

Isle Royale National Park

Moose-Wolf-Vegetation Management Plan/EIS

Public Scoping Comment Period - All Correspondence Received

All correspondence received during the public scoping comment period is included herein. The NPS posed the following questions online and in printed materials. Any reference to topic questions or question numbers, is as follows:

- *Topic Question #1:* What other alternatives, alternative elements, or management tools should be considered?
- *Topic Question #2:* What issues should be considered when evaluating future management of moose, wolves, and vegetation at Isle Royale?
- *Topic Question #3:* What type and intensity of management should the NPS consider given that approximately 99% of the land area of Isle Royale National Park is designated wilderness?
- *Topic Question #4:* What type and intensity of management should the NPS consider in the face of a changing climate?
- *Topic Question #5:* What do you like and dislike about the preliminary alternatives?
- *Topic Question #6:* Please submit additional comments here.

Correspondence Type: Web Form
Correspondence: Topic Question 1:
The alternatives are complete enough as a starting point. The issues will be related to the details.

Topic Question 2:
The importance of Isle Royale moose in light of environmental changes that are having significant impact on moose populations that are not on Isle Royale. Isle Royale has a population of moose that will not see an influx of white-tailed deer vs Michigan and Minnesota moose that will.

Topic Question 3:
Use the principle of "minimum necessary", but in line with park goals as outlined in the Foundation Statement.

Topic Question 4:
Use the principle of "minimum necessary", but in line with park goals as outlined in the Foundation Statement, but also remember that the moose can offer significant data related to global warming without the impact of white-tailed deer.

Topic Question 5:
I like the fact that the list is complete. What is missing is the need for completed Foundation Statement prior to defining a plan.

Topic Question 6:
The public scoping meeting have been announced with too little notice to expect interested parties to be able to be part of the meetings. Please add an additional meeting a couple weeks after these dates, and not on Isle Royale to give us a chance to participate. I accept that this means to need to extend the comment period.

Your system failed to email me about the Nov 2013 meetings and you said it was because computer issues, or a change in responsibilities related to your computer environment. Again I have failed to receive an email notification of anything related to this issue, and I have been careful to make sure you have my email address. Please let me know why I was missed this time and ensure my email address is in your system for further notifications. Thank you.

Correspondence: Topic Question 1:
Please don't overthink this. New wolves will control the moose population and keep them from destroying the island's vegetation as the wolves have done for decades. If it ain't broke, don't fix it. The new wolves won't breed with the three remaining wolves so there is no earthly reason to wait to add more wolves to the island.

Topic Question 2:
The last three wolves on Isle Royale will soon be gone. They are unable to manage the large moose population. It is too late for a genetic rescue since the NPS has waited for the demise of the wolf population to decide if they should act or not. The wolves, moose and vegetation can continue as it always has If

we add a few new wolf packs to the park. I would also add that a canine disease introduced by humans helped to destroy the island's wolves so the demise of the wolf packs did not happen naturally. Wolves have a important job on the island and it is past time to act on this issue.

Topic Question 3:

As little as possible with exception to restocking the wolf population. Wilderness areas should not be "managed" by humans. Let the wolves manage the moose and everything else will fall into place. The wilderness areas should be left to evolve naturally.

Topic Question 4:

Act now rather than waiting several more years to see what will happen. It makes the most sense to add wolves now to keep the moose population in check and protect the island's vegetation and ecosystem. Climate change is happening and keeping the island in a healthy balance should be the desired goal of the NPS and the US citizens that collectively own the parks and wildlife.

Topic Question 5:

I like that the NPS has at least started to think about doing something to save the fragile ecosystem of Isle Royale.

I dislike the reluctance to act to resolve this issue on the part of the NPS. 1. Genetic rescue is no longer possible since almost all the wolves have died and last three wolves are not genetically healthy. 2. Doing nothing ensures the moose will overrun the island and destroy the vegetation they and other species need to survive. 3. The last alternative is the only alternative that makes any sense at this time and that is to restore balance to Isle Royale by adding more wolf packs.

Topic Question 6:

Please make it a priority to add new wolves to Isle Royale. Wolves are the best moose managers around and they work for free. The time to act is now in order to keep the island healthy and harmonious. Wolves have not had a negative impact on the island. They have helped Isle Royale maintain it's wild beauty.

Comments: I have visited Isle Royale twice and it remains one of my favorite places in the world. The wolves and the moose have become a part of the island and that is a good thing. Wolves and moose aren't faring well on the mainland due to politics ignorance and climate change. Isle Royale remains a unique microcosm where we can still observe and study this ancient predator-prey relationship. In a world where species are becoming extinct on a daily basis, this rare relationship has endured and that should be given a lot of weight when making the decision of what to do about the wolf-moose problem on Isle Royale. Please use common sense and act sooner rather than when it is too late.

Correspondence: Topic Question 1:

Leave the island alone. You have an amazing 50 year predator / prey study on the island and if you start to do human management you will loose all of the future good data. If the moose over populate and eat the island then we learn that predators are very important Apex species. Maybe wolves will come to the island on their own once the moose population get high. Don't manage. Study the impacts. This is an opportunity. Don't let the wolf biologist "love for wolves" overpower science. Sometimes it's important to step back and watch.

Topic Question 2:

Long term data collection. Let nature do her thing. Use it like a natural lab and study the impacts, even if wolves leave the island.

Topic Question 3:

None. Wilderness is just that "Wild"

Topic Question 4:

Again this is an opportunity to study climate change and how it does effect moose and wolf populations. Climate change is real and we need more study areas to show the public.

Topic Question 5:

First off, I am a supporter of the return of the wolves to Wisconsin and Michigan. However, I think the wolf biologist of Isle Royal are too involved with the wolf and if we loose wolves on the island I fear they will push to bring in wolves to replace them. This in my opinion would be a huge mistake. We scientist study natural changes and if the island looses wolves it is an opportunity to study the impacts of the moose. Wolves will return on their own but lets not let the love of a large mega fauna animal influence good science. Yes they area drawn for tourism and research but what about the over 50 years of predator / prey data that would be lost when we start influencing the dynamic of the islands animals.

Correspondence: Topic Question 1:

The only option that has vegetation restoration also involves intensive moose management. Why not add it to other options?

Topic Question 2:

I can't think of anything else.

Topic Question 3:

Keep IR as wild as possible. Definitely don't build any roads or ATV trails into the wilderness so you can manage moose.

Topic Question 4:

Given the way Minnesota's moose population is declining, I am concerned that a warming climate could cause the moose population on IR to crash. If additional wolves had been introduced to the island as part of a management plan, then you'd have a predator population with insufficient prey. I don't need to spell out the problems with that.

Topic Question 5:

A: It's harsh. Lots of animals starving to death. Potential permanent changes to the park from moose overgrazing. Possible negative impacts to other species who need the same resources as the moose. Etc. It's the least expensive thing to do. The wolves will certainly die out (unless new ones migrate) and as a result you may lose some visitors (which I think is just fine). But it's also nature's way of things. So, I do favor this option.

B: I like the idea but see my answer to question 4. Without the threat to the moose, I would definitely go for this. Maybe if you planned in advance for the loss of the moose so you could act swiftly if it happened (relocate wolves, introduce new prey species)? Part of the reason I am in favor is that the wolf population was initially devastated due to humans when Parvo was introduced. It's like we'd be restoring what we took away. The other part is just that I like the idea of wolves being there.

C: I'm not totally clear about how the moose would be maintained in this scenario. Is the idea to continually introduce/cull animals to keep them in some predetermined balance? Bad idea.

D: See my responses to C and E.

E: Only if you didn't cull them. Also see my answer to 3.

F: Way no.

Topic Question 6:

I don't think you should cull moose. I'd prefer relocation. Definitely do not kill existing wolves. If you do decide to relocate moose, you might want to grab the ones hanging around Windigo or Daisy Farm. That would be a lot easier than trying to get them out of the center of the island- it would be really difficult and expensive to get them out of there given that half of it is swamp and the other half rocky ridges.

Comments: I've backpacked across IR 3 times and am going back again this year. I love that place.

Correspondence: Topic Question 1:

I think the alternatives that are listed are all important to consider-however-I would favor alternative B.

Topic Question 2:

The toll that without wolves, Moose can do a lot of damage to vegetation and the trees around ISRO>

Topic Question 3:

he irony is that Isle Royale is considered a wilderness island when in reality it has been populated by people going back to hundreds of years including resorts in the 20's and 30's and cabin owners (life leases). Now that it is--it does need to be protected and as said above, without natural predators-moose can do a lot of damage.

Topic Question 5:

I like alternative B. Introduce the wolves just once-no one really knows why they came over in the first place.

Topic Question 6:

It is confusing because there are two different strong opinions about what to do with the Wolves from Rolf Peterson and the likes of David Mech. Both know wolves very well and understand the depths of the problem in detail. Who knows what the right answer is? However, I do believe that what makes Isle Royale unique is its wolf moose relationship and given the fact it is a closed ecosystem-to not do anything would destroy the moose population (starve) and destroy the vegetation eventually.

Comments: I was a ranger on Isle Royale for 4 years many years ago-so I do believe that after living intensely in that space-one has a unique perspective. Thank you for making this transparent and allowing the public to have input. It is a wonderful place to continue to protect.

Correspondence: Topic Question 1:

No one seems to be addressing one of the factors in the demise of the current wolf population. Canine parvovirus was introduced to the island from some ones domesticated dog. This virus is highly lethal in an unvaccinated population and killed off a good number of wolves. Numbers of wolves have never returned to the pre parvo level.

Topic Question 2:

A balance needs to be maintained. The moose need a predator to keep their numbers in check, so they don't overgraze the vegetation. I would prefer to see

that done by wolves than human hunters. In so many areas of the US, including Minnesota, the wolves seem to vacillate between endangered and not, with one of the means of hunting them being traps. It would seem more humane to relocate some of them.

Topic Question 3:

Moose and wolf numbers need to be assessed on an ongoing basis to determine the success or failure of any of the alternatives.

Topic Question 4:

I think this will need to be addressed and readdressed on an annual basis. The moose population is dwindling in northern Minnesota and could do the same on Isle Royale with the effects of climate change. But no one really knows what will happen.

Topic Question 5:

Alternative Concept C seemed to make the most sense to me.

Correspondence: Topic Question 1:

Reintroduction of wolves only after existing population is gone with intense vegetation management.

Topic Question 2:

Minimal management is key. Reintroduction of wolves should only be considered once noticeable vegetation loss has occurred. Then intense vegetation management would obviously be necessary as well.

Topic Question 3:

Again, management should be minimal. It should only occur if/when the loss of a wolf population in the park leads to a loss in vegetation due to a lack of predation on the moose population.

Topic Question 4:

Is climate change affecting the wolf population on Isle Royale? The only thing that comes to mind is lack of an ice bridge every winter, but I believe that has been rare for some time. If climate change is a major factor in the loss of wolf population, then the public should be made aware of the environmental changes significant to this particular issue.

Topic Question 5:

I like the alternatives that offer minimal management. In my opinion, the first option - to do nothing - should be followed up to the point when either the wolf population is gone or there is noticeable loss in vegetation.

Correspondence: Topic Question 1:

Allow hunters to cull moose and use meat to eat.

Topic Question 2:

Everyone seems to think wolves have no effect on moose populations in Minnesota, it's all climate change right? The first thing the NPS should do is face facts. Wolves eat moose. Next they should accept wildlife management as taught by Aldo Leopold and used in all 50 states might actually be a good idea.

Topic Question 3:

Wilderness designation in other areas allows tons of wildlife harvest. People would have to travel by foot or horse, so what. Wilderness does not mean you have to stop managing wildlife, doing nothing is also a choice and see what it got you?

Topic Question 4:

None. What happens will happen.

Topic Question 5:

At no place did I read a denunciation of the "balance of nature" stuff. I'd like to hear you eat some crow and admit it's BS. Hasn't been taught in University level ecology courses for a quarter century, time to own up to facts and use it as a teaching tool.

Topic Question 6:

That wolf researcher Vesuvich or whatever his name is could use a haircut.

Correspondence: Topic Question 1:
Wolf reintroduction has to be initiated

Topic Question 2:
To let the wolves die out, the moose population will destroy the island

Topic Question 6:
There is nothing today that can be considered a natural environment. Man has impacted every aspect of natural ecosystems and to let the wolves die out would be the death nell of Isle Royale National Park.

Comments: Rolf Peterson, the leading authority on the wolves of Isle Royale is correct. Introduce wolves to the ecosystem.

I worked on Isle Royale from 1973-1975 and understand the issues.

Correspondence Type: Web Form

Correspondence: Topic Question 1:
The environment has moose. Since you cannot simply clear the island of moose; therefore, something needs to control the moose population. Or, if uncontrolled, the island gets overrun, browsed to death by a moose population explosion.

While active "management" in National Parks should be kept to a minimum, that doesn't mean there should be NO management. Human action over time has had an impact on all space whether we want it to or not (e.g., global warming).

The Isle Royale wolf population is under stress in part due to human activity (e.g., global warming and the reduced number of ice bridges, old mining activity and the 3 wolves that died in an old mine pit several winters ago). Inadvertant human activity has had an impact, therefore, some deliberate human activity can assist the wolf population.

In this instance, I'd posit that wolves are not only a logical predator for moose, but the best predator. Introduce more wolves.

Topic Question 2:

--

Topic Question 3:

Low intensity management. Keep the moose population from growing uncontrolled; and that can be done by ensuring there is a viable reproductive wolf population.

Topic Question 4:

This is a question for the scientist, the park service, and higher level policy makers. Not uninformed citizens.

Although recognziing 1) there is climate change; and 2) that there ought to be thinking, discussion, and policies to address climate change is a good start. Don't ignore the issue.

Topic Question 5:

Like - The process should be an open "discussion" between policy makers, park service, scientist, and citizens.

Dislike - That the process to date has been a long drawn out stalling tactic that doesn't appear to be based upon practicality; it appears to be "political." Open comment periods, previous public meetings, and the conclusion that "we need more data" are all part of the stall.

Correspondence: Topic Question 1:
Maintain the wolf population.

Topic Question 2:
Manage to prevent a genetic bottleneck.

Topic Question 3:
Only what is necessary to maintain the ecological processes.

Topic Question 4:
Cross that bridge when it comes.

Topic Question 6:
See below.

Comments: I support introducing more wolves onto Isle Royal NP. Human influence cannot be teased out of any landscape today. It is the ecological processes that need to be restored/maintained in our wild lands. Allow a small population of wolves to persist on the Island and introduce individuals that will help maintain a genetically viable population.

Correspondence: Topic Question 1:
Reintroduce wolves immediately, a "multi-year" study will quite possibly do further damage to the ecosystem.

Topic Question 2:
TIME

Topic Question 3:
Reintroduction within the constraints of whatever level of intensity will mitigate the potential damage the moose population growth will have on the islands designated wilderness.

Topic Question 4:
Climate should not be considered as this is a variable that to a greater or lesser degree is not fixed. Mitigate the immediate threat by acting on what we know today and the threats posed today in the immediate future.

Topic Question 5:
They DO NOT take swift enough action and relegate the island's future to a slow system of politics and bureaucracy.

Topic Question 6:
It's great that this is getting attention and efforts are being put in place to act. The time-frame in which these efforts are being worked on is the problem. A mindset needs to be taken that has a tendency for action and immediacy rather than pontificating over "options" while the moose are free to devastate the islands ecosystem.

Comments:

Correspondence Type: Web Form
Correspondence: Topic Question 1:
The Park service is going to have to make a paradigm shift if they expect to continue to be even relevant. You will not be able to formulate a 20 year plan. It is not possible. With the conjunction of Climate change, peak oil, and population the rate of change is accelerated beyond anything the agency has dealt with in the past. If you "wait and see " as you did with the wolf issue in ISRO the problem solves itself. All the wolves will be gone by the time you read this message. You no longer have the liberty to have a slow bureaucratic pace. You need to develop a rapid response triage approach.

Topic Question 2:
It is time to consider protecting the EXISTENCE of wildlife. I think the time is past to "let things take their course". The course for all wildlife is headed for is extinction. So consideration must be made to protect and nurture wildlife. If you have to seed the wolf population on ISRO to maintain the moose population and all the other species that depend on the wolf-moose relationship, do it!

Topic Question 3:
Again if you don't compensate for the negative effects of mankind there won't be any wildlife in the "wilderness".

Topic Question 4:
ANY and ALL necessary to save the wildlife that exists.

Topic Question 5:
Too slow to do anything at all.

Correspondence: Topic Question 1:

I don't know of any.

Topic Question 2:

What the overall purpose if for the park as a designated wilderness.

Topic Question 3:

No management.

Topic Question 4:

None.

Topic Question 6:

I vote for alternative A - doing nothing. Given that the land is a designated wilderness, I think it is what nature makes it - we should not intervene. If the moose grow and prosper, perhaps other wolves will cross over during the winter. If the moose increase without wolves and eat the vegetation, then the population will decline. These things are what happen in the wilderness and we should not try to change things.

Correspondence: Topic Question 1:

Either reintroduction of healthy wolves or the addition of the same to the very limited present population.

Topic Question 2:

The growing moose population is the most prominent.

Topic Question 3:

NPS should only allow scientific study by qualified academicians!

Topic Question 4:

NPS must be realistic. There are some things beyond the control of man. The environment will either adapt or crash.

Topic Question 5:

Allowing the wolf population to die before making a decision is unrealistic. Unfortunately, that may have already occurred.

Topic Question 6:

It is difficult to see sixty years of research end. My husband and I first visited Isle Royale in 1956 on our honeymoon. We were treated to many presentations and discussions by Dr. David Mech. We have followed the Isle Royale wolves since that time. We also lived in the west and followed the saga of the Yellowstone wolves. At least the wolves of Isle Royale can be somewhat guaranteed that they will not be hunted on the archipelago!

Correspondence Type: Web Form

Correspondence: Topic Question 1:

I am in favor of the first option which is to leave everything alone and let nature do what it has been doing for hundreds of thousands of years. Since wolves and moose migrated to the island early in the 20th century (moose) and mid 20th century (wolves), and were not introduced by humankind (with the exception of the two times wolves were introduced, but were removed or disappeared) then we humans should not intervene on either species behalf. As for the vegetation, it will adjust to the changing animal population.

Also, given that we are in a period of dramatic and most likely irreversible Global Climate Change, we don't know what is going to happen in the next 10-50 years. It could be that these dramatic climatic changes will counter anything attempted by human kind.

Topic Question 2:

Nothing more than managing, as best as possible, the natural order of species and vegetation evolution.

Topic Question 3:

Leave the intensity and management processes as they are.

Topic Question 4:

I don't think we humans can do much about the changing climate at this point, unless all countries around the world agree to dramatic reductions in carbon emissions, corporate greed, waste, and population and the ignorance of our own species regarding the planet on which we live--and its future!

Topic Question 5:

This should be answered in #s 1 - 4, above.

Topic Question 6:

Answered in #s 1-4 above.

Correspondence: Topic Question 2:

It is now known that several years ago a domestic dog was allowed onto the island (illegally) off of a visiting personal watercraft and that the Parvo virus was introduced to the wolf population with devastating consequences. It is also known that recent deaths of prime wolves can be attributed to accidental falls into historical copper mine shafts. Both incidents are attributed to the human activities that have impacted the wilderness area of the park.

Consideration of this information should be taken as, in my view, a restoration of the wolf population is now called for. Humans have played a major role in the down turn of the wolves despite the goal of non-interference in the wilderness area. Managers should be allowed to make an attempt to bring diversity back to what would have been in balance.

Topic Question 3:

Better enforcement to keep contaminants from contacting the islands.
Putting permanent covers on old mine shafts.

Comments:

Correspondence: Topic Question 1:

None. I believe the options proposed include all viable alternatives.

Topic Question 2:

1). A strong consideration of the impact man is having on island ecology, principally through climate change, The "hands off" approach to wilderness management has been forever tainted.
2). Public response/perception. In general the world embraces the existence of a top predator-prey relationship on Isle Royale. All things considered it is the best wilderness management option anywhere. The public's response to a controlled moose hunt would be far more controversial; ditto if hikers are stepping across dead, starved moose on the trail. Moose relocation is impractical and ineffective. Vegetation restoration is much more intrusive to a wilderness setting than is maintaining top predator populations.

Topic Question 3:

The NPS should embrace whatever it takes to insure wild wolves continue to occupy Isle Royale for as long as the environment supports moose.

Topic Question 4:

Let the moose dictate the management. Isle Royale's climate, strongly influenced by Lake Superior, cannot be compared with northern MN where warming temperatures have already influenced moose numbers. The island will see a slower impact and moose will benefit accordingly. Ultimately, as warming reduces the moose population, wolf numbers will follow suit.

Topic Question 5:

I support only the option that allows for introduction of wolves as necessary to maintain a healthy moose population. I am opposed to the park actively managing vegetation or moose numbers.

Correspondence: Topic Question 1:
Really none- Continue Concept A- It is a wilderness area and should be managed as such.

Topic Question 2:

Again it is a wilderness area and should be left alone- But this is an ideal place to study exactly how nature reacts. There should be an ongoing intense non political study of all that happens.

Topic Question 3:

Again- steady on the course- let nature manage the island

Topic Question 4:

Again this is a wilderness area and has been treated as such. Being an island makes it an ideal place to see what nature is doing without outside influence.

Topic Question 5:

I like A as it treats the island for what it is and allows nature to manage itself. The other alternatives have man intervening and possibly with good intentions harming the island in the long run.

Topic Question 6:

Being a wilderness area and a island makes it an ideal place to study nature and how it works and adapts etc. Good intentioned management of one thing can upset the applectart so to speak with another are. Nature has managed the island for thousands of years and with no intervention by man many future generations will have the opportunity to see what has happened in the past and is happening in the present giving guidance to land and wildlife managers throughout the country. Much of what we see is cyclical and there is no better way to understand it than a non intervention plan can offer. We must remember we are only a little blip in time and have much to learn from nature and sound scientific study. Our present biologists are good but still have lots to learn and this island is a perfect textbook to learn from.

Correspondence: Topic Question 1:
None whatsoever

Topic Question 2:

Leave the Island untouched by any attempts to manipulate any populations of any living things.

Topic Question 3:

Hands off....leave it alone, and don't touch it at all.

Topic Question 4:

None...don't make value judgments that there is a changing climate. Who can say that the environment is changing only that it is cycling?

Topic Question 5:

I can not give oppinion on this, as I have not read the alternative plans.

Comments: Because Isle Royal has its very own ecosystem, it has given years and volumes of information about this fragile system with years studied and simply because it was a unique environment that was completely (or as close to it as possible) separated from the mainland not far from this island. It gave a great opportunity to study all systems as they interacted upon one another over multiple years.

This unique environment afforded this study to be completely unaffected by other areas that might be influenced by the effect of human populations or other animals and plants that might skew the overall analysis and therefore the findings would become very accurate and it would be a finding that could not be affected by any other influences that any other places would or could afford.

For years the scientists that tallied the data and studied the wolf and moose populations always said that their purpose there was one only to observe and not get involved or interact with the results of the studies that they conducted there. It was a pure study that was unaffected by man. It was therefore pure science.

But now, unhappy with what might be the final chapter to this study, some seek to do the very thing that for decades was not done and that is to manipulate the gene pool and therefore alter the natural study by the very hand that they said for decades they would not do.

The final chapter is not yet written on these studies and until all the moose or all the wolves are gone, this study is NOT over yet. Playing God and stirring the pot by importing seed stock or genetic pools simply serves to render the entire study over the last 60 years as wasted.

Will the moose population increase again?

Will the wolves solve their own weak gene pool ?

Will the vegetation mature to a point that it can't sustain either of the latter?

Will climate change get involved?

We just don't know the answers to this question, yet.

What we do know is that the park is in a unique place affording science an opportunity to study the completely natural environment without being affected by any outside influences.

If the park service approves the theoretical need to import more wolves to strengthen the wolf population, then they should also import more moose and rabbits and grouse and enhance the vegetation right along with it. Doing so will surely affect the populations of nearly every living thing on the Island. Might as well turn it into a tourist park complete with rides and mechanically driven animals and plants. It will cease to be an eco-system worthy of study.

Correspondence: Topic Question 1:

I believe that necessary action should be taken to keep a healthy wolf population on Isle Royale. This will require that healthy wolves be brought to Isle Royale and released, because the present wolves are probably beyond rescue due to genetic problems.

Topic Question 2:
A healthy and adequate wolf population will help maintain a sustainable moose population. A sustainable moose population will keep vegetation in balance. Without the wolves the moose population gets out of control and harms vegetation.

Topic Question 4:
Due to climate change and less ice bridges connecting Isle Royale, the NPS should consider planning to introduce new wolves on Isle Royale periodically to keep their gene pool healthy.

Correspondence: Topic Question 1:
Not sure on this one, so I'll pass.

Topic Question 2:

Honestly, I think you need to preserve both species. To do nothing is to fail in the eyes of the many who make the long trip to backpack the island. To cull the moose, possibly needing to bring in helicopters to do so, destroys the very essence of the island, tranquility and nature; escape from everyday life. Unless of course you plan on doing it during the harsh winter months, and no other time, but even then, I think just the thought of it will destroy the islands mystery for many.

Having been to the island, seen a moose, yet never even hearing a wolf, it's all very intriguing to still follow the wolf/ moose study every year and wonder how things will turn out. I find myself learning things without realizing I'm learning. I love the island and the study and all its history. It's peacefulness and beauty island no place I've been. The night sky is a wonder to behold and I have never slept better than in the island.

Topic Question 3:

Please make sure the wetlands and the forests the breezes blow through are preserved, not ravaged by an overpopulation of moose!

Topic Question 5:

I believe I already stated this above.

Correspondence: Topic Question 1:

After having read your online draft alternative concepts, I am considering beginning with Concept B and going from there with whether or not to interfere with the moose population.

Topic Question 2:

I am considering an option for the wolves that are being designated for killing in the states. This option would be to capture and release them on Isle Royale. The wolves and moose are a big reason people visit and support this park. It is unique and very interesting. And, I want to give the wolves a chance to live.

Topic Question 3:

Introduce the wolves. Let them manage the moose. Let the trees grow as they will, considering the climate change. That is something we cannot control.

Topic Question 4:

Good point. Nothing.

Topic Question 5:

I like Alternative B

Topic Question 6:

Please capture and release the wolves. It seems like a no brainer to me. All the rest will fall into place and we can save our declining wolf population, not only on the Island, but in the States overall.

Comments: Thank you for considering my suggestions and comments. I appreciate all the science and study that has gone into these reports. Good brains. Please just rescue the wolves.

Correspondence: Topic Question 2:

More wolves need to be introduced due to detrimental decline in population which has led to inbreeding and only three unhealthy wolves remaining on the island. It never should have gotten to this few numbers.

Topic Question 3:

Study and reintroduce more wolves when needed - not when there are almost none left.

Topic Question 4:

Reintroduce more wolves because the ice bridge to the mainland hasn't happened much due to climate change. The island is not getting the influx of new genetic material needed to grow or even sustain the population.

Topic Question 5:
What alternatives?

Topic Question 6:
It's simple really - reintroduce more wolves to the island to ensure a healthy moose population in check which in turn sustains healthy vegetation.

Correspondence: Topic Question 1:

I believe the Park Service should follow Alternative A, and allow the populations of wolf, moose, and plant life to take its natural course. This would be the minimum impact possible, and would be consistent with a wilderness habitat.

Topic Question 2:

First and foremost I believe nature should be allowed to run its course. I understand that a large moose population may result in over eating of vegetation, however I do not believe the park service should intervene as this would end a over half century experiment. While the damage to vegetation may be aesthetically unappealing in some areas for visitors, Isle Royale is a wilderness, not a museum, and nature is not always pretty or kind.

Topic Question 3:

Minimum intensity. Wilderness means free of human impact, and few places on Earth are as pristine as Isle Royale.

Topic Question 4:

Climate change is a global phenomena, and is not going to be stopped by small changes. Thus although minimizing environmental impact and fossil fuel use by the park is a good idea, it will not have any impact on the Earth's climate. I believe the park service should set a good example by being as carbon neutral as possible, however I believe money would be best spent on education as a scary percentage of Americans don't even believe in climate change.

Topic Question 5:

I do not like that many of the alternatives involve humans interfering with the natural progression of an ecosystem just because we don't like it, or find it unhealthy. Death and extension are part of nature, and the decline in wolf population is not as a result of human impact, but as I understand it inbreeding to a large degree. The only time I support human intervention is to correct for clear human caused damage. An example of this would be when the park service had to respond to a virus introduced to the wolf population due to a visitor bringing a dog to the island.

Topic Question 6:

Thank you for reading my comments.

Correspondence: Topic Question 1:
Other than what?

Topic Question 2:

The health of all three needs to be considered and the balance in numbers. Now the moose are out of control and certain species of trees and plants are in decline. The wolf numbers need to be increased to keep the moose healthy by culling the weak and keeping the numbers down. I also think the interest of the population that goes to Isle Royale should be considered. Many people want to go to a place wild enough for wolves to live. The life of the wolf pack is an inspiring one- -mate for life, take care of your children all your life, keep your cubs in line, enjoy the wilderness. Seeing photos of the wolves playing in the snow is important for many people. Wolves live in a harsh environment and yet they have adapted well and really seem to enjoy the snow, cold, and ice.

Topic Question 3:

There should be little more development of buildings and places of convenience. The trails and campsites should be kept safe and clear for backpackers and day hikers. All the known steps should be taken to keep the environment pure including the kitchen having a garden and doing more composting.

Topic Question 4:

NPS needs to bring in two more wolf packs, each with an alpha male and female and perhaps two cubs. Place these packs far away from each other where other packs, whose members have died out, have had some success bringing down moose.

Topic Question 5:

I do not know what the preliminary alternatives are.

Comments: Isle Royale National Park needs to hold on to its reputation as the wildest, most pristine Park in the continental USA. It needs wolves as a reality and a symbol. The health of the vegetation of Isle royale depends on fewer moose, which means more wolves. We have studied the population for years. Now it is time to ACT. Bring in wolf packs according to the researchers who know what is needed. The reputation of wolves needs to be rehabilitated. They don't eat people and pretend to be their grandmothers. They don't eat grandmothers! Let people imagine the lives of wolves on Isle Royale and write new stories that show their loyalty, perseverance, caring and teaching techniques.

Correspondence: Topic Question 1:

Web Form

I feel it is important to re-establish the wolf population, in a natural way. To bring in local Minnesota wolves, breeding pairs to re-populate the island. To replicate as if they came naturally, then stayed on the island from an ice bridge, which is a possibility, as it almost was in the winter of 2015 and from earlier in their history of immigration to the Island. The wolves should not be related to increase the genetic pool. And to begin again so to speak.

Topic Question 2:

There are now too many moose and the vegetation is getting compromised. At times, man must help if need be rather than a 100% hands off approach. The wolves need our help. Helping responsibly, but in as natural a manner as possible is best.

Topic Question 3:

Man must help rarely, and with much consideration. The time is now, the waiting has been too long and now the current wolves are beyond help.

Topic Question 4:

Climate can not be changed. Isle Royale needs to be allowed to change naturally, as it will.

Topic Question 5:

Hands off approach: the wolves were not sustaining themselves and suffered deformities and non-breeding due to interbreeding. Its been hard to watch them suffer the past few years.

Limited Help: I am in favor of limited help by re-establishing the wolf population, in a natural way. To bring in local Minnesota wolves, breeding pairs to re-populate the island. To replicate as if they came naturally, then stayed on the island from an ice bridge, which is a possibility, as it almost was in the winter of 2015 and from earlier in their history of immigration to the Island. The wolves should not be related to increase the genetic pool. And to begin again so to speak. with the lack of ice bridge options as the climate warms, some help is needed

Topic Question 6:

I have visited the island three times. The first time in Sept 2010. Chippewa Harbor Pack was near Lake Siskiwit and I heard several wolves yipping while they chased a moose. The next visit two years later, in Sept 2012 I saw fresh wolf scat, 45 minutes old, just on the edge of Chippewa Harbor Campground near the shelter. The last visit in Sept of 2014, there was no evidence of wolves and my visit was rather sad and the island did not seem to hold as much mystery and adventure knowing there were not much of a population any longer. I am not visiting until wolf packs are back on the island.

Comments: Isle Royale is a better place with wolves, please bring them back to the island.

Correspondence: Topic Question 2:

I believe nature moves to its own time table, however, we can enhance it by taking a great deal of care in choosing to enhance, not destroy. I have been going to Isle Royale for 20 years, every year. I believe that wolves are an integral part of the island and the island experience. By "re-stocking" wolves, we are saving vegetation which an overabundance of moose will destroy. While there is now open hunting of wolves in Northern Michigan, we have the chance to "transfer" some of them to Isle Royale, instead of killing them. Seeing as the 3 remaining wolves on the island are maybe not mating and one is in very poor health, we shouldn't wait too long for the bureaucracy to run its course which will probably take longer than nature will.

Topic Question 3:

By enhancing the wolf population, you would be taking care of several elements of the moose, wolf, vegetation problems.

Topic Question 4:

Changing climate is inevitable, as there have been several climatic changes over the history of the earth. Maybe that is an area we can do nothing about.

Topic Question 5:
I believe wolves should be re-established on Isle Royale.
I dislike doing nothing about it.

Correspondence: Topic Question 1:

Consider more than one predator to keep the moose population balanced. Rather than concentrate on studying moose that are dead (usually lunch of the wolves) - more active study of living moose health.

Topic Question 2:
Vegetation seems to take the back seat. More balanced moose population management should be considered rather than the allowing the wild population swings and the extensive fir browsing. This could accomplished by either managing the wolf population with a diverse gene pool or hunting.

Topic Question 3:
Sleeping Bear Dunes - specifically South Manitou Island - is actively managed with regard to wildlife. When deer cross from North Manitou or the mainland they are shot by the park service. North Manitou Island has an annual deer hunt. This is two examples of active management of a National Park wilderness area being managed within the State of Michigan. Therefore the moose and wolf populations can benefit from active management, particularly given the vast historical dataset of moose/wolf ratios.

Topic Question 4:
I have not noticed a climate impact on Isle Royale - at least not to the degree that the moose have impacted the island.

Topic Question 5:
Letting the moose have their way with the island is dangerous from several perspectives including potential permanent damage to vegetation and potentially dangerous encounters with people (heightened by browse issues).

Topic Question 6:
My personal opinion (an Isle Royale visitor, biology degree, Ph.D., frequent backpacker) is that the wolf population should be managed to maintain a viable genetically diverse population that can keep the moose population in check.

Comments: Thank you for allowing input into a complex situation.

Correspondence: Topic Question 1:

Management tools that could be used are college study work on project,actual biologists that have devoted time of study in observing moose /wolf relationships,the effect man has had on the situation that brought us to this stage

Topic Question 2:
I believe man created many situations that influenced the balance between the two species from abandoned mines from which wolves were lost to such as climate change to influence ice bridging

Topic Question 3:
the type and intensity warranted should fit the situation to provide a healthy balance , a designation label would of be great if you could undo mans mark on

the lands or his actions but to let a species die off and to claim man had nothing to do with it is a lie , in some way shape or form he did so the designation " wilderness" is unwarranted,it never can be..I believe only get involved when it is absolutely warrented,like with the mess going on now hunters wanting it one way citizens the other

Topic Question 4:

A active one but a slow one unless its a emergency to prevent a specie die off,this world is ringing the alarm bell and will take many years to turn it around not something to be done with the thinking process has to change first,

Topic Question 5:

I am not foud of the length of time its taking to decide either to allow fresh genes or let them die off the wolf population was allowed to dip too low

Topic Question 6:

I hope that my children and their children and future generations will be able to see this world as it was before mans scars this earth much more but knowing politicians and politics I have no faith in that ever happening

Correspondence: Topic Question 1:

A hands off approach to the problems of Isle Royale is not appropriate. Since we created the problems, I. e. global warming, fewer ice bridges to allow wolves to migrate into the Park, vegetation changing to less acceptable food sources for moose in winter, & bringing diseases to the Island that effected the wolf population.

Topic Question 2:

Culling moose is not a solution.

Topic Question 3:

Take a look at what has happened at Yellowstone with it's introduction of a new wolf population. It has had a balancing effect on the entire ecosystem in a positive way.

Topic Question 4:

Bring in a healthy wolf population and first see how nature balances things out. Then review after a given time period.

Topic Question 5:

Culling moose = forget about it.
reintroduce wolves = It worked at Yellowstone.

Correspondence Type: Web Form

Correspondence: Topic Question 1:

It's a little late now, but a genetic rescue would have been a nice thing to consider 5 years ago or so, giving a chance for an introduction of new wolves to thin the blood line of the extremely inbred wolves on the island at the time.

At present, anything other than a sizable reintroduction of a new group of wolves seems to fall short of what will be needed.

Topic Question 2:

To think that this is still a hands off management program, no human intervention, etc is a bit naive. Global warming, yes I believe in it, is having an effect on the island, as indicated by the recent infestation of ticks and bees. In 2010 when I was last on the island, we ran into ground bees that were apparently a new and growing problem, all related to the overall warming of the island.

Topic Question 3:

The designation of wilderness should not impact the considerations for what to do. It may be designated wilderness, but it has felt the human impact for decades. So manage the island, it's 100% national park, it's what you're in charge of.

Topic Question 4:

The management needs to change in the face of changing climate. It's real and it's having an effect, so to manage otherwise would be irresponsible.

Topic Question 5:

I hate, hate the fact that it's taken the NPS sooo long to get to this point. You've known about these issues for years, the results were very predictable, yet you've waited at least 10 years to do anything. This is a process that should have been embarked on 10 years ago, in preparation for this day, when the next winter could be the last winter with wolves on the island.

Topic Question 6:

You have access to a project and it's research that has been ongoing for more than 50 years. Please use this valuable information and scientific research to aid in your decisions. Rolf Peterson and his team are the once constant, other than the wolves and moose themselves, over the past half century. He's more in tune with the island and it's population, the ecological change, the effects of climate change, etc. than any other source of information you have.

Correspondence: Topic Question 1:

Alternative Concept D
(introduce wolves once and
reduce the moose population)

Reestablish wolves on the island by bringing in new wolves one time; reduce moose density if/when the wolf population is no longer impacting the moose population and moose herbivory is having a demonstrated impact on park resources

Comments: I'm not an expert on anything remotely close to the situation the park is facing.(that is why 2-6 are blank) I do know that is a fantastic park that draws people and money to help support it. Obviously one of the key factors that draws people to the island is the wolf and moose population. Why not continue to support what has already been established on the island? If we let nature "take it's course", the moose will destroy the island and eventually starve to death. Doesn't seem like good PR for the National Parks Service. Hey, they're reintroducing wolves all over the north, why not help little ol' Isle Royal along? I'd really hate to see IR go wolf free....

Correspondence: Topic Question 1:
I'm pro letting it play out (no action) for now - so I don't see a need for additional tools / strategies at the moment.

Topic Question 2:
I'm very interested in the relatively simpler ecological community of Isle Royale and what we can learn about it scientifically. We have lots of studies about what landscapes look like after wolves come back - do we have really rigorous ones that look at exactly how it changes when they "blink out"? We generally know - but we don't have anything with the previous "wolf present" dataset that Isle Royale has followed up by "wolf absent". Wolves may also

come back on their own - and that similarly would be incredibly interesting and exciting. I don't think that we should assume that wolves should be a permanent part of Isle Royale.

Topic Question 5:

If wolves are brought in to supplement the population - how frequently must this be done to ensure a long term viable population? Is that something we want to do? I think we have a golden opportunity here to learn so much more about what happens when an important predator blinks out (if it does) and if they come back - what that "looks" like. If last year's ice bridge had broken up just a few days earlier - there would be 2 more wolves there right now. I'm interested in the science without an "*" (the * being that starting at such and such date wolves with approved genetics were relocated to Isle Royale).

Topic Question 6:

Take the worst case scenario - wolves blink out and moose crash and vegetation declines. I think we can learn a lot from that. Wolves haven't always been on Isle Royale - the island apparently survived a long time without them - is that possibly relevant to the discussion?

Correspondence: Topic Question 1:

the last remaining wolf could be uthanized to remove defective genes and one to three new wolf packs released to the island. This would ensure genetic diversity for a long period of time.

Topic Question 2:

keeping a healthy population of wolves would allow for natural balance of predator, pray and vegetation on the island. In my opinion hunting should not be used as a management tool to control moose population. Research can continue with the predator - prey relationship even though new wolf packs have been introduced to the island. Genetic mutation is now known to be an outcome of inbreeding due to a decreased wolf population. There is still more to learn. A moderate die off of moose is to be expected given the current population and high browse line in the forest canopy. Following the rule of the sigmoid curve the die off will continue until the population reaches the level that the habitat can sustain it.

Topic Question 3:

As far as I know this island has been left in its natural state. Timber management would be a costly venture and I believe this forest should be left in its virgin state. Natural regeneration will occur when single or cohorts of trees die and create canopy gaps. Moose will limit regeneration until their numbers are lowered which is another reason to keep a healthy wolf population. Fire and other natural factors will encourage regeneration of the forest if left alone. Spruce budworm is hitting hard in the region. If it affects the borial tree species on the island it will promote a great deal of regeneration.

Topic Question 4:

no management should be considered as far as climate change is concerned. This should be incorporated into the experiment.

Topic Question 5:

I do not think the experiment should be abandoned. Other than bringing wolves back onto the island human interaction should not be considered for management of flora or fauna. In my opinion it would end the experiment. Other than Gillopigose I know of no other place that is in its "virgin state" and to intervene would end that.

Topic Question 6:

we have learned what can happen to wolves as their population dwindles. The extra vertebrae is unique to the wolves of the island and an obvious genetic malformation of inbreeding. We don't know what can still be learned from the natural happenings on this island. It would be interesting to see what climate change and natural selection has in store but this can only happen if the experiment continues.

Thank you for your consideration

Comments: It would be a shame to lose this historical site. Old growth successional forest are not only rare but a great place for foresters to learn. It is difficult to find true all aged forests. Few foresters really know what they actually look like. If forest management were incorporated into the plan that would likely be lost.

I have been told that the animals have no real fear of humans. If hunting would be used as a management tool that would surely change. In my opinion it would be best to let nature do the work. The only help people should give is repopulating the predators and continue the experiment. Let's see what else we can learn.

Correspondence: Topic Question 1:
I am unqualified to discuss this.

Topic Question 2:

I would think that over-browsing of the island by moose without having the check/balance of a predator may leave an abundance of dead and/or dying vegetation that would make the island more of a tinder box for a forest fire than it already is.

About 10 years ago, when the moose population was around 2000, and there was the huge die-off of the moose, what type of effects did it have on the vegetation then? Obviously, the odors of the carcasses was nasty but that's life!

Topic Question 3:

If the 99% of the wilderness is going to be affected by the NPS decisions, I should think the management should be fairly intense.

Topic Question 4:

I think that climate change is going to have its effects on the whole world and what happens with the management of IRNP is not going to make a lot of difference.

Topic Question 6:

Part of the Isle Royale experience is not in seeing a live wolf but of knowing of their presence, of hearing the howl in the middle of the night. If a hiker is blessed to see a wolf, that is wonderful! In the 30-40 years I have been coming to the island, I found a carcass off the trail when I got turned around. That was back in 1976. I have seen way more wolves living here in the Copper Country in just the last 10 years!

Correspondence: Topic Question 1:
I don't understand this question.

Topic Question 2:

Maintenance of visitor interest should be considered because as the 2015 transportation study shows, the Park is facing challenges with respect to maintaining its transportation system. That system is the most expensive per visitor in the entire Park Service. I think that visitor interest may be adversely affected by the absence of wolves, the hunting of moose within the park, or the denuding of island vegetation.

Topic Question 3:

I think that public sentiment and budgetary constraints rather than wilderness designation should control the type and intensity of management. Given the relatively high public cost per visitor, anything that has a significant adverse effect on visitor volume could start a downward financial spiral that results in a de facto 100% wilderness.

Topic Question 4:

Assuming the politicians who have the ultimate say accept the existence of climate change, I think the NPS should recognize that ice bridges cannot be relied upon to maintain a wolf population in the future. If a wolf population is desired on the island, human intervention will be necessary.

Topic Question 5:

I think the hunting of moose from helicopters would be a public relations disaster. Using NPS or professional hunters, or auctioning permits to hunt would also be viewed unfavorably by the public in my view. A lottery of permits to hunt might be worth studying, but hunting in the wilderness zone during the fall would still be a tricky business from a public relations and a safety standpoint.

Topic Question 6:

I think the maintenance of a wolf population is the least expensive means of moose management, and also the most consonant with the maintenance of

visitor interest and the wilderness ethic.

Correspondence: Topic Question 1:

Just leave it be. If anything other predators should be brought in. Bears, coyotes, cougars or a combinations of them. Wolves have been studied to death and there is absolutely no reason to be spending another penny of tax payers dollars on that animal. The wasted dollars with wolves and the Endangered Species Act is beyond rational.

Topic Question 2:

The island is a breeding grounds for the likes of Wayne Pacelle.... STOP the wolf propaganda! A nation 18 trillion in debt don't need to be spending a dime on an animals like the wolf that is not endangered or threatened.

Topic Question 3:

Like I said aboveleave it be.

Topic Question 4:

Changing climate....in what way? Is this they type of question where the detective asks the suspect when did he stopped beating his wife?

Topic Question 6:

It disgusts me the number of dollars spent on wolves by a nation that is 18 trillion in debt and has 100 trillion in fun funded liabilities. YET, has money to spend on wolves!

Comments: Stop the abuse of the Endangered Species Act.

Correspondence: Dear Ms. Green;

A few years ago I wrote to you expressing my opinion on the subject of bringing to the Isle Royale wolves in order to strengthen the genetic health of those resident wolves now on the island. My position was and remains that Isle Royale is principally a place of moose and wolves in the minds of most visitors. The question of assisting nature in a wilderness area can be defended by the fact that man has so altered his environment that to expect to let nature take its course is in our present day an obsolete position (global warming preventing the formation of "ice bridges", the loss of three wolves to a man made mine shaft and the list could be expanded). To add healthy wolves seems to me a low risk proposition, not like bringing into the country Asian Lady Beetles or Asian Carp.

This is a topic which has been debated for years and nothing has happened which leads me to assume you have developed a position which would disagree with mine. I would like to hear from you your position. Thank you for your time.

Correspondence: Topic Question 1:
Genetic rescue of the wolves, or wolf reintroduction (Alternative Concept B or C)

Topic Question 2:

The top priority of the National Park Service should be to preserve ecosystem health. If the flora and fauna composition on the island has any risk of changing in a way that will drastically reduce diversity or cause a loss of natural "checks and balances," the NPS should take reasonable action to prevent that change.

Topic Question 3:

The Wilderness Act defines wilderness as "an area where the earth and its community of life are untrammelled by man, where man himself is a visitor who does not remain." This statement no longer applies to Isle Royale when considering the wolf-moose-vegetation relationship. In the 1980's, humans brought a dog to the island that introduced parvo to the wolf populations. While this was a solitary event, it's impact was devastating. Many wolves succumbed to the disease, significantly decreasing the population. Any strictly-island population is going to have low genetic diversity, and this human-caused loss of life compounded the genetic diversity issue. It's impossible to say whether the wolf population would larger in the absence of the parvo epidemic, but it certainly caused the population to be "trammelled by man." The National Park Service states on its website that it's mission is to "preserves unimpaired the natural and cultural resources and values of the National Park System for the enjoyment, education, and inspiration of this and future generations." The natural resource in question, the wolves, have been impaired. Humans had a hand in their decline, even if that role can't be quantified. We should have a hand in making up for the mistake, preserving not only the wolves but the entire unique ecosystem that the island is known for so future generations can enjoy the island to the fullest.

Topic Question 4:

As the climate warms, it can be expected that cold-weather species won't do as well in the southern-most parts of their range. When looking specifically at Isle Royale, and island dominated by boreal forest, a change in vegetation composition is almost guaranteed. Warm-weather species will likely start taking root on the island, and those that require constant cool temperatures may be phased out. Moose have also been shown to experience adverse affects in warmer weather, and a warmer climate is going to present challenges for them in many ways, including a change in native plant communities. Conversely, wolves don't rely on boreal forests. They were historically found throughout the world, and currently persist as far south as India. While they will certainly be effected by a moose decline if one occurs, the moose population is currently at the largest it's been in over ten years. Even if the moose were to suffer a population crash, it's feasible that wolves could persist on the island's beaver population. What's happening to the wolves now is not an effect of climate change, and I don't think it should be considered when trying to decide how wolves should be managed in the future.

Topic Question 5:

I don't like any of the options that call for moose management (Alternative Concepts D, E, and F). To my knowledge, there have been no large direct human effects to the moose population on the island. If that's accurate, the Isle Royale moose population can still be considered as "wilderness" under the Wilderness Act, and there is no reason that humans should actively, purposefully decrease their numbers. Furthermore, it would be terribly inconsistent to allow wolf extirpation in the name of a "hands off" approach, while managing the moose population through unnatural means.

However, the moose do need to be regulated, as does every other species on the island. In a healthy ecosystem, this is something that the island's wolves should be doing. I support any alternative that preserves the wolf population at a level capable of regulating the island's moose (Alternative Concepts B and C). This addresses the problem at hand (a low wolf population), while staving off problems that can be expected in the future (a moose population beyond the island's carrying capacity, a complete change in vegetation composition due to over-browsing, and the possible loss of moose due to a lack of winter browse).

I am vehemently opposed to the "do nothing" alternative (Alternative Concept A). Preserve the park for future generations as a unique ecosystem, unparalleled by any other place on Earth. Don't let it deteriorate to just another island, barren of the complex biological relationships it once had.

Correspondence: Topic Question 1:
I would like th NPS to consider introducing a mated pair and their pack perhaps from Yellowstone or Canada if the remaining 3 wolves do not survive .

Topic Question 2:

No additional concessions or human conveniences should be allowed in hopes of letting the land and animals revitalize.

Topic Question 3:

If a balanced wolf / moose population can be brought back to the island and survive then in due time they will naturally maintain the environment with minimal "management" by the NPS. The NPS should work with the concessioner to maintain but not further develop the areas already frequented by humans. If the public cannot access Isle Royal I don't think they will support it.

Topic Question 4:

Climate change is definitely happening but how fast is unpredictable so we cannot depend on an ice bridge forming in future years thus they need for human intervention to introduce a healthy, breeding pair of wolves to reestablish new packs in due time.

Topic Question 5:

I feel the most acceptable solution is to adopt Alternative Concept C - maintain both the wolves and moose - they need each other and the land needs them.

Topic Question 6:

I was fortunate enough to work in YNP in the late 90's and experience the thrill of seeing wolves thrive there. I have also heard them howl in Denali and seen their tracks in the White Mountains of AZ. I will be on ISRO next month and do not expect to see or hear one of the remaining wolves but hope to sense their presence and will pray for their survival. Since ISRO is primarily wilderness I feel it is imperative that a wolf population there be maintained.

Thank you for taking the time to consider my thoughts.

MINIMAL degree of management beyond just the need to facilitate the right ecological balance according to the suggested minimal management plan described below under "comments"

Topic Question 4:

See my comments below

Topic Question 6:

Judged from extensive prior research about the dynamics of the moose-wolves-vegetation relationships it appears very evident that an ecological balance necessitates a sufficiently viable wolf population.

Accordingly, it is paramount that the wolf population does not degenerate or dies out. This logically calls for a management plan with a renewal of the wolf gene pool to increase the viability/sustainability of the wolf population to counteract this possible, unfortunate scenario.

Correspondence: Topic Question 1:
none

Topic Question 2:
Consider the issue that NPS introduced wolves into Yellowstone, at great expense and in the face of considerable opposition. The opposition and expense of introducing wolves at Isle Royale could be significantly less if you stop dithering. It has already been demonstrated that wolves have been a benefit to vegetation and more at Yellowstone.

Topic Question 3:
Transport in some wolves from Minnesota and release them in an area of past human disturbance (Wilderness Area or not). No big deal. Doing so would have less impact on the Wilderness than some of the horse stock areas of other Wilderness Areas around the country.

Topic Question 4:
Changing climate, which means fewer ice bridges, is a large part of the reason for the need to introduce more wolves.

Topic Question 5:
They are fine. Move on.

Topic Question 6:
In case you haven't noticed, the politics in America are becoming more hostile toward this kind of work. The longer you take studying this issue, the more it will cost, the more likely Republicans will use this project as a poster child for why NPS and biology should have fewer taxpayer dollars.

Comments: Isle Royale is dear to me. The first backpacking trip of my life occurred in 1981 when I backpacked from Windigo to Rock Harbor. I saw moose and heard wolves. It changed my life and is a big part of why I became a conservationist.

DECIDING THE FUTURE OF THE WOLVES OF ISLE ROYALE:
A CASE STUDY ABOUT DYNAMIC ECOLOGY
AND THE FUTURE OF U. S. NATIONAL PARKS
Daniel B. Botkin
Draft August 17, 2014

Isle Royales Washington Harbor, a Tranquil Moment in a Wilderness

Abstract: Using the problem of likely wolf extinction at Isle Royale National Park, I discuss possibilities for the future of Americas national parks in terms of dynamic ecology, the new understanding that ecological systems are always changing and have always changed. Dynamic ecology offers major alternatives to the past emphasis on no touch nature never altered by human actions. The two laws that govern the national parks, the Organic Act of 1916 and, in some places including Isle Royale, the Wilderness Act of 1964, allow a set of human activities that lead to management that will be much more satisfactory to the public and to environmentalists and require less effort and costs than the existing alternatives. I call for the establishment of a new legal category of national parks and natural areas in general, Dynamic Ecology Conservation Areas, showing how these meet the ten reasons people value nature better than traditional approaches.

Introduction

Isle Royale National Park, a remote island in Lake Superior, 12 miles from the nearest mainland shore, is famous for its wilderness, which is one of the places in the United States least altered at any time directly by people. A series of parallel ridges and valleys, 45 miles long and 8 miles wide rising up out of Lake Superior, the island has rugged scenery of great variety.

Not the easiest park to get to, it averages about 16,000 visitors a year, providing a wonderful opportunity for visitors to wander far from others and get a deep personal sense of the connections between oneself and nature. Peter A. Jordan, my colleague in my research on the island, who had worked there for many decades and hiked off the trails much of his time there, never came across another person more than a quarter mile from a trail.

When I did ecological research on the island, I came to love its 45 lakes on this island within a great lake, and especially the view from the summit of Feldmann Ridge looking north, a view from hillside trees, down to a large wetland and then across a lovely variety of upland and lowland forests to the Lake Superior beyond and, in the hazy distance, the shores and hills of Minnesota and Ontario.

Isle Royale is a series of ridges and valleys,

Some valleys deep enough to be lakes

The islands remote location has other advantages. No major oil, gas, or coal resources lie nearby, the only valuable mineral resources is some native (pure) copper but theres not enough to be worth commercial mining. No roads, no highway pollution, no competition for land development.

Managing Isle Royale would therefore seem a snap among National Parks. Scenery was one of the primary motivations for the creation of Americas National Park System with the passage of the 1916 Organic Act. Therefore, just leave the island alone and let it be that wonderful natural area that people seek.

But today the island is the focus of one of the most difficult and controversial management decisions the National Parks has faced and is facing. Another of the parks main attractions is the populations of wolves and moose and the predator-prey interactions among them. Many visitors come to see these two animals, hoping especially to catch a sight of a wolf. Isle Royale is also famous among scientists for its long-term research on the wolf-moose predator-prey interactions. For over 50 years on Isle Royale, both wolves and moose, their main prey, have been monitored and studied, making it longest of any large vertebrate predator and prey interactions.,

The wolves, however, are in trouble. The population has been declining, reaching just 9 in 2012, 8 in 2013, and 9 in 2014 -- the lowest numbers ever recorded since the wolves arrived on the island. Also in 2012 no wolf reproduction was detected, the first time since the study of the wolves began in 1971. According to Vucetich and Peterson, the leaders of the wolf research on the island, the genetic health of the Isle Royale population has very likely been maintained by periodic gene flow, which is only possible during winters in which an ice bridge has formed. During the recent warming in this part of the world the frequency of ice bridges has steadily declined throughout the past five decades. They and fellow scientists therefore call for the reintroduction of

a few wolves from the mainland, to provide for genetic rescue.

What should Jon Jarvis, head of the National Park System, do? Keep hands off and let the wolves go extinct, ending one of the best reasons people come to the park? Introduce wolves from elsewhere before the present population goes extinct, so that the population can be sustained rather than having to rebuild itself completely, and allowing the long-term predator-prey study to continue? Wait and see if the wolves do go extinct and then, after some appropriate time, consider a wolf reintroduction?

The National Park Service has in fact made a decision, stated in a press release:

Isle Royale National Park announced last week-after two years of discussions with wildlife managers and geneticists and input from the public-that they will not be bringing wolves from the outside for the near term.

"There is time to fully explore all the consequences of such an action, said Isle Royale National Park Superintendent Phyllis Green. If the island population of wolves declines to all males or all females, and if the moose population grows to over-browse island vegetation, bringing wolves to the island remains an option.

"Our decision on a way forward is supported by our review of the best available science, law and policy," Green said in a news release. Vucetich and Peterson say they look forward to reading the review that led to this decision.

At the heart of the matter is the prevailing view of American society about nature and people, especially about wilderness and people. The National Parks decision about the wolves of Isle Royale is consistent with, and reinforces, the still dominant belief in the balance of nature, the idea that nature is only at its best if left alone by human beings, and that left so, it achieves a balance that is constant, beautiful, most biologically diverse, and the only kind of nature within which a human being, allowed to be a visitor only, can find that spiritual connection to nature that our society associates with John Muir and Henry David Thoreau. If nature is only true if left alone, then we cannot interfere.

But if nature is supposed to achieve a great balance, including a great chain of being- a place for every creature and every creature in its place --- how can Isle Royale be changing? Many will believe there must be something people have done to destroy nature's harmony.

The Isle Royale wolf dilemma is a dramatic demonstration of the questions that National Park System faces throughout as its centennial in 2016 approaches. What should be the future of Americas National Parks?

To seek an answer, the first thing is to consider what the law that set up Americas national parks allows. The National Park System was set up in 1916 with Congressional passage of National Park Service Organic Act, which states that its purpose is to conserve the scenery and the natural and historic objects and the wildlife therein and to provide for the enjoyment of the same in such manner and by such means as will leave them unimpaired for the enjoyment of future generations. The Act is quite open and makes no statements about what kinds of actions people can take nor about the limitations of any such actions. The hands-off idea about nature is not mentioned, stating simply that the parks should be managed to provide for the enjoyment of the same [scenery and wildlife] in such manner and by such means as will leave them unimpaired for the enjoyment of future generations. Such manner and by such means certainly includes introducing more wolves to Isle Royale so that future generations can enjoy the wolf-moose predator-prey in action.

But 1916 seems a time long past, and people are wondering how the national parks fit into America a century later, given the immense changes in America's society and composition, including: The passage of major environmental laws such as the Endangered Species Act of 1972 and the Clean Water Act of 1972; dominant political beliefs about people and environment; dominant goals for nature as perceived by those most concerned about environment; and increases in our understanding of the environmental sciences that are essential to managing these parks? The 1916 Organic Acts restrictions to scenery, rather than to other aspects of the islands ecosystems, and wildlife, rather than to all forms on life, seem an historical artifact, a matter of the focus and understanding of nature in the early part of the twentieth century by those who wrote the Act and their colleagues who influenced the thinking that led to the Act.

Few knowledgeable experts today about people, nature, and environment, if asked to write a law establishing a national park system de novo, would use these limited terms. This leaves America with either updating the interpretation of the terms scenery and "wildlife" or revising the Act to generalize these. Although film maker Ken Burns has called the National Parks Americas best idea, there have been surprisingly few government sponsored reviews of the purposes of the parks, just two: the 1963 Leopold Report and the 2012 Revisiting the Leopold Report. The Leopold report, like the 1916 Organic Act, focuses narrowly on wildlife, but is much more restrictive in the demands it makes on the parks, stating: As a primary goal, we would recommend that the biotic associations within each park be maintained, or where necessary recreated, as nearly as possible in the condition that prevailed when the area was first visited by the white man. A national park should represent a vignette of primitive America. The goal was therefore reinterpreted to mean that the parks should to maintain the parks in a single condition, that balance of nature that is still so prevalent a belief. Reinforcing this view that the desirable nature was static, the Leopold report continues that "Management is defined as any activity directed toward achieving or maintaining a given condition [Italics added] in plant and/or animal populations and/or habitats" and There is no need for active modification to maintain large examples of the relatively stable "climax" communities which under protection perpetuate themselves indefinitely. Although the writers of the Leopold Report were asked to interpret for the future what the national parks should be, they restricted the answer to the then prevailing beliefs, scientific and cultural, seeing the parks through a glass darkly. The authors of the Leopold report, five men with great amounts of experience in the establishment of the science of ecology and in wildlife management and federal policies, were stating the prevailing understanding of the nature of nature undisturbed, as in a great balance, except as affected by people or in certain rare event, acknowledging these by stating that

However, most biotic communities are in a constant state of change due to natural or man-caused processes of ecological succession. In these "successional" communities it is necessary to manage the habitat to achieve or stabilize it at a desired stage. For example, fire is an essential management tool to maintain East African open savanna or American prairie and where animal populations get out of balance with their habitat and threaten the continued existence of a desired environment, population control becomes essential. This principle applies, for example, in situations where ungulate populations have exceeded the carrying capacity of their habitat through loss of predators, immigration from surrounding areas, or compression of normal migratory patterns.

The qualifications in the Leopold Report that allow for removing animals that become out of balance with their habitat would seem to readily be extended to the opposite, an introduction of wildlife, when the present population is out of balance with their habitat to put it in this old-fashioned term. My interpretation therefore is that although the Leopold Report assumes a balance of nature, it does in fact allow for the kind of actions necessary to keep the wolf population, and therefore the moose population, sustained on Isle Royale.

The 2012 Revisiting the Leopold Report focuses on environmental change, and therefore allows changes to be made by people in the National Parks.

Today, there is a growing understanding that natural populations and ecosystems are rarely static, never in a perfect balance of nature, but always changing, sometimes in response to external environmental changes, sometimes due to the internal system dynamics. Moreover, there is also a growing recognition that life on Earth has always existed within changing environments and therefore species has had to adapt to these changes to the point that many, in my experience, most, species require change in order to persist. Terry Anderson and I have called this dynamic ecology and the primary purpose of this paper is to consider how the management of Americas national parks must change to accept dynamic ecology.

Isle Royale as a Legally-Designated Wilderness

A further complication is that Isle Royale was designated in 1976 to be a wilderness as defined in the U. S. Wilderness Act. This Act is much more restrictive than the 1916 Organic Act and the two National Park Service requested reports, 1963 and 2012. It states that

A wilderness, in contrast with those areas where man and his own works dominate the landscape, is hereby recognized as an area where the earth and its community of life are untrammelled by man, where man himself is a visitor who does not remain. An area of wilderness is further defined to mean in this Act an area of undeveloped Federal land retaining its primeval character and influence, without permanent improvements or human habitation, which is

protected and managed so as to preserve its natural conditions and which (1) generally appears to have been affected primarily by the forces of nature, with the imprint of man's work substantially unnoticeable; (2) has outstanding opportunities for solitude or a primitive and unconfined type of recreation; (3) has at least five thousand acres of land or is of sufficient size as to make practicable its preservation and use in an unimpaired condition; and (4) may also contain ecological, geological, or other features of scientific, educational, scenic, or historical value.

However, the Wilderness Act specifically states that it does not override any of the provisions previously enacted for the U. S. National Park System, stating:

(3) Nothing in this Act shall modify the statutory authority under which units of the national park system are created. Further, the designation of any area of any park, monument, or other unit of the national park system as a wilderness area pursuant to this Act shall in no manner lower the standards evolved for the use and preservation of such park, monument, or other unit of the national park system in accordance with sections 1, 2, 3, and 4 of this title, the statutory authority under which the area was created, or any other Act of Congress which might pertain to or affect such area, including, but not limited to, the Act of June 8, 1906 (34 Stat. 225; 16 U.S.C. 432 et seq.); section 3(2) of the Federal Power Act (16 U.S.C. 796(2)); and the Act of August 21, 1935 (49 Stat. 666; 16 U.S.C. 461 et seq.).

This suggests that the Organic Act of 1916 supersedes the Wilderness Act, and therefore legally national parks are open to actions that promote scenery and wildlife.

Implications of Dynamic Ecology for Isle Royale and its Wolves

As I stated earlier, the dominant belief about nature in the United States has been the balance of nature, which means that nature undisturbed by people achieves a constancy of form and structure, which would persist indefinitely in that single state, as long as undisturbed by people. As a consequence, nature is only unnatural when disturbed by us.

The new understanding of nature, which we call dynamic ecology is that change is natural, that the environment has always changed and is always changing at many scales of space and time. As a result, all life has evolved with and adapted to change. Species that exist today have had to make this adaptation. And in many cases, species promote change, in this way outcompeting other species less adapted to certain kinds and rates of change.

Furthermore, dynamic ecology places people within nature, and acknowledges that many landscapes that people appreciate most deeply and consider natural are a product of human actions combined with nature's dynamics.

This is not to say that all actions are good or desirable. On the contrary, it is clear that people have harmed nature in many places in many ways. As I've written elsewhere, once we accept the naturalness of change, then nature becomes our guide. If a change is natural in kind and rate, then species have had time to evolve and adapt to it, often requiring it. Therefore, if we make those kinds of changes, the results are likely to be good or at least benign. It is novel changes, like the introduction of novel chemicals as pollutants, that we need to be concerned about more..

THE TEN REASONS PEOPLE VALUE THE ENVIRONMENT

Let us therefore think generally about why people value nature, and therefore why the value national parks. Developing a management policy for the national parks that will serve for decades or more in the future must also consider effects of other deep changes in modern civilization and human societies during the past century. This leaves us with a number of possible goals for the national parks, as follows:

1. Some believe the national parks should be managed for their primary original goal -- scenery- which, as Alfred Runte as eloquently explained, was originally thought of in terms of geological wonders rather than biological diversity.
2. Today's environmental sympathies suggest that "scenery" is more than geological wonders and includes functioning, representative ecosystems, especially where and when a particular kind is there's threatened or endangered.
3. The 2012 report proposed it be managed for "environmental change." Some believe, and this can be read into the 2012 report, that the National Parks should be used as a weapon against global warming, to the subjection of the other local (within a parks boundaries goals.
4. Some believe the parks should have as the prime objective to meet the desires of America's increasingly multicultural society, arguing that scenery as a primary goal is an outdated Northern European White man's interest and not important to today's minorities.
5. We must also be aware that attempts to mine resources-geological and biological- -- in and near the NPs are always present

When ecologists discuss the value of nature, they have traditionally listed just for reasons: utilitarian; public service; ecological; and moral. The first means that something in nature produces a produce or is a product that has direct use and may be commercial valuable. Public service is something nature does for us that we value and would take a lot of time and energy for us to do ourselves, like bees pollinating flowers; moral means the right to exist independent, so it is said, of human preferences. Ecological refers to the idea that species have roles in their ecosystems, and that some of these are necessary for the persistence of their ecosystems, perhaps even for the persistence of all life. Everything else is lumped into a vague category under the term aesthetic.

Having immersed myself in nature throughout my life, thought about it, studied it, tried to understand it, and tried to solve some environmental problems, I have come to believe there is much more to a person's valuation of nature than these four categories. There's a special feeling I get going into wilderness that is something else than what one could say is seeing a beautiful view. Henry David Thoreau expressed this directly and with a sense of humor: I caught a glimpse of a woodchuck stealing across my path, and felt a strange thrill of savage delight, and was strongly tempted to seize and devour him raw; not that I was hungry then, except for that wildness he represented. That's a fun approximation of what I am trying to say.

My conclusion is that there are ten reasons people value nature: utilitarian; public service; ecological; moral; theological; experiential; aesthetic; recreational; spiritual; and creative. Utilitarian, public service, ecological and moral as generally stated. To these I add tTheological means that some religions value nature and its diversity directly, and a person who subscribes to that religion supports this belief.

Cross-country Hiking on Isle Royale.

Which values of nature is this man enjoying?

Aesthetic, experiential, recreational, spiritual, and creative reasons for valuing biodiversity have to do with the intangible (nonmaterial) ways that nature and its diversity benefit people. These are oft en lumped together, but we separate them here. Aesthetic refers to the beauty of nature, including the variety of life. Recreational is what it seems-that people enjoy getting out into nature not just because it is beautiful to look at, but because it provides us with activities that are enjoyable and healthy. Experiential means the what-its-like to be within some kind of natural setting, for example, what it is really like to be in a dark, dense forest far from a road? Some people like to get near dangerous animals, like grizzly bears, to get a feeling for what this is like. It is something other than aesthetic, because that refers to finding beauty. Experiential is not limited to nature, of course. One could get an experiential reaction from visiting a famous city like Venice, Italy or New York City's Manhattan. As one author put it, natural vegetation can influence people's moods, contribute to stress reduction, and promote medical recovery.

Recreational Fishing at Isle Royale

Spiritual refers to the way that contact with nature and its diversity have moved people ever since nature and its diversity have been written about, an uplifting often perceived as a religious experience. Creative refers to the fact that artists, writers, and musicians find stimulation for their creativity in

nature and its diversity.

Getting in touch with nature, off the trail,
on Isle Royale

To these kinds of formally designated wilderness, we should add the kind of landscape that Thoreau sought, a place where he could experience wildness, a spiritual state existing between a person and nature, which he distinguished from wilderness, which was land or water unused at present by people and thus a state of nature. As I discuss in *No Mans Garden: Thoreau and A New Vision for Civilization and Nature*, wildness meant so much to Thoreau that elsewhere he wrote: I caught a glimpse of a woodchuck stealing across my path, and felt a strange thrill of savage delight, and was strongly tempted to seize and devour him raw; not that I was hungry then, except for that wildness he represented. For Thoreau it was possible to find this wildness in places quite close to home and civilization, like Walden. It is much like the idea behind Japanese gardens, meant for reflection and meditation. Many places could evoke this sense of wildness, depending on ones sensitivities and experiences, but we can do much on the same scale to create some kinds of parks with this purpose in mind, including a city park that is isolated from the city's noises.

The Kinds of Nature Preserves

As I have discussed, the past predominant belief about our national parks is that they represent, as the Leopold Report put it, as nearly as possible in the condition that prevailed when the area was first visited by the white man - nature in its single permanent state of balance. Now that we understand that nature is quite the contrary, non-steady-state ecosystems never constant, it seems to be that there are three kinds of natural areas that we must maintain in the future: no-action wilderness, nature as it is believed to have been in some past state, such as preagricultural wilderness, and dynamic ecology conservation areas, in which changes are accepted and introduced as needed to meet the various needs and desires of people, as I have already discussed, and also as necessary for the conservation of biodiversity, for maintaining specific species, groups of species, or examples of kinds of ecosystems. I review these three types in turn.

Natural area type I: Wilderness untouched by human actions

The first is an area untouched by direct human actions, no matter what happens. This kind of wilderness is necessary for observation as a baseline from which scientists can measure the effects of human actions elsewhere; it is an essential calibration of the dials we should set up to monitor the state of nature.

Natural Area Type I, No-touch. The Thain Family Forest

At Bronx Botanic Garden, never burned, never logged.

Some of them may be pleasant for recreation, but some may not be, and some may become a nature never seen before. As should be clear by now, these will not be as nearly as possible in the condition that prevailed when the area was first visited by the white man.

The idea here has been to establish nature as it always was. But consider what is known about America's first legally designated wilderness area, the Boundary Waters Canoe Area of Minnesota, a 1 million acre wilderness. What is the true character of this wilderness that people seek in the Boundary Waters? That was a question that intrigued Miron (Bud) Heinselman (1920-1993), a career U.S. Forest Service scientist, a native of northern Minnesota, and one of the major proponents of the wilderness designation for the Boundary Waters. I got to know and admire Bud during the 1980s when I was doing research in and near the Boundary Waters. He was another of those fine naturalists like Murray Buell, a great observer who paid attention to what he saw and never, to my knowledge, reached conclusions in spite of appearances to the contrary.

Bud Heinselman studied the history of the vegetation of the Boundary Waters, using three kinds of evidence: written history; existing forests; and lake sediments. Here's what he found out. Pollen deposits from the Lake of the Clouds within the Boundary Waters Canoe Area indicate that the last glaciation was followed by a tundra period during which the ground was covered by low shrubs now characteristic of the Far North, as well as reindeer moss and other lichens and what botanists informally call lower plants-mosses, club mosses, and their relatives. As the climate warmed a bit, the tundra was replaced by a forest of spruce, species now found in the boreal forest of the North and dominant in many areas of Alaska and Ontario. The climate continued to warm, not at a constant rate but with a good bit of variation. About 9,200 years ago the spruce forest was replaced by a forest of jack pine and red pine, trees characteristic of warmer and drier areas. Paper birch and alder immigrated into this forest about 8,300 years ago; white pine arrived about 7,000 years ago; and then there was a return to spruce, jack pine, and white pine, suggesting a cooling of the climate..

Thus, every thousand years a substantial change occurred in the vegetation of the forest, reflecting in part changes in the climate and in part the arrival of species driven south during the ice age and slowly returning. (Species that could live in the same climate did not all arrive back in that climate at the same time, because seeds of each species move at different rates from one another.)

Lake with conifer forests in the Boundary Waters Canoe Area, Minnesota, 1 million acres of legally designated wilderness, and the first so designated wilderness established in the United States. Its large size suggests that a light touch would be needed for actions to retain a wilderness feel. This is, however, a legally no-touch area.

The question is, which of these forests represented the natural state? Or, putting it a slightly different way: If our goal were to return the Boundary Waters Canoe Area to its natural condition, which of these forests would we choose? Each appears equally "natural" in the sense that each dominated the landscape for approximately 1,000 years and each occupied the area when human influence was nonexistent or slight. The range of choice is great—from ice to tundra to boreal forests to hardwood forests to prairie—representing kinds of vegetation communities now distributed thousands of miles apart and some that no longer exist. If the goal is to seek the state that existed for the longest time in the several hundred thousand years, then that would be under two miles of glacial ice.

Natural area type II: nature as we believe it was at some specific time in the past

The second kind, nature as we believe it appeared at some past specific time, is an area that has the appearance of landscape or seascape that most closely matches the ideal of wilderness as it has been thought about in recent decades. In North and South America, Australia, New Zealand, and other places in which the time of arrival of modern technological man is readily dated, the idea is to create natural areas that appear as they did when first viewed by European explorers, as The Leopold Report states and the Wilderness Act details. In the Americas, this would be the landscape of the seventeenth century. It is necessary to choose a time period that has the desired appearance, discussed earlier for the Boundary Waters Canoe Area, which, from the end of the last ice age until the time of European colonization, passed from ice and tundra to spruce and jack-pine forest. If natural means simply before human intervention, then all these habitats could be claimed as natural, contrary to what people really mean and really want.

There are nature preserves that are intended to do just this. The Thain Family Forest at the New York Botanical Garden to be such a place, believing in a balance of nature. But that forest, like others in eastern United States, that have never been touched, have little resemblance to the wilderness in the sixteenth and early seventeenth century, supposed to be filled with only very large trees widely spaced, as I explain elsewhere..

In the twentieth century, this demand for reconstructing the past reached extremes with the work of zoologist Paul S. Martin, who called for resurrecting the biological diversity of sometime before 10,000 years ago, before American Indians arrived in the New World. He was asked in an interview published in *American Scientist*, If you were suddenly put in charge of an effort to repopulate North America with species lost during the late Quaternary, where

would you begin? What animals would you most like to see roaming the continent again?

Martin replied, I would like to see free-ranging elephants in secondary tropical forests of the Americas. Until the end of the Pleistocene, forest and savanna in the New World tropics supported three families of elephants.

Given the vast problems that arise from invasive species, this is an extremely odd goal for someone concerned about conserving biological diversity. To believe one of these fixed times is best and necessary is to believe in an imaginary world quite different from the history of life on Earth as so well revealed by twentieth-century studies in paleontology. As I have discussed, and many paleontologists have shown, our planet has gone through many changes in life-forms, degrees of diversity, and dominant species, and each stage has been consistent with the persistence of life past its time.

Natural Area type III: Dynamic Ecology conservation areas.

Dynamic ecology conservation areas, the third type of natural region, are set aside to meet a variety of the reasons people value nature, and to sustain biological diversity, either for a specific species, such as Kirtland's warbler, or for a kind of ecological community or ecosystem. Because we have so altered the landscape and have allowed inadvertently only small patches of former habitats to remain, most of these areas require active intervention on our part if they are to persist. For example, to manage the habitat of Kirtland's warbler in a way that allows the species to survive, we must pay attention to the frequency of fires and increase or reduce the rate so that it best suits the needs of that species. If the global climate changes, whether or not because of our actions, we may have to relocate the natural area for the warbler and also learn how to persuade it to move there. Then again, male Kirtland's warblers have recently been heard singing in Wisconsin, far from where we believed they would nest.

Conserving Biodiversity in the Pine Barrens Forests of New Jersey

Eastern Kingbird lives in young woods Pine warblers prefer old-growth

It is important to understand the distinctions among these three kinds of natural areas, each of which represents a different aspect of the older meanings attached to wilderness. Each is quite different from the others, and generally it won't be possible to manage the same area to be all three at once: truly undisturbed; appearing as in a specific time such as a presettlement landscape; and functioning to conserve endangered species or biological diversity. Under the old perspective on nature, one could assume that all three goals would be accomplished in any area simply by removing all human actions. To be viable, each kind of natural area must be a certain size (as yet generally undetermined). For example, Kirtland's warbler conservation areas must be large enough to support the breeding territories of hundreds of males.

Heavily managed with selective logging and prescribed burns, Pine Barrens forests of New Jersey promote biodiversity.

Bob Williams, certified forester with 30 years experience in the Pine Barrens, planning these selective harvests and prescribed burns, received the New Jersey Audubon Society 2013 Conservationist of the Year award for his work, long considered in the past to be the worst kind of anti-nature human interference.

The smaller the conservation area, the more kinds and more intense our actions must be. The smallest area is simply a zoo, in which we provide all the necessities and remove all the wastes for the forms of life that we maintain there. At the opposite extreme is nature before technological civilization, where vast areas unaffected by human beings existed. The amount of effort required to maintain a preserve of any size depends also on the characteristics of the species found there, including life-history characteristics, such as size and longevity.

Intense management including removing excess fuel and light prescribed fires, have restored these Ponderosa Pine forests to the way they looked over wide areas in presettlement times, widely spaced large trees with grasses growing in between. In contrast, an adjacent Nature Conservancy natural area that is no-touch has changed greatly, filled with very dense small trees and large amounts of woody fuel that eventually leads to fires that are highly destructive and from which the forests take a very long time to recover.

Maintaining wilderness areas in the future will require that we develop ways to make these lands secure from undesirable uses. As resources become limited and the human population continues to grow, there will be increasing pressure on natural areas for extracting timber, harvesting wildlife, and mining minerals.

Implications for Isle Royale National Park

The next step in considering the management for Isle Royale is to consider the ten reasons people value nature and discuss which will be satisfied by each of the three types of natural areas. (Those reasons are repeated here in Table 1.)

Table 1

Isle Royale as an untouched wilderness

It seems likely, although not certain, is that the wolves will go extinct without genetic rescue, leaving the moose without a predator on the island. Having done research on the island from 1970-1975, I was surprised to see how much the moose had changed the island when I returned a few years ago. Moose are creatures of young forests and it is well-known that they tend to clear forests of early successional species and leave the late successional species, especially white spruce and sugar maple, which they don't like. In the 1970s the island was well forested and many stages and was a beautiful place in my impression. When I returned this century to the west end of the island, it had a different aspect, heavily cleared, dominated by small stems of trees and shrubs nipped off about two or three feet high by the moose, giving the island a messy uncared-for look that was not beautiful nor inspiring. One implication of the out-of-date balance of nature theory is that a population of a species of wildlife left to itself will increase in abundance to a permanent carrying capacity, or else an herbivore species requires a predator and that the two of them will reach a constant abundance of a series of regular cycles, known as the Lotka-Volterra cycles. But I know of no evidence that supports either, and the one of the excellent benefits of the long-term scientific study of the wolves and moose of Isle Royale is to test how closely, if at all, that predator-prey interaction leads to a permanent stable cycle of both species. The overwhelming evidence for a large herbivore like moose introduced into a new habitat, or in the case of the moose of Isle Royale, released from any predation, is quite different. Australian ecologist ecologist Graeme Caughley analyzed such cases and showed that a large herbivore so released from pressure or introduced into a completely new habitat increases a first to a very great abundance, overusing its resources, and then crashes to a much lower level. In the long-run, the population varies considerably over time, but never reaches again any abundance near to its first maximum. A likely expectation, then, is that the moose will first increase to very high numbers, overeating key resources (most likely the aquatic plants so important for mineral nutrition of the moose) and then in many decades in the future the moose population will crash. It will then persist at much lower and time-varying population levels.

Which of the human values of nature will this choice satisfy? Only recreational, and it's a long way to go just to hike in no longer beautiful woods with either moose very common or not very common. Not a very good choice from a human perspective

Isle Royale as Natural area type II: nature as we believe it was at some specific time in the past

Many will think that the obvious choice for Isle Royale, given modern American environmentalism, would be what the Leopold Report called for - as the first white man saw it. The island's vegetation has been well studied as early as 1905, with one of the most detailed and interesting analyses done by botanist Cooper in 1913.

That Isle Royale as seen by the first white man would have no wolves or moose, and the dominant large vertebrate was caribou. These were still on the island around the turn of the twentieth century, but were moving north, for reasons nobody understood, and the moose came to the island in the first decades of the twentieth century, on their own and again for reasons no one understood, except that they were expanding on the mainland. The vegetation formed very dense forests from ridge top boreal of spruce and fir to well-drained downslope eastern deciduous dominated by sugar maple but relatively biologically diverse, and including large wetlands and the more than 40 lakes on the island, with their complement of northern North Hemisphere aquatic vegetation. The island would have a variety of habitats, most much denser and therefore quite difficult for hiking, lacking any trails.

This Isle Royale would not satisfy the current desire to have wolves and moose nor the continuation of the long-term study of their interaction. For simplicity, let us include scientific research among the creative category, and this option would fail to meet the current scientific interest. However, and this is the serious downside, this choice would require continued management of many kinds, including logging to get rid of vegetation that was not part of that scene, rebuilding where natural erosion had changed important drainages, hunting and removal of species not characteristic of that time. It would therefore not meet the terms of the Wilderness Act of 1964, which states that a wilderness is an area where the earth and its community of life are untrammelled by man, where man himself is a visitor who does not remain . . . retaining its primeval character and influence, without permanent improvements or human habitation, which is protected and managed so as to preserve its natural conditions and which (1) generally appears to have been affected primarily by the forces of nature, with the imprint of man's work substantially unnoticeable; (2) has outstanding opportunities for solitude or a primitive and unconfined type of recreation.

But it could serve, especially for people not familiar with its history, and visiting the island where and when there was not logging nor recent clear-cuts, nor active hunting. It would therefore at times and in places meet the experiential; aesthetic; recreational; and spiritual values, but only at certain times and certain places. The costs to maintain the island in that vegetation state would likely exceed what the National Park System could afford, and therefore this is a highly unlikely impractical choice.

Isle Royale as Natural Area type III: Dynamic Ecology conservation areas.

This choice allows for natural changes to take place and for people to introduce changes under certain circumstances. These circumstances would include inadvertent changes caused by human actions either within or outside a natural area that led to changes park managers determine do not meet the requirements of that natural area. It includes changes that are within a natural area that are not known to have been caused by human actions, but would lead the natural area to conditions that were not within those considered the goal of that area. Because managers would be working with dynamics changes that are inherent system characteristics, the required actions by people would be much less in kind and degree, and therefore the costs associated with management would likely be lower. This type of natural area meets the greatest number of reasons people value nature, Ecological, moral, experiential, aesthetic, recreational, spiritual, and creative.

