethical discourse (Lynn 2002, 2006, 2010). Many ethical approaches to understanding the human relationship to wolves have already been explored such as deep ecology (Naess 1974), wolves as symbols (Midgley 2001), ethics of ecological restoration (Sharpe et al. 2001), assumptions about science and management (Jickling and Paquet 2005), ecofeminism (Emel 1995), and the ethics of animal welfare as it relates to wildlife conservation (Paquet and Darimont 2010). These approaches, the last in particular, should be included in NPS examination of potential actions on Isle Royale.

Ethical considerations should not be left out of the management decision process (Schmidt and Salmon 1991, Eggleston et al. 2003, Littin et al. 2004, Littin and Mellor 2005). The decisions before NPS present difficult ethical questions requiring the weighing of duties to the current and future public, the animals, and the ecosystems impacted by those animals. Therefore, NPS should explicitly analyze the ethics of the alternative actions NPS might take (Minteer and Collins 2008, Minteer and Collins 2005a, Minteer and Collins 2005b).

NPS Must Include the Positive Value of Predator-Prey Relationship Research in Analysis

The NPS needs to address the impact each alternative concept would have on the research relating to predator-prey relationships taking place on Isle Royale. The value added and knowledge gained from continuing this long-running study is invaluable to the scientific community and for wildlife managers.

Predator-prey relationships and moose impacts on vegetation have been studied on Isle Royale for more than 50 years (i.e., Snyder & Janke 1976, Peterson 1977, Risenhoover & Maass 1987, Brandner et al., 1990, McInnes et al., 1992, McLaren & Peterson 1994, McLaren & Janke 1996, Paster et al. 1998, Vucetich & Peterson 2004a, Vucetich & Peterson 2004b, Vucetich & Peterson 2009, Vucetich & Peterson 2013, Previant et al. 2013). Scientists, wildlife managers, and the public have gained significant understanding of those relationships from the science that has come out of these long-term studies. The opportunity to continue this unique and valuable research should not be undervalued.

NPS Must Consider the Impacts of its Decision on the Public Beyond Park Visitors

Thousands of people are drawn to the Upper Peninsula (UP) of Michigan on their way to Isle Royale because of the lure of seeing a wolf. If wolves vanish, tourists are likely to go the same way, causing economic impact on the park and on UP communities. In the Greater Yellowstone Ecosystem, for instance, wolf-watching tourism nets \$35 million annually to local communities (Duffield et al. 2008). In 2015, park visitors spent an estimated \$4.1 million in local

gateway regions while visiting Isle Royale National Park. These expenditures supported a total of 66 jobs, \$1.4 million in labor income, \$2.6 million in value added, and \$4.7 million in economic output in local gateway economies surrounding Isle Royale National Park (NPS 2015).

Additionally, social impacts beyond the impacts on park visitors need to be addressed. National Parks belong to all Americans and the NPS acknowledges that wilderness can be valuable to people whether or not those individuals actually visit. Our review of recent public comments on genetic rescue of the Isle Royale wolves provided by NPS show that the public is overwhelmingly in support of a continuing wolf presence on Isle Royale and these views need to be considered.

The NPS should also consider the findings of Lute et al. (2012), who conducted a statewide survey of 973 Michiganders, and found 82% of Michiganders value wolves and most Michiganders wanted Michigan wolves managed using sound science.

Americans hold widely divergent attitudes about wildlife, but most value their conservation and protection (Kellert 1996, Sponarski et al. 2013). The North American model of wildlife management, which embraces the public trust doctrine, holds that wildlife belongs to everyone (Horner 2000, Jacobson et al. 2010, Nelson et al. 2011). Therefore, public agencies holding responsibility for wildlife must include the views of all who benefit from and care about that wildlife and must consider future stakeholders who are not alive today to voice their opinion—not just the views of that small number of people who are fortunate enough to be able to visit Isle Royale (Hare and Blossey 2014).

Seeking the views of a wider range of stakeholders, not limited to Park visitors, is necessary (Bruskotter et al. 2011, Organ et al. 2014). Considering just the people who live in Michigan, an overwhelming majority of Michiganders value wolves and most want sound science to be used to manage them (Lute et al. 2012). But the broader public has a stake in this decision, as they fund NPS activity through their taxes. Approximately 94 percent of total funding for wildlife conservation and management come from the non-consumptive users, lending significant weight to the need to listen to the general public and not just consumptive users, state wildlife agencies who promote consumptive use, and park visitors on wildlife issues (Smith and Molde 2014). Park visitors shouldn't be overlooked, of course, since wildlife watchers boosts local economies far beyond the contributions of consumptive users.

NPS Must Preserve Isle Royales Wilderness with Wolves and Moose

For many people, wolves, moose, and their interactions and conservation are a central feature of Isle Royales wilderness (Fisichelli, et al., 2013). One of the stated purposes of Isle Royale National Park is to preserve and protect the park's wilderness character for use and enjoyment by present and future generations (Isle Royale National Park website). To preserve and protect Isle Royales special wilderness character, NPS must help wolves persist on Isle Royale.

The history of wolves on Isle Royale has always been closely tied to humans. The moose themselves were brought to the island by people (Scarpino et al. 2015), and the islands plant and animal communities are being harmed by human-caused climate changes (Burns et al. 2003, Sheikh et al. 2007), including severely reduced frequency of ice bridge formation (Post et al. 1999, Fisichelli et al. 2013). Therefore, NPS must recognize the human aspect to the decline in the wolf population and step in to help translocate wolves in light of the impact anthropogenic climate change is having on them.

NPS Must Consider that Human-caused Climate Change has Negatively Impacted Wolves

The NPS must act swiftly to manage the wolf population on Isle Royale. The declining numbers of wolves on Isle Royale are due in large part to climate change caused by anthropogenic sources. (Huff and Thomas 2014, Grimm et al. 2013, Kunkle 2013, Trumpickas et al. 2009, Lofgren et al. 2002). Traditionally, ice bridges formed in the winter allowing for wolf migration and much-needed genetic variability. As temperatures continue to be, on average, warmer, fewer ice bridges have formed and no longer provide a reliable source for wolf migration.

Moreover, the wolf population acts as a buffer to the effects of climate change by creating more carrion for scavengers and making it available year round, to the advantage of numerically rare species such as bald eagles (Wilmers and Getz 2005, Constible et al. 2008). By modulating moose populations, wolves prevent the overbrowsing of plant communities that are needed by a variety of species (McInnes, et al., 1992; McLaren & Janke, 1996; McLaren & Peterson, 1994; Paster, et al., 1998; Risenhoover & Maass, 1987; Snyder & Janke, 1976; Brandner, et al., 1990).

Thus, because the wolf population is key to the ecological integrity of the park and its rapid decline is caused by human induced climate change, the NPS should act expeditiously to augment the wolf population.

Conclusion

We applaud the NPS for deciding to not cull the moose population at this time and to focus on managing and rebuilding the wolf population at Isle Royale. As stated above, the HSUS supports the Revised Preliminary Draft Alternative C, which recognizes that re-establishing a population needs to be based on the best available science, could involve more than one translocation event, and is a long-term commitment by NPS to manage this population. Additionally, The HSUS urges the NPS to examine the additional issues of ethics, value of research, and broader social impacts for each of the alternatives it puts forth in the draft EIS. Most importantly, we urge NPS to take immediate action on the critical need to augment the wolf population on Isle Royale and not to postpone action to the detriment of the species.

Sincerely,

Superintendent Phyllis Green
Isle Royale National Park
Attention: Moose-Wolf-Vegetation Management Plan
800 E Lakeshore Drive
Houghton, Michigan 49931

Re: Moose-Wolf-Vegetation Management Plan/EIS, Isle Royale National Park

Dear Superintendent Green:

On behalf of our supporters of The Humane Society of the United States (HSUS), we submit these comments regarding the National Park Service (NPS) Notice of Intent to Prepare an Environmental Impact Statement for Moose, Wolves, and Vegetation, Isle Royale National Park, Michigan. 80 Fed. Reg. 39,796 (July 10, 2015). The HSUS recommends that NPS translocate wolves from the Upper Peninsula (UP) of Michigan to restore the Isle Royale wolf population.

The HSUS continues to recommend that NPS coordinate with federal and state authorities to translocate problem wolves or packs (i.e., those wolves targeted for destruction) to Isle Royale from the UP of Michigan. Trophy hunting and trapping are now banned by voter referendum in northern Michigan, however, authorities are still allowed to kill wolves designated as problem animals. By translocating problem wolves from northern Michigan to Isle Royale, public concerns regarding these animals will be tempered and at the same time, these animals would help restore the Isle Royale ecosystem and promote tourism within the park.

Moreover, The HSUS is opposed to lethal culling of the moose population and instead recommends that the NPS consider more humane methods of population control including sterilization and/or contraception. Below are more detailed comments responding to the specific questions posed by the NPS.

Question 1: What other alternatives, alternative elements, or management tools should be considered?

The Humane Society of the United States (HSUS) recommends that the National Park Service (NPS) translocate wolves from the Upper Peninsula (UP) of Michigan to restore genetic integrity to the population and help restore the Isle Royale wolf population. Moreover, The HSUS is opposed to lethal culling of the moose population and instead recommends that the NPS consider more humane methods of population control including sterilization and/or

contraception.

Generally, The HSUS supports the Preliminary Draft Alternative Concept C (maintain both species). We request the following elements be specifically outlined within Alternative Concept C:

" When translocating wolves, the animals are taken from the UP of Michigan and are those animals classified as problem wolves.

" Wolf reintroduction or augmentation would not necessarily be a one-time only action but would be undertaken as necessary to maintain both moose and wolves.

" If the moose population needs to be managed, contraception and/or sterilization should be used instead of lethal culls.

Regardless of the final alternative chosen by the NPS, the three elements outlined above should be incorporated if the NPS is considering reintroduction or augmentation of wolves and/or managing the moose population. Additional details are given in our general comments (Question 6) below.

Question 2: What issues should be considered when evaluating future management of moose, wolves, and vegetation at Isle Royale?

In addition to the nine issues identified by NPS for consideration, The HSUS asks that these additional issues, which are detailed in our general comments (Question 6) below, be considered and addressed in the Plan/EIS:

" Timeline: NPS expects a Record of Decision (ROD) by the fall/winter of 2017, at which time it is likely that there may be no wolves left to manage on Isle Royale. The NPS needs to expedite this process by, at the latest, issuing a ROD by the fall/winter of 2016, in addition to taking immediate steps to augment wolves on the island on an emergency basis (i.e., next season) while the Plan/EIS process proceeds.

" Ecosystem Services Wolves provide: Wolves significantly influence biological diversity and ecosystem function on Isle Royale including limiting moose populations and indirectly protecting forests and other ecosystems in the park. NPS must explicitly analyze this issue in the Plan/EIS.

" Ethics: NPS must address the ethics of the alternatives and of its final decisions in the Plan/EIS including the ethics of failing to maintain the wolf population in the face of human-caused climate change and of lethal actions to manage the moose population when nonlethal alternatives exist.

" Value of research: The NPS needs to address the impact each alternative concept would have on the research relating to predator-prey relationships taking place on Isle Royale. The value added and knowledge gained from continuing this long running study is invaluable to the scientific community and wildlife managers.

" Social impacts: Social impacts beyond just the impacts on park visitors need to be addressed. National Parks belong to all Americans, who fund their operation through tax dollars. UP communities benefit from tourist travel to Isle Royal and will be impacted by NPS actions taken as a result of the Plan/EIS. All impacted stakeholders, including these, should be considered in the analysis.

Question 3: What type and intensity of management should the NPS consider given that approximately 99% of the land area of Isle Royale National Park is designated wilderness?

For many people, wolves, moose, and their interactions and conservation are a central feature of Isle Royale's wilderness. To preserve and protect Isle Royale's special wilderness character, NPS must help wolves persist on Isle Royale. Additional details are given in our general comments (Question 6) below.

Question 4: What type and intensity of management should the NPS consider in the face of a changing climate?

The NPS must act swiftly to augment the wolf population on Isle Royale because the decline of wolves is caused, in large part, by human-caused climate change. Climate change has resulted in ice bridges forming much less frequently and no longer providing a reliable route for wolf migration. Additional details are given in our general comments (Question 6) below.

Question 5: What do you like and dislike about the preliminary alternatives?

See our answer to Question 1 (above) and additional details in our additional comments (Question 6) below.

Question 6: Please submit additional comments here (up to approximately 10 pages).

The Plan/EIS Decision Timeline Should be Shorter and Immediate Steps Taken to Keep Wolves on Isle Royale

According to the timeline provided by NPS, the Record of Decision (ROD) will be issued by the fall/winter of 2017. This timeline is unacceptable. For far too long, the NPS has tarried over how to manage the wolf population, but immediate action is needed before it is too late. The wolf population has dwindled to three individuals, is inbred, and the moose population is erupting. If NPS waits until the end of 2017, it is likely that there may be no wolves left to manage on Isle Royale. The NPS needs to expedite this process by, at the latest, issuing a ROD by the fall/winter of 2016, in addition to taking immediate steps to augment wolves on the island on an emergency basis (i.e., next season) while the Plan/EIS process proceeds.

The Plan/EIS Should Include Analysis of the Ecological Importance of Wolves

From the study of predator-prey relationships conducted at Isle Royale for more than 50 years, we know that wolves provide remarkable benefits by limiting prey populations, culling very young or old or sick animals, and indirectly protecting forests and ecosystem function in the park (Peterson 1977; Brandner, et al., 1990; McInnes, et al., 1992; McLaren & Peterson, 1994; Vucetich & Peterson 2004a; Vucetich & Peterson, 2004b; Vucetich & Peterson, 2013). While several factors influence moose numbers on Isle Royale, the wolves have been recognized as the primary one (Peterson, 1977; Vucetich & Peterson, 2004). Moose, in turn, exert a major influence over the composition of the park's plant communities. Dramatic changes in vegetation have been documented due, in large part, to moose (McInnes, et al., 1992; McLaren & Janke, 1996; McLaren & Peterson, 1994; Paster, et al., 1998; Risenhoover & Maass, 1987; Snyder & Janke, 1976; Brandner, et al., 1990).

Wolves significantly influence biological diversity and ecosystem function wherever they are found (Hebblewhite et al. 2005, Beschta and Ripple 2006, Ripple and Beschta 2007, Beschta and Ripple 2009, Ritchie and Johnson 2009, Estes et al. 2011). Ecologically-functioning populations of wolves have been instrumental in restoring biological diversity in the Northern Rocky Mountains, including increasing the number of song birds, pronghorn, lynx, and other species, while simultaneously improving the ecology of vital riparian systems (e.g., Smith et al. 2003, Fortin et al. 2005, Berger et al. 2008, Beschta and Ripple 2009, Ripple et al. 2011). More recently, researchers found that wolves in the Great Lakes region have the same trophic-cascading effects on their ecosystems (Callan et al. 2013, Peterson et al. 2014). Wolves contribute to scavengers (Wilmers and Getz 2005, Stahler et al. 2006, Constible et al. 2008), check the effects of mesopredators (e.g., Berger et al. 2008, Ritchie and Johnson 2009, Estes et al. 2011, Ripple et al. 2011), and even affects soil nutrients, soil microbes, and plant quality (Bump et al. 2009). Small populations of wolves, however, cannot affect ecological function; they need to be restored to ecologically-functional population sizes sufficient to influence ecosystems (Belant and Adams 2010).

The impacts on moose population from hunting or culling would be different from the impacts of wolf predation-guns are not a substitute for wolves. For example, hunters kill different prey animals than wolves, typically young adults rather than calves and older adults resulting in a different age structure (Kunkel et al. 1999, Wright 2006) and human selection can even influence wild preys genetic traits due to selective pressure (Darimont et al. 2009, Darimont et al. 2015). Hunter-killed carcasses are more concentrated in time and location than wolf-killed carcasses, resulting in differences in the scavenger species benefiting (Wilmers et al. 2003a, 2003b), and will not have the same beneficial effects to soils, and ultimately to plant communities

(Bump et al. 2009).

The end of wolves on Isle Royale will be followed by an increase in moose numbers to the point that significant harms to the forest will result, including a loss of biological diversity. There are many other places where the absence of predators has led to large numbers of herbivores-moose, elk, or deer. We already have plenty of such places, but we have very few places like Isle Royale (Previat, et al., 2013).

If wolves are present in ecologically functional populations, they can mediate ungulate populations, which then confers greater biological diversity and function to ecosystems. Additionally, wolves indirectly benefit numerically rare species in the face of climate change. Wolves are a critical component to ecosystem health. Because of wolves enormous effects on their ecosystems from their various trophic cascades, the Plan/EIS must acknowledge and incorporate the best available science about the benefits wolves confer on their ecosystems and to biological diversity.

NPS Should Use Nonlethal Humane Methods to Manage Moose Population

Wolves create the well-documented ecology of fear that keeps their prey constantly on the move and prevents overbrowsing thus allowing greater ecosystem function and biological diversity (e.g., Ripple and Beschta 2012). Also, unlike humans with guns, wolves kill sick, weak, and old animals making the herd more vital (Vucetich et al. 2005, Wright et al. 2006, Darimont et al. 2015).

With merely three known wolves on the island, wolves are not acting in an ecologically-functional manner to control the moose population. They desperately need augmentation in order to fulfill this vital role. Such a population should be restored as swiftly as possible. However, if in the meanwhile, it is necessary to manage moose population numbers, only humane nonlethal management options such as sterilization and/or contraception should be undertaken.

Female moose can be surgically sterilized by ovariectomies which remove the ovaries - a technique similar to, but less invasive than, typical spay surgeries used to sterilize domestic dogs and cats. When performed on a similar ungulate species (white-tailed deer), preparation and surgery take approximately 20 minutes, is 100 percent effective, and mortality rates associated with the procedures are less than 1 percent (Boulanger et al. 2012). Typically, population stabilization is rapid and population reduction is gradual (10-30 percent per year) (Boulanger et al. 2012).

Immunocontraception vaccines activate the immune system to block a crucial aspect of reproduction. The porcine zona pellucida (PZP) vaccine is not a hormone and does not affect other body processes. The effects of PZP on moose and other animals are very well known (Shideler et al. 2002, Rutberg et al. 2004, Patton et al. 2007, Kirkpatrick and Turner 2008, Rutberg and Naugle 2008, Kirkpatrick et al. 2011, Massei and Cowan 2014). Treatment of white-tailed deer with PZP, for example, typically reduces pregnancy rates by 80-90 percent (Miller et al. 1999, Massei and Cowan 2014)-rates for moose would be expected to be similar. PZP management has successfully altered entire populations, stopped population growth, and even decreased populations of wild horses, urban deer, wapiti, and African elephants (Turner et al. 2008, Kirkpatrick et al. 2011). Similar results would be expected for moose.