I can imagine colleagues immediately raising a concern that the allowance of some kinds of changes are bound to lead to legally permissible changes that run counter to the goals for the natural area. No doubt in the real world of politics, lobbying, and poor thinking, this is possible, but I reply that this approach is still going to be better in the long run than any of the alternatives. Of course, I am merely suggesting an idea here, which will have to be developed carefully before it would become legally binding. I have to add that given the way environmental issues have been politicized and cast as moral arguments rather than technical decisions, I fear for the worst. But one must still hope for the best and set up plans that are most likely to succeed in a society of people of good will devoted to rationality.

Implications for All National Parks

The implications of all national parks should be obvious. There are three, not one, kind of nature preserves, and no doubt some national parks are best served by one while other are best served by another, but overall, the analysis provided here shows that in terms of present laws that govern Americas national parks changes of the kind I describe are allowed, and that dynamic ecology natural areas will in more cases than not allow national parks to achieve their specific goals. In addition, Americas national parks will also be better able to be managed consistent with the goal of the original 1916 Organic Act, preserving scenery in the largest meaning of that term, to include not just geological structures like Half Dome in Yosemite, and not just the structural grandeur attributed to giant sequoia, but also to wolves and moose interacting.

The concept of dynamic ecology natural areas will also allow for a clearer and more ready path to decisions concerning attempts to exploit mineral and biological resources within and near parks. The basis for this statement goes beyond the scope of this paper. It will be clear to those familiar with the history of Americas national park or at least lead to more rapid, more rational, and better decisions when these issues arise. If there is interest, the specifics of this implication could be pursued in future articles.

The failure to recognize that there are three types of natural areas leads readily to confusion and contradictions in management policies and in thinking about the national parks. For example, National Park director John Jarvis discussed the management of wilderness areas within the National Park System in Directors Order #41: Wilderness Stewardship. This document has an excellent goal, to improve the concept and management of legally designated wilderness within the national parks. However, the discussion of whether actions can be taken with these areas is somewhat confusing. In one place, Jarvis writes

Wilderness character is the combination of biophysical, experiential, and symbolic ideals that distinguishes wilderness from other lands. The five qualities of wilderness character are (1) untrammelled, (2) undeveloped, (3) natural, (4) offers outstanding opportunities for solitude or primitive and unconfined recreation, and (5) other features of scientific, educational, scenic, or historical value. Accordingly, each wilderness park will integrate the concept of wilderness character into park planning, management, and monitoring in order to preserve the enduring benefits and values of wilderness for future generations.

This would seem to require no-touch, consistent with the traditional balance of nature idea that only people damage nature and the nature undisturbed is the only good kind. This would seem to cast wilderness areas in national parks into natural areas type 1 only.

However, when it comes to climate change and wildfires, the director allows for actions, which as stated, are logically inconsistent with his characterization of wilderness. For example, he writes:

As a result of many factors including past fire management practices within wilderness and the need to control wildfires on adjacent lands, fire may not be adequately functioning as a natural change agent. In those cases, augmenting natural ignitions with prescribed fire or other fuel treatments within wilderness may be necessary to restore or maintain ecological function if that is a goal identified in the park's Wilderness Stewardship Plan or FMP. . . The analysis should specify the minimum activities (strategies, methods, and tools) that are generally permitted for managing wildfires, implementing fuels treatments, and conducting post-fire activities. For management of long-duration wildfires, an incident specific minimum requirements analysis should be considered to evaluate the methods and tools being applied to manage the event. The analysis should be periodically reviewed throughout the incident to ensure that appropriate strategies, methods, and tools are being used to protect wilderness character.

And regarding climate change, he writes

Climate change will have long-range effects on all aspects of ecosystem function. Wilderness managers and superintendents should collaborate across program areas to develop flexible, sustainable strategies that uphold wilderness values and integrate with park, regional, and national level responses. These strategies must account for any effects on wilderness character from actions taken or not taken.

The logical contradiction would be dealt with by putting some of the wilderness areas into natural area type III dynamic ecology natural area. The Directors Order #41 also accepts the need to preserve cultural resources with the national park wilderness areas, stating that , There has been prior human use in all areas now designated as wilderness, resulting in archeological sites, historic structures, cultural landscapes, and associated features, objects, and traditional cultural properties located in many wilderness areas that contribute to our appreciation of wilderness. I believe that the logical confusion between no-touch assertions and the acknowledgment of the need especially to conserve cultural resources but also to deal with a warming climate and wildfires will lead to confusions about what to do - it will lead to contradictory management demands, which will then delay or fail to achieve whatever the goals actually are. That is why there will, in the end, be a recognition of the need for several categories of natural areas.

POSTSCRIPT: A SHORT STORY

Having proposed a new category of natural area, I do have concerns about the ability of modern American society to carry it out successfully and to deal in general with Americas Best Idea in the future. The difficulty I have with the current approaches to environmental issues including this one is perhaps best illustrated by an experience I had in the 1980s. I hope the reader will bear with me while I relate this story, which is personal but revealing of my concerns. It was within that turnabout time, the time of awakening awareness of global environmental problems, and I was piloting a small aircraft-a Cessna 182- -- from Santa Barbara to San Jose, California, to attend a NASA meeting about whether there could be such things as a global ecology and global environmental problems, possibly man-made. I had filed an instrument flight plan, which enabled me to take advantage of the FAA's flight-control system to its greatest extent and, if necessary fly through clouds and land in instrument-requiring conditions. The weather forecast had been good, with only scattered clouds (meaning clouds would occupy less than 50% o the airspace), and I looked forward to a pleasant flight over Californias beautiful coastal mountain ranges.

Once I was in the air, however, it was immediately apparent that the day had grown much cloudier, between broken cloud cover (more than 50% coud cover) and overcast (100%).I was being routed at 10,000 feet over central California when I saw up ahead a large cloud buildup, the kind on its way to becoming a thunderhead-at least I thought it was only on its way. Then I was flying within that cloud and it was hailing heavily. Within 30 seconds the windshields were iced over, and likely the entire plane was iced over too. Since I couldn't see out, I had to depend completely on the instruments, but Id had extensive training for this kind of emergency and immediately did as Id been trained to do: Turn on the carburetor heat so the carburetor wouldnt ice over and halt the flow of fuel (yes, those planes still had carburetors, not fuel injection). Stabilize the plane, making sure that it was flying straight and level, on course and at its assigned altitude. Continue to scan and read all the instruments to make sure the aircraft was functioning properly. A minute or two had passed by. Everything seemed stable, even though iced-over.

Then I called the air traffic controller and in my calmest and most professional voice requested a lower altitude. I was told to descend to 8,000 feet, which I did immediately, and there, back in the bright California sunshine, the ice quickly melted away and the plane and I continued to fly safely and normally. Any similarly trained pilot could have done exactly the same thing, and instrument-rated pilots reading this will probably not be particularly impressed. In a few more minutes I saw another cloud buildup directly ahead, but it reached only 9,000 feet. Not wanting to chance flying within another buildup that looked harmless on the outside, I called the air traffic controller again and requested 10,000 feet. "You were just at that altitude and asked for a lower one," he replied. "Please make up your mind." But he okayed the higher altitude and in bright sun I sailed calmly over that next cloud.

This little story illustrates how one can respond to a potentially dangerous situation safely and calmly. It requires good training, much practice, and an understanding of the systems in which you are involved. The more I understood about how all the systems worked-engine, fuel flow, electrical, navigational-the safer I was. There was no time for fear, or to cross my fingers. There was no time and no need to focus on ideology, mythology, or anything else unrelated to the task at hand.

Without trying to stretch the analogy too far, upon landing safely and making my NASA meeting on time, it seemed to me that the approach used to pilot an airplane-objective, scientific, technically competent, and calm-was the right approach for dealing with potential global environmental problems that were coming to the fore but had not yet reached a condition equally treacherous as iced-over conditions, so to speak. I still believe that this is the correct approach, and am disappointed to see the search for solutions to what many consider the greatest crisis of our time, global warming, focusing on belief, wishful thinking, ideology, opinion without substance, and political orientations.

Not that emotion cant be a part of piloting aircraft. Far from it. As I mentioned much earlier in this book, one of my life heroes, Antoine de Saint-Exup ry, wrote that piloting small aircraft put him in touch with nature in a way unavailable to him or to anyone before the invention of powered aircraft. For him, piloting a small aircraft by himself was strongly emotional, an experience of great beauty and meaning in every sense of the word. Who knows clouds better, in a very human way, than one who has flown an iced-over airplane through their turbulence, winds, and dark gray? Of course we should, and could, approach the management of global environmental problems with connections to our emotions, our sense of beauty. But these should not prevent us from using our rationality, knowledge, and understanding to actually solve a global environmental problem at hand.

Correspondence: Topic Question 1:

The cost of interventions and the value of ecosystem services should be of paramount consideration. Of course, costs and priorities should always be considered especially in times of limited funding. But the value of the ecosystem that could be lost from intervention is equally important. To me the principle value of the Isle Royale ecosystem is that it is still relatively undisturbed from human intervention with natural processes still largely predominate. In the long view, we could easily lose more than we gain with aggressive interventions in response to current concerns.

Topic Question 2:

The primary issue should be maintenance of an island ecology that is constantly changing. While some intervention, such as control of non-native invasive species, is sometimes justified, interference with natural processes should be avoided as much as possible. The temptation to provide visitors and researchers with the wolf-moose experience that they have become used to in the past should not be the overriding management consideration.

Topic Question 3:

Low intensity. We visited Yellowstone right after the fires of 1988. At the time, there was great public and media consternation about the damage to our national treasure. As time passed, concern about the fire seemed to fade from public concern and even lead to better "management" of the resource where sometimes less intervention is better. We should take the long view in any management strategies on Isle Royale as well.

Topic Question 4:

Considering that there seems to be little political will to reverse or even curtail climate change, it's likely that climate change will continue or even accelerate in the foreseeable future. So it needs to be considered in management decisions but it should not be used as an excuse to intervene because the reduction in the wolf population might be "man-made". The wolf population may have eventually declined anyway.

Topic Question 5:

I prefer option A. I don't think D, E & F are reasonable approaches. Locally, the city and county parks have been culling deer to reduce damage to the parks and surrounding neighborhoods. I support that decision for that situation - ie soccer fields, golf course, decorative landscaping, etc. But I don't think it's the right approach on Isle Royale. It's too much tinkering in a natural island ecosystem that could lead to unpredictable and undesirable results.

Topic Question 6:

See below.

Comments: Thank you for your email notice, for your latest update on the Wolf / Moose / Vegetation Management plan and for the opportunity to comment.

We have visited about half of our national parks from the Everglades to Denali and from Acadia to Yosemite - but Isle Royale is still my favorite and the only one to which I have returned more than once. My first visit to Isle Royale was with two friends in 1983. Since then, I have visited a half dozen times with our son, once with my wife, once with our son-in-law, and twice solo. I plan to return again in August of this year. Except for the visit with my wife, in which we stayed in the lodge, all our trips have been backpacking. On one occasion, our son & I took the seaplane to Windigo; but all our other trips were on the Ranger with an 8-day stay.

I love the scenery of Isle Royale, the peace and quiet, the wildlife, the amenities for backpackers, the relaxed pace, the feeling of immersion and the other visitors. You meet the nicest people on Isle Royale! I also like that the park staff seems highly competent and especially respectful of the visitors.

I attended your public meeting in November, 2013 in Chelsea, MI and submitted comments afterwards. After reading your latest update, it still makes sense to me that the park service should carefully consider the effects of intervention on all the flora and fauna that come and go on Isle Royale now and in the future. You may well be accused of bureaucratic foot-dragging, but I agree that you should still stay the course. I also agree that you should involve others with relevant expertise in genetics, island ecology, wildlife management, etc.

My general feeling is that the least intervention is probably the best. You are charged with the duty to "preserve and protect" Isle Royale. To some, that might mean interventions to keep Isle Royale the way it is now. To me, it still makes more sense to preserve and protect an environment on Isle Royale that is constantly changing on its own - for the future benefit of all.

Best regards,

Correspondence:	Topic Question 1: New blood line of wolves would keep the balance on the island of vegetation, wolves and moose. All these factors have to be balanced to make the island ecology to continue.

Topic Question 2:

If nothing is done to balance moose and wolves there will be a disaster in the future.

Topic Question 3:

As many visits as we have made to just balance the existing populations would be great. We have been there at least nine times in the last sixteen years and have seen how over browsing effects the island. When wolf population is up everything is more balanced.

Topic Question 4:

Immediate and not delayed intervention is needed to balance the ecology in this location.

Topic Question 5:

The alternative of doing nothing will ruin the reason people go there. We have hiked every trail several times but the highlight was actually having interaction with the Alpha male of Chippewa Harbor. Moose can be seen in several locations through the US but wolves are not a usual sight or occurrence.

Topic Question 6:

Please reintroduce the wolves on the island for everyone to learn from.

Correspondence: Topic Question 1:

I support Alternative Concept B

(introduce wolves)

Reestablish wolves on the island by bringing in new wolves to mimic a migration event; no moose management

Topic Question 2:

Moose and wolf populations

Plants and woody vegetation, due to impacts from moose browsing

Sensitive plant species, such as orchids, that are affected by forest changes

Other wildlife species affected by changes in natural habitat conditions

Streams and hydrology, due to changing stream flow conditions

Wetlands, due to potential changes to wetland plant communities

Visitor experience, due to changes in forest structure and populations of moose and wolves

Wilderness character, due to the majority of this island's land area being designated wilderness and actions under consideration that could affect the quality of wilderness character

costs associated with human management.

Topic Question 3:

Reestablishing wolves on the island should help to keep moose populations in check so as to reduce human management. The alternatives do not specifically outline how moose would be managed without the wolves, but any type of shooting, trapping or poisoning would diminish both the quality of visitor experience and the quality of wilderness in the park. It would also be costly.

Topic Question 4:

Climate change is happening and will happen. Animals and plants will have to adapt. I don't think the NPS should attempt to manage specifically for effects of climate change, let nature do its thing.

Topic Question 5:

The one problem I have with Alternative Concept B (introduce wolves once) is that it only proposes a single re-introduction. Since wolves have declined on the island due to genetic problems associated with inbreeding, more than one reintroduction, with wolves from different areas, would facilitate more genetic diversity, which should be more effective in wolf populations remaining viable in the long term.

As in the re-introduction in Yellowstone, attempts should be made to introduce groups of wolves that are members of the same pack to minimize wolf conflict, but more than one pack should be brought in, established in different parts of the island, so as to increase genetic diversity. Lone wolves tend not to survive as well as wolves with a pack structure.

Topic Question 6:

The reintroduction of wolves to Yellowstone national park has had many unforeseen effects on the ecology of the park beyond the original intent of managing elk populations. Before re-introduction, elk had browsed on cottonwoods, and willows and as these trees declined so did beaver and moose. Yellowstone's wolves have both kept elk populations in check and led to changes in elk behavior: elk travel in smaller herds and do not spend as much time browsing in open areas.

As a result, cottonwoods and willows have returned and moose and beaver populations have begun to bounce back. Also wolf kills provide food for many other species such as foxes, coyotes, crows, ravens, eagles and grizzly bears. This is called trophic cascade. Restoring a viable wolf population on Isle Royale would have far reaching effects on the ecology of the island and would reduce the cost and the detriment of visitor experience and wilderness quality that would occur with humans having to manage moose populations.

Correspondence: Topic Question 1:

If in fact the wolves of Isle Royale are now nearly gone is true, it is a huge blow to the Isle Royale ecosystem, and a large black eye to the management of the park. Many generations of genetic tuning among the Isle Royale wolves are now gone, when an introduction of a few wolves from the mainland might have enriched and perpetuated the population.

Topic Question 2:

In my opinion, the science of ecosystem management should be at the forefront of any decision-making when evaluating the future management of the wolves, moose, and vegetation at Isle Royale. Isle Royale has provided a perfect laboratory to study predator/prey relationships over the years, and perpetuating this system with small inputs when necessary seems like a no brainer to me. My concern looking at this issue from the outside is that the science is being ignored, while the perpetuation of bureaucratic power structures is behind the decision making. This is a serious blow to the management of the park.

Topic Question 3:

Type: Whatever is necessary to maintain a genetically fit wolf population.

Intensity: Whatever is necessary. The cost of maintaining wolves will be negligible, particularly when compared with the cost of dealing with an out-of-control moose population.

Topic Question 4:

I think that in order to answer this question honestly, I'd have to be presented with some scenarios. How will climate change affect Isle Royale in the near and long term future, and how will this affect the Island's creatures and vegetation? It is hard for me to describe the type and intensity of management when I cannot predict the force climate change will inflict on the island ecosystem, and how those forces will manifest themselves to the advantage or detriment of the island ecosystem.

We cannot predict how climate change will affect moose and wolves of Isle Royale. We can only deal with what exists, which, in the case of Isle Royale, is a growing moose population that needs the best possible predators, wolves.

Topic Question 5:

I dislike the way this process is being managed. I don't get the impression the intention of the park service managers running the operation are being open and honest about the process. I get the feeling they are going through the motions, and are not interested in sharing what others have said so far. The emails that many of us submitted in the past year or two should have been made public, so that we can read what the public, especially, scientists, have suggested, as well as the NPS' responses to those suggestions.

Correspondence: Topic Question 2:

Please make sure public involvement in the Foundation Statement development is a significant part of what gets us to a decision. If things are done properly and in order, the Foundation Statement should be done prior to the close of the public comment period. Without the Foundation Statement, it is asking us to comment without defined goals for the park (unless you want us to look to the 1998 GMP) to understand the foundation for park decisions.

Topic Question 6:

I wish I could make the meetings, but really can't...

The notice was too short and the locations too difficult. The last meetings on the subject were much more dispersed and at easier locations. I believe it is a mistake to have them so hard to get to.

Correspondence: Topic Question 1:

transplantation of wolves to Isle Royale (why hunt them in one part of the state when they're needed alive in another?)

Topic Question 2:

indigenous populations, plant, animal, and human. Prior to European entry, there was a balance of the 3 based on the wisdom gained from ancestors. This has been disrupted for many years and it's passed time to return to original balance.

Topic Question 3:

wilderness has never meant indigenous populations couldn't thrive. They understand the limitations and the benefits of such an environment.

Topic Question 4:

go back to records especially those held and remembered by those with ancestors from this land (Ojibwe/Chippewa in particular). Our elders will teach you their knowledge, if approached respectfully.

Topic Question 5:

Like: you've invited me to comment. Dislike: our state has a law permitting hunting of wolves. Let's relocate them where they're needed, for all to live in peace.

Topic Question 6:

Brother Wolf has been respected by ancient peoples for countless thousands of years. We hunt the same foods but have an understanding not to harm one another in that pursuit. Wolves are as sociable/family oriented as humans and my ancestors knew this from long ago. Thus the understanding. That balance has been broken on Isle Royale. You have the ability to make it right. With respect to the national park status imposed upon these islands, people, wolves, and native plants need to be restored to the area. If not, you will see islands of sand in your lifetime.

Correspondence: Topic Question 1:

I like alternative concept A.

Topic Question 2:

There were coyotes on Isle Royale before the timber wolf population. I expect that once wolves are not on the island, coyotes will follow the ice bridge to the island and establish themselves. I'm interested in seeing how the moose and coyote population will act. I'd like to see if wolves would return to the island over the ice bridge and establish a new population.

Topic Question 3:

I think the trails and campsite facilities should be maintained. The gvt. buildings that are there are appropriate for supporting the park. Monitoring of vegetation and the biotic community should continue. The understanding of history and past cultural use should continue.

Topic Question 4:

I think a repeat photography program should be implemented to assist in change detection. I think the warming climate will put some pressure on the moose population but they will likely adapt.

Topic Question 5:

I don't really like the idea of interfering with the phenomena in our wild areas of Isle Royale. The other alternatives seem to set up an opportunity for that to happen.

Topic Question 6:

I think the moose population will do just fine on Isle Royale without our help. It will have its ups and downs but it will adjust to conditions. They seem to be managing their own habitat now. They will probably adjust their population to what the environment will provide.

Correspondence: Topic Question 2:

I have visited Isle Royale six times starting with a backpack trip in 1970. In addition to backpacking twice, I have canoed and kayaked on and around the island. From these visits over the period of 44 years, I have seen the island during times of widely different wolf and moose populations. When the moose population was high relative to the wolf population, the vegetation was over browsed and unsightly.

I have not seen or even heard a wolf during my visits, but each time I hoped I would. This possibility was important to me and I know that this is also true for other visitors.

It is my opinion that Isle Royale is not a true wilderness because thousands of people go there. Therefore a rigid 'let nature run its course' approach to the declining wolf population does not make sense. Allowing wolves to vanish would greatly diminish the island experience for visitors who would see overgrazed vegetation and starving moose. I feel that new genetic wolf stock should be introduced to try to prevent their disappearance from Isle Royale.

Correspondence: Topic Question 1:

I think you need to reintroduce wolves onto the island NOW. You have two groups of animals that are in peril and as a species are in peril and you need to do something quickly. It would be a pretty pathetic sight to let the wolves die off from inbreeding and the moose (another iconic animal having a hard time surviving) will die of starvation. Is this really necessary? Capture some wolves and put them out there.

Topic Question 2:

Since man has caused the global warming then man should make sure the numbers don't get this messed up again.

Topic Question 3:

Just keep an eye on the wolves and don't let them get depleted like this again without genetic rescue.

Topic Question 4:

Stop selling of NP to tarsanding and fracking, that will help a LOT

Topic Question 5:

Too little too late

Comments:

Correspondence: Topic Question 1:

Isle Royale National Park is designated as an International Biosphere Reserve and US Federal Wilderness. The management of the island includes letting nature take its course. Examples include if a natural fire occurred (lightning), the park service would let it burn. All visitors are not allowed to removing items (agates, greenstone, moose antlers, etc.) from the island. Visitors are not allowed to bring in pets such as dogs, cats, etc. for fear of bringing in disease, etc. Fisherman are not allowed to bring live bait or any bait. IRNP should not re-introduce wolves for this reason. Let nature take its course.

Topic Question 2:

IRNP should not re-introduce wolves because these wolves may bring some disease to the island. Additionally, there is no evidence that there would be any significant damage to the vegetation if the moose had no predator. How do you know, unless it happens? Let nature take its course. It could be 10, 20, 30 years before any significant issues came up. Leave the island alone.

Topic Question 3:

Too much land is designated wilderness. Visitors who travel by boat, hike and kayaker/canoe's often find that campsites are over crowded. There are not enough campgrounds to serve the public. I have traveled by boat and kayak. How I wish there were just campsites (new, not existing) for kayaker's. This would allow separation and keep the over crowding down. The same can be said for boater only.

Topic Question 4:

It is not a concern for Isle Royale. No focus needed. Focus on the visitor experience. Focus on more safe landing sites for kayak's/canoe's and boaters.

Topic Question 5:

I think the IRNP should let nature be nature. It's hypocritical to one day enforce a International Biosphere Reserve and Federal wilderness and not allow any foreign animals (pets), disease, etc. but once the wolves leave (so would the Wolf - Moose study) it is ok to bring in wolves. This is the wrong way to manage Isle Royale.

Topic Question 6:

One option to seriously consider to control the moose population is to allow moose hunting. The park would see a boost in visitors and gain funds through hunting license sales, daily user fees, etc. This would eliminate the need and cost to reintroduce wolves completely.

Comments: I have enjoyed coming to Isle Royale annually for 20 years. I have enjoyed it hiking, canoeing, kayaking and boating. I have experienced very poor treatment by park service and very good treatment. Overall, the park is an amazing place that needs to be used by the public that pays for its existence. It is the tax payers who fund the IRNP budget and where more attention should be paid.

There are always options, ideas and I'm sure there will be much debate. However, one option is always to "Do Nothing and Wait and See".

I vote, let's just let nature take its course.

Correspondence: Topic Question 1:

The current approach of letting malnourished and tick infested moose die of old age starvation disease and predation is inhumane and wasteful. The moose should have supplements to provide needed sodium and to treat the tick problem. A healthy population could support a fall hunting season that would increase utilization of park resources without interfering with the current tourist season.

Topic Question 2:

The issue of a few inbred wolves on an island too small for them should not be a gravy train for a few dishonest researchers. Those few wolves simply don't matter.

Topic Question 3:

The park should be managed for greater utilization and animal health regardless of wilderness designation.

Topic Question 4:

Park wildlife resources should be managed to increase utilization regardless of which species do best in the climate conditions they encounter.

Topic Question 5:

Alternatives E and F could be acceptable if it means hunters pay to shoot healthy moose and not if it means a government employee gets paid to leave unhealthy moose to rot.

Topic Question 6:

Ideally the island and it's resources would be returned to state ownership and control. The federal government uses the park as a way to waste tax dollars on propaganda.

Comments: Whatever plan is put in place should include banning the wolf moose "researchers" from the island. That they would pretend that malnourished moose and inbred wolves are doing poorly because of unproven human effects on climate exposes them as political propagandists rather than scientists.

Correspondence: Topic Question 1:

Why did the Park Service wait so long to address this issue! Something should have been done when the wolf started to die out. Now we have to wait until 2017 before something is done. Not good enough! The Park Service should reintroduce a healthy wolf population NOW.

Topic Question 2:

When human interference hurts the balance of the Park the solution should be fixed immediately. The Park Service administrators should work closer with the scientists and with the public who care about and love Isle Royale when a serious issue evolves. (People brought dogs, who brought diseases - that killed off majority of the wolf population - this issue was not something that should have been put on hold for YEARS to see what would happen!!!)

Topic Question 3:

Ok this goes back to the issue that People Created the Problem. I'd like to say more intense management but this is unrealistic with all the boats visiting the park. It is not likely park rangers can board and check out every one of them for hazards (dogs with diseases ... etc.). I would say reintroduce the wolf population and keep an eye on things without waiting until any Issue within the park gets out of hand. Keep the status at 99% wilderness.

Topic Question 4:
I'd have to study more on this question.

Topic Question 5:
Only solution for me on this subject is to reintroduce the wolf population before 2017 - do in now!!!! If the park service needs money - put up a fund and I'm sure they would get enough to solve the problem!

Topic Question 6:
My major problem is and has been the Wolf Population demise. I am not happy with the way this issue has been handled. I believe that the Park Service Administration has not acted fast enough in certain situations in all our National Parks. This system of wait and see is not working.

Correspondence: Topic Question 2:

Wolf and Moose populations and maintaining wilderness character (forest, wetland structure may change, but maintain 99% wilderness).

Topic Question 3:
Historically, the wolf and moose population has not intensively been managed - keep it that way. Reintroduction/augmentation of the wolf population would be appropriate to continue the historical moose-wolf dynamic. In determining the appropriate level of management, the line should be drawn at the point when heavy, motorized equipment would be needed (ATVs, helicopters, etc).

Topic Question 4:
Ideally, reintroduce/augment wolves to maintain the half century long moose-wolf dynamics so as to be able to also study the impact of changing climate.

Topic Question 5:
I don't like the alternatives involving intensive moose population management.

Topic Question 6:
In terms of vegetation management, I support active efforts to keep exotic species out and efforts to contain or eradicate invasive species.

Correspondence: Topic Question 1:

I understand that a moose hunt would not be a attractive alternative to a lot of people. This would be for many reasons including many hunters which are at risk in that environment and it would be hard to control. But I believe it would be the lowest cost method the solve the problem at minimal cost to the NPS or Government
Most other options would be very expensive.

Also there are a lot of hunters especially experienced hunters in remote areas that are very creative at being able to remove these animals
also maybe a great % of this meat could be given to people who need it
We do not need a die off similar but worse than some years back
Or the Island devastated
I feel this would be the quickest and lowest cost
I do not want to see people just going out there to kill the animals
just to kill them off, would rather see a hunt, where the hunters are responsible to remove the animals
Just make sure they are qualified

Topic Question 2:
long term introducing more wolves

Topic Question 3:
management should be limited unless there is a huge problem than now exists

Topic Question 4:
I don't believe the climate change is a huge problem
Also I believe climate change is a natural thing that happens in long term cycles as seen in historic earth layers

Topic Question 5:

I believe introducing wolves to stop the immediate problem will not work

Topic Question 6:

Isle Royal is a beautiful place and I visit it often

I think we have to be very careful what is done about managing it

But in certain cases we need to manage it properly or it will be damaged for many many years

Note that I would not be part of a moose hunt

Thank You

Correspondence: Topic Question 1:

Only 3 of the 6 alternative concepts mention wolf reintroduction or augmentation and none with any specificity. Concept B and Concept D only allow for wolves to be reestablished once which may not be sufficient and is very short sighted. Concept C allows for maintaining populations of wolves and moose which "could" include wolf reintroduction or augmentation.

Concept C appears to be the best alternative, however, it does not go far enough. There must be sufficient flexibility to allow for wolf reintroductions as necessary over the next 20 years to insure genetic diversity for wolves and sustainable populations of both wolves and moose into the foreseeable future.

Maintenance or culling of moose is not necessary if wolves are allowed to fulfill their ecological role. Absent wolf immigration, which no one can predict, there is no likelihood of having a wolf population without human action.

Topic Question 2:

We believe the NPS should consider and evaluate the ecological benefits wolves provide; The only pup observed in 2015 was visibly deformed; 100% of wolves examined since 1994 (over 30 of them) have spinal anomalies. The weakened state of the remaining wolves is likely interfering with reproduction and survival.

The NPS must consider the data collected through 57 years of research conducted on Isle Royale. These researchers should play a key role in the discussions.

Topic Question 3:

NPS must protect the unique wilderness qualities of Isle Royale through monitoring of habitat for wildlife, including wolves and moose; maintenance of soil and water quality and ecological stability of plant and animal communities including the control of invasive species. Management is necessary to maintain important wilderness values including the presence of a top carnivore which is vital for ecosystem health. The culling of moose and the use of motorized equipment is unacceptable.

Topic Question 4:

Climate change poses a fundamental threat to species and places. The only way to slow the impacts of climate change is to globally reduce carbon emissions. NPS could produce an informational flyer explaining the negative impacts climate change is having on Isle Royale such as the changes in the duration and frequency of the ice bridge, winter ticks, bird species etc. NPS could engage with businesses and private entities that use the island to reduce carbon pollution. Encourage visitors to reduce their carbon footprint by not bringing / disposing of water bottles.

Moose are not likely in any direct danger of being reduced by climate change, however, wolf predation is needed to limit the growth in their population.

Because of climate change, it is unlikely that wolves will be able to repopulate Isle Royale without NPS intervention and we ask for immediate action to augment / reintroduce wolves.

Topic Question 5:

For years, researchers have been sounding the alarm about the plight of wolves on Isle Royale. Yet, the NPS has chosen to take no action until now. The public scoping period ends 8/29, however, the Record of Decision is not expected until Fall 2017 at the earliest. Two and one-half years is simply too long. This foot dragging on the part of NPS is unacceptable.

Evidence suggests that the few wolves on the island will not be able to keep moose populations in check which will further degrade the island's vegetation. Every effort must be made by the NPS to expedite the decision

Topic Question 6:

Those who visit Isle Royale do so for the wilderness experience which includes wolves and moose. Explain what you value about wilderness and why.

Correspondence: Topic Question 5:

I think what disturbs me most about any type of "management" of wildlife, is that wherever/whenever people interfere with the natural balance of species, something always goes terribly wrong. It's like a ripple effect.

Comments: I am considering the information I've been reading about moose decline, due to climate change- ticks are taking over due to warming temperatures and sickening and killing many moose due to blood loss/weakness. Is it unrealistic to think there ought to be a movement to save the moose somehow? It seems foolish to cull moose from one island, if their populations are declining elsewhere.

Correspondence: Topic Question 1:

I believe that wolves will do a better job managing moose grazing problems better than any sort of cull or hunt. We should play to reintroduce wolves over the long term, at least twenty years, to establish a healthy wilderness area and scientific study.

Topic Question 2:

Ecosystem repair, no species oriented.

Topic Question 3:

absolutely NO MOTORIZED ATVS OR MOOSE HUNT.

Topic Question 4:

PS could engage with businesses and private entities that use the island to reduce carbon pollution. Encourage visitors to reduce their carbon footprint by not bringing / disposing of water bottles.

Moose are not likely in any direct danger of being reduced by climate change, however, wolf predation is needed to limit the growth in their population.

Because of climate change, it is unlikely that wolves will be able to repopulate Isle Royale without NPS intervention and we ask for immediate action to augment / reintroduce wolves.

Topic Question 5:

I do not agree with a moose culling. It does not have the same effect on vegetation as natural predation does.

Topic Question 6:

Re-Introduce wolves over a long term, possibly multiple times, to ensure both wolf and moose health.

Comments: When I visit Isle Royale I do so for the wilderness experience which includes wolves and moose. We are short on Wilderness and getting shorter every day. With wolf hunts all around Isle Royale the past three years, I need to know there's a place I can go with limited human interference and natural predation

Hearing a wolf howl on it's own in the night at Isle Royale is something I want my children to hear.

Correspondence: Topic Question 1:

"100% o wolves examined since 1994...have spinal anomalies." -Of the six alternatives put forth by the National Park Service, Concept C makes the most sense, although it SHOULD include reintroduction (adding wolves after Isle Royale wolves die) or augmentation (adding wolves to the existing population). "Conservation scientists believe that predation - the ecosystem function that wolves provide - is vital to the health of ecosystems inhabited by large herbivores such as moose." I believe the best approach is to help Nature provide the solution, without human "culling"

Topic Question 2:
Again, human action should be limited to HELPING nature provide the solution- -NO CULLING!

Topic Question 3:
The NPS should concentrate on observing the changes in the natural environment, and assuring the least possible human interference.

Topic Question 4:
NPS should encourage the general public to do whatever possible to reduce the advancing climate change by reducing peoples' carbon footprint.

Topic Question 5:
I like the idea of introducing more wolves to the island, given the health status of the wolves that are there now. I dislike the timeline- -too slow!

Topic Question 6:
I haven't had the opportunity to visit Isle Royale, but I hope to someday- -I hope I don't have to see a landscape of devastated vegetation, due to overpopulation of moose. Bring the wolves in to control the population naturally.

Topic Question 1:
The only alternative that makes ecological sense is to augment the wolf population. The wolves should maintain the ecological balance on the Island.

Topic Question 2:
There should be no future management with the exception of adding wolves if needed. Let nature do what nature does best.

Topic Question 3:
No management with the exception of adding wolves. Nature knows way more than we humans and we seem to have this mentality of managing everything. Let the wild be the wild as it see fit, not as we want it to be.

Topic Question 4:
None. We can't do anything about climate change. We caused this and we must live with it. It is ludicrous to think that we can manage anything related to climate change. Let Isle Royale evolve just like the rest of the Earth. Add wolves when we need to. We don't know anything about nature in the grand scheme of things...and we make more mistakes than successes. Hands off.

Topic Question 5:
The fact that you think human management is necessary at all, and better than natural process. If we don't maintain wilderness areas as just that and keep our mitts off them (except to augment wolves) we will lose them all. Don't set a precedent. The presence of all those hikers and radio collaring and following them in aircraft surely has an impact on the wolves, so to say there is presently a hands-off approach is incorrect.

Topic Question 6:
I have been to Isle Royale twice, it is a beautiful place with too many users nowadays. I would like to see the number of folks permitted to be on the island restricted much like the Okeefenokee Swamp is. We are impacting the island with our presence. I urge you to augment the wolf population. I am strongly opposed to "culling" the moose herd. Let the wolves do it. They are much better at it than we are.

Correspondence: Topic Question 1:
Consider one of several wolf reintroduction plans: genetic rescue, female and/or general wolf reintroduction.

Topic Question 2:
Preserving that special "wild and primeval" sense of place on Isle Royale.

Topic Question 3:
Whatever means help to preserve the wilderness.

Topic Question 4:
Climate change has affected the natural ice bridge access to Isle Royale. Therefore, intervention to reintroduce wolves should occur.

Topic Question 5:
Haven't formed an opinion here.

Topic Question 6:

Human introduction of CPV and population growth/development around Lake Superior shores has interfered with the natural wolf/moose dynamics, thus impacting the wolf population. Since human activity has already affected the wolf population, intervention is needed to preserve a healthy wilderness ecosystem. Wolves are a critical component of Isle Royale's wilderness character. It's not just the presence of the wolves but their effects on the moose and forest. Isn't preserving the "wilderness character- -a wild and primeval sense of place- -" of Isle Royale a basic value of wilderness management? Given climate change and the lack of reliable ice bridges, it is unlikely wolves can consistently travel from the mainland to Isle Royale. In conclusion, if wolves are going extinct on Isle Royale, reintroducing them by whichever means scientists think best will help preserve Isle Royale's natural wilderness.

Correspondence: Topic Question 1:

Only the reintroduction of enough wolves for them to maintain their viability.
BALANCE is essential on the island.

Topic Question 2:

I have been to Isle Royale..and I cannot emphasize enough how AMAZINGLY beautiful it was to be on land where animals have not been hunted, harassed, killed, culled, or 'managed'.(at least for many years since protection was in place) It is a precious and unique place and the energy there so different than our usual public lands where hunting is allowed.

The peace the animals enjoy there can be seen by the fact that one night at the campsite..three almost grown fox cubs came down the path playing and ignoring us.... they went their way after awhile..but it is clear that they had not had to learn to FEAR humans at all costs.. nor that they should be frightened and on alert at all times. How lovely!

Simply introduce enough wolves to give the wolves a chance to come back into balance..but NO KILLING/Culling.

I believe it would be wonderful if we could assist Nature's natural balance if we give it this one small boost.. that climate change took away (new wolf migration to the island). I would also regret if the island was so browsed that it became less than it is. Nature doesn't always take the optimal route..

Topic Question 3:

I would also regret if the island was so browsed that it became less than it is. Nature doesn't always take the optimal route.. Give the wolves a chance to reestablish themselves with new genetic material....

This maybe necessary on a routine basis?? to prevent the cruel dying out /extinction due to inbreeding..

Topic Question 4:

see above # 2 and #4

Give the wolves a chance to reestablish themselves with new genetic material....

This maybe necessary on a routine basis?? to prevent the cruel dying out /extinction due to inbreeding..

Topic Question 5:

NO KILLING /CULLING is my plea.

I cannot emphasize enough how AMAZINGLY beautiful it was to be on land where animals have not been hunted, harassed, killed, culled, or 'managed'.(at least for many years since protection was in place).

Isle Royale is a TREASURE.... given that it is accessible to so many humans (not as far away as ANWR or Brooks Range in Alaska) yet it has that rare rare quality of letting animals live their lives in their own naturalstate i.e.without Human's hunting and managing them..

Topic Question 6:

No Killing, no culling.

YES to a gentle assist to counteract inbreeding due to climate changes, such that there is not enough ice for wolves to freely migrate...

Correspondence Type: Web Form

Correspondence: Topic Question 1:

Introducing new wolves to the island now, while it is still possible to prevent damage to the ecosystem, should be considered.

Topic Question 2:

Humans have played a role in the island's ecology for centuries, and will continue to do so. Human-caused climate change, imported diseases, and deaths caused by abandoned and unsecured mine shafts have strongly influenced wolf populations, as well as the pressures on wolves on the Canadian mainland. Restoring a balance among wolves, moose, and vegetation by introducing wolves would repair the damage humans have caused and avoid the catastrophe moose overbrowsing has caused in the past and for certain will again in the next few years. Visitation will be affected when the island becomes considerably less attractive due to deforestation and starving moose.

Topic Question 3:

Given the wilderness designation, the lowest-impact management plans should be the only ones considered. This would rule out options D, E, and F, all of which would require active and noticeable interventions in moose and vegetation. Part of option C, maintaining moose populations (if this means maintaining moose at current or lower levels) would also be ruled out. Augmenting or reintroducing wolves would not affect the wilderness status, as it simply mimics a natural process (immigration of wolves from the mainland) interrupted by climate change and increasing human presence on the Canadian mainland.

Topic Question 4:

The effects of climate change, which are just beginning to be perceived, should be studied further before any management of moose or vegetation begins.

Topic Question 5:

Option C is the only viable option for maintaining the wilderness character of the island that visitors find attractive and expect. One-time wolf reintroduction is not likely to succeed and does not mimic natural processes. We know what option C will produce: moose overbrowsing, deforestation, starving moose. Attempts at reduction of moose populations and restoring vegetation will be too disruptive and destroy the wilderness character.

Topic Question 6:

The major problem with the Moose-Wolf-Vegetation Management Plan is that by waiting until winter 2017 to do anything the problems will be much harder to resolve and will probably involve much more disruptive fixes. The wolves will have vanished; the moose will have overbrowsed balsalm and will begin to starve. Fifty-plus years of research have offered a very clear picture of what will happen in the next two years. New wolves with similar habits (preying on moose, for example) should be introduced now.

Correspondence: Topic Question 1:

I'm in favor of Concept C, but new wolves need to be introduced to keep the genetics viable.

Topic Question 2:

I believe that the moose, wolves, and vegetation should be monitored for a short period of time.

Topic Question 3:

I would suggest minimal management/human interference.

Topic Question 4:

All animals adapt to changes in climate. I don't believe any management is needed.

Topic Question 5:

I don't like the fact that most alternatives do not include the re-introduction of wolves, especially unrelated wolves.

Topic Question 6:

I believe that wolves most definitely need to e re-introduced. If there are only two wolves there now and they appear to be in poor physical condition, a group of unrelated wolves (to provide diversity of genes) must be brought in. The wolves need to be in top physical condition in order to reproduce healthy pups and to be able to keep the moose population in check.

Correspondence Type: Web Form

Correspondence: Topic Question 1:

Of the various options offered, Concept C appears to be the best alternative. However, it does not go far enough. As a demographer it is my opinion that the NPS ensures sufficient flexibility in setting future policies regarding numbers, timelines, and goals. This flexibility will allow for wolf reintroductions as necessary over the next 20 years to insure genetic diversity for wolves and sustainable populations of both wolves and moose into the foreseeable future.

Topic Question 2:

The NPS should consider and evaluate the ecological benefits wolves provide. Given the weakened state of the remaining wolves on the island, long-term wolf reproduction and survival is not sustainable. In setting future policies, the NPS should give the data collected on Isle Royale over the past 50 years the upmost consideration. It is my professional opinion that wolf researchers like Dr. Peterson should play a key role in these discussions.

Topic Question 3:

NPS must protect the unique wilderness qualities of Isle Royale through monitoring of habitat for wildlife, including wolves and moose; maintenance of soil and water quality and ecological stability of plant and animal communities including the control of invasive species. Management is necessary to maintain important wilderness values including the presence of a top carnivore which is vital for ecosystem health. The culling of moose and the use of motorized equipment is unacceptable.

Topic Question 4:

Climate change poses a fundamental threat to species and places. The only way to slow the impacts of climate change is to globally reduce carbon emissions. NPS could produce an informational flyer explaining the negative impacts climate change is having on Isle Royale such as the changes in the duration and frequency of the ice bridge, winter ticks, bird species etc. NPS could engage with businesses and private entities that use the island to reduce carbon pollution. Encourage visitors to reduce their carbon footprint by not bringing / disposing of water bottles.

Moose are not likely in any direct danger of being reduced by climate change, however, wolf predation is needed to limit the growth in their population.

Because of climate change, it is unlikely that wolves will be able to repopulate Isle Royale without NPS intervention. This most likely outcome requires immediate action to augment / reintroduce wolves .

Topic Question 5:

Over the past couple of decades researchers have been sounding the alarm about the plight of wolves on Isle Royale. Although the public scoping period ends 8/29, the Record of Decision is not expected until Fall 2017 at the earliest. Two and one-half years is simply too long to wait before taking action.

As a professional demographer it is my opinion that the few weaken wolves that remain on the island will not be able to keep moose populations in check, which will further degrade the Isle Royale's vegetation. Every effort must be made by the NPS to expedite their decision about the future of wolves on the island.

Topic Question 6:

My family and I have visited Isle Royale several times over the past 30 years. We do so for the wilderness experience which includes wolves and moose. It is one of very few places in the Great Lakes Region where we can experience true nature, or what Thoreau described as places where "... our limits transgressed, and some life pasturing freely where we never wander." We must preserve this very special place by letting the natural relationship between wolf and moose to continue.

Correspondence: Topic Question 1:

Only 3 of the 6 alternative concepts mention wolf reintroduction or augmentation and none with any specificity. Concept B and Concept D only allow for wolves to be reestablished once which may not be sufficient and is very short sighted. Concept C allows for maintaining populations of wolves and moose which "could" include wolf reintroduction or augmentation.

Concept C appears to be the best alternative, however, it does not go far enough. There must be sufficient flexibility to allow for wolf reintroductions as necessary over the next 20 years to insure genetic diversity for wolves and sustainable populations of both wolves and moose into the foreseeable future.

Maintenance or culling of moose is not necessary if wolves are allowed to fulfill their ecological role. Absent wolf immigration, which no one can predict, there is no likelihood of having a wolf population without human action.

Topic Question 2:

The current wolf population is dwindling. There have been no introduction of new wolves since they first crossed the ice bridge to Isle. The NPS must consider the data collected through 57 years of research conducted on Isle Royale. These researchers should play a key role in the discussions.

Topic Question 3:

NPS must protect the unique wilderness qualities of Isle Royale through monitoring of habitat for wildlife, including wolves and moose; maintenance of soil and water quality and ecological stability of plant and animal communities including the control of invasive species. Management is necessary to maintain important wilderness values including the presence of a top carnivore which is vital for ecosystem health.

The culling of moose and the use of motorized equipment is unacceptable.

Topic Question 4:

The only true way to reduce climate change is changing the way the world relies on carbon and decrease the carbon emissions used globally. The NPS could decrease the number of people allowed on the island similar to a lottery used to visit delicate features of the Earth.

Because of climate change, it is unlikely that wolves will be able to repopulate Isle Royale without NPS intervention and we ask for immediate action to augment / reintroduce wolves.

Topic Question 5:

I highly dislike the idea of culling moose and allowing motorized vehicles on the island. I like the idea of reintroducing and or augmenting the wolves. This

would help to balance out the delicate food web on Isle Royale.
The environmental impact of allowing motorized or mechanized equipment not will further destroy the fragile vegetation on Isle Royale.

For years, the researchers on Isle have been warning the NPS of the decimation of the wolf population. Please do not allow "man" to come in and make his mark in the wilderness. Reintroduce the wolves.
The NPS needs to respect the Wilderness Act put in place by Congress.

Topic Question 6:
I have backpacked on Isle Royale several times. I travel specifically to this National Park because of its "wilderness" status. The majority of people who come to Isle want to see and experience the last true wilderness area left in the United States. People come to the island with a glimmer of hope of seeing a wolf or moose. I have been to Isle four different times and have only seen one cow moose. Many people never get that chance.
Culling of any specific species on the island would undermine what the island stands for. Reintroducing or augmenting wolves needs to happen to reestablish the food web. It may take several tries to reestablish the wolves as they may not find suitable mates. I also recommend that the NPS consult with the researchers who have lived and studied on Isle for many years.

Comments: Maintenance or culling of moose is not necessary if wolves are allowed to fulfill their ecological role. Absent wolf immigration, which no one can predict, there is no likelihood of having a wolf population without human action.

Correspondence: Topic Question 1:
Maintenance or culling of wolves is not necessary if wolves are allowed to fulfill their ecological role.

Topic Question 2:
Management is necessary to maintain important wilderness values including the presence of top carnivores which is vital for the ecosystem. The culling of moose and use of motorized equipment is unacceptable.

Topic Question 3:
Because of climate change it is unlikely that wolves will be able to repopulate Isle Royale without NPS intervention. I believe that the balance will occur once wolves are reintroduced. I don't think the intensity of monitoring is necessary, except in the beginning once the wolves are reintroduced.

Topic Question 4:
Maintenance or culling of wolves is not necessary if wolves are allowed to fulfill their ecological role. I believe that reintroduction of wolves to Isle Royale will help the ecosystem and prevent NPS from having to cull moose.

Topic Question 5:
Waiting until fall 2017 is unacceptable. This issue has been occurring for a long time and I believe NPS has waited too long to make a decision. The decline has been ongoing for years and every effort must be made by NPS to expedite the decision.

Topic Question 6:
We need to reintroduce wolves to Isle Royale. Before climate change and the loss of the ice bridge for wolves to cross over ice to get to Isle Royale these wolves survived, repopulated and kept the moose population under control. Yellowstone is a success story. Lets do the same for Isle Royale. Reintroduce them to where they will balance the ecosystem.

Comments:

Correspondence: Topic Question 1:
I agree with alternative concept C. Reintroduction has worked well in Yellowstone and should strongly be considered on the Island. I have been to Isle Royale twice on week long kayak trips in 2005 and 2009. I had the pleasure of a quick glance at a wolf early one morning paddling along the shore of Siskiwit Lake. For me, just knowing wolves are on the island even if you never see one is what makes a wilderness experience special.

Topic Question 3:
It's important to maintain the wilderness status but with all the outside influences in the modern world we must expect that managing it is a necessary evil. I feel as intense management as necessary to maintain a good balance of moose, wolf and vegetation.

Topic Question 4:
A management plan should proceed and be adjusted as climate changes take effect.

Topic Question 5:
Again I like concept C

Correspondence: Topic Question 2:

Available vegetation, forage as well as non-forage.

The decimation of wolf packs. The island is one of the few places where a higher degree of protection is possible, compared, say to areas that are adjacent to cattle.

Topic Question 3:

Other than the reintroduction of genetically healthy wolves, I would think a relatively low level of tinkering, with the hope of establishing a self-correcting population of wolves and moose. Wilderness is supposed to be free of human involvement, but ISRO is at a rare juncture with its deficient population of wolves and its burgeoning population of moose which require a level of predation for a healthy herd.

Topic Question 4:

Probably not much. Vegetation is going to shift to more northerly areas and that is really unstoppable. Can we expect moose to adapt or modify their preferences?

Topic Question 6:

As a one time visitor to ISRO in the summer of 2015, I submit a comment on the issue of wolf and moose management.

What does management mean in this wilderness area? Management of moose, and wolf populations needs to be both active yet restrained, with the intent of keeping a full ecological spectrum in place, from lowest microorganisms to peak predators. Variations in the wolf-moose ratio will occur over time, so there will be no perfect balance at any given time, and certainly no steady numerical ratio. ISRO, in my opinion, should keep a genetically viable population of wolves on the island to protect the herd health of the moose and the island vegetation, as well as to create a sanctuary for the wolves. At this point, a wolf re-introduction is called for.

I would advocate for Alternative B.

Comments: comment on the issue of wolf and moose management.

What does management mean in this wilderness area? Management of moose, and wolf populations needs to be both active yet restrained, with the intent of keeping a full ecological spectrum in place, from lowest microorganisms to peak predators. Correspondence: Topic Question 1:

Only 3 of the 6 alternative concepts mention wolf reintroduction or augmentation and none with any specificity. Concept B and Concept D only allow for wolves to be reestablished once which may not be sufficient and is very short sighted. Concept C allows for maintaining populations of wolves and moose which "could" include wolf reintroduction or augmentation.

Topic Question 2:

I am of the opinion the NPS should consider and evaluate the ecological benefits wolves provide; The only pup observed in 2015 was visibly deformed; 100% o wolves examined since 1994 (over 30 of them) have spinal anomalies. The weakened state of the remaining wolves is likely interfering with reproduction and survival.

The NPS must consider the data collected through 57 years of research conducted on Isle Royale. These researchers should play a key role in the discussions.

Topic Question 3:

NPS must protect the unique wilderness qualities of Isle Royale through monitoring of habitat for wildlife, including wolves and moose; maintenance of soil and water quality and ecological stability of plant and animal communities including the control of invasive species. Management is necessary to maintain important wilderness values including the presence of a top carnivore which is vital for ecosystem health. The culling of moose and the use of motorized equipment is unacceptable.

Topic Question 4:

Climate change poses a fundamental threat to species and places. The only way to slow the impacts of climate change is to globally reduce carbon emissions. NPS could produce an informational flyer explaining the negative impacts climate change is having on Isle Royale such as the changes in the duration and frequency of the ice bridge, winter ticks, bird species etc. NPS could engage with businesses and private entities that use the island to reduce carbon pollution. Encourage visitors to reduce their carbon footprint by not bringing / disposing of water bottles.

Moose are not likely in any direct danger of being reduced by climate change, however, wolf predation is needed to limit the growth in their population.

Because of climate change, it is unlikely that wolves will be able to repopulate Isle Royale without NPS intervention and we ask for immediate action to augment / reintroduce wolves.

Topic Question 5:

For years, researchers have been sounding the alarm about the plight of wolves on Isle Royale. Yet, the NPS has chosen to take no action until now. The public scoping period ends 8/29, however, the Record of Decision is not expected until Fall 2017 at the earliest. Two and one-half years is simply too long. This foot dragging on the part of NPS is unacceptable.

Evidence suggests that the few wolves on the island will not be able to keep moose populations in check which will further degrade the island's vegetation. Every effort must be made by the NPS to expedite the decision.

Topic Question 6:

I intend to visit this park in the future. The interaction of wolves and moose on the island is the most interesting thing about this park in my opinion.

Correspondence: Topic Question 1:

I feel very strongly that the island needs to continue with moose AND wolves, balancing each other in regards to their ecological impacts. It would seem at this point that the population of wolves needs to be restarted, or boosted, as soon as possible by introducing wolves of both sexes from the mainland.

Topic Question 2:

It seems to me that the degree to which we (mankind) caused the current 'problem' has to be considered in any plan and solution that is embarked on. In that sense intervening in this situation of imbalance seems justified.

Topic Question 3:

I understand that aggressive 'management' seems to go against what a wilderness area is about. I would feel differently I think if I didn't feel mankind had to a large extent caused the current situation, both through global warming, and through the introduction of canine parvovirus. In this situation, for the sake of the ongoing health of flora and fauna, of the incredible ecosystem itself, I think aggressive intervention is warranted.

Topic Question 4:

If anything, the fact that ice bridges are much less likely to provide a 'natural' access to the island (along with the people population concentration around areas wolves might be able to travel from) makes me feel the intensity of management needs to increase.

Topic Question 5:

I find the alternative of 'intensively managing the moose population' quite bothersome, seemingly in that scenario allowing the wolves to disappear. We do not have an abundance of areas in this country where wolves are living in balance and in abundance. Isle Royale is an incredibly special place, a small piece of wilderness that has provided for decades a home for an amazing balance of plants/animals/birds, and a place where man can be in touch with that. Losing any part of this would be a huge loss.

Topic Question 6:

I'm not a scientist, and have more emotional input than scientifically based thoughts. I've treasured many trips to Isle Royale, and have been transported to another world when I've heard loon at night, watched eagles soar, looked out a tent window at the knees of a cow moose and her young, come across what I thought was wolf scat on a trail, hiked through some of the special vegetation that I never see other places. The incredible balance of this small ecosystem is worth treasuring, and, I feel, worth intervening to save from the effects of our own mistakes.

Correspondence: Topic Question 1:

The ongoing study of the wolves and moose on Isle Royale clearly indicates that wolves play an important part of NATURALLY managing the moose population on the island and thereby also managing the abundance and health of vegetation. Maintaining an ongoing population of wolves by continually augmenting the packs provides a natural methodology to maintain a healthy and organic ecosystem on the island. Culling the moose population is not a natural solution, and would be temporary in nature requiring culling to be necessary on a regular basis. Augmenting the wolf population also strengthens the health of the moose population as natural selection is organically implemented. Culling will eliminate strong and healthy moose. Wolves will eliminate weak and sick moose which benefits the entire ecosystem of the island.

Topic Question 2:

As a wilderness area, allowing hunting, culling, and/or mechanized vehicles on the island should be ruled out unconditionally. Doing otherwise destroys

the purpose and intent of a wilderness area, and the impacts are likely to affect the pristine nature of the island's ecosystem for years, or possibly permanently. The unknowns of these unnatural interventions could be disastrous. Killing healthy moose through culling weakens the entire herd. Allowing mechanized vehicles introduces the potential for pollution and destruction of native plants.

Topic Question 3:

The NPS should engage in a long-term augmentation program to keep the wolves of the island at a healthy population and one that provides balance to the moose population.

Topic Question 4:

Due to the possibility of a shorter ice bridge season, the NPS should continually monitor the health and population of wolves on the island and react to reductions in numbers with an ongoing augmentation program.

Topic Question 5:

Three of the preliminary alternatives completely overlook maintaining a healthy and balanced wolf population. Two others only mention a one-time augmentation program for wolf population. The augmentation program will need to be ongoing to ensure the wolf population is maintained at a level that balances the population of moose and the health and abundance of vegetation.

Topic Question 6:

Using an ongoing natural and organic approach is the best solution. Culling moose will ultimately lead to a weakened herd, and the wolf population will become extinct on the island. By simply lending a hand augmenting the wolf population nature will return to its own balance. Continued research and studies will provide valuable information as to the success of the program and/or the need for further augmentation to maintain the proper population and a balanced ecosystem.

Correspondence: Topic Question 1:

Concept C seems the best, but if wolf reintroductions occur as needed to maintain genetic diversity, moose management will not be needed.

Topic Question 2:

Consider the benefits of a healthy wolf population. Also consider the opinions of scientists and wolf researchers that have studied the wolves in this area for years. They know the situation better than anyone else.

Topic Question 3:

Monitor to maintain the wilderness. No moose culling.

Topic Question 4:

Monitor for signs of change due to climate. Educate the public on climate change.

Topic Question 5:

Dislike the lack of action so far. The wolf population on the island has been in trouble for years. And no action is likely in the near future. It is not likely that the current wolf population could be saved at this point by bringing in new wolves, so at this point it would be starting over. Action is needed ASAP to bring in wolves to limit damage to the environment by too many moose.

Topic Question 6:

Bring back a healthy wolf population and then let things work the way they were meant to work in a wilderness.

Correspondence: Topic Question 1:

adding wolves as necessary. i support national wolfwatch coalition in their wanting more wolves brought to island to continue to have the moose wolf continue exist there. i see no reason for change. i see no reason to involve the corrupt nps in shooting moose and do not believe that is a good solution at all. we have corrupt federal agencies interested only in setting up things to make money for themselves and to attack nature. they seem to enjoy attacking nature.

Topic Question 2:

the current status which just needs a few more wolves to be transported out to the island. its time to do this and to do it as needed. also, our numbers could be skewed just for your own purposes and not for the truth. federal agencies far too often have been known to spin doctor so that you can't trust them anymore. they spin doctor so they can make money for their agency. the employees seem to have no honesty left in them. its all spin doctored.

Topic Question 3:

very little attention should be given to isle royale. wilderness demands natural, but bringing in a few wolves is not a big change so it can be accepted and it is natural. if there was more time wolves could swim there. it just hasn't happened recently. let nature then take its course the wolves can control all moose populations. keep

Topic Question 4:

keep the status quo. that is the best idea. maybe corrupt politicians will finally get action so that climate change does not happen and illness all until that time, let this little island remain with its nature. we need to protect nature every chance we all get.

Topic Question 5:

i don't like alternatives chosen for the public at all. i think it is presumptuous and churlish, against democracy for this group of public servants to take it upon themselves to be the gods they want to be. i think they are public servants and should be doing the will of the general public, not the will of rich men with big money who seem to dictate the assault against nature that is taking place.

Correspondence: Topic Question 1:

Wolves should be introduced/augmented in the area to restore the natural 'balance' of the ecosystem, with monitoring of the situation, taking a holistic perspective.

Topic Question 2:

The importance that wolves make to the ecological balance of wildlife in the area

Topic Question 3:

Monitoring and minimal proactive management of species numbers after the introduction of the animals, with time to let the flora/fauna recover. A STRONG understanding of the adverse effects of human intervention (poaching/trapping/hunting) and action taken accordingly.

Topic Question 4:

It should understand the consequences of climate change on wildlife and the environment and intervene only when these elements are having an adverse effect on the area and its natural balance.

Topic Question 5:
see general comments above

Topic Question 6:
Wildlife management has its place in areas such as this, but it should not affect what would have been the 'natural' balance of animals/flora /fauna in the area. There should be sustainable levels of wildlife where no examples exist of overpopulation (eg moose) resulting in their deaths through starvation and over grazing. The balance/harmony should be achieved, which includes the introduction/augmentation of wolves in the area.
Climate change (arguably man-made) should be seen as a major factor and a sensible, sustainable plan be prepared to minimise its harm/impact on the area.

Correspondence: Topic Question 1:

Only 3 of the 6 alternative concepts mention wolf reintroduction or augmentation and none with any specificity. Concept B and Concept D only allow for wolves to be reestablished once which may not be sufficient and is very short sighted. Concept C allows for maintaining populations of wolves and moose which "could" include wolf reintroduction or augmentation.

Concept C appears to be the best alternative, however, it does not go far enough. There must be sufficient flexibility to allow for wolf reintroductions as necessary over the next 20 years to insure genetic diversity for wolves and sustainable populations of both wolves and moose into the foreseeable future.

Maintenance or culling of moose is not necessary if wolves are allowed to fulfill their ecological role. Absent wolf immigration, which no one can predict, there is no likelihood of having a wolf population without human action.

Topic Question 2:

We believe the NPS should consider and evaluate the ecological benefits wolves provide; The only pup observed in 2015 was visibly deformed; 100% of wolves examined since 1994 (over 30 of them) have spinal anomalies. The weakened state of the remaining wolves is likely interfering with reproduction and survival.

The NPS must consider the data collected through 57 years of research conducted on Isle Royale. These researchers should play a key role in the discussions.

Topic Question 3:

NPS must protect the unique wilderness qualities of Isle Royale through monitoring of habitat for wildlife, including wolves and moose; maintenance of soil and water quality and ecological stability of plant and animal communities including the control of invasive species. Management is necessary to maintain important wilderness values including the presence of a top carnivore which is vital for ecosystem health. The culling of moose and the use of motorized equipment is unacceptable.

Topic Question 4:

Climate change poses a fundamental threat to species and places. The only way to slow the impacts of climate change is to globally reduce carbon emissions. NPS could produce an informational flyer explaining the negative impacts climate change is having on Isle Royale such as the changes in the duration and frequency of the ice bridge, winter ticks, bird species etc. NPS could engage with businesses and private entities that use the island to reduce carbon pollution. Encourage visitors to reduce their carbon footprint by not bringing / disposing of water bottles.

Moose are not likely in any direct danger of being reduced by climate change, however, wolf predation is needed to limit the growth in their population.

Because of climate change, it is unlikely that wolves will be able to repopulate Isle Royale without NPS intervention and we ask for immediate action to augment / reintroduce wolves.

Topic Question 5:

or years, researchers have been sounding the alarm about the plight of wolves on Isle Royale. Yet, the NPS has chosen to take no action until now. The public scoping period ends 8/29, however, the Record of Decision is not expected until Fall 2017 at the earliest. Two and one-half years is simply too long. This foot dragging on the part of NPS is unacceptable.

Evidence suggests that the few wolves on the island will not be able to keep moose populations in check which will further degrade the island's vegetation. Every effort must be made by the NPS to expedite the decision.

Topic Question 6:

Those who visit Isle Royale do so for the wilderness experience which includes wolves and moose.

Correspondence: Topic Question 1:

None of the concepts go far enough. There must be sufficient flexibility to allow for wolf reintroductions as necessary over the next 20 years to insure genetic diversity for wolves and sustainable populations of both wolves and moose into the foreseeable future.

Maintenance or culling of moose is not necessary if wolves are allowed to fulfill their ecological role. Absent wolf immigration, which no one can predict, there is no likelihood of having a wolf population without human action.

Topic Question 2:

There are 57 years of research data that can be analyzed to help provide a healthy wolf population. Have a data production analysis as well as the involvement of researchers. Find out why wolves on Isle Royale are deformed and weakened.

Topic Question 3:

NPS must protect the unique wilderness qualities of Isle Royale through monitoring of habitat for wildlife, including wolves and moose; maintenance of soil and water quality and ecological stability of plant and animal communities including the control of invasive species. Management is necessary to maintain important wilderness values including the presence of a top carnivore which is vital for ecosystem health. The culling of moose and the use of motorized equipment is unacceptable.

Topic Question 4:

Due to Climate change NPR must make a concerted effort to repopulate the island with wolves - waiting to do so destroys the ecosystem of the island.

Topic Question 5:

As stated above, none of the alternatives go far enough to ensure the success of any project.

Correspondence: Topic Question 1:

I had already submitted a comment

I have another good alternative but I think it would be very expensive and that would be to add wolves which I think would have to take place over some time so I dont think it is an immediate solution to the existing problem

Also moving moose to Minnesota or Michigan into the existing moose population areas

Thank You

Correspondence: Topic Question 1:

Only restoring wolf population. No other human intervention.

Topic Question 2:

No hunting or culling should ever be allowed in this pristine wilderness. This is one of the very last unspoiled wild preserves left. An ecosystem dependent on a healthy wolf population. New wolves must be brought in to keep the moose population in check naturally and stop the destruction of overgrazing by moose.

Topic Question 3:

This park should be left untouched with the exception of restoring a healthy wolf population which will restore the parks health and increase tourist revenue.

Topic Question 4:

Protect it but otherwise do not interfere.

Topic Question 5:

There should be no human intervention with the wildlife on isle Royal except to restore the healthy wolf population.

Topic Question 6:

If Michigan does not naturally restore balance in this most precious wilderness and allows some other form of management that would be devastating and cannot be allowed in this park, preserve.

Moose are not likely in any direct danger of being reduced by climate change, however, wolf predation is needed to limit the growth in their population.

Because of climate change, it is unlikely that wolves will be able to repopulate Isle Royale without NPS intervention and I ask for immediate action to augment / reintroduce wolves.

Topic Question 5:

For years, researchers have been sounding the alarm about the plight of wolves on Isle Royale. Yet, the NPS has chosen to take no action until now. The public scoping period ends 8/29, however, the Record of Decision is not expected until Fall 2017 at the earliest. Two and one-half years is simply too long. This foot dragging on the part of NPS is unacceptable.

Evidence suggests that the few wolves on the island will not be able to keep moose populations in check which will further degrade the island's vegetation. Every effort must be made by the NPS to expedite the decision.

Topic Question 6:

What I value about Isle Royale is its wilderness experience of wolves and moose. There are few places that can provide an experience of these iconic animals, and I value Isle Royale because of that opportunity. There is no better way to learn about these creatures than to experience them in their own habitat, thriving. We must be able to continue to provide this experience for generations to come.

The weakened state of the remaining wolves is likely interfering with reproduction and survival.

The NPS must consider the data collected through 57 years of research conducted on Isle Royale. These researchers should play a key role in the discussions.

Topic Question 3:

It is the responsibility of the NPS to preserve and protect the unique wilderness qualities of Isle Royale. This includes the monitoring of habitat for wildlife, such as wolves and moose; maintenance of soil and water quality and ecological stability of plant and animal communities including the control of invasive species. Any management must support the important wilderness character of Isle Royale. The wolf, a top carnivore is vital for an intact healthy ecosystem. But, wolves must be present in sufficient numbers to fulfill their ecological niche. The culling of moose and the use of motorized equipment within wilderness areas in not consistent with this goal and therefore should not be permitted.

Topic Question 4:

Climate change, habitat loss, fragmentation are each impacting wildlife.

The 3 remaining wolves can no longer limit the growth of the moose population. If the howl of the wolf is no longer heard on the Island, it is likely the entire ecosystem could collapse.

Climate change poses a fundamental threat to Isle Royale. However, the only way to slow the impacts of climate change is to globally reduce carbon emissions.

NPS could produce an informational flyer explaining the negative impacts climate change is having on Isle Royale such as the changes in the duration and frequency of the ice bridge, winter ticks, bird species etc. NPS could engage with businesses and private entities that use the island to reduce carbon pollution. NPS could ban the sale/use of bottled water and or encourage visitors to reduce their carbon footprint by not bringing / disposing of water bottles.

Moose are not likely in any direct danger of being reduced by climate change, however, wolf predation is needed to limit the growth in their population.

Because of climate change, it is unlikely that wolves will be able to repopulate Isle Royale without NPS intervention and we ask for immediate action to augment / reintroduce wolves.

This foot dragging on the part of NPS is unacceptable.

Evidence suggests that the few wolves on the island will not be able to keep moose populations in check which will further degrade the island's vegetation. Every effort must be made by the NPS to expedite the decision.

Topic Question 6:

While the National Wolfwatcher Coalition has no membership dues, we have nearly 700,000 supporters. While most of them will never see a wild wolf or hear its howl, knowing there are special places where wolves can live as wolves, not being chased by dogs or hunted / trapped by those desiring a trophy, is important to them. These values cannot be measured. NPS has a duty to protect these values and insure that the howl of the wolf is not silenced on Isle Royale.

Correspondence: Topic Question 1:

Concept C appears to be the best alternative. You need to allow wolf reintroductions as necessary to keep the genetic diversity. If you allow wolf introductions then you do not need to manage the moose. The wolves will do that job for you. Easy, peasy.

The hunting of moose and introduction of motorized vehicles in the wilderness area is unacceptable.

Topic Question 2:

The ecological benefit of wolves.

Topic Question 3:

The culling (hunting) of moose and motorized vehicles in a wilderness area is unacceptable. NPS must protect the unique wilderness qualities of Isle Royale through monitoring of habitat for wildlife, including wolves and moose.

Topic Question 4:

Climate change is human caused. Therefore we must bring in wolves for genetic diversity since it is not getting cold enough for the ice bridge to allow wolves to come on their own. NPS could produce an informational flyer explaining the negative impacts climate change is having on Isle Royale such as the changes in the duration and frequency of the ice bridge, winter ticks, bird species etc. NPS could engage with businesses and private entities that use the island to reduce carbon pollution. Encourage visitors to reduce their carbon footprint by not bringing / disposing of water bottles.

Topic Question 5:

For years, researchers have been sounding the alarm about the plight of wolves on Isle Royale. Yet, the NPS has chosen to take no action until now. See below

Comments: My comments are primarily directed at those who might take an extreme viewpoint on the Wilderness Act or those who believe humans have little or no role in wilderness areas, typically resting their arguments mainly on the Wilderness Act's use of the word "untrammeled".

To paraphrase what I've researched regarding The Wilderness Act, there are statements in the law that state that if humans created a problem then it can be OK for humans to take corrective action, with the primary example cited as fires started by humans.

Certainly in the spirit of this part of the law (and I believe the letter of it as well) there are two prominent examples of previous human intervention that has directly and indirectly contributed to the present wolf population degradation.

Namely:

- 1) The introduction of canine parvovirus by a pet dog and
- 2) Anthropomorphic global warming/climate change.

I won't go into the detail of why as I'm sure you are familiar with the causality of and reactions to both of these human actions. The bottom line of this comment is simply to make the case, not regarding the type of rescue best suited to the problem but to persuade those arguing against any rescue that their logic does not follow the legislation of The Wilderness Act.

Topic Question 2:
Maintaining a balance of predator/prey/habitat preservation so that all populations may remain healthy.

Topic Question 3:
NPS should aggressively manage the environment, predators and prey species as needed to maintain RNP as a true wilderness.

Topic Question 5:
I do not like the idea of letting the current wolf population die off and then reintroducing a new pack of wolves in order to keep the moose population within bounds. Wolves are a necessary part of this ecosystem so what is the point in letting the current pack die?

Topic Question 6:
I strongly favor introducing additional wolves to the island with the hope that not only will the moose population be kept in check but that inbreeding with the surviving members of the island's wolf population will enhance the wolf gene pool and promote healthier animals.

Correspondence: Topic Question 1:

Artificial insemination of existing female wolves. This may reduce conflicts between existing wolves and new wolves, but this would need to be determined. I am only stating that this should be considered (and possibly rejected). I am not advocating this approach.

Topic Question 2:

1. That almost all of the park is designated wilderness, where human influences on wildlife populations are typically minimal.
2. That justification of reintroduction of wolves might only be justified if it can be determined that human activities caused the wolf population to crash. I believe Rolf Peterson once stated that the canine parvovirus impacts on the wolf population appear to have run their course. However, whether parvo was a major contributor to the current wolf population issue may still be a possibility, which should be studied.
3. That ice bridge formation need not be less likely as our climate warms, since our climate is becoming more unpredictable, with greater extremes, both warm and cold.
4. That the overall viability of the wolf and moose populations in the Lake Superior region does not depend on how many moose or wolves are on Isle Royale.
5. That visitor expectations in terms of flora, moose, and wolves are not critical wildlife management issues in Wilderness.
6. That the forests of Isle Royale managed to survive a long period when moose were here and wolves were not. Logging and subsequent fires may have altered the island's flora more than moose have (and that the logging and fires created moose habitat).
7. Vegetation management should not be considered necessary unless impacts are human-caused. Who is to say whether an unbrowsed balsam fir is "better" than an intensively browsed balsam, and whether greater amounts of browsing has a negative impact on the park's forest? Minimal browsing does not necessarily equate to better management of the park's forests. Natural impacts on forests are what they are, neither bad nor good.

Topic Question 3:

In general, only manage to mitigate negative human impacts.

Topic Question 4:

1. Management should reflect the impacts of climate change only if the science clearly indicates what those impacts will be, not impacts based on speculation.
2. If climate change is impacting a species or subspecies endemic to Isle Royale, do what is necessary to protect that species or subspecies. If it is impacting common species, such that the distribution of that species may change but it has little risk of extinction, do not take intensive action to protect that species on Isle Royale.
3. Use Isle Royale as a laboratory to monitor climate change and its effects.

Topic Question 5:

My first choice is the no action alternative unless other actions are needed because human impacts have created that need. I would certainly not support any alternative that involves direct moose or vegetation management.

Topic Question 6:

Some may be concerned about the impacts of the loss of wolves on the ongoing wolf/moose study. I am not. The study would continue, and the impact of the loss of wolves would certainly be worthy of study. Besides, if wolves returned on their own, that would add another element to the study.

Correspondence: Topic Question 1:

Only 3 of the 6 alternative concepts mention wolf reintroduction or augmentation, and none with any specificity. Concept B and Concept D only allow for wolves to be re-established once which may not be sufficient and is very short sighted. Concept C allows for maintaining populations of wolves and moose which "could" include wolf reintroduction or augmentation.

Concept C appears to be the best alternative, however, it does not go far enough. There must be sufficient flexibility to allow for wolf reintroductions as necessary over the next 20 years to insure genetic diversity for wolves and sustainable populations of both wolves and moose into the foreseeable future.

Maintenance or culling of moose is not necessary if wolves are allowed to fulfil their ecological role. Absent wolf immigration, which no one can predict, there is no likelihood of having a wolf population without human action.

Topic Question 2:

I believe the NPS should consider and evaluate the ecological benefits wolves provide; The only pup observed in 2015 was visibly deformed; 100% o wolves examined since 1994 (over 30 of them) have spinal anomalies. The weakened state of the remaining wolves is likely interfering with reproduction and survival.

The NPS must consider the data collected through 57 years of research conducted on Isle Royale. These researchers should play a key role in the discussions.

Topic Question 3:

NPS must protect the unique wilderness qualities of Isle Royale through monitoring of habitat for wildlife, including wolves and moose; maintenance of soil and water quality and ecological stability of plant and animal communities including the control of invasive species. Management is necessary to maintain important wilderness values including the presence of a top carnivore which is vital for ecosystem health. The culling of moose and the use of motorized equipment is unacceptable.

Topic Question 4:

Climate change poses a fundamental threat to species and places. The only way to slow the impacts of climate change is to globally reduce carbon emissions. NPS could produce an informational flyer explaining the negative impacts climate change is having on Isle Royale such as the changes in the duration and frequency of the ice bridge, winter ticks, bird species etc. NPS could engage with businesses and private entities that use the island to reduce carbon pollution. Encourage visitors to reduce their carbon footprint by not bringing / disposing of water bottles.

Moose are not likely in any direct danger of being reduced by climate change, however, wolf predation is needed to limit the growth in their population.

Because of climate change, it is unlikely that wolves will be able to repopulate Isle Royale without NPS intervention and we ask for immediate action to augment / reintroduce wolves.

Topic Question 5:

For years, researchers have been sounding the alarm about the plight of wolves on Isle Royale. Yet, the NPS has chosen to take no action until now. The public scoping period ends 8/29, however, the Record of Decision is not expected until Fall 2017 at the earliest. Two and one-half years is simply too long. This foot dragging on the part of NPS is unacceptable.

Evidence suggests that the few wolves on the island will not be able to keep moose populations in check which will further degrade the island's vegetation. Every effort must be made by the NPS to expedite the decision.

Topic Question 6:

Those who visit Isle Royale do so for the wilderness experience which includes wolves and moose.

Correspondence: Topic Question 2:

I think the fact that climate change is a permanent issue we have to deal with should be considered.

Topic Question 3:

In spite of the wilderness designation, I think NPS must intervene in this situation. I would like to see a few more wolves brought into the island. If that does not happen, I think the moose population will get too big and decimate the vegetation on the island. I don't think the public has the stomach for a "moose cull", and that population cannot go unchecked. Many of the options include intervention, and I think killing animals cannot be an option when other viable options exist.

Topic Question 5:

I like that the preliminary alternatives do provide options for all sides in this issue.

Correspondence: The National Park Service (NPS) has announced the start of a Moose-Wolf-Vegetation Management Plan and Environmental Impact Statement for Isle Royale National Park and Wilderness, which will analyze options for the declining wolf population, including transplanting wolves from the mainland. Our help is needed to convince the NPS to protect Isle Royale Wilderness untrammled character from overt human manipulation.

Changes continue to occur on Isle Royale. In the late 19th century, the primary predator-prey dynamic there dealt with Canada lynx and woodland caribou. Neither of those species survived, and they were ultimately replaced. Moose arrived in the early 20th century, and by the 1950s, wolves had also arrived. Isle Royale is an ever-evolving ecosystem, and a classic case study for the changing dynamics of island biogeography.

Researchers have studied the well-known wolf-moose predator-prey relationship on Isle Royale for over 60 years. But the wolf population has become inbred over the decades, and has dropped in numbers in recent years. In 2015, only 3 wolves could be located, compared to 9 in 2014. This drop has occurred despite the formation of ice bridges to the mainland during the past two winters, which allowed wolves to move between the mainland and Isle Royale. With the declining wolf population, the moose population has increased to about 1,250.

Congress designated about 99% of Isle Royale as Wilderness under the 1964 Wilderness Act. The Wilderness Act defines Wilderness in part as untrammled or unmanipulated. The Wilderness Act requires humility and restraint on the part of us humans, where we let Nature call the shots rather than imposing human preferences upon the landscape, even if that might mean in this case that wolves become temporarily or permanently extirpated from Isle

Royale.

Wolf researchers and some wolf advocates have pushed the NPS to transplant more wolves to Isle Royale. The NPS is also considering culling or translocating moose, perhaps with mechanized or motorized equipment. But, such actions would fly in the face of Isle Royales wilderness designation and represent a significant human manipulation of the Isle Royale Wilderness. We need to help remind the NPS to uphold Isle Royales wilderness status.

1. Isle Royales wilderness designation requires that we protect the areas unmanipulated, untrammed wilderness character. Wilderness designation means we let Nature call the shots.
2. Transplanting wolves from the mainland to Isle Royale is a major manipulation of the Isle Royale Wilderness and must not be done.
3. Alternative Concept A, the No Action Alternative, is the best alternative to protect Isle Royales unmanipulated, untrammed wilderness character.

Always let nature take control. We should not be managing Isle Royale except as needed for population control, if and when it gets to that point.

Topic Question 3:

Allow nature to do what it will

Comments: The wilderness designation of Isle Royale requires that we protect the area's unmanipulated, untrammled character and let Nature call the shots.

Transplanting wolves from the mainland to Isle Royale is a major manipulation of the Isle Royale Wilderness and must not be done.

Re: Protect Isle Royale Wilderness from Human Manipulation/Some Park Service Options Threaten to Undermine Wilderness Act Foundation

The National Park Service (NPS) has announced the start of a Moose-Wolf-Vegetation Management Plan and Environmental Impact Statement for Isle Royale National Park and Wilderness, which will analyze options for the declining wolf population, including transplanting wolves from the mainland. The NPS should protect Isle Royale Wilderness untrammled character from overt human manipulation.

Changes continue to occur on Isle Royale. In the late 19th century, the primary predator-prey dynamic there dealt with Canada lynx and woodland caribou. Neither of those species survived, and they were ultimately replaced. Moose arrived in the early 20th century, and by the 1950s, wolves had also arrived. Isle Royale is an ever-evolving ecosystem, and a classic case study for the changing dynamics of island biogeography.

Researchers have studied the well-known wolf-moose predator-prey relationship on Isle Royale for over 60 years. But the wolf population has become inbred over the decades, and has dropped in numbers in recent years. In 2015, only 3 wolves could be located, compared to 9 in 2014. This drop has occurred despite the formation of ice bridges to the mainland during the past two winters, which allowed wolves to move between the mainland and Isle Royale. With the declining wolf population, the moose population has increased to about 1,250.

Congress designated about 99% of Isle Royale as Wilderness under the 1964 Wilderness Act. The Wilderness Act defines Wilderness in part as untrammled or unmanipulated. The Wilderness Act requires humility and restraint on the part of us humans, where we let Nature call the shots rather than imposing human preferences upon the landscape, even if that might mean in this case that wolves become temporarily or permanently extirpated from Isle Royale.

Wolf researchers and some wolf advocates have pushed the NPS to transplant more wolves to Isle Royale. The NPS is also considering culling or translocating moose, perhaps with mechanized or motorized equipment. But such actions would fly in the face of Isle Royales wilderness designation and represent a significant human manipulation of the Isle Royale Wilderness. You can help remind the NPS to uphold Isle Royales wilderness status.

1. Isle Royales wilderness designation requires that we protect the areas unmanipulated, untrammled wilderness character. Wilderness designation means we let Nature call the shots.

2. Transplanting wolves from the mainland to Isle Royale is a major manipulation of the Isle Royale Wilderness and must not be done.

3. Alternative Concept A, the No Action Alternative, is the best alternative to protect Isle Royales unmanipulated, untrammled wilderness character.

Thank you for the opportunity to bring these remarks to your attention.

Yours sincerely,

Correspondence: Topic Question 1:

There are few options to a declining and inbred wolf population. The NPS plan to introduce new genetics into the populations is both reasonable and feasible.

Topic Question 2:

In keeping a balanced moose and wolf population is essential to the existence of a genetically balanced mammal population on the island, even to the point of restricting human visitation.

Topic Question 3:

There should be a well researched wildlife management plan for the island and strictly adhered to. It is essential for the continued wilderness status that flora and fauna be given priority in the continuation of this small ecosystem.

Topic Question 4:

Climate changes should be taken into account in a comprehensive management plan.

Topic Question 5:

The mere fact that this issue of reintroduction is being discussed demonstrates a positive direction.

Topic Question 6:

Just as wolves were reintroduced to Yellowstone, the introduction of new genetics to Isle Royale is a positive step forward in continuing a traditional population on the island.

Comments: I am in favor of the introduction of new breeding stock on Island Royale with an end goal of maintaining a healthy and balanced wolf and moose population.

Correspondence: Topic Question 1:

. Alternative Concept A, the No Action Alternative, is the best alternative to protect Isle Royale's unmanipulated, untrammelled wilderness character.

Topic Question 2:

Since Isle Royale's wilderness designation requires that we protect the area's unmanipulated, untrammelled wilderness character. Wilderness designation means we let Nature call the shots.

Transplanting wolves from the mainland to Isle Royale is a major manipulation of the Isle Royale Wilderness and must not be done.

Topic Question 3:

The designation of 'wilderness' requires that no action be taken

Topic Question 4:

Since Wolf and moose populations are not listed as threatened, there should be no action taken regarding them = let Nature take its course.

Regarding rare plants, if they become legitimately endangered of becoming extinct in the wild (not just the island), cuttings should be taken and grown in a suitable place off-island.

Topic Question 5:

I feel that removing moose from the island would be expensive in time and resources, and would probably affect the untrammelled land and destroy its wilderness appearance in order to introduce trucking to remove captured moose, which again would contravene the wilderness designation of the island. The same would apply to introducing/removing wolves, although the damage would be less. As much as I wish to see wolf population increase, rather than decrease, taking action at this point, especially not knowing the reason(s) for the mortality of the individuals who have died, could well be merely introducing more endangered wolves to a bad situation.

Topic Question 6:

If any wildlife is to be removed, the removal of the remaining wolf population and relocation to another area, might be best for the remaining endangered wolves and less damaging to the land, but cannot be done if wolves were present on the island when it was given wilderness status.

Comments: This proposal is difficult as it raises the question of whether animal survival (or balance) should take precedence over a wilderness designation. If we truly believe in letting Nature take its course in a wilderness designated area, we must do nothing. There is still possibility that both wolves and moose may migrate via ice bridges and naturally realign the populations. Climate change in a wilderness area, cannot be reasonably ameliorated with current techniques, and to try might destroy the wilderness of the island forever, while not having the desired results. I am concerned about this, but I truly feel it is better to do nothing and allow Nature to take its own course, always remembering that mankind is responsible for much of the coming climate changes.

Thank you for considering my comments.

Correspondence: Topic Question 1:
Wolves are not in danger of extirpation in MN and it is likely that they will be able to migrate across Lake Superior to Isle Royale again sometime in the near future as their natural movements and dispersal move them further afield. Management should be minimal. Watch, listen and learn from the natural processes that will occur without human intervention.

Topic Question 2:

Isle Royale is a Wilderness area and as such it should remain unmanipulated, including manipulating either the wolf or moose population. Both the moose and the wolves arrived on the island via spontaneous natural migration likely over the ice. There are not very many places where we can watch and observe the natural process of migration in a natural ecosystem without applying the heavy hand of humans. Since we are not really very good at manipulating nature, I urge a hands off approach.

Topic Question 3:

The Wilderness designation of Isle Royale should be given full weight when making the decision to manage this natural occurrence or not. The Wilderness designation gives managers full permission to monitor without interference.

Topic Question 4:

There will be plant community change with an increasing moose population and with climate change. Let the moose run their course and let's address and attempt to mitigate climate change which is something that we do have and should have control over.

Correspondence: Isle Royale's wilderness designation requires that we protect the area's natural characteristics by not intervening to implement our own idea of how life should play out. Nature should be free to operate on its own terms, not human terms. Moving wolves from the mainland to Isle Royale would be an obvious intervention of the Isle Royale Wilderness and should not be considered. Alternative Concept A, the No Action Alternative, is the appropriate alternative to protect Isle Royale's untrammled wilderness character. Government resources will be much better spent on problems and areas that do not involve trying to "manage" wilderness. Stop attempting to manage everything in sight!

Transplanting wolves from the mainland to Isle Royale is a major manipulation of the Isle Royale Wilderness and must not be done.

Isle Royale's wilderness designation requires that we protect the area's unmanipulated, untrammled wilderness character. Wilderness designation means we let Nature call the shots.

Topic Question 3:
Alternative Concept A, the No Action Alternative, is the best alternative to protect Isle Royale's unmanipulated, untrammled wilderness character.

Comments: Isle Royale's wilderness designation requires that we protect the area's unmanipulated, untrammled wilderness character. Wilderness designation means we let Nature call the shots.

Correspondence: Topic Question 1:

1. Reintroducing new wolves to Isle Royale, it is a much more effective, long term and animal friendly way of keeping the ecosystem in balance.

2. Until this can happen, sterilization/contraception for the moose population will keep their numbers under control without taking unnecessary lives.

Topic Question 2:

One of the most magnificent things about Isle Royale is that it is virtually untouched by humans compared to other places especially in Michigan. Although some human interference is now necessary in order to keep a healthy and balanced ecosystem, we should also try to let nature take care of the problem. By adding wolves to the population, and by continuing to add wolves every few years to diversify the gene pool, we can assist nature in carrying out her job without taking the matter into our own hands and simply killing the moose.

Topic Question 5:

The moose do not need to be killed. Their lives are not a tool to be tampered with by outsiders. The population problem stemmed from too few wolves which resulted in too many moose. The most logical way to fix this is to simply add in more wolves.

Topic Question 6:

Killing moose is not a long term solution to the problem on Isle Royale. It is not natural. If wolves are to be added the entire ecosystem would experience a much better balance without taking unnecessary lives.

Comments: These moose don't deserve to have their lives taken when there are better and more long term, wildlife friendly ways to fix the population problem. The wolves of Isle Royale have always been a staple in Michigan society and the upkeep of their population is important to both the ecosystem and Michigan culture. Adding wolves will balance out the moose population and therefore the vegetation numbers will be kept in check. Simply killing moose will only temporarily balance the moose population and stabilize the vegetation numbers but will do nothing in order to bring the wolves of Isle Royale back.

Correspondence: Topic Question 1:

Please always make your decisions humane ones! The NPS should adopt Alternative C and maintain both moose and wolves, with these conditions:

Wolves are reintroduced/augmented more than once, if necessary.
Moose populations are managed by contraception and/or sterilization and not by lethal culls.

Comments: The federal wildlife 'service' kills wild animals by the millions every year, whether their numbers justify this or not, and all at taxpayer expense. There are always more humane methods but they do not even attempt to act humanely toward animals and they certainly do not have the intelligence to recognize the balance of nature. Since when does man know better than Mother Nature? The current imbalance on Isle Royale between wolves and moose is no reason to go on a killing spree like the wildlife service does.

Correspondence: Topic Question 1:
Everyone is complaining about the wolf population in the UP of Mich...we have voted down hunting already. Why not try to move a few of those wolves to the island to re-populate?

Topic Question 2:
Introduce species (both plant and animals)that can re-establish the eco-system

Topic Question 3:
Maybe for two years, limit camping/hiking/hunting visitors to allow for the animals/plants to re-establish without human interference.

Comments: I am a member of the Humane Society of the US and receive regular updates on issues regarding opinions/voting/law changes, etc. I will not need notices from any other organizations.

I always wonder who thinks up stuff like hunting season on doves, wolves, etc. People with nothing else to do with their time?? It's ridiculous and will always be voted down by me. By the time you shoot a dove, what's left to eat? If farmers are bothered by wolves/coyotes/bobcats, etc., they should probably be allowed to shoot one to save their animals, just like they can with deer eating their crops; otherwise, there's no reason to hunt them.

Correspondence: Topic Question 1:

Introducing more wolves to the island, sterilization of the moose.

Topic Question 2:
The health of the forest, the long-standing research value of the wolf/moose predator/prey dynamic, wildlife viewing for tourists, and the highly rare existence of a wolf population not at risk to hunting activities.

Topic Question 3:
It is for this reason I think reintroducing wolves is critical. After the initial human assistance required to relocate wolves to the island, the wildlife will take over management of the moose population.

Topic Question 4:
In terms of changing forest structure, there isn't much to be done. The range of species will change, and we'll see that in our shifting ecosystems.

Topic Question 5:
I dislike the idea of human management of the moose population. This is a wilderness area, and ideally the human impact on it should be minimal. I would prefer a solution that allows the ecosystem to manage itself. Furthermore, human management of deer and moose is sloppy at best. Relying on hunts to cull the population hasn't done this state much good with deer. Predators are best.

Comments:

Correspondence ID: 236
Moose-Wolf-Vegetation Management Plan/EIS

Outside Organization:

Correspondence Type: Web Form

Correspondence: Topic Question 1:

In most cases wildlife 'management' leads to more problems, just look at the Yellowstone quagmire. Predator prey relationships which lead to circle of life management should always be implemented first. Human intervention (management) always leads to imbalances and more problems. Wild life areas must be maintained, and allowed to be wild life!

Topic Question 2:
More human involvement = more problems. If wolf populations are allowed to stabilize, the moose population stabilizes by default. With less moose, vegetation has a chance to return to a natural state. By allowing the natural order to return, human involvement is minimized saving money. More involvement costs more, simply put

Topic Question 3:
It should be left wild and studied, not managed

Topic Question 4:
Climate change is affecting the world, trying to manage it on a small island is foolish. Trying to reduce the detrimental impact of humans is way more realistic. Studying the affects of climate change on a wild life population would provide valuable information for the years to come

Topic Question 5:

The possibility of a culling is both senseless & foolish, while forced sterilization are just as bad of an idea. The island needs more wolves, however that can be achieved is the quickest way back to balance.

Topic Question 6:

If we have learned anything it's that predator prey relationships benefit the entire ecosystem, until we look at it as a whole we are just causing more problems

Correspondence: Topic Question 1:

The wolves should be better managed on the island. As we are teh stewards of the environment and the ones moast at fault for dynamic change it's up to us

to do a better job of mitigating the impact.

Topic Question 2:

Wolf packs should be kept to a sustainable level, as well as teh moose level. By sterilizing both when and if needed the ecosystem can function the way is

should.

Topic Question 3:

Higer management visits should take place and additional electronic monitoring is possible, which will help keep the need for visits down. Work closely

with volunteers (colleges, other groups) to help collectd data.

Topic Question 4:

Based on the scientific facst a higher frequency of management should be anticipated in the near future.

Topic Question 5:

I like conserving and managing both the wolf and moose populations at levels where they have been histrically which is high.

Topic Question 6:

I feel it is our responsibility and duty to take care of our environment as well as all the creatures that one finds in it. We should be good stewards for our

planet and future generations.

Correspondence: Topic Question 1:

Reintroduce an adequate number of adult wolves and permit them to cull the moose herds to help restore ecological balance. Instead of sterilization of

moose, the young and very old moose would be the most likely prey for the wolves. Wolves would also help keep at bay rodents, rabbits, and other species

that would destroy vegetation. I believe it is important to maintain natural, ecologically balanced habitats in Michigan, both for sound economic principles

and for our grandchildren .

Topic Question 2:
Addressed above

Topic Question 3:
Continued oversight, restoration and maintenance of natural and ecologically sound management principles, protection from Michigan State government who put personal economic gain above the welfare of the environment, continue categorization as a designated wilderness- -we have so few remaining.

Topic Question 4:
Unable to answer

Correspondence: Topic Question 1:

The moose will ultimately regulate their own growth based upon the availability of resources. Vegetation will ultimately grow back. Preserving vegetation is not tantamount to preserving animal life. In many places birth control is used to control wildlife populations for a faster fix. Nature will do precisely that with time. Do not cull the moose. They are so called over-populating precisely because the wolf population was sport hunted.

The people have spoken many times regarding preserving the wolf and moose populations on Isle Royal and else where in Michigan.

Topic Question 2:

Vegetation does not take precedence over animal life. The best course is to leave nature alone to manage itself. It is out of balance because of the interference of hunters. We need to reintroduce wolves now as soon as possible and for as many times as needed as the only sensible and natural course of action. Then we need to back off and allow nature to stabilize.

Topic Question 3:

Get out of the way of nature. Leave it alone and it will recover. Restrict hunting and restrict visitors. There is a flaw in so called managing the woods thinking that if it is wilderness all is well. There seems to be zero compassion for the struggling animal populations that are preyed upon by hunters from as far away as Florida, etc. Inhumane treatment of these animal populations have come full circle.

Topic Question 4:

Again, if we manage wildlife it cannot adjust naturally to changes. Back off. Quit stressing animal populations...let them adjust. Stop the hunts!!

Topic Question 5:

If the primary alternative is to hunt the moose...then all you are doing is raising a crop for hunters. Moose that are culled will continue to over-populate.

Moose that allowed to sense limitations of resources, food will naturally limit population.

This is precisely the same equation that occurred in the Great Swamp of New Jersey...hunting the deer simply insured that the deer would continue to over-populate. So in fact insuring a yearly hunt. Barbaric. No one is fooled by this culling tactic. It is inhumane and based on false logic.

Topic Question 6:

Let the wolf and moose populations regulate as nature intended. Get the hunters out of the equation. Culling will only insure that the so called problem will stay the same. Bring wolves in as many times as needed. Stop the hunts. These are fragile populations that need our protection.

Comments: Back off the wildlife and let it regulate itself. If moose populations experience dwindling resources they will populate less. Wolves need to be reintroduced and NOT HUNTED!

The public has spoken many times on these issues and been ignored and side-stepped.

This issue needs to be settled asap, now.

Stop the wolf and moose hunts. Let the wildlife recover. The vegetation, trees, woods do not matter...they will recover.

Correspondence: Topic Question 1:
Adopt Alternative C and maintain both moose and wolves, with these conditions:

Wolves should be reintroduced/augmented more than once, if necessary.
Moose populations should primarily be managed by contraception and/or sterilization rather than by lethal culls.

Topic Question 2:

Without a wolf population to keep the moose population in balance on Isle Royale, the unique flora of the island will be decimated by over browsing. The plant communities on the island are relatively intact and a repository for southern boreal forest and bedrock communities which exist in few other highly localized areas in the U.S.. This and the number of threatened or endangered species on the island making them a national treasure. Furthermore, the coexistent of predators at the top of the food chain, such as grey wolves, is necessary for ecosystem balance, and Isle Royale is one of the perfect sites for grey wolf habitat, both because of the low potential for wolf conflicts with species artificially maintained by man (e.g., livestock, dogs) and because the wolf population is one of the primary reasons people visit Isle Royale.

Topic Question 3:
Moderate reintroduction of wolves with enhancing the genetic diversity of the wolf population on the island.

Removing or blocking off human-introduced hazards to wolves, such as the mine on Isle Royale into which 3 prime wolves fell and died several winters ago.

Topic Question 4:
Following the lead of The Nature Conservancy and other science-based organizations on maintaining populations that are likely to self-sustain on the island and minimizing the encroachment of non-native invasive plant and other species by actively removing them.

Correspondence: Topic Question 1:

If necessary, use passive methods to control moose population. Contraceptives and transportation come to mind.

Topic Question 2:

For about 65 years, Isle Royale National Park has been a natural experiment monitoring especially the wolf and moose populations. I'm unaware of any necessary modifications to the habitat except for something to mitigate the impact of tourism. Maybe.

Topic Question 3:

When I was there several years ago, it looked like the Park Service was managing the Park quite well.

Topic Question 4:

It's an experiment. Changing climate is part of it. Don't turn it into any kind of zoo.

Topic Question 5:

Instead of killing or removing moose, introduce more wolves. That's not ideal, but it would preserve the nature of this jewel in the Park System.

Topic Question 6:

The point of the Park system is to preserve natural environments so that people can enjoy and learn from them. Isle Royale is very special and perhaps unique because its location in the middle of Lake Superior makes intrusive development impossible. No one is going to try to build condominiums or hotels just outside the Park.

Comments: Don't mess with Isle Royale. I want it for my grandchildren ... and everyone else's.

Correspondence: Topic Question 1:

There is really no unspoiled wilderness left since every area is touched by man made pollutants, effects of hunting to reduce predator populations, global warming, etc. So, we should, I think, treat the wild-est areas left with the least human touches as possible.

I realize that there are arguments both ways for introducing more wolves or culling moose..but both fly in the face of 'wilderness' issues. I believe that the ebb and flow of prey and predator has played out many times on the island where different animals have come and gone over many years. It is our scope of view that is flawed. We look at things over a hundred years or so but these ups and downs have gone on for much more time than that and reach a 'balance' though, even that, shifts with time.

So, I don't think anything should be done. Leave the wild...wild

Topic Question 2:

Nothing...is exposes a hard and bad precedent for how 'wilderness' should / will be treated in other places where the outside influences are not as cleanly seen. For example: how can sheep or cattle be grazed in 'wilderness' ? The slippery slope of human-induced changes in predator status starts to come into focus since the non-native grazers can be preyed upon. Very tricky. Personally, I believe that animals should not be grazed in wilderness but if the consensus is that it is ok...I believe that the owners of the animals bear the risk..not the public and certainly not the have animals that are native but inconvenient be killed. That is why I think we should do nothing since it adds to the slippery-ness of the slope and facts can be used to demonstrate that interventions have taken place.

Topic Question 3:

no management. If it is wilderness - leave it alone. We don't have to hunt, graze, timber, mine and trap over every square mile of the world. For goodness sake, the environment is under such tremendous stress already...can't we just leave some alone ?

Topic Question 4:

EDUCATION about the effects. big picture. The scope of the change is outside of the ability to influence it by NPS but letting people know that the changes ARE happening and the current and potential consequences are real and meaningful.

Topic Question 5:

Humans can't seem not to tinker. I dislike any tinkering with the wild systems. We are playing GOD and we do a terrible job of it.

Topic Question 6:

Less is More. Enough said.

Correspondence: Topic Question 1:

Please use ecologically sound and humane measures to re-balance the wolf/moose population of Isle Royale National Park, Michigan. After this week's sad news of a thoughtless, selfish trophy hunter in Zimbabwe, I hope we can care for these noble beasts with interventions only to re-balance their numbers, eg., introduce new wolves as natural predators, use birth control for moose until numbers are stabilized for both species.

Topic Question 2:

Except for invasive species removal, allow natural balance.

Topic Question 3:

First of all DO NO HARM. Then protect the Island from invasive species including humans who behave badly in nature.

Topic Question 4:

Educate people about climate change and how to decrease its effects as soon as possible.

Urge them to vote accordingly for leaders and reforms to help re-balance us with nature.

I think it is so huge that we will have to allow nature's climate rebalance

Topic Question 5:

I don't like the idea of culling the herd. There's way too many humans on earth: would you cull us? Wolves are better at killing the weaker, older moose to produce a healthier herd.

Topic Question 6:

Thank you for giving us the opportunity to comment.

Correspondence: Topic Question 1:

Wolves should be reintroduced/augmented more than once, if necessary. While Moose populations are managed by contraception and/or sterilization and not by lethal culls.

Topic Question 2:

The moose population has been increasing at a rate of 22 percent per year for the past four years. That could cause significant ecological damage to the national park. And it's certainly due to the absence of wolves.

Regardless of whether or not the current population of wolves is saved, wolves are critical for managing the moose population. Without wolves, the moose population could reach levels that are not good for the island's ecosystem.

Topic Question 3:

Wolves should be reintroduced/augmented more than once, if necessary. While Moose populations are managed by contraception and/or sterilization and not by lethal culls.

Topic Question 4:

Again, as necessary reintroduce wolves onto the island while managing Moose populations.

Topic Question 5:

I'm afraid if option 1 or A is selected (I)do nothing, even if wolves go extinct; that the moose population will quickly grow out of control and devastate the island's ecosystem. Knowing the current condition of wolves on the island currently it's almost certain their fate has been sealed, and they will all eventually die off. By introducing more wolves to the population you're giving the wolves currently habituating on the island a chance for survival.

Topic Question 6:

I would agree with the sentiment that the presence of wolves provides enormous ecological and economic benefits, and these beautiful animals are a lure for tourists such as myself. I would love to the chance to see a wolf in it's natural environment.

Comments: There has never been a recorded wolf attack on a human in Michigan. Wolves are afraid of people and do all they can to avoid them. We should not let irrational fear of wolves drive the trophy hunting and trapping of these majestic creatures.

The Upper Peninsula is a special place-nature at its best, which is why it's one of my favorite places to visit. Natural predators like wolves play a significant role in the Upper Peninsula ecosystem by reducing densities of deer, beavers, and other species. Their presence can bring benefits to agriculture, public safety, water quality, and ecosystem health.

Thank you for your time and consideration. Please act soon!

Correspondence: Topic Question 1:

Please maintain both the wolf and moose population on Isle Royale. Wolves should be reintroduced and/or augmented more than once, if necessary.

Topic Question 2:

Moose populations could managed by contraception and/or sterilization and not by lethal culls.

Topic Question 3:

Only what is necessary to maintain the balance that has existed on Isle Royale between the wolves and the moose for centuries.

Topic Question 4:

If the moose food sources become threatened, it may be necessary to take additional measures.

Topic Question 5:

I like the idea of reintroducing wolves to Isle Royale. They belong there.
I don't like the idea of a moose cull, unless there is no other alternative.

Correspondence: Topic Question 1:
Introduce wolves from multiple gene pools. I prefer letting wolves keep moose population in check rather than hunting. If hunting is allowed, can meat be donated to homeless shelters?

Topic Question 2:
When it becomes clear that wolf population is decreasing precipitously, bring in additional wolves before situation gets far out of balance.

Topic Question 3:
Continue MTU's wolf/moose study. Use results to decide when wolves need to be introduced.

Topic Question 4:
Is global climate warming affecting Isle Royale in ways other than fewer ice bridges to mainland?

Topic Question 5:
I did not get to see overall listing.

Topic Question 6:
I have backpacked/canoed at Isle Royale a few times. I hope NPS is able to keep wolves & moose present in significant numbers. Do household dogs play any role in wolf mortality? If so, I would certainly support elimination of dogs (as is being done in some other wilderness areas).

Correspondence: Topic Question 1:
Reintroduce wolves to the island. The study of reintroduction of Yellowstone tells how important these predators are to an ecosystem. Control moose with contraceptives, and other procedures, perhaps relocating. Culling should be a last resort.

Topic Question 2:
The original wolf pack on Isle Royale were Eastern Timberwolves, not the Great Lakes Grey Wolf we find in the U.P. As far as I know this was the only pack of Timberwolves in Michigan and I think is important to preserve. There may be a need to introduce Timberwolves over a time until the population becomes established. This would also insure a healthy genetic pool.
The moose population will need to be monitored to prevent overgrazing.

Topic Question 3:
Management should be intense until populations of wolf and moose stabilize.

Topic Question 4:
The NPS probably can have little control of environmental policies but the wilderness parks are a great source for research and statistics of the effects of climate change.

Topic Question 5:
They at least show there is an awareness and interest in taking action.

Comments: I would like to see the Lynx reintroduced to the national forest in Michigan, perhaps Apostle Islands. The rise in coyote populations as well as an abundance of smaller prey shows conditions are good for a medium sized predator.

Correspondence: Topic Question 1:
How to protect the island vegetation without having to kill any of the moose.

Topic Question 2:
1. The moose came there on their own and stayed.
2. The wolves cr own, some have left, some stayed, some died and there have been a multitude of genetic Issues with those remaining.
3. Maybe wolves shouldn't be there?
4. What would become of the island if we didn't intervene?
5. How would this situation pan out if it wasn't a monitored national park? Nature can balance itself.

Topic Question 3:
The least amount of human interference is best.

Topic Question 4:
It changes everything. Now wolves may not be able to go to the island by their own will.

Topic Question 5:
Killing moose

Comments:

Correspondence: Topic Question 1:
The population of wolves has fallen so low that they are unable to manage the moose numbers. Wolves need to be reintroduced/augmented more than once, if necessary, on Isle Royale to achieve the correct ratio of wolves to moose.

Topic Question 2:
No culling of moose would be necessary if this population is managed by contraception and/or sterilization.

Topic Question 3:
Observation would be necessary to determine if a correct balance of wolf numbers to the moose population has been reached. Previously, the wolves were able to keep moose to an appropriate number.

Topic Question 4:
Contraception/sterilization of moose could still be utilized unless warming climate forces moose to move further north for their own well being.

Topic Question 5:
I intensely dislike the use of killing to control the moose population on Isle Royale. Wolves in sufficient numbers should be able to accomplish this with the assistance of contraceptives.

Correspondence: Topic Question 1:
Well, that depends on the species. For moose, you could have a hunt, although I personally would prefer reintroduction of wolves. This area has given us a wealth of information on the wolf-moose dynamic dating back to the work of David Mech. Given the reaction to wolf introductions elsewhere in the state, this information, and continuing these studies, is invaluable.

Topic Question 2:
Creating a natural, sustainable interaction. Management, by its nature, attempts to impose an artificial "quota" on populations. Sustainability allows changes in population sizes. I think close observation with occasional interventions (such as introducing moose or wolves to mimic natural immigration patterns) would be best.

Topic Question 3:
Restore the wolf population and continue to monitor and observe changes in the ecology.

Topic Question 4:
Climate change may dictate some need to introduce animals to re-populate as winter ice impedes the of wildlife to immigrate and emigrate from the island. If warming eliminates the boreal forest, then it may not be possible to have moose. Local whitetail deer might substitute but I do not know how well, given the forested nature of the island.

Topic Question 5:
I think that you need to check the data to see how often wolves and moose immigrated to the island. I assume that this would have been a reasonably frequent event, historically. Based on that assumption, I do not find concepts A and B tenable. Concepts E and F treat the island just like mainland populations and destroy any uniqueness or research opportunities the island represents. Of the remaining concepts (C and D) I favor C as being the most in keeping with the wilderness designation of the island. Concept D would prove disruptive to both populations.

Topic Question 6:
Several of these concepts rely on "managing" the moose population. If "management" is by hunting, then unless random culls are instituted, this will serve to remove the healthiest and best looking (for trophy purposes) moose. This is in direct contrast to predation by wolves which follows a "donor control" model where the weak, young or sick animals are targeted. The selection effects of a hunting model shift the population toward smaller, less trophy-sized animals whereas the selection effects of wolf predation are directly opposite. Healthy populations need predators. Please continue the Isle Royale experiment choosing concept C.

Correspondence: Topic Question 1:
I highly encourage the reintroduction of wolves into Isle Royale to maintain the population's genetic diversity and viability. In this modern, technological world, there are few places where wilderness can exist, and Isle Royale is one of them. It is our responsibility to protect and support the biodiversity of such places so that they remain not only wild but also biologically rich and ecologically viable.

Topic Question 2:
Ecology. Moose and wolves have an ecological relationship that is stable over the long term with little or no need for human intervention. Unfortunately, the small size of Isle Royale limits the number of large predators, thus putting them at risk of local extinction due to chance events (such as climatic fluctuations or disease). Supporting the natural ecological balance of predators and prey by maintaining the viability of predator populations is an extremely low-impact and very effective way to maintain the ecological viability of the island itself.

Furthermore, there are few places left in North America where wolves can even exist, much less be safe from human aggression. Isle Royale is one such place. Based on my reading of the 1916 Organic Act, which states that the NPS is mandated "to conserve the scenery and the natural and historic objects

and the wild life therein and to provide for the enjoyment of the same in such manner and by such means as will leave them unimpaired for the enjoyment of future generations", I would argue that maintaining wolves on Isle Royale is well within the bounds of this mandate, as this would not only protect the wild life, but also provide for much enjoyment by visitors to the park who wish for the wolves to be present, and by maintaining the natural ecological balance, will indeed maintain the park's scenery and nature unimpaired for the enjoyment of future generations.

Topic Question 3:

It is well within the guidelines of the Wilderness Act to reintroduce wolves to the park. Indeed, wilderness is the natural domain of large predators like wolves and one of the primary reasons that people seek wild places is to convene with such denizens of the natural world that have been extirpated from human-occupied zones. I do not recommend any other courses of action outside of the park's current operation procedures.

Topic Question 4:

Climate change is likely to cause increased instability and a higher frequency of extreme weather events, which is likely to damage natural populations through both natural selection and chance die offs. On a small island such as Isle Royale, supporting the genetic viability of these populations through extreme events will be critical to maintaining the long term viability and biological diversity of the entire ecosystem.

Topic Question 5:

I like alternatives that maintain biological diversity with little direct human intervention on the resident animals themselves. Isle Royale's ecosystems are fully capable of maintaining their balance. Wolves have few other places in the world where their presence is more welcome than Isle Royale. Reintroduction of wolves (more than once, if necessary), is likely enough to keep the moose population in check, and promotes the wilderness ethic by preserving the natural balance. Thus, I favor option C.

The options that do not include wolf reintroduction seem biased and unreasonable. There are semantic arguments about the interpretation of the word "natural" that people have used to discourage acts such as the reintroduction of wolves, but I think these are poorly conceived. The natural world itself is unpredictable and has no interest in promoting the mandates of the NPS. Wolves have a significant positive impact on the island and support the mission of the NPS, and should be maintained.

Correspondence: Topic Question 1:

Wolves have a long history on the island and do moose. Both provide an interesting natural process for the island. Having both wolves and moose also attracts tourists and naturalists to the islands. There are very few such places where the natural balance of wildlife and vegetation can be controlled naturally. Culling moose is a horrible intervention when a natural solution occurs.

Topic Question 2:

A natural checks and balance system of reintroduction of wolves will be the best alternative. There is substantial evidence that the introduction of wolves to Yellowstone National Park have created a marvelous balance that has enhanced the entire ecosystem of the park.

Topic Question 3:

The current approach of "summer" visits by humans is working well, I think. Having just visited the park July 25-August 1, 2015, I am so thrilled to have a place that is remote and as pristine as the park still remains. The education of park users is important to help prevent the spread of invasive species that would harm the park's ecosystem.

Topic Question 4:

Again, education and awareness. The more that everyone can be informed of the changes occurring, the more we can all make adjustments to protect this fragile resource.

Topic Question 5:

I do not support the culling of moose nor simply letting the wolves die out.

I do support introduction of new wolves to promote a strong genetic strain that will naturally control the moose population.

Topic Question 6:

This park is unique and it is a blessed part of Michigan. We need to continue to seek ways to keep it the jewel that it is. Thank you for this opportunity.

Correspondence Type: Web Form

Correspondence: Topic Question 2:

There should be a balance between the wolf population and moose. When it is not balanced there is more harm than good done to the environment. Please introduce more wolves on this island instead of decreasing their population and this will keep the moose in check.

Topic Question 3:

Please add more wolves to contain the moose population. So many wolves are under attack in other states and decreasing their population is NOT the answer. It only creates more problems to the environment. There should be intense management of the wolf population to help it thrive and return the land back to it's natural state where there are enough moose and wolves. I think the public should be consulted as far as future plans for any culling.

Topic Question 4:

There should be intense management to monitor the effects of climate change as this will affect all aspects of wildlife and plant life on the island.

Topic Question 5:

I do not like the idea of a moose cull. I like the idea of introducing more wolves to the island so long as there is harmony with the existing wolves on the island. Maybe possibly try to introduce another type of animal that would be a good balance with the wolves and moose but only if it does not disrupt the balance and create new problems.

Topic Question 6:

Other states have adopted disastrous wolf culling plans that are only in the interests of farmers and ranchers. As the wolf population is dwindling, other problems will begin to develop as there is not a proper balance. Please keep wolves in mind and do your best to increase their population before it is too late and more animals will be needlessly killed without the proper balance of mother nature.

Correspondence: Topic Question 1:

Introduce more wolves and utilize moose birth control methods until the wolves have established a significant population to control the Moose herd. These measure have the least amount of human intervention with the moose.

Topic Question 2:

Research as shown (Yellowstone and other areas) that a balance of grazing animals with natural perpetrators keeps the natural environment not only the environment, land, tree, rivers,etc. the healthiest but also keeps the herds the healthiest too. It has taken million of years for Nature to work out the correct management tools, humans can not do better.

Topic Question 3:

Isle Royal is not that big of an area so the solution mentioned above should not be difficult to implement.

Topic Question 4:

Lack of ice on the lake to allow wolves to cross is a problem so may need to reintroduce wolves from time to time to encourage genetic variety.

Topic Question 5:

Culling moose is not a good idea. See what happened in Africa when experts thought culling elephants was a good idea 40 -50 yrs ago. Now there is more drought. Moose provide a service to keep nature in balance, culling them and not allowing the wolves pack to increase will surely cause more problems in the near and far future.

Topic Question 6:

Humans should not try to control nature because we can do not understand how everything big and small interact. We should try to support nature's way with a little of effort as possible to not produce big impacts.

Correspondence: Topic Question 1:

I respectfully request that you follow Alternative Concept A, the No Action Alternative, as the best course for the future of that remarkable wilderness.

Topic Question 2:

see general comment below. As this is an island, natural resource management cannot be identical to continental sites.

Topic Question 3:

see general comment below as to the applicability of the Wilderness Act.

Topic Question 4:

Climate change is happening, the NPS should be a leader in education in helping the public to understand the new variability of climate in natural areas. As for man-made NPS sites, obviously your mission for preservation takes priority. As Isle Royale is a natural - and a wilderness - site, your role is to observe and educate.

Topic Question 5:

See general comment below as to the Wilderness Act

Topic Question 6:

see general comment below

Comments: Having worked for the NPS for a number of seasons I am concerned with the politicization of NPS policies and actions. And I am motivated by the NPS mission to preserve "unimpaired the natural and cultural resources and values of the National Park System for the enjoyment, education, and inspiration of this and future generations."

In the case of the wolves and moose on Isle Royale, I have to agree with President Theodore Roosevelt who famously said about the Grand Canyon,

"Leave it as it is. You cannot improve on it. The ages have been at work on it, and man can only mar it."

Furthermore, Isle Royale is a designated Wilderness; and that has legal implications, i.e. we are required by law to allow nature to run its course. We know that the wolves and moose were all relatively new residents on the island and it appears that the local ecology of the island cannot sustain these large animals. There is, indeed, an entire subset of study on the ecology of islands and how organisms change over time as evolution has its way.

Therefore, we must ecologically as well as legally allow the wolves and moose to disappear. We should not attempt to re-introduce them: an action that clearly disobeys the Wilderness Act.

Therefore, I respectfully request that you follow Alternative Concept A, the No Action Alternative, as the best course for the future of that remarkable wilderness.

Correspondence: Topic Question 1:

I believe we should try reintroducing wolves one time (since farmers in the UP are complaining about too many wolves) which would eliminate wolf hunting. Monitor wolf, moose, vegetation populations afterward.

Topic Question 2:

If there are still too many moose in 2-3 years, consider introducing more wolves one more time. After that, if still too many moose, move or cull the moose.

Topic Question 3:

I prefer to keep the wilderness area at 99% and not try to alter the vegetation.

Topic Question 4:

I am unsure.

Topic Question 5:

I think we must do all we can to try to keep wolves on Isle Royale. Since this problem is man-made (climate change), man must intervene to correct the situation.

Comments: Thank you for the update. Isle Royale was my first backpacking trip in September of 2001. While hiking we saw two moose (male & female, together) and we saw one wolfprint on the trail and heard wolves howling at McCargoe Cove, while camping. We have also heard wolves howling while camping in the back country in Yellowstone. There is nothing like it...please save the wolves.

Correspondence: Topic Question 1:

Trapping an entire pack or two in Michigan's UP and releasing them on opposite ends of Isle Royale. The ecosystem can support them for decades to come, and we wouldn't be "tampering" with the wilderness any more than we do just by sharing the planet with the animals.

Topic Question 2:

Please consider a non-lethal population control program for moose, such as chemical sterilization. IRNP is an excellent location for such research.

Topic Question 3:

Just keep it as unobtrusive as possible. Researchers going about their work certainly aren't going to be a concern. But maintain the wilderness appeal of IRNP for sure.

Topic Question 4:

I think it's reasonable to allow for a bit more human intervention since human activity is what's causing many issues in the first place. For example, it's just a lot less likely that wolves will find their way to IRNP on their own now, so it's reasonable to transplant them.

Topic Question 5:

I think we can move rapidly on adding wolves. I would prefer that moose not be removed lethally.

Reintroduction of wolves

Topic Question 2:

pack density and alternate breeding opportunities for wolves.

Topic Question 3:

wilderness only intervention to prevent genetic pooling of wolves.

Topic Question 4:

migration of mainland wolves if possible or if necessary capturing and reintroduction of genetically different wolf populations

Topic Question 5:

Not sure, need to read more about it. Right now it doesn't seem like the best alternative. Culling is not a good way to control populations.

Topic Question 6:

It's starting to appear that the powers that are in charge really don't want to use wolves to manage populations of other animals. If Isle Royale is truly a wilderness area wolves should be both reintroduced and allowed to multiply with minimal human interaction except when necessary to prevent hereditary problems by genetic pooling.

I certainly hope DNR and other powers allow wildlife biologists with no political affiliation to allow wolves to succeed without input from wolves haters.

Correspondence: Topic Question 1:

Wolves definitely should be reintroduced to Isle Royale.

Moose populations could EASILY be a pilot project on the island for sterilization and/or contraception. Lethal culling should not be allowed on Isle Royale.

Topic Question 2:

The wolf population should have been addressed with introducing new wolves much sooner than now. The dwindling numbers were very obvious for years. The increase in moose numbers was inevitable AND the vegetation obviously has been affected. Isle Royale is too special to have let this happen. Special management is necessary now. Introduce new wolves to the island, use sterilization and/or contraception for the moose and establish new vegetation if necessary before it will be too late.

Topic Question 3:

Isle Royale National Park should be cared for as a special location in the National Park system. Attention to the wolf/moose/vegetation issue should be a priority. Save this jewel of a National Park before it is too late. Wilderness in this location is cherished by many tourists/visitors...let that continue, but intervene using the special methods; reintroduction/relocation of wolves, sterilization/contraception on moose and finally if necessary reintroduction of native vegetation to re-establish the island.

Topic Question 4:

Since the ice bridge does not happen every year with climate issues, it is all the more apparent that wolf introduction/relocation needs to be a solution. Wolves will not be crossing the ice bridge as they did in the past due to climate issues hindering the ice bridge from developing.

Topic Question 5:

Personally I feel the introduction of new wolves is long overdue.

Not sure WHY the NPS has not acted before now.

Topic Question 6:

Will repeat that Isle Royale is a special National Park. It needs to be maintained in a manner where the wolf/moose/vegetation balance exists once again. Left as is, we all realize the moose will completely destroy the vegetation and the moose will starve to death. I have always been an advocate of introducing NEW wolf families, would have no problem using sterilization and/or contraception on the moose to maintain their population, and in the end the vegetation should rebound, but if not, native vegetation should be planted again. I strongly oppose ANY hunting/culling on the island now or ever. Lethal methods on the island are definitely not an option in our opinion.

Correspondence: Topic Question 1:

Introduce wolves in a measured, scientifically informed, and responsible manner in order to keep the moose herd in check and preserve vegetation. The demise of the wolf pack appears to be a human triggered event due to global warming.

Topic Question 2:

Maintaining the historic balance of species with only the minimal human interference required.

Topic Question 3:

Management should be limited to those measures needed to maintain the historic balance, and compensate for other human caused events, i.e.global warming, introduced invasive species, toxic spills, or visitor pollution and/or trash.

Topic Question 4:
Institute those measures required to compensate for global warming, I.e. species introduction.

Topic Question 5:
I believe the unique ecosystem of Isle Royal is doomed by the disappearance of the wolves, therefore I believe it would be a head in the sand approach to refrain from bringing the wolves back. While this was a long term success story of non-interference, global warming preemptively ended the non-interference, without the input of any of us who value the natural world.
While the moose herd needs to be limited in size, and may require temporary culls, I would prefer for wolves to do the task in a natural manner.

Topic Question 6:
Please take quick action to save the unique wilderness environment of Isle Royale!

Correspondence: Topic Question 1:
Sterilization, contraception and reintroduction of wolves.

Topic Question 2:
The balance of nature is off, as happens all over the world primarily because of humans. We need to find compassionate measures to bring back the balance that once existed. We need to be shepherds of the same animals that we have put in jeopardy.
Balance of vegetation, wolves and moose can be helped with humane trapping and reintroduction of wolves when necessary.

Topic Question 3:
Sterilization, contraception.

Topic Question 4:
This question is really beyond my knowledge. I would hope that climate considerations would be taken into account by environmental experts.

Topic Question 5:
I think adding to the extinction of any animal is criminal, cruel and frankly, lazy. We live in an ecosystem where one species is dependent and benefited by others.

Topic Question 6:
Please let's be proud of the way we treat every living creature on our Earth.

Comments: Thank you

Correspondence: Topic Question 1:
As an advocate of the island and its resources, I ask the NPS to consider establishing a balanced, timely approach to resolving the problem - Fall-Winter 2017 is to far away to have a genuine impact given the dire situation of the existing wolf population on the island and how quickly overgrazing moose could destroy the topography and ecosystem if left unchecked.

Topic Question 2:
Continued, long range planning that aim to maintain both the moose and wolf populations on the island - which should include wolf reintroduction and augmentation as needed to maintain the health of existing packs.

Topic Question 3:
This plan should happen swiftly - recognizing that the remaining 3 wolves are not in good health and may not survive the winter and that they are the only predator of island moose, it seems nonsensical to move slow. The tight connection between the natural predatory-prey relation of wolves and moose and the health of vegetation on the island bring to light the need to preserve the island's ecosystem.

Topic Question 4:
With climate change contributing to the demise of the ice bridge severing the natural migration of wolves to the island, it is logical that we should correct, to the best of our ability a potential natural disaster before it happens - especially because it is within our means to do so. Decisions and actions need to be swift with respect to the natural of order of living things on the island.

Topic Question 5:
As a reader I appreciate the diversity of options. At the same time, some options are extreme - either do nothing (alternative A) or act in a heavy handed and non-natural manner (Alternative F).

Alternative B is a short term fix flawed in that it does not continue to augment the moose population to avoid future inbreeding problems that brought us to the current scenario. This option considers the value of the predator-prey relations of wolves and moose and the positive dynamic outcomes this produces on behalf of the vegetation.

As an avid advocate for animals and our natural resources, I prefer we choose alternative C as an option because it aims to preserve the natural wolf-moose predatory relationship with an adaptation designed to offset the impact of climate change (loss of the ice bridge to the island from the mainland) by augmenting the wolf population as needed and recommended by researchers.

Alternative D is short-sighted; by providing a one time fix with wolves they set the island up for failure again when the wolf population succumbs to the perils of inbreeding because new wolves can no longer naturally get to the island and then implies culling of moose. In order to accomplish this, mechanical vehicles and helicopters brought in to kill moose will ultimately disrupt the environment.

Option E implies culling of moose.

Option F implies full mechanistic means to manage organic space. Social institutional theory suggests that mechanistic and progressive attempts to control natural spaces and species generally reproduce exponentially the ails it aims to resolve. This could result in a natural disaster and a death of the island as we know as a "natural" resource. This would be a tragedy.

Topic Question 6:

Again, knowing that there are only 3 wolves remaining on this beautiful island with limited chances of surviving the winter, it is imperative that we act quickly to preserve the predatory-prey relations of wolves and moose that subsequently attends to the ecosystem of the island. When considering any overarching policy to remedy natural systems, we must always look to organic, sympathetically natural ways to resolve a conflict. Human beings caused climate change. We must follow the wisdom of the natural order of living things by choosing an option that best patterns nature in this case. Please consider option C.

Correspondence: Topic Question 1:
Alternative C
If introducing wolves doesn't work, then birth control. No killing by humans.

Topic Question 2:

As long as there is a threat to Michigan U.P. wolves(DNR sanctioned hunts), those wolves can be moved to Isle Royale (when the moose-wolves balance is seriously threatening the island vegetation.) Minimalist, rare interventions that don't involve killing either species, should balance the legitimate desire to preserve the vegetation and the principles behind designated wilderness. Many park users want nothing to do government sanctioned killing of wildlife

Topic Question 3:

Actions that keeps human trophy hunters out of the moose-wolves-island ecosystem. Michigan has been embroiled in a bitter fight between big game baggers and citizens who want the "wild" left in wilderness. A compromise is moving some wolves from the Ironwood area or Delta County. That calms the anti-wolves contingent in those areas and provides a more diverse gene pool to breed with the three remaining Isle Royale pack. Minimalist, rare interventions that don't involve killing either species, should balance the legitimate desire to preserve the vegetation and the principles behind designated wilderness.

Topic Question 4:

Given that the lake ice is no longer consistent, and the vegetation, moose and wolves may not be able to survive on the island in twenty years, rare and non-lethal management should be used and very soon. Please implement alternative C in the next year.

Topic Question 5:

Likes: A-E refrain from taking on a long-term intensive human dependent role. They recognize the reality that the island will be transformed very soon permanently by humanity's failure to address our role in climate change.

Dislikes:No killing. It smacks of the circular logic used to justify killing threatened and endangered animals.

Topic Question 6:

The Michigan Tech biologists who have studied the wolves and Isle Royale ecosystem should have an immense influence on the park service management plan.

Correspondence: Topic Question 1:

I feel that, as wilderness, nature should be left alone and studied. If more wolves are to come to the island it will happen on a cold year when the lake freezes over.

Topic Question 2:

Study and manipulation are mutually exclusive.

Topic Question 3:

Very little management, but lots of study. We can only know what a working ecosystem is by comparison and leaving wild places truly wild.

Topic Question 4:

Sadly, although climate change is largely man made, I feel that only incremental management should be taken.

Topic Question 5:

Alternative Concept A, the No Action Alternative, is the best alternative to protect Isle Royale's unmanipulated, untrammelled wilderness character.

Correspondence: Topic Question 1:

With the population of wolves in Michigan's upper peninsula, an easy solution would be to humanely live trap the wolves and transport them to Isle Royale; another solution would be to trap and transport wolves from our western states. This would provide a more diverse genetic pool, helping the wolf population on the island to survive.

Topic Question 2:

To maintain the integrity of this island and keep it as it has always been, with healthy populations of moose and wolves; this balance itself would manage the vegetation...too many moose destroy the vegetation...a healthy population of wolves would keep moose numbers in check.

Topic Question 3:

Introduce a genetically diverse population of wolves to maintain balance with the moose and vegetation. This is more important than the cost and effort it would entail.

Topic Question 4:

Closely monitor the effects of climate change as they occur on this island and its inhabitants, then act accordingly.

Topic Question 5:

I dislike the culling of the moose population...re-establish the wolf population to naturally keep the moose numbers in check.

Topic Question 6:

Continuing to mull over various solutions when the simplest, most natural and obvious is to increase a genetically diverse wolf population would seem to be a no-brainer. Is this being discounted due to the cost and effort of this solution?
I hope not!

Correspondence: Topic Question 1:

This is a golden opportunity for Michigan to become a leader in healthy conservation and environmental issues if the moose management on Isle Royale is done 'right' in a sound manner. Hence,

Natural means of wildlife [fauna and flora] management are always superior to well intended but unnatural, short-sighted and thus usually ineffective human interventions

Please reintroduce wolves to Isle Royale more than once, if necessary. Let the wolf population become strong there. Scientists have seen and proven in the wester Upper Peninsula how the comeback of wolves have helped stabilize a healthy ecological balance and even flooding has stopped due to ample vegetation along riverbanks growing because deer and lagomorphs [rabbits] are not eating it because the wolves are keeping their numbers in check. Please manage current moose populations by contraception and/or sterilization and not by lethal culls.

Ideally, the NPS would expedite its final decision by the end of 2016.

Topic Question 2:

Again, This is a golden opportunity for Michigan to become a leader in healthy conservation and environmental issues if the moose management on Isle Royale is done 'right' in a sound manner. Hence,

Natural means of wildlife [fauna and flora] management are always superior to well intended but unnatural, short-sighted and thus usually ineffective human interventions

Please reintroduce wolves to Isle Royale more than once, if necessary. Let the wolf population become strong there. Scientists have seen and proven in the wester Upper Peninsula how the comeback of wolves have helped stabilize a healthy ecological balance and even flooding has stopped due to ample vegetation along riverbanks growing because deer and lagomorphs [rabbits] are not eating it because the wolves are keeping their numbers in check. Please manage current moose populations by contraception and/or sterilization and not by lethal culls.

Ideally, the NPS would expedite its final decision by the end of 2016.

Topic Question 3:

Sound reasoning and sound solutions bear repeating, so, once again.....This is a golden opportunity for Michigan to become a leader in healthy conservation and environmental issues if the moose management on Isle Royale is done 'right' in a sound manner. Hence,

Natural means of wildlife [fauna and flora] management are always superior to well intended but unnatural, short-sighted and thus usually ineffective human interventions

Please reintroduce wolves to Isle Royale more than once, if necessary. Let the wolf population become strong there. Scientists have seen and proven in the wester Upper Peninsula how the comeback of wolves have helped stabilize a healthy ecological balance and even flooding has stopped due to ample vegetation along riverbanks growing because deer and lagomorphs [rabbits] are not eating it because the wolves are keeping their numbers in check. Please manage current moose populations by contraception and/or sterilization and not by lethal culls.

Ideally, the NPS would expedite its final decision by the end of 2016.

Topic Question 4:

Eagerly consult scientists and conservationists and follow their sound, SCIENTIFIC advice.

LEAVE LOCAL STATE and Federal POLITICS OUT OF THE MATTER ENTIRELY because the misguided politicians

1. rely too much on opinion instead of fact

and

2. have ulterior motives that do not serve the best interests of all in our state [humans, fauna and flora, and the environment.

Topic Question 5:

I abhor culling the moose population and the NPS should, too. Killing of any kind is barbaric, unnecessary, costly, represents old paradigm thinking that does not serve humanity and the environment. Plus it is far less ineffective than preferred natural methods proposed above instead. There is no way to justify it when there are better ways to handle this issue.

Topic Question 6:

This is a prime opportunity for Michigan to become a leader in HEALTHY, NATURAL policies to benefit the environment and to show the nation and the world that the time has come to REALLY do what is right and NOT follow the misguided directions [hurtful opinions] of politicians. We must start doing what is right for the environment and we must STOP doing what only 'maximizes profits' for a few wealthy elite.

Comments: Thank you for considering the points in this letter.

Correspondence: Topic Question 1:
This is a golden opportunity for Michigan to become a leader in healthy conservation and environmental issues if the moose management on Isle Royale is done 'right' in a sound manner. Hence,

Natural means of wildlife [fauna and flora] management are always superior to well intended but unnatural, short-sighted and thus usually ineffective human interventions

Please reintroduce wolves to Isle Royale more than once, if necessary. Let the wolf population become strong there. Scientists have seen and proven in the wester Upper Peninsula how the comeback of wolves have helped stabilize a healthy ecological balance and even flooding has stopped due to ample vegetation along riverbanks growing because deer and lagomorphs [rabbits] are not eating it because the wolves are keeping their numbers in check. Please manage current moose populations by contraception and/or sterilization and not by lethal culls. Ideally, the NPS would expedite its final decision by the end of 2016.

Topic Question 2:
Again,

This is a golden opportunity for Michigan to become a leader in healthy conservation and environmental issues if the moose management on Isle Royale is done 'right' in a sound manner. Hence,

Natural means of wildlife [fauna and flora] management are always superior to well intended but unnatural, short-sighted and thus usually ineffective human interventions

Please reintroduce wolves to Isle Royale more than once, if necessary. Let the wolf population become strong there. Scientists have seen and proven in the wester Upper Peninsula how the comeback of wolves have helped stabilize a healthy ecological balance and even flooding has stopped due to ample vegetation along riverbanks growing because deer and lagomorphs [rabbits] are not eating it because the wolves are keeping their numbers in check. Please manage current moose populations by contraception and/or sterilization and not by lethal culls. Ideally, the NPS would expedite its final decision by the end of 2016.

Topic Question 3:

Sound reasoning bears repeating, so once again,

This is a golden opportunity for Michigan to become a leader in healthy conservation and environmental issues if the moose management on Isle Royale is done 'right' in a sound manner. Hence,

Natural means of wildlife [fauna and flora] management are always superior to well intended but unnatural, short-sighted and thus usually ineffective human interventions

Please reintroduce wolves to Isle Royale more than once, if necessary. Let the wolf population become strong there. Scientists have seen and proven in the wester Upper Peninsula how the comeback of wolves have helped stabilize a healthy ecological balance and even flooding has stopped due to ample vegetation along riverbanks growing because deer and lagomorphs [rabbits] are not eating it because the wolves are keeping their numbers in check. Please manage current moose populations by contraception and/or sterilization and not by lethal culls. Ideally, the NPS would expedite its final decision by the end of 2016.

Topic Question 4:

1. Consult scientists and environmentalists only and use their FACTUAL information
2. LEAVE ALL POLITICIANS [state and federal] OUT OF THIS DISCUSSION. WHY? they have a history of
> acting on OPINIONS instead of on FACTS and thus do greater harm than good
> making policies that do NOT serve the Greater Good of ALL [humans, flora and fauna, the environment] but which rather line their pockets with sordid profits from policies that hurt our environment and thus also hurt EVERYone and EVERYthing.

Topic Question 5:

Stop all killing of animals, like moose in this instance.
Use natural predators like wolves instead.
This is much better for the environment.

Topic Question 6:

Don't follow opinions of politicians.
Leave them out of the picture completely,
Consult only scientists and their facts and do what is right according to their suggestions and best practices.

Correspondence: Topic Question 1:

Is it possible to impregnate any of the current established wolves?

Topic Question 2:
Humans have been given the smarts and science to assist our other living creatures, to avoid a Dodo bird repeat..causing an animal/species extinction by over hunting or ignoring population issues is no different than assisting a species that needs help. Both are ways of messing with nature. It's up to us, to assist all subjects in keeping a balance on this island, for future generations of both four and two legged species. Plants and other foods needed for the moose and wolf survival, are within our capabilities to introduce and maintain.

Topic Question 3:
Major intensity is necessary. Too much time has already passed as we stood by. Please don't waste any more time discussing this issue, as we have the smarts to change the current direction. 99% my be wilderness! but experts can be brought in for safety and other procedures. The island is reachable with

the proper equipment, from all around. There is a small window of weather appropriate timing, and that needs to be addressed ASAP.

Topic Question 4:

Again, with today's equipment, science and radar, proper precautions and notice can be obtained to handle whatever functions/action necessary to assist. The people involved in starting this discussion are supposed to be college smart"...why is this taking so long to figure out????

Topic Question 5:

I like all of the stated possible options, each has good pros and few cons. Fatal culling has NO pros whatsoever. If we can make babies in a perri dish, why is deciding on a solution for this Eco system so hard???

Topic Question 6:

Please don't waste anymore time on this matter. Pick an option and get started. With the high possibility of a warm winter fast approaching, counting on an ice bridge for nature to take it's course is strongly coming to light as not an option.

Correspondence: Topic Question 1:
Moose should not be lethally culled, but instead the use of contraceptives should be employed.
More wolves need to be introduced to Isle Royale since there are only 3 now which is almost extinction. The natural balance of predator/prey is completely out of balance.
Culling/killing by humans NEVER works in nature. When will humans ever learn that?

Topic Question 2:

Contraception should always be used for the moose. New wolves should be introduced more than once...
Vegetation will replenish once the moose population is brought under control by the wolves.

Topic Question 3:

Just introduce new wolves when needed, use contraception on the moose when needed....then step out of the way!

Topic Question 4:

When our environment is left to nature....when humans keep their destructive ways out of the way....the Isle of Royale will do much better than the rest of the U.S. quite simply put!

Topic Question 5:

Culling/killing does not work to bring numbers of prey down...When will humans learn that?

Correspondence: Topic Question 1:
I support wolf reintroductions as necessary over the next 20 years to insure genetic diversity for wolves and sustainable populations of both wolves and moose into the foreseeable future. The wolf reintroduction in Yellowstone clearly illustrates the success of reintroduction itself.

Maintenance or culling of moose is not necessary if wolves are allowed to fulfill their ecological role. Based on historical data at this time, there is no likelihood of having a wolf population without human action.

Topic Question 2:

I believe the NPS should consider and evaluate the ecological benefits wolves provide. The only pup observed in 2015 was visibly deformed; 100% o wolves examined since 1994 (over 30 of them) have spinal anomalies. The weakened state of the remaining wolves is likely interfering with reproduction and survival.

The NPS must consider the data collected through 57 years of research conducted on Isle Royale. These researchers should play a key role in the discussions.

Topic Question 3:

The culling of moose and the use of motorized equipment is UNACCEPTABLE in a National Park. NPS must protect the unique wilderness qualities of Isle Royale through monitoring of habitat for wildlife, including wolves and moose; maintenance of soil and water quality and ecological stability of plant and animal communities including the control of invasive species. Management is necessary to maintain important wilderness values including the presence of a top carnivore which is vital for ecosystem health.

Topic Question 4:

Climate change poses a fundamental threat to species and places. The only way to slow the impacts of climate change is to globally reduce carbon emissions. NPS could produce an informational flyer explaining the negative impacts climate change is having on Isle Royale such as the changes in the duration and frequency of the ice bridge, winter ticks, bird species etc. NPS could engage with businesses and private entities that use the island to reduce carbon pollution. Encourage visitors to reduce their carbon footprint by not bringing / disposing of water bottles.

Moose are not likely in any direct danger of being reduced by climate change, however, wolf predation is needed to limit the growth in their population.

Because of climate change, it is unlikely that wolves will be able to repopulate Isle Royale without NPS intervention and we ask for immediate action to augment / reintroduce wolves.

Topic Question 5:

I am very concerned that NPS has not heeded the call of research scientists who have warned NPS for years of the plight of wolves on Isle Royale. Still the NPS has chosen to take no action until now. The island cannot afford to wait 2-1/2 years for NPS to make a decision considering this has been forewarned for years.

Evidence suggests that the few wolves on the island will not be able to keep moose populations in check which will further degrade the island's vegetation. Every effort must be made by the NPS to expedite the decision.

Topic Question 6:

National Parks serve important educational functions and reestablishing wolves should be part of the educational function. What an opportunity to educate the public with an intact ecosystem including an apex predator. The NPS has a mandate to reestablish natural conditions including restoration of species in some circumstances. NPS also has obligations under the ESA.

Allowing an ecosystem collapse on the island does not make sense with what we know about trophic cascades and the wolves' role as an apex predator.

Protecting biodiversity should be a high priority of NPS due to climate change and this is one of those situations where human manipulation, through reintroduction, will serve that purpose as well.

Comments: A visit to Isle Royale without wolves is incomprehensible to me. NPS has a fiduciary responsibility under the Public Trust to maintain Isle Royale for future generations which means wolves and moose coexisting together with intact ecosystems and the least amount of human intervention as possible. Most importantly for me, guns and motorized vehicles used to maintain an ecosystem no longer qualifies as a National Park w/ vast wilderness. Please expedite this process; reintroduce wolves sooner than later.

Correspondence: Topic Question 1:

Please adopt Alternative C, to maintain both moose and wolves.

Topic Question 2:

We need an effective predator-prey dynamic, which requires a larger wolf population than we now have. Wolves should be reintroduced and augmented more than once, as needed to maintain reasonable balance. Also, if additional measures to control moose population are necessary, they should be by contraception and/or sterilization, not by lethal culling.

Topic Question 3:

The wilderness designation is why it would be best to return Isle Royale to a natural predator/prey balance, with the least human intervention possible.

Topic Question 6:

Please expedite your final decision- -by the end of 2016.

Correspondence: Topic Question 2:

I think that it is important to introduce outside gene pool to the remaining wolf population. Part of the reasons for their reduction of numbers is due to the isolation of the packs. While normally the approach has been to let nature follow its course, the situation of Isle Royale is unique. The packs of wolves are necessary to balance out the numbers of moose. The number of moose need to be checked in order to maintain the vegetation of the island.

Topic Question 3:
The present situation with the park is such that it may call for more direct intervention with a greater number and support from staff. This I hope would be only a temporary fix with a return to more limited management in the future.

Topic Question 4:

Since the warmer climate makes the Moose more susceptible to insects and disease, perhaps it may be necessary to deal with that by giving them injections or other medications.

Topic Question 5:

I would like to see a method of control other than culling the moose population.

Topic Question 6:

I have visited the Isle Royale National Park on three separate times. Two of times it was backpacking. The last time was a canoeing adventure around the various islands. We have many wonderful memories of these trips. Our children had a great time and always talk of going back. One of my observations was there was more favorable treatment given to boaters than other visitors. Realizing their appearance was less damaging to the environment, I felt that backpackers were slowly being weeded out through reduction of support for their needs.

Comments: Isle Royale is a jewel of a park. It needs to be protected, but also made available to as many people as possible. It is limited access through its location. Many can not afford a trip there because of cost of transportation and lack of equipment. Hopefully a compromise and solution will come about.

Correspondence: Topic Question 1:

Wolves have kept Isle Royale's moose herd healthy for a long time. Every effort should be made for that to continue. There should be sufficient flexibility in the plan to allow for multiple introductions of wolves, if need be.

Topic Question 2:

The National Park Service should introduce wolves, then sit back and watch. This area has been a natural laboratory for 57 years. If wolves are gone there will be ecological havoc. Reintroducing wolves is therefore necessary. Other than that, the area should not be managed. Management by people is always inferior to natural management.

Topic Question 3:

Isle Royale's unique and spectacular wilderness should be managed only to ameliorate the impact of humans (invasive weeds, maintaining trails.) Wolves need to be the top carnivores.

Topic Question 4:

Because of climate change, it is unlikely that wolves will be able to repopulate Isle Royale without NPS intervention. It is important for NPS to immediately act to augment/reintroduce wolves.

Topic Question 5:

The decision on what to do should be expedited. Wolf impact on moose populations is likely to be negligible and moose numbers will increase. Why is NPS dragging its feet? I find it absolutely abhorrent that the NPS is even considering motorized vehicles and culling. If this is the case, Isle Royale will just be another hunting camp. The wilderness value will be degraded.

Topic Question 6:

There are very wild places left where there hasn't been a heavy handed management - mostly to the benefit of trophy hunters. It would be a terrible loss to lose this natural laboratory to this kind of management.

Correspondence: Topic Question 1:
Wolves need to be reintroduced to the island to keep the moose population in check and to improve the moose species by selecting weaker individuals. This, in turn, will ease the excessive demand for vegetation because of moose overpopulation.

Topic Question 2:
Nature is a delicate balancing act and performs beautifully when outside influences are absent. Protecting a pristine environment without human influence is the best option.

Topic Question 3:
We are stewards of this earth and its wildlife and animals. This precious wilderness must be protected against humans- -hunting, fishing, pollution and development,

Topic Question 4:
Climate change and pollution will affect these populations even more and increase the need and urgency to protect them, their habitat, and work to curb climate change by all of us.

Topic Question 5:
I detest hunting. I feel it's a sport only when both hunter and hunted have guns.

Topic Question 6:
The biggest threat to all wildlife is human greed. Please do whatever is necessary to guard against the hunting/firearm industry, ranching and trophy hunting industries, real estate developers, investment companies and wealthy people buying up lakefront property. Beware of people and politicians who are influenced by and/or indebted to big money. Don't sell out our heritage.

Comments: Strive to keep the best interest of the wildlife and environment at heart. We are putting our trust in you. Thank you for your consideration.

Correspondence: Topic Question 1:
I mostly prefer Alternative Concept C with a blending of Alternative Concept F. Regarding F, wolves should be reintroduced and managed via augmentation to create a healthy symbiotic relationship with moose, while the number one priority should be the preservation of natural habitat, vegetation and threatened/sensitive species with the least possible intrusion into the wilderness ethic.

Topic Question 2:
The maintenance as much as possible of a wilderness ethic and setting.

Topic Question 3:
Please see answers to questions 1 and 2. Reintroduce and maintain wolves to help them naturally cull moose through predation while remaining sensitive to the preservation of the natural habitat, vegetation and other species.

Topic Question 4:
Humans created climate change, and now humans need to start managing this mess before climate change wipes out other helpless species.

Topic Question 5:
I prefer C and aspects of F.

Topic Question 6:
Isle Royale isn't really wilderness. It is a natural park with boats, lodges, and other human structures. The park and wilderness have already been altered by man, and the wolf/moose population/relationship is unhealthy for numerous reasons. Wolves and moose on Isle Royale is what makes it wonderful, so let's do what we can to preserve this unique park while preserving as much wilderness as possible.

Correspondence: Topic Question 1:

import the wolves.....leave the dnr (don't know ????) and listen to the scientists that have studied this for years. Political appointments are not a substitute for science.....althou I realize that is a very common practice with other issues, such as climate change. When will money be trumped by knowledge

Topic Question 2:

listen to the people that know what they are talking about....not the dnr

Topic Question 3:

balance the ecology for the sake of the environment....that is why we are supposed to be smarter than politicians....this is not about money

Topic Question 4:

let it go and watch i9t

Topic Question 5:

dont' know, just know that the scientist at

Tech are waaaaay smarter than the dnr

Comments: quit being political, and save the wilderness in this state. If people choose to move to the wilderness, they should expect wolves. Save the wildlife and save the wolves and coyotes.

Everything is being killed by idiots.

Correspondence: Topic Question 1:

Farmers and pet owners only need to install simple yet adequate fencing as a means to protect their animals from potential harm or death by a wild wolf or near.

Killing endangered wild wolves is absolutely unnecessary as well as causing long term harm to other forms of animal wldlife.

Furthermore, in this modern era there is no beneficial reason for "trophy" wolf hunters to slaughter these beautiful and ecologically essential creatures in adequately controlling potential over population of deer, moose and other forms of wild animals.

Topic Question 2:

1. Prohibiting hunting of wolves coupled with injecting a few live captured wolves on the island from other geographical locations located within the confines of the USA geographical boundaries as a measure to improve control for an overly populated inventory of moose on this island.

Topic Question 3:

Exercising best practices of wildlife management predicated on the application of proven scientific methods.

Topic Question 4:

Same answer as given to question # 3 above.

Topic Question 5:

Any proposal to kill wild wolves that do not presentvsn imminent threat to humans should be rigorously enforced and practiced.

Topic Question 6:

Please stop the destructive and senseless slaughter of wild wolves by hunters or poachers through vigorous means of law enforcement techniques together with appropriate along with certain criminal penalties and sanctions against violators of the laws and regulations promulgated by duly responsible public officials.

Correspondence: Topic Question 1:

Please keep the island in a healthy state of balance by maintaining both moose and wolves, with these conditions:

1. Additional wolves are reintroduced as often as necessary to bolster both the size and genetic diversity of the Isle Royale pack.
2. Moose populations, if not fully kept in check by wolves, are managed by contraception or sterilization - not by lethal culls.

Topic Question 2:

It is my understanding that part of the reason wolves on the island are not doing well is because of climate change, and the decreased ability for new wolves to cross the ice in winter and join the island pack. It would therefore stand to reason that Isle Royale wolves can rarely, if ever, reach the mainland either. This should make Isle Royale National Park an ideal relocation site for wolves who have preyed on livestock. I strongly urge that wolves who prey on livestock and remain undeterred by other non-lethal methods, be captured and moved to Isle Royale where there is no livestock to come in conflict with. This would prevent them from being killed, and help preserve the genetic diversity of the species.

Topic Question 3:

I believe wilderness, by its very nature, needs very little management. However there are times when it is threatened by man-made problems that should be compensated for if possible.

Topic Question 4:

See answer to question #2. Wolves should be reintroduced as frequently as necessary, to compensate for the fact that they no longer cross the ice on their own in winter. Also, taking advantage of that same lack of ice, it would be an ideal spot for relocation of "problem" wolves.

Topic Question 5:

My main concern is for the health and wellbeing of the wolf pack. Culling moose would be a temporary fix, but if the wolves die out completely, moose numbers will rise higher than ever and a cull would have to be repeated every year. The best solution would be to help nature balance itself, by bolstering the wolf population so it can once again control the moose population naturally.

Correspondence: Topic Question 1:

Wolf reintroduction and population maintenance are nature's way of maintaining the balance. Target moose fertility if also needed with year-by-year reviews of the balance between populations.

Topic Question 2:

The best possible balance -- based on historical, pre-human ecosystems. It's a national park and the human footprint should be light, as in "take on pictures, leave only footprints."

Topic Question 3:

Global contaminants, climate change, increased use, etc. impact the park in ways nature did not prepare it. Keep the park as close to its pre-industrial nature as is feasible, while allowed humans to view it from existing paths that do no harms.

Topic Question 4:

Budget reasonably and aggressively to minimize the impact, though it looks to be far too massive an impact to stop or even know detailed influences at this time. It is a battle that must be fought, much better sooner than too late when defeat is imminent worldwide.

Topic Question 5:

Good preliminary plans.

Correspondence: Topic Question 1:
Wolves reintroduced/augmented more than once as needed.
Moose populations are managed by contraception and/or sterilization and not by lethal culls, repeated as needed in the future.
NPS must expedite its final decision by the end of 2016. All the wolves will be gone if there is a long delay.

Topic Question 2:
The goal should be maintenance of appropriate balance between moose and wolf populations. Isle Royale is so unique in that it offers this wonderful environment for wolf and moose to live unharassed. To continue this, we need to monitor the balance.

Topic Question 3:
Do not reduce the wilderness area. There are casinos and parks elsewhere for humans to use as recreation. There are NOT other Isle Royales

Topic Question 4:
Scrupulous monitoring to be able to identify new issues resulting from changes in climate, so that solutions can be produced as quickly as possible.

Topic Question 5:
Better than letting the wolves die off completely. But contraception is so effective, more humane, and relatively easy to administer to the moose, rather than a mass slaughter. And re-introducing of additional wolves must be done regardless.

Topic Question 6:
Whatever it takes, we must preserve this treasure, Isle Royale.
Among the options possible to be able to do so, why not take the highest road, rather than a bloodbath?

Correspondence: Topic Question 1:
Reintroduction of the major predator species to manage the moose population along with other prey species on Isle Royal.

Topic Question 2:
Because of the sparsely populated(human) island it should be returned to its natural state (vegetation/wildlife) and then managed accordingly.

Topic Question 3:
It should be granted the same attention of say Yellowstone or any other major natural area. It is much easier and cheaper to keep it natural then it is to try and return it to a natural state.

Topic Question 4:
no comment

Topic Question 5:
Culling is not the answer. It is usually indiscriminate in its process. Use of predator species keeps the healthiest and strongest in the herds, while removing the weakest. Human culling usually removes by total numbers weakening the overall genetic state of the herds.

Correspondence: Topic Question 1:
Please consider alternative C, that:

Wolves are reintroduced/augmented more than once, if necessary.
Moose populations are managed by contraception and/or sterilization and not by lethal culls.

As an avid outdoorsman, in love with our environment here in Michigan, I'm very conscious of our precious natural resources/wildlife. As most of you, I truly believe in preserving our resources through natural means and honoring life, thus, not thinning our wildlife through hunting.

Topic Question 2:

Wolves are reintroduced/augmented more than once, if necessary.
Moose populations are managed by contraception and/or sterilization and not by lethal culls.

Topic Question 3:

I believe that given our wildlife is self-sustaining and self-preserving, let nature take its own course with minimal interference.

Topic Question 4:

Again, I believe in letting takes its course unless we need to act due to changes introduced by other than those that are natural (i.e. White Nose Syndrome infecting our bat population introduced accidentally in other habitats).

Topic Question 5:

I feel that with our moose population would be better controlled with the introduction of more wolves. It worked wonders out west when the deer population ravaged our national parks in that region.

Topic Question 6:

I appreciate what you do to oversee our beloved resources and that you're taking the time to poll these alternatives

Correspondence: Topic Question 1:
Adopt Alternative C.

Do not cull/kill moose. Instead, employ sterilization/contraception.

Reintroduce wolves and augment populations where necessary.

Implement Alternative C by December, 2016 at the latest. Sooner.

Topic Question 2:
Reintroduce prey/predator relationships. Manage lightly. Let Mother Nature carry the load (she knows better than we do anyhow). Keep eye on disease. Work toward genetic diversity in all populations to create stability.

PROSECUTE ANY FOOL WHO KNOWINGLY OR ACCIDENTALLY SHOOTS WOLVES WHO ARE USING ICE BRIDGES.

Topic Question 3:
Do not cull/kill moose to manage the forest. This is problematic on its own. The only thing that will effectively manage the forest community is reestablishment of wolves back to the island.

Management should be approached with a philosophy of intensity, but a light hand. Only touch where needed and then get out. Mother Nature works best without human interference.

Topic Question 4:
Well, we made this mess, I guess we need to fix the problem. We need to work toward maintaining stability in the ecosystems as much as possible. This is tricky as this is fluid. Most will be out of our hands (temperature, shifting seasons, rainfall, plant community response to all of this). We need to work within shifting parameters and always work with ecosystem health as the first priority.

KEEP THE IDIOT POLITICIANS OUT OF THIS. THEY HAVE AGENDAS. THEY ARE DENIERS. THEY WILL NOT DO A [expletive] THING TO ENSURE HEALTHY FLORA/FAUNA ECOSYSTEMS. FIRST, THEY DON'T REALLY UNDERSTAND IT AND SECOND, THEY BECOME HYSTERICAL, ILLOGICAL AND THEY WILL LIE WITHOUT BATTING AN EYE IF IT SERVES THEIR AGENDA.

Stay close to your scientific and Native American communities for guidance. When in doubt, stop and listen. Go slow. Get it right the first time. But GO. Do. Soon.

Topic Question 5:
Culling moose? Really? Seriously? This is obscene. Find a better way while you get the wolf reintroduction on its feet. It is out there. Why not call your Michigan wolf experts and listen to what they think. I realize that the moose, unchecked, could ruin the forest in a heartbeat. No doubt about that. However, we have been screwing around with this discussion, while the wolves have been dying. Now, at the brink, we are waking up to a call that has been a long time coming and the moose have to pay with their lives because of our ineptitude? Give me a break. Find another way besides killing moose.

Topic Question 6:
No more time to waste.

Read: Aldo Leopold's Thinking Like A Mountain found in "A Sand County Almanac." Read it often.

We have made one [expletive] of a mess on this planet haven't we? It's now up to us and on us to correct the mistakes.

Comments: Let's do the right thing. Let's go to Isle Royale with a good heart and a right mind and fix this mess. We can sprinkle some tobacco and leave knowing that the wolves are still howling at the moon on Isle Royale. That will be a very good thing indeed. Our ancestors, past and future, will be proud. We need, desperately, to start listening to what the natural world is telling us. According to Leopold, we are not apart from it, we are a part of it. How many have reiterated this idea before and after him? Lots. We are so arrogant though, that we do not listen. We are paying for it too. We rarely do the right thing because it is not politically or economically expedient. Well, here we have a chance on Isle Royale to tell a different story about ourselves. Let's listen. Shut up and just listen for change. Listen to the Elders, listen to the scientists and most of all listen to the natural world. Let's for a change, just do the right thing.

Correspondence: Topic Question 1:
Plan C is the only option when considering the ecological health of the Islands. The balance of nature works when all aspects of the environment are working together (predator, prey, food supply, vegetation health, etc.). You must consider all these together, not just the Moose problem by itself.

Topic Question 2:
The balance of nature and how best to maintain it on Isle Royal. Need to consider both predator and prey.

Topic Question 3:
Keep it as wilderness. No hunting of any kind. And that should include no "culling" of the Moose herd. That should never be considered in a wilderness park.

Topic Question 4:
Keep it a designated wilderness park without human interference as much as possible. That means no Moose herd culling but reintroduction of Wolves if necessary. They have been a part of the Isle Royal ecology for the last 70 years and seemed to have kept the balance of nature working there. Why not continue that balance in the future.

Topic Question 5:
Culling of the Moose herd should not be considered. Wolf reintroduction should be seriously considered. This balance worked for a long time and should be maintained if possible.

Topic Question 6:
Be smart. No rash decisions about Moose herd culling and/or refusing to consider wolf reintroduction. This whole Isle Royal ecological disaster-in-waiting should be looked at by experts and public comments should be sought out and considered.

Correspondence: Topic Question 1:

Please, wolves should be reintroduced and allowed to thrive naturally, while the moose are temporarily and HUMANELY pared down by sterilization or other NON-lethal means.

Managing wildlife does not mean MURDERING wildlife. The ecosystem is out of balance, for the most part, because of human intervention and harm. Isle Royale is a national treasure and should be managed as such.

The predator/prey dynamic can be restored humanely and sensibly. In fact, instead of killing any wolves elsewhere, take them and allow them to establish packs on Isle Royale. This would re-establish the wolf population and be genetically healthy for the wolves and the moose. By the way, wolves target older, ill prey naturally.

Please, do all that is possible to naturally and humanely resolve the situation.

Topic Question 2:

The above issues stated in answer to #1.

Topic Question 3:

Except for importing wolves and temporary contraception of moose, very minimal NPS intervention! Also, see the response to #1.

Topic Question 4:

Same as above.

Topic Question 5:

I like restoring a balance between predators and prey. I dislike murdering animals when better alternatives exist.

Topic Question 6:

I think the National Parks Service, along with the so-called "Wildlife Services" (A disgraceful, murderous and secretive agency) of the United States should stop murdering animals and interfering with predator/prey ecobalances. Lobbyists and hunters should NEVER take precedence over naturalization and animals.

Comments: Nature balances itself if we allow it to. Wolves, cougars, etc. are so wrongfully vilified and persecuted it is abhorrent. Wolves and cougars are natural predators who would avoid humans at all costs if we would leave them be and stop senselessly murdering them. Moose, elk, etc. would not be overpopulating areas if their predators were not eliminated by murder at the hands of humans.

Please, stop the madness and do something useful.

Contraception

Topic Question 3:

Wolves manage their numbers through food availability...wolves manage the Moose through culling the sick not always the best and healthiest animals. Why do we intervene in this beautiful National Park since 99% idesignated wilderness?

Comments: Isle Royale wolves are a namesake, a culture of the state of Michigan. To preserve and protect these last few wolves is the honorable, most civilized step to take. To reintroduce wolves to the Island would be very beneficial to the gene pool. Wolves are a family entity and control their own population.

Let's use a non-lethal method of Moose control through contraception. Lethal means is always the top method of removal to our DEQ.

Lethal violence has increased in our society....to me lethal violence to Michigan wildlife is just another example of violence.

Correspondence: Topic Question 1:

Concept C appears to be the best alternative, however, it does not go far enough. There must be sufficient flexibility to allow for wolf reintroductions as necessary over the next 20 years to insure genetic diversity for wolves and sustainable populations of both wolves and moose into the foreseeable future. Maintenance or culling of moose is not necessary if wolves are allowed to fulfill their ecological role. Absent wolf immigration, which no one can predict, there is no likelihood of having a wolf population without human action.

Topic Question 2:

I believe the NPS should consider and evaluate the ecological benefits wolves provide; The only pup observed in 2015 was visibly deformed; 100% of wolves examined since 1994 (over 30 of them) have spinal anomalies. The weakened state of the remaining wolves is likely interfering with reproduction and survival.

The NPS must consider the data collected through 57 years of research conducted on Isle Royale. These researchers should play a key role in the discussions.

Topic Question 3:

NPS must protect the unique wilderness qualities of Isle Royale through monitoring of habitat for wildlife, including wolves and moose; maintenance of soil and water quality and ecological stability of plant and animal communities including the control of invasive species. Management is necessary to maintain important wilderness values including the presence of a top carnivore which is vital for ecosystem health. The culling of moose and the use of motorized equipment is unacceptable.

Topic Question 4:

Climate change poses a fundamental threat to species and places. The only way to slow the impacts of climate change is to globally reduce carbon emissions. NPS could produce an informational flyer explaining the negative impacts climate change is having on Isle Royale such as the changes in the duration and frequency of the ice bridge, winter ticks, bird species etc. NPS could engage with businesses and private entities that use the island to reduce carbon pollution. Encourage visitors to reduce their carbon footprint by not bringing / disposing of water bottles.

Moose are not likely in any direct danger of being reduced by climate change, however, wolf predation is needed to limit the growth in their population. Because of climate change, it is unlikely that wolves will be able to repopulate Isle Royale without NPS intervention and we ask for immediate action to augment / reintroduce wolves.

Topic Question 5:

For years, researchers have been sounding the alarm about the plight of wolves on Isle Royale. Yet, the NPS has chosen to take no action until now. The public scoping period ends 8/29, however, the Record of Decision is not expected until Fall 2017 at the earliest. Two and one-half years is simply too long. This foot dragging on the part of NPS is unacceptable.

Evidence suggests that the few wolves on the island will not be able to keep moose populations in check which will further degrade the island's vegetation. Every effort must be made by the NPS to expedite the decision.

Comments: People that visit Isle Royale do so for the WHOLE wilderness experience which means seeing packs of wolves not just a bunch of moose!

Topic Question 2:

the Wilderness Act

Topic Question 3:

manage people only,

Topic Question 4:

no management or manipulations, interventions, restorations in Wilderness. Let it adapt and evolve as it will.

Comments: The following are my personal comments on the proposed Isle Royale National Park Moose-Wolf-Vegetation Management Plan.

The crux of the issue-and bias of the NPS-is found in the agency's statement of purpose for the plan: "The purpose of the plan is to provide direction for managing the Isle Royale moose and wolf populations . . ." This purpose presumes that, contrary to the intent of the Wilderness Act, the NPS needs to manage these species and their interactions. That is, the ecological and evolutionary processes that created and continue to shape the island systems need to be controlled and manipulated to conform to what NPS thinks they should be.

This is in direct opposition to the overarching mandate of the Wilderness Act to preserve the wilderness character of designated Wilderness. Wilderness character is, first and foremost, the untrammelled, wild condition of the landscape. It is not a historic or static condition, or a condition the NPS or those who don't understand Wilderness prefer. It is the condition wherein the land and lifeforms remain as they are or become what they will when left free from the human intent to manage, manipulate, or control. Thus wilderness character reflects a relationship we have with the landscape, one of deference to evolutionary forces, restraint, forbearance, and humility. These are the qualities I urge the NPS to exercise on this "issue". Manage the visitors-including

yourselves-but leave the island and its wildlife alone. Let them adapt and evolve as they will, unconstrained by the agency's will. Please select the no-action alternative.

Correspondence: Topic Question 1:

Contraceptives for the moose population. Introduce more wolves to Isle Royale to augment the ones left.

Topic Question 2:
Allow nature to balance itself after correcting the imbalance created by humans wanting more Moose for hunting. In other words, bring wolves back for balance, and remove some Moose to other areas within the without killing them. All life is precious and since we have allowed man to create a problem on Isle Royale we must now pay to correct that. Hunting interests should not be considered as they have created most of the problem along with their lobbyist. The vegetation should be all native to Isle Royale and if non native species have been introduced by humans- use monies to remove the non native species and add native plants back. Have strict penalties for poaching wolves or killing other animals and use monies to prosecute those who break this law.

Topic Question 3:
Restore any damage done by humans on Isle Royale in regards to plant life (non native plants crowding out natives) Strict enforcement of poaching, wildlife killing, trapping etc. Give park management the tools and resources (money) to do just that.

Topic Question 4:
Nature at the park will adjust to climate change as it will. Just undue any damage that has been done there by humans and restore the park to it's original state in so far as is possible.

Topic Question 5:
If the preliminary alternatives are bringing in more wolves, I agree. If the preliminary alternatives involve contraceptives for the moose with removal to other areas for some, I agree.

Topic Question 6:
Man created these problems. Now we must pay to correct them. Our planets plant and animal life has been exploited and damaged by man's hand and Federal tax dollars should go to correct them to every extent possible.

Correspondence: Topic Question 2:

I believe that allowing wolf hunting in the United States in general is going to be very detrimental to wolf populations in our country. For this reason, I would like to see wolf populations maintained in areas where they are protected, such as National Parks, Isle Royale in this case. Having said that, I am concerned about the inbreeding described with the Isle Royale wolves, causing suffering to the wolves. It is a complicated problem, but the importance of healthy wolf populations in our wilderness areas is magnified by these issues at Isle Royale. Without wolves, everything suffers - the moose, the vegetation; overall, maintaining a healthy wolf population would be best, in my opinion.

Topic Question 3:

To maintain the wilderness for all species that exist at Isle Royale, it seems that reducing the overpopulation of moose is unavoidable. With only two wolves accounted for, it also seems unavoidable that wolves will need to be introduced to help with those moose populations. But what to do when the wolves start having problems with inbreeding? A problem for expert opinion, to be sure, but it seems that maintaining healthy wolf populations would also require long-term management.

Topic Question 4:

It is a very sad thing to contemplate, tragic, really, but if moose need specific plants and trees to survive, and these plants and trees no longer exist on Isle Royale due to climate change (or exist in greatly reduced numbers), then what choice would we have but to reduce the moose population.

Topic Question 5:

The preliminary alternatives spell out very well all the options available. My least favorite alternative is to do nothing. I would not favor that one at all. My favorite alternative is to manage both wolf and moose populations in keeping with vegetation changes due to climate change.

Comments: Thank you for your hard work to present all the alternatives to the public. I treasure our national parks and all our public lands. We are so very blessed as a country to have these areas for public use. I worry every day about stewardship of these lands, and it seems from reading the preliminary proposals that the stewardship of Isle Royale National Park is in good hands.

Correspondence: Topic Question 1:

I do not support the deliberate culling of moose. Despite the wilderness designation, I think you should move in some new wolves. This would diversify the genetic pool of wolves currently inhabiting the area, which would keep the wolf population healthy. It would also impact the moose population, keeping that population healthier, too. Wolves everywhere else are being vilified, so let some live in peace at Isle Royale.

Topic Question 2:

Beyond this action, I would encourage little manipulation, keeping the principles of wilderness in mind.

Topic Question 3:

As per the above, I think this exception is allowable, but otherwise I would encourage minimal manipulation.