NPS Should Analyze the Ethics of its Decision in the Plan/EIS

The ethics of the human relationship to wolves should be addressed by NPS in the EIS. Typically, current discussions about wolf management are flawed by bias toward overrepresentation of the natural sciences and underrepresentation of the social sciences and ethical discourse (Lynn 2002, 2006, 2010). Many ethical approaches to understanding the human relationship to wolves have already been explored such as deep ecology (Naess 1974), wolves as symbols (Midgley 2001), ethics of ecological restoration (Sharpe et al. 2001), assumptions about science and management (Jickling and Paquet 2005), ecofeminism (Emel 1995), and the ethics of animal welfare as it relates to wildlife conservation (Paquet and Darimont 2010). These approaches, the last in particular, should be included in NPS examination of potential actions on Isle Royale.

Further, NPS should consider the ethics of lethal control of moose, if that option remains on the table in the absence of wolves. Ethical considerations should not be left out of the decision process (Schmidt and Salmon 1991, Eggleston et al. 2003, Littin et al. 2004, Littin and Mellor 2005). The decisions before NPS present difficult ethical questions requiring weighing duties to the current and future public, the animals, and the ecosystems impacted by those animals. Therefore, NPS should explicitly analyze the ethics of the alternative actions NPS might take (Minteer and Collins 2008, Minteer and Collins 2005a, Minteer and Collins 2005b).

NPS Must Include the Positive Value of Predator-Prey Relationship Research in Analysis

The NPS needs to address the impact each alternative concept would have on the research relating to predator-prey relationships taking place on Isle Royale. The value added and knowledge gained from continuing this long running study is invaluable to the scientific community and for wildlife managers.

Predator-prey relationships and moose impacts on vegetation have been studied on Isle Royale for more than 50 years (i.e., Snyder & Janke 1976, Peterson 1977, Risenhoover & Maass 1987, Brandner et al., 1990, McInnes et al., 1992, McLaren & Peterson 1994, McLaren & Janke 1996, Paster et al. 1998, Vucetich & Peterson 2004a, Vucetich & Peterson 2004b, Vucetich & Peterson 2009, Vucetich & Peterson 2013, Previat et al. 2013). Scientist, wildlife managers, and the public have gained significant understanding of those relationships from the science that has come out of these long-term studies. The opportunity to continue this unique and valuable research should not be undervalued.

NPS Must Consider the Impacts of its Decision on the Public Beyond Park Visitors

Social impacts beyond just the impacts on park visitors need to be addressed. National Parks belong to all Americans and the NPS acknowledges that wilderness can be valuable to people whether or not those individuals actually visit (Wilderness: Gateway to National Park Service Wilderness webpage). Our review of recent public comments on genetic rescue of the Isle Royale wolves provided by NPS show that the public is overwhelmingly in support of a continuing wolf presence on Isle Royale and these views need to be considered. Also, thousands of people are drawn to the UP of Michigan on their way to Isle Royale because of the lure of seeing a wolf. If wolves vanish, tourists are likely to go the same way causing economic impact on the park and on UP communities. The NPS should consider the findings of Lute et al. (2012), who conducted a statewide survey of 973 Michiganders, and found 82% of Michiganders value wolves and most Michiganders wanted Michigan wolves managed using sound science.

Americans hold widely divergent attitudes about wildlife, but most value their conservation and protection (Kellert 1996, Sponarski et al. 2013). The North American model of wildlife management, which embraces the public trust doctrine, holds that wildlife belongs to everyone (Horner 2000, Jacobson et al. 2010, Nelson et al. 2011). Therefore, public agencies holding responsibility for wildlife must include the views of all who benefit from and care about that wildlife and must consider future stakeholders who are not alive today to voice their opinion-not just the views of that small number of people who are fortunate enough to be able to visit Isle Royale (Hare and Blossey 2014).

Seeking the views of a wider range of stakeholders, not limited to Park visitors, is necessary (Bruskotter et al. 2011, Organ et al. 2014). Considering just the people who live in the Michigan, an overwhelming majority of Michiganders value wolves and most want sound science to be used to manage them (Lute et al. 2012). But the broader public has a stake in this decision, as they fund NPS activity through their taxes. Approximately 94 percent of total funding for wildlife conservation and management come from the non-consumptive users, lending significant weight to the need to listen to the general

public and not just consumptive users, state wildlife agencies who promote consumptive use, and park visitors on wildlife issues (Smith and Molde 2014). Park visitors should not be overlooked, of course, since wildlife watching boosts local economies far beyond the contributions of consumptive users. In the Greater Yellowstone Ecosystem, for instance, wolf-watching tourism nets \$35 million annually to local communities (Duffield et al. 2008).

NPS Must Preserve Isle Royale Wilderness with Wolves and Moose

For many people, wolves, moose, and their interactions and conservation are a central feature of Isle Royale wilderness (Fisichelli, et al., 2013). One of the stated purposes of Isle Royale National Park is to preserve and protect the park's wilderness character for use and enjoyment by present and future generations (Isle Royale National Park website). To preserve and protect Isle Royale's special wilderness character, NPS must help wolves persist on Isle Royale.

The history of wolves on Isle Royale has always been closely tied to humans. The moose themselves were brought to the island by people (Scarpino et al. 2015), and the islands plant and animals communities are being harmed by human-caused climate changes (Burns et al. 2003, Sheikh et al. 2007), including severely reduced frequency of ice bridge formation (Post et al. 1999, Fisichelli et al. 2013). Therefore, NPS must recognize the human aspect to the decline in the wolf population and step in to help translocate wolves in light of the impact anthropogenic climate change is having on their population numbers.

NPS Must Consider that Human-caused Climate Change has Negatively Impacted Wolves

The NPS must act swiftly to manage the wolf population on Isle Royale. The declining numbers of wolves on Isle Royale are due in large part to climate change caused by anthropogenic sources. (Huff and Thomas 2014, Grimm et al. 2013, Kunkle 2013, Trumpickas et al. 2009, Lofgren et al. 2002). Traditionally, ice bridges formed in the winter allowing for wolf migration and much needed genetic variability. As temperatures continue to be, on average, warmer, fewer ice bridges have formed and no longer provide a reliable source for wolf migration.

Moreover, the wolf population acts as a buffer to the effects of climate change by creating more carrion for scavengers and making it available year round, to the advantage of numerically rare species such as bald eagles (Wilmers and Getz 2005, Constible et al. 2008). By modulating moose populations, wolves prevent the overbrowsing of plant communities that are needed by a variety of species (McInnes, et al., 1992; McLaren & Janke, 1996; McLaren & Peterson, 1994; Paster, et al., 1998; Risenhoover & Maass, 1987; Snyder & Janke, 1976; Brandner, et al., 1990).

Thus, because the wolf population is key to the ecological integrity of the park and its rapid decline is caused by human induced climate change, the NPS should act expeditiously to augment the wolf population.

Conclusion

Thank you for the opportunity to provide these comments on the NPS Notice of Intent to Prepare an Environmental Impact Statement For Moose, Wolves, and Vegetation, Isle Royale National Park, Michigan. The HSUS strongly urges the NPS to incorporate our suggested alternative action of transferring wolves identified as causing conflicts on the UP to Isle Royale to rebalance the predator-prey relationship there. Further, we urge NPS to incorporate contraception and/or sterilization as management tools for moose if wolves are temporarily insufficient to check moose population growth and not further consider lethal moose control. We urge NPS to examine the additional issues of ethics, value of research, and broader social impacts in the Plan/EIS in addition to the issues NPS identified. Most importantly, we urge NPS to take immediate action on the critical need to augment the wolf population on Isle Royale and not to postpone action for the lengthy time NPS has indicated it will take to complete the Plan/EIS.

Sincerely,

[REDACTED]

Correspondence: Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Correspondence: It hurts me to have to say this, but I support Alternative A. That's not because I don't like wolves. Rather, it's because I love wilderness and believe this is the only alternative that honors and upholds the wilderness status of Isle Royale.

Wolves are not and have never been integral to the ecosystem that is Isle Royale. In fact, they have inhabited Isle Royale for only a tiny fraction of post-glacial time, making their recent presence on the Island more an anomaly than the norm in the Island's long history. Also, we should let the wolves decide if they can/want to live there. And it appears that they don't.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the Island to continue what has been a "natural" ("unnatural") predator-prey study.

Thank you for your consideration.

Correspondence: Dear NPS,

Support Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Thank you.

Correspondence: Allowing wolves on Isle Royale to become extinct would not be in the best interest of science and ecology of the island. Global warming has interfered with the continued migration of wolves because there no longer is ice for them to cross over. I see wolves as a needed predator to keep the moose population under control. Over population of moose may well cause the same thing that has happened with wolves. Wolves need a new gene pool to stop the inbreeding that has caused serious birth defects.
I vote for plan C or D.

Correspondence: I have been to Isle Royale 7 times with my husband backpacking and canoeing. It is a wonderful place where natural processes have always been allowed to function. We have heard the wolves howl at our campsite and it is a riveting experience. It is the true essence of wilderness. But Wilderness demands that natural processes continue, and to reintroduce wolves seems to me contrary to everything the Island ecosystem stands for. It would be a tragedy for humans to intervene in this natural process and manipulate it for their own studies and whims. Isle Royale is trying to tell us something if we would just listen. The true study is about the Island and its relationship to humans and human-caused activity. We need to find out what is sustainable. We need to find out without our own intervention what it is telling us. It may not be pretty but it this 'hands off' approach is the one we must continue to pursue.

Correspondence: Hello, I'm writing about the "Wolf Decision on Isle Royale".

I would like you to choose; Option A: NO ACTION TAKEN.

I think this is best for everything due to the fact that wolves have come and gone on their own but seem to have started arriving in the 1940's. Since then populations have had the not-surprising consequence of bad effects of inbreeding in a small population.

Bringing more wolves for tourists is not a good reason to bring them. I think restoring wolves where they have been exterminated is a good idea, but just for tourist's experience is not good for the wolves themselves in the long run.

Also, the native moose population is not doing very well as I understand it. Bringing in an overabundance of wolves may not be a good idea for the moose also.

I live in Oregon, and formerly Wyoming and Montana and frankly I'm pretty stoked about being out backpacking and bowhunting and knowing wolves are back where they should be, so I am definitely not anti-wolf.

Thanks - Paul [REDACTED]

Correspondence: Leave the situation as it is now. By having humans messing with nature, they have caused an un-natural situation which is not working for either wolves or moose. I am always favoring the wolf because they have been maligned for years, but if moving them onto this island causes in-breeding which leads to a very unhealthy wolf population, I would think that the wolf population should be allowed to die out.

Correspondence: I recommend Alternative A: do nothing, allow wolves to come and go since that is the natural order. Being a Florida resident, I have seen & continue to see the disasters that translocating animals from one area to another when Texas cougars were brought to Florida to 'rescue' the Florida panther. The newcomers, which seem obviously to be problem cats that would otherwise have been euthanized for livestock predation, have now made themselves at home preying on calves, foals, goats and other animals near human habitation. Florida compensates livestock owners for their losses, but since unrestricted development continues, where are these animals going to live?

Correspondence: The draft implementation plan improperly diminishes the central importance of wildness to wilderness character. It reduces wildness to only 20% of wilderness character, and so would allow all kinds of manipulations in Wilderness for the benefit of other values at the expense of wildness. Rather, the agencies should scrap their flawed framework for wilderness character and restore wildness to its central importance as the framers of the Wilderness Act intended.

" The draft implementation plan is actually a roadmap for how to get away with manipulating Wilderness. The agencies should instead treat all Wildernesses as areas where humans wont manipulate them, as the 1964 Wilderness Act intended.

" The draft plan ignores the importance and decline of the professional wilderness stewards within the federal agencies. While volunteer groups can provide valuable services for activities like trail clearing, they are no substitute for the professionally-trained wilderness rangers within the agencies who provide long-term protection and care. The draft plan should recognize the decline in the number of wilderness rangers in all four federal agencies and call for better funding to support these professionals. In fact, we should bolster and professionalize the wilderness programs from the ground (like wilderness rangers) to the highest agency levels.

" Additional research in Wilderness must be conducted with methods that respect the Wilderness and without motorized/mechanized means or permanent structures and installations.

Correspondence: Re the Isle Royale Wolf plans, It is probably best to not introduce wolves now and wait to see if they are essential to the health of the area. If there are too many moose, they eat too much of the young vegetation and trees, so that nature is unbalanced. Wolves will remedy that situation by removing less healthy moose for their food supply. If both wolves and the moose are gone, what is the situation there?

I think a wait and see solution might be best, until more is known about the health of Isle Royale. There will be some problems due to climate change which may affect the situation at Isle Royale. Perhaps then more moose should be moved to the island or more wolves or both, but until there is some documentation from current studies(and hopefully those will be funded), it is probably best to just wait to see about the health of Isle Royale .

Correspondence: I write to comment on the question of whether to transplant additional wolves to Isle Royale National Park. This is a challenging issue for me to address. I have visited Isle Royale several times and have hiked the island end-to-end in the 1980s. I clearly recall that the presence of wolves added a feeling of excitement to that hike. I have followed the research being done on the wolves there for decades.

After much internal debate and thought, I have concluded that the best course of action in this case is to allow nature to determine the future of wolves in the park. Most of the park is designated Wilderness, a designation I strongly support. That designation, to me, should rule out any manipulation of wildlife populations, including wolves and moose. It also should eliminate any consideration of major vegetation management/manipulation. Instead, the park should continue to support scientific studies of the remaining wolves and, if wolves do disappear, of the ecological response of other wildlife populations and vegetation. There will be much to be learned in that event.

I am grateful that wolves arrived on the island some 60-70 years ago and that the NPS has supported careful research since then. We have learned much in that time. I will be pleased if wolves return to the park on their own at some point in the future. But nature should determine that, not us humans. Let Wilderness be what it is supposed to be - wild and untrammeled by people.

Therefore, I support Alternative A, the no-action alternative.

Thank you for considering my views.

Correspondence: Support Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the

Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study. Thank you for keeping the Isle Royale Wilderness wild and for protecting the autonomy of its wolves!

Correspondence: Dear NPS,
Concerning the plan for the Isle Royal wolf situation, I encourage selection of Alternative A, which honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

The translocation plans seem somewhat odd given the heavy-handed management of wolves by Wildlife Services in other areas of the country, many of

which can support greater wolf populations. Again, if the wolves want to go live there, then so be it.
Thank you very kindly

Correspondence: Regarding the wolf population in the wilderness of Isle Royale, Option A is the only decision that makes sense for this area. Nature has to be allowed to take it's course and maybe, at a later date, wolves will again return to this area on their own. Another reason to elect Option A is using Yellowstone as an example. We populated this area with wolves from another territory and when they have dispersed, they do so only to be killed once out of Yellowstone.
The NPS must make Option A the only alternative.
Thank you.

Correspondence: Alternative A please!

With the wolf population now at only two, many are calling for capturing wolves from the mainland and translocating them to the island, where they are likely to suffer the same "inbred and deformed" future as those currently there. The motivations for exiling the mainland wolves to the island are primarily to continue the predator-prey study and to satisfy tourist desires to see or hear wolves. There is some concern that Isle Royale's moose population-the wolves' primary prey-could explode, but moose numbers are declining throughout the upper Midwest to the point they have been proposed for listing as a threatened or endangered species.

The pro-transplant voices ignore that 98 percent of Isle Royale is designated Wilderness, and by law must remain "untrammled" (unmanipulated, untamed, wild) with natural processes unimpeded by managers. In Wilderness, nature calls the shots.

Alternative A: No action. Wolves would come and go based on natural migration.

Wilderness Watch works to protect wolves in Wildernesses across the country, including going to federal court several times to protect them from trapping, shooting, and other forms of harassment. We believe that in Wilderness natural processes, not human demands, should determine whether predators stay or go. For this reason, Wilderness Watch strongly supports Alternative A, the no-action alternative, which would honor and preserve the area's wilderness character while letting the wolves decide if they want to recolonize Isle Royale.

Support Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Your attention to this most urgent matter would be much appreciated by all present & future generations of all species.

Correspondence: I am writing concerning the management of wolves at Isle Royale. I understand that the NPS is considering a number of options regarding the issue of the declining wolf population. While I have fully supported seeing native wolf populations in other areas being restored, I do not support the NPS bringing wolves to Isle Royale. The fact that the wolves are there in the first place seems to be a fluke of nature to some degree since they cannot easily freely come and go to this area. Allowing natural processes to take their course without intervention from humans seems the only fair and scientifically grounded decision. Taking wolves from healthy populations elsewhere and putting them on an island where their chance of living healthy lives seems not only cruel, but completely unnecessary. Wolves had not traditionally inhabited this area and it seems it is time to just nature run its course for the wolves. Please just let the wolves decide where they want to live instead of thinking we humans know better how to manage this situation. Going with the "NO ACTION" alternative is the only alternative that supports Isle Royale's Wilderness status and leaves nature and the wolves to do what they want.

Correspondence: I offer the following comments on the Isle Royale Wolves Environmental Impact Statement:

Wolves are relative newcomers to Isle Royale, having arrived in the late 1940s by walking across frozen Lake Superior from northeastern Minnesota or Ontario. Other wolves have arrived since that time and, conversely, many have also left. The island's wolves have been the subject of one of the longest-running studies of predator-prey relations. But inbreeding and other factors associated with their isolation have caused the wolf population to steadily decline for many years.

With the wolf population now at only two, many are calling for capturing wolves from the mainland and translocating them to the island, where they are likely to suffer the same "inbred and deformed" future as those currently there. The motivations for exiling the mainland wolves to the island are primarily to continue the predator-prey study and to satisfy tourist desires to see or hear wolves. There is some concern that Isle Royale's moose population-the wolves' primary prey-could explode, but moose numbers are declining throughout the upper Midwest to the point they have been proposed for listing as a threatened or endangered species.

The pro-transplant voices ignore that 98 percent of Isle Royale is designated Wilderness, and by law must remain "untrammled" (unmanipulated, untamed, wild) with natural processes unimpeded by managers.

Correspondence: I am writing in support of Alternative A. Alternative A since I think it best upholds Isle Royale's Wilderness status.

Wolves should determine if they want to inhabit Isle Royal. Scientists should study the ecological responses to the absence of these wolves if they decide to leave. Forcibly inserting another wolf population on the island to continue what has been a predator-prey study may not yield valid data that will hold up in natural real world situations for this ecosystem. Please use sound science to help these iconic animals live free as a strong population.

Correspondence: Dear NPS,

Regarding the Isle Royale Wolves...

I am not an expert, though I do have a Biology degree from the [REDACTED]. I have never been an NPS employee, though I did have a 4 month internship at the Virgin Islands National Park on St. John-USVI.

Here are my thoughtsâ€

Through the view of this special wildlife/ecosystem dynamic being portrayed as a research project, human manipulation of the wolf population dynamics in any manner cannot be performed. Doing so would only contaminate and lessen the value of all previous, current and future research results. I cannot even comprehend that an established and esteemed doctor of the natural sciences would even consider such an encroachment and contamination of a research study group/environment. First, it is not natural in any way, which should scream 'lack of integrity' to anyone willing to listen. Second, the individual animals that chose to live on and/or were ultimately born into the island environment had something in them, even on the molecular level, which destined them to be part of this unique ecosystem. No amount of vetting could ever guarantee that a new, artificially introduced animal would contain the same 'inner' chemistry as that of the 'nature' selected animals. If artificial introduction is pursued, this would again bring into question the integrity and validity of

any research results and findings.

From the perspective of the animals that are to be artificially introduced to this new environmentâ€

You would be causing them anguish, possible harm and even death. Though the demise of these new animals may not be immediate or all too visible, but on the molecular level it will occur and it will only get worse for them from thereâ€ You see, these animal's core makeup and chemistry did not or would not have chosen to migrate to this island environment. Man would have made the choice for them. So now in addition to the research results being of no credible value, we also took an animal out of its natural environment, transplanted it into a foreign landscape and ultimately signed its death sentence because we think we knew better than nature. Essentially we would be thinking, saying and acting as though we could trick nature to allow the continuation of a now bogus research study as well as to appease the ego of a diluted doctor of science.

Please do the right thing, let nature and natural selection take its course. Do not allow the supposed educated thoughts and ideas of man dictate what only nature can achieve.

Take guidance from an old 1970's margarine commercial - "It's not nice to fool Mother Nature..!"

My sincere thanks to you and your colleagues as you contemplate this issue and all the others that are sure come your way as our natural world shrinks and you are asked to balance nature with the needs of man.

Correspondence: I support Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Correspondence: Conservation scientists believe that predation - - the ecosystem function that wolves provide - - is vital to the health of ecosystems inhabited by large herbivores such as moose. On Isle Royale, predation has been effectively nil for the past five years and is expected to remain so for the foreseeable future. Genetic rescue (among other alternative management options) is a means of mitigating this loss of predation. In addition a new wolf population should be re-established if wolves are to remain an ecological force on Isle Royale. It is essential to a healthy ecosystem that wolves are reintroduced to Isle Royale. When wolves were reintroduced to Yellowstone, it made room for many other species to thrive.

Correspondence:

I support Alternative A and ask that you please uphold the Isle Royale's Wilderness status by not interfering through the introduction of outside wolf populations. Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

It is time to face the reality of human interference and impact in ecological terms and how our interference and presence in such wilderness areas are quickly sealing the deadly fate of other species that might otherwise thrive given the right circumstance. We have blocked the ability for species to migrate under their own instinctual terms thus we have become the executioner to many species throughout the world. They too have every right to live freely on our planet and not be made a science project just to quench some scientific question. If we are to ask the most important question it would be 'what will happen to our environment and other inhabitants should they no longer be there?' Not because humans want to hear them calling in the wild or see them, like they are providing a source of entertainment, how deeply ignorant humans are!

I ask that you do the right thing and support the process of Alternative A when making a decision for the future of the last of these wolves. Thank you.

Correspondence: I would like to add my comments on the Isle Royale Wolves EIS.

I fully support Alternative A. It is the only alternative that honors and upholds Isle Royale's Wilderness status. Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, and we should let the wolves decide if they want to live there.

There are good biological reasons why the wolves are dying out on Isle Royale and the same reasons argue convincingly to NOT add more wolves to the ecosystem. Specifically, inbreeding and other factors associated with their isolation have caused the wolf population to steadily and naturally decline for many years. With the wolf population now at only two, any wolves translocated from the mainland will most likely suffer the same "inbred and deformed" future as those currently there.

The motivations for exiling the mainland wolves to the island are primarily to continue the predator-prey study and to satisfy tourist desires to see or hear wolves. There is some concern that Isle Royale's moose population-the wolves' primary prey-could explode, but moose numbers are declining throughout the upper Midwest to the point they have been proposed for listing as a threatened or endangered species.

Correspondence: The addition of wolves to an environment is almost always a GOOD thing. Check the scientific reports on the long-term (or even short-term) effects of the project in the Yellowstone! Over time, the addition of wolves changed everything for the better, including the course of the river flow!! If we're trying to save/protect our planet, restoring natural habitats can only be a plus, and there is plenty of evidence to back this up.

Correspondence: On June 2016, I finally made to Isle Royale for the first time spending several hours in the Windigo area. While I did not see any moose or wolves, it was good to know that they were there. However I also learned that in fact there are only two wolves left on the island. I then read Rolf Peterson's book "The Wolves of Isle Royale: A Broken Balance" to understand the dynamics of what had occurred over time leading to the current situation. My interest in wolves is not a passing fancy which just occurred from my one visit and reading about Mr. Peterson's research. While I live in California, I am a frequent visitor to Northern Wisconsin where I have done my own self-education about wolves. In the past three years, I have attended two wolf ecology and tracking seminars at the Treehaven, a University of WI at Stevens Point facility. I am aware of wolves being placed back on the Endangered Species List through a Federal court order.

Professionally, I worked from [redacted] with the U.S. Fish and Wildlife Service, Division of Law Enforcement. While I did not work directly in matters involving wolves, I did have first hand experience working with and knowledge of Federal and state wildlife experts who were part of recovery efforts involving whooping cranes, California condors, sea otters, eagles, manatees, and Florida panthers. Federal agencies, which did not necessarily involve the National Park Service (NPS), have done intervention to preserve these species.

Concerning Isle Royale, it appears to be well documented that having a viable wolf population does maintain a balanced moose population and thereby reduces overgrazing and destruction of certain plants and foliage. As the NPS is aware, negative intervention by humans such being the catalyst for the introduction of the canine parvovirus to Isle Royale and the larger impact of global warming (no more ice bridges from the mainland) could be factors in the decline of wolf population. Therefore even though Isle Royale is a wilderness park, because man has impacted the wolf, man now has the opportunity to rectify this situation. Thus I believe that Alternate C in the Revised EIS is the appropriate response. The initial research and monitoring which began over 50 years ago can be continued through the efforts of the NPS.

This year 2016 is the 100th anniversary of the NPS. What a credit it would be to the NPS to decide this year to take action by bringing wolves to Isle Royale to sustain a viable population. I hope to return to Isle Royale soon and would like to know that the wolves and other wildlife are still living on the island. Knowing that the NPS tried to do something rather than let the wolves on Isle Royale die out, is important to me as I am sure it will be to other future park visitors who will have the thrill of coming to this special place.

Correspondence: I'm writing in favor of Alternative A regarding the wolves in the Isle Royale Wilderness. This is the only alternative that is compatible with the wilderness status of the island. It's really up to the wolves to decide whether or not they can continue to live there, and not for managers to artificially manipulate the situation. Wolves historically, since the end of the last ice age, have not generally been residents of the island. Although their recent presence has provided interesting data for study of predator-prey interaction, if they leave or die out, then other predators and other prey may well take their place. This is for nature to decide, not managers. That's the very essence of wildness and wilderness.

Correspondence: Regarding this EIS, please select Alternative A, No action. That is, "no action" on the part of humans - - the wolves in question, however, along with things like ice pack and weather, would take many actions that would determine the outcomes This is exactly as it should be in a federally designated wilderness.

Given that 98 percent of Isle Royale is designated Wilderness, the federal law that guides our interaction with this land must be followed. That law clearly states that this wilderness must remain "untrammeled" - - free from manipulation by those that manage it, to the limited extent that wilderness is managed at all. Natural processes, not humans, are in charge.

I strongly supports Alternative A, the no-action alternative, because it not only honors the spirit of the Wilderness Act, it is in fact legally in keeping with the written words of the Act. No Action will preserve Isle Royale's wilderness - - its ecology and its character - - by letting nature and wild animals decide what will live there.

Please select Alternative A to keep Isle Royale's Wilderness what it legally is and should be. Thank you for your consideration.

Correspondence: While I appreciate that the National Park Service is looking at alternative ways to deal with this situation, I believe the best way is the natural way, let nature determine whether wolves continue to occur on Isle Royale. My choice is Alternative A, it is the only alternative that honors and upholds Isle Royale's Wilderness status.

Thank you for your consideration.

Correspondence: Support Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to, or can live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Sierra Club Comments re: Amended Notice of Intent to Prepare an Environmental Impact Statement to Address the Presence of Wolves at Isle Royale National Park (Federal Register/Vol.81, No. 108/Monday, June 6, 2016/Notices - page 36324).

Please note - these comments constitute the comments submitted by the Sierra Club on this Amended Notice of Intent. They are the only comments submitted on behalf of the Sierra Club.

Dear Superintendent Green,

Thank You for the opportunity to submit comments on this Amended Notice of Intent to Prepare an EIS regarding wolves on Isle Royale. The following are the selection of our preferred Alternative and the rationale for that preference.

Sierra Club Supports Alternative A (No-Action Alternative). Sierra Club Believes That The Narrowing of the Range Of Alternatives Itself Leaves Alternative A as the Only Viable Alternative.

We support this Alternative for the following reasons:

1) The Revised Preliminary Range of Alternatives is Inadequate

The effects of the "Presence of Wolves at Isle Royale National Park" simply cannot be analyzed in isolation from other issues, in particular the presence, abundance, and effects of moose on the island. In fact, the effects of moose, absent wolves, is one of the primary drivers for the consideration of augmentation of the wolf population on the island.

The primary stated reason for the need to augment the wolf population is the claimed necessity to reduce the effects of the moose population on vegetation through browse. To then restrict the analysis of methods for controlling the stated problem (the moose population and vegetative effects) to augmentation of the wolf population, without any consideration of other methods (such as culling, fire, etc, and others which were described in the original NOI), is disingenuous at best.

If the "Purpose and Need" of the EIS is to determine whether or not wolves should be brought to the island in order to control moose and their browse, this cannot be done without reference to the moose themselves. Posing the problem of moose browse, and then restricting the analysis of potential response to wolf introduction or not is an arbitrary and unacceptable situation.

There are virtually no references in the scientific literature to wolves on Isle Royal without attendant references to moose. Indeed, the long-running study on the island is about wolf-moose interactions. It is almost beyond comprehension that the NPS could conduct an EIS with the only topic under analysis whether or not to bring more wolves to Isle Royale, without concurrent analysis of other options.

It certainly appears that restricting the range of Alternatives to this truncated set is in response to public clamor for wolves, as opposed to controlling moose browse. NEPA does not provide for restriction of Alternatives considered to be based on public sentiment or popularity. Selection of which Alternative to implement can and often should, take into account public sentiment. But elimination of feasible and prudent Alternatives to place in analysis can not and should not do so.

The Revised NOI states that the Range of Alternatives would be "revised and narrowed" in the EIS, based upon "public comments we received and additional internal deliberations". There is no description of rationale for this revision and narrowing, simply a claim that it was based on public input and internal discussion.

One would hope that all decisions of any type are based upon "public input and internal deliberations". Indeed, it is difficult to conceive of other factors than "public input and internal deliberations" which might go into NPS deliberations. However, the content and conclusions of these discussions should be described, as well as the reasoning which led to the revision and narrowing of the scope of the EIS.

2) The Selection of any Alternative Other Than Alternative A (No-Action) from the Revised Preliminary Range of Alternatives constitutes an Irretrievable Commitment of Resources

Choosing any alternative other than Alternative A is likely to preclude other management options which are not described within this inappropriately narrow range of alternatives. As an example, woodland caribou are known to be intolerant of wolves. Choosing to locate new wolves on the island would preclude future caribou introduction.

Consequently, selection of Alternatives B,C, or D would preclude choices in the future, even before those potential choices have been analyzed. The EIS must disclose that the very narrowing of Alternatives inherent in this EIS will have the effect of shutting off future options.

In addition, even though changing course is theoretically possible after choosing Alternatives B, C, or D, in fact it is highly unlikely. Once the public becomes accustomed to the notion that wolves can be translocated to the island at will, it will be very difficult to reverse that course, and the NPS will be committed to similar future actions. This is doubly true if the primary reason for continued translocation of wolves is in order to satisfy public desire. The stated rationale for the narrowing of Alternatives in this EIS suggests that public sentiment is already driving the options for management.

3) The Selection of Alternative A (No-Action) from the Revised Preliminary Range of Alternatives will Not constitute an Irretrievable Commitment of

Resources, and in fact is the Only Alternative which Does Not Constitute an Irretrievable Commitment of Resources

Alternative A (No-Action) allows for all other Alternatives to be implemented at future date, including those considered but not carried forward. It is the only alternative which does not close off some range of actions in the future.

Contrary to the assertions by some commenters, there is no evidence that a lack of wolves on the island in the short term will cause permanent harm to the island's resources, either vegetative or animal.

Selection of Alternative A is the only option which allows all options for future management to be considered.

4) The "Narrowing and Revising of Alternatives", which led to the Revised Preliminary Range of Alternatives is Not Necessary to Prevent an Irretrievable Commitment of Resources. There has Been NO Demonstration of Urgency In This Matter

The only stated rationale for the narrowing of the Range of Alternatives is "public comments we received and additional internal deliberations". As described above, this narrowing of Alternatives is inappropriate. In addition, it is unnecessary. Choosing Alternative A, and conducting a full EIS will not result in any Irretrievable Commitment Of Resources.

Many of the public comments urging for immediate wolf reintroduction to the island have described it as a matter of some urgency. The concern seems to be that if wolves are not reintroduced to the island immediately, the moose population will rise sharply, and the attendant vegetative browse will damage the island's resources beyond repair, leading to an Irretrievable Commitment of Resources. We have not seen any evidence to support this claim of urgency, and indeed, history demonstrates otherwise.

Moose were on Isle Royale for almost 5 decades before wolves arrived, and more time passed before wolves achieved numbers sufficient to have any effect on moose population. During that time moose populations fluctuated from between 500 to 2500. Clearly, some significant vegetative damage occurred during periods of high moose population levels. However, we have seen no evidence that vegetation did not recover during periods of low moose populations, which leads to the conclusion that the absence of wolves for a few years will have no permanent deleterious effect on the island's vegetation, and the hence, there is no urgency to the matter.

We would also note that if there is actually concern over the delay in making a decision regarding the presence of wolves on Isle Royale, that no insignificant amount of the responsibility for that delay falls upon those calling most insistently, and applying political pressure, for an immediate decision.

The NPS has appropriately followed it's legal obligation to conduct a full and thorough examination and disclosure of the effects of various management options regarding wolves on the island. However, many segments of the public felt that this was a "needless delay" (as described in many comments) in taking action.

This resulted in public and political pressure to address the wolf question first, without regard to the other interrelated issues. Consequently, the NPS was pressured into conducting an inadequate EIS, with range of alternatives so narrow that the only defensible alternative at this time is Alternative A (No-Action). This alternative must be selected in order to allow the completion of a full EIS, with a full range of alternative, before any management actions are implemented which would preclude future management options.

Consequently, conducting this narrow EIS will require selection of the current No-Action alternative in order to allow for a necessary full EIS. Conducting this narrow EIS therefore will result in the delay of possible selection of any action alternative. The application of political pressure to conduct a less than adequate EIS, under the guise of urgent need for action, has instead resulted in an unnecessary and unfortunate delay in the possibility of any action whatsoever.

In addition, if we are to accept the reasoning which says that uncontrolled moose browse in the short term will cause irreparable vegetative damage, is there not a similar argument with regards to caribou? Perhaps the lack of caribou browse is itself causing irreparable alteration to the vegetative communities on the island. In that case, the longer we wait to consider reintroduction of caribou, the worse the damage gets. If we choose one of the narrowly ranged alternatives, not only will we lose the opportunity to implement that possible action, we will in fact lose the opportunity to even analyze and disclose the effects of implementing that action.

This is just one example of the options which will go unanalyzed if we do not choose Alternative A, and is included as an illustration. There are clearly other options which should be analyzed, but which will go unexamined if the NPS chooses any Alternative other than Alternative A

5) The Revised Preliminary Range of Alternatives is Arbitrary and Capricious

The Amended NOI presents alternatives which consider only wolves, and a narrow set of issues related to wolves at that. Absent from the NOI are Alternatives which involve :

- A) Management of moose through means other than wolves
- B) Management of vegetation through means other than wolf predation on moose
- C) Reintroduction of Woodland Caribou
- D) Reintroduction of Lynx
- E) Attempted coexistence of moose and caribou

Also absent is any rationale for elimination of consideration of these (and other) Alternatives. NEPA requires an agency to describe "Alternatives Considered But Not Brought Forward", and the rationale for not considering those Alternatives.

In "revising and narrowing" the scope of the EIS to "focus on the question of whether to bring wolves to Isle Royale in the near future", the NPS has essentially considered, and discarded, alternatives other than bringing wolves to Isle Royale. However, the NPS has provided no rationale for discarding alternatives which were clearly suggested by both "public input and internal deliberations".

Discarding feasible and prudent alternatives with no analysis and no public disclosure of the rationale clearly constitutes an Arbitrary and Capricious decision.

Determination of which alternatives to consider and analyze is not subject to public referendum or sentiment. In some rare instances, there may be feasible and prudent alternatives which carry such a universal lack of support that analyzing them would be a waste of time and resources. In those cases, a description of the alternative not considered, and the reason for eliminating it, are to be disclosed.

However, that is clearly not the case. There is strong public support for consideration of Alternatives beyond the paltry few in the Amended NOI. These include the Alternatives described in 5) above, as well as others. The support for analyzing those other Alternatives was expressed through "public input and internal deliberations".