Topic Question 4:

If the animals should become imperiled by rising waters or depleted food sources, further action to save them could be considered.

Topic Question 5:

I do not support the deliberate culling of moose. Moving the moose would be okay, but it sounds very labor-intensive. I do support moving some wolves to the location.

Topic Question 6:

Thank you for your consideration.

Correspondence: Topic Question 1:

what is needed is a healthy and vibrant wolf family packs so inbreeding is not possible due to a sufficient number of wolves with a good gene pool. This could bring back a proper balance in nature between the moose and the wolf. right now the moose are overpopulated, filled with ticks, suffering due to lack of food due to population explosion.

Topic Question 2:

Someone should be charged to be responsible for Isle Royale and its environment and animal population and not be put at the bottom of the priority lists for the NPS. Monthly to quarterly onsite visits should take place so problems can be addressed immediately and not reactive as we now are looking at.

Topic Question 3:

See above response to question 2 as this is appropriate also for question 3.

Topic Question 4:

A wildlife biologist and wildlife vet should be assigned as a priority to Isle Royale National Park and use any resources available to make rational and scientific decisions for proactive approaches.

Topic Question 5:

I need to see what preliminary alternatives that are available before answering question 5.

Correspondence: Topic Question 1:

Manage moose by contraception and/or sterilization.

Manage wolves by reintroduction.

Topic Question 2:

In future management of wolves, the predator-prey balance needs to be considered. (With only three wolves at present, the predator-prey issue is obviously not balanced.)

In future management of moose, forest sustainability needs to be considered. This again is a balance, to keep the forest in good repair. Both fauna and flora are integral parts of the ecosystem and need to be managed with respect to all forms of life.

Topic Question 3:

NPS management needs to be humane, respectful of life. No need for a violent scenario for those who have become desensitized. The intensity of management will be what it takes to remedy the situation, to bring balance to the ecosystem of the isle. Wilderness is precious in 2015. Take care of that 99% of the land area of Isle Royale National Park.

Topic Question 4:

Simply work with the natural world around us rather than abusing it. In limiting climate change, we hopefully are turning from abuse of the earth, our home, by using our knowledge and hearts to limit excess carbon, methane, etc. in the atmosphere as we turn from fossil fuels to readily available renewables.

Pumping carbon into the air is similar to pumping bullets into wolves and moose. Both are lethal, one just takes longer although we are seeing the effects as starving polar bears can no longer swim the long distances between remaining ice as they attempt to feed their young. As water rises, death comes to inhabitants in its path whether coastal villages or eventually coastal cities (i.e. Manhattan). Droughts and out-of-control forest fires are lethal also. WE

NEED LIFE-GIVING SOLUTIONS, and we need them now while we can limit the worst effects of climate change.

As I answered in other questions, please choose reintroduction of wolves, please choose contraception and sterilization of moose.

Topic Question 5:

The alternative of culls is disrespectful of life. There is honestly nothing about culls that I like. Furthermore, when alternatives to culls are possible, this is a moot question to me.

Topic Question 6:

Thanks you making choices with both your mind and your heart.

Correspondence: Topic Question 2:

Consider the unique ecosystem's prey/predator relationship and the years of consistently studied data on this relationship. Because of Isle Royale's isolation, it represents the ideal microcosm for future, critically important wildlife management strategies. Once the fragile balance is destroyed, it will take years to replicate. Those years represent lost opportunities that may never be come again,

Topic Question 3:

It is because of this 99% wilderness and very small land area that the efforts towards preservation of the prey/predator should be immediate and of the highest priority. Where else in the NPS can one find an isolated, small, and self-contained environment where the opportunities for such vitally important management data can be mined. This jewel of the NPS must be preserved because of its wilderness and low visitor numbers, not in spite of them.

Topic Question 4:

Isle Royale represents the same opportunities to study climate change that it does for prey/predator relationships. It is widely accepted that climate change affects both animal and plant health. As an isolated and remote island in the largest fresh water reserve on Earth, climatologists should learn from the past work of wildlife experts like Professor Rolf Peterson and consider the tremendous value that Isle Royale's represents for study of climate change.

Topic Question 5:

I truly believe Isle Royale's viable future can only be guaranteed by restoring the wolf population to the island. Bring in a genetically-diverse pack or packs of wolves and allow Isle Royale to continue to provide critical scientific data, a unique ecosystem for both animal and human interaction, and a return to the magnificent national park it has represented for decades.

Topic Question 6:

Isle Royale's future has reached a critical intersection and the paths before the NPS cannot be underestimated. Do we watch an out of control moose population over-browse the fragile island ecosystem until it's wilderness features are devastated, resulting in the ultimate in cruelty - death by starvation and disease? Once the food supply is gone, this is inevitable, I believe. Restoring the wolf population with genetically-diverse packs that are able to reproduce will restore the prey/predator and the moose population will be culled appropriately, allowing the healthy to survive. The delicate balance of this unique, unreplaceable island jewel will be restored for the enjoyment of both man and beast for years to come. The loss of all that Isle Royale's represents the loss of unimaginable magnitude.

Correspondence: Topic Question 1:

Consider augmenting wolf populations by using it as a relocation site for "problem" wolves (those who have preyed on livestock, et cetera) from other areas. This could be an ongoing program in order to continue bringing in new genetic diversity. Until wolf populations stabilize, moose could be managed through contraceptives/sterilization.

Topic Question 2:

The long-term humane sustainability of any plan. Also, maintaining the legacy of Isle Royale as one of the few places in the country that has had a wolf population consistently.

Topic Question 3:

The well-being of the wolves should be a significant priority and is clearly the place to focus the most attention in this situation.

Topic Question 4:

I do not have a good understanding of what effect climate change is having on this particular issue, but I am not sure it should change the plan overall, though a careful study of it may modify the exact methods used. Sadly, there is only so much you/anyone can do to mitigate the effects of climate change; hopefully natural processes will enable the Isle Royale ecosystem to adapt and balance itself once human efforts are taken to rebalance the populations.

Topic Question 5:

I think concept C is most beneficial. I want to be certain the moose management techniques do not include a cull. Also, I am not sure that a single wolf augmentation will be enough.

Topic Question 6:

No additional comments but I would like to re-iterate that moose populations should be managed through contraceptives or sterilization, never a cull. Wolves should be augmented as many times as necessary and I strongly suggest relocating problem or nuisance wolves from other areas to Isle Royale, as an alternative to killing them.

Correspondence: Topic Question 1:
Whether or not to import wolves (thus new genetic vigor) is the question I am addressing.

Topic Question 2:
Dr Peterson's presentation in July 2015 at Rock Harbor offered me enlightening perspectives. He recalled that moose have been on ISRO for about a century. And, wolves since the 1940-50's. Caribou have been present on ISRO in the past but no longer. Dr Peterson seemed also to say that wolf presence on ISRO is already non-functional due to weakness/inbreeding. What I take from this is: animal populations have come and gone and that the present "crisis" is neither new or unique.

Topic Question 3:
I am not sure what wilderness designation implies- -I presume a greater degree of protection. But does protection imply active management to keep things the same or active management to allow processes to take their own course? Defining terms is critical: what is "natural"?, "wilderness"?, "active management"? The NPS has managed many environmental issues actively- -fire suppression comes readily to mind but even this example begs the question of what is being protected.

Topic Question 4:
Not sure what changing climate means regarding the immediate wolf question. Perhaps, with climate warming, there may be less ice bridging between mainland and ISRO and thus less likelihood for wolf migrations to or from ISRO. This might prompt more ready importation of wolves to counter lack of bridging.

Topic Question 5:
I like importing wolves because it preserves the somewhat long and certainly cherished wolf/moose ecology at ISRO. This approach also affords the opportunity to study in more detail gene-environmental interactions- -Dr Vucetich is able and poised to advance this research. I don't like importing wolves because, to my mind, it is not "natural" and good research could alternatively focus on predator-prey issues- -what predators will take the place of wolves on ISRO? I have heard it said that we "know" what will happen on ISRO without wolves- -do we? If we import wolves too readily, we lose an opportunity to study this- -wolves could be imported at some future date if consequences of no-wolves becomes clear or unacceptable.

Topic Question 6:
But, overall, from a traditional and nostalgic point of view, I favor importation of wolves. Based on many active intervention precedents across the country, NPS could do this without apologies I would think.

Correspondence: Topic Question 1:

Management tools to be considered are that wolves are reintroduced/augmented more than once, if necessary, to control the moose population. Moose

populations are managed by contraception and/or sterilization and not by lethal culls.

Topic Question 2:
Translocating wolves to Isle Royale would provide a non-lethal solution to any problem wolf situations in the Upper Peninsula that would otherwise require the killing of these wolves. There is very strong sentiment throughout the state of Michigan to protect our fragile wolf population and that is vehemently opposed to the killing of wolves for sport. The concept of "culling" wolves during hunting season would therefore be totally unjustified. Since wolves have lost their federal protection status in 2012, over 3000 wolves have been massacred in the United States. There are roughly only 650 wolves left in the State of Michigan, and current legislation has placed the responsibility with the State of Michigan to protect its own fragile and vulnerable wolf

population. The wolf is an iconic creature and there is very strong public sentiment to protect the species in spite of the removal of federal protections. Plus, it is a scientific fact that predator species take much longer to recover than prey species.

Topic Question 3:

Management should be overseen, monitored and conducted by non-partisan university research groups that specialize in wildlife management as well as by such highly respected animal rights organizations such as the Humane Society and the Sierra Club. Other respectable wildlife organizations to consider include Defenders of Wildlife and the Center for Biodiversity.

Topic Question 4:

The NPS must expedite its final decision by the end of 2016.

Topic Question 5:

Culling the moose population is not the answer, because the proposed solution is much better and solves multiple wildlife problems in Michigan at the same time.

Topic Question 6:

If you have any further questions about wolves, please contact [...] the State Representative of the Humane Society of Michigan and the Director of Keep Michigan Wolves Protected.

Comments: For more information on the translocation of wolves, please contact the State Veterinarian of Michigan:

Please adopt Alternative C and maintain both moose and wolves, with these conditions:

Wolves are reintroduced/augmented more than once, if necessary.
Moose populations are managed by contraception and/or sterilization and not by lethal culls.
The NPS must expedite its final decision by the end of 2016.

Topic Question 2:

Wolves are a necessary part of the habitat at Isle Royale, and must be helped to survive and protected from hunting.

Topic Question 3:

Wolves should be reintroduced, and the moose population should be managed by contraception instead of with hunting. Over hunting is what has caused the imbalance in wolf populations all over the country.

Topic Question 4:

The climate is changing, and maintaining a balanced ecosystem will help fight climate change. The wolf population needs to be restored to correct the overpopulation of moose on Isle Royale to help prevent further loss of vegetation.

Comments: The National Park Service should do what's best for the environment and the animals, not what hunters want. Reintroducing wolves to Isle Royale will help to create a natural balance between the wolf and moose populations. Yellowstone experienced the same re-balancing when wolves were reintroduced there. The moose population came down, erosion along rivers and streams decreased to a normal rate and the wolves thrived without getting out of control.

Correspondence: Topic Question 1:
The one element that shouldn't be used is lethal culling of the herd.
Why has NPS waited til only 3 wolves are left on the Isle?
Sterilization, of moose. reintroduce more wolves etc. more than once if needed

Topic Question 2:

There was much talk in the U.P. western U.P. especially, by Senator Casperson. who wanted a culling of the wolves in the U.P. He got it also. they shot 43 wolves I think. He complained that the wolves were attacking pets and putting the children at risk. The majority of people did not want this hunt. If you follow anything about the wolves, you know that farmers are allowed to kill any wolf or wolves that are on their property and killing livestock. Instead of having this hunt in the U.P. they could have trapped the wolves and moved them to Isle Royal.

Topic Question 3:

Introduce more wolves in response to the large moose herd. Let all of them roam the Isle. Mother Nature will take its course. Do not sell Isle Royal as has been suggested by certain politicians.

Topic Question 5:

I just don't like that the easiest thing to do is to shoot them. They do it from helicopters out west. Can you see what other countries or states do to preserve their animal management. Even other countries.

Topic Question 6:
Please consider option C from Humane society.
Wolves are reintroduced/augmented more than once if necessary
Control Moose Population by contraception or sterilization if necessary not lethal culling.
NPS must expedite a plan by the end of 2016.
Thank you for taking the time to read this.

Correspondence: Topic Question 1:

Contraception and sterilization are being used with success to manage wild horse and bison herds out west. There is a cost-effective movement towards compassionate conservation, and I believe wildlife fertility control is a viable option for managing the moose population on Isle Royale.

Topic Question 2:

The wildlife who view Isle Royale as their habitat deserve a creative response to the issue of moose overpopulation and wolf underpopulation. Using contraception to control the moose population will maintain healthy vegetation levels for all wildlife present.

The hikers who visit Isle Royale & their expectations when given the opportunity to enjoy its natural beauty.

Topic Question 3:

Leave Isle Royale's wilderness designation alone. It's one of the biggest draws for people looking to get away from the ordinary, and there is plenty of scientific study left to be done. Especially in light of the destruction of so much of America's natural wonders.

Topic Question 4:

A calm, practical approach to climate change should be adopted. Plenty of monitoring is being done that will allow common sense planning for long-term wilderness/wildlife protections.

Topic Question 5:

Lethal means only serve to destroy what make Michigan special to those who live and visit our beautiful State. It is a lazy, destructive response to wildlife family structures. Lethal means would also unravel protections that have been rightfully in place for many years.

Topic Question 6:

Give wolves a chance to come back across on their own. A year to five years will provide ample time to determine whether they will reintroduce themselves. If not, wildlife contraception/sterilization methods will successfully manage moose populations and preserve vital vegetation. For more information, please contact [...].

Correspondence: Topic Question 1:

Sterilization of or contraception for a portion of the moose population, instead of a cull using hunters.

Topic Question 2:

As always, we must respect the Designated Wilderness aspect of Isle Royale. It's not a zoo; it also shouldn't be managed as a time capsule of the moose/wolves ratios of 1952. Ideally it should be allowed to flourish and reinvent itself according to natural cycles without human intervention.

Topic Question 3:

Very low intensity management. No hunting under any circumstance. No development. Let natural forces play themselves out.

Topic Question 4:

Isle Royale will adapt to a changing climate as best it can without human intervention. We should focus our national time and energy on reducing carbon emissions elsewhere, not trying to make a perfect island time capsule from before the Industrial Era.

Topic Question 5:

It seems I'm arguing for Alternative Concept A. If a laissez-faire approach isn't feasible, I support any of the less invasive options. I'm drawn to Alternative Concept B because it is less directly humanly invasive and more humane than a moose cull. It is also a more sustainable option than regularly reducing moose populations artificially. It seems like a limited amount of wolves (2-3) will not be sufficient if wolves are currently crossing the ice bridge of their own accord and then departing again each winter. A new pack may need to be established.

Topic Question 6:

If intervention will happen because it is a managed National Park, I would urge that less invasive methods be adopted before invasive ones. Perhaps moose

and wolves could both be considered the invasive species in this case, having only been on the island for 100 years and 50 years, respectively. How those populations reduce themselves could be more important to study than how we manage them.

Correspondence: Topic Question 1:
Genetic rescue is really the only answer if you want the ecosystem to maintain.

Topic Question 2:

If the wolves die off, the moose population will explode. If the moose population explodes, they will eat/destroy all of the trees on the island. Once they have done this, they will starve. You will be left with a dead island populated by dead moose. Who would want to visit that?

Topic Question 3:

Wilderness is just a name. I think that as stewards of this park is it your DUTY to protect it. Preserving the park means you will have to interfere, "designated wilderness" or not.

Topic Question 4:

I think NPS should have already been acting on this problem, but given where we are now, something needs to be done quickly to ensure the wolf population does not die out. I think the island should be managed with the help of scientists and then monitored once these scientists have decided that the pack has stabilized.

Topic Question 5:

I dislike the two alternatives in which NPS does nothing. I find it lazy and cowardly.

Topic Question 6:

I am a recent visitor to Isle Royale and was informed that the Park service is seeking public opinion on what to do about the declining wolf population. I think it should be obvious, but my (and most people I spoke with on the island) believe that the wolves should be genetically rescued. Isle Royale is unique because of its wolves. That's one of the reasons people go there! I believe that not saving the wolves will negatively impact tourism, as well as destroy the vegetation on the island. Without an apex predator the moose population will explode, causing them to eat everything on the island and starve. This will cause a sharp decline in their population as well (and who wants to go to an island with moose carcasses all over?)

I think it is your duty as stewards of this beautiful park to help preserve the wolves. Without an apex predator, the ecosystem will collapse. Don't wait for it to be too late.

Comments: (Resubmitting my "additional comments" from question 6. Not sure why there are two "additional comments" boxes...)

I am a recent visitor to Isle Royale and was informed that the Park service is seeking public opinion on what to do about the declining wolf population. Correspondence: Topic Question 1:
Relocate wolves from areas of the country where they are too abundant.

Topic Question 2:

People wanting to see moose during the day and hear wolves at night should not be the major driving requirement in managing the wolf/moose population.

Topic Question 3:

Since there are so many people that like to travel to Isle Royale, we are probably making an impact on the wolves behavior. Since we are part of the problem, we should intervene in establishing the proper balance of wolves to moose.

Topic Question 4:

Nothing.

Topic Question 5:

Where are they?

Topic Question 6:

Let's not get into the situation where there are so many moose that they eat themselves out of available food. If that happens, I think they should be culled out with a managed program and not opened up to the general hunting public. What would be a great idea is to make a moose hunt only available to

winners of the Pure Michigan project.

Correspondence Type: Letter

Correspondence: Thank you for the public presentation on July 29th in Grand Portage of the Moose-Wolf-Vegetation Management Plan/EIS and for the opportunity to comment.

Experiencing Minong (Isle Royale) has been and continues to be an important part of my life. My concerns are heartfelt and deep.

At this time I will not pick or choose between the proposed concepts A through F.

Instead, I will offer my opinion as to why I believe there is another alternative to all of them. This option has the potential to fit within the 20 year time frame of a management plan, honors the cultural and environmental legacy of Minong (Isle Royale) and adheres to the principles of wilderness. Although not an original idea, I sincerely believe as Minnesota wildlife biologist and author Chel Anderson, that, "If we are to give places like Isle Royale the best long-term shot at surviving assaults such as global warming and atmospheric pollution...then we must reintroduce and preserve as much as possible the original compliment of plants and animals that formed a complex, sturdy matrix of relationships in pre-settlement times."

The reintroduction of woodland caribou and lynx is the desired outcome in restoring an ecological balance that had sustained itself for thousands of years. But this will not happen until the perpetual imbalance of moose and wolves plays itself out without any further human intervention. This failed experiment needs to end. With the prognosis not looking good for a viable pack of wolves and should they become extirpated, the inevitable result would be an overabundance of moose. This cycle has played itself out in the past with predictable and sometimes devastating results. When this moment arrives in what could be the foreseeable future, the Park would have a rare opportunity to uniquely vision a sustainable future by looking into the past.

I sincerely believe that such a plan is the greatest legacy one could work towards to ensure a vibrant and dynamic Minong (Isle Royale) for future generations.

Correspondence: Topic Question 1:

I think you should consider the alternative of reestablishing the caribou population on the island. They were present into the 1920s. Some believe they were extirpated due to hunting but this interaction with newly arrived moose may have also had an effect on them. Introducing caribou would allow for an intensive research study (long-term) to determine how moose and caribou interact in a closed system. And augment the wolf population.

Topic Question 2:

The wolf-moose study is iconic and identifies Isle Royale. It is what you are primarily known for. It is your BRAND. I think it is incumbent upon you to at least try to augment the wolf population with a one-time reintroduction of 10 or 15 wild wolves. If this fails, you will be able to say you tried to maintain a sustainable population to control the moose. If you decide to just let the wolves disappear and then deal with the consequences, you will be open for lots of criticism. Use adaptive management in dealing with the current situation.

Topic Question 3:

I would like you to be much more explicit regarding how you might "manage" or reduce the moose population if wolves are extirpated. Does the NPS have a team of hunters or shooters to cull the moose? Would shooting them from helicopters be allowed in a wilderness area? This sort of activity would be very negative for the park managers to deal with. I think you want to avoid having to cull the moose herd.

Topic Question 4:

If global warming continues, the problem of moose overpopulating the island may become a moot point. Warmer climate may eliminate a good share of them. Otherwise, I am unable to offer suggestions to this scenario.

Topic Question 5:

I don't mind the various alternatives you propose (see 1 above). However, I would certainly like to see some reference to adaptive management. i.e. if A doesn't work, let's move to plan B, etc, etc. Be a little more flexible. Having to choose among 1 of 6 plans feel like being placed in a strait jacket.

Correspondence: Is the 1000 plus moose population sustainable on a tiny national park island? What is the value of wolves not only for tourism but to keep the ecosystem of the island safe? You only have to look to Yellowstone to see what the absence of wolves did and what the re-introduction of wolves did to solve the problems created by their absence.

In the states that want a wolf hunt in the Midwest there could be a number of breeding pairs selected and introduced to Isle Royale to save its ecosystem.

If wolves are not re-introduced we will be reading about the collapse of the Isle Royale ecosystem because a growing population of moose has not been kept in check by predators.

Comments: August 12, 2015
Isle Royale National Park
Attention: Moose-Wolf-Vegetation Management Plan
800 East Lakeshore Drive Houghton, Michigan 49931

Please consider these comments on ISRO Moose-Wolf-Veg. Mgt. Plan/EIS

Alternative Concept A (no-action alternative)
Current management would continue; the park would not actively manage vegetation or the moose and wolf populations

Alternative Concept A is untenable for multiple reasons:
It fails to comply with National Park Service Management Policies of 2006, which provide that native species extirpated by human action shall be restored. NPS Management Policies of 2006 on natural resource management begin with, The National Park Service will preserve and protect the natural resources, processes, systems, and values of units of the national park system in an unimpaired condition to perpetuate their inherent integrity and to provide present and future generations with the opportunity to enjoy them. Wolves provide an essential natural process of predation, are obviously a natural value, and a keystone unit in the ecosystem of Isle Royale, not to mention their paramount evolutionary role in moose predation. In section 4.1, P. 37: The Service will not intervene in natural biological or physical processes, except...to restore natural ecosystem functioning that has been disrupted by past or ongoing human activities; On P. 39, under 4.1.5, Restoration of Natural Systems: The Service will reestablish natural functions and processes in parks... Efforts may include, for example,...restoration of native plants and animals. On P. 44, under 4.4.2, Management of Native Plants and Animals: Management is necessary...because a population occurs in an unnaturally high or low concentration as a result of human influences.

Alternative Concept A also fails to carry out the park s 1998 General Management Plan (GMP) purpose to Preserve and protect the park s cultural and natural resources and ecological processes, and to Provide opportunities for scientific study of ecosystem components and processes... It also ignores the GMP s statement that ISRO is significant because Isle Royale is world-renowned for its long-term wolf/moose predator/prey study.

A wait and see policy would doom the park s balsam fir to destruction by overabundant moose, whose population was moderated in part by wolf predation (which has been lacking for the last few years, due to a precipitous decline of the wolf population). That decline has been accelerated by at least three human actions: climate change, which limits ice formation and the potential for genetic exchange; mining, which left a shaft that claimed three wolves; and introduction of canine parvovirus by an illegally present domestic dog. The impact of predator-free moose on the park s balsam fir is well documented.

The Revisiting Leopold report of 2012 noted that, The overarching goal of NPS resource management should be to steward NPS

resources for continuous change...to preserve the ecological integrity... On P. 8, they reaffirmed that, (S)everal of the [1963] Leopold Report findings remain valid and significant. These include: The need for the NPS to recognize the enormous complexity of ecologic communities and the diversity of management procedures required to preserve them. The necessity that management may involve active manipulation of the plant and animal communities, or protection from modification or external influences. And, The high importance of science to stewardship,... The park s Wilderness and Backcountry Management Plan stated that [N]o animal symbolizes the essence of Isle Royale wilderness more than the timber wolf. Losing that symbol would be indefensible.

Alternative Concept B (introduce wolves once)
Reestablish wolves on the island by bringing in new wolves one time to mimic a migration event; no moose management

Reestablishment of wolves is the obvious action from a policy, scientific, and public values standpoint, as documented in my comments under Alternative Concept A. However, introducing wolves once is hardly a robust means of assuring the continued ecological functioning of wolves on Isle Royale. Migration events have been documented twice in a half century, and each was essential in temporarily boosting genetic viability among Isle Royale wolves. Undetected gene flow during this period is likely (see Hedrick et al. 2014). But, in the absence of regular lake ice forming to provide a path for immigration, those events have been made far less likely. The cause of the lack of ice, of course, is man-caused climate change. Ice bridges, pathways for predators in the 1960s and '70s, once formed between the island and the mainland about eight out of 10 years. Today, it is one every 15 years.

In the presence of wolf predation as one of the complex of factors that modulate moose populations, we agree that no moose management would be required. Until recently, 12 to 14 percent of moose would be taken by wolves per year. That has dropped to less than 3 percent. A healthy moose population requires predation by wolves.

We suggest that Alternative Concept B be modified to read: Introduce wolves promptly to prevent habitat destruction by moose, and periodically refresh the wolf gene pool as needed by translocating wolves to the park to maintain genetic diversity, in consultation with geneticists.

Reference cited

Hedrick, Philip W., Rolf O. Peterson, Leah M. Vucetich, Jennifer R. Adams, and John A. Vucetich. 2014. Genetic rescue in Isle Royale wolves: genetic analysis and the collapse of the population. *Conserv Genet* (2014) 15:1111-1121 DOI 10.1007/s10592-014-0604-1

Alternative Concept C (maintain both species)
Maintain populations of moose and wolves on the island, which could include wolf reintroduction or augmentation

Of course it is important to maintain both moose and wolves. In fact, it has been demonstrated in predator-prey populations, including in the 56-year wolf-moose study on Isle Royale, in Banff and in Yellowstone (Hebblewhite and Smith 2010), that the prey and the prey s forage plants are healthier in the presence of predation. Simply leaving it open that this alternative could include wolf reintroduction or augmentation is hardly a definitive action, and provides little direction to future park managers. The goal of wolf management should be to establish ecologically effective populations of wolves (Lee et al. 2012).

I would suggest that Alternative Concept C read as: Maintain ecologically effective relationships between wolves and moose by continuing the long-term ongoing study, and employing adaptive management as required, including introducing wolves as needed to maintain their genetic health, and to preserve their function in the ecosystem. In a 20-year time-frame, nothing more needs to be said about moose.

Reference cited

Hebblewhite, Mark, and Doug W. Smith. 2010. *Wolf Community Ecology: Ecosystem Effects of Recovering Wolves in Banff and Yellowstone National Parks* in Musiani, Marco, Luigi Boitani, and Paul C. Paquet. *The World of Wolves*. University of Calgary Press.

Lee, Yohan, Jane L. Harrison, Cristina Eisenberg, Byungdo Lee. 2012. Modeling Biodiversity Benefits and External Costs from a Keystone Predator Reintroduction Policy. *J. Mt. Sci.* (2012) 9: 385-394 DOI: 10.1007 s11629-009-2246-1.

Alternative Concept D (introduce wolves once and reduce the moose population)

Reestablish wolves on the island by bringing in new wolves one time; reduce moose density if/when the wolf population is no longer impacting the moose population and moose herbivory is having a demonstrated impact on park resources

This alternative is simply indefensible. First, it is uncertain that a onetime introduction of wolves will be successful in restoring genetic viability, so the need for multiple introductions must be anticipated and authorized. Second, reducing moose is fraught with numerous dilemmas. One lesson learned at Yellowstone in the 1960s is that the public and Congress will not tolerate reductions of native ungulates in national parks by NPS shooters (Pritchard 1999, 220-21). And, if we justify not manipulating the wolf population on tenuous wilderness grounds, how in the world can we justify the intrusions needed to actively reduce moose, when conserving their major predator can do the job for us naturally? Also, moose herbivory is already having a demonstrated impact on park resources (Vucetich and Peterson 2014, 12-13). Parks Canada (Knight et al. 2015) has struggled with similar issues. We can learn from their experience. Here are two sections from the Knight et al report:

4.1 Ecological Integrity

The 2005 State of Park Report for Gros Morne National Park (Burzynski et al. 2005) identified significant ecological issues in the parks forest ecosystem. The most significant concern is the impact of non-native moose (*Alces alces*) browsing on the process of forest regeneration; only 25% of forest disturbances are regenerating to healthy young forest. The remaining 75% are experiencing marginal regeneration or total regeneration failure with consequent conversion to a grassland state (Figure 1).

7.2.2 Volunteers

Conducting this moose population reduction with local harvesters has been critical to success thus far and will be an important component of ensuring an effective and sustainable program into the future.

Given the number of licenses issued and an approximation of time spent by each harvester and helpers, it is safe to say that harvesters have provided somewhere in the vicinity of 50,000-75,000 hours of time contributing to the ecological health of Gros Morne National Park. Based on our current experience, we estimate that it would cost roughly \$3000-4000 per moose for Parks Canada to harvest an animal, remove the carcass, and distribute the meat; that would translate to a total program cost to date in the \$7-10 million range, exclusive of monitoring costs or VE and ER expenditures.

The other study that has lessons for Isle Royal is from Nova Scotia. *Grasslands in the Highlands: Restoring Forest Health to Cape Breton Highlands National Park*. The authors ask, How did large areas of the boreal forest become grassland and what can Parks Canada do to help restore balance to the boreal ecosystem? Moose were extirpated from Cape Breton in the 1920s after years of over-hunting and habitat change caused by humans. In 1947-48, 18 moose were brought from Alberta and released in Cape Breton Highlands National Park with hopes of re-establishing a healthy population... Then in the 1970s spruce budworm consumed large areas of mature boreal forest in Cape Breton Highlands, removing 90% of the forest cover in some areas. This, in turn, created a flush of new growth of young trees and shrubs - perfect food for moose. With lots of food and few predators, the moose population in Northern Cape Breton grew rapidly, reaching its peak of nearly 8,000 animals in the early 2000s. Since that time, the population has declined, but so has the state of the boreal forest...Cape Breton Highlands National Park has identified moose as hyperabundant and a serious threat to forest ecosystems.

The park has embarked on a four-year project to restore the forest. For more information visit: pc.gc.ca/capebreton. For more information on this project, contact [...]

I suggest that Alternative Concept D be rewritten as: Recognizing that superabundant moose have been impacting the balsam fir of Isle Royale for nearly a decade as the wolf population has declined, it is incumbent on park management to restore an ecologically functional wolf population at the earliest opportunity. Furthermore, provisions should be planned for future genetic augmentation of wolves to assure that their essential function of predation is maintained in perpetuity.

Alternative Concept E (reduce moose population)

No wolf reintroduction or augmentation; reduce moose density if/when the wolf population is no longer impacting the moose population and moose herbivory is having a demonstrated impact on park resources

This, like Alternative Concept E, is indefensible. As stated in my comment on D, moose herbivory has been impacting balsam fir for decades. But intensive predation in the 2000s prompted by genetic rescue in the late 1990s offers a small window for fir recovery that may be crucial for the future distribution of this species (Vucetich and Peterson 2014). Therefore, not restoring a functional wolf population is not an option, but an urgent necessity. Reducing moose by artificial means is unlikely to have public support, due to the need for intrusions into wilderness, and the obviously better alternative to enhance the natural role of wolf predation in moderating the moose population.

I suggest rewriting Alternative Concept E as: Expedite wolf reintroduction to prevent further, and perhaps irreversible destruction of the forage base of moose on Isle Royale. Use artificial means to supplement wolf predation and other natural controlling mechanisms (climate change, disease, etc.) only as a last resort.

Reference cited

Vucetich, John A., and Rolf O. Peterson. 2014. Ecological Studies of Wolves on Isle Royale. Michigan Technological University, Houghton.

Alternative Concept F (intensively manage the moose population)

No wolf reintroduction or augmentation; intensively manage moose population to a low level; potential for direct vegetation restoration through seed gathering and planting on offshore islands

This alternative is deficient in its intent, and lacks any rational justification. Wolves have interacted with moose for decades on Isle Royale (millennia elsewhere), and should continue to do so. Substituting intensive arboriculture for conserving natural ecosystem processes in a national park is simply unconscionable, and not in accord with NPS Management Policies.

My recommendation is to simply drop this Alternative Concept entirely. For reasons to do so, read the two study reports on Gros Morne and Cape Breton Highlands national parks, reported under Alternative Concept D, and consider NPS director Jon Jarvis's 2012 admonishments that long-term public interest and the precautionary principle should rule in decision making.

Reference cited

Jonathan B. Jarvis. 2012. Keynote: Using Science in Decision Making. 11th Biennial Scientific Conference on the Greater Yellowstone Ecosystem October 9).

Alternative Concept F (intensively manage the moose population)
No wolf reintroduction or augmentation; intensively manage moose population to a low level; potential for direct vegetation restoration through seed gathering and planting on offshore islands

This alternative is deficient in its intent, and lacks any rational justification. Wolves have interacted with moose for decades on Isle Royale, and should continue to do so. Substituting intensive arboriculture for conserving natural ecosystem processes in a national park is simply unconscionable, and not in accord with NPS Management Policies. Under General Management Concepts, 4.1 (P. 36), NPS Management Policies state: Natural resources will be managed to preserve fundamental physical and biological processes, as well as individual species, features, and plant and animal communities. The Service will not attempt to solely preserve individual species (except threatened or endangered species) or individual natural processes; rather, it will try to maintain all the components and processes of naturally evolving park ecosystems, including the natural abundance, diversity, and genetic and ecological integrity of the plant and animal species native to those ecosystems.

Wolves are obviously strongly interactive species. Soule et al (2005) wrote, By failing to consider current knowledge,....natural resource scientists and managers may be harming the species and systems they are charged with protecting. Most ecologists agree that the conservation of biodiversity is facilitated by maintaining population densities and distributions of strongly interactive species above estimable thresholds for ecological effectiveness. Assuming that conservation biologists and natural resource managers are 'physicians to nature, we therefore propose they are obligated to adhere to a doctrine of 'best conservation practices based on the best science, applying a more rigorous standard for the management of relatively interactive species than may be mandated by older statutes and effected by current practice and convention.

My advice is to restore wolves now to retain ecosystem resilience, rather than waiting for moose to further ravage their forage base, then resort to repairing the damage by labor intensive, untested means, meanwhile diminishing biodiversity in the face of the sixth extinction, as described by Kolbert (2014).

Isle Royale is a U.S. Biosphere Reserve. As described in NPS Management Policies 4.3.6 (P. 42), Biosphere reserves are sites that are part of a worldwide network of natural reserves recognized for their roles in conserving genetic resources; facilitating long-term research and monitoring; and encouraging education, training, and the demonstration of sustainable resource use." I see this alternative as an abrogation of the parks obligations to conserve genetic resources of wolves on the verge of local extinction, of threatening the continuity of nearly sixty years of wolf-moose research, and for failing to demonstrate sustainable resource use. Instead, the proposal to intensively manage moose and then to repair the damage they will have done is, to say the least, an unsatisfactory solution to a self-caused problem.

I suggest rewriting Alternative Concept F as: Restore a viable wolf population immediately to prevent further resource destruction by moose, and to retain ecosystem resiliency by promoting biodiversity. Meet the parks obligation under its designation as a biosphere reserve by enhancing the opportunity for continuing a worldrenowned research, education, and training program.

Correspondence: Topic Question 1:

If the moose and wolves where in balance there would be no problem! Moose are prey for wolves! Too many moose and leaves and grass are munched way to much leaving trees in danger of dying due to too many leaves ending in the mooses stomach. Mother nature has a way of balancing animals if you keep your hands off! If there is enough ice in the Winter these animals can also migrate to other areas with no help from you,

Correspondence: Topic Question 2:

It appears to me that in many circumstances we should let nature take it's course. Many times it is "fixing" what people have micromanged, the wolf situation in Yellowstone being one example, wolves being the top predator returned the ecosystems to what they should be, and it was healthy for all species. We need to stop interfering with the course of nature even when we don't always understand it. The native Americans at least got it mostly right.

Topic Question 3:

Control burns, removalof invasives, minimal road building especially in fragile areas.

Topic Question 4:

Encouagement of plants that can tolerate and more readily adapt to climate change. Plants and food for birds since they will be hard hit by climate change.

Correspondence: Topic Question 1:

There are only 3 of the 6 that mention wolf reintroduction. Concept B & D only allow a one-time introduction. This definitely is not enough time to insure the wolves are re-established.

Concept C appears to be the best plan but it needs to go far enough in allowing for wolf re-introductions as needed over the next 20 years.

Topic Question 2:

The NPS should consider the data collected through years and years of research conducted on Isle Royale. These researchers should play a key role in the discussions.

The wolves that are remaining are most likely weakened which likely is interfering with reproduction and survival.

With a healthy population of wolves the moose will be "naturally" curtailed hence the ecosystem will be balanced "naturally".

Topic Question 3:

You should protect the wilderness qualities of the Park by monitoring the habitat for wildlife, including wolves and moose; maintenance of soil and water quality and ecological stability of plant and animal communities including the control of invasive species.

As this is a National Park and so much of it is designated wilderness, there should be no, absolutely, no culling of the moose and use of motorized equipment in the Park. Bring back more wolves and give them a chance to turn it around.

Topic Question 4:

The only way to slow the impacts of climate change is to globally reduce carbon emissions. You could put a flyer out explaining the negative impacts that climate change is having on Isle Royale. You could encourage visitors to not bring and dispose of water bottles. The moose most likely aren't in any danger of being affected by climate change however the wolves definitely need the intervention from the NPS to immediately take action to increase/ reintroduce the wolves.

Topic Question 5:

As stated in Question 1, the only concept that appears to be half-way acceptable is Concept C but only if you allow at least 20 years of reintroducing wolves as necessary for it to work.

However, time is of the essence. You need to expedite the decision now, soon the few wolves left will not succeed in "naturally" culling the moose and thus the vegetation will further degrade.

Topic Question 6:

I have not had the opportunity to visit Isle Royale although it is on my bucket list. My husband I spend lots of time in Yellowstone National Park. So needless to say, we are strongly in favor of the wolves and what they can do for our ecosystem and of course seeing a wolf or hearing one is without a doubt a wonderful experience. And to be in wilderness is also an awesome experience as I have done so on pack trips. We must learn to appreciate what beautiful land we have in our country and take care of it as well as ALL the animals that God put on this earth!

Comments: PLEASE ACT NOW. DO NOT PUT THIS OFF ANY LONGER.

As Aldo Leopold said "Land is not merely soil, it is a fountain of energy flowing through a circuit of soils, plants and animals". This definitely applies to Isle Royale National Park.

Correspondence: Topic Question 1:

None really, the island needs an apex predator to keep the moose in check. That's either wolves or humans. Without a sustainable and healthy wolf population, human intervention would be required annually to control the moose and their impact to the Island.

Topic Question 2:

The issue of time is the biggest issue to me. The time it takes a government bureaucracy to work through this could be years. In that time, opportunities for positive change will be lost and there will be a financial and environmental impact to the Island that will take years to recover from. This is a process that should have started 5-6 years ago quite frankly.

Topic Question 3:

Concept B or C from the plan document would seem to be the most logical. It may require hands on management for a number of years to stabilize the populations, but for long term success that may be required.

As for the island being a "designated wilderness", in today's world the "wilderness" is far from being untouched by human hands/human impact. The resulting change in global climate has changed the ecosystem of the island over time, impacting both wolves and moose. So even though it's designated "wilderness", a hands on management plan is necessary for the long term success of the wolves and moose.

Topic Question 4:

I think you hands are kind of tied on this one. Climate change will happen and we only see the results of that change, we don't see it coming.

Topic Question 5:

I like that you have a number of options. I don't like the fact that it will take a long, LONG time to work through these options. Time is a luxury you don't have in this case.

Topic Question 6:

I've been to the Island only a few times. It's wonderful. However, I can't imagine my next trip involving the possible smell of dead animals, due to starvation from over-browsing, with no apex predator on the island to help balance the equation. I've never seen a wolf on the island, but just knowing the fact that they are there serving a purpose in the balance of the ecosystem is reason enough for me to be interested and active in this process.

Correspondence: While I have no professional credentials to give scientific backing to my comments, I believe taxpaying citizens can and should have just as much impact on wildlife and environmental policy decisions.

The protection of our wildlife and their environment is not just an emotional issue. It's certainly not a financial issue. It's an issue of our human responsibility to PROTECT AND PRESERVE that which the earth has given us to admire, respect and cherish.

Much of our responsibility rests in common sense. Even more rests in learning from past mistakes, and there have been plenty of those.

Mother Nature is a good teacher and sets the supreme example we need to follow. She knows how to provide balance, and isn't that the true goal?

Have hunters become so bloodthirsty and arrogant they believe they should be the only predators? Do we sell our souls to greedy business interests and sacrifice everything of real value in nature just to put a few more dollars in the bank?

The time has come to do the right thing for our wildlife and our environment. To decimate the tiny wolf population on Isle Royale would be a travesty. The damage to the biology of the island would be tragic with inadequate natural predators to control the vegetarian inhabitants. Natural predators actually do weed out the sick and the weak. Hunters merely use that premise as a lame excuse to murder more and more peaceful wildlife. They want "trophy" kills, not puny stragglers.

If people choose to live within a wildlife habitat, they have to accept the consequences and responsibilities that come along with all that beautiful scenery and privacy. They need to understand they have chosen to encroach upon the homes of multiple earlier, native inhabitants whose innate right to live there supersede theirs. People can, and common sense should dictate, install adequate security measures to non-lethally deter wildlife from entering their property. In other words, use your head.

Please use your heads when determining your future management of Isle Royale's wolves, moose and vegetation resources.

Correspondence: Topic Question 1:

Introduction of additional predators, and greater protection for existing predators. Then, allow the natural balance to reestablish itself, and don't allow anyone to mess with it. Isle Royale is a natural treasure that we must do all we can to preserve in a natural, balanced state.

Topic Question 2:
Preserve the natural balances of food, predator and prey once they are reestablished.

Topic Question 3:
This area must be managed to prevent development and exploitation of resources. Limit access to visitors if needed to protect the wild-ness of the area. We must allow nature to work to balance the ecosystem.

Topic Question 4:
The management goals should not change based on climate. Obviously, tactics may need to adapt as the area adjusts to climate differences.

Topic Question 6:
Isle Royale is beautiful in its natural state. I love the fact that we can visit it and enjoy the wilderness at its unsullied best. Please keep it unsullied, and if possible, let people visit there if they cause no harm.

Correspondence: Topic Question 1:

Take wolves from disputed parts of UP and reintroduce to the island. Make sure that you move families of wolves. Do not leave pups on their own. Healthy wolves vaccinated against rabies, etc. Consult with experts to do this.

Topic Question 2:

A proper balance recommended by experts should be maintained. Predators and prey keep each other healthy and together they keep the vegetation healthy.

Topic Question 3:

Monitoring for sickness and deforestation and using that info to prevent the type of situation that now exists on the island. The island should be designated No Hunting to allow the animals and vegetation to evolve as nature intended for the most part. Right now we have extra wolves in the UP. They are needed on the island to ensure their survival and that of the moose and vegetation.

Topic Question 4:

That would depend on the effects of the changing climate. Wild fires should be fought. Access to fresh water for the animals should be maintained. Anything that threatens the safety of the island should be dealt with.

Topic Question 5:

Dislike culling the moose. Do like bringing wolves from UP to island.

Topic Question 6:

Suggest current 3 wolves on island be sterilized to prevent inbreeding traits from being introduced to new wolves. After sterilization, allow them to live out their lives on the island they know as home. If a problem with inbreeding among moose develops, then introduce new stock to island before the situation reaches a critical point like it is for the wolves. We have too many species on the edge of extinction to ignore the opportunity to encourage life on the island. We have the ability for encouraging and protecting life on the island. It is our duty to use it. Letting the animals suffer and die is a cowardly way out. The island itself could essentially die if not protected. What a shameful loss that would be for our descendants to inherit.

Comments: Other countries and states are spending huge amounts of time and money to repopulate and save both animals and environments. We already have the island. We just need to protect it and give a little help now and then. It will cost money but it's not like building huge preserves and using armed guards to prevent poaching. It could be used as a successful model for other countries and states. If universities and colleges aren't using the island for unintrusive studies, they should be encouraged to do so. Maintaining park service on the island for the protection of the animals and those doing studies, is a small price to pay. Absolutely no hunting should be allowed. Extremely limited camping or hiking and very restricted areas should be used. No boaters should be able to access the island for any recreational purposes. Keep it as pristine as is possible. It's value to this state will increase hugely. If we can keep it unpolluted and unspoiled, we have a responsibility to our future generations to do so. No well drilling or mining or any commercial use of the island ever. Why ruin more of the state than we already have? In the future it may well be the only example of what we lost, to survive.

Please adopt Alternative C and maintain both moose and wolves, with these conditions:

Wolves are reintroduced/augmented more than once, if necessary.
Moose populations are managed by contraception and/or sterilization and not by lethal culls.
The NPS must expedite its final decision by the end of 2016.

Topic Question 2:

Loss of natural habitat on the mainland and value of allowing nature to right its own ship, so to speak.

Topic Question 3:

Management of this land area should be minimal and the wilderness should be allowed to be wild, including all of its inhabitants.

Topic Question 4:

Land acquisition throughout the country to increase wilderness/green space/natural, undeveloped space and/or space for restoration projects.

Topic Question 5:

I very much dislike and disagree with conducting a moose cull. It is unacceptable that our solution to dealing with an "overpopulation" of another species is to kill off portions of the herd/colony/etc. The speed at which the human species is increasing is also alarming; perhaps we might consider developing an educational campaign about the environmental impact(s) of more people on this people as well as the continued impact of loss of habitat for other species.

Comments: Please adopt Alternative C and maintain both moose and wolves, with these conditions:

Wolves are reintroduced/augmented more than once, if necessary.
Moose populations are managed by contraception and/or sterilization and not by lethal culls.
The NPS must expedite its final decision by the end of 2016.

Correspondence: Topic Question 1:

I can think of no plausible management options alternative to the ones already being considered.

Topic Question 2:

The three most important things to consider are ecosystem health, proper allocation and use of park resources, and adherence to the wilderness ethic. Also important is the viability of the park as tourist destination, but this aspect should not be looked at as seriously as the previous three.

Topic Question 3:

This is precisely why it is important to adhere to the wilderness ethic of as little human interference in the comings and goings of the island as possible. Given this, all management options that involve direct control of moose population are out of the question. As far as I'm concerned, there are only two "right" choices. Either reintroduce wolves once so as to reinstate the previous natural regulation of moose populations or do nothing and simply allow the ecosystem to change in whatever ways it will. Both of those options involve little to no direct human interference in the island's ecosystem, particularly as it pertains to the moose population. To do anything more invasive would be in disagreement with all of the wilderness principles that Isle Royale stands for. As far as culling moose, a similar situation was seen in Yellowstone prior to the reintroduction of wolves. Elk became so abundant in the absence of natural predators that the park had to start killing them off. Not only would that seem to be a greater strain on park resources than simply reintroducing that predator, it would also ruin the wilderness quality of Isle Royale.

Topic Question 4:

The changes that accompany the changing climate will come to pass regardless of the management option chosen. If anything, it would also make direct removal of moose even worse of an option due to the fact that the boreal to temperate forest transition that may take place as temperatures warm as well as rising heat will create a habitat that is less hospitable for moose and may ultimately result in a natural lowering of the moose population.

Topic Question 5:

I've already stated plenty in regards to my disdain for the idea of direct reduction of moose population, so I will use this space to address a major potential issue with not doing anything at all. As with many national parks, one of the major draws for tourists is the charismatic megafauna that inhabit the park, and in this case those are moose and wolves. I can understand that any scenario that involves the loss of even one of those species is potentially problematic as it may cause fewer tourists to want to visit that park, resulting in less money for the park. However, I believe that it is far more important to take ecosystem health into consideration first.

Topic Question 6:

Anyone who understands the concept of stochasticity and is familiar with the Wolf-Moose study will realize that what has happened to the wolves, while sad, is not actually that surprising. Stochastic events (unpredictable fluctuations in conditions), be they genetic, demographic, or environmental, can effect any population, but particularly small isolated ones like Isle Royale's wolves. The tree wolves falling down the mineshaft a few years ago would not have been as catastrophic to a larger population on the mainland, but it was devastating to the Isle Royale wolves. Also, due to the island's geographic isolation, genetic diversity was not able to find its way into the island's wolves, allowing for inbreeding to become rampant and weaken the already reduced population. Isle Royale's wolves aren't facing extinction because we hunted them to that point; they got there by a series of unfortunate events. When you understand this, it is possible to look at the situation more objectively. If we do reintroduce wolves and it works, wonderful. But if wolves die out and a healthy population cannot be reestablished, we must realize that that is simply the way of things and move on.

Correspondence: Topic Question 1:

Alternative Concept A, the No Action Alternative, is the best alternative to protect Isle Royale's unmanipulated, untrammelled wilderness character, even if that might mean in this case that wolves become temporarily or permanently extirpated from Isle Royale.

Topic Question 2:

Wolf researchers and some wolf advocates have pushed the NPS to transplant more wolves to Isle Royale. The NPS is also considering culling or translocating moose, perhaps with mechanized or motorized equipment. But such actions would fly in the face of Isle Royale's wilderness designation and represent a significant human manipulation of the Isle Royale Wilderness.

Topic Question 3:

Isle Royale's wilderness designation requires that we protect the area's unmanipulated, untrammelled wilderness character. Wilderness designation means we let Nature call the shots.

Topic Question 4:

As little human interference as possible.

Topic Question 5:

Transplanting wolves from the mainland to Isle Royale is a major manipulation of the Isle Royale Wilderness and should not be done.

Comments:

Thank you for the opportunity to comment on the NPS's Moose-Wolf-Vegetation Management Plan and Environmental Impact Statement for Isle Royale National Park and Wilderness.

The NPS should protect Isle Royale Wilderness's untrammelled character from overt human manipulation. Nearly all of Isle Royale is a designated Wilderness. The Wilderness Act requires humility and restraint on the part of us humans, where we let Nature call the shots rather than imposing human preferences upon the landscape. Transplanting wolves from the mainland to Isle Royale is a major manipulation of the Isle Royale Wilderness and should not be done. Alternative Concept A, the No Action Alternative, is the best alternative to protect Isle Royale's unmanipulated, untrammelled wilderness character, even if that might mean in this case that wolves become temporarily or permanently extirpated from Isle Royale.

Correspondence Type: Web Form

Correspondence: Topic Question 1:

Alternatives B and D mention wolf introduction one time. I seriously think that as time goes on, we will see that the need will prevail. Therefore augmentation may have to be taken over time. It will take time to establish genetic diversity in the wolf pack. I don't see the other options as providing that insurance.

Topic Question 2:

I believe that Isle Royal could be as close to a textbook case as they come when it involves the study of predator-prey relationships. But it is not perfect as I had stated. The work done here could be used to answer questions and problems in other and in other predator-prey relationships and in other closed tightly knit ecosystems. You have an excellent opportunity to maintain this balance. The wolves came here on their own as far as we know. The moose we are not so sure. We should maintain the natural progression of what we can.

Topic Question 3:

NPS goal is to protect the unique wilderness qualities of the land it oversees (like they are trained to do anywhere else). You do this through the monitoring of habitat, of wildlife and their habitat (including that of wolves and moose); for the maintenance of soil and water quality and ecological stability of plant and animal communities. The culling of moose is unacceptable just like the culling of bison is unacceptable here in Montana. We are trying to get that stopped here as well. That should not and is not the mission of the NPS.

Topic Question 4:

This is a tough question and one that is somewhat out of your control. Education of the public and the local communities as to the causes of climate change needs to be done. The NPS can and should be involved in that work. There is a story to be told here about how climate change as changed the dynamics of the island. The NPS can combat climate change by education and research. This is research which could either be done by either by NPS or others.

I feel that tick infestations are a result of climate change and in this way may have a negative result on moose populations. All of these impacts need to be closely watched and monitored. There is much to learn and documenting observations and ecological trends will be helpful for the future.

Topic Question 5:

From what I understand, the Record of Decision on this EIS is not expected until the Fall of 2017 at the earliest. That is two and one-half years from now and it is simply too long. It sounds like to me that the situation is close to being dire. Why has so much time gone by before we got to this point in time. An earlier acknowledgement would have been nice as then perhaps an earlier correction could have already been in place. Do the wolves, the moose and the forest have that kind of time?

The other alternatives do not seem to seriously address the problem. There is a problem on Isle Royal and several of the alternatives seem to allow an

ecological disaster take place. We cannot allow that to happen. Isle Royal is a unique place, for one reason it is on an island. On one hand that could be a good thing, but on another, it could also be a bad thing. It's a world onto its own. And that means paying special attention to the details.

Topic Question 6:

The majority and remainder of my comments are below.

Comments: In researching the issue of wolves and moose in Isle Royal National Park, there is no ideological purity here. Not if we are really honest with each other. To say that mankind has not already had an influence on this island would be dishonest and not true. From what I can tell, no one knows how or when moose arrived on Isle Royal. Some believe that moose swum across while others believe that man may have been responsible. There is no evidence validating either theory. And then there is the fact that humans inadvertently introduced canine parvovirus (CPV) to the island in the 1980s. According to (Vucetich, Nelson, Peterson, 2012) in their article Should Isle Royale wolves be reintroduced? a case study on wilderness management in a changing world, they state the following:

"The human-introduced disease, CPV, has been the single most significant event in the chronology of wolf-moose dynamics on Isle Royale."

The wolf population drastically declined after that event. Even though the disease seems to have vanished in the 1990s, CPV was detected again in 2007.

And then we have to consider climate change. The chances that wolves will have the opportunity to cross an ice bridge from the mainland to Isle Royal in the near future are most likely remote. How many times and for how long as the ice been thick enough, continuous enough, and persevered long enough for wolves to make that journey in the last 10 or 15 years? And how do we see that playing out in the future?

For you see with these impacts and others, to take the stand now that man has not already had an impact on Isle Royal would be extremely disingenuous. I understand this issue is a sticky subject and one that will probably have people of like minds disagree. But they do so on the purity of the definition of wilderness and the philosophy of letting nature take its own course. Both philosophies I would normally fight to protect, but this problem is not so ideologically pure, not so innocent.

So what do we do? Let the wolves die out and let moose devastate the forests? But the NPS was talking about culling out moose. This is a subject I am familiar with here in southwestern Yellowstone because that has been done and is being done with bison from Yellowstone National Park. What is natural about that? If man is going to interfere with nature in removing moose, then they might as well introduce wolves into the ecosystem to stabilize that population. Man has already introduced himself into the equation. Again to quote (Vucetich, Nelson, Peterson, 2012) in their article:

"It seems that humans have now impacted nearly every landscape on the planet and often in ways that are as significant as they are subtle. The history of human influence on the wolves and moose of Isle Royale is an important example."

Therefore I choose Alternative or Concept C; Maintain populations of moose and wolves which COULD include reintroduction (adding wolves after Isle Royale wolves die) or augmentation (adding wolves to the existing population). This will open the door for future involvement by man, no doubt about it. I can see that wolves may have to be brought back again in the future. We need to "let nature take its course" as much as we can, but it is silly to think that there is no place on earth that has not escaped the presence of man in some form or fashion. We also need to conserve and that means maintaining populations on this landscape that have an effective role in the natural balance of the ecosystem. Do we know what the balance was like here before man inserted himself into the mix?

We are having similar arguments here in southwestern Montana about wolves, bison, elk and you name it. There are some that just don't understand the larger picture, the delicate balance that needs to exist. There is no doubt that wolves provide an ecological benefit. We have a saying here, "Keep it Wild". And by that we mean keep all that was indigenous here, intact. That means keep the iconic species that signify the wild in the wild. There are places I know I will never get to see or experience. But I want to know that they are there, that those places exist.

Concepts A, B, D, E and F are not valid options. Again I would like to reinforce that Alternate C is the best option for the survival of wolves and moose and the ecosystem on this island. Please choose option C.

Thank you for allowing me this opportunity to comment.

Correspondence: Topic Question 1:

The no action alternative. At the very most the one time introduction of wolves alternative but under no circumstances should moose be intensively managed.

Topic Question 2:

Isle Royale's wilderness designation requires preservation of the area's unmanipulated, untrammled wilderness character. We have a unique opportunity to observe the long term island ecology going on here without our interruption despite our best intentions.

In this case, I think it would be wrong and against the intent of the Wilderness Act to transplant wolves from the mainland to Isle Royale.

Topic Question 3:

Low intensity if indeed management.

Topic Question 4:

Good question. It could perhaps be argued that humans are causing the wolf population to become inbred through less winters with complete ice coverage

due to climate change. But in this case we should probably default to less management.

Correspondence: Topic Question 1:

A apex predator is the logical and cost effective solution to the overabundance of moose on Isle Royale. The presence of wolves culls older and weaker moose, maintains mobility in the moose population and will protect the vegetation already showing signs of stress in some locations.

Topic Question 2:

The overall health of the ecosystem needs to be considered while maintaining a wilderness environment. Erosion, beaver population, forest health and aquatic plants all need to be considered.

Topic Question 3:

Let us always keep in mind that the hand of man is heavy on Isle Royale. It is a cultural as well as natural treasure. Wilderness designation has protected the recovering character of the island but the hand of man is also hurting the island. Example: less consistent ice bridges, disease, exotic species. Managing the island as wilderness should be maintained but we need to recognize that we have created these challenges. Man removed the Caribou, The moose introduction is uncertain but were clearly present at the time of the parks establishment and the passing of wilderness legislation. The wolf simply filled a niche, rather well as studies have shown.

Topic Question 4:

Climate Change is a reality. It will affect parks and wilderness areas throughout the entire federal lands system. As an Island Isle Royale is in a unique situation that limits transfer of genetics and protects the environment. We should manage as if the system is intact. Change will occur but we should not exacerbate that change by limiting a clearly logical solution because of political limitations.

Topic Question 5:

The only logical alternative is a wolf reintroduction from a population that currently kills moose as it's primary diet. It may not succeed on the first attempt but we must have the political and scientific will to continue.

A planned culling is a potential political disaster and very expensive to maintain. Wait and do nothing is a decision not to decide it demonstrate indecisiveness not science. Hoping for a natural reintroduction is just that. Hope not plan.

Topic Question 6:

This decision should have been made several years ago. For a variety of reasons the powers that be have delayed the inevitable conclusion. We should not let politics, personalities and personal ambitions within the NPS limit forward movement.

Isle Royale is in a unique situation for wolves. It is not surrounded by agricultural lands with grazing animals. Very few people will resist the idea of wolves in an isolated island ecosystem. We continue to learn from thier presence including the need for a fee flow of genetics. As we have limited this transfer it is our responsibility to reestablish.

Correspondence: Topic Question 1:

NPS has already implemented Concept A (no action) for failing to heed the warnings of the MTU Research team. The lack of action has resulted in the wolf population attaining an all-time low. We do not support Concept E or F because moose management would not be necessary with a healthy, thriving wolf population. Maintenance or culling of moose is not necessary if wolves are allowed to fulfill their ecological role. Absent wolf immigration, which no one can predict, there is no likelihood of having a wolf population without human action.

We do not support Concept B or D because it only allows for wolves to be reestablished one time. As a 20 year plan, reestablishing wolves just one time is very short sighted. Nature is unpredictable, the reintroduced wolves could die before they reproduce or could leave the island at the first opportunity.

Concept C seems to be the best alternative, however, the word "could" is problematic. We support sufficient flexibility to allow for wolf reintroductions or augmentation as necessary to insure genetic diversity for wolves and sustainable populations of both wolves and moose.

Topic Question 2:

Drs Rolf Peterson and John Vucetich stated in a letter to NPS dated 3/1/2014, "That senior personnel from Isle Royale National Park are not making appropriate use of the best available science in their deliberations about how to manage wolves on Isle Royale National Park." They pointed out that Park Superintendent Phyllis Green's comment to the press (that we don't need to rush to a decision) reflects "a serious misunderstanding of the problem." They explain, "The problem is not so much that wolves are at great risk of extinction over the next five years. The problem is that wolf predation - which is the ecosystem function of wolves - has become severely impaired for the past three years as a result of inbreeding. The best available science indicates that the

most likely method for mitigating that impairment is genetic rescue."

We support the use of the best available scientific data during this decision making process. The NPS must consider and evaluate the ecological benefits wolves provide. The NPS must acknowledge that the only pup observed in 2015 was visibly deformed and that the more than 30 wolves examined since 1994 had spinal anomalies. Researchers have concluded that the weakened state of the remaining wolves is likely interfering with reproduction and survival.

At a public meeting held 7/27/2015 Phyllis Green said the Michigan Technological University researchers who have conducted the wolf/moose study would not have a direct say in the decision.

We are perplexed by this statement. The wolves and moose of Isle Royale have been the subject of ongoing research for 57 years and is the longest continuous study of any predator-prey system in the world. The findings and recommendations of these researchers must be embraced not ignored.

Topic Question 3:

Our members highly value the unique qualities of wilderness areas including Isle Royale. They enjoy and appreciate the solitude that can only be found in true wilderness.

Management within Isle Royale must not only protect these values through monitoring of habitat, maintenance of soil, control of invasive species but NPS must insure the only predator of moose, the wolf, is present on Isle Royale in sufficient numbers as to fulfill their ecological niche.

The culling of moose and the use of motorized equipment is not consistent with the wilderness values of our members. UPEC strongly opposes these practices.

Topic Question 4:

Climate change poses a fundamental threat to species and places. The only way to slow the impacts of climate change is to globally reduce carbon emissions.

Research shows that the ice bridge between Isle Royale and the mainland is only expected to form 1 in 10 years (compared to 7 out of 10 years fifty years ago). It has also been suggested that ice bridges will continue to become increasingly infrequent (Austin & Colman 2007; Wang et al. 2012).

Yet, disappointedly, NPS has rejected these findings without any evidence. As part of this EIS, we suggest NPS consult with climatologists to fully evaluate the scientific data.

Moose are not likely in any direct danger of being reduced by climate change; however, wolf predation is needed to limit the growth in their population. It is unlikely that wolves will be able to repopulate Isle Royale without NPS intervention and we fear another 2 year delay will only exasperate the situation. We support an interim step to augment wolves immediately.

Topic Question 5:

We are concerned that each of Concept B, C and D, the only concepts that include augmentation/reintroduction of wolves, lacks specificity. Evidence suggests that the 3 remaining wolves will not be able to keep moose populations in check, even if these few wolves are able to hang on long enough for the NPS to make a decision 2 years from now. By then, the entire ecosystem of Isle Royale could be on the verge of collapse.

So, in effect, NPS has adopted the no-action approach which is simply unacceptable.

Correspondence: Topic Question 1:

Relocate two wolf packs from NE MN where there is still hope for the MN moose population to rebound, perhaps up the Gunflint trail. This will help a disappearing moose population in MN, partially attributable to wolves. Take these two packs and put them on Isle Royale to thin the moose herd there.

Topic Question 2:

If moose are calving two moose per birth because of wolves on the island, then start relocating some of these moose to northern MN to help the MN moose population.

Topic Question 3:

Unfortunately, the park has previously been disturbed by mining. That said, some of the natural features are not so natural, therefore, human interaction and management in this designated "wilderness" should be undertaken. This is a philosophical question, but sense the wolves disappeared to a human caused

mine mishap, then wolves should be reintroduced vis-a-vis human influence.

Topic Question 4:

Management should consider alternatives as it relates to climate change. Implement solar initiatives on building, perhaps utilize energy performance contracting which is big with the Feds right now.

Topic Question 5:

Alternative D makes the most sense. Relocate a couple packs from MN to the island. Relocate moose, primarily cows to MN

Topic Question 6:

I would hate to see an ecosystem collapse ultimately because a mine (human influenced) cause the ultimate demise. Reintroduce wolves to Isle Royale. Take some moose from Isle Royale to MN.

Correspondence: Topic Question 1:

Since the wolf population in the U.P. has recovered to the point that a hunting season has been established in some counties, why not relocate some wolves from those areas to Isle Royale? If wolves from several different packs could be taken to Isle Royale it should solve the problem of inbreeding for several generations. At the same time it might help solve the problems caused by too many wolves in certain areas of the U.P.

Topic Question 2:

All data that has been collected throughout the decades of the moose-wolf study should be considered. Otherwise we would be wasting a valuable tool.

Topic Question 3:

Try to bring the wolf and moose populations into balance now, then let nature regulate them for at least 20 years before any further intervention. Hopefully it won't be needed for many years to come.

Topic Question 4:

Climate change is the wild card in the game. It could affect drastic changes in the whole ecosystem of any wilderness area. I think we have to do our best to preserve these natural areas for future generations to enjoy.

Topic Question 5:

I don't think doing nothing is a wise alternative. Isle Royale needs our help at this critical time period. I think it's best to introduce new wolves now and, if necessary, reduce the moose population at the same time to help restore balance.

Topic Question 6:

I read about the preliminary alternatives in a tourism publication while traveling in the U.P. in July. That's how I learned about this public comment period. I was unable to find them listed on this website though. I was surprised they didn't appear in the newsletter document. It would be helpful for citizens wishing to comment.

Comments: THANK YOU for inviting public comment. You never know, somebody could come up with a great alternative that has not yet been considered by those in a position to act on it.

Correspondence: Topic Question 6:

I have a very strong background in wildlife and wildlife management (anybody can say that right?) trust me. Okay here's my opinion: Let nature take its course with a little help from man. If wolves go extinct on the island and they will soon, then without wolves man will have to control moose numbers. So that's "hunting" which is not allowed on NPS land in this case. So NPS employees are brought in to cull (kill) moose. Its Still hunting the moose is just as dead except The meat is not as well taken care of as by true hunters and sinful waste may occur. I say this augment the the present wolves with a dozen or two mainland wolves of diverse genetics. I believe the whole system would balance itself in short order with no more "help" from mankind.

Correspondence: Topic Question 1:

I think alternative concept C (Maintain both species) is the best option. However, I do not see the need for any type of management for moose at this time. It is my understanding there are sufficient populations of moose on the island. A proper reintroduction of a viable population of Wolves will immediately impact moose.

Topic Question 2:

Genetic viability of the wolf population - ice bridge formation is too sporadic to be counted on.

Topic Question 3:

Maintain the wilderness designation at all costs with maybe 1 annual allowance for authorized personnel and scheduled activity for whatever species issues need to be addressed.

Topic Question 4:

It may be necessary to simulate ice bridge formation events by augmenting wolf introductions at some yearly interval (3-years, 7 years, 10 years?) depending on expert opinion and genetic viability.

Topic Question 5:

I don't understand the moose management requirements on Concept C. I do not think a single introduction event is viable - it all depends on success.

Topic Question 6:

Follow the successes of the 1995 YNP reintroduction but scaled properly to the Isle Royale ecosystem.

Correspondence: Topic Question 1:

Wolves are a very important part of the eco system on Isle Royale and should NOT disappear from it. I have never had the opportunity to visit this park and at my age (73) probably never will but I do extensive reading about it. We have established wolf packs over much of Michigan, in fact, in some place they have become problems to residents. I feel that some of these animals should be trapped and transported to Isle Royale to enhance the present animals and to provide a new genetic pool for the pack. Additional animals should be added in future years to refresh the genetic pool and keep wolves as a viable part of Isle Royale.

Topic Question 2:
Wolves are needed to keep the moose under control which will help balance out the supply of vegetation on the island.

Topic Question 3:
I favor Alternative C in your proposal.

Topic Question 4:
Continue with the current plan.

Topic Question 5:
We need to continue to have both wolves and moose on the island. Without wolves, moose will over populate and over graze the vegetation to the point of destroying vegetation and causing a major moose die off.

Topic Question 6:
A visit to Isle Royale is still on my Bucket List and I hope to get there to see the land, moose, and wolves (at least hear them).

Correspondence: Topic Question 1:
I think option B is reasonable at this point. Here is my reasoning:

Assuming the wolf population declines to 0 in the next year or two, the researchers and park service will have the opportunity to monitor the moose and vegetation levels over the next few years while the plan is being created.

Having wolves on the island keeps the moose population healthy and in check. Since there are so few places left in the country that have healthy populations of either, I feel it is important to try to keep both on Isle Royale where they are easier to protect and preserve because it is insulated from habitat destruction and other animals such as deer and humans hunting.

Also, the wolves still have the freedom to come and go, along with migrant wolves, if ice bridges allow, so nature still has some control of the situation is we simulate a migration event of a small pack.

I don't think it's appropriate to reduce the moose population because humans hunting will not necessarily take out the same moose that the wolves would naturally select, and using helicopters and motorized equipment will disturb the environment more than is necessary at this point. (There's a reason no cars are allowed on the island.)

Topic Question 2:

History is filled with examples of humans trying to solve environmental problems such as invasive species by introducing a new animal to control it, without knowing what the consequences of that introduction would be. The introduced animal ends up becoming an invasive species itself because it has no natural predators. This situation is different. Moose and wolves have coexisted on the island for a long time and the wolf population has never gotten out of control.

Topic Question 3:

I think preserving (and if needed, restoring) the habitat is important for conservation. This doesn't mean doing nothing; rather it means doing as little as necessary. For example, removing invasive species that would edge out native plants or animals. (Ie Zebra mussels and Spotted Knapweed). And maybe introducing a new wolf population.

Topic Question 4:

See above. Do as little as necessary, but don't just continue to observe if something needs to be done.

Topic Question 5:

We should only change one variable at a time and see what effect it has. (Ie don't reduce the moose population and introduce wolves at the same time).

Topic Question 6:

I appreciate that you're taking comments from the public about what they would like to see for the future of the island, but scientists should be giving the primary input on which plan is likely to achieve that.

Correspondence: Topic Question 1:

Only 3 of the 6 alternative concepts mention wolf reintroduction or augmentation and none with any specificity. Concept B and Concept D only allow for wolves to be reestablished once which may not be sufficient and is very short sighted. Concept C allows for maintaining populations of wolves and moose which "could" include wolf reintroduction or augmentation.

Concept C appears to be the best alternative, however, it does not go far enough. There must be sufficient flexibility to allow for wolf reintroductions as necessary over the next 20 years to insure genetic diversity for wolves and sustainable populations of both wolves and moose into the foreseeable future.

Maintenance or culling of moose is not necessary if wolves are allowed to fulfill their ecological role. Absent wolf immigration, which no one can predict, there is no likelihood of having a wolf population without human action.

Topic Question 2:

We believe the NPS should consider and evaluate the ecological benefits wolves provide; The only pup observed in 2015 was visibly deformed; 100% of wolves examined since 1994 (over 30 of them) have spinal anomalies. The weakened state of the remaining wolves is likely interfering with reproduction and survival.

The NPS must consider the data collected through 57 years of research conducted on Isle Royale. These researchers should play a key role in the discussions.

Topic Question 3:

NPS must protect the unique wilderness qualities of Isle Royale through monitoring of habitat for wildlife, including wolves and moose; maintenance of soil and water quality and ecological stability of plant and animal communities including the control of invasive species. Management is necessary to maintain important wilderness values including the presence of a top carnivore which is vital for ecosystem health. The culling of moose and the use of motorized equipment is unacceptable.

Topic Question 4:

Climate change poses a fundamental threat to species and places. The only way to slow the impacts of climate change is to globally reduce carbon emissions. NPS could produce an informational flyer explaining the negative impacts climate change is having on Isle Royale such as the changes in the duration and frequency of the ice bridge, winter ticks, bird species etc. NPS could engage with businesses and private entities that use the island to reduce carbon pollution. Encourage visitors to reduce their carbon footprint by not bringing / disposing of water bottles.

Moose are not likely in any direct danger of being reduced by climate change, however, wolf predation is needed to limit the growth in their population.

Because of climate change, it is unlikely that wolves will be able to repopulate Isle Royale without NPS intervention and we ask for immediate action to augment / reintroduce wolves.

Topic Question 5:

For years, researchers have been sounding the alarm about the plight of wolves on Isle Royale. Yet, the NPS has chosen to take no action until now. The public scoping period ends 8/29, however, the Record of Decision is not expected until Fall 2017 at the earliest. Two and one-half years is simply too long. This foot dragging on the part of NPS is unacceptable.

Evidence suggests that the few wolves on the island will not be able to keep moose populations in check which will further degrade the island's vegetation. Every effort must be made by the NPS to expedite the decision.

Topic Question 6:

Those who visit Isle Royale do so for the wilderness experience which includes wolves and moose. And so do I.

Correspondence: Topic Question 1:

Only 3 of the 6 alternative concepts mention wolf reintroduction or augmentation and none with any specificity. Concept B and Concept D only allow for

wolves to be reestablished once which may not be sufficient and is very short sighted. Concept C allows for maintaining populations of wolves and moose which "could" include wolf reintroduction or augmentation.

Concept C appears to be the best alternative, however, it does not go far enough. There must be sufficient flexibility to allow for wolf reintroductions as necessary over the next 20 years to insure genetic diversity for wolves and sustainable populations of both wolves and moose into the foreseeable future.

Maintenance or culling of moose is not necessary if wolves are allowed to fulfill their ecological role. Absent wolf immigration, which no one can predict, there is no likelihood of having a wolf population without human action.

Topic Question 2:

The NPS must consider the data collected through 57 years of research conducted on Isle Royale. These researchers should play a key role in the discussions.

Topic Question 3:

NPS must protect the unique wilderness qualities of Isle Royale through monitoring of habitat for wildlife, including wolves and moose; maintenance of soil and water quality and ecological stability of plant and animal communities including the control of invasive species. Management is necessary to maintain important wilderness values including the presence of a top carnivore which is vital for ecosystem health. The culling of moose and the use of motorized equipment is unacceptable.

Topic Question 4:

Climate change poses a fundamental threat to species and places. The only way to slow the impacts of climate change is to globally reduce carbon emissions. NPS could produce an informational flyer explaining the negative impacts climate change is having on Isle Royale such as the changes in the duration and frequency of the ice bridge, winter ticks, bird species etc. NPS could engage with businesses and private entities that use the island to reduce carbon pollution. Encourage visitors to reduce their carbon footprint by not bringing / disposing of water bottles.

Moose are not likely in any direct danger of being reduced by climate change, however, wolf predation is needed to limit the growth in their population.

Because of climate change, it is unlikely that wolves will be able to repopulate Isle Royale without NPS intervention and we ask for immediate action to augment / reintroduce wolves.

Topic Question 5:

For years, researchers have been sounding the alarm about the plight of wolves on Isle Royale. Yet, the NPS has chosen to take no action until now. The public scoping period ends 8/29, however, the Record of Decision is not expected until Fall 2017 at the earliest. Two and one-half years is simply too long. This foot dragging on the part of NPS is unacceptable.

Evidence suggests that the few wolves on the island will not be able to keep moose populations in check which will further degrade the island's vegetation. Every effort must be made by the NPS to expedite the decision.

Topic Question 6:

Those who visit Isle Royale do so for the wilderness experience which includes wolves and moose. Explain what you value about wilderness and why.

Correspondence: Topic Question 1:

Reintroduction of 'problem' wolves from elsewhere, as outlined by Wayne Pacelle: <http://www.mininggazette.com/page/content.detail/id/546494/Isle-wolves--Humane-Society-urges-an-elegant-solution-.html?nav=5006>

Topic Question 2:

The maintenance of viable and healthy populations of both species.

Topic Question 3:

Monitoring with minimal non-essential interference once a viable wolf population has been established.

Topic Question 4:

Monitoring and routine management of vegetation with a view to allowing species to adapt; more intense management if essential for species survival.

Topic Question 5:

I favour alternative B, introduction of wolves but without limiting this to one time only, for two reasons: firstly because the process may need to be repeated in order to maintain sufficient numbers of wolves for a viable population; secondly as a means of managing wolves seen as 'problematic' elsewhere by relocating rather than exterminating them.

I do not support the no action alternative as this could result in local extinction of wolves, nor do I support culling the moose population when wolves as keystone predators would likely achieve population control naturally.

Topic Question 6:

I strongly support the suggestion by Wayne Pacelle that wolves should be relocated to Isle Royale in order to establish a stable population.

Correspondence: My comment pertains to the scope of the EIS. It's possible that the decision made on this issue will set a precedent for future actions by the National Park Service in response to species-composition changes in national park units under climate change. It is therefore important that this EIS and the resulting decision consider the complete context of the Isle Royale ecosystem, not just two charismatic species and their interactions with the vegetation of the national park.

Instead of an EIS that is limited to moose/wolves/vegetation, the study should also include, at a minimum, alternatives that take into account other species that were historically present in the park (for far longer periods than moose and wolves) but which are now absent. These species might be able to fill all or part of the same ecological roles now being played by moose and wolves. Caribou, coyotes, and lynx are three that come to mind, and conceivably there may be more (wolverines?).

If we are going to consider bringing more wolves to the park, I see no inherent reason why other species that died out on or were extirpated from Isle Royale should not also at least be considered for the same action. (Whether or not such species were on the island at the time Isle Royale National Park was created is irrelevant from an ecological standpoint).

In addition, any EIS should consider the potential effects of the alternatives on interactions among ALL the national park's flora and fauna, not just on highly visible, charismatic species. The EIS should have an ecosystem, and not just a (limited) species, focus.

In summary, an EIS limited to moose/wolves/vegetation implicitly endorses and unjustifiably privileges the species composition of Isle Royale National Park that has prevailed merely for the past half-century or so. Such a "presentist" bias would be a dangerous precedent (if indeed it were to become one) for the National Park Service - especially since we know that conditions under climate change are already altering the "present normal," perhaps irrevocably. This is one of the main messages of the National Park Service's "Revisiting Leopold" report, and this EIS should align with that.

Thank you for considering these comments.

Correspondence: Topic Question 1:
Reintroduction of Wolves only

Topic Question 2:
Reintroduction of Wolves would protect the vegetation and take care of the moose population naturally.

Topic Question 3:
None other than reintroduction of Wolves. Man should be left out of it!! There should be no culling of anything!! This pristine wilderness must be protected at all costs and not fall to the same travesty as the shame of Yellowstone's mismanagement. Bison's slaughter that has the country in uproar. This is a place untouched by man and rightly so. It must remain protected, people come from all over the world to get a glimpse of these wonderful creatures and this amazing lost world.

Topic Question 4:
Observation

Topic Question 5:
No culling should have ever have ever have been brought to this forum as even a consideration. It's unfathomable.

Topic Question 6:
There is no solution other than to do the best thing for this nature preserve than to reintroduce Wolves to save this precious habitat and wilderness as it is meant to be. I and my family heard the remaining Wolves on our last visit but were not blessed to see them, not for lack of trying but were informed by caretakers of resort that some had fallen into abandoned mine during the previous winter. Which was disturbing and thier lack of concern and also thier lack of concern while telling they had to "rescue" stranded wolf pups from a small outlying island annoyingly (whether true or not) is also disturbing. Maybe better management should be sought there.

Comments: Please consider this preserve is a precious place that must be carefully saved and untouched by man only by reintroducing the predator will you save it. Thank you.

Correspondence: As a member of the organization Wilderness Watch, I am in agreement with their opinions about Isle Royale. I've enclosed their points below as fitting my opinion:

1. Isle Royale's wilderness designation requires that we protect the area's unmanipulated, untrammelled wilderness character. Wilderness designation means we let Nature call the shots.
2. Transplanting wolves from the mainland to Isle Royale is a major manipulation of the Isle Royale Wilderness and must not be done.
3. Alternative Concept A, the No Action Alternative, is the best alternative to protect Isle Royale's unmanipulated, untrammelled wilderness character.

Don't be put off by my overseas address. I'm an American living abroad, and I vote (absentee ballot) in every major election.

Correspondence: Topic Question 1:

Only three of the options mention wolf reintroduction, none with any specificity. And certainly, one reintroduction only is short-sighted because it may not work the first time. Why tie your hands? The third option, C, appears the best alternative because it calls for managing both moose and wolf populations, but the language "could" include wolf reintroduction is wish-washy. Although it appears the ecological balance of this wilderness area cannot be maintained without human intervention, culling the moose population wouldn't be necessary if wolves were allowed to perform their ecological role.

Topic Question 2:

The NPS should evaluate the ecological benefits wolves provide. There is plenty of study material to do this- well over 50 years of data collected on Isle Royale. Researchers are the experts in this case, not NPS administrators. Researchers should play a key role in discussions.

Topic Question 3:

NPS is obligated to protect the unique wilderness habitat, including monitoring wildlife, soil and water quality, ecological stability of wildlife communities, including plant life, and controlling invasive species. Management is critical in order to maintain this wilderness, and that includes the presence of wolves, which are vital to the health of this particular eco system. Moose culling, and the use of motorized equipment to do that, is simply not acceptable.

Topic Question 4:

I'm not sure what the NPS can do, beyond educating the public of the importance of reducing global carbon emissions, and individual carbon footprints. At this point it doesn't appear that the moose population is in danger of being reduced due to climate change; however, climate change is affecting the frequency and duration of the ice bridge, thus it is unlikely wolves will be able to repopulate Isle Royale without human intervention. Reintroduction/augmentation of the wolf population should take place immediately.

Topic Question 5:

I dislike that the NPS has taken so long to address the obvious correlation between declining wolf population and increasing moose population. Researchers have been vocal about these concerns for years. The alternatives are not well-thought out. Evidence suggests that the current declining wolf population isn't enough to keep rising moose population in check, further degrading the island's vegetation. And yet the NPS proposes to delay the Record of Decision for another two years? Hunting is not allowed in national parks. This delay, and the term "culling" is a thinly veiled avenue to allow hunters to use motorized equipment to kill moose on protected lands.

Topic Question 6:

I do not support the culling of animals on any protected lands. Further, I certainly do not support doing so using motorized equipment. Humans are responsible for the climate changes that prevent the natural migration of wolves to Isle Royale; thus it is our responsibility to intervene and restore balance immediately. The opportunity to observe animals in their natural habitat is one of the greatest gifts we give to one another. Along with the many ecological benefits wolves provide, their intrinsic value is immeasurable. Observing wolves in the wild, as I did in Yellowstone during March of 2013, was one of the single great experiences of my entire life.

Really so weary of reading that our NPS is shirking its responsibility to maintain the balance of eco systems in our wilderness areas for the benefit of all of

us, and bowing instead to the pressures of a self-interested parties. Isle Royale is designated a wilderness area, the highest level of conservation protection on federal lands. As such, it demands your action to preserve it as a place of solitude and protect its primitive state. I urge you to examine your conscience and act immediately to refrain from culling moose and instead support a healthy wolf population on Isle Royale.

Correspondence: Topic Question 1:

Only 3 of the 6 alternative concepts mention wolf reintroduction or augmentation and none with any specificity. Concept B and Concept D only allow for wolves to be reestablished once which may not be sufficient and is very short sighted. Concept C allows for maintaining populations of wolves and moose which "could" include wolf reintroduction or augmentation.

Concept C appears to be the best alternative, however, it does not go far enough. There must be sufficient flexibility to allow for wolf reintroductions as necessary over the next 20 years to insure genetic diversity for wolves and sustainable populations of both wolves and moose into the foreseeable future.

Maintenance or culling of moose is not necessary if wolves are allowed to fulfill their ecological role. Absent wolf immigration, which no one can predict, there is no likelihood of having a wolf population without human action.

Topic Question 2:

We believe the NPS should consider and evaluate the ecological benefits wolves provide; The only pup observed in 2015 was visibly deformed; 100% of wolves examined since 1994 (over 30 of them) have spinal anomalies. The weakened state of the remaining wolves is likely interfering with reproduction and survival.

The NPS must consider the data collected through 57 years of research conducted on Isle Royale. These researchers should play a key role in the discussions.

Topic Question 3:

NPS must protect the unique wilderness qualities of Isle Royale through monitoring of habitat for wildlife, including wolves and moose; maintenance of soil and water quality and ecological stability of plant and animal communities including the control of invasive species. Management is necessary to maintain important wilderness values including the presence of a top carnivore which is vital for ecosystem health. Correspondence: Topic Question 1:
Introduction of wolves to provide biodiversity.

Topic Question 2:
Once biodiversity is introduced, monitoring both wildlife and environment for early warning signs of compromise to their health and protection.