6) The "Narrowing and Revising of Alternatives" is Simply Contrary to the Spirit and Letter of NEPA, and is therefore likely to lead to an Unfounded and Poor Decision.

The very purpose of NEPA is to examine the full range of potential actions and disclose the effects of each. Only when this is done can the public provide informed input, and federal agencies make informed decisions. Excluding some Alternatives from consideration, and restricting analysis to Alternatives which may in fact preclude some of the excluded Alternatives from ever being implemented, is a grievous error on the part of the National Park Service, and poorly serves the public.

As a result of these inadequacies in the Revised Preliminary Range of Alternatives, the National Park Service should refrain from taking any actions to implement any of the Alternatives until a full, appropriate, and NEPA compliant EIS, which analyzes the full range of issues and alternatives, is completed.

Selection of any other than A (No-Action) would preclude the National Park Service from accomplishing this, and thus the NPS should select Alternative A (No-Action).

It is important to note the following: It is not the case that the Sierra Club supports the Selection of Alternative A (No-Action) on the grounds of opposing the introduction of more wolves to the island. At the current time, we neither support nor oppose the introduction of wolves to the island as a long-term management option.

We do oppose it as a short-term management option. This is because we believe that absent a full and complete EIS, neither Sierra Club, other interested parties, or the NPS has sufficient grounds to make an informed decision and disclose the effects, as is required by NEPA.

If you have any questions, please feel free to contact me.

Sincerely,

I support adding a viable pack of wolves on a one time basis. Close monitoring is required, not only re. moose but also the fox population. It is my understanding that the moose have no predators on Isle Royale and have expanded to an unsustainable level.. The Wilderness designation for Isle Royale occurred after the moose and wolves were initially introduced, way back. I am conflicted re. this...The island is unique, should never be developed and remain wilderness. The visitor who comes to the Isle comes for the very reasons I have described. Generally, I support reintroduction of wolves back into their normal ecosystem.

Correspondence: I support EIS Alternative A. Alternative A is the only alternative that is consistent with Isle Royale's existence as a Wilderness.

Wolves are relative recent inhabitants at Isle Royale (mid-1900s). Being a Wilderness system, I urge the National Park Service to take a hands-off approach and let nature run its course.

Wolves may return to Isle Royal of their own migratory habits. There is much to learn even if the existing wolf population dies out and no new wolves take up residency. We can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Respectfully,
[REDACTED]

Correspondence: Our family cares very much about our National Parks. We are avid campers and hikers. So far this year, we have traveled to four National Parks. We believe the NPS has done an outstanding job in creating new parks and caring for the ones we own. We are thankful for the many ranger led programs the NPS has offered over the years. Recently, we were able to visit Isle Royale National Park and would like to comment on the wolf and moose project.

Topic Question #1: We believe that ecosystems evolve and change but they shouldn't be affected by human intervention. We believe this is exactly what happened at Isle Royale. Humans brought dogs to the island although the presence of dogs was clearly prohibited. One particular dog had parvo. This virus then spread through the wolf population and caused a huge decrease in a small number of years. These large decreases in population meant that the remaining numbers were too small to be genetically viable. Inbreeding began to occur to the point at which the wolves are no longer sustainable. Since this was a situation that was clearly brought on by people, it's up to us to make it right. We suggest that wolves be reintroduced to Isle Royale to bring back the balance that was originally present before humans brought diseased dogs to the island.

Topic Question #2: The wolves should be periodically monitored for diseases and treated appropriately. Many new types of surveillance and management can be used to monitor the health of both the wolves and moose. Our parks deserve the best in surveillance and treatment of disease.

Topic Question #3: What type and intensity of management should the NPS consider given that approximately 99% of the land area of Isle Royale National Park is designated wilderness? Our parks belong to us and as so, we are responsible for their management. We need to manage in a way so that future generations will be able to enjoy their splendor and beauty. We need to use cutting edge technology and best of practice tools to ensure that our Parks remain viable for all future generations.

Topic Question #4: What type and intensity of management should the NPS consider in the face of a changing climate? The changing climate only means that plants and animals adapt. However, we as humans need to own up to our responsibility when we have done things that affect the flora and fauna in adverse ways. We need to be willing to restore balances that we have affected.

Topic Question #5: What do you like and dislike about the preliminary alternatives?

Topic Question #6: Please submit additional comments here.

Sierra Club Comments re: Amended Notice of Intent to Prepare an Environmental Impact Statement to Address the Presence of Wolves at Isle Royale National Park (Federal Register/Vol.81, No. 108/Monday, June 6, 2016/Notices - page 36324).

Please note - these comments constitute the comments submitted by the Sierra Club on this Amended Notice of Intent. They are the only comments submitted on behalf of the Sierra Club.

Dear Superintendent Green,

Thank You for the opportunity to submit comments on this Amended Notice of Intent to Prepare an EIS regarding wolves on Isle Royale. The following are the selection of our preferred Alternative and the rationale for that preference.

Sierra Club Supports Alternative A (No-Action Alternative). Sierra Club Believes That The Narrowing of the Range Of Alternatives Itself Leaves Alternative A as the Only Viable Alternative.

We support this Alternative for the following reasons:

1) The Revised Preliminary Range of Alternatives is Inadequate

The effects of the "Presence of Wolves at Isle Royale National Park" simply cannot be analyzed in isolation from other issues, in particular the presence, abundance, and effects of moose on the island. In fact, the effects of moose, absent wolves, is one of the primary drivers for the consideration of augmentation of the wolf population on the island.

The primary stated reason for the need to augment the wolf population is the claimed necessity to reduce the effects of the moose population on vegetation through browse. To then restrict the analysis of methods for controlling the stated problem (the moose population and vegetative effects) to augmentation of the wolf population, without any consideration of other methods (such as culling, fire, etc, and others which were described in the original NOI), is disingenuous at best.

If the "Purpose and Need" of the EIS is to determine whether or not wolves should be brought to the island in order to control moose and their browse, this cannot be done without reference to the moose themselves. Posing the problem of moose browse, and then restricting the analysis of potential response to wolf introduction or not is an arbitrary and unacceptable situation.

There are virtually no references in the scientific literature to wolves on Isle Royal without attendant references to moose. Indeed, the long-running study on the island is about wolf-moose interactions. It is almost beyond comprehension that the NPS could conduct an EIS with the only topic under analysis whether or not to bring more wolves to Isle Royale, without concurrent analysis of other options.

It certainly appears that restricting the range of Alternatives to this truncated set is in response to public clamor for wolves, as opposed to controlling moose browse. NEPA does not provide for restriction of Alternatives considered to be based on public sentiment or popularity. Selection of which Alternative to implement can and often should, take into account public sentiment. But elimination of feasible and prudent Alternatives to place in analysis can not and should not do so.

The Revised NOI states that the Range of Alternatives would be "revised and narrowed" in the EIS, based upon "public comments we received and additional internal deliberations". There is no description of rationale for this revision and narrowing, simply a claim that it was based on public input and internal discussion.

One would hope that all decisions of any type are based upon "public input and internal deliberations". Indeed, it is difficult to conceive of other factors than "public input and internal deliberations" which might go into NPS deliberations. However, the content and conclusions of these discussions should be described, as well as the reasoning which led to the revision and narrowing of the scope of the EIS.

2) The Selection of any Alternative Other Than Alternative A (No-Action) from the Revised Preliminary Range of Alternatives constitutes an Irretrievable Commitment of Resources

Choosing any alternative other than Alternative A is likely to preclude other management options which are not described within this inappropriately narrow range of alternatives. As an example, woodland caribou are known to be intolerant of wolves. Choosing to locate new wolves on the island would preclude future caribou introduction.

Consequently, selection of Alternatives B,C, or D would preclude choices in the future, even before those potential choices have been analyzed. The EIS must disclose that the very narrowing of Alternatives inherent in this EIS will have the effect of shutting off future options.

In addition, even though changing course is theoretically possible after choosing Alternatives B, C, or D, in fact it is highly unlikely. Once the public becomes accustomed to the notion that wolves can be translocated to the island at will, it will be very difficult to reverse that course, and the NPS will be committed to similar future actions. This is doubly true if the primary reason for continued translocation of wolves is in order to satisfy public desire. The stated rationale for the narrowing of Alternatives in this EIS suggests that public sentiment is already driving the options for management.

3) The Selection of Alternative A (No-Action) from the Revised Preliminary Range of Alternatives will Not constitute an Irretrievable Commitment of Resources, and in fact is the Only Alternative which Does Not Constitute an Irretrievable Commitment of Resources

Alternative A (No-Action) allows for all other Alternatives to be implemented at future date, including those considered but not carried forward. It is the only alternative which does not close off some range of actions in the future.

Contrary to the assertions by some commenters, there is no evidence that a lack of wolves on the island in the short term will cause permanent harm to the island's resources, either vegetative or animal.

Selection of Alternative A is the only option which allows all options for future management to be considered.

4) The "Narrowing and Revising of Alternatives", which led to the Revised Preliminary Range of Alternatives is Not Necessary to Prevent an Irretrievable Commitment of Resources. There has Been NO Demonstration of Urgency In This Matter

The only stated rationale for the narrowing of the Range of Alternatives is "public comments we received and additional internal deliberations". As described above, this narrowing of Alternatives is inappropriate. In addition, it is unnecessary. Choosing Alternative A, and conducting a full EIS will not result in any Irretrievable Commitment Of Resources.

Many of the public comments urging for immediate wolf reintroduction to the island have described it as a matter of some urgency. The concern seems to be that if wolves are not reintroduced to the island immediately, the moose population will rise sharply, and the attendant vegetative browse will damage the island's resources beyond repair, leading to an Irretrievable Commitment of Resources. We have not seen any evidence to support this claim of urgency, and indeed, history demonstrates otherwise.

Moose were on Isle Royale for almost 5 decades before wolves arrived, and more time passed before wolves achieved numbers sufficient to have any effect on moose population. During that time moose populations fluctuated from between 500 to 2500. Clearly, some significant vegetative damage occurred during periods of high moose population levels. However, we have seen no evidence that vegetation did not recover during periods of low moose populations, which leads to the conclusion that the absence of wolves for a few years will have no permanent deleterious effect on the island's vegetation, and the hence, there is no urgency to the matter.

We would also note that if there is actually concern over the delay in making a decision regarding the presence of wolves on Isle Royale, that no insignificant amount of the responsibility for that delay falls upon those calling most insistently, and applying political pressure, for an immediate decision.

The NPS has appropriately followed its legal obligation to conduct a full and thorough examination and disclosure of the effects of various management options regarding wolves on the island. However, many segments of the public felt that this was a "needless delay" (as described in many comments) in taking action.

This resulted in public and political pressure to address the wolf question first, without regard to the other interrelated issues. Consequently, the NPS was pressured into conducting an inadequate EIS, with range of alternatives so narrow that the only defensible alternative at this time is Alternative A (No-Action). This alternative must be selected in order to allow the completion of a full EIS, with a full range of alternative, before any management actions are implemented which would preclude future management options.

Consequently, conducting this narrow EIS will require selection of the current No-Action alternative in order to allow for a necessary full EIS. Conducting this narrow EIS therefore will result in the delay of possible selection of any action alternative. The application of political pressure to conduct a less than adequate EIS, under the guise of urgent need for action, has instead resulted in an unnecessary and unfortunate delay in the possibility of any action whatsoever.

In addition, if we are to accept the reasoning which says that uncontrolled moose browse in the short term will cause irreparable vegetative damage, is there not a similar argument with regards to caribou? Perhaps the lack of caribou browse is itself causing irreparable alteration to the vegetative communities on the island. In that case, the longer we wait to consider reintroduction of caribou, the worse the damage gets. If we choose one of the narrowly ranged alternatives, not only will we lose the opportunity to implement that possible action, we will in fact lose the opportunity to even analyze and disclose the effects of implementing that action.

This is just one example of the options which will go unanalyzed if we do not choose Alternative A, and is included as an illustration. There are clearly other options which should be analyzed, but which will go unexamined if the NPS chooses any Alternative other than Alternative A

5) The Revised Preliminary Range of Alternatives is Arbitrary and Capricious

The Amended NOI presents alternatives which consider only wolves, and a narrow set of issues related to wolves at that. Absent from the NOI are Alternatives which involve :

- A) Management of moose through means other than wolves
- B) Management of vegetation through means other than wolf predation on moose
- C) Reintroduction of Woodland Caribou
- D) Reintroduction of Lynx
- E) Attempted coexistence of moose and caribou

Also absent is any rationale for elimination of consideration of these (and other) Alternatives. NEPA requires an agency to describe "Alternatives Considered But Not Brought Forward", and the rationale for not considering those Alternatives.

In "revising and narrowing" the scope of the EIS to "focus on the question of whether to bring wolves to Isle Royale in the near future", the NPS has essentially considered, and discarded, alternatives other than bringing wolves to Isle Royale. However, the NPS has provided no rationale for discarding alternatives which were clearly suggested by both "public input and internal deliberations".

Discarding feasible and prudent alternatives with no analysis and no public disclosure of the rationale clearly constitutes an Arbitrary and Capricious decision.

Determination of which alternatives to consider and analyze is not subject to public referendum or sentiment. In some rare instances, there may be feasible and prudent alternatives which carry such a universal lack of support that analyzing them would be a waste of time and resources. In those cases, a description of the alternative not considered, and the reason for eliminating it, are to be disclosed.

However, that is clearly not the case. There is strong public support for consideration of Alternatives beyond the paltry few in the Amended NOI. These include the Alternatives described in 5) above, as well as others. The support for analyzing those other Alternatives was expressed through "public input and internal deliberations".

6) The "Narrowing and Revising of Alternatives" is Simply Contrary to the Spirit and Letter of NEPA, and is therefore likely to lead to an Unfounded and Poor Decision.

The very purpose of NEPA is to examine the full range of potential actions and disclose the effects of each. Only when this is done can the public provide informed input, and federal agencies make informed decisions. Excluding some Alternatives from consideration, and restricting analysis to Alternatives which may in fact preclude some of the excluded Alternatives from ever being implemented, is a grievous error on the part of the National Park Service, and poorly serves the public.

As a result of these inadequacies in the Revised Preliminary Range of Alternatives, the National Park Service should refrain from taking any actions to implement any of the Alternatives until a full, appropriate, and NEPA compliant EIS, which analyzes the full range of issues and alternatives, is completed.

Selection of any other than A (No-Action) would preclude the National Park Service from accomplishing this, and thus the NPS should select Alternative A (No-Action).

It is important to note the following: It is not the case that the Sierra Club supports the Selection of Alternative A (No-Action) on the grounds of opposing the introduction of more wolves to the island. At the current time, we neither support nor oppose the introduction of wolves to the island as a long-term management option.

We do oppose it as a short-term management option. This is because we believe that absent a full and complete EIS, neither Sierra Club, other interested parties, or the NPS has sufficient grounds to make an informed decision and disclose the effects, as is required by NEPA.

If you have any questions, please feel free to contact me.

Sincerely,

Correspondence: As avid supporters of the NPS, our treasured national parks and their role in preserving viable populations of our precious native wildlife, we have looked at your alternatives for Isle Royale and find ourselves conflicted for various reasons on whether or not you should transplant wolves into Isle Royale. Obviously, there needs to be balance between moose and wolves. Both came to Isle Royale naturally over the ice, even though wolves came much later. Alt. D offers the flexibility the NPS needs to balance the natural resources of the park without being forced into a particular option at present. For this reason we think Alt. D may be the best option. Scientists on the ground should make decisions concerning wolves and moose based upon the best available science. Climate change is also a factor. We trust the NPS will do the right thing to keep Isle Royale a premier wilderness park while retaining the responsibility to preserve our native wildlife and natural predator-prey-vegetation relationships for future generations. Congratulations on your Centennial!

Correspondence: Support Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Correspondence: At this time, I feel compelled to recommend alternative A, but do so with some reservation because I do not consider myself fully educated. My hesitation comes from having been involved in reintroduction of the Osprey in western Pennsylvania, due to its extirpation in our area.

The only reason I would deviate from my opinion is if the scientific community felt it important for the overall survival of the wolf population that a separate pack be established or reestablished on the island to help ensure its biodiversity in other areas of the country.

Thank you for giving me the opportunity to comment.

Correspondence: Having recently visited Isle Royale National Park and being informed about the decline of the wolf population, I feel that I need to comment on the options given in the recent newsletter. I would like to see plan B or plan C (take action soon to introduce wolves to Isle Royale) implemented for a number of reasons. First, I believe that the moose population will grow unchecked, and often unhealthy, without introduction of a predator species to cull the herd(s). The wolves in the past have been instrumental in keeping the moose numbers within reasonable bounds for the good of the vegetation and the island's ecology. I would like to see a number of wolves introduced to Isle Royale as soon as possible for the good of the whole park. Secondly, I really like the idea of a wilderness area within the U.S. that has both moose and wolves. Visitors to Isle Royale seem intrigued with the idea of possibly seeing a wolf or hearing wolves as part of their wilderness experience. Wolves would be a magnet to attract visitors for the first time and would be one of the reasons for visitors to want to return to this national park. Taking no action at this time seems impractical to me; wolves will help to balance the herbivore/vegetation ratio in the park. Please consider taking some action - - Plan B or Plan C - - that will bring wolves in reasonable numbers back to Isle Royale.

Correspondence: I urge adoption of Alt. A, leaving the question of wolves on Isle Royale to nature. The park is not a zoo, nor a primitive Disneyland; indeed, most of it is wilderness. The NPS should not be in the business of manipulating the environment for the benefit of a handful of scientists or spectacle-hungry tourists. I have been there several times and enjoy the wolf howls. But that is a small part of the overall experience. Moreover, rangers can use the demise of the wolves as a dramatic example of how things work in the real world, not the fantasy world of amusement parks and television dramas.

Correspondence: June 2016 - To All Stakeholders: I first visited Isle Royale 40 years ago in 1976 when I was 25 years old with my wife. We canoed and hiked the entire park for 14 days. We shared the island at that time with a number of wolves and were privileged to glimpse them on three occasions, once on a trail and twice from a distance with binoculars. We often heard them at night. I recently returned to Isle Royale with my wife and a lighter canoe and were saddened to learn that the wolf population is likely down to one lone wolf at this time!! After reading about the different perspectives and proposals under consideration at this time, I urge all stakeholders to support proposal alternative three (3) and take whatever action is required to sustain and support a wolf population on Isle Royale. Dr. Rolf Peterson's and John Vucetich's "Ecological Studies of Wolves on Isle Royale - Annual Report 2015-

2016 and the work they have done for the past 40 years in collaboration with numerous other scientists and stakeholders clearly shows that 'science' supports Alternative 3.. 'to provide wolves to Isle Royale for the next 20 years' will improve the health of the moose population and positively impact the overall ecological health of Isle Royale National Park.