Topic Question 3:
The avoidance of wildlife "management" - the less intervention the better. The continuing regulations on visitors and the maintaining of a true wilderness experience for those who come to the island. No introduction of "luxury" amenities.

Topic Question 4:
Very challenging for NPS since they cannot control the changes -most troubling is the increase in harmful insect populations and the hazards they present to wildlife and plant species. The early introduction of beneficial insects and microorganisms might be appropriate interventions to combat these hazards.

Topic Question 5:

Cannot comment at this time because I did not copy down the alternatives and I am unable to leave this page and still retain my comments. I shall go back and review your alternatives and submit a comment on just Question 5 if I am allowed.

Topic Question 6:

A careful physical survey of the island to remove the manmade hazards, e.g., the deep "well/pit" shown on one of the films on the island, carefully fenced off as a warning to visitors, not filled in, certainly accessible to animals. A camera view into the pit revealed several wolf bodies. It is very likely that once one of the pack had fallen into the pit, others coming to the rescue suffered the same fate - because of the depth and the sheer sides, none were able to escape and died from their injuries. Obviously park crews recognized the hazard since the fence was erected with warning signs. The attention to all such hazards needs to include the protection of the wildlife as well.

Correspondence: Topic Question 1:
We have grown so much as a scientific society, yet the basics still remain...wolves are imperative to continue keeping Isle Royale from becoming yet another barren place on this planet. Think simple with the highest effectiveness... protect the wolves and get NPS involved in making sure they flourish and restore the natural order.

Topic Question 2:

NPS absolutely needs to involve scientists whose life work is to see the wolf restored to its healthy state. NPS needs to provide assistance and support in order to get the future generations to provide Isle Royale what it needs which is its natural ecosystem, which cannot happen without healthy wolves.

Topic Question 3:

NPS needs to provide 100% financial, scientific, protection and ongoing support to see Isle Royale return to its former glory. This cannot be done overnight and needs to be an ongoing (forever if necessary) endeavor. Wolves are being born deformed and weak at birth and that won't change without continuous provisions and protection.

Topic Question 4:

Re-introduction of the wolf population at Isle Royale is imperative and cannot be denied. Climate changes impact the wolves and their reproduction ability in many ways. Education, prevention and negotiation with companies to minimize the causes of climate changes are a must if they want to maintain a healthy environment.

Topic Question 5:

While I like that they are offering a reintroduction, this appears to be a pathetic ditch effort to appear as if they are trying to compromise. NPS must introduce a long term reintroduction of wolves, protection of them and assistance with the continued recovery efforts that will take years.

Topic Question 6:

I am simply aghast at how wolves are treated and the fact that NPS negotiations are with such a lack of interest in protecting our wildlife and ecosystem. Wolves are an essential part of the ecosystem there and are beautiful and amazing creatures that we have had the honor share this planet with...I say had because NPS is clearly doing what they can to see this species erased across our continent. Please don't let that happen!! The eradication of the wolves, is the eradication of our brother mammals, and soon to be our own eradication.

Correspondence: Topic Question 1:
All alternatives including international input need to be included.

Topic Question 2:

I backpacked from 1976-2007 on the island and as a scientist I closely followed the moose/wolf ups and downs. If we do not introduce an entirely different genetic group of wolves on the island, there will be major over browsing by the moose and incredibly great death rates because the moose will get genetically weaker. I think an immediate infusion of a new set of predators will help create a balance.

Topic Question 3:

if you do not introduce new wolves, I think you will need a controlled burn or an intentional elimination of the weaker moose or the vegetation will be destroyed by the over population of the present level of moose.

Topic Question 4:

None. The climate will take its own toll without our interference.

Topic Question 3:

THE BARE MINIMUM, LET IT BE WILD, LET IT BE WILDERNESS. ONLY INTERFER WHEN OTHERS ARE INTRUDING WITH POSSIBLE HARMFUL RESULTS.

Topic Question 4:

THIS IS A HUGE QUESTION BECAUSE THIS IS A GLOBAL ISSUE. THE NPS HAS TO CO-OPERATE WITH OTHER NATIONAL AND INTERNATIONAL ORGANIZATIONS TO STOP THE MANY CHALLENGES FACING ALL OF US IN REGARD TO CLIMATE CHANGE.

Topic Question 5:

I LIKE ALTERNATIVE A - DO NOTHING AND HOPEFULLY, HEALING AND A RETURN TO NORMALCY WILL AFFECT THIS BEAUTIFUL AREA.

Topic Question 6:

WHEN WE REALIZE HOW OUR INTERFERENCE INTO NATURAL AREAS HAS BROUGHT HARM TO THOSE AREA BY CREATING AN

INBALANCE, WE MUST RECTIFY THE SITUATION. WE MUST LEARN FROM OUR MISTAKES. WE ARE CHANGING OUR CLIMATE, OUR WILDERNESS AREAS, OUR ENTIRE PLANET BY INTERFERING WITH OR ABUSING ECOSYSTEMS FOR SATISFACTION OF OUR NOT SO INTELLIGENT EGOS OR FOR MATERIAL GAIN, WE ARE UNDERMINING THE FUTURE OF OUR BEAUTIFUL PLANET AND ALSO OUR OWN FUTURE AS WELL!

Comments: I HOPE AND PRAY THAT WE HUMANS ALL WAKE UP AND REALIZE THAT WE ARE NOT THE OWNERS OF THIS PLANET BUT THAT WE ARE ONLY A PART OF THIS FANTASTIC, BEAUTIFUL WORLD. WE SHOULD BE SO THANKFUL AND NOT RUIN WHAT WE ALREADY HAVE.

Correspondence: Topic Question 1:

Only 3 of the 6 alternative concepts mention wolf reintroduction or augmentation and none with any specificity. Concept B and Concept D only allow for wolves to be reestablished once which may not be sufficient and is very short sighted. Concept C allows for maintaining populations of wolves and moose which "could" include wolf reintroduction or augmentation.

Concept C appears to be the best alternative, however, it does not go far enough. There must be sufficient flexibility to allow for wolf reintroductions as necessary over the next 20 years to insure genetic diversity for wolves and sustainable populations of both wolves and moose into the foreseeable future.

Maintenance or culling of moose is not necessary if wolves are allowed to fulfill their ecological role. Absent wolf immigration, which no one can predict, there is no likelihood of having a wolf population without human action.

Topic Question 2:

The NPS should consider and evaluate the ecological benefits wolves provide; The only pup observed in 2015 was visibly deformed; 100% of wolves examined since 1994 (over 30 of them) have spinal anomalies. The weakened state of the remaining wolves is likely interfering with reproduction and survival.

The NPS must consider the data collected through 57 years of research conducted on Isle Royale. These researchers should play a key role in the discussions.

Topic Question 3:

NPS must protect the unique wilderness qualities of Isle Royale through monitoring of habitat for wildlife, including wolves and moose; maintenance of soil and water quality and ecological stability of plant and animal communities including the control of invasive species. Management is necessary to maintain important wilderness values including the presence of a top carnivore which is vital for ecosystem health. The culling of moose and the use of motorized equipment is unacceptable.

Topic Question 4:

Climate change poses a fundamental threat to species and places. The only way to slow the impacts of climate change is to globally reduce carbon emissions. NPS could produce an informational flyer explaining the negative impacts climate change is having on Isle Royale such as the changes in the duration and frequency of the ice bridge, winter ticks, bird species etc. NPS could engage with businesses and private entities that use the island to reduce carbon pollution. Encourage visitors to reduce their carbon footprint by not bringing / disposing of water bottles.

Moose are not likely in any direct danger of being reduced by climate change, however, wolf predation is needed to limit the growth in their population.

Because of climate change, it is unlikely that wolves will be able to repopulate Isle Royale without NPS intervention and I ask for immediate action to augment / reintroduce wolves.

Topic Question 5:

For years, researchers have been sounding the alarm about the plight of wolves on Isle Royale. Yet, the NPS has chosen to take no action until now. The public scoping period ends 8/29, however, the Record of Decision is not expected until Fall 2017 at the earliest. Two and one-half years is simply too long. This foot dragging on the part of NPS is unacceptable.

Evidence suggests that the few wolves on the island will not be able to keep moose populations in check which will further degrade the island's vegetation. Every effort must be made by the NPS to expedite the decision.

Topic Question 6:

Intelligent and compassionate wilderness management, which includes large carnivores, is an integral part of maintaining the integrity of the land that maintains not just our own physical well-being, but our emotional and spiritual well-being as well. It is time to rethink what we do and ensure that future generations will look back and see this as the point at which we chose life in all its forms. The NPS is an important part of that process.

Correspondence Type:

Web Form

Correspondence: Topic Question 1:

The only alternative I can support is a modified alternative Concept C. Rather than "could", I believe the concept should read: "Maintain populations of moose and wolves on the island, which WOULD or SHALL include wolf reintroduction or augmentation." This would allow for wolf reintroductions/augmentation over the next 20 years as necessary to maintain the predator/prey relationship.

Topic Question 2:

Wolves provide many ecological benefits and the NPS should carefully consider and evaluate these benefits. The NPS must acknowledge that the only pup observed in 2015 was visibly deformed and that the more than 30 wolves examined since 1994 had spinal anomalies. Researchers have concluded that the weakened state of the remaining wolves is likely interfering with reproduction and survival.

The wolves and moose of Isle Royale have been the subject of ongoing research for 57 years and is the longest continuous study of any predator-prey system in the world. The findings and recommendations of the researchers must be key components of the EIS.

Topic Question 3:

I do not support the use of ATVs or any mechanical equipment within the designated wilderness area. I believe this would set dangerous precedent for other wilderness areas around the country.

Nationwide, there are few true wilderness areas and the wilderness qualities must be protected from damaging ATVs and mechanized equipment.

NPS must insure NPS must insure that wolves exist on Isle Royale in sufficient numbers as to fulfill their ecological role by maintaining the moose population.

Topic Question 4:

As a long term plan for Isle Royale, there must be enough flexibility to allow for wolf reintroductions or augmentation as necessary to insure genetic diversity for wolves and sustainable populations of both wolves and moose.

It does not appear that moose are in any danger of being reduced by climate change; however, wolves are needed to keep the moose population in check.

Research indicates that wolves will not be able to repopulate Isle Royale without NPS intervention and I support an interim step to augment wolves immediately. This could possibly preserve the genetics of the remaining island wolves.

Having just returned from a trip to Yellowstone, I was impressed with the many steps YNP has done to reduce the carbon footprint of the millions of visitors to the Park. Conservation / recycling is stressed everywhere. Water is sold in cardboard boxes, not plastic. There are water bottle refill stations. Hotel rooms are equipped with recycle and compost bins. Lights in the hotel rooms are turned on with the room key and go off automatically when the key is removed from the slot. Scientists agree a warming climate is a threat and a reduction in carbon emissions will slow its effects. NPS can help by raising awareness.

Topic Question 5:

There is a vocal minority calling for a moose hunt on Isle Royale. But since hunting is not allowed in National Parks, three of the proposed concepts, include reducing moose populations through "culling". I do not support the hunting or culling of moose on Isle Royale.

I believe one of the reasons the moose population has continued to grow is because of the failure of the NPS to heed the warnings of researchers. For the past five years, their work has shown that the declining wolf population and the low wolf predation rates would result in the growth of the moose population which could lead to negative impacts to park resources.

Rather than initiating an EIS, the NPS chose to ignore the scientific data and did nothing until now.

While Concept C seems most appropriate, it lacks any detail. The term "could" is too ambiguous and must be changed to "shall" or "will". To protect / restore the ecological balance of Isle Royale, I support the reintroduction / augmentation of wolves.

Topic Question 6:

Beginning 2012 through July 2015, nearly 1100 comments addressing wolves/moose of Isle Royale were submitted to NPS. Approximately 75% of the comments submitted called for genetic rescue which supports the recommendation of the two leading wolf researchers, Rolf Peterson & John Vucetich. Another 9% support restoration once the remaining wolves are gone. Many comments reflect support for the ecological niche that wolves provide. The people who wrote care deeply & support the wilderness qualities of Isle Royale.

I attended the 7/27/2015 meeting in Houghton and was disappointed to hear Phyllis Green say that the previously submitted comments would not be considered because they were not part of the formal process.

In a press release dated 11/6/2013, announcing public meetings about Isle Royale, Phyllis Green said, "I hope the public takes this opportunity to become more informed on the natural resources of the island." I attended the 11/12/13 meeting, which among other topics included the history of wolves on Isle Royale, climate change implications and the current and future status of wolves. At that meeting Paul Brown stated that there was no specific timeline for when the park service would have a plan in place. He also said the park service was gathering public input.

It was made clear the NPS was soliciting comments related to natural resources, ecology, climate change and wildlife management on Isle Royale prior to the opening of the formal comment period. To disregard the comments would be a violation of the guiding principles of 1946 Administrative Procedures Act which provides for public participation in the rulemaking process.

In addition, it is a violation of the public trust. Those who took time to write during the informal process initiated by NPS, did so believing their opinion would be considered. While NPS sent an email to those on the Isle Royale mailing list, they were merely encouraged to provide comments if their views had changed. It was not made clear that to be considered as part of the formal process, it was necessary to resubmit their previously submitted comments.

It appears that these comments are being deliberately discounted because they do not support the NPS predetermined decision.

Correspondence: Topic Question 1:

Adaptive Management techniques are going to be crucial. (Plan, Do, Evaluate, Respond - - with specific time-frames in place)

Additional research into introducing other natural predators of moose?

Management of vegetation; managing the overall ecology, not just the moose or wolves. Taking steps to restore (or control) vegetation that may be negatively effected by moose overgrazing.

Topic Question 2:

Fluctuations unforeseen due to climate change. (thus the plan has to be adaptable)

When you're managing those two organisms you must ever-aware of the trophic-cascade effects. I think a lot can be learned by close communications with Yellowstone with regard to their wolf reintroduction programs.

Topic Question 3:

If you are going to do anything, that means that you need to continue to do something. Just because it's designated wilderness does not mean that management cannot be put into place. The Act was put into place for the greater good of all people, in order to preserve wild spaces in an ever-increasing population. Furthermore, in 1964 they had no idea of Climate Change and how it may impact any wilderness spaces, nor did anyone (most likely) predict the eventual downfall of the wolves on Isle Royale - they didn't know that the winters would become so warm that wolves migrating on and off (in order to provide genetic diversity) would cease to be. I think that the plan will need to be aggressive at first, with the understanding that it will be it's own roller coaster (booms and busts) but NPS is going to be there to prevent a collapse of the Island's entire ecosystem.

Topic Question 4:

Again - it will have to be adaptive. You cannot predict how severe the changes will be, when they will happen, and certainly not how the organisms will respond on their own.

Topic Question 5:

I like the idea of managing both moose and wolves - reintroducing wolves from other areas as a founder-event - as well as managing vegetation. I don't like just watching it all happen and doing nothing.

Topic Question 6:

If the wolves go, and the moose take over, and all the other organisms that exist on that Island respond - - what would that look like? And is NPS going to be okay with whatever that looks like, and try to draw people to that Park?

Correspondence: Topic Question 6:

The wolves of Isle Royale are nearly extinct, with only three remaining. A predator-prey dynamic that was in check for decades is now out of balance, with an increasing moose population and irreparable harm to the forest. The National Park Service is taking public comments on alternatives to address this problem and is considering a cull to kill moose.

My family and I are asking the NPS to adopt Alternative C and maintain both moose and wolves, with these conditions:

Wolves are reintroduced/augmented more than once, if necessary.
Moose populations are managed by contraception and/or sterilization and not by lethal culls.
The NPS must expedite its final decision by the end of 2016.

Comments: The HSUS has proposed an elegant solution to this problem. In northern Michigan, where trophy hunting and trapping are now banned by voter referendum and also by federal protections granted to the wolves under the Endangered Species Act, we recommend that federal and state authorities consider the idea of translocating problem wolves or packs - targeted for destruction - to Isle Royale. That would address the concerns of Upper Peninsula residents worried about misbehaving wolves, and also help Isle Royale and northern Michigan by keeping the Isle Royale ecosystem intact and pleasing tourists who head to the park largely to step on terrain inhabited by wolves and moose.

The National Park Service is taking comments on the issue until August 29th, and we are recommending wolf transfer as a favored option for the park service. My family and I want to help the entire ecosystem of Isle Royale and, at the same time, find better outcomes for wolves who have found their way into conflicts in mainland Michigan that would never turn out well for them.

Correspondence: I think there should be other ways to manage wildlife besides killing. The animals have lost habitat due to human sprawl and destruction of habitat...land and trees gone from what used to be their home. We humans just keep on procreating with no thought to the lives that the ever increasing population explosion is having on the planet. In order to sustain all wildlife without killing and eventual extinction, it would be nice if people would allow some thought to how we can all give back or leave wild the spaces that these animals inhabit. To me it's just the same as the land taken from the American Indians. And yes, they were slaughtered too. Have we learned nothing?

Correspondence: Topic Question 2:

Human actions have already caused climate and environmental change so a minimal amount of additional human interference is acceptable. I do not favor any killing of the moose, let's see what the introduction of wolves will do. I believe there is value in continuing the long standing scientific study of the moose and wolves in this environment.

Topic Question 3:

Alternative B is my first choice, perhaps multiple wolves or reintroductions will be necessary.. The Park allows visitors and seaplanes and motorized boats, cabins, etc so bringing in a few wolves once, or several times seems ok to me. Shooting moose from the air seems barbaric and out of character for a wilderness. If moose die from starvation or predation their bodies should be left on the ground, even if visitor experience is changed.

Topic Question 4:

There will not be as many ice bridges to the mainland in the future so introduction of wolves is a necessity to prevent moose decimation of the vegetation. If the vegetation changes due to climate change then that is acceptable.

Topic Question 6:

Well done background information and alternatives.

Adopt alternative C to maintain both wolves and moose, and abide by these principles:

Wolves are reintroduced/augmented more than once, if necessary.

Moose populations are managed by contraception and/or sterilization and not by lethal culls.

The NPS must expedite its final decision by the end of 2016.

Topic Question 2:

I want the moose and wolf populations to be as fully functioning and healthy as possible, left to survive with as little human intervention as possible, (save for the ideas above). Vegetation can be managed through proper mgmt of moose and wolves per above.

Topic Question 3:

IMO, as little intervention as possible while still ensuring healthy and viable populations per above. I do not agree with culling moose and believe they can be managed with a healthy population of wolves.

Topic Question 4:

I don't know enough of the specifics of the biodiversity there to comment. However, I assume NPS would be dedicated to staying on top of most recent and best knowledge and be able to respond - in a non-lethal way - accordingly. In this case, bring over wolves from more troubled populations to bring in genetic diversity to the wolf population and help that population recover.

Topic Question 5:

I disagree with culling moose, completely. There is no reason in my understanding to kill moose if you allow for wolves.

Topic Question 6:

I implore you to make decisions based on humane alternatives to managing wildlife. The public is no longer interested in having NPS aggressively killing animals without pursuing more humane methods. Please work with experts such as John Vucetich and Rolf Peterson, the HSUS and others.

Correspondence: Topic Question 1:

Reintroduce wolves to check the moose population. The HSUS has many resources to do this effectively. Killing is not the answer and people need to be more responsible and think on a different level than always going the killing route.

Topic Question 6:

Sterilization and contraception should be used to keep the moose population in check and not culling. That is the easy way out and uses too many resources that could be used for better alternatives like wolf population maintenance and contraception.

Correspondence: Topic Question 1:
I would suggest #B. There are so many unwanted wolves in this country. I would suggest capturing whole packs and insert them into the Isle Royale National Park. I would not do anything to the number of moose. The wolves will bring them into balance with the land. I would suggest Wisconsin or Idaho. I have no doubt they would be glad to give them up.

Topic Question 2:

Since so much of Isle Royale is wilderness, I don't believe much management is necessary except to ensure most wolves are not leaving the park. The wolves will do all the work that is necessary.

Topic Question 3:

Low intensity. Perhaps monitor the number of wolves and moose every year but I do believe that if man attempts to manage the park, man will screw it up as he has in the past. I would be inclined to follow Aldo Leopold and let the land manage itself.

Topic Question 4:

The land and animals have experienced climate changes many times over the past years. This will happen again, probably sooner, again thanks to man.

Topic Question 5:

I don't think nothing should be done. The moose population will become unmanageable unless a predator is inserted. Eventually there will be no food for the moose and then what? I am not sure just one insertion of wolves will be enough. Perhaps it should be open to a second or even a third.

Topic Question 6:

I am not a scientist. I think wolves have a place in the country despite what various states and peoples scream loudly. i also totally disagree with the USFWS who seems determined to get rid of them in the most secretive way possible. I think chasing any animal with a helicopter and then killing them when they are to tired to run anymore is nothing more than cowardice. Also, traps are cowardly.

Comments: Again, I think wolves are most remarkable. They are aggressive with other animals yet caring with their mates, pack and pups. They mate for life. The have feelings and mourn their dead. Sounds almost human, almost because many of us do not mate for life.

I think one of the saddest things I have ever read is:

Aldo Leopold in "Thinking like a mountain" from "The Sand County Almanac":

"We reached the old wolf in time to watch a fierce green fire dying in her eyes." If I understood correctly he never killed another wolf.

It is way past time for us to honor the wisdom of those who came before us. There are times man must make way for animals before all of us are extinct!

Correspondence: Topic Question 1:

Please import wolves from packs that would otherwise be killed.

Topic Question 2:

A genetically diverse wolf pack.

Topic Question 3:

Other than the importation of wolves, management should be low intensive.

Topic Question 4:

One of the reasons the importation of wolves is required is because the increasingly warm winters have effectively cut off the access routes to the island by other wolves. For this reason wolves need to be brought to the island to ensure the pack has genetic diversity and remains healthy.

Topic Question 6:

A healthy wolf pack is important for the island's ecosystem.

Correspondence: Topic Question 1:

Please bring more wolves to Isle Royale to establish one or two packs to keep the natural ecosystem in balance with the moose.

Topic Question 2:

The future management of wolves and moose should be left alone to so they can maintain a natural balance of nature. That is why wolves need to be reintroduced to the island so that they can reestablish healthy packs. There should be no hunting of the moose by people on this island. If need be, use birth control on the moose until the wolves can get re-established.

Topic Question 3:

You will have to make sure that the moose do not overgraze their habitat with the use of birth control as a last resort. No hunting.

Topic Question 4:

With climate change, there is no possibility of wolves making it to the island on their own. You will have to bring new wolves to the island. Possibly there is a pack that could be taken to the island as a whole.

Topic Question 5:

Do not start hunting of moose on this island.

Correspondence: Topic Question 6:

The wolves of Isle Royale are nearly extinct, with only three remaining. A predator-prey dynamic that was in check for decades is now out of balance, with an increasing moose population and irreparable harm to the forest. The National Park Service is taking public comment on alternatives to address this problem and is considering a cull to kill moose.

Please ask the NPS to adopt Alternative C and maintain both moose and wolves, with these conditions:

Wolves are reintroduced/augmented more than once, if necessary.

Moose populations are managed by contraception and/or sterilization and not by lethal culls.

The NPS must expedite its final decision by the end of 2016

Correspondence: Topic Question 1:

Wolves are reintroduced more than once if necessary. There should be sufficient flexibility to allow for wolf reintroduction as necessary over the next 20 years to insure genetic diversity for wolves and sustainable populations of both wolves and moose into the foreseeable future. Maintenance or culling of moose is not necessary if wolves are allowed to fulfill their ecological role.

Topic Question 2:

The NPS should consider and evaluate the ecological benefits wolves provide. The NPS must protect the unique wilderness qualities of Isle Royale by considering the data collected through 57 years of research. Monitoring of habitat and wildlife is necessary to maintain important wilderness values. The presence of a top carnivore is vital to the ecosystem.

The best available science must be used.

Topic Question 3:

The culling of moose and the use of motorized equipment is unacceptable.

Topic Question 4:

It is unlikely that wolves would be able to repopulate Isle Royale without NPS intervention. Because of climate change, the possibility of an ice bridge forming where more wolves from other areas might come, is almost non-existent. Therefore, it is necessary for the NPS to reintroduce new wolves to improve genetic diversity. Again, the best available science must be used.

Topic Question 5:

The inflexibility of Concept B & D. Only allowing wolves to be reestablished once may not be sufficient and is very short sighted.

Topic Question 6:

My opinion is to adopt Alternative C and maintain both wolves and moose, with these conditions.

Wolves are reintroduced more than once if necessary.

Moose populations are managed by contraception and/or sterilization and not by lethal culls.

The NPS must expedite its final decision by the end of 2016.

Comments: For years researchers have alerted the NPS about the plight of wolves on Isle Royale, however, the NPS has chosen to take no action until now. I am aware that the public scoping period ends 8/29/15, yet the Record of Decision is not expected until Fall of 2017 at the earliest. What would be the reason or excuse for the NPS to take so long? I find this unacceptable and I think every effort must be made by th NPD to expedite the decision.

I feel that the long term recovery and preservation of wolves should be based on the best available science and the principles of democracy. Isle Royale should always support a healthy population of wolves. Public opinion has changed in favor of wolves and other predators. People who truly enjoy the wilderness want to coexist with wolves on the landscape. We want our voices

heard on these issues and our votes to count. We do not want legislators or the NRC making these decisions. Politics should not trump science.

Correspondence: Topic Question 1:
I think we have pushed the edge of the envelope since we first took endangered species status away from the wolf. I do not understand the casual approach to allowing so much killing of wolves when the animal is crucial to the balance of predator and prey. We need the wolf in abundance, along with the cougar and coyotes and foxes to keep our wilderness in balance.

Topic Question 2:
Making sure that the wolf population there is increased from its current size. Federal and state authorities should consider the idea of translocating problem wolves or packs - targeted for destruction - to Isle Royale. That would address the concerns of Upper Peninsula residents worried about misbehaving wolves, and also help Isle Royale and northern Michigan by keeping the Isle Royale ecosystem intact and pleasing tourists who head to the park largely to visit terrain inhabited by wolves and moose.

Topic Question 3:
I would define wilderness as inclusive of a healthy population of predator and prey respectively but few humans.

Topic Question 4:
Climate change is hard to grasp. We can be absolutely sure of little. I do not see concern about that as appropriate in determining the management of the wildlife of Isle Royale.

Topic Question 5:
Any time a wolf can be saved from unnecessary slaughter I am pleased.

Topic Question 6:
I trust HSUS - its philosophy and its body of knowledge. It balances scientific awareness along with humane concepts. That is not always true of FWS or NPS.

Correspondence: Topic Question 1:

Make private boats that are not transported by the park service, i.e. on the Ranger III, illegal within 5 miles of the island.
A private boat brought the disease that crippled the wolf population, so nip the problem in the bud.
Besides, Isle Royale should be a nature experience.
There are unfortunate few place left where one can leave civilization behind. Please protect this one.

Topic Question 2:

Consider that the International Biosphere project promised to study what happened to the island if we remained hands off.
Consider, we do not know what will happen if we remain hands-off, if we choose to get hands-on.
Consider, we do not know what we do not know... That's the point of an experiment.
See it through to the BITTER end.
Something extraordinary might just happen.

Topic Question 3:

The NPS should increase it's protection of the of island. The NPS should evaluate which of the currently allowed activities have the worst impact on the islands resources and the islands ability to exist as it would if people were not there.
The NPS should limit or remove the worst of those activities.

Topic Question 4:

Close the Rock Harbor Lodge. People that want see "nature" from a hotel room window have many other choices.

Topic Question 5:

It pains my heart to think that Isle Royale, the most special National Park in the USA, would abandon it's vow to remain hands off in the relationship between it's two largest species.
I, personally, am terribly curious to find out if..
..the wolves find a way to survive?
..the wolves die away and another pack establishes rule over island?
..the age of the wolf passes and the Lynx returns?
...So many possibilities...
Or we could just take matters into our own hands and dictate to mother nature how she should act.... oh wait, that never seems to work out well.

Topic Question 6:

Isle Royale is special for many reasons but the fact that is the longest running study in the world between moose and wolves is extraordinary. The plan, in the beginning of the study, was to remain hands-off. The Study is now coming to some extreme findings. Why, then, are we now considering abandoning the plan?
I like and respect Rolf and Candy Peterson, but I think (at least) their emotions are dictating their opinion of "saving" the (non-native) wolf population - and possibly (at worst) the fact that the majority of their fame and income come from the wolves of Isle Royale is causing them to lean heavily on the park service trying to sway it to break it's vow and step in and augment the wolf population.
This would most certainly be a HANDS-ON approach.

Correspondence: Topic Question 1:

Transfer of wolves to populate Isle Royale is recommended. It will help the wolves, as well as the moose. In 1960, when I was 13, my parents took me to Isle Royale on a ferry called the Ranger III. I have never forgotten the magic of this island. I feel so blessed to have been there; it holds a special place in my heart. I have a tremendous interest and care for wolves, all wildlife, and want to know Isle Royale is balanced and healthy again. My dad instilled that great interest in my heart, as he cared greatly too. He was Forest Supervisor for the Ottawa and the Superior Nat'l Forests (John O. Wernham). Praying for Isle Royale to be restored to good health of wildlife.

Topic Question 2:

Obviously, disease protection is upper-most. Beyond that, an abundant, sustained food source for all wildlife.

Topic Question 3:

Wilderness needs to be so highly protected. The BWCA and Sylvania certainly can be a study for guidelines for management. In addition, the fact that parvovirus was introduced via a pet dog accompanying a visitor and then led to infection of wolves (horrific!) should be enough reason to bar any domestic pets from the island.

Topic Question 4:

Changing climate and its resulting effects will require involvement of specialists from many fields of knowledge to be properly prepared. Isle Royale is so unique in its physical location that a comparison will be hard to find. It will take great minds to solve these concerns. I wish I possessed a strong knowledge to beneficial.

Topic Question 5:

I need to do further review.

Comments: Keep focus and stay in a steady course to fix this. Don't ever give up, ever!

Correspondence: Topic Question 1:

Relocating problem wolves from the mainland to the Isle to increase and diversify the population

Topic Question 2:

The fact that nature's "balance" is always in flux and the fact that all things are connected. Allowing the top predator to thrive keeps the whole ecosystem healthy. Allowing it to die off would be detrimental environmentally, economically and ethically.

Topic Question 3:

Limit human encroachment to keep the island the unique area it is for wolf and other wildlife research.

Correspondence: Considering the facts of climate change, mankind is already affecting even our wildest places. The option of maintaining true wilderness areas that are untouched by man is already off the table. I believe it incumbent upon us to actively (but gently) manage wildlife populations to the extent that those populations are able to remain more or less in balance with their environment (natural swings in populations allowed of course) and are healthy, and genetically diverse - at least until such time that climate change alters the habitat to the extent that this no longer practicable. In my opinion, the first step is to bring new wolves to Isle Royale. Both moose and wolf populations should continue to be monitored and action taken as-needed to achieve the goal stated above.

Correspondence: Topic Question 1:

The listed alternatives seem fairly complete, except the impact of visitors/human activity wasn't addressed. When we visited Isle Royale in the summer of 2013, it seemed to me that there were a significant number of humans there at the same time. Also, the issue of climate change is very hard to predict, and obviously is a long-term effect, as trees take quite some time to grow and forests don't change overnight.

Topic Question 2:

Cost is one that comes to mind. Using helicopters sounds very expensive. If wolves are reintroduced, there may be problems with their accepting one another and forming packs unless the reintroduction is done very carefully. The 3 existing wolves on the island seem to have some genetic problems that would be passed on to any offspring, if they were accepting of the new wolves. As far as moose removal, would the culling be done at such a time and in such a manner that calves would not be deprived of their mothers while still nursing/dependent? Would a single wolf reintroduction be sufficient to reestablish the predator/prey relationship, or would that be monitored carefully and adjusted as necessary?

Has something been considered that would allow planting of new vegetation to replace that decimated by moose?

Topic Question 3:

Since I am unfamiliar with the laws governing designated wilderness, I'm not sure what management techniques are in keeping with the scope of those laws. Isle Royale, I understand, is the least visited national park, but that doesn't mean the human impact isn't there. In what ways is that being taken into consideration in the planning of any intervention?

Topic Question 4:

I believe climate change has always been happening, but is being rapidly accelerated by human activity. Since Isle Royale is sort of between climate zones, it may be uniquely vulnerable to these changes, and predicting how severe these changes will be could prove to be very difficult. It would seem to me that any plan should be very flexible in scope, so as to change quickly if need be in the face of a rapidly changing environment and climate. I realize that is a difficult thing to accomplish, however!

Topic Question 5:

I like the idea that a number of alternatives are being considered. I don't like the idea of large numbers of moose being killed, but I realize that helicopter removal would be a very expensive alternative. I don't like the idea of the remaining wolves being allowed just die off, but I do understand that their genetic defects and their established place on the island may make introduction of "strangers" into their realm unlikely to have the desired effect.

Topic Question 6:

Bravo to the NPS for working on this thorny problem and allowing for public comment! I sincerely hope that a good solution can be found, and trust that the good minds working on this will settle on the best possible way to manage this problem. Thank you for your concern!

Correspondence: Topic Question 1:

Adding to the genetic diversity of wolves on Isle Royale by bringing problem wolves from other states.

Topic Question 2:

the fact that the mosse population will soar without predators bringing other problems.

Topic Question 3:

area should be kept as wilderness with ongoing studies of predator/prey ratios.

Topic Question 4:

as the ice bridges are now gone the genetic diversity of the wolves has plummeted. For this reason new genetic material has to be introduced by bringing in wolves from elsewhere

Topic Question 5:

I dislike the idea that wolves will disappear from Isle Royale without a viable program being introduced

Comments: I have been introduced to this problem by reading the HSUS blog site. I am convinced that Isle Royale is a perfect place for a healthy wolf predator population as there are no livestock concerns. The moose population is getting out of control with no predators. I think that the proposed solution put forward by Wayne Pacelle to trap and bring in problem wolves from livestock areas to Isle Royale is a perfect solution to bolstering the gene bank of wolves in Isle Royale and keeping the wolf population healthy.

Correspondence: Topic Question 1:

In Jared Diamonds Book "collapse" he reviews the historic evidence of societies that collapse as a result of environmental change, and human activities. Is there a parallel expert for this sort of potential 'collapse' event that Isle Royale may be facing if no wolves return (introduced or migrating) and moose over graze? I imagine such expertise is a relatively small community. Can they reach consensus?

Topic Question 2:

The main objective should be to preserve the islands ecosystem for the sake of the animals and vegetation on the island. Secondary is the historic and recreational significance.

Topic Question 3:

I don't know the laws here, so I don't know how hamstrung NPS is with a designated wilderness. Where possible every bit of rigor required to achieve the preservation of the island ecosystem for the sake of the animals and vegetation on the island should be employed.

Topic Question 4:

It could be a losing battle. For the moment the reduced frequency to ice bridges appears to have resulted in wolf population issues. Climate change 2.0 could bring changes that the NPS will have limited or nil chance to impact. While we working under climate change 1.0 all reasonable intensity/expense should be employed.

Topic Question 5:

I like the idea of introducing wolves, and actively managing the wolf/moose balance by continuing to feed genetic diversity as needed. A governing body who defines 'as needed' should be identified and empowered.

I am not fond of the 'let nature take it's course' approach as I believe that will result in a collapse on Isle Royale.

Topic Question 6:

Thank you for allowing comments and for your commitment to this amazing place. I believe most people understand that this is a difficult subject, but an important one.

Correspondence: Topic Question 1:

I don't have any suggestions pertaining to other alternative elements or management tools, other than to comment to stick to using as natural of processes as possible; the less motorization and less human presence on the island involved, the better.

Topic Question 3:

Low intensity and low management; I can understand and appreciate the need for protection of an area, but no one corner of the planet is exactly the same as it was thousands of years ago, with or without human influence - the one constant is change, in nature as in life. Wilderness carries out its own changes, independent of humanity, however, it has become harder for wilderness to do so with human-influenced climate change. This is a part of our world that we can work to augment, but ultimately will become a part of everyday life for people and nature alike. Wilderness will deal with the external factors as best as it will in any other similar place on the globe. The little that we can manage or augment should be done in a way considerate to nature's operation and with as little human influence as possible. Where there is human influence, it should mimic nature's approach as closely as possible (I would as I am most a fan of Alternative Concept B, as the moose population cycles seem to be self-containing and manage themselves with time - I am NOT a fan of the human intervention on the island that relocating or culling the moose would entail).

Topic Question 4:

Again, as low intensity and low management as possible, but do so where necessary. Preserving the threatened species of the island may mean preserving them in a climate-controlled green house on the island or off shore until conditions are conducive to their survival on the island once more. This is a tough one - I am conflicted because I feel human intervention is necessary due to the fact that we are, in a large part, to blame for the current changing climate, but iceage-hot cycles are not unknown to Earth and many plant species have survived through retreating habitat and then growing back. Is the rate of change currently too great for current vegetation to handle? I don't know.

Topic Question 5:

I dislike the human impact that relocating and culling the moose would have on the island, or any of the options that involved intensively managing the moose population. I am concerned with the extent of the use of motorized or mechanized equipment that this would entail.

I like mimicking natural events, such as proposed in Alternative Concept B with a wolf migration event.

I see the benefit of the potential for direct vegetation restoration through seed gathering and planting on offshore islands, but am again not a fan of the extent of human intervention. I propose a combination of the efforts put forth in Alternative Concept B with reestablishing wolves, monitoring the vegetation health, and proceeding to vegetation restoration proposed in Alternative Concept F if the wolf population is not able to control the moose population to the extent required to protect the vegetation or climate change is deemed to have impacted the vegetation to an extent where intervention is needed.

Comments: Thank you for taking the time to survey and seek input before deciding on an action forward. I trust that a lot of good information and conversations will result and ensure the best possible path forward in this situation. I look forward to continuing to follow Isle Royale on its adventures into the future.

Correspondence Type: Web Form

Correspondence: Topic Question 1:

I am in favor of Alternative C whereby individual wolves or wolf packs from the mainland are relocated to Isle Royale. This will serve to augment genetic diversity of remaining wolves, boost the wolf population who will in turn stabilize the moose population naturally. This is the balance of nature so desperately missing from the current equation.

Topic Question 2:

The moose population, if left unchecked will destroy vegetation needed for sustainability, therefore, the introduction of wolves will not only stabilize the population, but will help redirect well worn paths that contribute to erosion and habitat degradation. A cull of the moose population by human means is unnecessary if the wolf population is allowed to increase.

Topic Question 3:

The type and intensity of management ought to be minimal. Relocating wolves from the mainland will be the largest expense, and for those already on Isle Royale conducting wolf and moose research, this work will be a continuation of that, not an additional role. Economically, this national park adds vital tourism dollars to Michigan, yet if wolves and moose are in peril, or wolves disappear from this landscape, those dollars will be lost.

Topic Question 4:

Given the disappearance of ice bridges from the mainland, the opportunity for genetic diversity in the wolf population on Isle Royale is dwindling. NPS should consider the relocation of wolves to be a priority given they can no longer cross the water on their own.

Topic Question 5:

A moose cull is a last resort given the opportunity to readily restore the balance of nature without lethal intervention. This alternative is unpalatable and not needed.

Allowing the introduction of wolves in peril on the mainland to Isle Royale is a hallmark of good stewardship. This alternative also has the possibility to be a precedent setting way to mitigate wolf-human conflict in a humane and beneficial way.

Correspondence Type: Web Form

Correspondence: Topic Question 1:

The lack of gene flow to the wolf population should be addressed by introducing healthy genetic diverse wolves to the current population to "water down" any recessive traits that may affect the fitness of the wolves.

Topic Question 2:

Preservation of the diversity of this unique ecosystem should be the top priority. Any one of those elements out of balance would have drastic long term effects on Isle Royale.

Topic Question 3:

Even though 99% of the island is designated wilderness, it is a small area and under intense selective pressure due to the isolation of the wolves (the lack of gene flow) which in turn allows the moose population to become overgrown which then overgrazes certain vegetation. The moose population being too large could negatively affect the plant diversity and the health of the moose themselves as competition for resources will become intense.

Topic Question 4:

Climate change can not be managed by the NPS but by tracking the effect climate change has on the diversity of the island it should be able to plan for managing the natural resources. It may be necessary to bring in new wolves and thin the moose population (possibly transport them off the island? would not like to see a controlled hunt though).

Topic Question 5:

I like the idea of preserving the wolf population on the island but I also appreciate the idea of letting nature take its course. Though I really think that man's interference with the environment is why the island is in this situation as the forming of ice bridges allowed wolves to come to the island (and to leave) and possibly for moose to migrate away as well. Nature seemed to be able to keep things balanced before climate change.

Topic Question 6:

I visited Isle Royale a year ago and was absolutely enchanted by it. The raw beauty of the place is amazing and the diversity of plants alone makes it worth the trip. I am hoping to return soon and bring my children and would hate for it to have lost any of the wonderful creatures or plants.

Correspondence: Topic Question 1:

I think it is important to reestablish the wolf population on the island. The island has been home to them for so long and there are so few such places left for them. Their numbers continue to grow in the West, and they are being killed, can't some be removed and relocated on the island. I think they should be reintroduced and the moose population should continue to be monitored.

Topic Question 2:

Maintaining the island as a wilderness is important, but I believe a healthy wolf population is key to that.

Topic Question 3:

Introduce the wolves, but leave the moose population alone.

Topic Question 4:

I don't think we have any control over that or shouldn't have any.

Topic Question 5:

I do not want to see moose destroyed, but I do think it is critical that wolves be brought back. I hope to see concept B put in place.

Topic Question 6:

I have never been to the island, but I have followed the moose/wolf study for years and have felt like a part of this beautiful place. I hope someday to visit and I hope there will be a wolf and moose population for my children as well. Please do the right thing to make sure this places remains wild.

Correspondence Type: Web Form

Correspondence: Topic Question 1:

Since you cannot remove all the moose for the island. And letting them browse the island to nubbins and then all starve seems imprudent. Hunting is an unlikely option. Perhaps a natural predator might work? In North America that limits the options to wolves, bears, cougars . . . Wolves self-selected and came to island on their own. They are only now under extreme distress due, in part, to human actions (e.g., climate change and reduced ice bridges, death of 3 wolves in an abandoned mine pit).

Wolves still seem to be the most logical and likely choice.

Topic Question 2:

- 1) The long-term health of the island's eco-system.
- 2) Diversity.
- 3) Science.
- 4) The above points, when working properly, makes the island a much more inviting place for tourists, campers, hikers, kayakers, etc.

I'd suggest that trying to avoid a sterile, low diversity, island ought to be a goal.

Topic Question 3:

Management? Having visited 10 or 12 National Parks, one of the best aspects is the limited impact of humans. Humans are an obvious, selfish, and invasive species. And our impact is indirect and long lasting (the ice bridge, abandoned mine thing again). The NPS obviously cannot solve climate change; but can within reason act to alleviate or lessen some of our impacts. When that is possible, inaction is weak; especially when there is a fairly good body of evidence that inaction will lead to further problems. In this instance over browsing and a die-off of moose.

Topic Question 4:

Humans have screwed up the climate. And will continue to exacerbate the problem. Therefore, targeted actions to soften or counter the impact of climate change should be considered and, when appropriate, acted upon.

Topic Question 5:

Dislike: These are not truly "preliminary." The Park Service has been muddling along on this topic for several years and looks decidedly indecisive. This looks like a normal political dodge, going through the process repeatedly with no real intention to act.

Topic Question 6:

Introduce some new wolves and be done with it. The knowledge gained from a genetic rescue can inform science and the NPS in other decision making situations.

Correspondence: Topic Question 1:

New wolves should be introduced to the Island if (and only if) it looks as though the current wolf population will die out. As seen in the 90's, when the wolves are down, the moose practically destroy the island, and since removing all the moose isn't an option, helping keep their predator populations healthy is the next best thing.

Topic Question 2:

This is a unique situation for a unique place! Obviously it's ideal that the NPS steps back and lets mother nature do her thing, but when that threatens the park as a whole, it's important that you look at the research that has been happening for decades and do what's possible to save the island.

Topic Question 3:

Nothing too intense. I see the lack of wolves as being similar to a wildfire. Without wolves, the moose go wild and destroy all the vegetation and then ultimately starve to death. With a wildfire, the vegetation is gone and the animals die. Even in an extreme wilderness situation, I think the NPS' job is to go manage the wildfire.

Topic Question 4:

I think the NPS needs to work closely with the local science community, who are monitoring the changes in climate and the affects on the world around them, to determine what can be done.

Topic Question 5:

Alternative Option A - I think would end up in the Island being destroyed.

Alternative Option B - I like B because it leaves the wolves to manage the moose, which is always better than humans managing the moose.

Alternative Option C - I like this but I worry too much human interference could have other, unforeseen affects on the Island.

Alternative Option D - I think this is a good backup plan if B doesn't seem to be working - obviously something made those wolves not stick around last Winter, maybe the Island isn't good habitat for wolves anymore?

Alternative Option E and F - I think then, you're losing part of what makes Isle Royale special. The moose and the wolves are a huge draw for tourists. If you take over as the moose's main predator, it's a bit disappointing. I also feel it's cheaper if you let the wolves take over the management duties, and saves the NPS money. Plus, Isle Royale is a tough slog to get around sometimes, make a wolf do it!

Topic Question 6:

I think it's interesting that the wolves seem to be leaving the Island (or not sticking around, as in last winter). It might be worth a consultation with someone who really knows habitat to create something so that the wolves stick around. But keep the wolves! They're honorary NPS employees, with no pay needed,

who do the dirty work of keeping the moose populations in check. Plus, they're vilified all over the country, this is their one safe space where they can have a healthy population and not be a threat to local farmers or hunters.

Correspondence Type: Web Form

Correspondence: Topic Question 1:
Non interference by man.
Only option A accepts such a concept.

I do not support any of the other options since all involve human manipulation of wildlife populations.

Topic Question 2:

Keep "management" out of it. Biologists have a vested interest in having a management plan that involves their activity and manipulation. Isle Royale was not established as a job source for people who want to manipulate the animals and vegetation into a model of something they think it "should be". If wolves can not maintain a viable population without the assistance of human intervention, then that is how it should be. If they are able to increase their numbers, then that is great too. Sure, it is great to visit the island and see moose, and hope to see wolves. But it wasn't for wolves and moose that Isle Royale was set aside.

Topic Question 3:

Let the wilderness continue to be wilderness. Allow for visitation as it currently exists. Maintain facilities, trails etc. but otherwise leave it alone. Any meddling with the resources is artificial and hence not in keeping with wilderness.

Topic Question 4:

The only changes the NPS should consider would be changes in practices that effect climate change. Ie. increased fuel efficiency of operations. Let nature take it's course. If climate change allows for a longer visitor season, then adjustments could be made. If climate change creates more ice bridge winters, then perhaps more wolves will explore the island. NPS should continue to measure and record weather data to document climate change.

Topic Question 5:

Except for option A, all call for the intrusion of human manipulation into the ecology of Isle Royale. I prefer option A. Hands off. No artificial introduction of wolves, no artificial removal of moose. No prescribed burning of forests. No suppression of natural fires (except to protect structures and human life). No artificial planting of "desirable" plant species except where rehabilitating behind human disturbance.

Topic Question 6:

Isle Royale was not set aside as a national park to provide biologists a place to play god and decide how the landscape "should" look. It was not established to be a laboratory to play with population dynamics through introduction of this species or that to get the balance that meets someones conception of what is ideal. Let nature decide. if more wolves want to visit and establish themselves on the island, fine. If they die out completely, also fine. They weren't there when the park was established, nor were bears, coyotes, etc. I don't hear anyone suggesting introduction of any other predators to help manage the moose population.

If as a result of leaving the park alone, the biology of the island group changes, well then so be it. Let the biologist document the change without interfering.

I was very disappointed during a recent visit to the park when I learned that all of the antlers "collected" by the wolf ecology project were to be removed from the island and sent to some mainland warehouse for storage and "study". What an ignorant concept. If you need to take measurements, do so in the field, and then leave them in place to return their nutrients to the ecosystem. Now they are just displayed and removed from the island as trophies by the wolf project.

Comments: The national park service isn't charged with maintaining Isle Royale as a snapshot of 1970. It is charged with providing for the enjoyment of the park while maintaining the natural characteristics of the park which make it an enjoyable place to visit.

Wolves were not present when the park was established. They had probably visited before, and certainly established themselves subsequently. To argue that wolves must be ever present, even if by manipulation and artificial reintroduction, misses the whole point of a National Park. It then becomes a National Zoo. Where man decides which species belong in a given place because it makes us feel all warm and fuzzy.

Let nature make it's own way. If the wolves die out, the islands will adapt. Perhaps not in the way that is most aesthetically pleasing to certain people (unemployed wolf biologists among them). It will be what nature, and evolution intends. Artificial reintroduction wolves is not a natural process. It is human interference in the natural evolution of the islands to achieve or maintain a certain goal desired by certain people.

If moose populations skyrocket and moose start to die of starvation and old age instead of being eaten by wolves, well that is nature too. Nature isn't always pretty.

Please let the natural processes continue without human manipulation. There are too few places left (including most national parks) where that is the case. Have the courage to just say "No".

Correspondence: Topic Question 1:

As a visitor to the island on multiple occasions, both to backpack and kayak, I think that the wolf population should be augmented, and if necessary, make this an ongoing effort to reestablish the wolf population. (i.e. not just a one time event). I think it is quite possible that the wolves may leave over the winter on an ice bridge and if that happens, more wolves should be brought in until a steady well genetically diversified population resides on the island.

Topic Question 2:

What's best for the balance of prey and predator on the island should be the main consideration. The moose are too numerous, and will strip the island of vegetation, and die from starvation if they are not reduced in number. The natural way to do this is through predator introduction. The isolation of the island makes this a special situation, since normal migratory patterns don't happen on the island due to the water. Culling the moose by helicopter, or through hunting is ridiculous. I don't want to go to Isle Royale, and find shells, or see helicopters shooting moose from above. Introduction of wolves is a win-win policy. The moose will naturally be better managed, the wolf population will get the genetic diversity it desperately needs, and the island will get great publicity from visitors who will hear the wolf calls each night.

Topic Question 3:

Wolf introduction and low intensity management I think will work best. This is a slow process, that will naturally balance itself once the wolf population is established again with healthy stock.

Topic Question 4:

Don't know how to answer this.

Topic Question 5:

I don't think the reasons for not introducing wolves to the island can be that "it's not natural, and we need to let nature take it's course" - and then, come in and shoot the moose to reduce the population. That certainly is not natural in any sense of the word. The buildings on the island, and the power plant and hotel, are not natural - so why can't we bring wolves to the island, where they've been for decades, to help reestablish the population and bring in new genetic diversity? All the visitors I've talked to, mention the moose and the wolves, and how great it would be to see or hear a wolf. Let's make that happen again.

Correspondence: Topic Question 1:

Relocation of wolves should be used to reestablish a viable set of packs. In the short term perhaps some hunting of moose could be used. However these moose have small racks and will not be the trophies that some are looking for

Topic Question 2:

We should strive to keep the ecosystem in dynamic balance. It will never be a constant equilibrium, but should be stable (in a mathematical sense).

Topic Question 3:

As little as possible. Transplant wolves, reduce the moose to preserve the browse and let nature take its course.

Topic Question 4:

This is a longer term issue. If the vegetation changes to not support moose than so be it.

Topic Question 5:

Concept D seems the best to me. Best way back to closest natural state.

Topic Question 6:

The park is a gem, largely unappreciated. It should remain rugged and remote. It is a shame that the wolves are going extinct. (Due to parvo?) Let's try to restore the past balance. If we simply left it alone in time a new balance would occur, though this might very well be a much less diverse ecosystem. I think that humans should step in and hopefully provide a needed course correction.

Correspondence: Topic Question 1:

Introduction of wolves and maintain their population through natural decline and, if necessary, more introductions of wolves.

Topic Question 2:

What kind of future wolf/moose/vegetation studies do we want to do in the future? How do we minimize drastic reductions of the vegetation?

Topic Question 3:

I wouldn't like to see hunting become a standard practice to managing the moose. I would like to see wolves brought back once and then add new blood (1-3? Wolves) when the gene pool is suffering as a method to maintain the wolf, and therefore moose, populations.

Topic Question 4:

Adding wolves to simulate ice bridge events as needed. I don't know, but it seems like the information from the wolf/moose study would provide tests that can be used to monitor the wolf genetics to assess when new blood is needed. Maybe it should be less scientific than that and just add wolves on certain criteria (e.g., population drops, every n years, etc). If wolves get to the island on their own consider it a bonus.

Topic Question 5:

I like the ideas of introducing wolves and simulating ice bridge migrations. I don't like the idea of human hunting of moose. I don't like the idea of letting moose ruin the vegetation.

Topic Question 6:

Though it isn't much, I have spent 5 weeks on the island camping from backpack and sea kayak. The first time I was there it seemed that the interior of the island (between Lake Richie and Chickenbone) was quite open and somewhat unnatural due to overbrowsing. I have never seen wolves, only their tracks. I have seen moose, but not "many". To me, the thing you see the most of, that makes it "Isle Royale" is the vegetation (and Rocks). Without the wolves, that aspect would decline.

Correspondence: Topic Question 1:

I believe the six alternatives are well laid out and self-explanatory. I do not have any additional suggestions.

Topic Question 2:

In managing moose, wolves and vegetation at Isle Royale, it is important to not set up a system that is cruel to any of the animals involved (reduced numbers due to starvation, for example) and will not do irreparable damage to the vegetation on the island.

Topic Question 3:

It is wilderness, but it is extremely isolated wilderness. In years past, the ice bridges formed much more often and animals could easily travel between the island and the mainland. Management was not needed because the animals could manage themselves. We humans have already unwittingly performed some intense management by not taking care of our environment, so things have changed. More management at this time to try to undo the damage already done by changes to our climate that are impacting the life on the island is not a bad thing.

Topic Question 4:

I believe that additional wolves should be reintroduced to see if the wildlife on the island can return to a level of self-control. The populations of both moose and wolf should be monitored closely to see how things are going. If it appears that the climate has changed to the point that either moose or wolves cannot live there without our help, then a decision could be made about whether, and how, management might need to be modified/increased.

Topic Question 5:

I think that Option A of no management, would be inhumane for both the remaining wolves and the moose and would lead to extreme damage to the vegetation on the island. The wolves have been interbreeding for some time and this is bad for their healthy future. The moose are increasing and eating more of the vegetation, but will get to a population level where they start to starve. The vegetation is suffering under increased moose populations and is also changing due to climate change. There needs to be some kind of management.

Topic Question 6:

Thank you for accepting public comment on this beautiful and unique part of our world. Please try to do what is best for all of the creatures and vegetation

involved.

Correspondence: Topic Question 1:
The Moose-Wolf has been studied for many years and the importance of the wolves to keep the moose in check has been shown over the years. I feel a decision should be made as soon as possible

Topic Question 2:
The environment of the Island will be effected if the wolves are not on the Island. We are part of the environment of the Island and we can see the importance of being involved. When the dog infected the wolves, when we have diesel generators or solar panels, we are making an effect on the island

Topic Question 3:
Man has been making an effect on the island since it has been a wilderness area. We build docks and structures. If we let the wolves die off and the moose over graze the trees- this will have a negative effect

Topic Question 4:
Let the wovles control the moose. They can do a better job than killing moose or bring in equipment to to drag or lift the dead moose out.

Topic Question 5:
The Park Service has been doing a great job on the Island but a decision should have made a few years ago when the wolves started to be a small group

Topic Question 6:
It is important to make a decision now and not wait two years to try and implement a solution

Comments: I have been bringing groups out to the Island since 1974. We have been teaching youth about the importance of the Moose and wolves interacting together. I feel one or two wolves should be brought in to increase the packs. A few years later the situation should be looked at to see if this should be done again. Waiting for two years, would mean a larger amount of wolves would need to be brought in to re-establish the wolves. Killing the moose or bringing equipment onto the island would be negative. I saw the issues and complaints when the city of Marquette had an issue with too many deer at the local park. They tried to relocate and finally brought in sharp-shooters to control the situation. The negative comments were bad for the city and the DNR

Correspondence: Topic Question 1:
Alternative Concept C

(maintain both species)
Maintain populations of moose and wolves on the island, which could include wolf reintroduction or augmentation

Topic Question 2:
Moose and wolf populations
Plants and woody vegetation, due to impacts from moose browsing

Topic Question 3:
I think there needs to be intensive management of the wolf and moose populations, and monitoring of the vegetation, because of the unique and fragile conditions found in an island wilderness setting. These unique circumstances, I believe, demand more active management than is typically considered in a designated wilderness.

Topic Question 4:
Monitor the vegetation and if necessary, foster growth of suitable browse for moose. Achieve a balance of moose and wolves and ensure the island's resources are sustainable for both species.

Topic Question 5:
I like the idea of a one time introduction, mimicking a migration event, followed by a hands off approach, but I don't believe it will stabilize the current situation. And for the sake of the island itself, including the vegetation and all the other species that live out there, we need to step in and help achieve a balance between moose and wolves. Wilderness "designation" or not, in this unique and fragile island setting, there needs to be active management on the part of the Park Service.

Topic Question 6:
I think the Park Service should consult with and give great credence to the opinions of wolf/moose researchers John Vucetich and Rolf Peterson of the School of Forest Resources and Environmental Science, Michigan Technological University, Houghton, Michigan.

Comments: I extend my thanks to the good people of the Park Service for all you do!

Correspondence: Topic Question 6:

Using the argument that the Park Service should have a hands off approach in the management of the wolf problem due to the park being a wilderness is sophistry. The mainland wolf population is affected by human forces and so is disproportionately below natural levels. If they were at natural levels, the percentage of mainland wolf visits to the island would be greater which would in turn increase the chances of genetic rescue. Humans are already negatively affecting the problem on Isle Royale and we should attempt to level the playing field.

Correspondence: Topic Question 1:

I believe the plan should be to reintroduce additional wolves to Isle Royale so that the natural balance of predator to herbivore to vegetation is in place. Why else would I want to travel to this beautiful park except to have the possibility of seeing moose, and if not an actual wolf, to see wolf tracks. That is nature's beauty at it's best.

Topic Question 2:

I believe the experts (especially Dr John Vucetich) advise should be followed. They have already studied what needs to be put in place for the balance needed. Having a moose hunt for man's ego is definitely not an option that I want to see put in place. I don't believe any type of hunt should be allowed on this island by humans - period! There are plenty of other designated hunting areas for humans.

Topic Question 3:

Isle Royale should continue to be as close to 100% wilderness as possible. No boat harbors, no tourist conveniences. Wilderness with very little human intervention.

Topic Question 4:

LOL - Washington DC and the international community need to step up and make corrections to avoid future climate demise. NPS should try to keep things balanced within it's means.

Topic Question 5:

As a taxpaying citizen - I do not want human intervention with a moose hunt to occur. Perhaps move some of the moose herd to the upper peninsula if absolutely necessary until the wolves can be integrated back into the food chain.

Topic Question 6:

I hope the public will continue to be made aware of the decisions made with our public land and it's resources without the manipulations of special interest groups.

Correspondence: Topic Question 2:

The moose wolf study has made Isle Royale famous and attracts visitors to the park. When I was at Ordean Junior High School in Duluth many years ago, a scientist from Michigan Tech gave a presentation on this study. It was one of the reasons I later choose to go to Michigan Tech. And after seeing that presentation, I always longed to go to Isle Royale, and was finally able to go for the day in 2009. It was a wonderful day. We loved the island. I hope that you would bring some wolves to the island so the study could be continued.

Topic Question 3:

I don't feel qualified to answer this question, but I think besides the addition of some wolves that the management should be minimal so that the predator/prey study can continue.

Topic Question 4:

I have read that ticks have become a larger problem for the moose because of warmer temperatures, and with vegetation changes I guess their population will be declining, so I think the addition of wolves should be gradual to ascertain the effect it has on the moose population.

Topic Question 5:

I think B or C are good alternatives. I think bringing in more wolves would be good for the island's vegetation, and select for a healthier moose herd. It would also help attract more tourists to the island who are interested in the predator/prey study and the vegetation.

Topic Question 6:

Identifying wild flowers is one of my hobbies. I was in 7th heaven that day on Isle Royale. I saw some flowers and plants that I had never seen in my travels around Michigan and Minnesota. I think it is important to preserve the vegetation on Isle Royale too. Introducing more wolves would be the most natural way to do this. The predator/prey study on Isle Royale is historic and although the addition of wolves would add a man-made blip in their data, it would be a way to continue this valuable study.

Correspondence: Topic Question 1:

Please use wisdom and foresight. Putting "problem" wolves on Isle Royale is THE perfect answer to the genetics of wolves and saving the wolves from some anti-wolf nut.

Topic Question 2:

It should be treated as a semi self contained environment. With help eradicating invasive s and reintroducing and helping native fauna and wildlife.

Topic Question 3:

Eradicate all invasive species and plant native nut, berry and nesting plants and trees. Leave the island as wild as possible, with help to mitigate the damage of humans.

Topic Question 4:

Plant all of the above.

Topic Question 5:

I don't like the insane and arbitrary anti-wolf positions that seem to dominate the conversation.

Topic Question 6:

On a different and yet similar topic, Land Between the Lakes in KY/TN should be managed in a similar fashion as Isle Royale. It is large enough to be almost self contained. It should be fenced at the land side of the peninsula an wolves, elk and porcupines should be reintroduced. Let the bison roam free over the whole peninsula. Campgrounds could be fenced. There should be no more building or development. Let it serve as almost a terrarium. Thank You.

Comments: Save more land. Eradicate invasive species. Stop nurseries and retail stores (and catalogs) from SELLING invasive species. Let more areas be allowed to grow old and serve as refuge for the animals. No hunting or foraging areas should serve as oasis' in our park systems and on BLM lands.

Correspondence: Topic Question 2:

1. Overall health of eco-system of Isle Royale, including animal (and human) and plant life, and water and air quality.j
2. People can and should be enlisted to advance a healthy eco-system. This is a win-win.
3. Climate change will have a growing impact; this should be addressed directly and publicly.

Topic Question 3:

To us, Isle Royale has always been a leader in the world of National Parks- -because it is small enough to act locally, with personable rangers and a small population of visitors. Therefore I hope that IRNP will lead with the emerging definition of "wilderness"- -not as a place to be left alone, (as was thought possible 100 years ago), but as a place wherein we, the human species, are part of the system and must therefore play an active role in its health.

Topic Question 4:

I can't speak to the intensity of the management, but I think IRNP should follow the guidelines of those who have been studying this park eco-system for decades and who, more than anyone, know what a healthy eco-system looks like. My understanding is that a healthy eco-system must have a top predator. On that basis I stand for wolf re-introduction. Also Isle Royale has the opportunity to act explicitly and publicly in response to a changing climate- -which both prepares it better to deal with the future, and continues to advance awareness of what climate change really looks like and what the impacts are.

Topic Question 5:

I'm unclear exactly how the moose population can be managed. Hunting season for moose? deportation? If the troubles of moose overpopulation are seen as short-lived (a 5-10 year cycle) then there is a case to be made for letting it go. If it's going in one direction only (as seems likely with the disappearance of a predator) then long-term impacts are likely and a stronger case can be made for managing the moose population.

Topic Question 6:

We are longterm visitors to Isle Royale and bring dozens here by sailboat. We hope to continue to come for years to come and sing your praises throughout the year. Thank you very much for all your effort in moving forward! I appreciate that much is at stake and many people have many opinions. Please move forward boldly and quickly once a path is defined.

Correspondence: Topic Question 1:

Move some of the wolves from Isle Royale to the mainland or vice versa and hope for successful breeding which would lead to genetic diversity.

Topic Question 2:

Money is one and possibly controlling the number of visitors and length of visitor access to Isle Royale. Not sure how the number of visitors impacts the moose and wolf behaviors, but my view is that generally when humans and wild animals start to interact, the wild animals eventually lose.

Topic Question 3:

My answer to question 2 above also applies to this question.

Topic Question 4:

NPS and those people interested in Isle Royale may have to face a future without moose and wolves on the island if climate change becomes as dramatic as I think it will. What's already happened is scary enough.

Topic Question 5:

I don't know what this is.

Topic Question 6:

None.

Correspondence: Topic Question 1:

Alternative Concept C (maintain both species)

Maintain populations of moose and wolves on the island, which could include wolf reintroduction or augmentation

Topic Question 2:

The Island and the study are such an amazing view of nature. Please please continue both. This is rare and important. I love moose, but even I know there needs to be balance. We need to have the wolves take care of them, not culling. Please.

Topic Question 3:

The wilderness is part of what makes Isle Royale so magnificent. However, for most of us, the 1% i incredible. It seeps into your soul. It is needed. Please please do not ignore this important need to bring wolves back. Thank you. We need both.

Topic Question 4:

Keeping the balance between the two will allow the vegetation adjustments to flow with the speed of the climate change.

Topic Question 5:

Very much appreciate you asking for feedback. I dislike that it is taking so much precious time. However, know you truly care and will focus on bringing back the wolves to the island. This is so special. I can't speak eloquently enough to tell you what this place means. The wolves and moose are an intergral part of this whole magnificent experience.

Topic Question 6:

Thank you for asking for input. Thank you for listening. Please bring the wolves back. Please. And, quickly. Thank you.

Comments: The scientist on the island KNOW what they are doing. Please trust them. We need the wolves back for balance. Please. And, thank you.

Correspondence Type: Web Form

Correspondence: Topic Question 1:

The impact of the moose on vegetation is a big issue. When I was last on the island, the researchers I spoke with discussed the devastation that occurred in the late 90's when the moose population spiked. I was told the subsequent drop in the moose population was largely due to the lack of food available as a result. I realize that wolves are extremely territorial and that new/rival wolves are often killed, but if the native population is so low now would the introduction of a new pack(s) to the island be a problem? Another option might be to remove the native wolves from the island and then introduce a new pack(s).

Topic Question 2:
What would it take to establish/maintain a healthy ecosystem on the island?

Topic Question 3:
If you see the comments I made above, I think the NPS should take steps to stabilize the wolf population. It then should closely monitor the ecosystem (with the help of outside researchers such as those from Michigan Tech) to evaluate the success of these steps.

Topic Question 4:
See #3.

Topic Question 5:
I liked option C the best, as it might take time to stabilize the ecosystem. If this has been a research topic for a half century, this option seems to be a logical continuation of previous efforts. The biggest concern I have overall is who are the stakeholders that are involved in the decision making process? (see #6)

Topic Question 6:
When I was last on the island there seemed to be a conflict between the Park Service and the wolf researchers who have been on the island for some decades. Isle Royale is a treasure and a unique biosphere, and such bickering over policy has the potential to damage it. Three generations of my family have now visited, hiked and camped on the island so I would hope that all interested parties could put their differences aside for the good of the park. I would love to have a fourth, fifth, and other future generations of my family to be able to experience the wonder of Isle Royale the way we have so far.

Correspondence: Topic Question 1:

Topic Question 2:
Maintaining the historic predator/prey study means maintaining that the predators continue to exist. Also the over population of moose can not be allowed to destroy the habitat. Yes, Isle Royale is a wilderness, but the fact is that it gets a lot of use and that the problems (for example, diseases that have impacted the wolves) have been created by humans introducing (illegally) dogs to the island.

Topic Question 3:
See question 2. Technically Isle Royale is a wilderness, but the human impact is already severe.

Topic Question 4:
Clearly it changes the equation, so I think NPS needs to be flexible and listen to ecologists.

Topic Question 5:

Topic Question 6:
I would like to see the wolf population maintained. I would hope that would reduce the moose population.

Correspondence: Topic Question 1:
Management of people. Plan to maintain limited entry so anthropogenic effects are minimized as the populations are further studies?

Topic Question 2:

Lag times in nature's cycles, climate change, welfare of individuals, maintaining genetic variation among populations, non-invasive or minimally invasive methods, maintaining ethical standards in all research methods and management actions so that no harm is done to individuals (or kept to absolute minimal possible)

Topic Question 3:

Concept B and C. Hands off approach, with the exception of reintroducing wolves to maintain genetic variation and species survival. MAINTAIN WILDERNESS AS WILDERNESS.

Topic Question 4:

As above. This is a good barometer to learn from.

Topic Question 5:

Dislike that there is no mention of long-term plans for management of humans, unless it is already established that no development will occur in area b/c its a National Park. I am still wary to see this not included in planning as I watch Canada's Mountain National Parks continue to build infrastructure that impacts the wildlife.

Topic Question 6:

The world has learned a great deal about wolves and moose and vegetation from this Island. We need to honour the lessons that we have been shown, and allow room to be open minded and continue to learn more. Even if wolves are reintroduced one time, this area remains as one of the last few true wilderness places and I feel that it is imperative to minimize human tinkering in such places.

Correspondence: Topic Question 2:

I would hope that scientific input, especially from Dr. Peterson of Michigan Tech, would be considered.

Topic Question 6:

I do not feel qualified to comment on wildlife management techniques. I urge that the National Park Service use the best available scientific information available. The public desires to see and/or hear the wolves and moose, while important, should give way to the preponderance of scientific studies.

Comments: Recently our family visited Isle Royale and enjoyed the experience. The National Park Service does a wonderful job protecting the island for the public.

The reason we visited Isle Royal was to enjoy the out-of-doors wilderness and to 1. See a Moose, 2. Hear a Loon and 3. Hear a Wolf. We managed to fulfill the first two items. It was thrilling and could only have been made better by hearing a wolf. Seeing a wolf seems out of the question as I understand there are only two left on the island.

We visited Dr. Rolf Petersen on Edison Island and heard him claim that he has evidence that the wolves have not been completely isolated but have continually traveled from the mainland to the island. This seems to indicate that reintroduction of a wolf pack could be successful and is not anything that has not happened in the past. It would help keep the moose population in check. It would also cause excitement among the tourists visiting the island.

I urge the National Park Service to reintroduce wolves to the island.

Correspondence: Topic Question 1:

Concept C is by far the best of the offered alternatives. "Maintain populations of moose and wolves on the island, which could include wolf reintroduction or augmentation." This alternative should be written stronger by replacing "could" with "will as necessary" include wolf reintroduction or augmentation. Also, this should have begun years ago when it became apparent that Isle Royal wolves were in genetic decline because of increased isolation due to human caused climate change.

Topic Question 2:

The importance of keeping both moose and wolves on the island with as little management as possible.

Topic Question 3:

As little as possible but enough to maintain both wolf and moose populations.

Topic Question 4:

The necessity of transporting new wolves to the island to compensate for the lack of ice bridges due to human caused climate change

Topic Question 5:

Concept C is the only one with any realistic chance of maintaining wolves on the island absent a reversal of global warming (that is extremely unlikely).

Correspondence: Topic Question 2:

I don't know what impact introducing new wolves to the island would be, but as it stands, it looks like the 3 remaining wolves's days are numbered. Why not, instead of an open hunting season on our wolves in Michigan, figure out a way to catch and release these wolves into Isle Royale. Whether or not they conflict with the 3 remaining wolves, seems irrelevant at this time, for those wolves with the original DNA. The health of those 3 is not prime, but if mating occurs with them by the new wolves, maybe, the strain will improve. If not the new wolves would begin the resurgence of the wolf population on Isle Royale. If the predators are not reintroduced, then the moose population will increase to the point of starvation and vegetation deterioration. It's all connected. It worked in Yellowstone, why would it not work on Isle Royale, a pretty much closed environmental situation. Expediency would be making a move in the right direction, instead of letting the existing wolves die and taking too much time to bring more wolves in. The moose population will increase until starvation occurs. We cannot control the weather, but with our help, the balance in predator/prey would be a plus.

Topic Question 3:
Do you want an island with no vegetation and dead moose all over?

Topic Question 4:
We can't control the climate, but we can assist the animals in a way that will keep the balance healthy. Vegetation will manage itself with the balance of wolves and moose.

Topic Question 5:
Not proceeding fast enough.

Topic Question 6:
I have been coming to Isle Royale for over 2 decades. It would be a shame to not aid in the balance of moose and wolves. IT IS TIME TO HELP !

Correspondence: Topic Question 1:
The fewer management tools the better in order to protect this ecosystem.

Topic Question 2:
If the moose remain without wolves, the moose population will rise and then crash and the island will not be an attractive place during the later parts of this cycle.

Topic Question 3:
I would not like to hear the sound of a helicopter while there.

Topic Question 4:
Not sure that any is appropriate.

Topic Question 6:
Which of the two comment boxes do I use? To have two is confusing.

Comments: I've backpacked there 7 times in last 10 years, a total of about 50 days, almost all of which was off-trail. To have wolves there is very exciting, even if one doesn't see them. It's this way with any large predator to some extent. I've been on some of the Channel Islands where rifles and traps were used to cull out certain species. I'm aware you could reduce the moose herd this way if there are no wolves. But wolves naturally cull the moose herd and do it for us in a natural way at low cost and manpower. It would sure be nice if you could allow this system to continue. Isle Royale is something I'm very proud of, and the study there is something to be proud of. We don't want wolves to be "managed" per se, but perhaps some experienced moose-killers could be brought in from Ontario or Quebec or elsewhere to reinvigorate the wolf population there. I realize the best thing, if that is done, might be to wipe out the genetically defective wolves on island now. That's not such a terrible thing if that becomes necessary. Then again, having some local DNA get incorporated into the new wolves might be good too. IRNP has low public attendance now. I think it will get worse if the wolves are gone. The chance to hear one at night, to see the tracks which are common, to maybe catch a glimpse of one which is rare (I saw 3 in 2013) is what brings hikers there. I think Concept B has the most merit. I also think highly experienced researchers at Michigan Tech are best suited to making the decisions about the wolves rather than lowly experienced Nat'l Park personnel.

Correspondence ID: 652
Moose-Wolf-Vegetation Management Plan/EIS
Outside Organization:
Affiliation:
Received: Aug,18,2015 10:40:30
Correspondence Type: Web Form
Correspondence: Topic Question 1:
I think all the Concepts being considered cover the problems, in one form or another.

Topic Question 2:
I would consider the human national park experience in this mix. The national parks preserve wildlife, but they also involve humans. For most people living today, wolves are part of the Isle Royale experience and I would like to see measures that keep them there. I would like to see them re-introduced to the island, and I'd like to see the predator-prey study continue. I would not like to see the island deforested because the moose breed unchecked by any predator. There is certainly precedence for re-introduction - just look at Yellowstone. You can reintroduce a natural predator. And, in this case, you don't even have to set up a fund to deal with domestic livestock killed in peripheral actions.

Topic Question 3:
Do whatever measures are necessary to maintain that ratio and balance. And the ratio does involve both moose and wolves.

Topic Question 4:
The type and intensity of management techniques you choose will have to go one of two directions: maintain wilderness and the park experience as people know it, or let the chips fall where they may. If the latter course is pursued, the island will be vastly different within a relatively short time. There is no easy answer for this. The only true course is constant vigilance and fluid actions. You won't have years to make decisions, you'll have to be lighter on your feet.

But the wolf decline, as I understand, began with a manmade event (canine parvovirus inadvertently introduced?) and it should be reversed with a manmade event - reintroduction. The decline is not really climate related. There are man-caused factors in there, and man-intervention to restore should occur.

Topic Question 5:

I find Concepts B, C, and D to be the best, with D probably being the optimal plan. But regardless of the plan chosen, I favor the reintroduction of wolves and - probably - some sort of management of both species. Whatever management is necessary to preserve the flora of the island. But whatever plan is implemented, it will require ongoing assessment and fluidity. It's not a static, one-off, management problem, as you're dealing with live species and their ongoing interaction with each other, and their ongoing impact on a land mass.

Topic Question 6:

Thank you for soliciting and considering public input from people who use the park.

Comments:

Correspondence: Topic Question 1:

Before the Moose population grows so much that they start another starve-off, or completely denude the vegetation, they should be culled. The best way would be to introduce predators again, but if you delay too long the cost to the trees and other fauna could be too great to recover from easily or in a timely manner. Management to keep the wildlife and plants in balance is essential during the decision process. We know what the result is when the moose don't have predators- -starvation and vegetation loss. We shouldn't have to relearn that. Selective culling should be started now. New predators should be identified and provided soon.

Topic Question 2:

The wilderness aspect of Isle Royale is what attracts visitors. Maintaining the most equal predator/prey relationship provides the wildlife and the vegetation that visitors come for. It has been a great experiment without intervention, but I think to maintain the value of the Park/Wilderness, management intervention is essential. The less mechanized the intervention is, the better for the wilderness. Time is the enemy- -decisions need to be made now.

Topic Question 3:

Too much management via helicopter and mechanical roundups or hunting would interfere with the wilderness aspect of the island. Non-tourist season culling should start soon so that the winter season doesn't weaken the herd too much. Introduction of new predators needs to be as soon as possible.

Topic Question 4:

Monitoring the climate and predator/prey relationship once it is rebalanced will help determine future management requirements. Intensity should be mediated by the consideration of maintaining the wilderness.

Topic Question 5:

I like the idea of reintroducing a strong strain of predator with diversity and I believe in the previous balance of packs in managing the moose population. Oversight by biological researchers is essential in recognizing emerging problems.

Topic Question 6:

The annual survey and long term research are essential for understanding and mitigating problems with management of both predator and prey populations.

Correspondence: Topic Question 1:

I don't see any alternative to the management of the moose population other than the human reintroduction of several pairs of mated wolves to Isle Royale. Culling of the moose is just not feasible. Climate warming has just about eliminated the possibility of an ice bridge that would last long enough for several wolves to cross from the mainland.

Topic Question 2:

Moose without predators will devour the vegetation. Wolves are extremely important on the island to keep the moose healthy and the environment in balance. Without the wolves the moose will do havoc to the vegetation.

Topic Question 3:

Human help to reintroduce several pairs of mated wolves to Isle Royale. Observations of the wolves (radio collard) and moose encounters should be monitored to see if two packs are enough to keep the moose population in check. If the moose population continues to swell another pair of wolves should be introduced. We cannot control the climate, but we can control the moose/wolf ratio to help balance the environment on Isle Royale. It is not the same on the mainland..... Isle Royale is an island.

Topic Question 4:
Management of wolves from a distance (radio collars). No culling of moose by humans. Wolves do an excellent job if there are enough of them.

Topic Question 5:
Wolves need to be reintroduced as soon as possible..... this fall.

Topic Question 6:
Wolves on Isle Royale are a tourist draw besides being very important to keep the moose population healthy and in check so they don't overgraze the island. My parents volunteered on Isle Royale for many years. My father (Col. Templar Cawthorne) checked the waters depth around the island and my mother (Betsy) staked out the orchid trails. I'm 84 now but I have visited the island many times in the past and always enjoyed the peace and quiet and occasional howl of a wolf.

Correspondence: Topic Question 1:
Since the number of moose must be controlled, their natural enemy, the wolf, must remain on Isle Royale. It looks like the only way to do that is to introduce a new wolf population.

Topic Question 2:
One issue, of course, is the moose destroying the vegetation on Isle Royale.
I am particularly interested in the many wild flowers growing on Isle Royale.

Topic Question 3:
If you want no management, then you'll have to get rid of the moose. Do you want that?

Topic Question 4:
As climate changes, new decisions will have to be made.

Topic Question 5:
I have been very interested in the moose/wolf interactions for many years. I have read the several articles in National Geographic. I have visited the moose/wolf study center and met Mr Peterson and his wife. None of the alternatives are ideal. We have to do what seems best for Isle Royale and the many people who visit it. It didn't always have moose and wolves. Just letting nature take its course, one alternative, doesn't seem to me to be the best course in the short run; but maybe in the long run.

Correspondence: Topic Question 1:
The Alternative should be leaving the ego system alone. Man has many times tried to control nature just to have it go out of sync and major problems have arisen after his interference. I am wondering why man thinks he has to control everything? We have ISIS in the United States with their little cells and we are worried about wolves and moose?

Topic Question 2:
Wolves will manage the land. They will keep the population down, prime example of this is yellowstone. Many plants etc were scarce and the land looked barren until the wolf was reintroduced. The wolves were an asset to the land on keeping the population regulated of vegetating eating wildlife.

Topic Question 3:
leave the wolves along they will be able to manage the land on their own. They will not be eating healthy moose or deer, they only eat the weak and the sick.

Topic Question 4:
This world is a living organism she knows what she needs allot more than any agency does. She knows how to regulate herself and what her needs are.

Topic Question 5:
When man starts interrupting nature only bad comes out of it. The eco system is thrown out of balance and many things suffer. Just leave the wilderness alone. She can manage herself better than man.

Topic Question 6:
It upsets me very much that we think that we know best. We dont know best. We kill this and kill that and then end up finding out it was a mistake. For instance in Minnesota the DNR said we have a abundance of deer we will allow 5 deer per person, well now we dont have any deer because of that major kill that season and the bad winter that followed. The DNR of Minnesota did say it was mismanagement on their part. We dont know what the future holds, nor can we predict it. It's in the best interest of nature to let her balance herself out.

Comments: Why is it so important for man to interrupt what nature herself knows what she needs? Man is the reason there is many species that are no longer on this earth, they are also the reason that this earth is being destroyed The best thing man can do is to protect all wildlife and to protect this earth. There is allot of habitat stripped from wildlife that it has caused more human interaction. The wolves did fine on their own for many years. But since man doesnt understand their importance, they think they should limit or eliminate them in some areas. To do such an act is not only wrong but very much a mistake. We dont need to be in control of everything. Sometimes its just more smarter to leave mother nature alone.

Aug,18,2015 11:45:39

Correspondence Type:

Web Form

Correspondence: Topic Question 1:

Alternative Concept C appears to be the best choice- brining in and maintaining a healthy wolf population to help control both moose and wolf populations. Moose starvation and culling are barbaric alternatives.

Topic Question 2:

-moose starvation

-genetic inbreeding of current wolf pack and its impact on new wolves should they mate

-the possibility that wolves won't stay on island

-new wolves may not instinctually know how to hunt moose

-extinction of plant and animal species

-TIME is of the essence The time to act is now. The lack of wolves isn't new. The population has been dwindling over the past 4 years.

Topic Question 3:

As was the case at Yellowstone, wolves were reintroduced because man intervened in their survival. Likewise, man intervened at Isle Royale- the animals didn't construct a mineshaft that took the lives of three wolves- man did. The ecosystem at Yellowstone is flourishing after the reintroduction of the wolves. It seems that when there is a far less complex food chain and there is only one form of predator and prey, that it makes sense to reestablish the predator.

The numbers are staggering. The moose population is estimated at 1250 calves and is expected to double in the near future. They will decimate the vegetation and starve if the NPS continues with the status quo. Part of the allure of Isle Royale is not only its pristine wilderness, but rather its the wolf and moose inhabitants. If you as a park are going to continue to attract people, you must do your part to maintain both populations.

Your very own purpose and intent statement makes it clear that the park hopes to entice future generations to come to the island, to maintain natural resources and to encourage scientific studies. None of which can happen if the moose die of starvation, if the wolves are no longer in existence and if the vegetation is decimated to the point of a wasteland. Taken directly from the Isle Royale website:

The purpose of Isle Royale National Park is to:

Preserve and protect the park's wilderness character for use and enjoyment by present and future generations.((Preserve and protect the park's cultural and natural resources and ecological processes.((Provide opportunities for recreational uses and experiences that are compatible with the preservation of the park's wilderness character and park resources.((Provide park-related educational and interpretive opportunities for the public.((Provide opportunities for scientific study of ecosystem components and processes, including human influences and use, and share the findings with the public.

Consider adding a new building/shelter to encourage education, growth and research. Despite, the 99% wilderness designation, and the difficulty in building pit toilets into basalt slabs, some of the pit toilets are in desperate need of cleaning/ overhauling- perhaps consider an anaerobic digester?

<http://www.treehugger.com/renewable-energy/biogas-and-how-to-make-a-diy-anaerobic-digester-video.html>

Topic Question 4:

NPS should look into cultivating, planting and growing vegetation that is conducive to a boreal forest. I understand that due to climate change, temperate species are favored; however, moose browsing should be considered when questioning the decline in vegetation. Allow me to think outside the box...maybe an environmentally friendly, solar paneled ice bridge should be formed in the winter months- seeing as ice bridges were an annual occurrence in colder temperatures.

<http://www.solarroadways.com/intro.shtml>

Topic Question 5:

I am frustrated that NPS chose a color document for the moose/wolf vegetation management plan/EIS that appears to be filled with limited, biased fluff. There is no mention of the wolves that died in a mad-made mine shaft. There is no mention of the moose starving to death because they overate the vegetation- "the population increased ...and declined." They starved! Rather than spending money on a glorified color brochure, the NPS should have been proactive years ago and brought new wolves to the island to encourage genetic rescue. Now, you as managers and overseers are bound so tightly by rules, regulations and wording, that you are rendered paralyzed to effectively manage. You are locked in gridlock and essentially are unable to take vital steps needed because of your own rhetoric.

I am encouraged that the NPS is starting to see the urgency of the situation and is considering which action should be taken. However, I am fearful that the momentum and proposal will be passed down to another superintendent and the decision will be suspended in limbo for years to come.

Take action. Bring wolves to the island.

In the words of Theodore Roosevelt, I leave you with the following thoughts:

"There are no words that can tell the hidden spirit of the wilderness that can reveal its mystery, its melancholy and its charm."

"The nation behaves well if it treats the natural resources as assets which it must turn over to the next generation increased and not impaired in value."

"Conservation means development as much as it does protection."

- Theodore Roosevelt

President of the United States

Thank you for your time and consideration.

Sincerely,

Correspondence: Topic Question 1:

The Humane Society of the United States(Wayne Pacelle,CEO) has proposed an Excellent program to benefit Wolves and protect the environment of Michigan's Isle Royale. Wolves have too long been the target of hunters, ranchers, and poor public policy programs, regulations ... and now HSUS has a viable plan in conjunction w/noted researchers.

Topic Question 2:

I respect the expert opinions and firsthand experience of the HSUS personnel- -researchers, professionals whereby wildlife and notably wolves can be an asset to the special Isle Royale National Park.

Topic Question 3:

Beautiful wilderness is ideal for wildlife as long as humans do not violate the pristine quality and the welfare of animals in the natural habitat... Again HSUS can provide guidelines to initiate and incorporate the Best Interests of All.

Topic Question 4:

This is also a critical factor and reality and must be essential part of the Management plan and the impact of changing climate conditions on this precious and valuable area.

Topic Question 5:

I am not familiar with the "other preliminary alternatives."

Topic Question 6:

Please give priority to the HSUS proposed plan for Isle Royale National Park.

Thank you for this opportunity to express my views. Your attention and support to this critical issue are so appreciated for all the voiceless, vulnerable animals.

Correspondence: Topic Question 1:

I believe they should be introducing new wolves on to the island and they should come from areas as close to the island as possible. The current study can manage the wolf pack from their ongoing work and the introduced wolves should be electronically tagged.

Topic Question 2:

the overall impact to the ecosystem and how a die off affects the increased population of moose on the island.

Topic Question 3:

After the wolves are introduced, I believe the management can be mostly hands off with tracking devices and observational study of the introduced wolves to see the impact of an increased wolf population on the island's ecosystem.

Topic Question 5:

I like the introduction of the wolves to the island because I think it will have a positive impact on the whole ecosystem. Allowing the wolves to die off will result in a moose population explosion, which the island couldn't sustain.

Correspondence: Topic Question 2:

This present situation (having a ecosystem involving moose and wolves) isn't the first situation (re: caribou and lynx previously) and probably will not be the last. Isle Royale is unique and special and is defined by more than one or two charismatic mega fauna. The island's ability to affect populations, shape specific specie characteristics, and create a small and controlled environment in which effective scientific study can be conducted is more valuable than an individual's personal experience- which is important, but typically lacks the ability to create great change, whereas a scientific study is a stronger communication point.

Topic Question 3:

Monitor, document, and let it happen.

Topic Question 5:

Wolves should not be introduced simply because of pro-pho pressure. This is not a responsible way of managing.

Correspondence: Topic Question 1:

Please listen carefully to the suggestions that the Petersons favor.

Topic Question 2:
I do not ever want to see human hunting of moose occur on the island. I would rather see the wolves and moose manage themselves, with as little human intervention as possible. At this point a new wolf bloodline seems like a good idea. Possibly a new moose bloodline. Will the vegetation thrive when the wolves and moose have a better balance? I'm not sure of all of the issues.

Topic Question 3:
Manage as lightly as possible to restore a healthy wolf/moose balance.

Topic Question 4:
Low intensity.

Topic Question 5:
I like plan B which would mimic a wolf migration to the island, and leave the moose alone. I feel this is the most natural and least invasive solution that would restore balance to the island. I do believe that the moose are inbred as well, so possibly some new bloodline should be introduced as well. This

would probably fall under a different "plan" but I'm not sure which one that would be.

Topic Question 6:

We visited Isle Royale three years in a row in August of 2010, 2011, and 2012. I cannot wait to return when personal health permits. This island would not be the same without the wolves and moose. We want them to be there, and we want them to be healthy.

Comments: We love to follow the winter study.

Correspondence: Topic Question 1:

I favor reintroduction of wolves as needed to maintain the moose population such that overbrowsing is curtailed. Culling the moose herd is a less preferred but acceptable option.

Topic Question 2:

The visitor experience is degraded when the native fauna is severely over browsed. Ongoing supplementation of the wolf population will likely be needed, given the small wolf population the island can support, and the subsequently small gene pool. Limit over browsing and the vegetation should take care of itself.

Topic Question 3:

Intensive population management such as culling can be done in the winter when there are few visitors. Additional structures and other permanent changes should be avoided, although they would not likely be necessary. This seems consistent with management of a wilderness area. Neglecting moose overpopulation is not management. Ongoing monitoring of moose and wolf populations and effects on the fauna will be essential to continued success.

Topic Question 4:

If the fauna changes such that it does not support a moose population, the wolves will probably also disappear. I'm not sure this changes management, but it does emphasize the need to protect the fauna from overbrowsing.

Topic Question 5:

Whichever alternative is selected, it should be made clear that management options can be changed if continued monitoring and observation show unexpected results. (And unexpected results can be anticipated.)

Topic Question 6:

The "enclosures" are a vivid demonstration of what the island could (and I think should) look like. Keeping the moose population in check would give the rest of the park a chance to look like a real wilderness again. Best of luck in your efforts- -the island appears to be in good hands.

Correspondence: Topic Question 1:

Artificial insemination using the sperm and egg from the original species, and then place the newly formed zygotes into the bodies of captive wolves. These newly born wolves should be used to rebuild the species dwindling within the Isle Royale population.

Topic Question 2:

Integrity and responsibility. With technology at our present disposal, there is no reason that this species of wolf should disappear from the planet.

Topic Question 3:

Once the wolves have regained a foothold, the entire island should be left alone to manage itself. The interference of humanity has caused species by the hundreds to go extinct. We should replace those species and withdraw, only to be stewards in case a situation like the present one ever develops again.

Topic Question 4:

More education, further persuasion given to the public as to the causes and effects of our presently changing climate.

Topic Question 5:

This hands off alternative, which allows this wolf population to become extinct is waste of human time and resources. The question here is do you want to make a difference or do you just want to earn a paycheck?

Topic Question 6:

Whatever you do or plan to do is nothing compared to saving these wolves.

Correspondence: Topic Question 1:
Federal state authorities should consider humanely translocating wolves or packs who would otherwise be killed, to Isle Royale. And in addition to this, there should be No Moose Cull. Contraception would be a preferred alternative.

Topic Question 2:

The one most important thing to consider is that Both Wolves and Moose are Needed to Balance the Ecosystem on Isle Royale. Wolves and Moose do Not, need "managing" by 'man'. The Wolf needs only to be left Alone. Due to the reckless behavior of humans, Wolves need to have federal protections in place and be on the Endangered Species List. We also need The Endangered Species Act kept strong, and intact, and there needs to be laws to Ban Traps and Snares, which are inherently cruel to Wolves, Wildlife, and both Endangered Species and Companion Animals.

Topic Question 3:

Leave the Wilderness alone and also the Animals there, once it is stable.

Topic Question 4:

Changing climate is the fault of man, and the use and abuse of Animals in factory farms. Farm Animals were meant to be outside, and free, not confined and abused in factory farms. This cruel industry, is driven by greed for profit, and the Animals suffer. Regarding Wolves, changing climate, decreases ice, that Wolves would use to get to Isle Royale, from Canada.

Topic Question 5:

Wolves who would otherwise be killed, could live, on Isle Royale. Moose should not be culled, but since this is a problem one alternative is contraception. Allow for the fact, that sickness was brought to Wolves and Isle Royale and further reduced Wolf population, Parvovirus. Wolves need to be Protected on the Federal level, and stop the "wolf massacre" that has shamefully taken place. What sense is it, for Wolves to be hunted and trapped to near extinction, then some to be relocated, because there are only three left, when they should not have been ravaged in the first place! They should never have lost protections, in the first place.

Topic Question 6:

It would make so much more sense, if Wolves were not hunted and trapped to near extinction, rather than having to relocate Wolves to a Island where there are only three Wolves left. If Wolves can ever make a come back, and recover, there should never again be such a slaughter of them. This is not just about numbers and politics, it is about life, and nature, and protecting the Animals we have. The Wolf is an Icon, and must be respected as the apex predator. They are essential, they are needed. Extinction, is, forever, and once gone, they can not be brought back. Isle Royale is a beautiful place, but will not thrive without a healthy Wolf and Moose population. Wolves and Moose are beautiful, and many tourists, go to Isle Royale for that reason.

Comments: This is summary: Keep Both Wolves and Moose and have Wolves reintroduced, more than once, if needed. Have Moose populations 'managed', by contraception, not by cull. This is the reason the Wolf is needed to Balance the Ecosystem for a Healthy Wilderness Area. The National Park Service must have a decision final by the end of 2016. I strongly recommend Wolf transfer as a favored option for the Park Service. Both the Wolf and Moose are needed for a Balanced Ecosystem on Isle Royale. Keep Wolves federally protected. Once the Wilderness is "stable", leave the Wolves Alone. This world was not made just for humans. It was made for the Animals, too.

Correspondence Type: Web Form

Correspondence: Topic Question 1:

The six alternatives provided cover the logical options. Alternative Concept C is the alternative I would urge you to adopt.

Topic Question 2:

Long term sustainability of a natural ecosystem should be the top priority. Maintaining Isle Royale as an ongoing site for research on predator/prey relations would be a secondary priority. Maintaining wildlife and vegetation to enhance the experience of park visitors would also be a secondary priority.

Topic Question 3:

Given that Isle Royal is a wilderness area and a national park, using natural methods to manage wildlife populations and vegetation should be followed. Regular hunting to control moose populations should be avoided, as this is a less natural management tool, and would result in increased human avoidance by moose, detracting from visitor's experiences.

Topic Question 4:

Maintaining a viable wolf population by periodic introduction of new wolves to maintain needed genetic diversity seems like the best option. While this does involve human interference, this interference is warranted due to other human impacts, specifically climate change and the introduction of disease that impacts natural population levels.

Topic Question 5:

Most of the alternatives would either result in significant moose population swings with resulting high impacts on vegetation. The alternatives involving human control of the moose population could avoid these large fluctuations, but would involve more active ongoing human involvement in the wildlife population than seems appropriate for a national park or wilderness area.

Alternative C seems like the best compromise. With climate change, the probability of ice bridges to the mainland will be reduced in the future, making the natural introduction of genetic diversity into the island wolf population significantly less likely. Allowing for the introduction of additional wolves as needed to maintain genetic diversity and a wolf population controlled primarily by their relationship with the moose population seems likely to dampen the magnitude of population swings and vegetation/ecosystem impacts. At some time in the future there may even be need to introduce moose to Isle Royale to maintain the genetic diversity of that population.

Topic Question 6:

I think the minimal level of human intervention provided by Alternative C is the best option, and the intervention is warranted to offset the negative effects of other human impacts, especially climate change, which will make ice bridges much less common, or perhaps non-existent in the future. This option does involve introducing additional animals to the population, but avoids other methods of active management of wildlife populations and vegetation on Isle Royale.

Comments: In my visits to Isle Royale I have often seen moose, and wolf tracks, but never actually seen a wolf. However knowing the wolves were there, and knowing about the relationship between the wolves, moose and the vegetation added significantly to my enjoyment of those visits. I hope Alternative C is selected so those conditions can be maintained in the future.

Correspondence: Topic Question 1:

Please go to Q. 6. Thank you.

Comments: I enthusiastically support your preparation of an EIS on Isle Royale's moose-wolf vegetation management plan. I emailed some comments to the planning site on August 11, and have a few more thoughts to add.

As a graduate student in Forest Recreation and Wildlife Management at "The Ranger Factory," Colorado State University, Fort Collins, my major professor introduced me to Aldo Leopold's Sand County Almanac. In thinking about wolf-prey-vegetation dynamics, I often think back to Leopold's essay, "Thinking Like a Mountain." Decades after killing a wolf as a youth, Leopold learns the effects of no wolves on a landscape: "I have seen every edible bush and seedling browsed, first to anaemic desuetude, and then to death...as if someone had given God a new pruning shears, and forbidden Him all other exercise." Adolph Murie's description of the impact of moose on Isle Royale without wolves in 1930 is hauntingly similar: "(T)he top of every tree is broken off, and there is little to eat except bark...winter moose food is practically gone..." I hope we won't let this happen again.

My more recent interest in wolves, and through them restoring the ecological integrity of national parks, began at Yellowstone, where in 1980, as resource management specialist, I read the first Rocky Mountain Wolf Recovery Plan. After the second plan was approved in 1987, the impetus grew to move toward an EIS, but Congress was slow to give the go-ahead. Instead, we were ordered to respond to several questions first. That resulted in our preparing Wolves for Yellowstone? published in 1990 and 1992. Finally, we and the US Fish and Wildlife Service got the nod to prepare an EIS in late 1991, and, in April 1994, after we had collected and analyzed 170,000 comments, the EIS was approved. In January 1995 we carried 14 wolves into pens in Yellowstone, near the center of the 25,000 square miles called the greater Yellowstone area. Another 15 were released in the central Idaho wilderness area; about 20,700 square miles. In 1996, we added another 17 to Yellowstone, and 20 more to central Idaho. Yellowstone's population began with families of wolves from ten different packs. Central Idaho's started with 35 young potential dispersers; genetic diversity was thus assured. All were taken from registered trappings.

Given the apparent reluctance to intervene in wilderness expressed in the Alternative Concepts you have presented to reviewers, I must observe that the

wolves reintroduced to Idaho were released in an area that encompasses several designated wildernesses: The Frank Church-River of No Return, Gospel-Hump, and Selway-Bitterroot wildernesses. Yellowstone is flanked by wilderness on three sides. Intervening in wolf recovery in wildernesses is not the only precedent: Grizzly Bears are being augmented apace, as illustrated in the article whose URL is listed here. <http://fishandgame.idaho.gov/public/wildlife/workshops/blackBear/Kasworm.pdf> In essence, grizzly bears are being augmented successfully in 6,750 sq. km of the Cabinet Wilderness. I recall that Isle Royale and Yellowstone were both sites for recovery of peregrine falcons by hacking. In summary, there are ample precedents for active intervention in wildlife restoration in wilderness areas.

You have suggested that human-induced climate change is somehow different, and perhaps less a direct source of mortality to Isle Royale wolves than shooting or trapping was in the West. Extinction, however, is forever, and lack of immigration is just as fatal to a population as bullets, albeit a bit slower.

A basic tenet of NPS management is to serve the public interest. I have followed the public and scientific dialogue about Isle Royale's moose-wolf plan with that in mind.

Internationally prominent wolf scientists who have contributed to the dialogue on the Isle Royale issue and who have participated in discussion of the of issue in the George Wright Forum have shown strong support for conserving wolves on Isle Royale. See John A. Vucetich, Rolf O. Peterson, and Michael P. Nelson. 2013. Discernment and Precaution: A Response to Cochrane and Mech. The George Wright Forum, vol. 30, no. 3, pp. 333-340. The authors, for instance, observe: "The watchful waiting suggested in Mech (2013) is associated with considerable risk of long-lasting damage to Isle Royale's ecosystem health." Another note: "To say that considerable evidence exists for believing that inbreeding depression places Isle Royale wolves at great risk of extinction is not to say that we alone are impressed by the weight of evidence. We have also solicited the views of others with expertise in conservation genetics, including L. Boitani, University of Rome; R. Frederickson, University of Montana; P. Hedrick, Arizona State University; R. Lacy, Chicago Zoological Society; O. Liberg, Swedish University of Agricultural Sciences; L. Waits, University of Idaho; R. Wayne, University of California-Los Angeles. It also appears to be the collective judgment of experts in conservation genetics who are familiar with the Isle Royale case that inbreeding depression places the park's wolves at considerable risk of extinction."

I also found interesting the Vimeo interview of 13 wolf biologists by George Desort recorded in October of 2013 at the International Wolf Conference at Duluth, some of whose names appear above. Unfortunately, I have been unable to get my iMac's reader to show me all of the interviews, but the several I've been able to see seemed to all support maintaining the wolf population, and continuing wolf-moose research.

My hope is that you will come expeditiously to a solution that will preserve the dynamic resiliency and ecosystem integrity that has characterized Isle Royale in the past, and for the enjoyment of future generations, both esthetically and scientifically.

My best wishes for success in conserving the wildness of Isle Royale. As a friend of mine wrote me recently, "Without the goal of rewilding for large areas with large carnivores, we are closing our eyes to what conservation really means-and demands. Disney cinematographer Cris Crisler's wife, Lois, after years of living with wolves in the Arctic, wrote, "Wilderness without animals is dead-dead scenery. Animals without wilderness are a closed book."

Correspondence: Topic Question 1:

Alternative Concept B 'Reestablish wolves on the island by bringing in new wolves one time to mimic a migration event; no moose management' is my suggested alternative to follow. With the possible addendum of allowing the possibility to mimic future migrations in the future.

Topic Question 2:

The only reason that we need to be considering intervening in the situation is the constant, frequently unknown, impacts that humans have had on the planet. And I am not only referring to the possible link of humans the the issue of global worming, but to the thousand of other ways we impact our environment. Human driven migration of invasive species has had a continual dramatic impact on our environment. Along with habitat reduction as our population expands along with our basic needs (food shelter etc.). More specifically with the impact on Isle Royal humans have created dangerous structures (mine shafts) that have played a part in this story along with the movement of disease. As ambassadors to our planet we should not sit ideally by and watch the genetic diversity of umbrella species such as the gray wolf be bottle necked globally and domed to inbreed. Around the world we need to consider this in other Wilderness zones (Should we allow the tiger populations to crash because of the habitat elimination issues. Resulting in small populations that can not interbreed due to location a type of man made island system.)

Topic Question 3:

The wilderness designation is a tricky one that I am not sure I completely understand the legality of, but it is my opinion that we have a certain responsibility to make an effort to retain a healthy wolf population, by encouraging a divers genetic diversity of the population. There are population islands all of the world that are either man made or influenced that require our efforts to also maintain a healthy amount of genetic drift. If humans were completely out of the picture one could argue that the genetic drift of these populations would remain health by natural forces and we would need to do nothing, but that sadly is not the case.

Topic Question 4:

I am not sure the advocating the problems of climate change is the correct tactic for the NPS. Due to the controversy surrounding the issue it may be advisable to steer clear of the issue and not instigate it.

Topic Question 5:

I dislike the idea of 'managing' the moose population. With a reasonable amount of genetic drift re-established for the wolf population the moose population should not be an issue. Humans nutritiously mess these things up. If we go and start culling the herd it is inevitable that we will not do it base on natural selection, as the wolfs would. And as a result would most likely do more harm then good to the genetic diversity of the moose population.

Topic Question 6:

I would like to see Alternative Concept B; With the possibility of continuing a monitoring program of the genetic diversity of the population. If the populations genetic diversity is reduced due to outside disease or some other catastrophe that boodle-necks the population, then at the time more wolfs

should be re-introduced to mimic the genetic drift that humans are inevitably influencing, the externalities of humans.

Correspondence: Topic Question 1:
The range of alternatives seems complete to me.

Topic Question 2:

I value the concept of wilderness and have made 11 trips and spent more than 100 days of Isle Royale. I have traveled every shore of the main Island and most of the 400 outlying islands of the archipelago.

I particularly value the wilderness experience offered on this Island. I have traveled extensively in the continental US, Alaska, Europe, Central America and Africa and Isle Royale is a uniquely wonderful environment. Some of the things that I value about the Island are the opportunities for isolation, for experiencing the boreal and temperate forest vegetation, and the evolving biological communities. For example, when I 1st came to the Island in 1991, great blue herons were common and now they are rarely seen. Sometimes I've seen moose just feet from my camp and on other trips have seen none. I also value the human history of the island, the wonderful boats and fishing equipment, the shuffleboard on Belle, and the museum in the Rock Harbor lighthouse.

Despite its wilderness designation, there are many ways that Isle Royale is impacted by humans, including my presence. It is unrealistic to think the Island won't be influenced by humans. The question is how that human influence impacts the Island's values of isolation, vegetation, and history.

The historical wolf-moose predator-prey study is also a part of the Island's history that I value. I would like to see the study continue as long as the climate allows moose to remain on the Island.

Topic Question 3:

See above.

Topic Question 4:

Well, it isn't reasonable to think we can chill the Island for moose, in the face of climate change. And as long as there are moose on the island, a naturally-balanced biological system requires a predator. I would rather that predator be wolves than humans, even if it requires human intervention to maintain healthy packs and genetic diversity.

In other words, let the moose biology dictate the number of wolf packs on the Island. I realize that there isn't an easy mathematical relationship, but it will give the on-going wolf-moose study something to gnaw on.

Topic Question 5:

I don't like an option of moose on the island without a predator species. It is too hard on the vegetation and I don't think that a moose boom-bust cycle has any inherent value. I also prefer on-going, active management of the wolf population to either translocation of live moose or moose culling. There are so many places where wolves are not valued or welcome. Here is one place where they could be valued.

Comments: I appreciate the park service's public process on this question. We are also tremendously fortunate to have the many years of research and public education on the mysterious and mystical Isle Royale moose-wolf relationship. I hope that you will carefully consider the perspectives of the researchers, especially Rolf Peterson, in any decision you make.

Correspondence Type: Web Form

Correspondence: Topic Question 1:

Due to the ice bridge no longer available, genetic transfer exchanges to ensure a healthy species survival is no longer available. Morally and ethically, all animals should be removed and relocated. An animal bridge to the mainland could be constructed to allow ingress and egress. All wolves stuck in small sanctuaries situations could be relocated there alleviating space in the overcrowded sanctuaries. True, those wolves would still die there as there is no egress, but it would be more dignified than the tiny allotment of space in a sanctuary they will die in anyway. It will not resolve the inbreeding of the moose stuck there, only make more space of a species that shares the same fate of the wolves...a slow death by inbreeding.

Topic Question 2:

If a land bridge isnt made possible, all animals should be removed. To keep them there and add more is not in the animal's best interest. It is only to serve human convenience which has never benefited any animal, anywhere. The animals there now benefit and destroy the vegetation. W/ out moose, the vegetation may have a chance to replenish itself. To arrest free world wolves and place them in solitary confinement on Isle Royale is less humane than outright slaughtering them. They have no place to disperse and mate w/ unrelated family. The moose are in the same situation. To "fix" Isle Royale, a connecting land bridge is imperative. How feasible that is will determine whether your motives are in the best interests of wildlife or just an extension of human interference. Wildlife and Nature do a remarkable job of managing itself. We, on the other hand, seem to just complicate and make matters worse. I'm all for animals there as long as there is a means of ingress and egress available. If a family of humans were to be in a situation of no escape and no avenue others could reach them, 100 years from now they wouldnt be sporting too many branches in their family tree. Animals are no different and are not our commodity.

Topic Question 3:

Being a wilderness, no development should be allowed. No roads, no buildings, no tours, no people. How can any area be called a wilderness if humans are traipsing through it, trashing it, and leaving a footprint that takes much time to absorb? W/ out a connection to the mainland, it will become basically, a bird sanctuary. Keeping people off the island would be about the only issue to address.

Topic Question 4:

At the present, the only acceptable avenues is to legally challenge industries roles in damaging the environment. It only takes an annual temperature of 1 degree change in trees to cause the tree to start dying and releasing more carbon back into the atmosphere. At he current rate, moose wont have anything to eat on the Isle w/ in 30 years. If we were to halt all damage to the environment immediately, it would take a minimum of 60 years to see significant recovery. Patience would certainly be paramount.

Topic Question 5:

Am not versed on alternatives offered. I see 5 possible resolutions, and 3 of them arent good. 1. A connecting land bridge. 2. Relocation of all animals on the isle presently. 3. Destruction of all animals on the isle, presently. 4. Emptying out wolf shelters and releasing them to a more dignified death. 5. Ignoring it and forgetting it. Those are the reality of Isle Royale. We created climate change that melted the ice bridge and we cant hardly expect animals to pick up our slack. We cant undo our harm. The closest is to construct a connecting bridge. If that isnt possible, then you're just wasting time, effort, and finances which opponents will use against you, subsequently, again, making animals to pay w/ their lives.

Topic Question 6:

You cant justify a team of biologists and rangers constantly bringing new animals to the isle and taking off those ready to disperse. NPS is severely underfunded as is and the licking they're getting in the appropriations bill doesnt assure things will get better next year. I do not view NPS as an enemy and in fact, am more than willing to share information w/ NPS to better serve animals and us. Personally, I can see Isle Royale as a sort of second Yellowstone project if a bridge were built. You could actually introduce bears, mountain lions, bobcats, deer, elk, etc. as well. The only reasons Isle Royale is even being considered is that scientists in 50 years couldnt learn enough about wolves and you have 2 senators that want to re-wolf the isle. 2 senators that couldnt tell you 3 genuine facts about wolves and obviously, a team of scientists that cant tell you 3 things either! Human desire is not part of NPS job descriptions nor directives. Being responsible for the land and all life on it, including human life, is the mandated criteria. W/ wildlife disappearing at the alarming rate it is, if anyone is to be catered to, it should be the animals long before humans. And of course, the environment first as w/ out it, there would be habitat for any life. I have entered all my personal information and please ask NPS to keep me informed and to share their take on things. I enjoy working w/ you and realize I am wrong about many things. Sometimes i am actually right, though.

Correspondence Type: Web Form
Correspondence: Topic Question 1:
I am not very familiar with all these topics, but in general I am in favor of the solutions that Wayne Pacelle and the HSUS have come up with. Please keep that in mind for all of the questions about this topic.

Anyway,I am also in favor of any method that prevents humans from killing any animals. No problem should give any human the excuse to kill.

Topic Question 2:

The only concern is to balance the system with minimal interference from humans and then let the animals handle their own issues as best they can. A very naive person is writing here when it comes to the wilderness, but all I know is the value of all forms of life, which should be protected at all costs.

Topic Question 3:

Again, the human involvement should be the least possible after providing protection can be considered done.

Topic Question 4:

This is serious. The NPS and every government agency should join me and others in urging the entire population of Earth to stop eating meat immediately. The effects on the environment will take time, but will effectively stop the problems of climate change instead of just some people dealing with symptoms like these issues with wolves. After that, leave it to me and God to start showing results about benefits to the Earth. First, we need to focus on 7 billion humans ceasing to eat meat. Without that, any solution will never work. This is serious and realistic and necessary, so please share this urgency with the public and everyone.

Topic Question 5:

I like the protection of animals, but I dislike anyone thinking that these ideas will work without complete non-violence on the part of humans combined with faith in whichever God people choose to believe in. On this Earth, we have gone beyond what humans can do on their own while they don't correct their own actions. We need vegetarianism for 7 billion people along with faith in God. This takes priority over what any agency can do alone, so this should be the focus. Help spread the word.

Topic Question 6:

Fixing these problems would be nice, but would just lead to more problems. Enough damage has been done to this Earth that we need drastic measures. Please urge all officials and the public that vegetarianism worldwide for 7 billion people is the only way to solve things. Discussing anything else is just a waste of time. We need to stop the murderous action, repent, and pray that our God will save us. Help me get these people to do this and I and God will provide you with all the results you could want. Please take this seriously, it is the only way out.

Comments: While I support the Humane Society in all they do, I have my own facts and opinions to spread. I assure you, meat-eating has led to every problem we have had for centuries. You see I am blaming an action and not a group of people. We all may be guilty of something, but hurting innocent animals is the worst and is the reason why we all suffer now for so many reasons. Nobody thought to fix the food they intake daily, but why not? Food is the fuel that drives you, and if you put in garbage, you get garbage results. It is only because humans are so divine and close to God that we even got decent results by eating meat. I assure you, all we have accomplished in centuries has all been done before and is minor compared to the future when we become pure from the inside. Now, we all need to correct our actions and seek forgiveness from God. This doesn't matter what religion you follow or what place you come from, so nobody is exempt. We all need to face the facts and jump into action.

Then, we pray that God gives us the results we need, not what we want. We need 7 billion humble, apologetic souls united in one cause of peace for this entire Earth. You notice no peace settlements have ever worked out with meat-eaters sitting at the negotiating table.

We need new ideas like mine, which are also old as dirt. The Hindus have preached vegetarianism and non-violence for centuries and have never invaded another country in over 10,000 years of history. So, I am bringing back an old idea in a new way.

Either way, saving some wolves won't prevent nuclear war and destruction of this Earth. Vegetarianism will solve every problem. In other words, while you think of wolves, focus on these issues to bring us the progress we need.

Remember and spread love and devotion to God, peace and non-violence, and vegetarianism as the only means of achieving peace within our lifetime.

My plan has the umbrella effect of saving wolves and humans and all living things. Focusing on just the wolves makes us have a new problem to fix everyday. We need a permanent solution.

That permanent solution is vegetarianism.

There isn't enough space to show all the points favoring vegetarianism, so take it on faith. If anyone needs more info,:

This is the way we save the animals and the humans and the Earth. Don't play dumb, you know this is the way. Some people would throw the whole Earth away just because they think meat tastes good, which is a poor excuse.

Remember, meat is murder. What consequences do you think come from 7 billion people playing a part in murder?

We have to evolve.

Please join us and spread this to all officials and the public. I have much more I can disclose persuasively, but the facts are clear.

Let's save our planet right now, by letting 7 billion people play a role in their own salvation. The official stance of the NPS and other agencies should be that we need vegetarianism to save us. Anyone can reach me for more info, but please embrace this topic as it is necessary and vital.

Instead of waiting for a hero to solve everything, let's be our own heroes.

Peace or perish, there is no other choice.

Thank you.

Correspondence: Topic Question 1:

When predators were reintroduced into Yellowstone N P they brought back a more stabilized ecosystem for the prey and the fauna that sustained them. Without a healthy wolf population on Isle Royale the moose will overpopulate, decimate their food chain and then crash rapidly in numbers. Playing the odds of an ice-bridge forming and wolves crossing in an era of global warming is not realistic. Wolves should be reintroduced.

Topic Question 2:

Sustainability. One without the other will result in a park with neither.

Topic Question 4:

As long as the moose can withstand the warmer climate, action should be taken to protect and preserve the eco balance. A healthy wolf population will need to be part of that plan.

Topic Question 5:

There is 50 plus years of research that shows a dysfunctional dynamic change will occur with an extensive lapse in one of the primary predator/prey species. Always having the wolves on Isle Royale will be of importance to having a healthy National Park on Lake Superior. Taking action will assure that happens.

Correspondence: Topic Question 1:

The range of alternatives seems to cover quite a few options. I'm unclear what would be the goal of Concept C. It calls for maintaining populations of wolf and moose, but to what end? What is the goal of the management and how would decisions be made regarding augmentation or culling or other options? This alternative should be clarified in the EIS.

Topic Question 2:

Diversity and resiliency. Health of populations of plants and animals.

Topic Question 3:

I do understand the Wilderness Act and the "hands-off" management that is often justified by invoking language from the Act. But we should recognize reality. Isle Royale has been affected by human intervention for a couple of centuries - including commercial exploitation. It is now being affected by human-caused climate change. The landscape can hardly be described as untrammelled. I suggest we set our goals for managing a healthy and diverse landscape, and attempt to achieve that with the minimal amount of interference as is possible.

Topic Question 4:

Climate change is human disturbance, plain and simple. We cannot kid ourselves that wilderness is an untouched and untamed landscape. First of all, Isle Royale has been intensively settled, altered, and commercially exploited in the past. Second, climate change is having an impact on everything. It really isn't possible to tease out exactly what the landscape would be like without human intervention. Therefore, I suggest that the desired condition of management might be a diverse and resilient landscape. This would tend to lead toward maintaining the presence of both predator and prey species and maintaining a balance between them.

Topic Question 5:

I like the idea of imitating nature by providing wolf augmentation in a way that simulates what has happened in nature - a one time migration event. Now that there seem to be more common land bridges, I'm wondering if you can get the wolves that might be introduced to stay on the island?

Topic Question 6:

I have spent almost 2 weeks on Isle Royale during two different visits. I've been to the north and south ends of the island and to many places in between. I have seen moose on the island and learned about the wolf/moose studies. Thank you for starting this study and evaluation - it is needed.

Correspondence: Topic Question 2:

We should allow for the most "natural" methods of preserving this national wilderness treasure. Because both wolves and moose had natural means of migrating to and living on Isle Royal we should allow (and provide) for this to occur again. Environmental changes would also need to be considered to sustain current or possibly future vegetation.

Topic Question 3:

NPS should provide and foster an intense program of management that includes, NPS staff management, grants to other agencies and institutions for both research and management, data collection and management by volunteer from qualified organizations, and annual reporting, review and swift adjustment in protocols.

Topic Question 4:

Continued analysis and reporting to congressional leaders regarding the effects of climate change on the wilderness of Isle Royal. If needed, introduce appropriate vegetation to sustain the wilderness.

Topic Question 5:

The preliminary alternatives seem to offer a broad range of options. I don't appreciate that it will take yet another two years before any real action is taken. The data already presented in the report strongly suggests the relation between wolves and moose and the defoliating effects of no controls. Reintroduce enough wolves or packs of wolves to maintain a natural balance and do it now.

Topic Question 6:

No more studies on which alternative plan to use. Get on with the plan and study the outcomes, monitor the effects, and adjust the plan on a regular (annual?) basis. Get on with it.

Correspondence: Topic Question 1:

Isle Royale is a very special place whose ecosystem has been largely shaped by the last 50 years wolf/moose dynamic. It is a unique and priceless laboratory where the process of predator/prey/flora has been allowed to play out with minimal competing variables. Thanks to the research by Rolf Petersen and others in this micro-environment, we know far more about how the balance of nature will play out in its purest form. Therefore, to use management tools beyond reintroduction of a viable wolf population would be regrettable. You may have to do some culling of the moose herd over the next two or three winters until a couple of viable packs can be reestablished to protect the vegetation, but the goal should be to end intervention by NPS as soon as possible so the natural system can function. The research by the Wolf/Moose team from Michigan Tech has pretty clearly documented the statistical parameters of the system. We must use these parameters to guide the desire to "Manage" the system.

Topic Question 2:

1. How long it takes to make a decision. If the "study period" drags out for two or three seasons, the balance will be undone and more drastic measures than NPS has historically had an appetite for would be required to prevent destruction of the vegetation due to the burgeoning moose population as documented over the last three Winter Studies.
2. Given public squeamishness, culling efforts should be restricted to mid-winter when the park is closed and culling can be surgical thanks to the ease in finding and identifying target moose.
3. Contrary to normal wildlife management practice, NPS must resist culling the old and weak Moose. These should be reserved as prime targets for the reintroduced wolf population. Professional hunters should cull moose in prime breeding status if it is to be effective.
4. If winters become warmer, there is the potential that the deer tick and encephalitis issues will render Isle Royale unfit for moose. in that case, management would have to embrace reintroduction of deer as a replacement.
5. The introduced wolves are very likely to destroy the last of the current pack. Public Relations needs to be ready to deal with this natural event.

Topic Question 3:

Absolutely minimal beyond reintroduction of viable wolf packs. Culling should be done during Mid-winter to facilitate aerial identification of target moose and minimally invasive insertion and extraction of the cull teams.

Topic Question 4:

This depends on how the climate change presents in northern Michigan. If winters become more intense (as the last two have been), reintroduction of wolves should be sufficient, if done ASAP. If winters become warmer, there is the potential that the deer tick and encephalitis issues will render Isle Royale unfit for moose. in that case, management would have to embrace reintroduction of deer as a replacement and relegation of Isle Royale to the status

of a nice island to hike and camp on, versus a place where you can hear wolves call from your tent.

Topic Question 5:

I firmly believe that a robust injection of enough new wolves with diverse genetic pedigrees is the only viable alternative. "Enough" means at least two potential "packs" of 4 - 5 adult, breeding capable wolves. I dislike the "let's do a EIS for a couple of years" mentality because the situation is already in collapse. Reading the Winter Study on the estimated recruitment success of cow moose this year suggest dire trouble for the vegetation as early as this next season.

Topic Question 6:

If NPS stays in study mode much longer, they could make real money keeping the lodge open for a month in the winter and selling very high priced licenses for hunters to fly in and be ferried out to cull moose. Not very elegant, but a good source of income for an under-funded agency until the bureaucracy works through its processes.

Comments: If all you want is a place to hike and camp, there are lots of easier and cheaper to access sites in North Michigan than Isle Royale. The ONLY reason to go is the high potential of seeing moose and the potential of at least hearing wolves talking in the night. That is a sound that make all the aches and pains of 6 hours on the trail that day fade away and is the ONLY reason to go to Isle Royale if you are not a scuba diver or kayaker.

Moose-Wolf-Vegetation Management Plan/EIS

Outside Organization:

Affiliation:

Received: Aug,18,2015 20:27:47

Correspondence Type: Web Form

Correspondence: Topic Question 1:

It seems as though every alternative available is being discussed.

Topic Question 2:

Attempting to maintain a healthy ecosystem

Preventing long-term destruction of vegetation due to moose over-population

How an over-abundance of moose (and over-browsing) will affect other animals

Topic Question 3:

Is it possible to relocate "problem" wolves from the mainland to ISRO? Could wolves that prey on livestock - either in MI or from Rocky Mt States be trapped and moved to ISRO?

Could a move like this be made during the months of Winter Study so there are fewer people on the island? Is a soft release, like YNP, possible?

It should be understood that helicopters and vehicles would need to be used for this purpose.

Topic Question 4:

It seems less likely that wolves will migrate to ISRO from the mainland with fewer winters cold enough to form an ice bridge.

If the vegetation on the island changes to a more temperate mix, will the island still support moose? Would wolves eventually run out of prey if the vegetation is not right for moose to continue to breed and survive there?

While I am not a scientist or an expert, and I certainly trust the ISRO team to make the best decision for the island, my non-professional opinion is that wolves should be introduced at least once and more than once if necessary. I would like to see the wolf/moose balance maintained for the health of the island vegetation and all the inhabitants.

Topic Question 5:

I don't like the idea of a moose hunt to cull the heard, if that is being discussed (I don't remember if I read that in the newsletter or not!).

It seems like a more cost-effective thing to bring wolves in once or twice than to have to move live moose from the island a number of times.

Topic Question 6:

As I mentioned above, I certainly trust the opinions of trained scientists and biologists more than my own! That being said, it seems best to me to try to maintain a viable population of wolves to prey on the moose. Protecting the vegetation from over-browsing seems better than trying to "fix" it after it is over-browsed by too many moose.

Even though ISRO is designated wilderness, we humans are having an effect on the ecosystem there. Using helicopters/vehicles and maybe building temporary holding pens for new wolves seems like a fair trade-off for a healthy moose/wolf balance and a healthy ecosystem on the island.

Comments:

Correspondence Type: Web Form

Correspondence: Topic Question 1:

I have been a visitor about ten times to Isle Royale, always by our private boat. We were always fascinated by the incredible beauty of the place, but also impressed by the rigors developed by the Park Service to keep it as wilderness. Now the island struggles because the balance of the wolf-moose interconnection is thrown off due to the decreasing wolf population. I personally feel a more natural solution to the upsurge in moose would be to introduce wolves native to the region (certainly not zoo-type animals) that could hold their own in familiar climate and terrain. Culling the moose by shooting from

helicopters seems so horribly wrong when nature has a far more efficient way.

Topic Question 2:

Climate change will no doubt be a huge consideration, especially where moose are concerned. Obviously, Isle Royale now suits their metabolism with the cooler summer temperatures and cold waters. Warmer conditions may alter those factors, to the detriment of the moose. Which would in turn effect the number of moose the wolves would prey upon.

Topic Question 3:

I haven't been to the island in about seven years, so don't know how much the NPS is managing it currently, given monies are not as readily available for park upkeep or research. I thought then everything seemed under good management but the current problem points to more scrutiny, perhaps more intense management. I strongly believe the NPS should leave the island as designated wilderness forever.

Topic Question 4:

No simple answer to this one! Climate change is proving to be happening faster than first thought. Would guess management should take serious steps to research and understand how climate change is affecting the vegetation and the animals dependent on it.

Topic Question 5:

I do not like the idea of artificially culling the moose from the island. Another case of human vs nature, and nature always loses. I know introducing new wolves is also human intervention, but to bring the island back to its well-functioning and more natural status quo, I believe that is a viable alternative to bringing in guns when that doesn't have to be an option.

Topic Question 6:

I am privileged to call Rolf and Candy Peterson friends. I highly respect both of them for many reasons, but for sure the intense research done for all those years has to hold huge clout with their own vision of what to do with this problem on this incredible island. I do hope you listen to their reasons- -they, of all people, know the island inside and out not only scientifically but also their hearts beat with the pulse of that magnificent, unspoiled and wildly beautiful place.

Correspondence: Topic Question 1:

If no wolves migrate to and stay on the island after next winter introduce Wolves from diverse "families".

Topic Question 2:

The island has endured a moose population of 2500, without serious damage, while the wolf population was average to low. Culling of moose does not appear to be required at the current population. Excess of 2500 or high population for an extended period may need review.

Topic Question 3:

Minimal intensity. Introduce a few wolves from diverse backgrounds and let nature take its course as it did beginning in the 50's

Topic Question 4:

You can not manage the climate to a specific end. Cyclical change is inevitable. The creatures and vegetation will adapt or perish and other organisms will replace them

Topic Question 5:

Would prefer that wolves be introduced one time. Management of both wolves and moose may be necessitated based on future events. Keep options open but avoid unnecessary meddling.

Topic Question 6:

I have a long personal history on Isle Royale. Was a summer resident as a child and have visited several times as an adult and with my children. It is a special place that should be preserved in its wilderness state for future generations to explore and enjoy.

To that end some management will be necessary but over management or exclusion would be wrong.

Correspondence: Topic Question 1:

I read through the alternatives and feel the NPS should do whatever possible to keep a good balance in the park. Alternative C then is my choice. Reintroduce wolves then see what happens with the moose and vegetation. If the vegetation is already at risk then taking a proactive approach now is the best choice in my opinion.

Topic Question 2:

I think you should try and let nature take its course but as said earlier when it's clear that the park is in danger take preventive steps while trying to maintain the wilderness.

Topic Question 3:

The park is unique from other wilderness areas because it is isolated. If actions needed to save the park infringe on the wilderness I think the actions should still be taken to save the park.

Topic Question 4:

This is a tougher question because if the moose cannot graze on the vegetation that is naturally there it would become a losing battle to try and modify what grows due to climate change. I think some steps could be attempted with caution but it's not feasible to replace large areas of vegetation.

Topic Question 5:

I think doing nothing may doom the park except with a large die off of moose due to loss of vegetation that could in the end allow the park to recover in a way that is natural. This could in theory be a test for the rest of the worlds challenges with climate change. In that argument I can see where just introducing wolves would be a jump start for nature.

Topic Question 6:

Thank you for doing the study. It is interesting following the park and the wolf and moose interactions.

Correspondence: Topic Question 1:

Culling of moose should not be considered! Man has had a part in the creation of the problem with climate change, colder winters-ice bridges and warmer summers-ticks. Man also brought in diseases to the wolf population via dogs long ago. Many states are actively killing their wolves why not trap some of those wolves destined to be shot, such as a whole pack that will thrive as a pack without the need of killing others and will also be able to hunt the large moose prey. Just bringing in 2-3 wolves is not enough to make a pack strong enough to effect the moose population. Start off with several packs what ever the normal pack size is including an experienced and knowledgable pack leaders able to defend themselves against attacks for many seasons.

Topic Question 2:

Packs of wolves should be re-introduced so they have a fighting chance against large moose and several like sized packs will not compete against one another where if 2 wolves are introduced in one spot and 3 in another and 2 in another some will fight for control. Moose should not be culled. Leave the culling to the wolves that are re-introduced. In denning areas of the park where the wolves have pups limit travel and backcountry use by visitors so the pups have a good chance of survival.

Topic Question 3:

Leave the park wilderness, no roads, Although as a wheelchair user I am missing out on the use of the park I would very much like to experience!

Topic Question 4:

Kill the skeeters and ticks,they are effecting the moose and other animals

Topic Question 5:
No culling, no to concept D,E,F! Yes to B

Correspondence: HATS OFF to adopting Alternative C, the stellar plan to transfer persecuted, wild wolves in the Upper Peninsula from the mainland to Isle Royale, and maintaining both moose and wolves.

Essentials to include are ...
Wolves are reintroduced/augmented more than once, if necessary.
Moose populations are managed by contraception and/or sterilization and not by lethal culls.
The NPS must expedite its final decision by the end of 2016.

A win for the iconic, beleaguered wolves ... a win for the imperiled ecosystem of Isle Royale ... a win for our world!

Correspondence: Topic Question 1:
Keep the original concept of a hands off approach.

Topic Question 2:

Either this should be considered a wilderness and nothing should be "managed" or designate it an operating national park and manage it as such. But, stop trying to pretend that it's a hands off study if you do anything.

Topic Question 3:

None, if you consider it a wilderness.

Topic Question 4:

None.

Topic Question 5:

My previous comments explain my position.

Topic Question 6:

It would be really be nice to have places in the United States that are true wilderness and are treated as such. Sometimes places should be difficult to get to. Being difficult to get to makes it a wilderness by default. It defies casual tourism. Casual tourism requires infrastructure and consumption of energy and natural resources. And money! It would be nice to not have to go to Canada to find these things. With the explosion of world population, and the "everyone should be able to access all places" mentality, the true wilderness experience has been ruined in too many places these last couple decades.

Correspondence: Topic Question 1:

I know of none.

Topic Question 2:

I think that introducing wolves to the island will make a significant difference. However, doing something like controlling the moose population through the hunting of moose scares me. Vegetation management is the most logical option to me in terms of protecting wolves and regulating moose.

Topic Question 3:

More management should be given and taken into consideration when dealing with a wolf population that is so low and a moose population that is so high.

Topic Question 4:

Stronger management and more strict watch over the moose population and the wolves are going to help both parties survive the climate change.

Comments: The wolf population in Isle Royale is very small and needs to be protected. This is one of the only few safe havens for wolves of a dying species to live in peace. This is where the wolves won't be shot and are protected which is what is mostly wanted in this situation.

Correspondence: Wolves need to be reintroduced to Isle Royale because the wolf population in many places is declining. Isle Royale is one of the few safe zones for wolves. People will not shoot at them, the wolves will not just kill dogs for sport. They can live and breed and reproduce freely.

Because the wolf population in many other places is decreasing, wolves need to be introduced in a place where they can be safe. They will be safe on Isle Royale.

Also, the moose population on Isle Royale has increased because there are no wolves to hunt them and keep the population at a normal number. Bringing more wolves to Isle Royale will keep the moose population in check and allow the wolves to reproduce and repopulate the island.

SAVE THE WOLVES!!!!

Correspondence: Topic Question 1:

The wolves will need medical attention in the case of their spines. Afterwards they should be contained in a big, closed off area to themselves where they can be watched and taken care of until they reproduce. For the moose population, once it increases to an extravagant amount, which I'm sure it already has, then trusted hunter should be given permission with approved documents to hunt the moose to maintain population. The hunters amount of moose per hunt should be calculated to adjust to a healthy population. Once the hunters are finished their fur, antlers, and meat should all be used and not wasted. What isn't used should be sold to someone who can use it.

Topic Question 2:

When the populations of both the moose and wolves are back to normal, you should be able to release both of the back into their natural habitat.

Topic Question 5:

I don't like the fact of hunting the moose, but for overpopulation reasons, it must be done.

Topic Question 6:

I hope this helped in some sort of way and I hope you guys find a solution.

Correspondence: Topic Question 1:

I think that the six concepts represent all viable plans I might think of, so I have no additional insight on this particular question.

Topic Question 2:

It's become apparent as we look back on our history as a nation that we have done much damage to our ecosystems, both by introducing "solutions" to problems we created through overhunting of the destruction of native habitat for farming, railroads, cities, etc., and by doing nothing in times of ecological crisis. But when we consider Isle Royale, I think there are a few items to keep in mind. The wolves and moose arrived in the natural course of things, and their populations have risen and fallen as part of a natural cycle. They have not been exterminated by people.

Topic Question 3:

With so much of the archipelago designated wilderness, my first inclination would be to let nature take its course. When the current wolf population dies out, the moose population may rise and fall more dramatically as has been suggested. There may be over browsing, but plants and animals and waterways are part of the natural world which has mechanisms for restoring balance. What Isle Royale looks like in fifty or one hundred years may be very different from what it looks like now, but that is only bad inasmuch as it might impact sensitive species (like orchids) or our own sense of "what it should be."

Humans see a marvelous place at a point in time and come to believe that that is how it always was and always should be, and so the tendency is to believe that we should do everything possible to keep it there at that point in geological and environmental time. But when you remove the human element from the equation where humans are being neither destructive nor micromanaging (sometimes poorly) the planet moves on through its long history and enters new phases. On a smaller scale, we could view Isle Royale in the same way.

Topic Question 4:

Related to my comments above, the issue of climate change too is, at its core, a natural cycle (despite the obvious impact humans are having in the last couple centuries). The earth has warmed and cooled dramatically before. This happened without the influence of large human populations. The last big warming cycle that brought an end to the last Ice Age is what gave our marvelous state some of its most incredible features. That being said, it is obvious that the earth is changing and that it affects humans, animals, plants, water, etc. This may impact vulnerable species on Isle Royale. But I wonder if interfering in the wolf/moose relationship will have any measurable impact on this process.

The climate is changing. The wolf and moose populations are changing. Species adapt or die out and they have for millions of years. If either species were critically endangered I might have a different opinion, but it would be for selfish reasons of not wanting to be of the generation that allowed this or that incredible creature to become extinct. At this point my gut says to let nature take its course.

Topic Question 5:

Were I to choose one of the plans that has been suggested to alter the wolf/moose balance, I would choose to let the current wolf population die out (thus removing defective genes) and reintroducing a new pack, simulating a migration, which would be a natural event. I do not support moose culling which would disrupt the peaceful wilderness environment and would bring LOTS of bad PR to the state.

Topic Question 6:

I appreciate the chance to put in my two cents and I appreciate the obvious evidence of deep thought and careful consideration of the problem. I hope that whatever course of action is taken that someday I can get up there for a backpacking trip. And it would be perfectly lovely to hear wolves while I'm there. Best wishes to all of you who are involved in making these decisions.

Correspondence: Topic Question 1:

The best management tool is to reintroduce wolves to Isle Royale. If this cannot happen before the remaining 3 have died, the newly established wolves will figure out how to hunt and live on Isle Royale just as the first wolf did when she first made Isle Royale her home in the 1940s.

Topic Question 2:

Issue #1

We should look at the well-being of the two species in question -- moose and wolves -- in the national picture.

Moose are struggling to survive in other states including Minnesota where they are besieged by deer ticks. On Isle Royale, the moose have found a hospitable environment and, with a proper predator-prey relationship, can thrive. Moose need Isle Royale and Isle Royale needs wolves to keep the moose population healthy and in check. (The lynx is not an able predator.)

Likewise, wolves are struggling to survive in sustainable numbers out West where they are at the center of controversy with ranchers and hunters. Isle Royale, with its prey (moose) population intact and absence of human predators, should continue to be managed as wolf habitat.

Issue #2

People come to Isle Royale for the experience of wilderness. You cannot have wilderness without a healthy predator prey relationship. I was dismayed to visit Isle Royale this last week and know that it no longer supports a viable wolf pack. What will happen to the moose without the intelligent culling that ONLY wolves can supply? What will happen to the myriad vegetation that is its bountiful trade mark?

Will Isle Royale simply become another pretty, rocky landscape, or will it become a beacon for wilderness restoration?

Topic Question 3:

I have heard the argument that when it comes to managing wilderness, nature should be left to take its course. At this point in the history of the planet, people have so altered the climate systems effecting wilderness that to "let nature take its course" is to sentence it to destruction. Nature no longer can operate on its own, uneffected, unencumbered by human civilization. If we want Isle Royale to survive as wilderness, we must intensively manage it for wilderness. At the heart of the Wilderness Act is the survival or wilderness and in turn, the human spirit.

A peek behind the saying "let nature take it's course" is an empty, and destructive jingoism.

Topic Question 4:

I have heard that the boreal forest is moving further north and that Isle Royale, being on the border of the boreal and the deciduous forests is seeing a greater amount of deciduous growth. Both moose and wolves can thrive in either kind of habitat.

Topic Question 5:

Culling the moose heard is woefully insufficient to keeping the moose population healthy. Even trained hunters do not have the skill to select the moose that need to be eliminated from the gene pool. Only wolves can do that.

Topic Question 6:

Please keep Isle Royale wilderness. In order to do that, the wolf population must be restored. Embark on a wolf reintroduction program as quickly as possible. Isle Royale could be the next jewel in the crown of the NPS wilderness management efforts.

Correspondence Type: Web Form

Correspondence: Topic Question 1:

You are already not allowed wheeled vehicles in the park. I believe this should be increased to "No powered vehicles within 5 miles of the park EXCEPT the park services transports like the Ranger III.

Topic Question 2:
Consider the wolves and moose were not on the island to start with and it was decided to take a "hands off approach" to studying the wolves and moose.

Consider if you do ANYTHING you invalidate 50 years of research because we as a species couldn't keep our emotions in check and "HAD TO ACT".

Consider if we didn't even know the island existed the wolves and moose would be in the same predicament. That's IF the moose actually did swim there and weren't transported by a hunting club like some research is pointing towards.

Topic Question 3:
Evaluate what is the worst activities that have impact on the island and remove those. This is the "touristy" aspects. People bringing high powered boats to the island unchecked with the potential of bringing something on the island that is forbidden. People do what they want if left to their own devices, because "it's just MY dog". Or, It's just ONE solo cup. Isle Royale is not Cancun. It shouldn't be treated as such. And yet I hear stories of "party barges" pulling up to the docks or the shoreline area and interrupting the serenity that is Isle Royale. Let's do our part and keep it as nature intended.

Topic Question 4:

Close off all access outside of coming over on the Ranger III or the other ferry's. In 1988 we had the infection of the Parvovirus due to someone supposedly sneaking a dog onto the island and infecting the wolves.

If that is the case remove the possibility of a dog sneaking onto the island by closing off that access point. Have steep penalties for anyone that's caught on the island that didn't come on the ferry. Up to and including lose of the boat.

Topic Question 5:

I completely dislike the fact that this is even being put up for public opinion. This is a long term monitoring / experimentation of a biosphere to see how nature responds. The wolves as Rolf will remember back in 1988 became infected with the Parvovirus. To the best of my knowledge we had ZERO intervention. The wolves had a drastic decline in population and made a recovery a few years later. It was MIRACULOUS! No human intervention when people were certain that the wolf population would die off. Why would we do ANY intervention now?

Comments: I feel that Rolf and Candy are allowing their emotions come into the discussion. They have not only made a 30 year career out of studying this, but they have also raised family on the island. Up to and including one of the sons being a park ranger on the island.

If the wolves and moose die off they no longer have a job and lose animals they have become attached to over the years. I get it, we all have "soft spots" for things we dedicate our lives to. But we all need to step back and look at the big picture of what the original intentions were and why it is even up for debate of human intervention.

Hands-off means hands-off! Don't risk the study now. If the wolves die of, well They are non-native on the island anyways (along with potentially the moose). So it's just mother nature correcting herself.

Correspondence: Topic Question 1:
No action. Develop opportunities to study climate change as it occurs.

Topic Question 2:

Most of the alternatives are quite dramatic and invasive, drastic. Climate change is so much bigger than us. Introduction of wolves or direct management of the moose is premature. If indeed the trend is warming than you will need to reintroduce every 20 years or so. The is a National Park not an outdoor zoological garden.

Topic Question 3:

We should monitor and study the effect of climate change over time; this is an opportunity to develop some other research models to study the impacts of climate change on the island.

Topic Question 4:

Climatologist study historical data for likely past ice bridges. Study plants in a changing climate.

Topic Question 5:

Most are much to aggressive and out of place.

Topic Question 6:

Wolf and Moose are only a short span in the natural history of Isle Royale, it is too easy to get focused on something so small in the greater scheme of the natural history.

Comments: There has been times in the past with lots of moose and no wolves and they did not eat up the island then. More ice bridges are likely to occur. The scientist say when they cross they are looking for a mate during bad timing so likely to leave. Well a pair of new wolves are just as likely to cross and establish themselves too.

Let natural forces prevail.

Correspondence: Topic Question 1:
The only management tool that should be considered is leaving the island alone, without human intervention, which means not introducing species (like wolves) and allowing a specie to become extinct on the island if that is what evolution/natural selection end up dictating.

Topic Question 2:

From above: "leave the island alone, without human intervention, which means not introducing species (like wolves) and allowing a specie to become extinct on the island if that is what evolution/natural selection end up dictating." This approach includes both plant and animal species, as well as the non-living physical environment in which they live.

Topic Question 3:

Again, I refer to my response to Questions 1 & 2 just above: "leave the island alone, without human intervention, which means not introducing species (like wolves) and allowing a specie to become extinct on the island if that is what evolution/natural selection end up dictating." This approach includes both plant and animal species, as well as the non-living physical environment in which they live. As natural selection unfolds in a habitat, often a specie will overpopulate. This is natural as well, so people should not try to alleviate high numbers (intensity management), rather allow natural mechanisms to proceed (as they have done on earth until humans began "messing it up").

Topic Question 4:

NPS should not consider any type of intensity management through our changing climate we're experiencing. Rather, it should closely monitor what unfolds there, so we can learn from natural events how where we can adjust the environments where we've chosen to cluster so we're as adapted as possible to climate change.

Topic Question 5:

Like: NPS is trying to help.

Dislike: NPS thinks that by considering or doing an environmental adjustment, this wonderful island can be saved. It will save itself!

Correspondence: Topic Question 1:
None. I feel the alternatives presented are adequate.

Topic Question 2:

Using the least amount of human intervention to reach the desired goal.

Topic Question 3:

Given that Isle is 99% wilderness I feel like the intensity should be as low as possible to reach the goal. Alternative Concept B seems to be the answer. This one time influx of wolves to mimic a migration event would be the most natural type of management for the island. The other alternatives either interfere with more than one aspect of the issue (whether it be moose, moose wolves or moose, wolves vegetation) while Concept B interferes with just one - wolves. In theory, by increasing the number of wolves through human management, natural management of the moose population and over grazing of the vegetation would occur naturally.

Topic Question 4:

Although it is easy to argue that since the island is a designated wilderness no human intervention should be done, the NPS needs to take into consideration that the changing climate is a direct result of humans. Because of this changing climate, ice bridges are not forming as often which is preventing wolves to ingress/egress from the island. Alternative Concept B allows humans to help 'fix' a problem we have created.

Topic Question 5:

I like that Concept B only involves wolves which then would naturally manage the moose population and the preservation of the vegetation. I dislike that some of the other concepts involve more than one variable and the potential use of additional aircraft and vehicles on the island.

Topic Question 6:

I think taking no action (Alternative Concept A) is not an option. Something needs to be done to preserve this beautiful wilderness and I believe Alternative Concept B is the answer. Having just visited the island a little over a week ago (our team of four landed in Windigo and traversed the island to Rock Harbor in less than five days), I want this land to be preserved for generations to come. It is one of a kind and should be treated as such.

Correspondence: Topic Question 1:
Maintaining populations of moose and wolves on the island through wolf reintroduction.

Topic Question 2:
Wolves are a critical component of the island's wilderness culture - not just their presence, but their interactions with moose and the forest, in the absence of any hunting or logging by humans. One of the longest and most prominent research projects to ever take place in a federally designated wilderness would be sacrificed for the far-from-solid claim that doing so might affirm the value of non-intervention. Research indicates that an "overwhelming majority" of Michigan residents do not believe that allowing "nature to take its course" is an adequate reason to allow the extinction of Isle Royale wolves.

Topic Question 3:
Human actions have already altered the course of nature on the island. Wilderness policy recognizes the vital role of education in maintaining values that promote healthy relationships with nature. Wilderness policy also recognizes that recreation is an important value that is sometimes associated with compromising the wilderness value of non-intervention.

Topic Question 4:
Climate change has altered the course of nature in nearly every protected area. Consequently, the principle of managing for naturalness is becoming less coherent, and the value of non-intervention as a means of preserving naturalness is becoming less useful. The transition from naturalness to ecosystem health as a basis for understanding the value of wilderness is a concept appreciated by land management agencies.

Topic Question 5:
The other alternatives seem to have less to do with will of Michigan residents and modern wilderness policies.

Topic Question 6:
Failing to reintroduce wolves would degrade the wilderness value of Isle Royale, and wolf reintroduction is an appropriate way to honor that value. Lingering concerns about the inappropriateness of intervening in a wilderness are mollified by the evolution of our understanding of wilderness. That is, ecosystem health may well be superseding non-intervention as the central value of wilderness.

Correspondence: Topic Question 1:
Management tools are always in the ideal -- parvo came into the Park probably on the shoes of visitors and no one anticipated that. The I.R. moose/wolf study has presented more information than scientists could glean in other non-isolated environments and hands-off should be the byword.

Topic Question 2:
Determination of an ideal ratio of wolves and moose which will balance vegetation. When prey animals cannot linger at forage sites, foliage is not denuded. "Management" should consist of being alert to declining wolf/moose populations and not waiting until perhaps it is too late to make decisions about species re-introduction.

Topic Question 3:
Management should consist of allowing I.R. biologists to track wolf introduction and document/record interactions between wolves and moose to determine ideal ratios if possible.

Topic Question 4:
None at this time until trophic cascades can be evaluated as a result of wolf introduction and wolf/moose interactions. Do we know what species of beetles are in the I.R. vegetation and what effects their presence/absence has on vegetation?

Topic Question 5:
Alternative B is the best option although it is not spelled out sufficiently for review. So many of the alternatives are same old/same old as were presented with different species in different scenarios (Florida panther for example). I'm extremely concerned that no introduction is going to happen in the short term resulting in the worst possible consequence: no wolves, overbreeding of moose, loss of vegetation, denuded park, disease, dead moose.

Topic Question 6:
please see my comments in the comments section below.

Comments:

It is unfortunate that declining populations often become remnant populations before remediation is considered because there is a tendency when dealing with remnant populations to wait until the situation becomes dire before initiating such remediation.

Such was the case with development of cryptorchidism and other inbreeding manifestations in the remaining males in the declining Florida panther population until finally two female cougars from Texas were brought into the area in 1995. Before that reintroduction occurred, many of the same alternatives were proposed by NPS that are contained in the current document under assessment; and to my way of thinking too much time elapsed discussing the alternatives until a prudent conclusion was reached. While risks to that population continue, the increase in their numbers provides the opportunity for survival while other options are explored.

It is my sincere hope that the obvious conclusion in the Isle Royale situation is reached sooner rather than later and that not too much time elapses before that occurs.

That the two remaining wolves in the Isle Royale population do not represent a viable population is self-evident. Indeed, they may not survive another winter.

Toward that end, a recognized wolf pair who will start a new pack should be introduced along with two or three additional wolves who may start a new pack. I therefore support Alternative Concept B which seems to suggest this action while not spelling out my specific suggestions.

Other than observation, humans should play no additional role until the Isle Royale biologists have weighed in at a future time determined by them on the success or failure of the introduction.

Discussions of climate change and vegetation are ancillary to the urgent need to stabilize the wolf population and should be undertaken in a separate document in the future after wolf reintroduction when interaction between wolves and moose have attained the observable annual fluctuations that have occurred in the past. Trophic cascade effects on vegetation will also be observable at that time.

Thank you for the opportunity to comment on the proposals.

Correspondence: Topic Question 1:

Transplant wolves from the lower 48 onto Isle Royale. There is no reason for a wolf hunt in any state so let's protect these animals while keeping the ecosystem of IRNP in balance.

Topic Question 2:

While nothing will ever be in perfect balance, we need to do what we can to protect the beauty and balance of Isle Royale. Doing nothing is not an option.

Topic Question 3:

Most of the time we need to allow nature to run its course and not interfere in a designated wilderness. In this case, however, it is my belief that human intervention is critical to the stabilization of the natural resources of the island. Reintroduce the wolf to the island. It's what makes IRNP special, and it's what's needed to keep the island in balance.

Topic Question 4:

As stated above, 99% of the time we need to let nature run its course.

Correspondence: Topic Question 1:

I think that a few healthy wolves should be introduced to Isle Royale to increase the wolf population. I don't think you should let the wolves die off entirely. It is such a wonderful environment for them to prosper!

Topic Question 2:
The wolf population will help keep the moose population in check, which will keep the vegetation from being wiped out by the moose.

Topic Question 3:
I believe you have always treated it as a true 'biosphere' and I think that interference by the NPS should be kept to a minimum. Except, I still truly believe that wolves belong on the islands and you should help that happen.

Topic Question 4:
Climate changes have occurred as far back as recorded history, both colder periods and warmer periods. I don't believe in climate change or global warming!

Topic Question 5:
I don't like the idea of doing nothing.
I don't like the idea of letting the wolves die off and just managing the moose population.
I encourage the introduction of wolves to the island, which I believe will help manage the moose population.

Topic Question 6:
I know the wheels of progress work slowly, but by your timeline, no recommendation will be made until 2017?! In that time periods, the wolves could die off entirely, the moose population could skyrocket, and the vegetation could be overbrowsed to being non-existent in some areas.

Correspondence: Topic Question 1:

The six listed "options" are sufficient to address the issue.

Topic Question 2:
I have made 24 trips to the Island since 1990 and for many of those trips I listened to Park Staff and/or Ranger III presenters express the "International Biosphere"/wilderness/naturalness aspects of Isle Royale. Over and over the need to "leave undisturbed"/minimize human impact on the landscape of the Park was touted. Now that a popular/long running study is in jeopardy it appears that some individuals are more than willing to "toss all of that out" by promoting human involvement in the maintaining of the wolf population.

Topic Question 3:
The Park Service should maintain a totally "hands off" approach, let nature run its "natural course".

Topic Question 4:
Same answer as that to Question 3. Changes in climate are natural (even, as some believe, if they are the result of human activity) have always existed and will always exist. Just as the last ice age "created" much of what exists in the upper Great Lakes basin today, future natural changes could also create severe impacts on Isle Royale, let nature take its course without "trying to manage it".

Topic Question 5:

Only one of the preliminary alternatives is worth any consideration and that is Concept A. All of the others involve some type of "human management" and as is clearly evident that would be contrary to all of the Park Services previous philosophy regarding Isle Royale. Regardless of the impact of the loss of the wolf population, the increase/decrease in the moose population, nature should be left to run its course, whether or not it is distasteful to certain individuals or the public in general.

Topic Question 6:

Isle Royale is indeed a "very special" place, but natural forces have and will continue to change the Island. Early in the Parks history efforts were made to eradicate the "human impact" on the Island by the commercial fishing families...to return the Island to a "more natural state", and now a certain faction of individuals are promoting "human interference" by politicking for the reintroduction of wolves in some manner to "save" the type of Island they want. Is it true that in fact the Michigan Dept. of Natural Resources is the true "owner and determiner" of the wildlife on the Island? And without their approval there can be no reintroduction of wolves?

Correspondence: Topic Question 5:
I like Alternative Concept A. Leave it alone. Let nature take care of it.

Comments: I've been to the island several times. And hiked across it Rock Harbor to Windigo. And listened to Candy Peterson talk at the Daisy Farm campground. It was very interesting and informational. She said "many things we thought were true, we're finding out that we were wrong". And just think this is after we've been studying the moose wolf relationship for fifty years.

Isle Royal is a neat place. Just because an animal population is high or low doesn't mean we have to jump in and try manage it. We cannot control the amount of snow or number of cold days each winter. Just let Mother Nature take care of it.

Correspondence: Topic Question 1:

Having watched Michigan's and the Great Lake's ecology decline for 70 years I'm saddened. Comments from authorities - after hearing my concerns - indicate our natural world will always have to be managed; They tell me we can't turn back the clock or eliminate the many, many man made problems. Only management can keep places like Isle Royale and other parks wild and natural.

Topic Question 2:

The big issue is keeping Isle Royale in its historical, wild, natural state as much as possible. What balanced the moose population before wolves arrived? Can those conditions be restored? We know wolves weren't always on the island, what about moose? Is eliminating both species realistic? We know now that in such a closed system lack of genetic diversity will trump benign neglect.

We can't let the moose over browse. The public won't like culling the herd - so that leaves get rid of both animals or augmenting the wolves periodically. The old goal of letting nature take its course is out of date and doesn't acknowledge the real world.

The level of management and for what purpose are the issues to address. I'm not in favor of managing wolf/moose population just to please tourists. How far back can we realistically turn back the biological clock on Isle Royale. Can we afford the management it would require?

Topic Question 3:

I believe Isle Royale and all National Parks are under funded and over worked; and believe the intensity and expense has to match the difficulty of restoring and assisting natural processes to achieve a natural balanced and a wilderness status. I also believe the Park Service often bites off too much - trying to make the parks appealing and accessible to too many diverse interests. Separate the true wilderness areas and create semi-wild recreation areas. Isle Royale should remain, by virtue of its isolation, a WILDERNESS area.

Topic Question 4:

Management intensity has to increase in the face of climate change and other problems brought about by increased visitations, invasive species, global shipping in Lake Superior, etc.

If the Park Service believes fewer ice bridges in the future perhaps both wolves and moose will disappear, but in the mean time intensively manage the problem.

Topic Question 5:

Don't like #1 No Action because the moose population would alter the island too much.

Don't like #2 One time reintroduction of wolves will lead to same situation we have today.

Do like #3 Help Nature take her course by augmenting the wolf pop/genetic diversity as necessary.

Don't like #4 for same reasons as #2 is kicking the can down the road.

Don't like #5,6 because they rely on human control of moose population. If there are going to be moose then help nature process take place by promoting a genetically healthy wolf packs.

Topic Question 6:

I believe the park service should not try to make the park an appealing destination for every type of traveler. Concentrate on a true wilderness and less of a recreation area.

Don't give in to concessionaires and congressmen's desire to overpopulate the island. After all there is a carrying capacity for everything on the island.

Comments: Most of the options propose no wolves in the long run, and human control of the moose population, that would be neither cheap nor natural in the long run. Wouldn't it be closer to the Park Service's goals to encourage an ideal wolf population to control the moose. Or is that solution too artificial?

Is culling the moose herd by means of hunts un-natural? Many would prefer it to hunting on the island.

If there were no moose on the island historically why not eliminate both wolves and moose. With global warming making ice bridges less likely in the future the problem might be more manageable.

Prior to the arrival of white settlers there were no deer on either of the Manitou Islands in lake Michigan. The introduction of deer on North Manitou create overbrowsing. So much so that the Park Service still has to conduct culling operations. Either manage a prey/predator environment or eliminate both species. And don't go to the expense of controlling a moose herd just for the sake of tourist wildlife viewing.

Correspondence: Topic Question 1:

Genetic rescue of the current Isle Royale wolf population. I base this opinion on personal experience as a graduate student in the field of conservation biology at UC Davis as well as an opportunity to participate with MooseWatch in summer 2013. Hearing Dr. Rolf Peterson explain his reasoning for genetic rescue based on rigorous research and a deep knowledge of the island's ecosystem built upon many decades of dedicated observation and investigation, I hope to see NPS take up his expert advice. My own studies as a scientist and researcher indicate to me that Dr. Peterson has thoroughly

weighed all possible options for Isle Royale and would not speak on behalf of one in particular if he did not have rigorous evaluation to back up that claim.

Topic Question 2:

Climate change, invasive species, disease spread (i.e. parvovirus), cultural/social impact of Moose Wolf Study, public engagement opportunities (i.e. rigorous citizen science projects such as MooseWatch), island biodiversity and biogeography. The management of Isle Royale moose and wolves offers an incredible opportunity for scientists to better understand the processes of adaptive management, genomics, and genetic rescue. It is in the National Park's best interest to remain on the scientific world stage as it has for so long with the Moose-Wolf Study. It is essential to continue this important ecological work, and there is no way that can continue if NPS takes no action. There is so much potential for NPS to capitalize on if the agency can acknowledge that it must stay up to speed with inevitable change and thus build its own adaptive capacity by accepting new management practices that are sometimes non-traditional and remain on the research frontiers.

Topic Question 3:

Genetic rescue of the Isle Royale wolves- -while the Wilderness Act sets a valuable precedent for conservation in this country, complex issues of the 21st century and advances in conservation biology deem that we have to look at this statute differently than we did when it was first written into law. Specifically, the field of conservation biology was just gaining its roots as a frontier field in the 1970s, and management practices have been adjusted ever since. Other areas managed by Fish and Wildlife Service, USFS, and NPS in California for example include wildlife management in designated wilderness (i.e. SWAP- -State Wildlife Action Plan). So far, there are indications that intensive fish irradiation in the Sierra Nevadas (including designated wilderness such as Yosemite National Park) has been beneficial for endangered amphibian species.

Topic Question 4:

Adaptive management practice that at times may seem extensive. We are facing new challenges that we never have before, we can no longer afford to passively manage our environments. Resilience is built upon agencies like NPS being open to new conservation management practices and ideas and considering social values (such as presence of wolves on Isle Royale and citizen science efforts surrounding the study of them such as MooseWatch).

Topic Question 5:

If no action is taken, or even if wolves are reintroduced to IRNP after the current population dies off, a huge research opportunity to better understand species sub-population genomics and biogeography will be lost. Isle Royale as the opportunity to capitalize on issues currently at the forefront of conservation biology. While ignorant members of Congress are calling for the close of IRNP, the park as the chance to prove to the world why it truly is a World Heritage Site and what new knowledge it can help generate for the world. The other options for wolf management do not promote this, and with no wolves on the island, moose will likely continue to decimate vegetation and ecosystem collapse may be possible. As E.O. Wilson says, "Get in there and shift nature around a little bit, see what happens." As humans we are already doing so much shifting of nature, not usually for the better. This is an incredible opportunity to take that challenge on with the potential for resoundingly positive outcomes for once.

Topic Question 6:

I had the opportunity to visit Isle Royale and participate in MooseWatch because of a grant I applied for through my work as an environmental educator. I was later told that my proposal and the intricacies of the Moose-Wolf Study were so compelling, my proposal was the selectors' first choice. Since my experience as a citizen scientist on Isle Royale, I have been compelled to return to school pursuing a graduate degree in conservation management. The stories I have shared upon my return to CA of Isle Royale and of the moose and wolves has garnered immense interest from many to whom Isle Royale was an unknown place until I shared my experiences with them. Without the wolves, Isle Royale loses so much of both its ecological and social resilience. Please consider keeping alive the very emblem of wilderness, as well as the symbol for what has throughout our history been time and time again caste off, hated, and abused- -the wolf. In light of all that, the wolf is resilient, and it brings resilience in so many ways to Isle Royale. While large-scale management can be a scary notion, think of the Elwha Dam removal in Olympic National Park- -the second largest restoration project in NPS history, extremely intensive management to make amends for humans' own invasive inclinations in nature. ONP not sits in the national spotlight, setting a precedent for 21st century successful environmental restoration and management. Please be forward thinking enough to consider a similar future for Isle Royale National Park- -out of all the wild places I've visited, it remains my favorite, largely in part due to the wolves. While I've never actually seen one on the island, just knowing they're there is enough for me.

Submitted response on 8/19

Comments: After submitting my responses yesterday I had one more thought regarding this matter:

It certainly appears that from all that I have read and heard, over the past 25 years since I made my first trip to Isle Royale, that the moose and wolves are "new" arrivals to the Island (especially in geologic time), the moose arriving in the early 1900's and wolves later. Therefore, the wolf/moose phenomenon is just one of hundreds or thousands of "phases" which have come and gone in Isle Royale's evolving ecosystem. It should be viewed as such and no effort to artificially extend the phase should occur.

If the wolves disappear and alternatives "E" or "F" were chosen then why not the following: Eliminate all the moose as well and restock the Island with woodland caribou, reverting back to a time when these animals were present on the Island without the presence of moose or wolves.

I did hear a theory that the moose were actually moved to the Island by the Minnesota DNR or private citizens in the early 1900's, but no confirmation was ever established. Perhaps this did occur since during that time period the Island was privately owned and something very similar happened on Grand Island near Munising in the early 1900's when animals not native to the Island or mainland for that matter were transported to the Island by private concerns.

Correspondence: Topic Question 1:
Considering the current situation of the Isle Royal wolves I am concerned about the moose population continuing to grow unchecked which will have a negative impact on the vegetation/ecosystem. With that said it seems that one of the following should be considered:

Reintroduce wolves from the mainland.
Establish a controlled moose hunt to maintain a population that the islands vegetation can support. Has a hunting season been considered?
Possibly both of the above.

Correspondence: Topic Question 1:

I believe in the reintroduction of wolves but I do think the NPS will have to include periodic genetic boosts to that population over time. IR is an isolated location and I fear that unless periodic additions to the wolf population occur, the same genetic issues will reoccur.

Topic Question 2:

There is a need to control moose population levels or a variety of negative outcomes will occur. There needs to be a predator on the island that can exert some control on moose population. That predator cannot be human beings or the park is no longer a wilderness. Additionally, park visitation could be negatively affected if it no longer has wolves and is perceived as a place that no longer really is a wilderness.

Topic Question 3:

The less direct intervention the better. Reintroducing wolves or augmenting the few wolves left via adding to the population is certainly human intervention. But, once that step is taken for at least a period of time some form of predator/prey balance will occur. A regularly scheduled moose culling program will require ongoing human intervention of a destructive nature.

Topic Question 4:

Given the realities of climate change and its varied impacts upon the park, human intervention will have to occur. Direct culling of the moose population will probably have to occur but doing so via a predator is far and away a better option than having human beings shooting moose in what is supposed to be a wilderness park.

Topic Question 5:

I really dislike the idea of engaging in any sort of culling of the moose herd via hunting. That approach would ruin the wilderness aspects of the park which make it so unique. Instead of human intervention in the form of culling I strongly recommend the reintroduction of wolves as a natural form of moose control.

Comments: I have visited the park 34 times. I have hiked about 1700 miles on Isle Royale. The park has meant a great deal to me but I fear that unless thoughtful intervention occurs there will be a significant diminution of the wilderness qualities that make Isle Royale such a magical place, I hate the idea of human culling of the moose population. I strongly support adding wolves to the island in order to continue the predator/prey relationship that has been in place for 70 years. This is an imperfect option but one that would minimize ongoing human intervention. Thanks to all the people who work for the betterment of this wonderful place.

Correspondence: Topic Question 1:

I like the idea of reintroducing or augmenting the wolves on the island. Wolves are an important part of the ecosystem and hopefully, doing option B will allow the wolves to take care of the moose overpopulation issue which would help the vegetation recover. Re-evaluating the effectiveness of the option chosen should be done on a regular basis.

Topic Question 2:

Making sure there is a healthy functioning ecosystem - as much as it would be nice to have "no management", that would only work in a perfect world. Outside influences do affect the island, including human accentuated climate change, so being totally dogmatic and retentive about not managing a wilderness area could just lead to disaster.

Topic Question 3:

Good question - I dunno... Just don't be too dogmatic about it.

Topic Question 4:

Really good question. No clue....

So is climate change a factor in all the dead birch trees around South Desor CG?

Topic Question 5:

I do NOT like the alternative where wolves go away and people just hunt the moose. Hunters might like this, but I like there to be wolves on the island, even if they are "managed".

Correspondence: Topic Question 2:

I firmly believe that letting nature take its course should be the only alternative considered. Moose and wolves were not native to the island in the first place.

Topic Question 3:

If 99% of the land area is designated wilderness, let it be so. No need to mess with it.

Topic Question 4:

The changing climate has always been present, although the burning of fossil fuels may have contributed to the present cycle. The "management" or intended purpose of management has led to disasters in many parts of the planet. Mankind brings in a non-native species, plant or animal, and it has led to the disruption or destruction of the native species.

Topic Question 5:

I am a firm believer in the natural process. I dislike mankind intervening by introducing more wolves into the area. If wolves decide to cross an ice bridge and remain, so be it. If they don't, then so be it.

Topic Question 6:

If the current wolf population does not survive, it is not because of what has been done or not done. I think all of the research has been beneficial, but leave it at that. The wolves that crossed the ice bridge this past winter could have stayed on the island; they did not. There is plenty of food for them, but they did not stay. Why? If the moose will overpopulate the island because of the lack of wolves to "control" them, let nature take its course. Remember, they are not native to the island in the first place.

I have been to Isle Royal several times. I think it is a very pristine place and should remain so. Why mankind cannot accept the fact that nature has its own way to manage has caused many disasters in different parts of the planet. When will people wake up?

Correspondence: Topic Question 1:

It seems as though a good possibility exists that wolves will be exterminated from Isle Royale; that is the driving force behind this entire exercise. I don't see an alternative that is triggered by that possible event. For example IF wolves disappear from the island, several alternatives (most already noted) may be examined, but if they do not, what is the course of action. In other words, the alternatives seem to strongly suggest that extinction is imminent and even if wolves do not disappear, some of the alternatives will be considered.

Topic Question 2:

Due to the designation of the island as wilderness, I believe that "management" should be limited to a "hands off" approach. This natural laboratory has yielded much as a study site and should remain as interference free as possible. This is one place where we can let wolves/moose and vegetation teach us about their relationships....very few such places exist today.

Topic Question 3:

Management on Isle Royale should follow the edicts of the Wilderness Act and the various policies that NPS has adopted to conform to that act.

Topic Question 4:

I dont think that NPS should be baited into a "knee jerk" reaction regarding climate change. I hope that NPS does not actively change policy due to the spector of climate change. Again, this is a site where those changes can be carefully measured and interpreted.

Topic Question 5:

The alternatives do not provide an option that speaks to the imminent likelihood of wolf extinction on the island. For example, I would like to see the island remain as is without any interference until and ONLY IF wolves are extepated. Then we will have learned all that is to be known about an insular wolf/moose population in these circumstances. If we mettle in this balancing act before the "final chapter is written" we will never know what else was to be learned.

Topic Question 6:

The wolf population on Isle Royale has been at low levels several times in the past with dire predications. Although it is now at its lowest level, we still do not know IF it will recover, or WHEN it will be extirpated. There may be much left to learn about this insular system. One of the purposes of wilderness is to allow us to glean what the natural system has to offer us, potentially to apply that knowledge elsewhere. If the study of moose/wolves on Isle Royale would have been halted at several critical junctures in the past, we could have never predicted the outcome that we see today, and much of the excellent knowledge we have about this system would today be unknown.

Correspondence: Topic Question 1:

Bringing onto the island enough healthy wolves to form a viable pack seems essential to maintaining a balance between predators (wolves), prey(moose) and the natural vegetation that supports the moose.

Topic Question 2:

Since Isle Royale is (mostly) isolated from the mainland, it may need some management to keep a balance between predators and prey. However, ideally, once a balance is established it should be left alone as much as possible, knowing there will be inevitable fluctuations from year to year.

Topic Question 3:

Continuing to study and evaluate the health of the main predators and prey and the ecosystem that supports them would seem necessary and reasonable if we are to understand the reasons behind annual fluctuations within populations.

Topic Question 4:

As a part of any study, basic monitoring of weather and climactic conditions should be factored in. Climate tends to change more gradually, making Isle Royale the perfect lab for studying the effects of any changes on the ecosystem there.