Correspondence: I ask you to Support Alternative A as it is the only offered option that honors and upholds Isle Royale's Wilderness status.

As wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time I believe their recent presence on the Island is more an anomaly than the norm for this Island's very long history. I believe we should let nature, and individual wolves decide if they want to live there.

If the current wolf population dies out (and no new wolves take up residency) I believe a valuable alternative study of the ecological responses to the loss of wolves becomes possible. That data could be as important as continuing the current "natural" predator-prey study, by artificially inserting another wolf population onto the island.

Correspondence: I would support either Alternative A (or less enthusiastically - D).

I realize there can be no wolf/moose study without wolves. However bringing in wolves so you continue a study seems a perversion of reasons for studying natural relationships. Rather I would like to see a new purpose evolve for a study...what happens without wolves? How does the vegetation change? Are wolves from the mainland more likely to migrate to the island when they don't sense the presence of other wolves? Perhaps they can smell or sense in some other way that the current pack is compromised and they seek only healthy mates. Will disease will arise to cull the moose herd? While this would be a painful occurrence, it might be worthwhile to note scientifically.

Recently my husband and I had to give a small talk about the trip we took to Isle Royale in 2015. In the course of studying for the slide presentation, I learned that miners had effectively denuded the landscape in the 1840s to expose the mining potential. Suddenly I realized that none of the growth on the island is original growth! I also read that at one time the fauna on the island was different: with caribou, lynx, and coyotes, etc - creatures which aren't there now, so obviously the island has found ways to regenerate from a drastic assault. I see no reason why it won't cope with change again. It may not be fast enough for our taste though, so for that reason, I could accept D as well as A.

Superintendent
Isle Royale National Park
800 East Lakeshore Drive
Houghton, Michigan 49931-1896

Subject: Keep the Isle Royale Wilderness wild and protect the autonomy of its wolves by choosing Alternative A - - Isle Royale Wolves EIS Public Scoping Newsletter

Dear Superintendent Green,

Thank you for accepting public comments as you consider whether the National Park Service should transplant wolves to Isle Royale National Park and Wilderness in Lake Superior to replace those dying or leaving. It is a challenging question, yet one with a clear answer.

Wolves are relative newcomers to Isle Royale, having arrived in the late 1940s by walking across frozen Lake Superior from northeastern Minnesota or Ontario. Other wolves have arrived since that time and, conversely, many have also left. The island's wolves have been the subject of one of the longest-running studies of predator-prey relations. But inbreeding and other factors associated with their isolation have caused the wolf population to steadily decline for many years.

With the wolf population now at only two, many are calling for capturing wolves from the mainland and relocating them to the island, where they are likely to suffer the same "inbred and deformed" future as those currently there. The motivations for relocating the mainland wolves to the island are primarily to continue the predator-prey study and to satisfy tourist desires to see or hear wolves. There is some concern that Isle Royale's moose population-the wolves' primary prey-could explode, but moose numbers are declining throughout the upper Midwest to the point they have been proposed for listing as a threatened or endangered species. And even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. The proposal to relocate wolves to Isle Royale ignores the fact that 98 percent of Isle Royale is designated Wilderness and, by law, must remain "untrammled" (unmanipulated, untamed, wild) with natural processes unimpeded by managers. In Wilderness, nature decides what happens. Their recent presence on the Island is more of an anomaly than the norm in the Isle Royale's very long history, but in any event we should let the wolves decide if they want to live there.

I strongly support most efforts to protect wolves from trapping, shooting, and other forms of harassment in and outside of Wilderness areas across the country. However, I believe that in Wilderness natural processes, not human demands, should determine whether predators stay or go. For this reason, I support Alternative A, the no-action alternative, which would honor and preserve the area's wilderness character while letting the wolves decide if they want to recolonize Isle Royale.

Please keep the Isle Royale Wilderness wild and protect the autonomy of its wolves.

Thank you for your consideration of my comments. Please do NOT add my name to your mailing list. I will learn about future developments on this issue from other sources.

Sincerely,

Correspondence: Please choose the true wilderness alternative: Alternative A: No action. Wolves would come and go based on natural migration.

Why? Because 99 percent of Isle Royale's 209 square miles is congressionally designated wilderness. It is meant to stay as wild as possible.

The prime directive of the Wilderness Act is for you, the National Park Service, to maintain or enhance the wilderness character of this rare ecotype. There is no evidence that wolves lived on this island prior to 1950. They are like the caribou who lived on the island in the early 20th century. And the caribou are like the lynx, coyotes, and spruce grouse, who had appeared and then disappeared on the island.

Although the subject of intriguing and important research, wolves are not essential to the island, and, indeed, if they "blink out" on Isle Royale, their existence will not be endangered elsewhere. The predominant principal here is whether humans can restrain their desire to control nature.

I believe that the island's wilderness designation mandates that we let nature take its course. Please don't intervene. Leave this rare, wild island a authentic wilderness.

Correspondence: I write to encourage you to select Alternative A, the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a minuscule fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any case it's appropriate to allow the wolves to decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we would learn so much more by studying the ecological responses to the loss of wolves rather than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Thanks for considering my comments.

Correspondence: The study has been monumental, but the NPS should consider Alternative b or Alternative C.

Due to the fact that climate change has diminished the frequency of ice bridges and human intervention (fear) has lowered the mainland population of wolves that would have a chance to cross the rare ice bridge, it should be up to NPS scientists to balance the system again.

Without intervention, the moose will starve and suffer. Vegetation on the island, especially native vegetation, will suffer from the overpopulation of moose leaving the island open to more invasives.

To me, we as humans should intervene in this system to keep things in balance, despite the fact that the natural experiment will end. It's time to step in.

Correspondence: I am opposed to reintroduction of wolves to Isle Royale NP. They were not present when Europeans first visited the island. Wolves in the vicinity of the Great Lakes are not particularly endangered.

I suggest you consider reintroducing woodland caribou and lynx. Both were present on the island in the 1920s and before. Woodland caribou are exceedingly rare in the United States.

I realize a problem for lynx would be lack of snowshoe hares, perhaps because of moose which did not occur on the island before the 1900s. But the moose themselves may disappear due to global warming.

Correspondence: To the NPS:

I am a resident of Minnesota and am very concerned about our wild life and wild lands. I strongly believe that humans have over-manipulated our environment in almost every place they have tried to "manage" these natural processes. Wilderness is one space were we have held some restraint and should continue to do so - in fact it is the law.

I support ALTERNATIVE A - the no action alternative. I do not believe in a human created Facsimile of a natural process just because we wish to use it for our own interest (the predator-prey study).

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Isle Royale National Park
Attention: Moose-Wolf-Vegetation Management Plan
800 East Lakeshore Drive
Houghton, MI 49931

Sent via: <http://parkplanning.nps.gov/ISROwolves>

Dear Isle Royale Staff,

The following are comments from Wilderness Watch on the scoping stage of the Isle Royale Wolves EIS Public Scoping. Wilderness Watch is the only national wilderness conservation organization solely focused on protecting the existing National Wilderness Preservation System and its individual units like the Isle Royale Wilderness. Wilderness Watch has members in every state in the country, including Michigan, and has long been interested in the Isle Royale Wilderness. Our conservation director and executive director have both visited the Island within the past year on multi-day wilderness trips.

In general, Wilderness Watch has strongly supported the presence of wolves in designated Wildernesses, and we understand the ecological roles played by such a keystone, apex predator within a wilderness ecosystem. We have fought to prevent the killing of wolves within Wildernesses to bolster prey species such as elk or moose. Most recently, for example, our litigation suspended and possibly ended the State of Idahos program of sending a trapper deep into the Frank Church-River of No Return Wilderness to kill wolves in order to allegedly boost elk populations.

Wilderness Watch also supports scientific research in Wildernesses like Isle Royale, provided that such research is conducted in accordance with the 1964 Wilderness Act. We believe the opportunity to learn from Wilderness is one of, if not the most important wilderness values. Wilderness Watch appreciates and values the long-term wolf-moose predator-prey study that has been conducted over the past 60 years on Isle Royale.

Wilderness Watch also understands the problems with inbreeding of the wolves on Isle Royale and the flattening of genetic diversity in that population. We also recognize the declining number of wolves in the Isle Royale Wilderness, and some of the potential changes in the Isle Royale ecosystem should wolves become extirpated there, be it for one year, ten years, a century or forever, just as it is different today because of the extirpation of lynx and caribou decades ago.

Of the alternative concepts listed in the Spring 2016 newsletter for the Isle Royale Wolves EIS Public Scoping Newsletter, Wilderness Watch supports Alternative A, the No Action Alternative. We suggest strengthening this alternative to clarify that this alternative best upholds the wilderness designation of 99 percent of Isle Royale by Congress. We don't believe that wilderness designation is sufficiently highlighted or focused on in the public scoping newsletter.

Alternative A is also the only alternative that respects the wolves' autonomy and lets them decide whether or not they inhabit Isle Royale. For reasons known only to the wolves, they have apparently chosen to not be long-time residents of the island, having arrived fewer than 70 years ago, less than the span of a single human lifetime. Since that time, some if not many wolves that have followed the ice-bridge trail from the mainland to the island have left in short order, while others born on the island have left for the mainland, resulting in the genetically-impoverished population on the verge of extirpation. Perhaps the wolves intuitively know of the genetic downsides to island isolation, or maybe they prefer the freedom to roam beyond the confined borders of Isle Royale. Regardless of the reasons wolves have chosen to not be a permanent, continuous presence on Isle Royale, and consistent with the Wilderness Act's fundamental tenets of humility and respect, a decent respect for wolves and their right to exist free of human desires argues we should let the wolves decide whether and when to return to Isle Royale.

The heart of the issue—and an apparent bias of the National Park Service—is found in the agency's statement of purpose for the plan: The NPS began this planning process by considering a broad range of potential management actions as part of determining how to manage the moose and wolf populations. (2016 newsletter, p. 1). This purpose presumes that, contrary to the intent of the Wilderness Act, the Park Service needs to manage these species and their interactions. That is, the ecological and evolutionary processes that created and continue to shape the island systems need to be controlled and manipulated to conform to what the agency thinks they should be. This bias appears to pre-determine the outcome by inappropriately assuming that the National Park Service's job is to manage and manipulate the populations of wolf and moose. This agency bias must be removed in the next step of environmental review for this project.

As detailed below, Wilderness Watch believes that wilderness designation requires a non-intervention approach, and we believe a non-intervention approach must be taken even if it means that wolves might become extirpated from the Isle Royale Wilderness. Our reasons for supporting non-intervention at Isle Royale include the following:

1. Wilderness. In 1976, Congress designated about 99% of Isle Royale National Park as Wilderness under the 1964 Wilderness Act, Public Law 88-577: 16 U.S.C. 1131-1136. Wilderness designation is the law of the land, and wilderness designation cannot just be ignored in the case of Isle Royale. (We note that in the Spring 2016 newsletter, the word wilderness was used just once in reference to the island's wilderness character, and that the Congressional designation of 99% of Isle Royale as Wilderness was completely missing.)

The prime directive of the Wilderness Act is to preserve wilderness character, not to preserve individual species, even popular or charismatic ones. The prime directive is not to artificially maintain a specific predator-prey population, but all of the ecosystem dynamics, even if that results in the extirpation of a current predator or prey species as frequently happens in island ecosystems even absent the actions of humans. Similarly, the Wilderness Act does not direct us to preserve the ecosystem function of a species that is waning, but all ecosystem functions unfettered and unmanipulated by humankind. The prime directive is to preserve wilderness character, to let nature run its course.

The Wilderness Act did not define wilderness character, though Wilderness Act author Howard Zahniser reminded us as early as 1953, We must remember always that the essential quality of wilderness is its wildness. The best definition of wilderness character is the degree to which wilderness is free from deliberate human modification, control and manipulation of a character and scope that hampers the free play of natural ecological processes. (David Cole et al. 2016. In press. The 'Keeping It Wild' Monitoring Frameworks Definition of Wilderness Character Jeopardizes the Wildness of Wilderness, International Journal of Wilderness.)

The Wilderness Act also defines Wilderness in part as untrammeled or unmanipulated. This means that we allow Nature to call the shots in Wilderness, even if that means that Nature might make decisions that we humans may not like, such as the extirpation of wolves from the Isle Royale Wilderness, either temporary extirpation or permanent extirpation.

Dr. Robert Lucas, a pioneer wilderness researcher, could have been speaking directly to the situation with wolves on Isle Royale when he wrote, If ecological processes operate essentially uncontrolled within the wilderness frame of reference, the results, whatever they might be, are desirable by definition. The object is not to stop change, nor to recreate conditions as of some arbitrary historical date. The object is to let nature 'roll the dice and accept what results with interest and scientific curiosity. (Lucas, R.C. 1973. Wilderness: A management framework. Journal of Soil and Water Conservation, 28: 150-154.) From a scientific/research standpoint, there is probably volume more to be learned by letting nature take its course than by artificially injecting more wolves into the Isle Royale ecosystem and trying to perpetuate the status quo of the past five or six decades.

This is the very essence of Wilderness, that we humans must treat Wilderness with humility and restraint. The current debate over the potential loss of wolves indicates the fairly short-sighted approach of most land management practices that are often based on the next few years, a career-post, or human lifetimes at best, not millennia. Because Wilderness is forever, we need to look beyond the short timeframe of human lifetimes. We need to allow these natural processes to play out over much longer time spans, to make it possible for those areas from the eternity of the past to exist on into the eternity of the future, as Wilderness Act author Howard Zahniser once eloquently described it.

Some people may argue that wilderness designation is a nice add-on, but it really doesn't or shouldn't change the way a national park should be administered. That argument, however, doesn't hold water. In a case involving Wildernesses in the High Sierra, for example, the U.S. 9th Circuit Court of Appeals ruled in 2004 that the Wilderness Act imposes substantive requirements on an administering agency to protect the wilderness. (High Sierra Hikers Assn v. Blackwell, 390 F.3d 630.) In another case, a Federal District Court ruled, [S]ubjective characterizations aside, the Wilderness Act is as close to an outcome-oriented piece of environmental legislation as exists. As such, it is as close to a 'purist manifesto as may be found in the area of environmental law. (High Sierra Hikers Assn v. U.S. Forest Service, 436 F.Supp. 2d 1117.)

Wilderness designation therefore has significant meaning. And wilderness designation at Isle Royale strongly argues against manipulating the wolf and moose populations, against both transplanting more wolves from the mainland as well as culling the moose herd.

2. Island Biogeography. As the National Park Service wrote in the Summer 2015 newsletter, Isle Royale exhibits a unique biogeography. Organisms that live on islands have more dynamic population trends and are more often subjected to extinction events with colonization and immigration occurrences depending on island size, distance to the mainland, length of isolation (time), chance events, habitat suitability and human activity, to name a few influencing factors. In other words, things come and go from islands; local extirpation is natural, as is establishment and re-establishment of new

populations.

Wolves and moose are relatively recent natives to Isle Royale. Canada lynx and woodland caribou, two earlier natives, provided the predator-prey dynamic up to about the turn of the 20th century but have both become extirpated. So it may ultimately be with wolves and moose, to be replaced with other species. These are common occurrences related to island biogeography. Moose arrived in the early 1900s, and their population has fluctuated dramatically at times since then. Wolves became an even later migrant when they crossed the ice to Isle Royale between 1948-1950.

The presence of wolves and moose on Isle Royale has provided a unique and well-documented opportunity to study the predator-prey dynamics since the mid-20th century, however, a study that continues to this day.

Yet even the length of this noted study does not mean that the dynamics of island biogeography have ended. Species come, and species go. Extirpations can occur. Particularly because of wilderness designation, we must let it be Nature that makes those decisions, not us humans who want to impose human preferences on the Wilderness.

The DEIS also needs to assess whether Isle Royale can support a self-sustaining wolf population over the long-term. Isle Royale is relatively small for a wide-ranging, territorial species like the wolf. Even at its highest level of 50 or so wolves, Isle Royale has never harbored a large enough population to sustain itself, nor has inflow from the mainland been enough to avoid the detrimental effects of inbreeding after just a handful of generations. Given the average number of wolves on the island-around 20-the problem only gets worse, and even 20 wolves might be an unusually large population for such a small area. For comparison, Yellowstone National Park-at 2.2 million acres-harbors roughly 100 wolves in 10 packs. That's one pack and 10 wolves for every 220,000 acres in an area that provides a banquet of prey species, and pack territories that in many cases extend well beyond the park. Isle Royale, wonderful as it is, provides none of these beneficial characteristics and, at best, might only sustain intermittent wolf populations. Recent history suggests this is the case, while long-term history suggests wolves might never have inhabited the island. The alternatives that contemplate translocating wolves to Isle Royale need to explain why the future will be different and why maintaining a stable wolf population on the island won't require managing Isle Royale like a zoo, where individual wolves and or packs will need to be routinely captured from their native homes and exiled on Isle Royale to perpetuate an unnatural condition to appease some visitors and researchers alike.

3. Slippery Slope of Manipulation. As mentioned above, an essential part of wilderness designation is that humans must avoid the hubris and arrogance we often exhibit towards landscapes and wildlife. We must instead show humility and restraint, allowing untrammelled Wilderness to remain unmanipulated to chart its own ecological and evolutionary course without succumbing to human preferences and desires.

If humans start transplanting wolves to Isle Royale, we start on a slippery slope that may have no end. Additional wolves will almost certainly be needed on the island after the first installment, to freshen up the gene pool again. With a warming climate, Isle Royale may eventually lose its moose population, too. Will we then import moose to Isle Royale in perpetuity to keep the wolves fed, in order to perpetuate 1950s predator-prey conditions? Or will we have to control the wolves to give the moose a fighting chance? And what of the native lynx and woodland caribou that inhabited the island before the wolves and moose? Should we reintroduce them to re-create 1900s conditions?

4. Research Can Continue. Some people fear that a loss of wolves from Isle Royale will mean that ecological research on the archipelago will come to an end. Ecological studies on Isle Royale will continue to provide new scientific insights, however, whether or not the wolves survive or become extirpated. Wolves are not the only species to be studied on Isle Royale, even if the somewhat exaggerated symbolism of the wolf and some of its promoters might have us think otherwise.