Correspondence: Topic Question 1:

We need to reestablish the wolf population by bringing more in. It can work. No need trying to preserve the "integrity" of natural wildlife as it occurs - we need to protect those animals living on it, and give them a natural habitat they can call home. It's extremely important that both species maintain a strong presence.

Topic Question 2:

Their well-being, as well as the beauty of the isle.

Topic Question 3:

I think that reestablishing the wolf population wouldn't need to be a detriment to the designated wilderness area. We can still not be as "intense" with this, and still work toward the solution.

Topic Question 4:

No different intensity than what I listed above.

Topic Question 5:

Some of them don't protect the safety of the animals and their habitat, while simply reestablishing their presence wouldn't do harm at all!

Topic Question 6:

Save the wolves, yo!

Comments: Save the wolves, yo!

Correspondence: Topic Question 2:

Impact of present population of moose vs reduction of moose on vegetation, how a more diverse wolf population will effect the moose population by way of natural culling and how this will in turn effect the vegetation. Taking a step at a time and watching how it impacts the area would be wiser than taking an all or nothing approach.

Topic Question 3:

Make small changes and monitor impact by research scientists who deal not only with population control in the wild, but particularly micro-populations of this type that are self contained with only limited access to the outside world. (when the lake freezes over enough for moose and wolves to cross)

Topic Question 4:

This is even more reason to monitor the park and its populations over time and not make big changes with eyes closed.

Topic Question 5:

They sound like large steps, black and white, watching how each little step effects the area. Anything done will be magnified due to the relatively small area of the island.

Topic Question 6:

Thanks

Correspondence Type: Web Form

Correspondence: Topic Question 1:

I support Concept C, which allows for maintaining populations of wolves and moose.

Wolves could be reintroduced to better balance the number of wolves and the moose population.

There must be sufficient flexibility to allow for wolf reintroductions over the next 20 years to insure genetic diversity for wolves. 100% of the 30 wolves examined since 1994 have spinal anomalies. The weakened state of the remaining wolves is likely interfering with reproduction and survival.

Topic Question 2:

The NPS should evaluate the ecological benefits wolves provide. A balance of healthy, reproducing wolves would keep the moose population in check and eliminate the need for culling.

Topic Question 3:

99% of the land area of Isle Royale National Park is designated wilderness. It is incumbent on the Park Service to protect the unique wilderness qualities of Isle Royale.

Intervention is necessary to protect and enhance a healthy wolf population, the top carnivore which is vital for ecosystem health. Culling moose and the use of motorized equipment is unacceptable.

Topic Question 4:

Climate change is the greatest danger to wild places around the world. We need to immediately stop burning carbon, reduce our energy consumption, intensify recycling, convince park visitors that climate change is real and each of us is responsible for reducing our carbon footprint.

Topic Question 5:

The problem of declining wolf populations and the resulting increase in moose populations has been known for years. The Park Service has been slow to recognize and act on this

imbalance. The Record of Decision is not expected until Fall 2017. This is too long to wait for a decision.

Three unhealthy, non-reproducing wolves on Isle Royale National Park will not be able to keep moose populations in check which will further degrade the island's vegetation. Every effort must be made by the NPS to expedite the decision.

Topic Question 6:

The longest predator/prey study has been conducted on the wolves and moose of Isle Royale for more than 50 years. The balance of moose-vegetation-wolf are interdependent.

In 2009, the wolf population was 24. The latest survey shows 3 wolves, the lowest level since studies began in 1959. With so few wolf predators, it's not surprising last year the moose population increased from 1050 to 1250.

Conservation scientists believe that predation is vital to the health of ecosystems inhabited by large herbivores such as moose. On Isle Royale, there are only 3 wolves and predation has been effectively halted for the past four years and is expected to remain so for the foreseeable future.

Correspondence: Since the scope of any proposed actions is intended to address only the next 20 years, alternatives intended to manage moose population (options C through F) seem to be beyond the 20 years. For example, the concern about the climate warming and changing the type of vegetation growing on the island to be something less favorable to moose would be a longer term problem than is intended to be addressed here.

Budget issues are always going to be a concern, and alternatives C through F tend to be much more expensive than A and B.

In general, mankind does not have a good track record when intervening with natural processes. There usually is an unintended and unforeseen consequence.

For the above reasons I favor alternatives A and B. The argument for alternative A is that the wolves and moose came here mostly on their own and we should let things progress on their own as much as possible. The argument for alternative B is 2-fold, and probably emotionally driven: (1) There's value in maintaining the wolf/moose mystique associated with Isle Royale, and (2) having the wolves be a top predator will help keep the moose population from a boom and bust cycle which seems tragic.

Correspondence: Topic Question 2:

The NPS should allow change to happen, but should take action to ensure that the ecosystem is not being stressed by factors beyond climate change (i.e. high moose populations over-browsing the vegetation), so that it has the best chance of adapting to whatever the future climate looks like.

I don't know what the NPS should do if the moose population begins to decline as a result of climate change; that would have to be a topic for future discussion. Likewise if increasing the genetic diversity of the island's wolf population does not result in a sustainable population, I would be open to re-examining the alternatives.

Topic Question 3:

I realize that "letting nature take its course" is becoming less realistic in the face of climate change if we want to maintain the Isle Royale ecosystem as it has been in the past, but especially given the overwhelming percentage of wilderness in the park, I would prefer to see the most passive management possible to maintain a healthy and resilient ecosystem.

Topic Question 4:

I would prefer that the NPS start with the least intensive management actions, and use adaptive management to re-evaluate if those actions do not keep the moose population at a level that does not harm the ecosystem. A one-time introduction of wolves seems to be a low-intensity management action compared to active human management of the moose population.

Topic Question 5:

I am glad that the park service is considering augmenting the wolf population. I would be in favor of that, even if it isn't 100% "atural".

Comments:

Correspondence Type: Web Form

Correspondence: Topic Question 1:

The only viable, long-term alternative is to maintain a balance of predator and prey and a balanced Eco-system. The wolf population must be increased quickly. If the moose population is too high for the island to support, then contraception methods should be used until the wolf population is reestablished.

Topic Question 2:

Ensure an on-going balance between the wolves and moose so that both species thrive. Wolves hunt the weak, old and infirm thus ensuring the survival of the moose herd with the strongest of their species.

Topic Question 3:

One of the factors that disrupts wilderness areas is the influx of people and their pets. At a minimum, the number of human visitors needs to be limited and if pets are permitted, pet owners must provide evidence that they are not carriers of contagious diseases.

Topic Question 4:

Correcting climate change is a long-term, global requirement. For the shorter term, my only suggestion is some sort of bridge, perhaps barges, which can be placed so that the wolves are not dependent upon the ice flows.

Topic Question 5:

I dislike any form of hunting, especially for a cull, and especially in wilderness areas. The whole point of wilderness areas is to maintain the plant and animal species as they are - without human intervention. Too often, humans get too involved and wind up decimating the land or rendering a species extinct.

Topic Question 6:

This is a prime example of one of the many reasons wolves are absolutely necessary to the balance of nature. Their existence here is vital as it is in all wilderness areas. This must become a high priority and must be resolved before it is too late. We have a chance to do the right thing for wildlife.

Correspondence: Topic Question 1:

Moose hunting could be considered by lottery if the moose population allows some harvest. Hunters must be on foot. This will only work out if a way could be found for successful hunters to have help removing moose carcass.

Topic Question 2:

Preventing wetlands damage due to vegetation overuse.

Protect hiking trails. If hunting is allowed to cull the moose, there must be a way for hunters to remove the carcass without allowing individual hunters to run motorized vehicles on any fragile hiking trails.

Topic Question 3:

Augment wolf population but do not otherwise manage vegetation with intensity.

Topic Question 4:

At this time, affects on types of vegetation due to changing climate should only be monitored. Not in favor of vegetation intervention.

Topic Question 5:

Alternative C seems like a reasonable alternative.

I dislike the time frame. I think the wolf population should be augmented in 2016.

Topic Question 6:

Since there is precedent to introduce wolves such as was done in 1951-52, there is not a strong reason to avoid this option in the future.

Comments: To me it seems like the planning time frame is too long. Studies have been done on Isle Royale and after public comments, a plan should be able to be developed much faster.

Correspondence: Topic Question 1:

Please reintroduce a pack of healthy wolves.

Topic Question 2:

Studies should continue with minimal impact of the wildlife, vegetation, and visitors. We think a new pack of wolves will give new life to the park, similar to a fire. A fire is devastating but renews life for everything involved.

Topic Question 3:

Re-introduce new wolves and keep up the current intensity of management. Wilderness is very important to all of us.

Topic Question 4:

Re-introduce the wolves and let nature take it's course for the next 50 years. Animals will adapt to the climate changes. We all have to adapt.

Topic Question 5:

We like #2.

Topic Question 6:

Please reintroduce the wolves like they did in Yellowstone. It wouldn't be Isle Royale without them. Generally speaking a little help from humans is a good thing sometimes.

Comments: Please reintroduce a new pack of wolves for the next generations to study. Thank you.

Correspondence: Topic Question 1:

I believe the alternatives offered are sufficient in light of the present concerns.

Topic Question 2:

How important is it, what is the priority, for the moose/wolf/vegataion relations to remain silent directed by nature? Once man intercedes, the "relationship" will never be the same. Do we want Isle Royale to be the "natural wonder" that it is or an artificially managed "nature park"?

Topic Question 3:

I believe "wilderness" dictates a minimal interference by man. I believe the main question is "How important it it to maintain the wolf/moose/vegation balanced relationship vs letting nature take its course?"

Topic Question 4:

Little or none. Climate change is a natural occurrence,even though the extent and speed of this era of climate change is exacerbated by man. The more mgt. intervention in light of climate change the more "artificial" Isle Royale becomes.

Topic Question 5:

If it is decided that the moose/wolf/vegation relationship must be maintained at historical levels, then a "one time" action most likely will not be sufficient. We either leave Isle Royale alone to natures whims or we actively manage it to be a representative sample of what the natural world would be like. Then what do we do in light of continued and irreversible climate change.

Topic Question 6:

As a frequent visitor to Isle Royale both as a hiker/backpacker and a kayaker,I have found Isle Royale to be a magical place and the possibility to encounter moose/wolf only makes it more special. However, if nature decides to change the island then it remains wilderness. If we actively manage it for certain wildlife/vegation, then by definition it becomes less "natural". Either way, it would not decrease my desire to visit the island.

Comments: As much as I would love to see the wolf/moose relationship to continue and flourish, I believe intervention introduces a potentially slippery slope. If intervention is determined to be necessary, I would support the introduction of main land wolves as often as necessary to maintain the desired populations ofwolves and moose for the future. While such actions would affect the "natural" occurrence of wolf/moose population, it would enable the vital research on moose/wolf relationship to continue.

Correspondence: Topic Question 1:

None.

Topic Question 2:

Whatever would be the most natural course if humans hadn't been involved.

Topic Question 3:

The management should be small and minimal.

Topic Question 4:

In case ice bridges become much less frequent due to climate change, the NPS should consider periodically importing wolves to improve genetic diversity. I'm not convinced they should do this, but I don't believe they should consider anything more than that.

Topic Question 5:

I dislike the more intensive proposals. 4-6 are far too active. I like option 2 the most in that it mostly aims to repair the human-caused damage to the wolf population, such as diseases transmitted from dogs and falls down human-made mine shafts, but otherwise lets nature run its course. Correcting for these human-caused events by way of human action is a limited, sensible course of action to take.

Correspondence: Topic Question 3:

I know the fact that ISRO is 'wilderness' is one of the largest strikes against introducing new wolves... but Isle Royale had a huge resident tourist population for so long... whatever Rolf and Jon think is best is probably best for the world's longest running predator-prey study. Being a living laboratory is more important than being "wild".

Topic Question 4:
Lake Superior will never freeze again.

Topic Question 6:
I'm a former NPS ISRO employee. Isle Royale was my first, and maybe favorite, park of them all. I know that the wilderness designation is the primary hurdle towards introducing new wolves but it's honestly not that bad if we meddle a little. We can LEARN so much from this archipelago. I vote whatever Rolf and Jon vote- seriously. No one knows more about the island's mega fauna population than they do and I trust them 100% percent.

Correspondence: Topic Question 1:

You could allow more moose hunting.

Topic Question 2:
If you introduced more wolves the moose herds would be more controlled thus bringing vegetation life back just like at Yellowstone.

Topic Question 3:
Intensity management might be the problem if you stop killing the major predators the herds of all big deer elk & moose wouldn't have to be managed. I understand the cattlemens concerns but they knew the wildlife up there when they decided to bring a new food source in. Maybe instead of managing & killing the wild life you start managing the local poachers & ranch owners more.

Topic Question 4:
Stop clear cutting entire mountain sides you can't replant the trees to replace the oxygen quick enough if you do at all. Restrict the mining on mountain sides, I know money & politicians control all that but that's who really needs to be managed.

Topic Question 5:
First of all you allowed the killing of wolves for years because of the [expletive] ranchers that's the first mistake then the cougars then the bears, I think you see where this is going.

Topic Question 6:
All I have to say is the only thing that really needs to be managed is humans & their greed!

Comments: Thank you for allowing me to speak my mind & my small input on this matter. I don't think anything will change but it needs to now! Nature manages itself if you leave it alone it's the human interference that needs management. Thankyou for your time.
Sincerely

Correspondence: Topic Question 1:

There needs to be some places in the world where man does not interfere. Limited interaction with humans gives a baseline to what the world would be like if left alone.....giving a target to what other parks should try and emulate.

Topic Question 2:

As a person who has been fortunate enough to visit the island multiple times over the past 35 years, I value the remoteness and purity of the environment there. Key to this is the "hands off" approach which leaves most of Isle Royale in a state nature intends.

While it is tempting to interfere with this to save moose, wolves, and vegetation; not to mention the revenue generated, this is not the approach which should be taken.

Topic Question 3:

No change should be done.

Topic Question 4:

Pouring money into trying to make accommodations for the changing climate is futile. The climate will change more than man can compensate. Use the money to research and support areas such as traffic and education in all parks.

Topic Question 5:

If wolves wanted to reside on the island they would have stayed after crossing the ice bridge. They obviously found something unappealing about the habitat. Putting wolves on Isle Royale is no guarantee they will remain.

Culling the moose seems against the philosophy of such a natural place. Not that I'm against hunting, but to many this would be hard to justify when done by the NPS within a national park. This seems to be a horrible PR move in a time when our parks need more support from the public.

Topic Question 6:

It is sad that the Isle Royale experience I have been privileged to enjoy will not be available to my grandchildren. But human interference affecting the island is even more disappointing.

Visitors to the island treasure the remotes, not just to see the moose and wolves.

Comments:

Correspondence: Topic Question 1:

I believe that we should do a gene rescue of the wolves on Isle Royal. I have only been to the island once, but do plan on coming back in the future. I could not picture the island without wolves. As the wolf population increases in the Michigan UP, there are times that a wolf might have to be relocated. Why not bring it to the island.

Topic Question 2:

As with any management of natural resources, we should try to maintain a balance. Like we do with the hunting season for deer. What is the long term goal of the management of Isle Royal? Follow that as much as possible without human intervention, but it does not mean no human intervention.

Topic Question 3:

Again, follow the long term goal for the island. If there is only two wolves left on the whole island, then I would say we have high intensity to get to a balancing point. Then back off when we can. It depends on the nature of the emergency.

Topic Question 4:

Take that into consideration with the long term goal for the island. If the goal is to keep wolves, then do what is necessary to have healthy animals. If the issue is with vegetation, do what is necessary to keep things balanced. If it's dealing with invasive species or deciding to go in a totally different direction, then do what the long term goal would be.

Topic Question 5:

I went to Isle Royal to see moose, wolves, and the natural beauty. I don't like the idea of the island without wolves. And if you don't have wolves, I don't think you will have moose for long.

Topic Question 6:

Come up with a long (50-100 year) plan, and do what you need to do to have that happen. Allow some flexibility in your plan to modify your course (climate change), and do that plan with passion.

Comments: Thank you NPS for taking care of our parks, and all the work you do.

Correspondence: Topic Question 3:

Good question. Perhaps none. Just let nature do her thing. Man interfering seems to screw things up in the first place. Good intentions with unintended consequences.

Topic Question 4:
If the boreal species and island unique species are in imminent danger of extinction, can they be relocated to a more suitable climate? Or does that cause unintended consequences in the new location? I suspect so. This isn't my field at all. I suspect that millions of dollars and endless person hours can be thrown at this, and climate change will still win out.

Topic Question 6:
I'm conflicted between concept A and concept D. Either let nature play it out herself (even if we don't like the short-term result) and what will be, will be, 100 yrs, 200 yrs from now. Or introduce wolves once after the current genetic in breeds are gone. Give it one more try to balance out the moose and wolf populations. At this point, moose population is a lot more worrisome than wolf. I understand the island vegetation and other species will be thrown out of

whack, but I think that climate change is already too far ahead of us.

Correspondence: Topic Question 1:
Introduce more wolves and manage moose and vegetation as needed to maintain all.

Comments: Logically, if you want to maintain the island in a natural state, there must be a balance struck between predator-prey and prey-vegetation. Any imbalance in either of the dicotomies, and it will affect the other dicotomy.

The only way to establish and maintain the balance at this point, is to:

1. thin down the moose;
2. allow the vegetation to recover;
3. bring in more wolves;
4. observe the relationships;
5. intervene, as needed, if the relationships become skewed again.

Any other intervention will lead to one of the following:

- a. too many moose;
- b. eating too much vegetation;
- c. moose migrating away from depleted vegetation;
- d. wolves starving;
- e. unusable island.

Correspondence: I support the No Action Alternative regarding wolves and Isle Royale. Yes, I've heard wolves there many years ago. But in a wilderness, we must most often Let It Be. I've hiked the island for several days at a time, Northern Lights, wolves, and all. The wild character, without human manipulation, inspires my experience the most. All over North America, we've been chip chipping away at the natural landscape, such that there are few places where true wilderness can be had. Mankind cannot improve on it. As Teddy Roosevelt said years ago, we can only mar it - leave it alone. The wolves got there naturally and can be un-got there just as naturally.

There are times to withdraw from the "Management" consciousness. Most of our human managing creates more problems than it solves.

Thanks for your consideration.

Correspondence: Topic Question 1:
Management of vegetation should also be considered.

Topic Question 2:

If one species is lessened or diminished from Isle Royale, what impacts will it hold on all other species and the ecosystem of Isle Royale? Wolves especially, as a keystone species, could allow the elk to override the island and destroy natural vegetation until their population grows so large it cannot be supported, but by then much damage will be done. What impacts would a lower elk population induce?

Topic Question 3:

The situation should be managed without intervention as much as possible, however it is important that the ecosystem is kept balanced, in which case a little intervention may be necessary. A one-time reintroduction of wolves to the island should act as an attempt to reestablish the wolf population and let nature take its course from there. However, if the elk population continues to grow uncontrollably and it is shown to have great impacts on island vegetation, further action will be necessary to manage the island's wildlife and prevent the elk from causing harm. In such a case human intervention to lower the elk population should occur, but only as much as needed, and with strict rules that only the elk population will be lowered in the process. If at all possible, as little human interaction as possible with the island's animal populations should occur since it's a wilderness area.

Topic Question 4:

The NPS should keep its management light and step in only when necessary as changes in ecosystems are expected, however that is not to say action cannot be taken to manage wildlife and attempt to keep the ecosystem healthy.

Topic Question 5:

I like how many of them tend to provide little intervention and allow nature to handle the rest. However, I do not like the idea that the wolf population be left alone as it needs further support to ensure its survival as a necessary part of the island's ecosystem.

Topic Question 6:

It is vital the wolf population on Isle Royale remains healthy so that it may keep the ecosystem of the island healthy.

Correspondence Type: Web Form

Correspondence: Topic Question 1:

Concept C seems to be the best alternative but is too limited. There must be adequate room to allow for wolf reintroductions as necessary over the next two decades to ensure both genetic diversity and sustainable populations of both wolf & moose. There is no need to maintain or cull moose if wolves are allowed to fulfill their ecological roles. Other than things that people cannot predict, like absent wolf migration, there is no likelihood of a wolf population occurring without human action.

Topic Question 2:

NPS should consider and evaluate the ecological benefits wolves provide. The only pup observed in 2015 was visibly deformed and 100% o the wolves examined in the last 11 years all had spinal anomalies. The weakened state of the remaining wolves is in all likelihood affecting & interfering with reproduction and survival. The NP must consider the data collected in research conducted on Isle Royale over the last almost 60 years and those researchers

be allowed a key role in discussions.

Topic Question 3:

NPS must protect the unique wilderness qualities of Isle Royale through monitoring of habitat for wildlife, including wolves & moose. Management must be made to maintain proper wilderness values, including the presence of an apex predator which is crucial for a healthy eco-system. The culling of moose and the use of motorized equipment is unacceptable.

Topic Question 4:

Climate change is a very real and fundamental threat to species and places. NPS should encourage businesses, private entities and visitors alike to reduce carbon pollution and their carbon footprints. Because of climate change, wolves are unlikely to repopulate Isle Royale on their own. Immediate action must be taken to add more wolves to the current population.

Topic Question 5:

I feel like NPS has been dragging its feet for far too long already & are now only very begrudgingly taking action. There are too few wolves on Isle Royale to keep the moose population in check and the island's vegetation is being increasingly degraded. This process of action must be expedited!

Correspondence: Topic Question 1:

These alternatives run the gamut. They also reflect the reality on the ground in reflection of conservation best practice, tradition, and federal law. Well done.

Topic Question 2:

the ecosystem as a whole is of paramount importance. As such, balancing wilderness principles with the realities of human impact is the only way forward.

Topic Question 3:

The Wilderness Act should not prevent action by the Park Service. Howard Zahniser would be horrified to learn that 50 years on the act was being used to prevent reintroduction and the sustaining of a healthy ecosystem, as opposed to limiting human development.

Topic Question 4:

The islands will change as the earth warms. We should acknowledge, observe, and learn from this. If this means that certain cold weather species die out (up to and including moose) so be it. But for now, the park should attempt genetic rescue of the park's wolves.

Topic Question 5:

I like the less invasive approaches that still maintain a presence of wolves on the island. I dislike the high intensity gardening approach.

Topic Question 6:

The Park Service at Isle Royale has the opportunity to lead a durable, dynamic approach to park protection for the 21st century. Please do not squander it.

Citing a tradition of nonintervention-codified into law by the Wilderness Act of 1964-as reason to allow the island's wolf population to go extinct ignores reality. The Act is the product of a particular time when the impacts of pollution were just beginning to be understood (Rachel Carson's Silent Spring had been published only two years earlier). It was a time well before the threat of climate change would be understood. And it was a time when federally designated wilderness could be thought of as a fortress.

Although it is a remote island, to think of Isle Royale National Park as an ark of untrammelled nature ignores its connection to the larger Great Lakes ecosystem. The Great Lakes are geologically young and are being changed at an increasing rate by air and water pollution, invasive species, and climate change. All of these affect Isle Royale's wilderness in addition to the mistakes of human visitors who may inadvertently introduce disease into, or otherwise harm, native wildlife populations.

Correspondence: Topic Question 1:

Reintroducing wolves to the island is the most responsible option. I don't have a background in wildlife management, so outside of what is being suggested I'm not sure what other alternatives there are out there.

Topic Question 2:

Consider how the moose will decimate the vegetation on the island if their numbers are not kept in check via the predator/prey relationship with the wolves. Due to the eating habits of the moose it won't be long before they are starving themselves to death due to over browsing the available vegetation.

Topic Question 3:

Considering the wilderness portion of the park will be destroyed if the NPS does nothing they should take a very active role in reestablishing the wolf population. Reintroducing wolves to the island will not take anything away from the wilderness aspects of the park. Doing nothing will certainly lead to the destruction of the wilderness. The NPS should be working very intensely on this issue and not let it drag on for more and more years until it's past a point of no return.

Topic Question 4:

Changing climate is definitely a factor in the decline of the wolf population on Isle Royale as is the interference of man. The NPS should work closely with the Moose/Wolf Project to maintain a reasonable and healthy balance of both wolves and moose regardless of whether any fluctuation is due to climate change. I do not have the training or knowledge to recommend any specific solutions regarding climate change, but the NPS has an obligation to the people to keep Isle Royale in a healthy condition.

Topic Question 5:

That there is any consideration being given to doing nothing to solve this problem. It also doesn't seem right to not introduce new wolves and just "manage" the moose population. If this is a wilderness park then the predator/prey dynamic should remain. Otherwise it turns the island, a truly magical place, into a gruesome moose murdering nightmare. Knowing that these two species exist how they do is one of the most amazing aspects of the island.

Topic Question 6:

Isle Royale is one of my favorite places in the world. Everyone who visits has a truly unique and magical story to tell when they return. It's so diverse and full of life. Taking away a major part of the core of the island by not reintroducing wolves would eventually lead to the vegetation on the island being completely gorged by the moose leading to the death of not only the plants, but animals that survive on them and the animals that survive on those smaller animals. The NPS needs to step in, as it has in the past with other parks, and save this national treasure.

Correspondence: Topic Question 1:

I guess that I don't know. In large measure the problems seem to stem from the 'wilderness' designation which mostly translates to "Let Nature take its course." However, we've taken it out of nature's hands. Nature was doing fine until the early 1900's when, I surmise, hunting pressure caused the moose to migrate from the mainland. The moose being prey wolves followed. But in small enough populations to exacerbate statistical variations. Add the parovirus and 'climate change' which led to a weakened wolf population and an emaciated moose population due to food shortage and tick populations. Isle Royale is a national treasure and a natural showcase, but it is really not 'natural' in the wilderness sense. Thus Alternative C would seem to be the best course of action, but would require ongoing management of the health and welfare of both the wolves and moose. The food chain problem with overgrazing and plant species changes resulting from climate change need to be considerations in establishing a healthy population (the latter clause of Alternative E). But the above makes it less of a wilderness and more of a zoo.

Topic Question 2:

Vegetation would seem to be the base requirement. If the climate won't allow the naturally preferred food sources of the moose, then the moose will suffer. Without moose, the remaining wildlife won't sustain the wolves. Secondly, though, more effort seems to be needed to isolate the visitors and the wild population such that such unnatural intrusions as the parovirus are minimized; and mitigated if they do occur. A question which seems apparent, but which doesn't seem to be addressed is the rapid increase in moose population from roughly 1993 to 1996, followed by a precipitous drop of 80% of the moose population in the following 2 years - with no noticeable variation in the number of wolves. The causes of both could provide some areas to address.

Topic Question 3:

While designated wilderness, there has been enough human intrusion in the last 100 years to contradict the idea that the conditions on Isle Royale have naturally evolved. Experience seems to have shown that letting nature take its course is not a viable option if Isle Royale is to remain a viable natural

environment. Hence change the designation to a more managed Park environment.

Topic Question 4:

The problem is that its chasing a moving target. This July is reputed to be the hottest ever recorded. 2015 seems likely to gain the same status. For the Park Service I would suppose that the chore will be to analyze the past, predict the future, and take appropriate action to mitigate the damage. A really tough job.

Topic Question 5:

Alternative A has not advantage other than being easy and cheap, but spells doom for a viable natural Isle Royale park. Reintroducing more wolves seems the most rational providing that steps are taken to shield the new population from the unique diseases that plague the current population. The current moose population is unsupportable, particularly in view of climate change. A combination of Alternatives B & D. The out of balance present state mitigates against B. Alternative C ignores the present out of balance populations. Alternative E is a defacto alternative A. Alternative F allows/encourages the disappearance of wolves from Isle Royale

Topic Question 6:

With 'man' intruding into almost all aspects of our environment, its comforting to maintain islands where his hand is only lightly laid, but nature is an evolutionary process and often the time span required for Nature to bring things back into line exceeds the time spam that we are given to enjoy her works. Where our hand lays heavily on the environment, we need the Park Service to hold the line.

Correspondence: Topic Question 1:
Wolves introduced with new bloodlines to help keep the Wolf population healthy and Moose numbers in check. Seeing Parvo virus has been taken to the Island it is no longer a pristine place.

Topic Question 2:

Food supply and over grazing.

Topic Question 3:

Enough to keep it a somewhat balanced.

Comments: The need for new bloodlines for the Wolves is great. Without the Wolves the Moose will overgraze the Island and face starvation. With Parvo found on the Island it is no longer a pristine place. The U.S. Fish and Wildlife have done nothing but slaughter off the Wolves country wide for their big ranch and farm friends who pay nothing for the federal land their cattle graze on. It is time to use some real sound science and not what the rich cattlemen and farmers want.

Correspondence: Topic Question 1:
What is the vision of this park? What is its mission?

Topic Question 2:

What is the vision of this park? What is the role of humans in nature?

Topic Question 3:

Whatever is necessary to maintain the health of the ecosystem should be done.

Topic Question 4:

Whatever is necessary. In reality, all you need to do is maintain wolves.

Topic Question 5:

Shoot moose? you must be kidding!

Comments: 1)None of the alternatives is satisfactory. Isle Royales ecosystem has been managed by wolves ever since they arrived in the late 1940s, and it can be so again, if the NPS policy is to maintain a viable wolf population.
2) Letting nature take its course involves humans, who are, by nature, active, intelligent, social, and spiritual animals who try to do the right thing. When we engage in open, science-based, civil discussions about our public lands, we make good decisions. (ISRO management has ignored the Blue Ribbon Panel report - ISRO_Strategic_Plan_2009 - which advised/prioritized scientific research on the island.) We can and should mitigate for mistakes weve made in the past (bringing disease to the wolves, changing the climate, leaving old mine pits to serve as animal traps.) We know what the island needs - a top predator - and we can easily ensure that this goal is realized.
3) NPS staff often refer to the caribou-lynx system that existed in the past. Caribou and lynx are not a system - lynx prey on snowshoe hares, not caribou. Even if caribou were re-introduced to Isle Royale, they would need a predator, and the appropriate predator would be the wolf.
4) Isle Royale is a haven, and just about the only haven, for moose in the Great Lakes region, and moose have been proposed as a threatened species. Without deer, Isle Royale offers life without the threat of brainworm, a parasite that is lethal to moose.

- 5) NPS (ISRO staff) repeats the statement that the island will be moose-free in 30 years, if climate change means hotter, drier summers. The current plan covers the next 20 years. Lets deal with that time frame. Nobody knows what will exist here in 30 years. Right now, we have moose.
- 6) Prey such as moose, confined as they are on Isle Royale, need a predator to cull the old, sick and weak. This should be my first point and is the most important consideration when we are trying to manage Isle Royale's ecosystem.
- 7) Wilderness needs wolves. Of what good is a wilderness when its impaired?
- 8) Isle Royale is an International Biosphere Reserve, largely because it has been, until recently, an intact, healthy ecosystem.
- 9) The environmental movement has lost the support of the next generation because of its negativity. Young people want an opportunity to fix mistakes made by their elders, including lifestyle choices that have contributed to climate change. Isle Royale offers a great opportunity to do something right- to say, We made a mistake by not rescuing the Isle Royale wolves when we had the chance, but we can now introduce new wolves who will perform their vital role in ensuring the health of the islands ecosystem.
- 10) Many people submitted comments to the NPS via email over the past 2 years. These messages should have been made public and should now be included in the current public scoping process as they contained well-thought-out suggestions. I cannot believe that the current 6 alternatives arose from that email input.

Correspondence: Topic Question 1:
 I vote for Alternative Concept C - Maintain populations of moose and wolves on the island, which could include wolf reintroduction or augmentation.

Topic Question 2:
 The health of the population, which is linked to the ability to reproduce, is of paramount concern. If the populations are in balance, little should be needed in the way of intervention. Vegetation too benefits in a healthy ecosystem.

Topic Question 3:
 Isle Royale National Park is a jewel among our national parks. It's value to mankind can not be measured. What we can learn from the environment and the lifecycle of its inhabitants may one day influence our own futures - far beyond the borders of this small island.

Isle Royale is also a treasured vacation spot for many, although I understand that due to access issues, fewer individuals visit then many other parks. Still, we owe it to future generations to maintain and recognize its value and given its role as a natural laboratory, it is probably better to have fewer individuals visiting annually in any case.

Finally, wolves are persecuted around the world. Only here, on this protected island, are they safe to live out their lives as nature intended. How can we place a value on this? Isle Royale may well be our "Arc", saving an entire species whose value we are only beginning to understand and appreciate.

Topic Question 4:

Understanding climate change and its impact on Isle Royale inhabitants - this is going to be one of the greatest gifts that Isle Royale can give us. We are going to learn from changes on the island. These should be allowed to occur naturally so that we can see the impact that climate changes have on the flora and fauna existing on the island.

Topic Question 5:

I like the fact that we have these choices. I think that some of them would result in over-population of one species or the other and therefore they don't seem to make sense to me. Our goal should be to attain an ecological balance.

Topic Question 6:

I would defer to the scientists (Drs. Peterson and Vucetich) because I believe that given their years of history and work on Isle Royale, they understand it best. I hope that NPS listens to their experience and advise.

Comments: I am a Michigan native (currently living in Kentucky) who plans to return to Michigan and to retire in or near the Upper Peninsula in the next few years.

It is important to me that wolves be a part of the landscape that surrounds my future home. To me, the value of having a diverse ecologic landscape and a variety of inhabitants, including predators, is immeasurable.

I do NOT believe that wolves should be hunted however I do understand that population control is needed to assure a healthy population. I believe that this control should be carried out by wildlife professionals with compassion and professionalism.

Michigan citizens sent a clear message to legislators in Lansing that they too value the presence and influence of wolves. The population of wolves on Isle Royale is unique and should be treasured by us all.

Correspondence: Topic Question 2:

Out of the 6 plan option that NPS has proposed I think option #3 is the most attractive.

3. Maintain both species: Maintain populations of moose and wolves on the island, which could include wolf reintroduction or augmentation.

This is because if something goes wrong, it gives us a chance to learn from the mistakes and make it right the next time.

Another reason for #3 is economic - I visited Isle Royale last year (along way from my home in NM) mainly to hear about the wolf-moose interactions. Taking away the predators would seriously decrease tourism to Isle Royale.

Comments: Out of the 6 plan option that NPS has proposed I think option #3 is the most attractive.

3. Maintain both species: Maintain populations of moose and wolves on the island, which could include wolf reintroduction or augmentation.

This is because if something goes wrong, it gives us a chance to learn from the mistakes and make it right the next time.

Another reason for #3 is economic - I visited Isle Royale last year (along way from my home in NM) mainly to hear about the wolf-moose interactions. Taking away the predators would seriously decrease tourism to Isle Royale.

Finally I would like to add that it is appalling that the NPS has not done this study already, rather than waiting till the wolf population declined to 3(!) before even beginning the study. These processes take a long time, especially in a govt institution (I know because I work in one such place). The management should have started this study way earlier.

Correspondence: Topic Question 1:

I feel that It is our responsibility to ensure that there is a healthy population of wolves on Isle Royale. This will keep the Moose population healthy and under control. As a result, the vegetation will not be decimated and other wildlife will have habitat and balance also From the listed/suggested options, I feel that alternative Concept C would be best and Alternative Concept B as a second option. However, I don't think that introducing/reestablishing wolves only once should be the only consideration. If for some reason, the population doesn't thrive, or is low again in the future, the option of augmentation of the pack(s) should be done before the population gets as low as it is now. Also consistant introduction of new wolves will help the gene pool so the problem of in-breeding could be reduced if not negated. The introduction of new wolves periodically could simulate emigration from the mainland on ice bridges that would have formed if not for climate change, another human interference.

Topic Question 2:

Human interference should be acknowledged and we should take the necessary steps to preserve the National Park for future generations as well for future research. The introduction of parvo to the wolf population decreased the numbers which was interference by man. Also, climate change which reduces the

frequency and length of the formation of ice bridges is due to human interference. The old mine shafts are also the cause of wolf deaths. Letting the wolves die out resulting in the Moose population growing unchecked with no predator, until they decimate the vegetation to the extent that they die off from starvation is cruel. The entire eco-system will be adversely effected. The moose will decimate the vegetation, causing erosion and loss of habitat for smaller animals.

Topic Question 3:

Although 99% of the land area is designated as wilderness, humans have negatively impacted the natural environment and it is our responsibility to actively help reestablish and maintain the balance. I feel by ensuring there is a continuous and healthy wolf population which is able to keep the moose population in balance, it will help the entire island. I do not think that a moose culling or relocation of moose is necessary. If there are enough healthy wolves, we can let nature balance the population. While I feel it is our responsibility to ensure a healthy wolf population is maintained, I do not think that the use of helicopters and hunting by humans should be used for either wolves or moose. If we help the dominant predator when necessary, we can observe and only become involved when/if the wolf population becomes dangerously low. The researchers can continue to observe and learn and would be the ones to raise an alert when/if needed.

Topic Question 4:

Due to climate change and the decrease in frequency and duration of the ice bridges, I feel it our responsibility to ensure a healthy wolf population remains on Isle Royale. The presence of healthy wolf packs will ensure that the moose population stays in check, the vegetation will not be decimated, thus habitat for smaller mammals, birds, rodents etc. will be intact. Continuing the research and monitoring of the Moose/wolf relationship with minimal manipulation by us is ideal. However, we need to be ready to introduce new wolves when and if necessary.

Topic Question 5:

I like the fact that there are options being considered other than the no interference option. As I have stated above, I think it is our responsibility to ensure that Isle Royale is available for future generations with the Moose, wolf and vegetation as well as other wildlife present now. I feel to accomplish this, we need to monitor and ensure that the wolf population is at a healthy level and maintained at that level for years to come without having to readdress the issue every few years. Hopefully the balance of wildlife, vegetation and the streams, lakes etc will be positively impacted.

Topic Question 6:

Thank you for taking action to preserve this National treasure for future generations. I hope that the invaluable research, observation and learning can continue for many years because of the actions taken now. I feel it is imperative that we take responsibility to do what is necessary to ensure that there are healthy wolf packs as well as Moose herds on Isle Royale. We can achieve this goal with minimal interference, keeping the natural beauty and wilderness intact. We just need to help nature when it becomes dangerously out of balance, as it has become. In the future, we have to be diligent so that we can step in quickly and decisively without years of delay or procedure to rectify the unbalance. The fact that it is remote and has a short operating season helps to maintain the natural wilderness. There are fewer and fewer wilderness areas. We are responsible to preserve, protect and help maintain all wildlife in the wilderness.

Comments: Please see above (question 6). Thank you

Comments: Before I begin, let me give you some background.

Im a retired Forester who worked for the Michigan Department of Natural Resources, Forest Resource Division, for 34 years. The last 25 years I served as a Silviculturist working out of the Gaylord, Michigan office. While working, I was actively involved with Silviculture, timber sales and reforestation. Im well aware of the effects of excessive browsing (deer and elk) on the forest resource.

Ive been to Isle Royale ten times, the first being back in 1968 when I was in high school. My last visit was in May of this year and Im hoping to return to the island in early September.

I have a keen interest in the forest ecology of the Island and especially the Northern Hardwood resource that grows on the SW part of Isle Royale. Isle Royale is a unique place for any reasons, but the presence of a sizable stand of Northern Hardwoods in an otherwise mostly boreal setting interests me greatly.

As to the wolf/Moose issue, my own thoughts are that the NPS will have to actively manage the wolf and moose populations on Isle Royale. This will mean the NPS will have to monitor vegetation, moose numbers and wolf numbers and constantly adjust as needed. Adjusting as needed means reducing moose numbers when over-browsing becomes a problem and/or bringing in more wolves to keep the moose population at some desired level (whatever that number will be). It may also mean implementing some sort of vegetation management when needed. Setting up exclosures to keep moose out of sensitive areas and the planting of certain endangered plants/trees (e.g. Balsam Fir) may have to be considered.

I would prefer that the moose population be controlled by natural means, e.g. wolves, but if moose numbers rise to a level where major damage is occurring to the parks vegetation, the NPS should consider artificial methods of population control on a temporary basis. Im open to using sharp-shooters to cull the herd, and admit to being intrigued by the possibility of having a limited moose hunt on the Island.

I also think it is critical that a healthy wolf population be maintained. Being surrounded by Lake Superior, it will always be difficult for wolves to access the park. Ice bridges cant be relied upon which means there will always be the danger of genetic degradation of the wolf population occurring over time like we seem to be experiencing now. The wolf population may need to be periodically replenished to keep it genetically healthy and to maintain the necessary numbers that are required to control the moose population. I have no problem with bringing in wolves from Ontario or Minnesota as needed.

Im not even sure what Im suggesting is even possible. With 99% o the Island being officially classified as wilderness, management options are limited, probably more than I realize.

When looking at the alternatives listed in your Scoping Report, I dont think what Im suggesting (actively managing the moose population, actively managing the wolf population, and actively managing the vegetation) fits any of the alternatives listed.

I hope what I offer is of some help. And I thank the NPS for asking for input on this important matter. Isle Royale is a special place to me and I appreciate the chance to offer my thoughts.

Correspondence: Topic Question 1:
adopt Alternative C and maintain both moose and wolves, with these conditions:

Wolves are reintroduced/augmented more than once, if necessary.
Moose populations are managed by contraception and/or sterilization and not by lethal culls.
The NPS must expedite its final decision by the end of 2016.

The HSUS has proposed an elegant solution to this problem. In northern Michigan, where trophy hunting and trapping are now banned by voter referendum and also by federal protections granted to the wolves under the Endangered Species Act, we recommend that federal and state authorities consider the idea of translocating problem wolves or packs - targeted for destruction - to Isle Royale. That would address the concerns of Upper Peninsula residents worried about misbehaving wolves, and also help Isle Royale and northern Michigan by keeping the Isle Royale ecosystem intact and pleasing tourists who head to the park largely to step on terrain inhabited by wolves and moose.

Topic Question 2:
The moose population is growing rapidly without the full force of a healthy and viable wolf population to check its growth. There is a concern that the moose will inflict damage to themselves and to the Isle Royale ecosystem if the wolf population isn't restored.

Topic Question 3:
Wolves should be reintroduced/augmented more than once, if necessary. The reintroduction should involve humanely capturing wild wolves from the mainland and moving them to the island. This makes sense because science tells us that predators strengthen the health of an entire ecosystem. That's one central lesson from the wolf-moose research that began in Isle Royale in the late 1950s, and it's been reinforced after wolf reintroduction at Yellowstone

National Park in the 1990s. Moose populations should be managed by contraception and/or sterilization and not by lethal culls. In addition, visitors to the park should not be allowed to bring dogs. The island suffered a parvovirus outbreak some time ago brought by a visitor who brought his dog along that killed off a large number of wolves.

Topic Question 4:

Warmer winters, due to climate change, have made ice bridges from Canada more infrequent, making it more difficult for emigrant wolves to come to the island and add genetic diversity. Consequently, wolves may need to be reintroduced/augmented more than once, if necessary.

Correspondence Type: Web Form
Correspondence: Topic Question 1:
The existing options are comprehensive and practical.

Topic Question 2:

Maintain the wilderness experience; I think heavy handed approaches such as culling the moose are not in character with a wilderness experience. A healthy wolf population has and will bring the moose population back to sustainable levels. Isle Royale has had a long standing wolf population they are part of the ecosystem.

Isle Royale is a unique ecosystem and needs to be protected....island extinction events are not uncommon; man has unwittingly reduced the wolf population via global warming, the introduction of parvovirus, the creation of mines (drowning pools.. we need to lift up the wolf population.

Topic Question 3:

I think that wolves should be reintroduced to the island and let them augment the existing population and establish themselves. They will provide a natural tool for bringing the moose population down to a sustainable level. Helicopter gunships patrolling the skies in search of moose seem very out of character with a wilderness designation.

Topic Question 4:

Climate change will impact the island; this is inevitable....I am not sure that a lot can be done.

Topic Question 5:

I would like to see more information on the wolf augmentation plan; where would the wolves be obtained? how many wolves would be added? What portion of the island would be the reintroduction point? Etc.

I would like to see the opinions of various experts; including Rolf Peterson, John Vucetkich, etc....you have some of the best biologists on the planet studying the wolf-moose dynamics....what are their recommendations?

Topic Question 6:

Please augment the existing wolf population. In addition, Isle Royale has the worlds longest standing prey-predator study....what happens when there are no predators?

Comments: Isle Royale is a special place and a unique ecosystem. The wolves have had a series of setback,including global warming which has limited the ice bridges, parvovirus brought in by boaters, drownings from abandoned mine shafts, etc. Wolves are an alpha predator and have a proven track record of maintaining the moose population and thriving on the island. Please augment the existing wolf population immediately so,that we can continue use to enjoy Isle Royale for decades to comes.....Isle Royale without wolves is not Isle Royale.

Correspondence: Topic Question 1:

My preference is with Alternative Concept C. I would introduce enough wolves to allow for a sufficient gene pool. If over time there is in-breeding I would continue bringing new wolves to the island especially if the ice bridge does not form allowing wolves to move on their own from the mainland.

Topic Question 2:

No Answer

Topic Question 3:

My preference is with Alternative Concept C. I would introduce enough wolves to allow for a sufficient gene pool. If over time there is in-breeding I would continue to bring new wolves to the island especially if the ice bridge does not form allowing wolves to move on their own from the mainland.

Topic Question 4:

My preference is with Alternative Concept C. I would introduce enough wolves to allow for a sufficient gene pool. If over time there is in-breeding I would continue bringing new wolves to the island especially if the ice bridge does not form allowing wolves to move on their own from the mainland. I would allow the wolf population to 'handle' the moose naturally.

Topic Question 5:

I dislike Concept A, E and F. Since these problems are being caused mainly by man and possibly climate change, it makes sense for us to re-establish a natural prey-predator relationship on the island. I do not like the idea of culling moose.

Correspondence: Topic Question 1:

I believe that the wilderness set aside should not be changed. I think that bringing in new blood into the wolf population should be considered.

Topic Question 2:

Keeping the wolf population healthy.

Topic Question 3:

Considerable. It is a rare environment that needs to be preserved.

Topic Question 4:

Whatever it takes. The Isle is unique in that it is surrounded by the lake to help temper the climate.

Topic Question 6:

This environment is unique. Without the wolves, the herbivores would decimate the island. I'm sure hunters would be glad to step in, but I don't think that that is the answer. The intrusion of so many humans would destroy the quality of the island.

Topic Question 2:
humane treatment of animals; long-term effectiveness; level of human (boots-on-the-ground) labor required to maintain

Topic Question 3:
Alternative Concept B or C

Topic Question 4:
Alternative Concept B or C

Topic Question 5:
I like the options that allow wolves and moose to return to a balance in a natural process without humans killing them. I dislike the concepts of culling, reducing, and "managing to a low level" because I believe that these methods weaken the gene pool. Natural predation primarily thins weak and sick animals - this is typically not the target of hunting.

Topic Question 6:
Thank you for providing information on this issue and inviting public input.

Maintaining the most rare species should be given priority.

Topic Question 3:
Occasional intervention when the balance is leaning very far one way.

Topic Question 4:
Occasional intervention while keeping an eye on when intervention will become futile.

Topic Question 5:
It seems that all the best options have been presented.

Comments: I visit federally managed parks, forests and monuments several times a year. For my domestic travel, they are often the purpose of my vacation. I appreciate the opportunity for public comment on this matter.

I am untrained in conservation matters other than preserving quiet/noise control, so my comments are not from a biology or botany viewpoint, just as a visitor to natural areas. I have not yet been to Isle Royale, but have friends that have been.

I believe man has profoundly affected the environment, and pertaining to this matter, the frequency of ice bridges seems likely to decrease over time and thus the island will become less accessible to wolves.

I am in favor of Alternative Concept D, using wolf augmentation and professional culling of moose as needed. Translocation of live moose would be wonderful, but that level of management is much more expensive than letting the wolves or professionals control the population. Translocation should only be considered if the moose species becomes rare or if private donations allow it.

If the changing climate or other factors do not support wolves on the island for whatever reason, we should unfortunately accept our new reality and stop trying to perpetuate the past. Thus I am in favor of only once introducing a sizable of wolves that are projected to be self-sustaining and letting nature run its course with them.

Moose population control may have to be revisited in the future, as I understand their numbers are on a downward trend also, most likely due to climate change.

Thank you for your careful consideration of the situation and solicitation of opinions.

Best regards,

Correspondence: Topic Question 1:

For more than a half century wolves have demonstrated their ability to effectively "manage" the moose population and vegetation (via the trophic cascade) on Isle Royale. Of the six concepts being evaluated for the management of wolves, moose, and vegetation, three include intervention in the manipulation of the wolf population in some way. At this time the scientists who have been studying these interactions for nearly the same amount of time that the wolves have been on Isle Royale state that inbreeding is likely a major reason for the recent severe decline in the wolf population. Rather than resorting to "culling" strategies that would also likely require motorized or mechanized equipment to be used in a wilderness area, instead, use the knowledge that has been gleaned about wolf-moose population dynamics, and other related issues to monitor and "manage" wolves, which are at the apex of the trophic cascade on Isle Royale. Only Alternative C would provide the probable flexibility that would be needed to accomplish this task of monitoring and managing wolves, moose, and island vegetation over the 20 year time span of the plan.

Also, because inbreeding and inadequate genetic diversity in the wolf population has had a strong influence on the demise of the wolves on Isle Royale, Alternative Concept C should specifically state that there is flexibility in the plan for periodic wolf reintroductions as necessary. History and a changing climate suggests that multiple reintroductions could be needed in order to ensure genetic diversity in the wolf population. Accidental or planned human intervention is present in all biological systems of which we are a part. Values of justice and responsibility that flow from the human presence on Isle Royale will help guide and maintain sustainable wolf and moose populations on Isle Royale for at least the next 20 years covered by the plan, and hopefully, even beyond then.

Topic Question 2:

Something not mentioned in the issues section of the Scoping Newsletter was the role that researchers have had in collecting data and understanding the wolf-moose-vegetation interactions that have occurred on IR over the previous half century. These researchers should be given an important role in the discussions and reviews that will contribute to the consultations of the NPS about what to do about the situation described in the Scoping documents.

Topic Question 3:

The IRNP management plan and EIS includes the following: "However, at its essence wilderness character is unseen and immeasurable; a unique challenge of wilderness management. Wilderness character includes the natural and scenic condition of the land, natural numbers, cycles, and interactions of wildlife, and the integrity of ecological processes."

Wolves have intrinsic value, and prior to the arrival of more recent European immigrants to the continental US wolves were once present on the continent in large numbers. They were an integral part of the "wilderness". More recently wolves were nearly extirpated from the continental states.

I have had the bounty of spending some time on Isle Royale, have heard wolves howl, looked for and followed their sign & tracks, and even had one run through a campsite. Wolves constitute an important piece of several of the phrases in the above sentence from the IRNP management plan. As such, "intensity of management" should include enough of it to maintain the wolf presence in the National Park.

Topic Question 4:

This is a difficult question to answer as it is unclear, at present, what the changing climate might do to local weather patterns, especially over a period of only 20 years. However, the global climate is warming, and without knowing what the local effects might be near term, it could safely be presumed that eventually some of the changes mentioned in the Scoping Newsletter will occur. Given that ice bridges are the means by which wolves have moved on and off of Isle Royale, and that the likelihood the presence of ice bridges will diminish as the climate warms then, if healthy populations of wolves on the island are to remain on Isle Royale humans must intervene. How best to do this is addressed in the previous responses.

Also, some of the management options to be considered under this proposal could focus on what might be done to minimize the carbon footprint of the island. The NPS should consider how to work with the private businesses and other private entities on the Island to minimize and possibly reduce their carbon footprints.

NPS could create informational documents and flyers for the public that would help them understand changes to biological systems on the island that are being driven, in part, by a warming climate.

Topic Question 5:

Like: That the NPS is soliciting this public input about an issue that is intimately associated with the idea of "wilderness" represented by and present in the IRNP.

Dislike: Researches have described a need to do something about the declining wolf population on Isle Royale for at least 6 years. The decision on this plan is not scheduled to occur until late in 2017. These delays are undesirable and should be inappropriate for an agency charged with managing the public resource. The moose population is increasing as the wolf population has diminished to nearly zero. Waiting until late in 2017 to reintroduce wolves may be too long to prevent serious vegetation damage by moose on the island.

Topic Question 6:

Some other points to consider:

1. Wolves are at the apex of the trophic system on the island. Without the wolf the entire trophic cascade is affected.
2. Scientific research has highlighted the value of wolves to the health and diversity of the biological network on Isle Royale and in other places in the US.
3. Wolf is thought to be the predecessor of our "best friend". So, how is it that so many fear and despise the wolf? The presence of wolves on Isle Royale and the ongoing research there contributes to our education and understanding of wolves that can serve to overcome inaccurate and inappropriate myths, fears, and beliefs.
4. There is much value to the population dynamics science that has been gleaned from studying the wolf-moose population on Isle Royale. What are the lost opportunities that will occur as a result of allowing the wolf population to disappear?

Correspondence: Topic Question 1:

1. What other...should be considered? NPS is one of many federal and state agencies that have significant data from research and knowledgeable experts available to assist with decisions concerning managing their resources. NPS should use their research data as well as listen to and give weight to the suggestions from the experts that have been involved in the multiple-decades long research efforts studying the Moose-Wolf population at ISRO. Additionally NPS has successfully manage these animal population in other locations and those program can be used as models for ISRO. Yellowstone National Park's reintroduction of wolves several decades ago has been seen by many as a successful rebalancing of one part of that parks ecosystem. That Park is not culling its animal herds but rather using nature to manage itself.

Topic Question 2:

2. What Issues should be considered...? ISRO should be managed within the dual directives of the NPS Organic Act and related directives as well as the Wilderness Act. Management plans should be to "preserve and protect" and emphasize "man as a visitor".

Topic Question 3:

3. What type and intensity...? NPS already goes beyond the intent of the Wilderness Act in many ways at ISRO and this new study should not be used as another opening to violate the intent of that law. For example, the use of Helicopters as a management tool or supporting hunting to control the Moose population should not be seen as fitting within the intent of the Wilderness Act at this National Park. Based on available new drone technology the need of managing animal populations with helicopters is an unwise use of funds and not necessary. Drones can easily be used to count animal populations at all times of the year without harming the environment or the visitor's experience. While hunting is allowed under the Wilderness Act and does occur in many NPS units, including others located in Michigan, it can be argued that that the Act's intent at this park is that "man" should not manage the designated regions with a heavy hand but more of a standoff and let nature rule. There is no need to "control" the Moose population with hunting. Often animal populations are not control by "culling" rather managers are responding to sporting group's desire to bag a big one. The recent wolf hunting debate that continues in Michigan concerning the hunting of wolves is just one example of managers and hunting groups using their needs as the driving force to decide how to manage animal populations. We know from managing animal populations for decades that culling the large males, which hunters often do, does not control animal numbers. It would be a poor decision, based on people's need, not animal management, if hunting was allowed.

Topic Question 4:

4. What type...consider in the face of a changing climate? NPS has an opportunity to demonstrate its commitment to addressing climate change by reducing its energy needs by committing to only using renewable energy sources. This could be done by reducing its staff footprint at this wilderness park to only needed personal. A significant percent, not a majority but a significant number, of the visitors to this park are not members of the general public but rather family and friends of the staff and life leases. It is time to lower the impact of these groups by committing to lowering the energy needs of this park. This can be accomplish by using only renewable energy sources at all locations, reviewing each NPS position and lease to justifying its need to be located and supported at the island rather than elsewhere. NPS should and can make a commitment to reduce its impact at this Wilderness Park and provide an example of reducing climate changing energy production.

Topic Question 5:

5. What...preliminary alternatives? A, B, and C all have benefits and seem to fit within the directives that should be used to manage this National Park. Which one is best? I would suggest the NPS turn to the experts and ask them. I am willing to give them my vote on A, B or C. It can be argued that there is a need to reintroduce wolves due to climate change's impact on Lake Superior ice and the increase of population on the shoreline of Minnesota and Canada interfering with wolf migration to the islands. Managing animal populations by reintroduction is a time honored method employed by the NPS in other locations but as Aldo Leopold taught us hunting is not a method that is true animal management. Let nature be in charge.

Topic Question 6:

6. Additional comments: In closing, I would recommend that NPS listen to the nationally known researchers that conduct research on this topic since they know and understand this issue better than any of us. While I support public processes, such as this one, being undertaken by the NPS, I recognize that sometimes there is research data and individuals that are far more knowledgeable and available to help us make a decision. This is a case on the topic of Wolf-Moose management at ISRO. NPS can seek expert researchers at ISRO and other parks such as Yellowstone for their input based on years of research along with the general publics.

Correspondence: Topic Question 1:

The six options provided seem to be adequate.

Topic Question 2:

The reasons that animals can no longer migrate to Isle Royale may be because of effects caused by humans; so who knows how to determine "normal?"

Other places throughout the United States there are those who want to justify killing off wolves because they endanger the lives of livestock or whatever else they might choose. Anyone who makes the effort to reach Isle Royale would be on razor thin ice trying to find any such justification; so Isle Royale

seems like the perfect place to ensure the wolf population doesn't go the way of the Passenger Pigeons.

Topic Question 3:

To me, the option of maintaining what can be determined a "natural" balance of wolves and moose makes sense; which includes introduction of new wolf families to avert the need for breeding within families. (From what I understand of the family mores of wolves, mating outside of their own family would be a singular choice, were it choice.) In making any decision, I'd wonder if it might be best if Rolf Peterson had veto power on any options he felt would be ill-advised - - including mine.

Topic Question 4:

it seems to me that humans can't say they have NO effect on climate change; so what I said in response to Question 3 applies here.

Topic Question 5:

Seems to me the six alternative I've seen delineated pretty well cover choices.

Correspondence: Topic Question 1:

Treating Wilderness as wilderness - and, therefore, no options should be considered that require human intervention. The only option that respects the wilderness character of Isle Royale is Alternative Concept A, the No Action Alternative. This alternative is the best alternative to protect Isle Royale's unmanipulated, untrammelled wilderness character.

Topic Question 2:

The fact that Isle Royale is wilderness. Isle Royale's wilderness designation requires that we protect the area's unmanipulated, untrammelled wilderness character. Transplanting wolves from the mainland to Isle Royale is a major manipulation of the Isle Royale Wilderness and must not be done.

Topic Question 3:

No options should be considered that require human intervention. The only option that respects the wilderness character of Isle Royale is Alternative Concept A, the No Action Alternative. This alternative is the best alternative to protect Isle Royale's unmanipulated, untrammelled wilderness character. Isle Royale's wilderness designation requires that we protect the area's unmanipulated, untrammelled wilderness character. Transplanting wolves from the mainland to Isle Royale is a major manipulation of the Isle Royale Wilderness and must not be done.

Topic Question 4:

In wilderness, NPS should just let nature take its course. This has already occurred in Isle Royale - woodland caribou are no longer on the island. If wolves cease to be there as well, it's wilderness, that's OK. Even climate change should not change how wilderness areas are managed. Instead, NPS should focus on ensuring that there are corridors between wilderness areas for appropriate movement. But climate change should not be used as an excuse for human-based meddling in wilderness areas. Nature should still be allowed to decide what happens - not humans.

Topic Question 5:

Only Alternative Concept A recognizes the unmanipulated, untrammelled wilderness character of Isle Royale. The rest should be scrapped because they interfere too heavily and disrespect the wilderness character of Isle Royale.

Comments:

Correspondence: Topic Question 1:

Concept C appears to be the best alternative, however, it does not go far enough. There must be sufficient flexibility to allow for wolf reintroductions as necessary over the next 20 years to insure genetic diversity for wolves and sustainable populations of both wolves and moose into the foreseeable future.

Maintenance or culling of moose is not necessary if wolves are allowed to fulfill their ecological role. Absent wolf immigration, which no one can predict, there is no likelihood of having a wolf population without human action.

Topic Question 2:

We believe the NPS should consider and evaluate the ecological benefits wolves provide; The only pup observed in 2015 was visibly deformed; 100% of wolves examined since 1994 (over 30 of them) have spinal anomalies. The weakened state of the remaining wolves is likely interfering with reproduction and survival.

The NPS must consider the data collected through 57 years of research conducted on Isle Royale. These researchers should play a key role in the discussions.

Topic Question 3:

NPS must protect the unique wilderness qualities of Isle Royale through monitoring of habitat for wildlife, including wolves and moose; maintenance of soil and water quality and ecological stability of plant and animal communities including the control of invasive species. Management is necessary to

maintain important wilderness values including the presence of a top carnivore which is vital for ecosystem health. The culling of moose and the use of motorized equipment is unacceptable.

Topic Question 4:

Climate change poses a fundamental threat to species and places. The only way to slow the impacts of climate change is to globally reduce carbon emissions. NPS could produce an informational flyer explaining the negative impacts climate change is having on Isle Royale such as the changes in the duration and frequency of the ice bridge, winter ticks, bird species etc. NPS could engage with businesses and private entities that use the island to reduce carbon pollution. Encourage visitors to reduce their carbon footprint by not bringing / disposing of water bottles.

Moose are not likely in any direct danger of being reduced by climate change, however, wolf predation is needed to limit the growth in their population.

Because of climate change, it is unlikely that wolves will be able to repopulate Isle Royale without NPS intervention and we ask for immediate action to augment / reintroduce wolves.

Topic Question 5:

For years, researchers have been sounding the alarm about the plight of wolves on Isle Royale. Yet, the NPS has chosen to take no action until now. The public scoping period ends 8/29, however, the Record of Decision is not expected until Fall 2017 at the earliest. Two and one-half years is simply too long. This foot dragging on the part of NPS is unacceptable.

Evidence suggests that the few wolves on the island will not be able to keep moose populations in check which will further degrade the island's vegetation. Every effort must be made by the NPS to expedite the decision.

Topic Question 6:

I have always wanted to visit Isle Royale National Park to see the wolves and moose in an unspoiled wilderness. The use of motorized vehicles is completely against what I value most in the park and the culling of moose will not be necessary with a healthy wolf population. Please do all you can to strengthen the wolf population and keep this National Park as wild and natural as possible.

See below.

Topic Question 2:

The wolf/moose population have been studied long enough that it should be a scientific basis for establishing an ideal ratio of wolves and moose on the island. this can be used as a guide to 'management' of the ratio. It's already a park that has the need for significant management due to its size and island location.

Topic Question 4:

See question 2 above. for example, there may be less years with a hard freeze of Lake Superior (even though recent winters have been cold). One must look at the long prospective.

Comments: Over the past thirty years I have visited Isle Royale several times and hiked its length from Windigo to the other end twice and paddled a canoe up the harbor and then portaged across the island to McCargo Cove before venturing outo Lake Superior and around the island back to Windigo. they were each unique and beautiful journeys, made more so by encounters with moose and the knowledge that there were wolves present around us. On more than one occasion we heard them howl at night.

I understand now that, due likely to inbreeding and resultant decline in wolve viability, the population (which ofter hovered between 12 and 24) has been reduced to 3. Three wolves can not sustain a pack without drastic action.

Therefore I strongly support the introduction of at least four (more likely 8) new wolves onto the island to broaden and strengthen the gene pool. Without the wolves the moose will enter a boom/crash cycle that, When at its height, will significantly change the vegetation on the island; perhaps in a permanent manner. Having an active wolf population will act to restore a balance that will also be beneficial to the moose in that there will be sufficient food in most

years to reduce death by starvation.

Phyllis Green, Superintendent
Isle Royale National Park
800 East Lakeshore Drive
Houghton, Michigan 49931-1896

Subject: Protect Isle Royale Wilderness from Human Manipulation - - Moose-Wolf-Vegetation Management Plan/EIS Public Scoping Comments

Dear Superintendent Green,

Thank you for the opportunity to comment on the Moose-Wolf-Vegetation Management Plan and Environmental Impact Statement for Isle Royale National Park and Wilderness, which will analyze options for the declining wolf population, including transplanting wolves from the mainland. I encourage the National Park Service (NPS) to protect Isle Royale Wilderness's untrammeled character from overt human manipulation.

"Every man who appreciates the majesty and beauty of the wilderness and of wild life, should strike hands with the farsighted men who wish to preserve our material resources, in the effort to keep our forests and our game beasts, game-birds, and game-fish- -indeed, all the living creatures of prairie and woodland and seashore- -from wanton destruction. Above all, we should realize that the effort toward this end is essentially a democratic movement."
-- Theodore Roosevelt

Changes continue to occur on Isle Royale. In the late 1800s, the primary predator-prey dynamic there dealt with Canada lynx and woodland caribou. Neither of those species survived, and they were ultimately replaced. Moose arrived in the early 1900s, and by the 1950s, wolves had also arrived. Isle Royale is an ever-evolving ecosystem, and a classic case study for the changing dynamics of island biogeography.

Researchers have studied the well-known wolf-moose predator-prey relationship on Isle Royale for over 60 years. But the wolf population has become inbred over the decades, and has dropped in numbers in recent years. In 2015, only 3 wolves could be located, compared to 9 in 2014. This drop has occurred despite the formation of ice bridges to the mainland during the past two winters, which allowed wolves to move between the mainland and Isle Royale. With the declining wolf population, the moose population has increased to about 1,250.

Wolf researchers and some wolf advocates have advocated for the NPS to transplant more wolves to Isle Royale. The NPS is also considering culling or translocating moose, perhaps with mechanized or motorized equipment. But such actions would be contradictory to Isle Royale's wilderness designation and represent a significant human manipulation of the Isle Royale Wilderness.

"With regard to areas of wilderness, we should be guardians not gardeners."
-- Howard Zahniser, author of the Wilderness Act

Congress designated about 99% of Isle Royale as Wilderness under the 1964 Wilderness Act. The Wilderness Act defines Wilderness in part as "untrammeled" or unmanipulated. The Wilderness Act requires humility and restraint on the part of us humans, where we let Nature call the shots rather than imposing human preferences upon the landscape, even if that might mean in this case that wolves become temporarily or permanently extirpated from Isle Royale.

Alternative Concept A, the No Action Alternative, is the best alternative to protect Isle Royale's unmanipulated, untrammeled wilderness character. Please protect Isle Royale's wilderness status.

"A thing is right when it tends to preserve the integrity, stability, and beauty of the biotic community. It is wrong when it tends otherwise."
-- Aldo Leopold

Correspondence: Topic Question 1:

Finances, Nat Parks is sorely underfunded now. You have 5 choices and 3 of them are bad. To fix the problem where it corrects itself in time, is simply affording an animal bridge to the mainland. Ingress and egress are now open and genetic transfer exchanges can occur to promote healthy species survival. If no bridge, the next ethical issue is to remove all animals to new locations on the mainland. Do nothing and the moose either die from inbreeding too much or starvation...they are not shy to strip a forest in short amounts of time. That may be the least expensive, but is far the cruelest. You can euthanize all animals there, but that would be pretty expensive. The last option is to of course waste time, effort, and finances to arrest free world wolves and sentence

them to die on the Isle of no return. The mosse will still continue to inbreed, and now, so will the wolves and its just a matter of time before they all die from being unhealthy specimens of their species. The ecosystem is not in dire need of moose. you could gather all the sanctuary wolves and moose to place on the isle and at least be offering some form of dignity to dying in a larger space than a pen. Putting wolves back on the isle is catering to human wants and has absolutely no benefit to any animal. Are you concerned for the animal and their well being, or are you interested in what feather you can put in your cap? I dont say that w/ disrespect. People are people regardless of who they work for. I dont consider the Nat Park Service an enemy nor I one to them. Keeping dialogue open is imperative, as is honesty. You have 2 senators making this their pet project so you already have pressure on you.

Topic Question 2:

Obviously you will need checks and counts of the animals. #1, no powered vehicles on land! They can walk and keep trails and roads to a minimum. If scientists havent learned all in 50 years about wolves, they wont learn anymore in 500 more years. You need park Rangers to carry out duties and may have to camp there 9 months a year...and no permanent buildings! They cant go out singly, they have to stay in at least, pairs. They would probably never have any problem w/ wolves, but that is not a guarantee. They will have much trouble w/ the moose. Tranquilizer darts w/ mechanism to fire is imperative. Tents, sleeping bags stoves, etc. They probably should have a couple motor boats. Collars for animals GPSes, weapons for self defense, general outfitter gear. Lab equipment, a weekly boat to come out and resupply them and check on their well being. Several means of communication,,you do have incimate weather there. =You're not going to be there to check pregnant animals, but will be when pups and calves are being born. 70% o wolf pups do not survive their first yea, Dont know the numbers for moose If you have a team there, you can bring in new blood for wolves and moose, plus take out "selected dispersers" to the mainland. Vegetation will be mostly fine barring climate or insects. You dont have the same team every year as the ones that were just there are needed elsewhere w/ their knowledge and new blood for team members is required too. Accidents will incur and they will cost more than you saved by sending one out at a time. Safety in all areas is mandatory.

Topic Question 3:

have already basically covered that issue, no roads, no permanent buildings, and all trash and garbage to be returned to the mainland when the weekly supply comes out. Just put it wheeled lock cans than can be pushed right out to the supply boat, trade for empties and do that each week. Keeping specimens of vegetation is something lab people have figured out I assume.

Topic Question 4:

Trees die if their annual average temperature varies even 1 degree. That means more carbon will be released. You may have to bail out the entire Isle, especially if ticks come.

Topic Question 5:

the preliminary alternatives are too much human orientated and not enough concern for animal well being. Its all about people convenience and not animal reality. I know, you got hot to trot senators lighting your fires, but Isle Royale isnt the only Park that needs funds. You have crowd control issues in other ones that there arent enough Rangers to enforce the rules and issue citations. Its like once inside the park, the idiot comes out! Including so called animal advocates who have no respect for others lives, including their own kids. I just watched it at a carcass site in Yellowstone a couple weeks back. Or the so called advocates that called in for the bear incident w/ profanity and death threats! Those are morons who give the rest of us a black eye. I got to talk to Kerry Gunther for a good half hour sharing information like bear cub re-wilding facilities and he shared the congressional structure of yellowstone, plus the idiots that called in.

Topic Question 6:

In short, you have to have a bridge for ingress and egress...if a most of the time team is present, transfers can be done the hard way, or even artificially if need be. Putting more animals on the Isle defeats conservation and animal welfare in general. You dont have the people concern in the same degree there as you do in Yellowstone.

Topic Question 1:
Reintroduction of wolves.

Topic Question 2:

I would defer to the experts that have been looking at these issues for many years and would recommend following their recommendations. My understanding is that they would reintroduction of wolves.

Topic Question 3:

I believe that wilderness is not a reason to do nothing. We manage wilderness often, such as trail maintenance and fire suppression, when it is to our benefit.

Topic Question 4:

Put wolves on the island. Doing this soon in numbers recommended by the scientific experts.

Topic Question 5:

There is an alternative that fits what the scientist are recommending. I would like to think that they know what would work best.

Topic Question 6:

This has been studied and discussed for a long time. It is now time for a final resolution.

Correspondence: Topic Question 1:

The Park Service EIS should consider as many alternatives that fit the wilderness area as possible.
The study should consider Isle Royale as part of an area system, of naturally occurring flora and fauna, and not just as an isolated island.
This study should also take into consideration as much historic evidence as possible, with particular attention to pre-moose era flora and fauna.

Topic Question 2:

The EIS should begin with a baseline understanding of the natural system that includes Isle Royale, as well as surrounding islands and nearby mainland.
What dominates in that larger system? What is working and what trends in local changes to flora and fauna can the EIS consider broadly?
The issue of occasional ice-bridges should be studied and understood.

Topic Question 3:

The EIS should consider that man's most intense participation is at the beginning of any new project, and that the wilderness designation should be understood to mean as little human intrusion as possible.
The EIS should also start with the assumption that the last project - the wolf-moose study is now over. Whatever happens going forward is a new project, with humans as engineers.

Topic Question 4:

The EIS should consider changing flora in nearby systems, such as the Sibley peninsula and St. Ignace Island. The study should work to determine both human and climate affects on Isle Royale's system, including the ice bridge as well as Isle Royale within a larger system.

Topic Question 5:

The alternatives are not broad enough. The EIS should consider more historic flora and fauna, as well as understand what may work best in the changes that it can best predict for the eco-system.
I would like to see more study of hares and lynx in the study, as an example.

Topic Question 6:

The EIS should seek Canadian information sources, such as forestry and Lake Superior studies.

Comments: Isle Royale is a part of a larger geologic and natural system. The EIS should consider the island in its totality, with participation of Canadian observers. The EIS should also consider returning to the dominant flora and fauna of the island pre-moose. In fact, with pressure on woodland caribou and lynx in the area, the EIS would do well to consider those species intensely.
The periodic connection to the mainland will continue and the EIS should consider the occasional ice-bridge and what it may mean to any ongoing project. The wolf-moose relationship study is over, and the results are what they are. If the EIS considers continuing a variation of that study it should first insist on a "post mortem" or look-back on the last moose-wolf decades even as the EIS considers that relationship as a management alternative going forward.

Correspondence: Topic Question 1:

Genetic rescue of the wolf population should be #1. The wolves represent a form of biological control that can keep herbivory in check (to some degree), and are evocative of the 'North Woods' experience Americans are looking for when they travel to Isle Royale. If Isle Royale were closer to the mainland or attached the wolf population would have no problem. Of course, it is unique in that it is far offshore of Lake Superior, and thus a difficult migration is part of the nature of the island itself. Still, a limited and occasional genetic rescue, mimicking migration to a less isolated island (or an island with a more frequent ice bridge) seems like a sound management option that both respects the wilderness nature of the park and the public's use and desire for the park.

Topic Question 2:

The existence of a wilderness-type experience should be at the top of the list. If a population of wolves can exist and thrive on Isle Royale with an occasional genetic rescue (i.e. if the prey base is large enough to sustain a stable population of wolves with multiple packs), then the NPS should work to ensure that the wolf population can survive. Isle Royale is a park for the people. We are not suggesting active management or changing its fundamental

nature, just mimicking natural migration patterns that would exist if the island were attached to the mainland. This is important, because having wolves on the Island helps its "North Woods", wilderness aura.

Topic Question 3:

I think management of species can be valuable, but I do not think that vegetation should be managed in any way on the island. The park is wilderness, and should be kept that way, by-and-large. If the NPS is not going to introduce biological agents to control herbivory, there is no reason that the NPS itself should step in. That said, I believe that mimicking natural migration patterns is valuable on Isle Royale. The park is a wilderness, but of course the idea of 'wilderness' is a construct of man. Americans want Isle Royale to have the 'North Woods' experience, and if populations of wolves and moose can be maintained without excess human intervention (i.e. a yearly introduction of a few individuals), I think that active management of those populations should be considered. That said, if the ecology begins to permanently change as a result of climate change (outside of changing migration patterns for wolves), I do not believe that the park has any business in changing the vegetation/makeup of the park.

Topic Question 4:

No management in the face of climate change. Planning for climate change is a near impossibility - outside of changing patterns of ice and wintertime freeze-up/thaw, it is difficult to predict the impacts of climate change on the ecosystem. The only management should be in migration. If wolves can survive on the island with sufficient genetic diversity, I think they should be introduced on occasion.

Correspondence: Topic Question 1:

Whether through augmentation, or worst case re-introduction, the genetic diversity of the wolf population on Isle Royale needs to be increased.

Topic Question 2:

Ideally after an initial introduction of new wolves to diversify the genetic pool, the balance between the predation cycle on Isle Royale would normalize on its own. However, there may be need for human intervention to maintain the unique ecosystem on Isle Royale. This is one of the few truly wild areas left in the US and the archipelago is incredibly isolated. When possible, it is best to have as little human intervention as possible, but this does not mean that the wolf and moose populations should be left unassisted as the balance becomes more and more skewed.

Topic Question 3:

The most intense area of management the NPS should consider is to increase the wolf population. If the wolf population were greater, the moose population would be better controlled through natural predation. When possible, the natural eco-system should be allowed to maintain itself meaning that there will be fluctuations in the species populations. However, the wolf population has declined to a point where it may already be too late to help the existing population on Isle Royale. If this decline occurred with no human influence, then I would argue that we should consider allowing the survival of the fittest to take place. However, the decline did not happen in isolation without outside human influence. Global warming has prevented the ice bridges from Canada to form most years, limiting opportunity for new genetic diversity to enter the wolf population. A single new wolf entering the system has been shown through studies to allow the population on Isle Royale to grow until they are the only new entry to the gene pool and the declining cycle reoccurs due to lack of genetic diversity.

Canine parvo-virus was introduced in the 1980s to the generally closed eco-system when humans brought household pets to the island. This was not something the isolated population of wolves were able to fight. This is similar to when European explorers brought diseases to the New World killing the native tribes who were unaccustomed to these illnesses. It was not a natural occurrence that would have taken place without outside influence. The past cannot be changed, but should not be ignored that this was not a symptom of natural selection or evolution. If we can correct the decline, we should do whatever is necessary to keep the population healthy and return it to a non-critical level.

Topic Question 4:

Because of climate change, the ice bridges that could form between Canada and Isle Royale are less likely to occur. This further limits the natural opportunity for genetic diversity to be introduced without some human intervention.

Topic Question 5:

I do not like the option to do nothing about the current situation from either the side of the Wolf or Moose populations. Without this natural predator-prey relationship, further impacts to one of the most beautiful and wild places in the US will continue to be threatened. If the moose population continues to grow without intervention, the vegetation of the island will be threatened much like the wolf population is now. "Re-locating" plant species to an outer island might prevent extirpation in the archipelago but not on the main island from over consumption by the growing moose population.

Topic Question 6:

I've grown up visiting, camping, and sailing around Isle Royale. It is one of the truly unique places in the US. It has shaped my love of the natural world and I cannot imagine not having both wolves and moose on the island. While I am not an expert at how the genetic diversity of the wolf population should be increased, I think it needs to be done. Because a significant part of the problem has been caused by human action, we need to help try and correct the problem. Both species need to be maintained on the island so that future generations can witness what I was so lucky to... A cow and calf moose in the wilderness, in a place that very few people can ever say they have traveled.

Correspondence: Topic Question 1:
Monitoring and Alternative A.

Topic Question 2:

Decline of moose populations in the larger upper Midwest as a consequence of winter ticks and other parasites, loss of habitat and forage, climate change - all factors that are present with or without wolf predation.

Topic Question 3:

Intensive management is not compatible with wilderness designation.

Topic Question 4:

Continued monitoring of an island-bound natural system would provide a unique natural laboratory for observation of climate change effects on flora and fauna.

Topic Question 5:

All alternatives with the exception of A propose heavy-handed management for a system that will never be stable without continued heavy-handed management, particularly given rapid climate change.

Comments: What follows is largely a repeat of comments submitted earlier in this process:

Thank you for the opportunity to comment.

I respectfully encourage you to choose Alternative A and allow the wolf/moose populations to either die out or recover in a natural process without human interference. Sometimes doing nothing is the most difficult thing to do, but in this case I think it is the ethical choice. It is troubling to consider merely observing this sad little population of genetically impoverished wolves struggling along, but I believe it is not as troubling as the process and consequences of introducing new wolves. Uprooting mainland wolves from their homes and packs is dubiously ethical in itself and I see no reason to suppose that another drastic disruption (parvovirus or other disease, rapid climate change-driven drastic weather events or other) of the isolated wolf population would not occur over time and probably with more frequency given the rate of habitat loss and climate change in the Great Lakes region. It is pleasant to think Lake Superior might freeze with enough regularity again to allow Canadian wolves to cross over to the island, but this seems a remote possibility.

It has been a remarkable 50 years for Isle Royale and those of you who have participated in the wolf/moose study. I thank you all for your work, but perhaps it is time to walk away with what has been learned and leave management decisions to natural processes. What has been learned is substantial, I believe. I was especially impressed by the following paragraphs written on your website summary copied below:

"If we see Nature as a system whose future we can predict, then we will be confident in our efforts to control and manage Nature. If, in Nature, we are more impressed by its essentially contingent, and hence unpredictable character, then our relationship will be more strongly rooted in striving to live within the boundaries of Nature's beautifully dynamic variation.

Western science has come to understand a great deal about Nature. But pride for our knowledge of Nature, need not become hubris to fuel an obsession with controlling Nature. The wolves and moose of Isle Royale show how it is not so difficult to be proud for all that we've learned about Nature, yet humble for knowing how limited our understanding of really is. This is the humility from which a rich relationship with Nature may be rooted."

It was with great appreciation that I read these thoughts. The concept of wildlife management has come far in the past 50 years. You will of course be familiar with the relatively new work on trophic cascades across ecosystems. We do indeed have so much to learn.

To my mind, perhaps the most valuable thing learned from the study in terms of future ecosystem work is the importance of biological corridors. The need for connectivity of island populations has become increasingly urgent in these times of rapidly progressive habitat loss and the uncertainties of rapid climate change. No work is more challenging than preserving existing corridors and establishing new ones. Continued monitoring of an island system such as Isle Royale could provide real-world data about why biological corridors are vital.

On a personal note, I was interested in the Isle Royale study from the beginning. My father was a refuge manager on National Wildlife Refuges in the Upper Midwest at the time the study was begun. He had strong feelings about the persecution of predators during the 50s and did his best to remove predator control methods from the refuges where he worked. He was thus interested in and hopeful for the knowledge that might be gleaned from the Isle Royale study. He also had concerns at the get-go, however, about genetic variability on island populations.

Thank you for taking the time to read my comments and for your valuable work.

Sincerely,

Correspondence: Topic Question 1:

The alternatives under consideration are not mutually exclusive, and a combination of those should be fine-tuned and considered.

Topic Question 2:

The key consideration should be to limit, and if needed to reverse, the disruptions on the island caused by climate change and other forms of human interference.

Topic Question 3:

Management should include one-off interventions, e.g. one instance of moose culling and/or wolf re-introduction, followed by close monitoring to establish the impact. Timing of both one-off interventions and monitoring needs to be determined carefully, to avoid intervening and stopping monitoring too early or too late.

Topic Question 4:

Control the population of moose and introduce new wolves, manage vegetation.

Topic Question 5:

Timing considerations need to be made explicit.

Topic Question 6:

Let nature take its course has proven a bad idea in instances, such as forest non-management, which led to destruction by wildfire that could have been avoided. There is no reason to believe that human interference in the form of management of wilderness is bad while human interference in the form of climate change is OK because we cannot stop it. Climate change and other forms of human interference (pollution, introduction of non-native species, introduction of harmful germs, etc.) should be confronted, not accommodated. Of course management should be sensitive.

Correspondence: Topic Question 1:
Continue the Rolf Petersen study of wolves and moose in Isle Royale.

Topic Question 2:

How many wolves should be reintroduced for a health wolf-moose mix.

Topic Question 3:

Given the relative small size of this park, wolf/moose populations need to be checked regularly.
Prolong to current wolf/moose winter study from December - mid March would be good.

Topic Question 4:

Continuation of study of moose health. If temperate plants start to dominate the vegetation perhaps moose from a population that has thrived on temperate plants could be introduced.

Topic Question 5:

I like Alternative C which would introduce and maintain a viable wolf population. The Wolf Augmentation program should begin as soon as possible.

Topic Question 6:

Please augment the wolf population as soon as possible.

Thank you for this opportunity to comment.

Correspondence: Topic Question 1:

I believe that every effort should be made to save or restore the wolf population on Isle Royale, and am in favor of Alternative Concept B or Alternative Concept C. I believe that reintroduction or augmentation of the wolf population is absolutely vital to ensure the delicate balance of the predator/prey relationship that has been a part of the park for over 60 years. Implementation of plan B or C will help to manage the wolf and moose populations with minimal human impact and interference.

Topic Question 2:

Given the current state of the wolf population and its extremely low numbers, I believe intervention should be done as quickly as possible. Please do not delay in making a decision, and begin to implement a plan as soon as you are able. Time is of the essence for both the wolves and moose of Isle Royale.

Topic Question 3:

Every effort should be made to keep the wilderness intact, with as little human interference as possible. Having said that, I believe some human intervention is required to help maintain the delicate balance of the predator/prey relationship between the wolves and moose.

Topic Question 4:

None (or very little). I am not sure what can be done in the face of changing climate.

Topic Question 5:

I strongly oppose the culling of the moose population through human intervention, especially the use of motorized equipment to hunt and/or remove moose from the island.

Topic Question 6:

Please act quickly and in a timely manner before the moose population and vegetation are severely impacted by the loss of wolves. Again, every effort should be made to save and/or restore the wolf population on Isle Royale.