Research will actually become even more important if the wolves do become extirpated. If the wolves die out, how will the moose population respond? Will genetic variability in moose also flatten over time? Will the moose population return to the boom-and-bust cycles of the 1920s to 1950, or will something else occur? Will wolves naturally re-colonize Isle Royale on their own, utilizing ice bridges to the mainland such as those that have formed in recent winters? How will the vegetation respond?

We have far more to learn about the ecological dynamics of Isle Royale if wolves actually do become extirpated from the archipelago, rather than re-creating a temporary wolf-moose dynamic that has already been studied for more than 60 years.

5. Proposed Listing of Moose. While we appreciate the NPS desire to separate this current analysis from the larger wolf-moose analysis originally proposed, we think the current dramatic decline of moose throughout much of the Upper Midwest and the proposed listing of moose under the Endangered Species Act (ESA) suggests we can't disentangle the issues of wolves and moose on Isle Royale. If moose begin to struggle on Isle Royale, as they are in much of the Midwest, then a decision to translocate wolves to the island could spell the moose's demise. Moose might well be listed on the endangered species list by that point. The DEIS needs to address this issue.

6. Visitation without Wolves. While wolves are a popular species on the island, the question of whether the absence of wolves will have an appreciable impact on the number of visitors should be addressed. Some might argue that losing this popular species will have an impact on visitation to Isle Royale and, potentially, on the economy of mainland communities. We don't think that will happen, though; people will still come to visit Isle Royale even if wolves become extirpated. But that question should also be addressed in the DEIS.

7. Researchers Who Call for Non-Intervention. Wilderness Watch is not alone in calling for a non-intervention approach on Isle Royale. Other highly respected researchers have also supported this approach. Their research and writings addressing the issue of wolves on Isle Royale should be reviewed and incorporated into the Isle Royale wolf analysis. Some of those writings include:

Dr. L. David Mech. 2013. The Case for Watchful Waiting with Isle Royale's Wolf Population, *The George Wright Forum* 30(3): 326-332.

Dr. Tim Cochrane. 2013. Island Complications: Should We Retain Wolves on Isle Royale? *The George Wright Forum* 30(3): 313-325.

Dr. Tim Cochrane. 2014. Rejoinder to 'Discernment and Precaution: A Response to Cochrane and Mech', *The George Wright Forum* 31(1): 94-95.

██████████ 2015. A Case Against Intervening in the Isle Royale Wolf/Moose Issue. Attached.

Please keep Wilderness Watch on your contact list for further steps in this analysis. Thank you for this opportunity to provide comments.

Sincerely,

[REDACTED]

A CASE AGAINST INTERVENING IN THE ISLE ROYALE NATIONAL PARK WOLF/MOOSE ISSUE
October 2015

[REDACTED]

BACKGROUND:

Isle Royale, a 209 square mile (133,782 acres) island in northwestern Lake Superior was dedicated as Isle Royale National Park in 1940. In 1976, approximately 99 percent of the park became a designated wilderness area- a part of The National Wilderness Preservation System. In 1980, Isle Royale was added to the list of International Biosphere Reserves. The island lies in the transition zone between the southern edge of the Boreal Coniferous Forest and the northern edge of the Northern-Temperate Deciduous Forest. The island is best known for its six-decades-long Isle Royale Wolf-Moose Project, a series of investigations of moose-wolf interactions and its influence on the islands habitat.

Wolves first appeared on the island sometime during the winters of 1948-50 when ice bridges connected the island to the mainland (1 female, 2 males). Genetic evidence suggests that there were several additional wolf arrivals from the mainland in the past 60-plus years. It is also known that several wolves left the island for the mainland. Regardless, recent genetic analysis has shown that all remaining members of the Isle Royale wolf population have descended from a single female. This past winters wolf survey found three wolves on the island- a female and male and what appeared to be a juvenile. One female was discovered to have crossed over to Minnesota where it was shot, and one male was found dead on the island. Three wolves from the mainland were seen on the Isle Royale in February of 2015, but returned to the mainland after six days. Currently, the remaining wolves exhibit signs of inbreeding and may die off due to lowered or non-existent breeding capacity. Park officials have through the NEPA process raised the question of whether or not to supplement the remaining population by capturing and introducing new wolves from the mainland in an effort to genetically rescue the population. That is currently where we stand.

Before proceeding, let me make it clear that I am not in favor of intervening with a genetic rescue, but do favor allowing the current situation to play itself out unhindered by human manipulation. And for full disclosure, [REDACTED], an organization dedicated to keeping wild the nations wilderness areas, and whose position on this issue is also one of non-intervention. However, I am [REDACTED] not representing Wilderness Watch.

THE CASE:

Over the past decades Ive formed my conservation principles, and hence the basis for many of my desired outcomes from an amalgamation of some of our nations greatest environmental laws, including the National Park Services Organic Act which allows certain environmental manipulations, and the text of the 1964 Wilderness Act whose core value is to leave the land untrammelled by man. To these I must add my respect for the Precautionary Principle. All of which are reinforced by the writings of various conservation leaders and my own extensive travels in the U.S. and to over two-dozen foreign countries where I was introduced to numerous endangered species and land management programs. Ironically, on Isle Royale we have two of our Nations strongest land conservation laws overlapping on the same piece of land, each providing somewhat conflicting guidance as how to proceed with the wolf issue. This is not an easy one.

A strong argument can be made that many of the wolfs current problems can be traced back to human intrusions, primarily the impacts of human-caused climate change and the accidental introduction of parvovirus to the island in 1980 or 1981. However, over and over I read that the lack of genetic diversity leading to inbreeding poses the most imminent threat to their existence. A whole host of scientists attest to this. No question- I believe them and their findings. However, inbreeding is a consequence of many factors, including, but not limited to, disease, climate change and the fact that Isle Royale is a remote and relatively small island. I firmly believe the most significant of these three factors is the isolation of the islands wolf population-which of course is made worse due to climate change.

The real question is what should be done about this- if anything? And not wanting to split hairs, the word extinction is regularly used to describe the likely future of the Isle Royale wolf population. That could happen, but if it does it is unlikely that it will in any way threaten the overall survival of the wolf as a species. If species survival were at stake here, I would almost certainly have a very different opinion.

Faced with the possibility of losing the islands wolves, we need to remember that there is no evidence that wolves were on the island prior to 1948-50. And it was only in the early 1900s that moose appeared on the island, apparently having swum from the mainland. Also, recent genetic analysis of the islands moose population suggests that they are most closely related to Minnesotas northwestern moose population. This has lead to speculation that Isle Royales moose may have been brought onto the island by humans, contradicting the assumption that all or most of the first immigrants swam from nearby, northeastern Minnesota.

It is known that at the beginning of the 20th century, Isle Royale was home to caribou, lynx, coyotes and spruce grouse- all now extinct on the island. And who knows how many other species have appeared only to disappear later for unknown reasons, but likely human-related. This is not unusual for island ecosystems whose species composition tends to be less complex and much more volatile then larger mainland systems. This is particularly true when modern humans enter the picture. (Isle Royale is home to 19 mammalian species while the nearby mainland is home to 40.)

Many people question the meaning and very existence of natural and wildness. Isle Royale is an island and history shows that its species composition has changed in modern times. Consequently, where on the time-line of the islands biotic history do we define natural: Pre- or post-caribou? Pre- or post-moose? Pre- or post-wolf? When and how often in the past have human actions affected species make-up on the island? What significance should we assign to Pre- or Post National Park designation? What do we hold up as our naturalness standard?

Evolution is a process and it takes place on all scales, even at the ecosystem level, and even within small island systems. And by my thinking, evolution itself is a process worthy of protection, one worth leaving alone. Importing wolves to the island would be a significant, conscious act of human intervention in this evolutionary process- however tarnished we might think it is.

The 2006 National Park Services Management Policies states: The National Park Service will preserve and protect the natural resources, processes,

systems, and values of units of the national park system in an unimpaired condition to perpetuate their inherent integrity and to provide present and future generations with the opportunity to enjoy them. (Emphasis added). I believe these words make a strong case for the protection of the system or process of change- of evolution, even if it means by not intervening we might lose a species.

Perhaps seen as weakening my own argument, I will add that the same policy document makes clear that native species extirpated by human action shall be restored. Unfortunately I'm not aware of any park document that provides guidance or establishes protocol for dealing with species extirpated due to indirect human phenomenon such as climate change. And to the best of my knowledge, park service documents provide no clear guidance as to the appropriateness of intervening to rescue a species as opposed to restoring a lost species. This is the new ground we as conservationists must find our way through. This isn't going to be the only such dilemma we face as climate change increases its impact on the globe and humans continue to encroach into our shrinking wildlands.

Regarding the human-caused presence of parvovirus- that is the argument I see as having the strongest legs in this discussion. However, looking at the wolf and moose numbers before and after the occurrence of parvo and up to about 2010, it seems wolf numbers remained in the 20 to 40 range with one or two years exceeding 50. Clearly, in the past 5-6 years wolf numbers have plummeted, but the strongest, proximal culprit still appears to be inbreeding as evidenced in large part by the observation that since 1994, every wolf skeleton found on the island has shown significant abnormalities.

As mentioned earlier, recent genetic analysis suggests that the remaining wolves all descended from a single female. Additionally, at least twice single males have immigrated to the island (1967 and 1997), and contributed to the populations genetic diversity, but to no long lasting benefit.

During the same period moose numbers fluctuated widely- as they did before the arrival of wolves. The literature suggests that part of the more recent fluctuations can be attributed to severe winters and above normal summer temperatures accompanied by heavy winter tick infestations. And, of course, there is the predatory role of wolves. A publication by M. Nelson, R. Peterson and J. Vucetich (2008. The George Wright Forum. Vol. 25, No. 2) concludes that These discoveries (50 years of moose-wolf interactions on Isle Royale) suggest wolves are the proximate, but not ultimate, cause of most moose deaths. The article went on to say that: That is, wolves seemed to have relatively little impact on moose abundance. And last, the article stated that: Most importantly, most of the fluctuations in moose abundance are attributable to factors that we have yet to identify. I don't pretend to say that wolves are not a major factor in lives of Isle Royale moose, only that they are far from being the only, significant factor.

With ongoing climate change, future environmental factors may have even greater impacts on the moose population, particularly as the islands average temperature increases causing habitat shifts from boreal forest species to temperate forest species with the potential loss of balsam fir, an important winter food source of moose. This is a trend already being noticed on the island. In nearby northeastern Minnesota the moose population has recently plummeted primarily due to parasite infestations augmented by warming climate. A similar situation is occurring in northern New England where declining moose numbers are tied to rising temperatures and a huge increase in winter ticks. Consequently, the Isle Royale moose population may very well undergo a decline- or extirpation caused more by environmental changes than by the presence or absence of wolves. Or stated differently, importing wolves to Isle Royale may contribute little to the long-term survival of the islands moose population. In fact, under the worst case scenario doing so could hasten their demise.

I have very reliable information that the park service recently ran five population models with various scenarios, four of which predicted that moose would go extinct on the island with or without wolves while the fifth predicted a drastic fall in numbers, although perhaps not extinction. The point is that if current environmental trends continue, the Isle Royale moose population will very likely drop significantly if not completely die out. What do we do then? Begin limiting wolf numbers in order to increase moose survival? Import moose to augment their population? Where does this end?

Climate change is certainly largely due to human activities, but to use climate change to drive a decision as significant as this is wrought with unintended consequences. I say this because if we open this door, where does it lead us: do we attempt to modify the islands habitat in response to climate change by planting balsam fir even though the species can no longer compete with the encroaching temperate deciduous forest species? Do we somehow manipulate the terrestrial environment or even the moose population so that they can better adjust to warming temperatures, regardless of the direct impacts of disease and parasites- or the absence of wolves? Where is the wilderness or naturalness then?

I understand the emotions and share the desires to keep wolves on the island to keep the systems operating as we know them, to hang on to the conditions of yesterday when the island was dominated by moose-wolf interactions. But then what? Does it, as many prominent biologists admit, cause us to adopt a long-term plan of importing wolves every time inbreeding shows its deadly head? That is not sustainable, that is not natural and that is not wilderness.

Science is critical in any environmental discussion, but so too is the rule of law and the authority of existing regulations. Isle Royale functions under the authority of the park services Organic Act, its enabling legislation, Directors Orders etc , AND the 1964 Wilderness Act. The parks web page states that The purpose of Isle Royale National Park is to: (1) Preserve and protect the parks wilderness character for use and enjoyment by present and future generations. (2) Preserve and protect the parks cultural and natural resources and ecological processes. (The next two purposes deal with the publics recreational and educational opportunities.) And the last purpose listed- (5) Provide opportunities for scientific study of ecosystem components and processes, including human influences and use, and share the findings with the public. Clearly, these purposes can be interpreted differently. For me, the need to protect the wilderness character and on-going ecological processes stand out. I say, continue to document the changes and share the (tragic) results with the public. Yes, results that could make Isle Royale one of the first, dramatic examples of the consequences of societys refusal to act on climate change.

Many scientists and wolf proponents state that a reason to import wolves to the island is to continue the 50 year wolf-moose interaction research. That could be seen by some to be just a few words short of saying wolves need to be imported so someone can maintain their job. The proponents likely don't mean it that way, but proposing an action as precedent-setting as importing wolves to a national park in order to keep a research project going seems inappropriate. Plus, once wolves are imported, the resulting research reports will always have to include a bold asterisk explaining that at some point the system was deliberately altered by the importation of X-number of wolves from the mainland. The resulting data would not represent information from a continuing, natural predator-prey study, but rather it might best be described as a before and after intentional human intervention study. And again, how long will it be before additional wolves have to be imported to again avoid the perils of inbreeding? When does this wolf population shift from being free-ranging to becoming a routinely manipulated population experiment in a natural island impoundment? Where is the wilderness and naturalness then? Importing wolves may provide a short-term fix, but it is not a long-term solution.

The argument is made that with climate change, ice bridges are occurring far less frequently, and therefore the chances of wolves naturally immigrating to the island are diminished. That makes sense, but if I'm reading the most recent information correctly, the past two winters have seen ice bridges form in Lake Superior. And apparently, two wolves from the mainland did get to the island this past February (2015), but after spending 6 days wondering about they returned to the mainland. Their departure is truly unfortunate, but apparently all natural. If we are willing to physically import wolves, should we not have tried to entice these two wolves to remain the island? I say this rather tongue-in-cheek, but doing so could be seen by some as being half natural while physically importing wolves is totally unnatural. And then there was the recent case where the ice bridge allowed one female to leave the island and

migrate to the mainland. In the future do we haze wolves away from such behavior?

Many make the case that the reintroduction of wolves into central Idaho 20 years ago occurred in a wilderness area, so why not do the same on Isle Royale? There is a significant difference between the Idaho reintroduction and the Isle Royale situation. First, wolves were very deliberately removed from Idaho decades ago whereas if Isla Royales wolves die off it will be due only in part to unintentional human actions (parvo and climate change). Reintroducing wolves, or righting an earlier wrong, as was the case in Idaho (and Yellowstone Park) seems compatible with the intent of the Wilderness Act which repeatedly states the need to preserve wilderness character. The Act considers the restoration of native wildlife populations that have been depleted due to human actions as compatible management actions.

The Wilderness Act also recognizes that natural processes and fluctuating populations are important components of wilderness character. Unfortunately, as with national park policies, the Act does not differentiate between intended and unintended human actions, or the degree to which either supplements natural events. Nor does the Act give guidance as to what human actions, if any are appropriate responses to such events. That seems to be where we are with the Isle Royale issue. (Perhaps existing case law can shed some light on these questions, I just havent taken the time to begin that search.)

I point all this out only to say that I can look at the circumstances and make an argument for leaving events play out without additional human interference. It becomes a personal value call and I respect the well-reasoned opposing positions. What I fear most is the precedent that would be set if wolves were imported into a national park of which nearly 99 percent is a designated wilderness. I worry that this could set a disturbing precedence for the next wave of wilderness challenges looming on the horizon: do we begin planting disease and beetle resistant whitebark pine into Greater Yellowstone Ecosystem wilderness areas to augment the grizzly bears fall diet? Do we try and fabricate some method of cooling our mountain streams in order to maintain our native cutthroat and bull trout populations in our parks and wilderness areas? Or some similar scheme- perhaps cloud seeding in order to ensure deep snows at high elevations to prolong summer run offs, or to support wolverine populations?

We can all add to this list of forthcoming challenges brought on by human-caused climate change. My fear-laden questions are simply these: does the trammeling brought on by human-caused climate change justify more trammeling? Do drastic interventions that may at best prolong changes in ecosystem mechanics then allow the climate change deniers to say see, humans can fix these problems without having to address the root causes, thus delaying the real work that needs to be done now?

And once we begin making exceptions to the provisions of The Wilderness Act, we weaken our defense to those arguing that because no landscape is now free of human trammeling, we should do away with the concept of wilderness all together. Or, how do we argue against those pushing to open up wilderness areas for other activities such as mountain biking. If you are not aware, there is a new Colorado-based organization, The Sustainable Trails Coalition, whose sole purpose is to amend The Wilderness Act so as to allow mountain bikes, chain saws and wheelbarrows in wilderness areas. Where does this end?

The Wilderness Act and the wildlands they protect are under attack like never before. I will defend wilderness because I strongly believe we need intact ecosystems and large contiguous, undisturbed habitats where species can survive by their own wits, with minimal human interference. If we dont maintain the integrity of our wilderness areas, we weaken the heart of our wildlands, and by so doing; we jeopardize the very landscapes all these species require for their survival.

Likewise, I will defend national parks and their charge to allow natural systems to play out, and their authority to restore native species. However, in the case of Isle Royale and its wolf population, importing wolves will almost certainly not be a one-time event, and even if repeated many times, it may still fail in that the wolfs major food source- the moose may go extinct on the island with or without wolves.

I also understand the problem the park service has had, and perhaps still has with The Wilderness Act. Of all the land management agencies, the park service has had the most difficult time embracing this legislation, certainly in the lower 48 states. I dont know what to say other then I wish it werent so and I hope it isnt part of this Isle Royale issue.

Humans have contributed indirectly to the problem facing the Isle Royale wolves, but it is inherently difficult to retain genetic diversity in isolated island ecosystems, particularly for an apex species such as the wolf that evolved to exist at very low densities spread across extremely large landscapes. This strategy ensured genetic diversity through connectivity even for this naturally low-density species. It appears that the Isle Royale wolves were never, even at best of times, a part of a larger wolf habitat or population. And now their prospects for diversity through connectivity, looks even worse. Available information would suggest that the past 60 years were an anomaly, not a period of normality for the islands very long history. This has even lead some to questioned whether or not wolves and moose are true natives to the island.

This is by far one of the most difficult questions I have faced, but for now I support protecting the wilderness character of Isla Royale over manipulating the islands wolf population. I dont like it either, but this is why I stand where I do on this issue. I dont expect many to change their minds, but I hope we can agree to disagree- with respect.

Correspondence: I Support Alternative A which is to take no action. The wolves should come and go based on natural migration. It should be left to nature and the animals to decide. Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Thank you.

Correspondence: The Sierra Club North Star Chapter strongly supports Alternative A. Isle Royale is a designated Wilderness area, and therefore it is to be left untrammled. Manipulating wildlife populations interferes with natural processes and is counter intuitive to the legal mandate of an untrammled Wilderness area. Human reintroduction of wolves will only result in the same isolation problems of the past. The no action alternative is the best fit to preserve Isle Royale's unique Wilderness area.

Correspondence: I believe Alternative D is best in this situation. I think NPS should continue current management allowing natural processes to control the wolf population in this Wilderness Area. The two wolves may migrate elsewhere, or new wolves may migrate in like they did before. I think NPS should have the means to bring wolves to the Island in the future to reduce in-breeding if certain conditions of prey are met so that the species will survive there. If the moose population does not decline to where it is listed as a threatened or endangered species, then wolves could be transported there. I believe in giving the NPS the scientific means to monitor this island and using good judgment to maintain this pristine wilderness island. The island should not be populated with wolves because tourists wish to hear them howl at night.

Correspondence: To me the issue of whether or not the National Park Service should intervene to maintain a population of wolves within Isle Royale National Park is not ultimately a question for science to answer, but rather a matter of human preference and will. It is a cultural question.

But if the best science was to be the primary deciding factor used to maintain the wild natural character of the island, I hold that the most obvious conclusion would be to let the wolves disappear from the island. Island biogeography is defined by booms and busts, comings and goings, peaks and valleys. Should the wolves disappear the island will find a new albeit altered "balance".

And then there is the different argument, also based in the language of science, that Isle Royale needs park managers to release wolves on the island to preserve the current perceived ecological equilibrium. Most of Isle Royale was designated as Federal Wilderness in 1976, which means it is to be managed to retain "its primeval character and influence...affected primarily by the forces of nature". Releasing wolves would be a force of human will, not a force of nature. Using the language of science to justify releasing wolves is simply employing coded and indirect language to justify a personal or cultural vision for what Isle Royale's wilderness should look like. If we craft the wilderness to our image, to me it will signal a collective surrendering of hope and an abandonment of humility, as if to say, Nature, step aside, you can no longer care for yourself and we know what is best. So let's acknowledge that what we are debating here is the aesthetic of the wild and, ultimately, the desires of the human heart.

I prefer my wilderness in its least-curated form, thank you, even if that means wolves disappear from the island. To see the wolves go, however, would not come without an element of sadness for me. Some of the most powerful moments of my life have been with wolves on Isle Royale: following fresh tracks in the sparkling February snow; falling breathless and silent around the camp stove to listen to a pack howling in the distance; exchanging burning stares across a lily-strewn dark water beaver pond. The wolves' presence is electrifying and intoxicating. I wish they could cling to the bedrock and swamps of Isle Royale forever.

In this story, my love for wolves is surpassed only by my love for wild places—the unpredictable order of the wild—where humans exercise restraint in controlling and sculpting the natural world that sustains us. While humanity's fate is intertwined with the health of nature, and we must learn and practice more sustaining ways of caring for the land, water and air we occupy, we must also let places like Isle Royale be wild and free. We must honor the natural cycles of this insular wilderness. When we enter wild spaces we are able to experience true stillness, reflection, perspective and solace. It is in places like Isle Royale where we are able to connect to the purest sense of who we are and where we came from.

There is no question that we live in an extraordinary and uncertain time of environmental change. Through climate change and atmospheric pollution, wilderness everywhere is changing. But despite a warming planet, and theoretically fewer opportunities for new wolves to reach the island over winter ice, in both 2014 and 2015 ice bridges formed between the mainland and the island. In 2014 a resident Isle Royale wolf left for the mainland never to return. And in 2015 two mainland wolves walked to the island, sniffed around for six days, then set out across the ice again back to the mainland. Migration stories such as these—surprising, elating, and unpredictable—stories are all rooted in the context of a hands-off management approach. Bringing wolves to the island changes the context, and therefore the meaning and impact of the stories yet to unfold. For me, the wild character is diminished if we are tampering with the make-up of the living community.

The brief 65-year tenure of the wolf on Isle Royale is ending because of genetics, not because of human-caused environmental changes. Wolves are disappearing because Isle Royale is an isolated island in the middle of the world's largest lake, an island so wild even the wolf—one of our greatest symbols of the wild—can't hold on.

Correspondence: I've only read the first line and it stopped me. NO, I DO NOT BELIEVE TRANSPLANTING WOLVES OR ANY OTHER PREDATORS WORKS. Therefore, I am against transplanting wolves in this case. I live in N.M., adjacent to national forest. Any bears I've seen "transplanted" have returned. Wolves and other predators need hundreds of sq. miles to wander...to consider their territory. We, humans are the ones who need to accommodate the predators....not the other way around. THEY BELONG - WE DO NOT.

Correspondence: To Whom It May Concern: National Park Service concerning Isle Royale and their remaining 2 wolves:

As you are aware there are four alternatives that will be voted on concerning the present state and issues on Isle Royale. First I wish to display the choice in which I've chosen: quote: Im in favour of the following for many reasons: Alternative C

The NPS would bring wolves to Isle Royale as often as needed in order to maintain a population of wolves on the island for at least the next 20 years, which is the anticipated life of the plan. The wolf population range and number of breeding pairs to be maintained on the island would be determined based on best available science and professional judgement. This action would occur as soon as possible following a signed record of decision.

QUOTE: Although wolves have not always been part of the Isle Royale ecosystem, they have been present for more than 60 years, and have played a key role in the ecosystem, affecting the moose population and other species during that time, plus were an expected tourist attraction.

The situation on Isle Royale is one of the most fascinating ones I've been following for quite some time. My hope is that due to only 2 wolves remaining as of 2016 and of course earlier, plus the overpopulation of moose, the two wolves should be removed and possibly cared for in retirement on the mainland. The overpopulation of moose will continue to overgraze and over populate, plus it's quite possible that deer have made it across to make matters worse. This has been an ongoing scientific debate and study for decades and if something should happen to one of the remaining two, the other one could not make it alone, nor should have to after so many decades of study. The humane decision is to first remove them now and perhaps as stated allow them to live out the rest of their lives in a sanctuary environment as a humanitarian rescue. I feel that at least 3 or 4 healthy packs (between 5 and 6 individuals) of wolves with strong DNA genes should be reintroduced to the Island now before the next winter season. In the following year another 2 packs could possibly supplement the Islands newer packs. This past year a few wolves from the mainland supposedly made it to the island, but turned around heading toward the mainland. This decision shouldn't be put on hold any longer for the sake of the two remaining male and female as they shouldn't be mating as it only resulted in deformed offspring and an unhealthy outcome that will never be rectified. I believe further packs of wolves would make a difference in reducing the now overpopulated moose herds. When reading about the tick problem, I'm just wondering if this has lead to the demise of so many wolves as it can be fatal and even the moose which number in the range of approx. 1400 are most likely plagued with ticks. Due to a certain type of tick, the blacklegged tick of Ontario described at: <http://health.gov.on.ca/&/pu&/publications/disease/lyme.aspx> https://www.researchgate.net/publication/258797417_Fatal_acute_babesiosis_in_captive_grey_wolves_Canis_lupus_due_to_Babesia_canis (references purposes only)The site described is very detailed in it's medical/veterinarian findings, but there is also a worldwide tick described and discovered after 2 Eurasian male wolves were found dead and a necropsy was performed...they both had enlarged spleens, as well as the gallbladder and kidneys and subcutaneous tissues plus haemorrhaging under the facia. It was determined that both wolves suffered from Fatal acute babesiosis in (Canis lupus) due to Babesia canis. Im not saying this was the cause of demise for so many wolves in the past few years, only an observation.

I have read comments from last July, 2015 where they too have suggested that reintroduction is the only way to solve this problem at present. After a year the same questions have been put forward once more. This year should be the year to consider such action and not wait any longer. The Isle Royale study has continued for over 60 odd years, but biologists must have learned from it and feel that due to many circumstances it warrants a reintroduction after all these years. If there were healthy packs of wolves the overpopulation of moose would once again diminish rather than augment as is the case. Its also been stated that deer made their way across last winter and most likely will remain.

Its a difficult task for the two remaining wolves to take down a moose, and risk injury unless a calf was targeted. Its a chore for them and they will weigh their chances to take down any unless the moose are ill or weak or old. Its a sad situation all around, but Isle Royale has been studied since the 50's and there were over 50 wolves at one time. For an area of approx. 894 square miles, it seemed(s) the perfect spot for them.

In addition, quote: an ice bridge formed again this past winter for the second year in a row, and a pair of wolves crossed the ice bridge from their home range on the Grand Portage Indian Reservation and traveled about 14 miles to Isle Royale. The pair explored the island, but did not stay, returning to the mainland five days later.

Not taking immediate action is a cruel fate for these two wolves as neither one could survive on their own. They are now 9 and 7 which is a normal but dangerous age for wolves, although they do not have other packs to challenge for territory. One could not survive on his/her own if an incident or illness takes either wolfs life. In this situation, it is a fate worse than death for the other.

Most comments submitted on this issue are leaning towards reintroducing more wolves (individuals) to Isle Royale which is totally suggested and required , but they need to take into consideration the remaining two and their age. If other packs were reintroduced, yearlings would have an opportunity to disperse in order to locate a mate from another pack. One pack will not do when it pertains to this scenario, but a few could. Ive studied wolves for 20 years, not formally of course, but via many books, documentaries, groups as well being a member of ██████████ Park and approx. 16 years membership with the ██████████. I usually investigate ALL issues concerning wolves and their lives and of course the manner in which they have been persecuted endlessly. That of course is never ending to attempt to advocate in a plethora of ways possible and attempt to teach others on the importance of wolves. Im involved as an ██████████ with a group entitled ██████████ which has exceeded 27,100 members at present. These obviously are not proper qualifications to judge the outcome of this study, but studying wolves from a distance and learning a great deal about them not only in North America, but around the world makes one want to express how they feel on this pressing issue. Im sorry for the length of this comment, although I had to delve into as many aspects as possible which obviously Park Service is already aware. I wish to make an additional comment which is more of a question which is while the comment page requires where one lives, I obviously displayed Canada, but in another drop down menu, the province choice was not available, thus I had to use the N/A option, as well I added my province (Ontario) after my city. Thank you for your time and allowing such a lengthy comment which I hope proves positive for all involved. On another note, I feel the public should be involved in some way (optional of course)not hands on per se, but monetarily to be a part of a historical event/decision. This of course would be left up to the individual to donate to a great cause.

Correspondence: I would like to voice my opinion that the NPS should choose Alternative A. Alternative A is the only alternative that honors and upholds Isle Royale's Wilderness status.

Wolves have inhabited Isle Royale for only a tiny fraction of post-glacial time. Their recent presence on the Island is more an anomaly than the norm in the Island's very long history, but in any event we should let the wolves decide if they want to live there.

Even if the current wolf population dies out and no new wolves take up residency, we can learn much more by studying the ecological responses to the loss of wolves than by artificially inserting another wolf population on the island to continue what has been a "natural" predator-prey study.

Correspondence: I am sure this decision making process must be difficult with all of the emotions and special interests involved. As I offer my opinion on this subject, I would also like to wish you all the best of luck as you weigh your options.

I am in favor of option A (hands off approach)
(Please Read Why)

I believe a literal interpretation of the NPS guidelines and the Wilderness Act should be fully considered. Artificially introducing wolves to IR (as was previously attempted in the 1950s via the Detroit Zoo) would go against the conservation of the "natural" history of the island.

Using NPS policy and the Wilderness Act as my guide.

- Scientific value?

The wolf/moose study, although informative, has run its course. We now know why there is no archeological, cultural, or historical evidence of Wolves on IR prior to 1949. They cannot survive long term on an isolated island environment. As the forest continues maturing, the boom and bust cycles of the moose population are going to get worse (young forests are more suitable for moose). These lower moose populations, especially during bust cycles, will cause rapid declines in the "pet" wolf population. This will accelerate genetic bottlenecking, and lead to the inhumane suffering and inevitable demise of the introduced wolves. Do we really want to be stuck choosing between forced inbreeding and indefinitely supplementing a "non native" wolf population in a national park and wilderness area?

Also the research seemed to almost exclusively focus on the wolves, with little attention paid to the moose. I cannot find any published studies on the genetic origins or original herd size (common ancestry) of the Isle Royale moose population (both of which could help better answer the question as to how moose really got to the islands in the first place!)

This is an opportunity, to focus any scientific study on the moose, the environment, and the natural history of the islands.

-Educational value?

For educational purposes, it would be best to teach the islands "natural history" and use science to better understand that natural history so it can be more accurately explained. Turning it into a zoo for a species incapable of survival on IR serves only one educational value (teaching what not to do).

- Historical Value?

Wolves serve little historical value to an island in which they only have a 60 year history. Most zoo animals have longer histories than that. The long running study is the most important historical value and there is no need to do it again, this time 100% artificially.

- Conservational Value?

Wolves are neither endangered nor threatened in any adjacent mainland (unlike woodland caribou). They have had opportunities to naturally migrate and their instincts told them to go back to the mainland. All that is left to conserve is the myth that they are part of the island ecosystem, "left as it was, untrammelled by man." Most have no idea they were not on the islands all along! Some seem to think they are some kind of subspecies on the verge of extinction! Forcing more of them to live on the island serves only to further miseducate the public

Chapter 6 on Wilderness Preservation and Management

"Allow natural processes insofar as possible to shape and control wilderness ecosystems"

However

"To the extent necessary correct past mistakes"

Any action, other than option A only serves to perpetuate past mistakes.

NPS policies for restoration of "NATIVE" species:

- Historical presence?

Unknown prior to 1949.

This area WAS a pristine wilderness with a functioning ecosystem for 3500 years, the recent "brief" wolf colonization and subsequent extirpation hardly constitutes a historical presence.

-Role of Humans in its extirpation?

The population received a genetic infusion in the 1950s from wolves introduced from the Detroit zoo, contributing to their longevity on the islands.

This is to complement the Center for Biological Diversity's comments that were submitted to the National Park Service on Aug. 29, 2015 for the previous scoping period on management of wolves, moose and vegetation in Isle Royale National Park. The Center is a national, 501(c)(3) organization dedicated to protecting and restoring endangered native plants and wildlife and their ecosystems. Many of our million-plus members and supporters have visited Isle Royale National Park, in part to experience an ecosystem shaped by trophic cascades induced by wolves. Indeed, Isle Royale's wolves have helped teach scientists how ecosystems function.

The Center for Biological Diversity continues to support Alternative C - translocation of wolves to ensure the persistence of the island's wolf population through the planning period of 20 years. (footnote 1)

Some commentators in last year's scoping period argued that translocating or reintroducing wolves to Isle Royale is not natural and thus, they suggest, inimical to the 1964 Wilderness Act. They point out, for example, that Isle Royale previously supported caribou, lynx, coyotes and spruce grouse - all of which no longer inhabit the island, and that wolves are only known to have existed on the island since the 1940s. Yet, the fact that some species have disappeared from the island and are not considered at the present juncture for reintroduction has no bearing on the propriety of wolf reintroduction; to paraphrase the title of Edward Abbey's last book of essays, "One Life At A Time, Please," here we must exclaim: One species at a time - for that is better than none.

At least one critic also opposes the reintroduction of wolves to Isle Royale National Park by distinguishing the inadvertent causes of wolf extirpation from the park from the purposeful reason that wolves were extirpated in the northern Rocky Mountains, where, according to this line of argument, the 1995-1996 reintroduction of wolves to central Idaho and to Yellowstone National Park was justified because deliberate human action caused the original loss of the wolves. In contrast, human actions bereft of malice, such as those that cause global warming, which increasingly prevents formation of an ice bridge from mainland Canada to Isle Royale, supposedly do not suffice to justify wolf reintroduction to the island to make up for the loss of ice which the wolves could otherwise utilize. (Additional anthropogenic causes of insufficient wolf immigrants to the island may lie in the destruction of the ice bridge to the mainland through the use of ice-breakers, and the persecution and diminution of wolves in southern Canada that lessens the likelihood of a dispersing wolf heading to Isle Royale even when the ice bridge is present.) However, the naturalness of wolf reintroduction does not hinge on whether the effort seeks to correct an intentional or inadvertent set of human actions.

Moreover, abstractions such as whether wolves would be unduly prioritized over other species in restoration, and thus whether wolf restoration reflects an arbitrary human value system, or whether humanity intended to harm the wolves of Isle Royale or not, do not implicate the Wilderness Act in proscribing or even frowning up translocation of wolves to Isle Royale National Park. In 1995, wolves were translocated to and released at the edge of the Frank Church-River of No Return Wilderness Area in Idaho. And at various times since 2000, Mexican gray wolves have been released within the Gila Wilderness Area in New Mexico. The Mexican wolves were packed deep into the Wilderness in specially-designed panniers carried by horses, and then placed in temporary mesh enclosures constructed within the Wilderness and later removed. As these and other precedents to the contemplated instant action suggest, the Wilderness Act, which bans construction of roads and operation of motors within designated wilderness areas, was never intended to proscribe reintroduction of native species.

Thank you for your consideration.

Sincerely,

Footnote 1: We note our frustration that the National Park Service chose to disregard our advice from almost a year ago to expedite and simplify the NEPA process greatly and begin to translocate wolves into Isle Royale during last Fall or Winter. Had the park service done so, the last two or three surviving wolves on the island might have had mates and passed on their genes and their multi-generational knowledge of the island. The park service's inaction is particularly galling since, as we explained last year, the agency's 2006 management policies authorize and even mandate wolf conservation, the 1998 Isle Royale General Management Plan suggests a responsibility to conserve the wolves, and a simple environmental assessment would have sufficed to take action. The park service's refusal to act over the past year is the latest manifestation of several years of unconscionable delay while scientists warned that the wolf population would not survive.

Correspondence: Dear National Park Service,
I believe the NPS should put alternative C into effect as soon as possible. This plan lends to a more diverse and healthy wolf population, with support from humans as needed. Having a sustained and stable wolf population will keep the moose in check, helping with overgrazing on the island. With the least risk of severely changing the balance on Isle Royale, alternative C is the best course of action for the island and wolf/moose relationship. I believe this choice is the best option available to the island and everyone that visits, along with the animals living on the island. As a concerned outdoor citizen of Michigan, I would like to see this alternative chosen. Thank you for your consideration. Respectfully yours,

Correspondence: I had to voice my opinion on the subject of introducing more wolves to Isle Royale. It would be a tragedy if the wolves were not brought back. Letting nature take its course, is not an option here. Man has influenced events on the island for hundreds of years. It needs our help now. Bring the wolves back! Use your common sense! Listen to Rolf and Candy Peterson. They are the experts! They know more on the subject than any politician!

Correspondence: Dear Sir or Madam:

I recommend Alternative C, bringing wolves to the island as often as needed.

Alternatives A and B would allow damage to the island ecosystem from high moose numbers, and D would simply delay the introduction of wolves which is needed now.

A single (one time) introduction is inadequate as this small isolated population will always be subject to inbreeding and genetic drift.

Furthermore, this action is needed as the "naturalness" of the system has been and is being severely compromised by a warming climate, which now makes ice bridges to the mainland increasingly rare, making the entry of new wolves to the island unlikely, and if it did occur, inadequate to maintain a healthy population.

Thank you for the opportunity to comment on this important matter.

Sincerely yours,

Correspondence: We support Alternative C for the Moose-Wolf-Vegetation Management Plan and Environmental Impact Statement (EIS) for Isle Royale National Park.

This plan would bring wolves to Isle Royale as often as needed in order to maintain a population of wolves on the island for at least the next 20 years, which is the anticipated life of the plan.

The wolf population range and number of breeding pairs to be maintained on the island should be determined based on best available science and professional judgment. We support this option as it allows for maximum flexibility and presents the best long-range view for the health of Isle Royale National Park's ecosystem. Evidence suggests that the few wolves on the island will not be able to keep moose populations in check, which will further degrade the island's vegetation.

Without wolves, Isle Royale will become a site of starvation, disease and death. Thank you for your consideration.

Correspondence: I am in favor of Alternative A. Most of Isle Royale is a wilderness area and should be treated as such.

In regard to the wolf moose study, if the wolf population disappears then part of the study would be to see what happens when there are no wolves there.

Without a wolf presence the ecosystem would revert to the natural wilderness state it was before the wolves migrated there.

If we interfere with the natural process it is no longer a wilderness but a managed park/zoo.

It is possible wolves may naturally migrate to the island as has happened before. With the cycles in climate there would likely be ice bridges again as happened last year.

We should let nature take its course.

Added thought:

In a wilderness area, are we to define what the ecosystem should be like or do we let nature take its course? If we don't it is no longer a wilderness.

Correspondence: Dear Sir or Madam:

It came to my attention that you now only have two wolves surviving in your park. I have signed a petition asking that you do all you can to save those wolves.

I would like to suggest a couple of places where you may be able to get more wolves to populate your park. I know through emails from Defenders of Wildlife coming into my account, that wolves are being routinely killed out in the western states. Idaho and Wyoming are even gassing the dens to kill pups. Also in Chattanooga, TN, the Reflection Riding Arboretum & Botanical Gardens organization is breeding red wolves in an attempt to help save them from extinction. I am hopeful that you can contact these sources to obtain wolves for your park.

It would be a pleasure to visit your park in the future. I look forward to getting back up to Upper Michigan one day. Good luck in your attempt to save wolves!

Sincerely yours,

Correspondence: Dear Superintendent Green:

My seasonal ranger-husband, [REDACTED] at Malone Bay on Isle Royale National Park the summers of 1970 and 1971.

At that time, the Isle Royale wolf pack made an attempt to leave the island. Since that "failed" attempt, the wolf and moose populations together have been

an unnatural existence.

Therefore, it has been an adulterated study from the start. It has been more of a study to see how many generations it would take for the unmerciful genetic failure of a sequestered species.

I would recommend that this pack be allowed to totally die out. I do not recommend a reintroduction of more wolves. If they want to come, let them, on their own. But let the islands mend themselves. Let the soil rest, unnatural pests die out, and the wolf-moose cysts become less prevalent. Let the moose be self-regulating, healthier. Let them leave the islands if they wish as they are tremendous swimmers, or self-limit their population to the quantity of food.

Please allow the islands to take on their own persona. Let the wolf-moose relationship be a part of the history like the native visitors and the copper. Study the islands for their great changes that are arriving there due to climate change. Extoll the incredible geology. Enjoy the islands for their raw beauty and challenge. The relationship between the islands and Lake Superior is exhilarating. Consider all that exists there, naturally.

Please do not allow a relationship between wolves and the moose to continue on Isle Royale.

Sincerely,

Correspondence: To whom it may concern:

I urge the National Parks Service to reintroduce wolves to Isle Royale for many reasons. How sad to see one pair of wolves and their unhealthy pup as the only wolves left in Isle Royale. It appears symptomatic of a landscape that needs to be brought back to a healthy balance. Bringing back wolves will help to reestablish that healthy eco-system. It will enable researchers and scientists to study the interaction between predator and prey in another controlled environment as they are doing in Yellowstone. Bringing wolves back will be a wonderful educational opportunity for families with their children, animal lovers and the general public to come to see and hear wolves. This would be a significant and worthy resource to help get visitors back to enjoy our parks. Wolves back in Isle Royale will help to teach the public about the important role they play in a healthy ecosystem, foster public acceptance and appreciation of our natural landscape. It's a vital step in enlightening the public in social tolerance and the acceptance of wolves.

Thank you.

Correspondence: I think the Park Service should do nothing in regards to the wolf situation on Isle Royale. If the island is to be a true wilderness area, it should be allowed to find its own solution to the wolf problem. The moose might dwarf down as an island species or fall prey to the same inbreeding problems as the wolves. One way or another an ecosystem will develop. It may not be the lovely "Disney" wilderness that everyone loves now, but it will be unique to Isle Royale. It's not often that we get a chance to see what happens with a problem not caused by human intervention.

Correspondence: Dear Sir:

Thank you for this opportunity to comment and select an alternative regarding future wolf management within Isle Royale wilderness.

I strongly request the no action alternative, alternative A to be the only choice. Please take no manipulative actions with wolves in accordance with the intent of the Wilderness Act Statute of 1964.

Wilderness is the one place in America where the hand of man is absent and it must remain that way to be wilderness. To chose otherwise opens the door to unintended consequences and likely the ultimate unraveling of the wilderness act in its entirety. Let us not be responsible for that, please.

I believe wilderness managers are special people with a challenging job. I also believe wilderness oversight should come from a two person cabinet level position within the White House and wilderness rangers should be among the highest paid positions in our government. Please select the no action alternative for Isle Royale wolves. Let wilderness be true wilderness.

Thank you for reading my letter and carrying out my request.

Correspondence: To Whom It May Concern,
I understand the National Park Service's idea of being noninterventionist with the wildlife on Isle Royale, thoughtful but not realistic. NPS's idea of no human involvement in altering the environment is short sighted.

On the other side of thinking there is no reason to arbitrarily introduce or experiment with new species at this time, or immediately repopulate the wolves, though I would default to the knowledge of Dr. Rolf Peterson.

With regard to the Wolf/Moose study, is there more to learn? Can we apply learned events to help the current world?

Action D seems the most logical as perhaps others wolves could find their way, let's watch and observe the reaction of the two remaining wolves and observe all affecting aspects.

At some point of critical mass, again I default to Rolf Peterson's expertise, an introduction of (2) competing wolf groups could add value to the study between wolves and wolves and wolves and moose. I am no expert, I do not know what value the two remaining wolves have, but if their demise is apparent and they have apparent value, perhaps they could be moved onto the main land and be studied for their potential. Perhaps the (2) remaining wolves have some built-in radar remembrance system that would have them return one day with a new pack for a known food source. Perhaps the smell of overpopulated moose dying off would attract other wolf groups.

I appreciate the NPS, but sometimes their thinking involves self imposed "blindness". NPS does not consider the fact the wolves and moose likely found their own way onto the island.

In any event this island is a great study and to restrict human interaction is absurd. Our educated best deserve a place to continue their studies, elevating the knowledge of our world.

Correspondence Type: Letter

Correspondence: Dear Superintendent:

The U.S. Environmental Protection Agency received notice of a public scoping opportunity requesting feedback regarding the purpose, need, and range of preliminary alternative management concepts for the Moose-Wolf-Vegetation Management Plan and Environmental Impact Statement (EIS) for Isle Royale National Park (Park). This letter provides EPA's comments on the scoping document, pursuant to our authorities under the National Environmental Policy Act (NEPA), the Council on Environmental Quality's NEPA Implementing Regulations (40 CFR 1500-1508), and Section 309 of the Clean Air Act. Wolves have been part of the Isle Royale ecosystem for approximately 65 years. During that time, wolves played a key role in the ecosystem, affecting the moose population and other species as the apex predator on the island. The average size of the wolf population on the island over the past 65 years has been approximately 22 wolves, with as many as 50 wolves on the island. At the present time, only two wolves remain. Due to this decline, the National Park Service (Park Service) needs to determine whether additional wolves should be brought to the island. The Park Service believes that natural recovery of the population is unlikely. During 2015, the Park Service began its planning process by considering a broad range of potential management actions to manage moose and wolf populations for the next 20 years or more. Based on public comments received during 2015, the Park Service narrowed the scope of the EIS to focus on the question of whether to bring wolves to the Park in the near term, and if so, how to do so.

The scoping newsletter indicates four alternatives are being considered for analysis in the EIS: Alternative A, the No-Action Alternative -The Park Service would not intervene and would continue current management. Wolves travel to the island through natural migration, although the current population of wolves may die out.

Alternative B - The Park Service would bring wolves to the island as a one-time event over a defined period of time (e.g., over a 36 month period) to increase the longevity of the wolf population on the island.

Alternative C - The Park Service would bring wolves to the island as often as needed in order to maintain a population of wolves on the island for at least the next 20 years, which is the anticipated life of the plan.

Alternative D - The Park Service would not take immediate action and would continue current management, allowing natural processes to continue. One or more resource indicators and thresholds would be developed to evaluate the condition of key resources, which could include moose or vegetation-based parameters. If a threshold is met, wolves would be brought to the island as a one-time event or through multiple introductions.

EPA offers the following comments, categorized by topic, to help the Park Service prepare the EIS.

- clearly explain how wolves travelled to the Park historically and the chances of similar travel in light of climate change;
- clearly explain the cause(s) for the current low numbers of wolves;
- if wolves are reintroduced to the Park, from where will they be selected? Will an entire pack(s) be introduced to the Park?; and
- if wolves are reintroduced to the Park, will they be released using "hard" or "soft" release methods, similar to the releases in Yellowstone National Park in 1995?

Thank you for the opportunity to comment on the proposed project at its earliest stages. We look forward to receiving future NEPA documentation concerning this project. If you have any questions about this letter, please contact [REDACTED] of my staff at [REDACTED] or via email at [REDACTED]

Sincerely,

[REDACTED]

Correspondence Type: Letter
Correspondence: Final Position Statement: Wolf Restoration and Management in the Contiguous United States

Gray wolves (*Canis lupus*) were once distributed throughout most of North America, except possibly the southeastern U.S., where a different wolf species (*Canis rufus*) may have once lived. Wolf taxonomic theory continues to develop and the scientific debate on speciation will continue. We refer to 'wolves' as those designated as *Canis lupus* across North America, and include wolves of southeastern Canada and the eastern U.S., that some have recently referred to as *Canis lycaon*. By the 1970s wolves were deliberately extirpated from Mexico, nearly all of their historic range in the contiguous U.S., and parts of Canada and Alaska in deference to other social objectives, primarily livestock production, enhancement of big game populations, and human health and safety. In recent years, wolves have recolonized suitable habitat (e.g., typically areas with limited human development that are not used for intensive livestock production) throughout Alaska and Canada. Those areas now support > 70,000 wolves. Conservation of those secure wolf populations includes: monitoring, law enforcement, public outreach, research, and regulating human-caused mortality through public harvest, defense of property by the public, agency control to reduce livestock depredation and predation on wild ungulates, and mitigation of the potential threat to human health and safety.

In this position statement we address wolf conservation and management in the contiguous U.S. Wolves were listed throughout the contiguous U.S. by the 1973 Endangered Species Act (ESA). Wolves were restored by a combination of natural recovery and translocations in the Northern Rocky Mountains. In 2011, there were >1,700 wolves in a 3-part meta-population in Montana, Idaho, Wyoming; eastern one-third of Oregon and Washington; and a small part of northern Utah. Wolves recovered naturally in the Western Great Lakes. In 2011, there were >4,500 wolves in a 3-part meta-population in Minnesota (the only area in the contiguous U.S. where wolves were not extirpated): Wisconsin, Michigan, and parts of surrounding states. Both distinct population segments (DPS) of wolves in the Northern Rocky Mountains and Western Great Lakes are well-connected southern extensions of the wolf population in Canada. Wolves in the Northern Rocky Mountains, except in Wyoming, were delisted by Congress in 2011 when it reinstated the 2009 U.S. Fish and Wildlife Service (FWS) delisting rule that had previously been overturned in federal court. Wolves in the Western Great Lakes were delisted in 2007, but were returned to ESA protections in 2008 by court order. In January 2012, the FWS announced that the Western Great Lakes DPS of wolves had fully recovered and was healthy, leading to these wolves again being delisted. The wolf population in the southwestern U.S. resulted from translocations. For the past decade, the Southwest has contained about 50 wolves in a single isolated wild population, but several hundred others are maintained in captivity, all originating from only 7 founders. Recovery efforts in the Southwest are continuing but additional efforts over a larger area will be needed to achieve recovery. Suitable habitat exists in other areas of the Southwest and in Mexico. Wolves will continue to disperse naturally beyond the Northern Rocky Mountain, Western Great Lakes, and Southwest populations, but currently there are no other established populations.

While some areas of suitable habitat exist elsewhere, attempts to reestablish viable wolf populations outside of the Northern Rocky Mountains or Western Great Lakes through natural recolonization or by translocation will be more challenging due to human modification and fragmentation of once suitable historic habitat and no, or very limited, connectivity to larger secure wolf populations. Wolf restoration in the Northern Rocky Mountains and Western Great Lakes succeeded because of connectivity between secure wolf populations, there were large blocks of suitable habitat that could support persistent packs, agency management minimized conflicts, and adequate tolerance by local residents was achieved. That combination of conditions is uncommon elsewhere. Wolves do not need wilderness or protected lands to thrive, but they do best and there are fewer wolf-human conflicts in large blocks of wildlands that are not used for intensive livestock production.

The ESA played an essential role in restoring wolves to the Northern Rocky Mountains, Western Great Lakes, and Southwest; however, this legislation is not the most effective tool for long-term management of biologically recovered wolf populations or to conserve wolves in some areas where establishment of a self-sustaining population is unlikely. Thus, restoration and conservation of wolves beyond these three regions could be best achieved by localized efforts by states and tribes. Wolf conservation requires a variety of management efforts that range from protection in areas such as national parks, enforcement of the federal ESA to enhance recovery of listed populations, state and tribal management of resident wolf populations, and discouraging wolves from areas where wolf presence is not desirable due to unacceptable levels of conflict with humans. Wildlife management agencies should consistently inform the public that there are

areas where wolves have been restored and where some might be restored in the future (e.g. Cascade Mountain Range in the northwestern U.S.), but that in the majority of vacant historic range, wolf populations will never be restored to biologically sustainable levels.

Scientific inquiry can help provide accurate information about wolf biology and the likely effects of various management options. Science should be an important part of the complex process that human society uses to make decisions about wolf conservation and needs to include the human dimensions of wildlife management. While The Wildlife Society continues to advocate for the appropriate use of science in wolf conservation, it recognizes that all branches of government and many others with expertise (i.e., stakeholders) are involved in making decisions. Scientific expertise and data, however, should be clearly distinguished from advocacy positions and different human values in debates about wolf conservation.

The policy of The Wildlife Society regarding wolves in the contiguous U.S. is as follows:

1. Recognize that wolves occupy an important ecological niche and should be conserved in portions of their original range in North America where suitable habitat exists, natural ecological processes are desired, conflicts are minimal or can be minimized through management actions, and there is adequate public tolerance for wolf restoration.
2. Recognize the existence of wolf-human conflicts (e.g., domestic animal depredation, competition for wild ungulates with big game hunters, and concerns about public health and safety due to attack, diseases, or parasites) and that many wolf populations will require active management to be tolerated by local residents.
3. Encourage continued work with Canada and Mexico to maintain adequate connectivity with U.S. wolf populations and to support wolf conservation in all appropriate areas of North America.
4. Promote habitat conservation that sustains adequate space for the life history characteristics of wolves and their wild prey, including the establishment and management of areas (e.g., parks, National Wildlife Refuges, wilderness, and natural areas) where natural processes, including natural wolf population structure and predator-prey dynamics, would be encouraged, and where limited human-wolf interaction is likely.
5. Support wolf restoration and delisting, when appropriate, under the ESA in the Northern Rocky Mountains, Western Great Lakes, and Southwest and strongly encourage professional state and tribal wolf conservation programs to maintain viable wolf populations in those areas.
6. Encourage inclusion of the concerns from all stakeholders in wolf conservation issues and dissemination of scientific information regarding wolf conservation and management.
7. Encourage scientific agencies and organizations to clearly distinguish biology and science from issues that have an ethical, political, or legal foundation when establishing positions or providing information on wolf conservation and management.
8. Encourage adequate public and private funding to support wolf conservation, management, and damage control.
9. Recognize the ESA has limitations regarding wolf conservation and in many areas state and tribal agencies can be more efficient and cost effective in the conservation and management of wolves than maintaining federal-level protections.

Approved by Council May 2012. Expires May 2017.