Correspondence: Topic Question 1:

I've felt the same since my first visit to this special island in 1993. The Wolves needed new blood lines introduced.

Topic Question 2:

Same as above to keep a balance.

Topic Question 3:

I think over all that the island is being managed as best you can with the resources available. The exception being allowing the Wolves to die out because of a lack of a new blood line. Sadly, this has been coming for decades.

Topic Question 4:

I haven't any idea.

Topic Question 5:

I haven't seen a list of alternatives. However, if the alternative is to allowed the Moose to forage until they've destroyed most of the vegataion and then die lacking a food source, then I don't like the alternatives. I saw what happened in the ninties with over population of moose.

Topic Question 6:

Balance between the wolves & moose is the main issue. That's over now. I only hope that the powers that be rectify this sooner rather than later. If you want this unique relationship to be once again, then do it. Otherwise, you'll have rotting corpses all over the island. Then the least visited National Park will have even less visitors. Some didn't want interference by man here, but sometimes Mother Nature needs help. There are necessary regulations in place to try and control invasive species. But, it all requires cooperation by people.

Correspondence: Topic Question 1:

Doing a trade with the Michigan DNR. What I mean is putting some wolves from the Upper Peninsula to Isle Royale and bringing moose from Isle Royale to the Upper Peninsula. Wolves have become a major issue in the Upper Peninsula and the moose could use a boost. This would greatly benefit both sides. I'm afraid that in the near future the moose will have similar issues that the wolves do on Isle Royale.

Topic Question 2:

Evaluate what's going on with each species. If one species is suffering in particular we should add more. We shouldn't worry about the vegetation as much. If there isn't enough food for the moose already on the island then we shouldn't add more moose and we definitely shouldn't add more wolves in that situation. Nature will balance itself.

Topic Question 3:

Lightly. Only intervene if the wolves or moose are really struggling.

Topic Question 4:

The climate is getting colder which is both good for the moose and wolves. Shouldn't have to worry about that at all.

Topic Question 5:

Don't know where we're getting the wolves from if decided to restore them.

Topic Question 6:

We need to restore wolves in Isle Royale. People go to the island because they hear about all of the wilderness there. The NPS should look into doing a swap with the Michigan DNR. Isle Royale gets wolves from U.P., U.P. gets moose from Isle Royale. It's a win-win for both sides.

Correspondence: Topic Question 1:

Only 3 of the 6 alternative concepts mention wolf reintroduction or augmentation and none with any specificity. Concept B and Concept D only allow for wolves to be reestablished once which may not be sufficient and is very short sighted. Concept C allows for maintaining populations of wolves and moose which "could" include wolf reintroduction or augmentation.

Concept C appears to be the best alternative, however, it does not go far enough. There must be sufficient flexibility to allow for wolf reintroductions as necessary over the next 20 years to insure genetic diversity for wolves and sustainable populations of both wolves and moose into the foreseeable future.

Maintenance or culling of moose is not necessary if wolves are allowed to fulfill their ecological role. Absent wolf immigration, which no one can predict, there is no likelihood of having a wolf population without human action.

Topic Question 2:

I believe the NPS should consider and evaluate the ecological benefits wolves provide; The only pup observed in 2015 was visibly deformed; 100% o wolves examined since 1994 (over 30 of them) have spinal anomalies. The weakened state of the remaining wolves is likely interfering with reproduction and survival.

The NPS must consider the data collected through 57 years of research conducted on Isle Royale. These researchers should play a key role in the discussions.

Topic Question 3:

NPS must protect the unique wilderness qualities of Isle Royale through monitoring of habitat for wildlife, including wolves and moose; maintenance of soil and water quality and ecological stability of plant and animal communities including the control of invasive species. Management is necessary to maintain important wilderness values including the presence of a top carnivore which is vital for ecosystem health. The culling of moose and the use of motorized equipment is unacceptable.

Topic Question 4:

Climate change poses a fundamental threat to species and places. The only way to slow the impacts of climate change is to globally reduce carbon emissions. NPS could produce an informational flyer explaining the negative impacts climate change is having on Isle Royale such as the changes in the duration and frequency of the ice bridge, winter ticks, bird species etc. NPS could engage with businesses and private entities that use the island to reduce carbon pollution. Encourage visitors to reduce their carbon footprint by not bringing / disposing of water bottles.

Moose are not likely in any direct danger of being reduced by climate change, however, wolf predation is needed to limit the growth in their population.

Because of climate change, it is unlikely that wolves will be able to repopulate Isle Royale without NPS intervention and I ask for immediate action to augment / reintroduce wolves.

Topic Question 5:

For years, researchers have been sounding the alarm about the plight of wolves on Isle Royale. Yet, the NPS has chosen to take no action until now. The public scoping period ends 8/29, however, the Record of Decision is not expected until Fall 2017 at the earliest. Two and one-half years is simply too long. This foot dragging on the part of NPS is unacceptable.

Evidence suggests that the few wolves on the island will not be able to keep moose populations in check which will further degrade the island's vegetation. Every effort must be made by the NPS to expedite the decision.

Topic Question 6:

Isle Royale is an incredibly special place that I intend to visit in 2017. What would make me and thousands of top-paying tourists happy would be to see the reintroduction of wolves. We long to see the drama play out in the web of life that includes wolves and moose on Isle Royale. Please don't delay, NPS. Make it ecologically right.

Comments: Isle Royale is an incredibly special place that I intend to visit in 2017. What would make me and thousands of top-paying tourists happy would be to see the reintroduction of wolves. Correspondence: Topic Question 1:

I think the Park Service has given a broad range of options listed in the attached article.

Topic Question 2:

I think the NPS should go with C and or D. There is, unfortunately, no guarantee of future ice bridges which might have brought more wolves to the island and as noted, 5 of the wolves may have left.

Topic Question 3:

C & D, because of uncertainty of ongoing climate change.

Topic Question 4:

See above

Topic Question 5:

I think they offer a diverse choice of solutions. I can't believe it will take 2 years to reach a final answer though. The situation may be settled on its own by then. Having visited the wolf center, we were told that there was much inbreeding, so without new bloodlines, they wolves will die out anyway.

Comments: Thanks for asking for public input. As a nurse with genetic background in infertility, I found the whole wolf-moose study absolutely riveting.

Correspondence: Topic Question 1:

An explosion of moose on Isle Royale without predators would devastate the natural vegetation and their own wellbeing.

The only alternative to destruction of wolves is controlled hunting for population control; hunting should not be allowed on the island.

Topic Question 2:

Equilibrium maintaining a healthy natural mix

Topic Question 3:

Use historic record to set a balance. People interact with wilderness in controlling ways without destroying the basic nature of the island.

Topic Question 4:

To early to plan beyond historic record

Topic Question 5:

Doing nothing will expand moose destruction of the environment beyond reasonable limits

Comments:

Correspondence: Topic Question 1:

Only 3 of the 6 alternative concepts mention wolf reintroduction or augmentation and none with any specificity. Concept B and Concept D only allow for wolves to be reestablished once which may not be sufficient and is very short sighted. Concept C allows for maintaining populations of wolves and moose which "could" include wolf reintroduction or augmentation.

Concept C appears to be the best alternative, however, it does not go far enough. There must be sufficient flexibility to allow for wolf reintroductions as necessary over the next 20 years to insure genetic diversity for wolves and sustainable populations of both wolves and moose into the foreseeable future.

Maintenance or culling of moose is not necessary if wolves are allowed to fulfill their ecological role. Absent wolf immigration, which no one can predict, there is no likelihood of having a wolf population without human action.

Topic Question 2:

We believe the NPS should consider and evaluate the ecological benefits wolves provide; The only pup observed in 2015 was visibly deformed; 100% of wolves examined since 1994 (over 30 of them) have spinal anomalies. The weakened state of the remaining wolves is likely interfering with reproduction and survival.

The NPS must consider the data collected through 57 years of research conducted on Isle Royale. These researchers should play a key role in the discussions.

Topic Question 3:

NPS must protect the unique wilderness qualities of Isle Royale through monitoring of habitat for wildlife, including wolves and moose; maintenance of soil and water quality and ecological stability of plant and animal communities including the control of invasive species. Management is necessary to maintain important wilderness values including the presence of a top carnivore which is vital for ecosystem health. The culling of moose and the use of motorized equipment is unacceptable.

Topic Question 4:

Climate change poses a fundamental threat to species and places. The only way to slow the impacts of climate change is to globally reduce carbon emissions. NPS could produce an informational flyer explaining the negative impacts climate change is having on Isle Royale such as the changes in the duration and frequency of the ice bridge, winter ticks, bird species etc. NPS could engage with businesses and private entities that use the island to reduce carbon pollution. Encourage visitors to reduce their carbon footprint by not bringing / disposing of water bottles.

Moose are not likely in any direct danger of being reduced by climate change, however, wolf predation is needed to limit the growth in their population.

Because of climate change, it is unlikely that wolves will be able to repopulate Isle Royale without NPS intervention and we ask for immediate action to augment / reintroduce wolves.

Topic Question 5:

For years, researchers have been sounding the alarm about the plight of wolves on Isle Royale. Yet, the NPS has chosen to take no action until now. The public scoping period ends 8/29, however, the Record of Decision is not expected until Fall 2017 at the earliest. Two and one-half years is simply too long. This foot dragging on the part of NPS is unacceptable.

Evidence suggests that the few wolves on the island will not be able to keep moose populations in check which will further degrade the island's vegetation. Every effort must be made by the NPS to expedite the decision.

Additional Comments: Those who visit Isle Royale do so for the wilderness experience which includes wolves and moose. Explain what you value about wilderness and why.

Correspondence: Topic Question 1:

Option C seems the closest to my preference; however, there should be specific wording to show true concern over this critical issues. Wolves currently on the island do not have a diverse genetic mix; and this has had a detrimental effect on their health/survival/longevity. Introducing new "stock" is a requirement for any kind of management to make sense and over a period of time, say twenty years with close observation to ensure the right diversity and a healthy growth in population to counter the ever-increasing number of moose. That is called management. You do not manage by just leaving the current population to just dwindle down to nothing, and then manage the moose by killing them. It is wasteful of taxpayer dollars, it's not sound management, and in the meanwhile the balance of predator/prey is off leaving humans as predators?

Wolves help the ecology; (human interference) culling of the moose would not be necessary if wolf number is increased (and the genetic pool broadened) allowing wolves to do their jobs.

Topic Question 2:

I've read that the agency, although it is gathering comments now, is not planning to act until Fall 2017... That is more than two years away. I believe the issue is critical and needs to be acted on much sooner, if we are to have a viable solution. The park needs action, the ecology needs help, and wolves need assistance to lift their number so they can do their job.

I like many Americans like the "wilderness" because of its wild inhabitants. We hope the wolf population gets a little help, which in turns can only help maintain a strong and healthy landscape on the island.

Topic Question 3:

Wolves need this lift now and for the next twenty years or so a keen eye must be kept to ensure the "wolf introduction" plan is increasing wolf population appropriately (i.e., more wolves should be introduced if there continues to be imbalance). I believe that after the initial "assistance" balance can be established and we can keep hands off or have sporadic checks. The agency also needs to incorporate the study data (much study has been done on moose-wolf populations in the park) gathered for more than 50 years into its plan for action. That would be the intelligent way of doing things.

Topic Question 4:

Climate change is wreaking havoc all over the world. The NPS can encourage smart use of resources by placing signs that educate park users about reducing their carbon prints (by not using and/or throwing away water bottles is one example). Signs and/or educational flyers can educate the public about climate change, about cause and effect (increased risks of tick bites?)

On the issue at hand, moose population will not suffer in the foreseeable future due to climate change; and wolves are needed to control moose population and help the environment.

Topic Question 5:

I do not like those "do nothing" options. There are three options that propose adding wolves to the current wolf population, but I do NOT like the "only one time" language. I want my tax dollars to work a bit harder in helping nature. So as I mentioned above, I prefer "concept C" but it needs to add more substance in terms of the length of time that we'd be willing to add more wolves (20 or 30 years).

Topic Question 6:

I love nature and wildlife. I go to national parks for a chance to see wildlife; and I think I speak for the majority of Americans and foreign tourists: when I think of America (my adopted home) words like "pristine", "wild" "breathtaking" come to mind. I hate what is being done to the America I have come to know and love by big industries. I hate trapping and hunting although I do recognize the need to "manage" wildlife (why must we choose the cruelest form to end other creatures' lives? Please consider my comments with thought and seriousness as I have put much thought and seriousness in providing comments here.

Comments: Sometimes Nature needs help and this is one of those times. When nature is helped it in turns help the humans that enjoy it and often impose upon it.

Correspondence: Topic Question 1:

No other alternatives, elements, management tools needed for consideration.

Topic Question 2:

My first trip to Isle Royale was in 1990 and since that time I have made over 20 trips to the island. During those times I have had conversations with NPS personnel; attended NPS sponsored presentations, as well as read various NPS publications concerning Isle Royale. In all cases the overriding philosophy embraced by NPS was that the public as well NPS personnel "must work to assure that the natural processes are allowed to function naturally. We must observe but not manipulate them". It appears to me that the island has been managed by the Park Service based upon that very philosophy. For example, during my visits to the island I have experienced various rule changes all of which seemed to be rooted in the core philosophy cited above. The current state of the island's wolf population is of course impacted by various factors all of which fall into the category of natural causesagain referring to core philosophy. The same holds true for the island's moose population and vegetation.

I do not see a valid argument for moving away from the philosophy of letting nature take its course in this situation. All of us should allow natural processes to continue in regard to the island's resources. I trust nature will do much better than us in managing those resources. As stated in your Summer 2015 newsletter, "things come and go from the island; local extirpation is natural, as is establishment and re-establishment of new populations". I agree. these are natural processes which are best allowed to develop on their own without the interference of humans.

Topic Question 3:

Concept A (no-action alternative) is the only valid alternative. See comments in my response to question 2 above.

Topic Question 4:

Climate has been changing (warming/cooling) for eons. it is a natural process which will continue in perpetuity. Any consideration of current climate is simply not valid and does not change my response to question 3 above.

Topic Question 5:

Alternatives B through F all involve management of moose and/or wolves which is completely opposite your current philosophy of only allowing natural processes to occur as noted in my responses above.

Correspondence: Topic Question 1:

1. Wolves are reintroduced/augmented more than once, if necessary.
2. Moose populations are managed by contraception and/or sterilization and not by lethal culls.
3. The NPS must expedite its final decision by the end of 2016.

Topic Question 2:

A balance to maintain a healthy ecosystem. The wolf population declined, primarily, for two reasons: a disease introduced when a visitor to the island brought a pet dog who was ill, and inbreeding because lack of cold winters resulted in no wolves from the mainland traveling to Isle Royale and relocating there.

Topic Question 3:

Survey twice a year, and make adjustments to wolf and moose populations accordingly.

Topic Question 4:

Be mindful of the need to introduce new moose and wolves as necessary, given the ice will not allow natural introduction of new animals

Topic Question 5:

I like the objective to support plant and animal life. I dislike the cost to taxpayers, but all important investments cost money.

Topic Question 6:

Those who visit Isle Royale do so for the wilderness experience which includes wolves and moose. I absolutely love wolves. Wolves really need to be

OUR NATIONAL TREASURES, and we as humanity need do everything we can to look after them and ensure they are protected accordingly allowed to thrive in their natural habitats in our world. WE need the wolves here. Please do everything possible to support and assist these precious wolves. Wilderness is the place humanity goes to, to relax and unwind and to be thrilled to witness the sheer majestic power and grace of nature which is epitomised when wildlife lovers, as myself, have the privilege to witness wolves in the wild. I am a tourist and wolves are a major tourist attraction. Please help these wolves to thrive here. They deserve that and we need respect wolves for they are ESSENTIAL in countless ways. WE NEED THEM HERE. Please take care of them.

Comments: What we, as humanity, are witnessing in terms of the disgraceful actions of sheer inhumanity targeted at wolves especially, is an utter human disgrace. The real science does not support the wolf hunts we see too often as the solution to deal with predation, whilst this kill-first mentality is provably, not the way forward, and there are highly successful non lethal methods available which have been around for thousands of years, and when done ethically, honestly and correctly, they yield highly effective results. Kill - first mentality is in fact proving to be counter productive for ranchers. Not only have wolves been subjected to that approach in other states, the killing of wolves has also served to unleash a blood thirst which shames the very notion of ethical hunting across the planet, as the deliberate trophy hunt of Cecil the Lion from Zimbabwe, by the American dentist who paid money to do so has shamefully revealed to the world, what was hidden behind trophy kills. And wolves are certainly on trophy killers' lists....killed for the sport, the fun. And the cruelty, barbaric acts and violence associated and witnessed against wolves in particular, aimed at causing suffering, is nothing less than the reveal of a very frightening, specific type of individual behind these acts of shame, that of a worrying serial killer/ psychopath type in terms of psychological personality profiles, which any registered psychologist will verify. In the case of Isle Royale, the science / research of some 40 years - a world record of accumulated incredible science being gathered begs the requirement of yourselves, at the very least to step in and do everything necessary to help these wolves struggling to survive, which are worthy of surviving and to indeed help them to thrive. There is excellent evidence of the role of wolves in eco systems as seen in Yellowstone National Park. Wolves are an essential natural-world predator. Please help these wild animals. America needs to redeem itself in relation to the shameful, violence directed at these predators, pushed erroneously by mythological fairy tales of the big bad wolf, which is propaganda at its worst. WOLVES BELONG HERE. And we as humanity need them to. Please help them.

Correspondence: Topic Question 1:

My first choice is Alternative Concept B, with Alternative Concept C being my second and D being a distant third. I want enough action to be taken that will reestablish the wolf population so that there is a better balance of species (wolf/moose/plant). Since man's actions have seriously put the wolf population at risk i.e.: parvovirus introduction by boater and wolf drownings in open pit mines, it is only right that man fix this situation.

Topic Question 2:

Balance of species. Trying to avoid plant and then moose population collapse.

Topic Question 3:

Whatever it takes, minus mass shootings of moose, to establish balance.

Topic Question 4:

Fully realize that ice bridges may not occur anymore.

Topic Question 5:

I don't like the idea Alternative Concept A or helicopter shootings of moose. Open season on moose by hunters also invites disaster.

Correspondence: Topic Question 1:

NPS is seeing tools disappear through delay - see Question 6 below.

Topic Question 2:

The following should all be considered carefully - management objectives, white-tailed deer, west-end balsam fir, research needs, and a more appropriate timetable.

Topic Question 3:

I recommend that NPS commit to maintaining a viable and fully functional wolf population for the next 20 years. If that is accomplished, I see no further need for management intervention. In several important ways, and without significant compromise, ISRO would then be restored to an "untrammelled" condition, wherein wildlife fluctuations in a tightly coupled predator-prey system are allowed to function in a self-directed manner.

Topic Question 4:

The immediate prospects of a wolf-less Isle Royale and the current and anticipated ecological repercussions should be addressed without delay. Avoid or at least reduce deleterious surprises by maintaining ecological resilience, as specified in NPS Director's Order 41 (see Question 6 below).

Topic Question 5:

Comments on Alternative Concepts: Under the circumstances (imminent extirpation of wolves), Alternative A risks unacceptable ecological degradation, contrary to the charge from Congress in the Organic Act of 1916 to "preserve and protect...the wildlife therein." Alternative B is acceptable if the words "one time" are omitted; as written it is an arbitrary concession to a rather extreme view of wilderness management. Alternative D is similarly deficient. Alternative C is acceptable if the words "and moose" are omitted; if wolves are adequately maintained there is no need for moose management. Alternatives E and F are socially unacceptable, logistically not feasible, and they run contrary to the Organic Act, the Wilderness Act, the spirit of the establishing legislation for Isle Royale National Park ("solitude" and "wildlife"), and they fail to even minimally approach endorsement coming from a Minimum Requirements Analysis. In summary, I recommend that NPS commit to maintaining a viable and fully functional wolf population for the next 20 years. If that is accomplished, I see no further need for management intervention. In several important ways, and without significant compromise, ISRO would then be restored to an "untrammelled" condition, wherein wildlife fluctuations in a tightly coupled predator-prey system are allowed to function in a self-directed manner.

Topic Question 6:

Specific issue that should be addressed - there are no management objectives provided. Alternative A prioritizes an extreme view of wilderness management, while Alternative F would seem to violate all reasonable interpretations of federal law and NPS policy. Selection of appropriate management direction depends on management objectives. These need to be specified, justified, and explained.

Specific issue that should be addressed - the protracted timetable that has been proposed risks ecological damage and is unnecessarily long. The extended timetable may remove some tools, such as wolf population augmentation (augmentation may already be impractical because of low numbers), it will undermine the public credibility of the NPS as a responsive resource management agency, and further delay increases the risk of unrecoverable damage to vegetation (west end balsam fir). The EIS for introducing wolves into Yellowstone only took 2.5 years. The ongoing EIS to introduce grizzly bears into North Cascades National Park is not expected to take any longer than 2.5 years. The NPS seeks to do no better than average in taking 2.5-3 years for the ISRO Moose-Wolf-Vegetation Plan/EIS. The average time to complete an EIS by federal agencies is 3 years, and the minimum time was 6 months. Every timetable publicly mentioned over the past 2 years for "reaching a course of action" or launching this EIS has been missed.

Specific issue that should be addressed - white-tailed deer: NPS has emphasized future uncertainties such as moose vulnerability to heat stress. It has not mentioned one of the near-certainties that will affect Isle Royale, namely the arrival of white-tailed deer and its endemic parasite that is fatal to moose, the brainworm (*Paraelaphostrongylus tenuis*). This is exactly the kind of climate-related change that will reduce the resilience (resistance to change) of the ecosystem, the kind of resilience referred to in NPS Director's Order 41 (2013), which states that superintendents and staff should lead efforts to "increase landscape connectivity, improve ecosystem resilience by reducing negative human impacts on the ecosystem." Furthermore, landscape connectivity is exactly what would be provided by mimicking wolf immigration events with assisted immigration.

Specific issue that should be addressed - west end balsam fir: While NPS refers to uncertainty in moose viability because some plant species (e.g. balsam fir) may not flourish in future climates, it is far more certain that balsam fir over the western half to two-thirds of the island is endangered by uncontrolled growth in the moose population.

Specific issue that should be addressed - research needs are largely ignored. There is an obvious need for enhanced research and a more secure ecological inventory and monitoring program, scarcely mentioned by NPS in spite of urging by a "blue-ribbon panel" of distinguished scientists many years ago.

Correspondence: Topic Question 1:
I do not see a need for additional management tools or options beyond those included in the current proposal.

Topic Question 2:
Cost, degree of complexity, potential effectiveness, and time scale are important practical issues to consider. The Isle Royale ecosystem, though less complex than many mainland systems, is influenced by a variety of top-down (predator controlled) and bottom-up (vegetation-controlled) forces...management actions can have far greater influence for a given amount of effort if done at the top level (in this case wolves), simply because there are fewer of them. Infrequent, non-invasive, and relatively straightforward wolf reintroductions could effectively manage the entire island's moose population and vegetation. Wolves, simply in their effort to survive, would constantly manage the island's moose population (and hence vegetation) for as long as wolves persist. Human management of the moose population, absent wolves, would be incredibly costly, invasive (helicopters and high-powered rifles), and would need to happen regularly. Human management of the vegetation would be pointless (incredibly costly, short-term, and probably ineffective) without equally intensive management of the moose population.

Topic Question 3:
Generally speaking, the most appropriate alternatives should be those that accomplish management goals (maintaining populations of moose and wolves on the island) effectively in the most straightforward and minimally invasive manner. In my opinion, artificially managing the moose population (through translocation or culling) does not qualify as straightforward or minimally invasive. On the other hand, maintaining a wolf population (through one or more reintroductions) on the island does meet these criteria. The designation of Isle Royale as wilderness is not a valid rationale for letting wolves go extinct on the island. Indeed, wolves are the most effective and natural means of controlling the island's moose population.

Topic Question 4:
Although we know that the climate is changing profoundly, and that human activities are behind these changes, we do not begin to understand the complex effects that climate change will have to specific locations. The NPS should acknowledge that climate change increases the role that chance events (unusually hot, cold, wet, dry seasons) may have on the island's ecosystems, and keep track of such changes/events through monitoring.

Topic Question 5:
I think the alternatives provide a reasonable spectrum from no action through what I consider too much action. I am glad that the alternatives are limited to those involving moose, wolves, and vegetation (not caribou, coyotes, lynx, or other species that have been absent from the island in recent history). I think Alternative A is not a good option as it does not accomplish what I consider to be a vital management goal for Isle Royale (maintaining the population of wolves on the island given the presence of moose). Alternative B may work but lacks a longer-term provision for maintaining a wolf population should the single attempt be unsuccessful. I prefer Alternative C, as it allows for the provision to both augment the existing wolf population and/or reintroduce wolves should they disappear from the island. However, I think this alternative could be improved by including an explicit goal of augmenting the wolf population if possible (taking action soon). I interpret Alternative C to not include moose management. Human management of Isle Royale's moose population, included in alternatives D, E, and F, would be ineffective and/or a poor use of resources, in my opinion. These alternatives also include an ambiguous threshold of action when moose herbivory causes a "demonstrated impact on park resources" (any level of moose herbivory has a demonstrated impact on park resources).

Topic Question 6:
see comments below

Comments: Having spent 21 summers on Isle Royale, first as a child growing up and later as an adult working for the Park Service, I care deeply about the island. I am now a professional biologist and recognize the complexity of decisions that agencies face as they manage places like Isle Royale. I appreciate the opportunity to comment on this matter!

Isle Royale needs wolves, so long as moose live on the island. Until wolves arrived on the island in the mid-1950's, the unchecked moose population had a profound effect on Isle Royale's forests. The devastation that moose had on the Island's forests was cause enough for Adolph Murie to suggest a variety of moose management strategies in his 1934 publication "The Moose of Isle Royale", including a state-sponsored moose hunt and sale of the meat, or capturing moose and transporting them away from the island. Murie also suggested another option-introduce an "effective predator." Wolves ended up coming to the island on their own two decades later, a serendipitous arrival for the long-term health of the moose population and the island as a whole.

Wolves have proven to be highly effective managers of the moose population on Isle Royale. Humans, on the other hand, do not have many tools for moose management beyond those proposed by A. Murie in 1934. The cost of culling moose or translocating them from the island would be outrageously high, and would have no long-term effect absent a population of wolves on the island. Unlike human moose management (included in Alternatives D, E, and F), which would be costly, highly invasive, and ecologically blind (sharpshooters in a helicopter would not be very good at picking out sick, weak, diseased moose), wolves exert continuous pressure on moose and help maintain a strong, healthy moose population.

I think Alternative C is the best option, as it includes the potential to augment the existing wolf population and reintroduce wolves should they go extinct. Introducing wolves now to supplement the existing population would be the most straightforward and efficient option, as fewer wolves would be needed, and the benefits of moose control would be realized most quickly. From a personal or ethical perspective, I also think the approach of "genetic rescue" honors the experience and legacy of Isle Royale wolves. To stand by and watch them gradually dwindle to nothing would to me represent the loss of a culture of wolves-a population that for generations has known only Isle Royale and its uniqueness.

While the "hands off" approach of standing by to let "nature take its course" (Alternative A) sounds romantic and would seem to align with a wilderness ethic, Isle Royale has been very much influenced by people, from Native Americans through today's visitors. Indeed, primary reasons for the low wolf population are very much related to humans and our far-reaching impacts-the introduction of canine parvovirus in 1980, the decreasing frequency of ice bridges to the mainland from human-induced climate change, the barrier of human development along Lake Superior's north shore, and even the recent accidental death of 3 adult wolves that fell into a historic mine pit. Justifying inaction based on a "wilderness" ethic would ignore our past impacts and mischaracterize our role as stewards of Isle Royale. Sometimes we need to take action, and the Park Service is now presented with an opportunity to act based on a result of the longest running study of predator-prey interactions-that Isle Royale's ecosystem depends on wolves so long as moose are present. The relationship between wolves and moose on Isle Royale is also an incredible aspect of the park, and one that has been deeply ingrained in the visitor experience for the past half-century.

I urge the Park Service to proceed with Alternative C, and to do so as soon as possible. Considering the inevitable impacts that moose will have on the island's entire ecosystem should wolves go extinct, and acknowledging that reasons for the dwindling wolf population are very much linked to the human history on Isle Royale and beyond, supplementing the existing population of wolves and maintaining a population of wolves on the island in the future would be the most efficient, effective, and appropriate action for the Park Service. However, in this case, the most straightforward, efficient, and least invasive approach seems relatively clear-maintain wolves on the island, and let them do the rest!

Correspondence: Topic Question 1:

Introducing new wolves and as needed based on research done on the island.

Topic Question 2:

Climate change and making sure the island stays balanced by having enough wolves to naturally manage the moose so that the vegetation can continue to grow as it should.

Topic Question 3:

As minimal as possible to keep the wilderness intact but keeping the island balanced as mentioned above.

Topic Question 4:

Base it on ongoing research. If moose decline then less wolves need to be introduced, and so forth.

Topic Question 5:

Concept B-introducing new wolves makes the most sense

Comments:

Correspondence Type:

Correspondence: Topic Question 1:

I suggest and you have considered this I am sure to do nothing. Obviously there has been an ice bridge that would have allowed for the passage of wolves to the island if the habitat was suitable. It seems it was not. I would suggest that even if wolves are introduced they could easily leave the island on the ice bridge as the other wolves have done. Therefore I suggest let nature take its course. The moose can leave the island if there is not enough vegetation as did the wolves. The only purpose of this introduction of wolves is to perform a man made solution to a natural problem and we know how that works out most of the time. Good luck I wish things had worked out better on the Isle...it was a grand example of prey predator relationships that for some reason didn't follow what you would expect. It would be interesting to determine what caused the imbalance in the natural ecosystem.

Topic Question 2:

What is the purpose of management? Sustainable tourist industry? The implication of the question is that there must be management forever. The question is why and to what purpose? Surely the moose, wolf and vegetation will recover given enough time. If not we are only creating a glass bubble on this Island that is not sustainable.

Topic Question 3:

Obviously I feel that should only be monitoring for scientific purposes and not management. Management should be keeping the impact of human activity to a minimum.

Topic Question 4:

Again we cannot sustain a glass bubble over the Island. Climate change is affecting everything. Adaptation is the order of the day, which may not come fast enough. All efforts should be placed in reducing the climate change. Managing it is fantasy thinking unless you can move the Island.

Topic Question 5:

I do not believe that an introduction of wolves will be a long lasting solution. Obviously the wolf population decreased for a reason. The new population will most likely do the same. Therefore the alternative will have to be raising wolves to keep populating the Island.

Topic Question 6:

I wish you luck in your endeavours and wish that this situation was not upon us. I have no strong objections to your man made solution but am not convinced it is the way to go. I guess we shall see. I am looking forward in 50 years to your email telling me that the populations have stabilized and all is in harmony with the landscape of the island.

Isle Royale National Park
Attention: Moose-Wolf-Vegetation Management Plan
800 East Lakeshore Drive
Houghton, MI 49931

Sent via: <http://parkplanning.nps.gov/ISROMoosewolf>

Dear Isle Royale Staff,

The following are comments from Wilderness Watch on the scoping stage of the Moose-Wolf-Vegetation Management Plan and EIS for Isle Royale National Park. Wilderness Watch is the only national wilderness conservation organization solely focused on protecting the existing National Wilderness Preservation System and its individual units like the Isle Royale Wilderness. Wilderness Watch has members in every state in the country, including Michigan, and has long been interested in the Isle Royale Wilderness.

In general, Wilderness Watch has strongly supported the presence of wolves in designated Wildernesses, and we understand the ecological roles played by such a keystone, apex predator within a wilderness ecosystem. We have fought to prevent the killing of wolves within Wildernesses to bolster prey species such as elk or moose. Most recently, for example, our litigation suspended and possibly ended the State of Idahos program of sending a trapper deep into the Frank Church-River of No Return Wilderness to kill wolves in order to allegedly boost elk populations.

Wilderness Watch also supports scientific research in Wildernesses like Isle Royale, provided that such research does not conflict with the protections of the 1964 Wilderness Act. Wilderness Watch appreciates and values the long-term wolf-moose predator-prey study that has been conducted over the past 60 years on Isle Royale.

Wilderness Watch also understands the problems with inbreeding of the wolves on Isle Royale and the flattening of genetic diversity in that population. We also recognize the declining number of wolves in the Isle Royale Wilderness, the increasing moose population, and some of the potential changes in the Isle Royale ecosystem should wolves become extirpated there, be it for one year, ten years, a century or forever, just as it is different today because of the extirpation of lynx and caribou decades ago.

That said, of the alternative concepts listed in the Summer 2015 newsletter for the Scoping Process for the Moose-Wolf-Vegetation Management Plan and EIS, Wilderness Watch supports Alternative Concept A, the No Action Alternative. We suggest that a new alternative be developed as well, an Alternative Concept G (upholds wilderness designation). We dont believe that wilderness designation is sufficiently highlighted or focused on in the other alternatives contained in the public scoping newsletter. Wilderness designation means much more than just conducting a minimum requirements analysis, as the newsletter implies (newsletter, p. 5).

The heart of the issue-and an apparent bias of the National Park Service-is found in the agencys statement of purpose for the plan: The purpose of the plan is to provide direction for managing the Isle Royale moose and wolf populations . . . (newsletter, p. 3). This purpose presumes that, contrary to the intent of the Wilderness Act, the Park Service needs to manage these species and their interactions. That is, the ecological and evolutionary processes that created and continue to shape the island systems need to be controlled and manipulated to conform to what the agency thinks they should be. This bias appears to pre-determine the outcome by inappropriately assuming that the National Park Services job is to manage and manipulate the populations of wolf and moose. This agency bias must be removed in the next step of environmental review for this project.

It also appears from the proposal that another agency bias may exist for the retention or reintroduction of native species on Isle Royale (despite the forces

of island biogeography), to retain natural conditions on the island even if a species becomes extirpated. If this is indeed the case, why should we stop with just retaining or reintroducing wolves and moose? Why shouldn't we reintroduce all native species that have become extirpated from Isle Royale, including Canada lynx and woodland caribou?

As detailed below, Wilderness Watch believes that wilderness designation requires a non-intervention approach, and we believe a non-intervention approach must be taken even if it means that wolves might become extirpated from the Isle Royale Wilderness. Our reasons for supporting non-intervention at Isle Royale include the following:

1. Wilderness. In 1976, Congress designated about 99% of Isle Royale National Park as Wilderness under the 1964 Wilderness Act, Public Law 88-577; 16 U.S.C. 1131-1136. Wilderness designation is the law of the land, and wilderness designation cannot just be ignored in the case of Isle Royale.

The prime directive of the Wilderness Act is to preserve wilderness character, not to preserve individual species, even popular or charismatic ones. The prime directive is not to artificially maintain a specific predator-prey population, but all of the ecosystem dynamics, even if that leads to the extirpation of a current predator or prey species. Similarly, the Wilderness Act does not direct us to preserve the ecosystem function of a species that is waning, but all ecosystem functions unfettered and unmanipulated by humankind. The prime directive is to preserve wilderness character, to let nature run its course.

The Wilderness Act did not define wilderness character, though Wilderness Act author Howard Zahniser reminded us as early as 1953, We must remember always that the essential quality of wilderness is its wildness. The best definition of wilderness character is the degree to which wilderness is free from deliberate human modification, control and manipulation of a character and scope that hampers the free play of natural ecological processes. (David Cole et al. 2016. In press. The 'Keeping It Wild Monitoring Frameworks Definition of Wilderness Character Jeopardizes the Wildness of Wilderness, International Journal of Wilderness.)

The Wilderness Act also defines Wilderness in part as untrammled or unmanipulated. This means that we allow Nature to call the shots in Wilderness, even if that means that Nature might make decisions that we humans may not like, such as the extirpation of wolves from the Isle Royale Wilderness, either temporary extirpation or permanent extirpation.

Dr. Robert Lucas, a pioneer wilderness researcher, could have been speaking directly to the situation with wolves on Isle Royale when he wrote, If ecological processes operate essentially uncontrolled within the wilderness frame of reference, the results, whatever they might be, are desirable by definition. The object is not to stop change, nor to recreate conditions as of some arbitrary historical date. The object is to let nature 'roll the dice and accept what results with interest and scientific curiosity. (Lucas, R.C. 1973. Wilderness: A management framework. Journal of Soil and Water Conservation, 28: 150-154.) From a scientific/research standpoint, there is probably volumes more to be learned by letting nature take its course than by artificially injecting more wolves into the Isle Royale ecosystem and trying to perpetuate the status quo of the past five or six decades.

This is the very essence of Wilderness, that we humans must treat Wilderness with humility and restraint. The current debate over the potential loss of wolves indicates the fairly short-sighted approach of most land management practices that are often based on the next few years, a career-post, or human lifetimes at best, not millennia. Because Wilderness is forever, we need to look beyond the short timeframe of human lifetimes. We need to allow these natural processes to play out over much longer time spans, to make it possible for those areas from the eternity of the past to exist on into the eternity of the future, as Wilderness Act author Howard Zahniser once eloquently described it.

Some people may argue that wilderness designation is a nice add-on, but it really doesn't or shouldn't change things on the ground. That argument, however, doesn't hold water. In a case involving Wildernesses in the High Sierra, for example, the U.S. 9th Circuit Court of Appeals ruled in 2004 that the Wilderness Act imposes substantive requirements on an administering agency to protect the wilderness. (High Sierra Hikers Assn v. Blackwell, 390 F.3d 630.) In another case, a Federal District Court ruled, [S]ubjective characterizations aside, the Wilderness Act is as close to an outcome-oriented piece of environmental legislation as exists. As such, it is as close to a 'purist manifesto as may be found in the area of environmental law. (High Sierra Hikers Assn v. U.S. Forest Service, 436 F.Supp. 2d 1117.)

Wilderness designation therefore has significant meaning. And wilderness designation at Isle Royale strongly argues against manipulating the wolf and moose populations, against both transplanting more wolves from the mainland as well as culling the moose herd.

2. Island Biogeography. As the National Park Service wrote in the Summer 2015 newsletter, Isle Royale exhibits a unique biogeography. Organisms that live on islands have more dynamic population trends and are more often subjected to extinction events with colonization and immigration occurrences depending on island size, distance to the mainland, length of isolation (time), chance events, habitat suitability and human activity, to name a few influencing factors. In other words, things come and go from islands; local extirpation is natural, as is establishment and re-establishment of new populations.

Wolves and moose are relatively recent natives to Isle Royale. Canada lynx and woodland caribou, two earlier natives, provided the predator-prey dynamic up to about the turn of the 20th century but have both become extirpated. So it may ultimately be with wolves and moose, to be replaced with other species. These are common occurrences related to island biogeography. Moose arrived in the early 1900s, and their population has fluctuated dramatically at times since then. Wolves became an even later migrant when they crossed the ice to Isle Royale between 1948-1950.

The presence of wolves and moose on Isle Royale has provided a unique and well-documented opportunity to study the predator-prey dynamics since the mid-20th century, however, a study that continues to this day.

Yet even the length of this noted study does not mean that the dynamics of island biogeography have ended. Species come, and species go. Extirpations can occur. Particularly because of wilderness designation, we must let it be Nature that makes those decisions, not us humans who want to impose human preferences on the Wilderness.

3. Slippery Slope of Manipulation. As mentioned above, an essential part of wilderness designation is that humans must avoid the hubris and arrogance we often exhibit towards landscapes and wildlife. We must instead show humility and restraint, allowing untrammled Wilderness to remain unmanipulated to chart its own ecological and evolutionary course without succumbing to human preferences and desires.

If humans start transplanting wolves to Isle Royale, we start on a slippery slope that may have no end. Additional wolves will almost certainly be needed on the island after the first installment, to freshen up the gene pool again. With a warming climate, Isle Royale may eventually lose its moose population, too. Will we then import moose to Isle Royale in perpetuity to keep the wolves fed, in order to perpetuate 1950s predator-prey conditions? And what of the native lynx and woodland caribou that inhabited the island before the wolves and moose? Should we reintroduce them to re-create 1900s conditions?

4. Research Will Continue. Some people fear that a loss of wolves from Isle Royale will mean that ecological research on the archipelago will come to an end. Ecological studies on Isle Royale will continue to provide new scientific insights, however, whether or not the wolves survive or become extirpated. Wolves are not the only species to be studied on Isle Royale, even if the somewhat exaggerated symbolism of the wolf and its promoters might have us think otherwise.

Research will become even more important if the wolves do become extirpated. If the wolves die out, how will the moose population respond? Will genetic variability in moose also flatten over time? Will the moose population return to the boom-and-bust cycles of the 1920s to 1950, or will something else occur? Will wolves naturally re-colonize Isle Royale on their own, utilizing the ice bridges to the mainland that have formed in recent winters?

5. Researchers Who Call for Non-Intervention. Wilderness Watch is not alone in calling for a non-intervention approach on Isle Royale. Other highly respected researchers have also supported this approach. They include:

Dr. L. David Mech. 2013. The Case for Watchful Waiting with Isle Royales Wolf Population, *The George Wright Forum* 30(3): 326-332.
Dr. Tim Cochrane. 2013. Island Complications: Should We Retain Wolves on Isle Royale? *The George Wright Forum* 30(3): 313-325.
Dr. Tim Cochrane. 2014. Rejoinder to 'Discernment and Precaution: A Response to Cochrane and Mech', *The George Wright Forum* 31(1): 94-95.
Dr. Peter Landres. 2010. Let It Be: A Hands-Off Approach to Preserving Wildness in Protected Areas. In *Beyond Naturalness: Rethinking Park and Wilderness Stewardship in an Era of Rapid Change* (D.N. Cole and L. Young, eds). Island Press, Washington, DC: 88-105. (Not specifically about Isle Royale.)

Please keep Wilderness Watch on your contact list for further steps in this analysis. Thank you for this opportunity to provide comments.

Sincerely,

Correspondence: Topic Question 1:

I am a strong advocate for reestablishing the wolves on the island. This is a unique island and has provided years of research. Any management of the island has to focus on reestablishing the wolves on the island. I am in support of Concepts C and D. I have a concern about if Concept B would in itself work with the amount of moose that are currently on the island.

Topic Question 2:

The impact that we play as humans on this island. It is because of some of the past practices of humans that have interfered with the wolves on the island. A balance has to be maintained in allowing the island to be enjoyed by visitors and causing a minimum impact on the wildlife there.

Topic Question 3:

The NPS can intervene with the reintroduction of the wolves without having the problems associated with neighboring land owners. (i.e. ranchers having problems with wolves killing livestock on nearby properties). With that said, based on the moose population the NPS may have to hunt some of the moose to lower the herd numbers. I do not support turning this into a money making endeavor of allowing hunting each year to get the funds. However, a hunt that is necessary to lower the herd numbers may be in order.

Topic Question 4:

The NPS needs to recognize that the climate has made it less likely to have the ice bridge form as in the past. The animals are more secluded and therefore more than one intervention may be needed in the future with the Wolf population. Inbreeding has been a big issue. I don't like the idea of looking at the island as a zoo type environment, but it should be looked at as a wildlife preserve in which intervention is used to prevent the extinction of the species. I know there are more wolves out there in the world but these wolves are unique because of the circumstances that exist on the island.

Topic Question 5:

I like the concepts that include reintroducing the wolf population. Provided it is done correctly and not bringing wolves from the Detroit Zoo as in the past. This is were the experts who have studied the wolves should be involved. I'm not a fan of hunting the moose, but realize that it might be necessary to lower their numbers, which leads to less habitat loss and could makes their herd healthier overall.

Topic Question 6:

My preference would be to use Concept C and D with reintroducing the wolves. I realize that there are only two wolves on the island at this time. If they could be used in reestablishing the wolf packs, that should be considered. I do leave it to the experts that have studied these wolves for years to decide the best action. To do nothing, makes no sense. We as humans already have contributed to the demise of the wolf packs on the island. Now is the time to give back and preserve such a unique island. I have enjoyed the island twice now and wish to be able to see and/or hear the wolves in the future.

Correspondence: Topic Question 1:

Only least invasive by humans. Isle Royale is magical because it is pristine wilderness, unspoiled. Mankind doesn't always have a better way. We stumbled into either creating or seriously aggravating global warming. To help mend its affect on Isle Royale the least invasive would be to make a way possible for wolves to reach the island again. New genes are obviously needed from time to time to maintain the balance between wolves, moose, vegetation, and all else.

Topic Question 2:

Wolves culling of moose includes elimination of diseased individuals, better health of the herd, and efficient disposal of remains. Still skeletons and teeth would be available to continue learning from all the research, cataloguing, and storage of such in a location available to researchers on-going.

Topic Question 3:

Calculated replacement of wolves as necessary would be most cost-effective and fitting with a wilderness area.

Topic Question 4:

Do all possible to stop global warming for ALL National Parks and the globe. Minimal management, only to lessen deleterious human activity and to stabilize the moose/wolf ratio makes sense to me.

Topic Question 5:

Any time we think we know more than nature, we seem to create far bigger problems. Isle Royale is a rare jewel and needs to be preserved unspoiled. We have managed to prevent ice bridges so we must find a substitute way to bring in new wolf stock. That is the equation to preserve in order to preserve this place for future generations.

Topic Question 6:

We have experienced Isle Royale as a 4-generation family group, each getting something uniquely valuable and individual from the adventure. None of us will ever forget this unique place and its preciousness to us as we live out our lives on this fascinating planet.

We have also experienced this island with a Road Scholar group, and it too was incredibly valuable in different ways. It was something each of us felt really privileged to participate in. This living in a complex and different place, even for a short time changes our outlook and perspective after we've had to leave.

Correspondence: Topic Question 1:

Other than what? A pristine place like Isle Royale should, to a large extent, be allowed to manage itself and only be interfered with when it needs assistance to continue it's natural processes. On several trips to the island, our family has delighted in the way nature has managed to balance itself under varying circumstances.

Topic Question 2:

We have watched how wolves and moose ket each other in balance. Wolves sense when a moose is weakened by disease, even subtle clues. I doubt that humans are equal to their sharp intuitive ability. Having that ability, they keep the moose herd healthy by culling out the ill, weak and elderly. With no wolves, moose would decimate vegetation and starve. A total destruction to the wolf / moose phenomenon on Isle Royal. The loss would include the extremely valuable and long range study which can have many benefits for us all. Wolves remain healthy when their breeding stock is refreshed by new members coming to the island and by plenty of healthy moose to eat. So new wolves need to be introduced in order to keep the natural balance functioning.

Correspondence: Topic Question 2:

Moose numbers are too high and they are destroying the vegetation.

Topic Question 3:

I agree with a modified option C. More wolves should be introduced and numbers maintained so they can reduce number of moose. With that, the moose numbers should be reduced which should maintain the vegetation base/ environment for their long-term viability.

Topic Question 4:

The vegetation has and will continue to be impacted due to climate change. Reducing moose numbers will be beneficial in terms of preserving the environment.

Topic Question 5:

I'd go with adding wolves and being sure that their numbers are stabilized.

Comments:

Correspondence ID: 854
Moose-Wolf-Vegetation Management Plan/EIS

Correspondence Type: Web Form

Correspondence: Topic Question 1:

I have no other alternative management recommendations beyond the ones currently listed.

Topic Question 2:

An ecosystem works when all components are in place. Currently with the lack of wolves acting as the island predators, the system is out of balance. For the island to regain it's ecological balance, the predators need to be in place on the island. And this is most likely not going to happen without human intervention, esp. since it is human impact that has impacted the formation of an ice bridge to the island for most of the last 20 years - due to climate change. If wolves can be reestablished on the island in sufficient numbers in in good genetic health, then the balancing will resume based on predator and prey activity to keep the island's ecosystem in balance. If there are no predators on the island to control the moose, the entire nature of the island will eventually change-for the worse-as moose multiply, unchecked, and they denude the forests in their search for food. Eventually, the lack of food for the growing number of moose will cause some die-off, but not before the island's vegetation and landscape come under harsh abuse and damage by the foraging moose.

Topic Question 3:

While 99% of the island is designated as wilderness, I feel that there should be an exception to the policy of "NO Human Intervention in Wilderness Areas". I feel that humans DO need to intervene to get a healthy compliment of wolves back on the island since there is a good chance that this will not happen "naturally" due to climate change impacting the formation of an ice bridge and that wolves have not been inclined to remain on the island for whatever reason when they have scouted out the island territory in the past year or two.

Topic Question 4:

I think that in the face of a changing climate, it is important that NPS assist the process of getting wolves reintroduced to the island by actually bringing in new wolves which will invigorate the current wolves' genetic pool with outside genes that will reduce the negative effects of inbreeding that is leading to the demise of the island's wolf population.

Topic Question 5:

I prefer Alternative B. This proposal allows for bringing in new wolves which will hopefully breed with each other and/or with the current wolves to begin to build up one or more packs of wolves. Once the wolves pack(s) are in place, the wolves will begin to have an impact on the moose population. I think that letting the wolves cull the moose herd rather than opening the island up for a moose hunt is the preferred method, since it involves the least intervention by man into the ecology of the island.

Topic Question 6:

Please take action to reintroduce wolves to the island within the next year. Also please continue to allow research on the wolves and moose of Isle Royale so more can be learned of the complexity of the life cycles of all living beings on the magnificent Isle Royale environment.

Correspondence: Topic Question 1:

I feel long term management of the wolf population may be a good solution

Topic Question 2:

Without predation the moose population will grow and put a lot of pressure on the native vegetation. Eventually the moose herd will be stressed and become less robust as they deplete food resources.

Topic Question 3:

Reintroduction of wolves from elsewhere is a possible solution, but long term management may mean that that wolf population may need to be augmented again over time. Particularly as climate change may mean that Lake Superior may not freeze over to allow a natural influx of new wolves from elsewhere.

Topic Question 4:

but long term management may mean that that wolf population may need to be augmented again over time. Particularly as climate change may mean that Lake Superior may not freeze over to allow a natural influx of new wolves from elsewhere.

Topic Question 5:

I am not sure that the population of moose will need management if the population of wolves or other top predators is monitored. Letting things go may mean damage to the wonderful diverse flora of Isle Royale. Also, the eventual absence of the iconic wolves there would be a real shame.

Correspondence: Topic Question 1:

All alternatives, elements and management tools should be left in the hands of the most qualified park professionals and wolf/moose/vegetation experts at Michigan Technological University.

Topic Question 2:

Long-term maintenance of the park ecology should be the primary goal for Isle Royale National Park.

Topic Question 3:

Hands on approach should be utilized, especially ,to assure that wolves always exist on the island.

Topic Question 4:

Minimize the use of fossil fuels on the island to assure the NPS is doing its part to reduce the carbon footprint.

Topic Question 5:

I like any alternative that recognizes a wolf population must exist on the island. I dislike any alternative that waits for nature to run its course. Taking a chance that wolves will be absent from the island for any length of time is courting ecological island disaster.

Topic Question 6:

A PhD degree is not required to understand that wolves are the keystone species on Isle Royale National Park. Wolves keep the moose population in check. A balanced and healthy wolf/moose population assures the vegetation will remain in a relative balance. It is critical that a wolf rescue effort be initiated immediately.

Correspondence: Topic Question 1:

no suggestions

Topic Question 2:

The impact of humans on Isle Royale's situation. Are we having a negative effect on wolf population with the minimal tourism that there is? One wouldn't think so given examples such as the seeming increase of population in the Keweenaw where wolves and man are bumping up against each other more and more. However, there may be something we are doing that encourages those who can leave to do so.

Topic Question 3:
Minimal no matter what method is followed.

Topic Question 4:
Take cues from the surrounding ecosystems and how they are reacting to the climate.

Topic Question 5:
From a laypersons perspective - management is tricky. It is hard to predict the outcome even for professionals. Replicating how nature would solve this problem seems the best course of action.

Topic Question 6:
I trust and support the NPS to evaluate the data and make a decision that is best for the land.

Correspondence: Topic Question 1:
I am in favor of Alternative Concept C. I believe that there are many important reasons to maintain both species (moose and wolves) on the Island.

Topic Question 2:
All of the following:
Moose and wolf populations
Plants and woody vegetation, due to impacts from moose browsing
Sensitive plant species, such as orchids, that are affected by forest changes
Other wildlife species (e.g. beaver, hare, coyote, fox, ravens, and other bird species) affected by changes in natural habitat conditions
Streams and hydrology, due to changing streamflow conditions
Wetlands, due to potential changes to wetland plant communities
Visitor experience, due to changes in forest structure and populations of moose and wolves

Topic Question 3:
Still Concept C.

Topic Question 4:
Concept C

Topic Question 5:
Considering the fact that people have had an impact on all of the island's ecology over the centuries, I don't see how reintroducing (if all of the current wolves die) or augmenting existing wolf population is contradictory to the wilderness character of the island. Without the wolves, the cascade of detrimental impacts to the plants and animals is going to leave an island that few people will want to visit.

Topic Question 6:
I was on the island just a week ago and was Shocked and dismayed to find nothing in the Visitor Center or on the Ranger program schedule talking about this very important issue. It was as if the Park didn't want visitors to know anything about it or the deadline for the comments. I have been coming to Isle Royale since 1983 and the biggest draw has been the knowledge that I was on an island where two major, charismatic mammals were present (even if I never saw them). That to me was the Symbol of Wilderness.

Correspondence: Topic Question 1:
The concepts described are quite general and lack some important details but I understand they are concepts. With that said, I do not believe reestablishing wolves ONCE as a method to solve the issue at hand as noted in concept B and concept D will be a long term solution. Inbreeding may repeat itself and create the same problem and likely be more costly in the long run. Concept C would prove to be the best alternative as it would allow both wolves and moose to occupy Isle Royale and could include wolf reintroduction or augmentation. Concept C does not give many details though. Time is required for families of wolves to regenerate and acclimate to their new ecological surroundings. Genetic evaluation would need to be managed among wolves for several decades in order to ensure a sustainable population of wolves and moose. I do not agree w/culling moose. There is no reason if the wolf population

is healthy. Culling would change the entire branding of Isle Royale and would cause havoc on already damaged terrain.

Topic Question 2:

Wolves benefit an ecosystem. Wolves belong on Isle Royale as they are an ecological benefit. The island would not be the same without them. I strongly believe NPS should utilize the 57-yrs of data and research conducted and encourage discussions with all scientists who collected the data using their recommendations to determine the future of Isle Royale.

Topic Question 3:

Isle Royale is a compelling wilderness area. I can only hope NPS protects its unique qualities. NPS needs to closely observe and inspect wildlife habitat even if it requires trail cams. Monitoring wolves and moose and providing maintenance of plant and animal species is imperative. Removing invasive species before seeding occurs is necessary. Management is necessary to maintain important wilderness values including the presence of a top carnivore which is vital for ecosystem health. As I mentioned in Question 1: the culling of moose is not necessary if wolves are reintroduced and the use of motorized equipment is totally unacceptable. Combustion engines of any type would ruin what Isle Royale is all about.

Topic Question 4:

Climate change is an issue and a threat to many species and is evolving at a rapid pace even though there are those who deny it. Reducing carbon emissions globally is the first and foremost solution. Awareness to the problem on Isle Royale can be emphasized specifically by means of a hand-out, flyer or brochure and through social media. Isle Royale has issues that could be addressed such as the changes in the duration and frequency of the ice bridge, resistant tick issues, bird species such as Common Loons becoming sterile due to acid rain and much more. Even more importantly, provide a well or water fountain encouraging visitors to eliminate all plastic water bottles.

Topic Question 5:

The preliminary alternatives are rough in concept. What seems a little strange is that NPS waited until the last minute to take action on the decreasing wolf population...down to three wolves? The only pup observed in 2015 was born deformed; 100% of wolves examined since 1994 (over 30 of them) have spinal anomalies. I don't understand why action was not implemented earlier. The Record of Decision is not expected until Fall 2017 at the earliest. Two and one-half years away? This is ridiculous. The Island is in poor shape. Fewer wolves equates to further vegetation destruction. Every effort must be made by the NPS to expedite the decision.

Topic Question 6:

I feel there is an urgency in making a decision to repair a broken Isle Royale. It is a unique wilderness experience so many look forward to and hold memories of. If it were not for the wolves...it would not be Isle Royale. I live w/wolves in northern WI. I chose to live in a very remote area where I reside with my dog. Wilderness is my backyard...Nicolet National Forest. I am lucky to have this space where there are no malls, few people and not too many combustion engines. Wolves, bear, deer, bobcats and now cougar roam the terrain. A favorable ecosystem except for hunters and poachers. I respect wildlife and hope NPS respects the visitors who want to continue to enjoy the Isle Royale they heard about or once knew.

Comments: I was to visit Isle Royale this summer and decided against it when I heard of the decrease wolf population. I was to document the vegetation situation, the wolves and the moose. I am now on hold.

Web Form

Take action now instead of continuing this delay tactic process. Put wolves in the wilderness. Maintain the delicate balance and get some action going now.

Topic Question 2:

The fact that this is a public debate means that it is more than a management issue. Look at the parks image - wolf and moose are the keys.

Topic Question 3:

Designation does not eliminate the history of the park in which 99% w impacted by humans. Make decisions that make sense, not decisions dictated by legal documents.

Topic Question 4:

This is one of the few places where moose might survive in this changing climate, give the balance that has been in place a chance to continue.

Topic Question 5:

I like the idea of augmentation, but the park has dragged their collective feet so now I like reintroduction of wolves.

Topic Question 6:

The park could not have done more to reduce comments or restrict public involvement. This is a very poor reflection on the park and the park management.

Comments: We have had mange, ticks, climate change, previous wolf introductions, possible moose introductions, mining and mining related accidents, and yet the park can be considered wilderness. It is the absence of motors and the presence of wolf and moose that makes this possible.

Correspondence: Topic Question 1:
Wolves should be reintroduced to the island and should be kept above a minimum level that is scientifically sustainable. Population and bio-diversity should be a main concern addressed in a plan. No culling should take place in a National Park.

Topic Question 2:
The ecological benefit of wolves. Top predators provide a trophic cascade that should fix the rest of the issues state in this question.

Topic Question 3:
NPS must protect the unique wilderness qualities of Isle Royale through monitoring of habitat for wildlife, including wolves and moose; maintenance of soil and water quality and ecological stability of plant and animal communities including the control of invasive species. Management is necessary to maintain important wilderness values including the presence of a top carnivore which is vital for ecosystem health. The culling of moose and the use of motorized equipment is unacceptable.

Topic Question 4:
Climate change poses a fundamental threat to species and places. The only way to slow the impacts of climate change is to globally reduce carbon emissions. This is quite the task. Educating the public is key to attempt to reduce carbon footprints.

Topic Question 5:
The time that is being taken to produce and implement a plan. Wolves need to be restored/reintroduced to stop the downward spiral of the ecosystem.

Topic Question 6:
Those who visit Isle Royale do so for the wilderness experience which includes wolves and moose. Please help the wolf population to help naturally store the rest of the island's ecosystem. Immediate action must be taken.

Correspondence: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Correspondence: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,

[your name here]

Correspondence: Topic Question 1:
Reintroduction of a viable wolf population is the only sensible option

Topic Question 2:

Without the wolves, the moose will need to be culled, which makes no sense considering that supporting a healthy viable wolf population would return a balance of nature and maintain the opportunity for park visitors to experience the predator/prey relationship that's not possible anywhere else. The park offers the best conditions for wolves considering there's no chance of interaction with domesticated animals.

Topic Question 3:

The naps should actively manage the wolf population until it is viable and sustainable on its own.

Topic Question 4:

Seeing how the ice bridge to the mainland has been unreliable to guarantee wolves crossing and interbreeding, the naps should manage the population through reintroduction or captive breeding.

Topic Question 5:

It makes absolutely no sense to allow hunters to cull moose when managing the wolf population would protect the ecosystem and provide a tourist draw.

Topic Question 6:

Wolf reintroduction of wolves would have nothing but positive effects on the park. Unlike reintroduction in other locations, there are none of the negatives of interactions with livestock and even human populations.

Correspondence: Topic Question 1:
the best alternative is to promote a healthy ecosystem, which includes top predators, to keep Isle Royale healthy. Wolves, which offer no harm to humans, support wilderness by culling the oldest and weakest moose, deer and other plant-eating species.

Topic Question 2:
the world is rapidly losing wilderness and native animals, such as wolves, your job is to keep Isle Royale an island of healthy wilderness as so much other habitat is taken away by development etc.

Topic Question 3:
NPS' emphasis should be to keep the park wild, which means maintaining a healthy ecosystem, protect it from illegal hunting, motor vehicles and other threats.

Topic Question 4:
wilderness, with all its trees and other plants, is one of the most important tools humans have to reduce carbon in the atmosphere and the resulting climate change

Topic Question 5:
from my answers above, clearly I think any alternative other than promoting a healthy ecosystem, which includes supporting healthy predator populations, is not adequate.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,

Correspondence: Topic Question 1:
Selective removal and relocation of moose calves to areas where the moose population is in decline (increase genetic diversity of moose in other areas). Allow the existing moose population at Isle Royale to "age out" for a few years.

Topic Question 2:

Wolves are territorial. Putting new wolf packs into an area claimed by resident packs will disrupt their behavior. Introduction of new wolves could be accomplished by catching and using artificial means to impregnate female wolves. Adult males in the pack will help raise the cubs. This will broaden the gene pool. The result will be a healthier, more viable wolf population.

Correspondence: Topic Question 6:
I have read the research conducted by David Mech and others. I believe that scientific evidence is the best source of information for data to be used in making conservation decisions. I have backpacked on Isle Royale and seen, first-hand, the negative effects on the moose population from lack of wolf predation. I would like to see more wolves brought onto the island to increase wolf population and genetic diversity.

Correspondence: Topic Question 1:
Plugging up the holes creative by climate changes and the interventions that have not worked here. Planting vegetation that encourages nature to recover and provide what is destroyed or missing.

Topic Question 2:
Simply enhance the habitat, perhaps introduce more wolves or help the wolves to multiply so that the eco chain can stabilize and continue to limit the human intrusions.

Topic Question 3:
To be even more stringent in keep pristine nature just that.

Topic Question 4:
Making sure there is enough food in the food chain to continue the original balance on this amazing environmental laboratory.

Topic Question 5:
I like the idea of expanding the existing wolf population. I think this is the best choice. The wolf conservation efforts here in NYS have been successful and while other unenlightened states are wiping out their wolves We here in NYS are doing all we can to help wolf populations recover and thrive. There is nothing i dislike about what you are proposing to do.

Topic Question 6:
I have a friend who has hiked Isle Royale. People who are respectful and qualified to do this certainly appreciate and know how crucial this national park is. I applaud what you are trying to preserve and do.

Comments: At a time of diminishing wilderness and appreciation for the national treasures of wild life this country still possess I am deeply appreciative of any and all efforts to enlighten the public and make sure that our children and grand children will be able to observe and preserve habitats such as Isle Royale.

Correspondence: Topic Question 1:

We don't need management tools. Let Mother nature take its course and lets keep our bloody hands off.

Topic Question 2:

Again the nasty human word management which is a sub word for Killing.

Topic Question 3:

Exactly, lets keep it natural and a wilderness and keep our human stink away from the island

Topic Question 4:

Drone and satellite fly overs and an occasional researcher but if we can reduce our fossil fuel consumption we would not need so called management of any kind!

Topic Question 5:

Preliminary always turns into permanent. Just leave the natural happenings alone. They will work themselves out better than anything we think we know to do.

Topic Question 6:

Again we always hear from the so called experts when an animal or plant species comes into conflict with corporations or the rich land owners. They have the influence and money to be heard and that's something we need to FIX! The NPS works for all the people not for the ones who control the media and the politicians.

Comments: It is sad that a national park needs to be managed by any organization. We allow unlimited grazing and charge little or no fees. We allow rampant hunting and poaching and do nothing about this yet when an animal or plant happens to get in the way of some rancher or corporation it becomes a crisis. How sad when we let idiots with guns sit outside of Yellowstone and wait until a beautiful bison happens to wander out of the park and gets shot! This is what we should manage. Men and women with guns who think this is an acceptable behavior. Its ignorant and cowardly and should not be allowed for any so called reason.

Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you.

Sincerely,

Topic Question 2:

Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

Topic Question 3:

I like introducing the wolves; it allows for natural predation. The other method of controlling moose is to hunt or otherwise cull them. I would prefer not to go in that direction.

Topic Question 4:

I think the issues with the wolves reflect climate disruption. I know the wolves went to the Island from the mainland during a freeze on the Lake. This is less likely to happen now and so new wolves are not likely to be introduced in this "natural" way.

Topic Question 5:

Not having wolves puts the vegetation at risk. I think having wolves in Yellowstone has shown that areas in which the wolves are active and keep down the deer population, have benefited the prairies and the rivers adjacent to them.

Topic Question 6:

I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Correspondence: Topic Question 1:
The wolves could be relocated to another remote spot-they are a unique variety of wolf and this strain should be protected by any means possible.

Topic Question 2:
Actually you should leave all the animals and plants alone to work out their own density-predators self regulate as to the availability of prey-less prey-less wolves-as for vegetation-again-the moose eat vegetation-if vegetation becomes less, there are fewer moose and thus fewer wolves. Nature is quite capable of self regulation without the interference of men. It is not up to us to manage a wilderness area-it is up to the animals and plants that live within the area to manage naturally.

Topic Question 3:
I don't think that National Park Service need to do anything-leave the place alone-there is something to be said for a natural wilderness untouched by man there isn't much of that left in the world.

Topic Question 4:
Changing climate affects all living creatures and plants-there will ultimately be changes in vegetation which will cause changes in animals that rely on that material for sustenance, which will necessarily affect the numbers of predators for that plant eating species. If left alone-perhaps the moose and wolves would grow either smaller or bigger to adapt to climate change, grow longer or shorter coats etc. Animals are quite able to adapt without human interference.

Topic Question 5:
I don't think hunting a very few very endangered wolves or killing or trapping them would help the ecosystem recover. I live in Florida, and the Army Corps of Engineers thought it would be best to drain the Everglades and have canals rather than let the system drain naturally as it had always done-we spent millions of dollars rerouting and building canals and locks to change the natural flow of water-now we are having to spend many more millions to restore what we destroyed. Best to leave nature to itself. Now we have algae blooms in our bays, estuaries, in the Indian River and flowing out to sea which is harmful to humans and animals alike-why? Because we interrupted the natural flow of water from Lake Okeechobee sheeting through the Everglades which purified the water which we contaminated with pesticides and fertilizers to flow harmlessly to the sea along long established waterways-Florida can never replace what nature gave us in the first place. The same goes for your area-For heaven's sake-be smart and leave it alone-all of it.

If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Correspondence: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

The maintenance of each of the species of animals and vegetation.

Comments: Dear NPS Staff,

It is my opinion that the addition of more wolves to the Park will help keep the moose population from expanding to the point where they cannot survive without damaging the vegetation in the wilderness area.

I believe the periodic evaluation of the the wolf population with additional wolves being added as needed is something that can help all the species maintain themselves and the environment.

If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,

Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

I have camped on Isle Royale twice. Both experiences on the island were great. Seeing moose everywhere on the island. I never saw a wolf but did get to hear them howling at night. That was awesome. Please help to keep the park's ecosystem balanced by adding more wolves.

Thank you for considering my concerns.

All these animals should have plenty of food and shelter.

Topic Question 3:
Need to keep all animals safe and their habitats safe.

Topic Question 4:
The management should be to make sure that these animals have rights and that they are safe.

Topic Question 5:
There is not enough protection for these animals and their habitats.

Topic Question 6:
All these animals need to feel safe. These animals need to be protected. These animals belong in the wild. No one should ever harm these animals. We need to keep the wolves going strong. Wolves have been an issue for sometime now. It is about time these wolves stay protected along with their habitats. Don't

give up on these wolves. No more hunting wolves. Wolves are not the problem people are. People are the biggest threat to all animals. These wolves need to know that they are protected. There are not many wolves around anymore all because of people. People do not understand the wolves and what wolves really represent in life in general. Don't destroy these wolves. You people need to know what you people are doing. Don't let this keep happening over and over again. You people don't seem to be doing your jobs to well what a pity that is. Keep all wild animals safe. Let no harm come to them.

Correspondence: Topic Question 1:

Killing the moose is not an option! Somehow, the balance of nature has been lost and must be regained. The transfer of wolves would provide a balance, and Mother Nature would take her course!

Topic Question 2:

Always keep the animals' lives a top priority! Unnecessary killing just does not work! The wilderness is also a priority, as the animals have to have their habitat to survive. Vegetation must be protected for survival reasons.

Topic Question 3:

This wilderness must never be encroached on by man! It needs to remain wild and never built on, used for mining or for any other purpose other than maintaining the wild of the Park!

Topic Question 4:

We must address climate change now in order for the wilderness and its animals to survive! If we decide to wait and see, we will be in big trouble, along with our environment and its animals! Pressure must be put on the President to continue to strengthen the demands on those who are polluting our ecosystem!

Topic Question 5:

Man often gets involved when it is better to leave nature alone. However, this off balance situation in the Park needs to be addressed. It will be stressful to trap and send wolves to this region, but not sure what else can be done. The large amount of killing of wolves in this country must be stopped. If we don't, there won't be enough to do what you propose in the Park!

Topic Question 6:

We are wondering why there are so few wolves in the Isle Royale National Park. Is it because they have been hunted to bring them to such a low level of population? It would not surprise us if that is the case. Typically, if man leaves animals alone, the balance of nature is healthy and well.

Comments: Dear Superintendent Green,

We care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

We support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it!

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and

ecosystem. We support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Correspondence: Topic Question 1:
Wolves should remain a presence on the island. This will preserve the prey/predator balance, preserving species and saving vegetation, which is critical to controlling global warming.

Topic Question 2:
Wilderness areas need to remain such. If wolves die off, the vegetation in the area will inevitably change, given the increase in the moose population, affecting numbers of trees, a healthy understory, and ultimately the amount of carbon that can be removed from the atmosphere.

Topic Question 3:
Monitoring the progress of new wolves in making a home in the area will be important. This means tracking their movements.

Topic Question 4:
This is ultimately the reason why wolf introduction is so important. We want to ensure that wolves have a decent chance to survive in a world where humans continue to encroach on wilderness areas, both because of their own intrinsic value and for the crucial role they play in regulating moose populations to ensure healthy vegetation.

Topic Question 5:
Doing nothing is the worst idea. Wolves would die off, moose populations would expand, trees would die and the earth will continue to get warmer. Not an option.

If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,

Correspondence: Topic Question 1:

Get complete information as to why the IR wolves haven't thrived.

Topic Question 2:
See question #1, "other alternatives".

Topic Question 3:
Wilderness should not be "managed". Possibly too many humans have been part of the problem.

"Intensity" of management and visitors is stressful for wilderness.

Topic Question 4:
Changing climate is also stressful. No "management" other than limiting human use and interference will be effective.

Topic Question 5:
We haven't seen the preliminary alternatives.

Topic Question 6:
We are keenly aware of the damage too much "management" has done and is doing to our shrinking wilderness areas and National Parks. That the areas remain undisturbed WILDERNESS, in spite of the population (human) explosion and the corruption in government agencies is where the focus needs to be.

We become more and more discouraged when we read about our parks and wilderness areas, overseen by federal and state agencies, allowing trees to be harvested (for profit) and animals to be killed (for profit), plus mechanical devices (snow mobiles) and guns allowed everywhere ...to increase profits .

When will all this damage to what is supposed to be protected habitat end? What is the answer? This a vitally important ... more than ever now, when we are looking for answers to the climate change resulting from too many humans?

Correspondence: Topic Question 1:
I support Alternative Concept B.

Topic Question 2:
Wolves are natural predators to moose. Without wolves keeping the moose in check, they will overrun the island and eat themselves out of room.

Topic Question 3:
Introduce wolves!!

Comments: Dear Superintendent Green,

As a person who believes that God created all species for a reason, I believe that Isle Royale is a wonderful wilderness that needs a little help to stay balanced. I believe that you need to introduce more wolves to equalize the prey/predator relationship. Since Isle Royale is almost completely a wilderness area, the habitat is perfect for both species.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation. This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

I want wild places like Isle Royale to stay wild for future generations.

Thank you for listening!

Click Here by August 29 to Help Save Isle Royale's Wolves!
(This link will take you to the National Park Service's Planning, Environment, and Public Comment website.)

Take Action

Dear Kathy,

Isle Royale National Park, a remote and beautiful island in Lake Superior, is home to a famous community of wolves and moose. These two species have an important predator-prey relationship and are critical to the overall health of the island ecosystem.

But with only three wolves left on the island, the character of Isle Royale is in jeopardy.

If wolves die off, the island's moose population will continue to increase, consuming the native vegetation and eventually running out of food, disrupting the natural balance of the island. We don't want that to happen.

The National Park Service (NPS) is responsible for protecting and managing the beautiful natural resources and wildlife at Isle Royale. NPS is seeking your input by August 29 on how best to manage the wolf and moose community, as well as plants and other wildlife in the park.

One option NPS is considering- -Alternative Concept B- -includes introducing new wolves to the island to balance the delicate ecosystem, preserve the native plant life, and keep the moose population in check. After many years of consulting scientific experts and conducting extensive research to determine what we view is the right response, we at NPCA support this option.

We are urging NPS to bring new wolves to the island so this iconic species does not become extinct at Isle Royale and they continue to fulfill the critical role of balancing the island's natural environment.

Take Action: Tell the National Park Service to bring new wolves to Isle Royale National Park to help balance the park's ecosystem.

Here's how to submit your comments to the Park Service.

Step 1: Go to <https://parkplanning.nps.gov/commentForm.cfm?documentID=> and carefully follow the form instructions.

Step 2: Submit your comments by copying and pasting the sample message below into the "Comments" box on the web form. Questions 1-6 on the form

are optional. Remember to personalize your comments by adding personal observations or stories.

Step 3: Once you have completed all of the required fields on the form, click the gray "submit" button at the bottom of the page.

Topic Question 5:
54942370

Comments: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely

Correspondence: Topic Question 2:
That all three may survive on the island in an ecological balance.

Topic Question 4:

The changing climate poses a real threat and challenge to all National Parks. As research progresses and a fuller determination of the effects and impacts these changes will make on the natural communities on Isle Royal additional steps will have to be made to maintain a natural balance. More intervention maybe required then is currently allowed in "wilderness" designated environments.

Correspondence: Topic Question 1:

Alternative Concept B- -includes introducing new wolves to the island to balance the delicate ecosystem, preserve the native plants, and keep the moose population in check. I support this option. I grew up in Michigan (and would live there still if I had work there). Knowing the wolves were on Isle Royale was a point of pride. Moreover, I worry that moose will become overpopulated without wolves present and extreme moose populations can have a deeply negative impact on plant diversity.

Topic Question 2:

The primary concern should be biodiversity first and foremost. While I enjoy opportunities for the public to enjoy the island, the most important thing is a thriving and diverse ecosystem, especially given how few relatively untouched places remain and how much climate change already threatens the stability of all ecosystems.

Topic Question 3:

Management should be kept to a minimum, but I also would hate to see the wolves go. While there is value in seeing how the island would do with absolutely no intervention, there are so few wild places left that management must consider biodiversity beyond the parks borders. Each species has value unto itself, and not merely in terms of its contribution to the ecosystem. And given that no place is immune to the consequences of human action, management to keep the wolves strong is the best way to maintain harmony and balance on the whole. There can be no fully untouched location. So, it is incumbent upon us to make that human touch as gentle as possible.

Topic Question 4:

The better question would be what are we actually going to do stop making the climate worse and making the challenges faced by the NPS even more extreme, but for the purposes of this question, NPS should more aggressively protect species to ensure as much biodiversity can make it through climactic changes as is possible. History teaches us that biodiversity is the toolbox for facing unique challenges. Climate change represents an unparalleled assault on that toolbox. We need to do as much as we feasibly can to protect what biodiversity remains.

Topic Question 5:

I like plan B. Please see previous comments. I hate to see major indigenous populations of Isle Royale die out.

Correspondence: Topic Question 1:
Reintroducing wolves to Isle Royale

Topic Question 2:

There is a 44 year long study of the Isle Royale wolves...there are many ways to help the wolf population survive and it demonstrates the wolves role in rodent and pest control. The ISLE ROYALE WOLF STUDY is still available on amazon.com...PLEASE READ IT!!!!!!

Topic Question 3:

Being sure that the wolf population survives should be the first priority.

Topic Question 4:

I think shelter should be a consideration...even if it is artificial.

Topic Question 5:

I dislike the fact that older and more comprehensive studies are no re-examined for significant information.

Topic Question 6:

Please read the ISLE ROYALE WOLF STUDY. It followed these wolf families for 44 years and it has information that is pertinent to the survival of these pack in this park. Ignoring comprehensive study only upsets the balance of nature and will only further the degrade the quality of the environment and the species that live within this area.

Correspondence: Topic Question 1:

I believe the least intrusive method should be used. Alternative B is the least intrusive method.

Topic Question 2:

Cost, environmental impact and best, most natural methods for the animals involved. Do not allow the unnatural hunting of moose just to kill them to reduce their numbers. Allow nature, via the wolves, to reduce the numbers via the nature circle of life.

Topic Question 3:

Reintroduce wolves and allow nature to take it's course - as it should in the wilderness.

Topic Question 4:

That will have to be evaluated in the future as the need arises.

Topic Question 5:

I hate people hunting so I hate the option of killing moose just to kill them. Nature provides innate control by the wolves, who kill not to kill but to eat and survive. That is what I like.

Comments: Dear Superintendent Green,

Correspondence: Topic Question 2:

a balanced ecosystem - one which maximizes species diversity.

introducing wolves would serve the additional purpose of helping to preserve that species, which is under threat in most parts of the US (especially since its delisting from the Protected Species Act).

My understanding is that wolf introduction worked well at Yellowstone (many years ago) where the habitat was being damaged by excessive elk numbers.

Topic Question 3:

"wilderness" is a vague concept. I would guess that a great deal of the features of this wilderness have been affected by humans - otherwise surely there would be a much larger native wolf population. So you shouldn't be trying to preserve what is there now, but should imagine what a real wilderness should be like

Topic Question 4:

wish I knew! - important question to consider

Topic Question 5:

Concept A seems to abandon responsibility

Concept B seems best and I take it would incorporate concept C

Concept D seems an answer to the question: what do we do if wolf introduction does not control the moose? One would need a better understanding of why not.
Concept E involves a lot more Park Management effort, and although it reduces moose population does not help the area be a real wilderness and does not maximize species diversity. Concept F seems like answer to the question: suppose the wolves control the moose but we are not satisfied with the vegetation regeneration? Then the answer seems that one should indeed pursue those avenues.

Comments: I vote for wolf introduction. If it doesn't work, you can consider other options at that point.

If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,

Correspondence: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Correspondence: Dear Superintendent Green,

I am an annual visitor to Isle Royale, having paddled the inner lakes and hiked the length of the island many times. This past spring I brought students to the island for a course in wilderness writing. I've produced two plays and several monologues that are set on the island; I was an artist-in-residence in 2003 and it was an encounter then with a moose and a wolf that changed the course of my creative focus. I care deeply about the balance between wolves, moose and the flora.

I support Alternative B and I agree with the NPCA that the park service introduce genetic diversity to the population on an as-needed basis. I believe the precedent established by the reintroduction of wolves into the Yellowstone ecosystem is applicable here even though the circumstances were and are different. But intervention is, I think, warranted at Isle Royale.

During my visit this spring I spoke to another long-time visitor- -self-described as an engineer by day and a part-time poet by night. We spoke of the two wolves who visited the island this winter, but then crossed back to the mainland. He believed the couple detected the sickness on the island- -the genetic weakness of the three extant wolves- -and decided to risk crossing the ice bridge back to the mainland rather than establish themselves on the island. I don't know why the wolves only visited for a short time. But having been on the island when there were three healthy packs and over 30 wolves, I know that this trip was different. And while I saw a few tracks and scat along the Minong trail, I did sense that the perils of imbalance in this ecosystem have altered the experience of the place, and not for the better.

I strongly support introducing wolves to the island.

Thank you for considering my concerns.

Sincerely,

Correspondence: Topic Question 1:
Wolves should be maintained or expanded as a necessary part of the ecosystem.

Topic Question 2:

Of course, safety of people should be considered, but it is important to give all the animals all the atmosphere/environmental conditions they need to succeed.

Topic Question 3:

The NPS should, in my opinion, allow all animals to thrive. I think the least intrusive we people can be might be the best for the island.

Topic Question 4:

I am unsure of how climate change impacts the island's animals. It is important to me that if climate change is a problem for some species, then it might be appropriate to relocate those animals or to leave them to perish. One problem with moving animals, is that it could mess up the other habitat. If animals cannot survive the change in climate, it might be best to leave them alone to their fate, as we typically do with wild animals.

Topic Question 5:

I have no answer.

Topic Question 6:

I have no additional comments.

Correspondence: Topic Question 1:

The introduction of new wolves is the best solution. I would add that the wolves (wolf families) be taken from an area such as Idaho where they are threatened to be killed due to ridiculous laws. By relocating wolves from such areas, not only do you protect these wolves, you are preserving the balance of Isle Royale.

Topic Question 2:

Nature naturally balances itself. As wolves increase, Moose decrease. As Moose decrease, wolves decrease allowing Moose to increase, and so on. Man should only manage the vegetation, Moose and Wolf to maintain such a balance should the balance tip to far to either extreme.

Topic Question 3:

Minimal. Only the amount absolutely necessary.

Topic Question 4:

Climate change and global warming is the most important issue facing nature (wildlife and the environment.) We should attempt to manage, repair, remove invasive species as they arise, and replant native species as necessary to mimic the natural vegetation of Isle Royale as to maintain the natural Predator/Prey relationship.

help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Correspondence: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

As wolves are being reestablished in other parts of our country, it's ironic that basically the one place in the lower 48 where they were free to be, is losing there wildest wildlife.

Eradicate the beaver fever and keep the wolves and the Moose roaming @ Isle Royale!

Correspondence: Topic Question 1:

We support management Alternative B to bring new wolves to the island.

Further, we urge the Park Service to do this immediately and continually, rather than one time only.

This is vital because the existing 3 wolves have inbred to the point of genetic run. The pup is unhealthy, hunchbacked and frail.

Wolves must be brought in regularly to repopulate the park with healthy wolves over a period of time.

Immediate action is also necessary to preserve some of the remaining genetics of the wolves who are native to this area.

Further, without a sufficient number of wolves, the moose population on the island will continue to increase, eating until the food sources are gone.

Bringing new and diverse wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park for all of our benefit, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem.

We therefore support the Park Service taking action to bring new wolves to the park immediately and consistently over the coming years.

Correspondence: Topic Question 1:

The only alternative to actively repopulating the wolf population is to wait for individuals to cross the straights when the lake freezes solid. Despite two cold winters with solid ice in the straights area, no wolves have moved onto the island.

Topic Question 2:

Trying to maintain a natural balance among the three should be the primary goal. With the high moose density, vegetation suffers. The island is home to many plant species found nowhere else in the Great lakes region and with global climate change, the vegetation will be stressed enough without

overgrazing by moose.

Topic Question 3:

little to no management, save for the control of non-native invasive species and overpopulation by primary habitat regulators, such as moose.

Topic Question 4:

None, other than to maintain a healthy wolf population, which in turn should regulate the moose population, which should reduce stress on the vegetation.

Topic Question 5:

There is no real, viable option for wolf re-population other than re-introduction.

Correspondence: Topic Question 1:

Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,

Thank you for taking the time to help protect Isle Royale's fragile environment.

Sincerely,

Topic Question 2:

The moose population is not being kept in check due to the death of the wolf population. Therefore the vegetation is taking a big hit.

Topic Question 3:

As a National Park the Park should give as much management as necessary to keep the balance.

Topic Question 4:

The re-introduction of new wolves would also benefit climate change.

Topic Question 6:

We enjoy Isle Royale and the possibility of seeing both wolves and moose. It is one of the reasons we come to Isle Royale.

Correspondence: Topic Question 1:

Everything needed to keep the balance in the ecosystem - enough wolves, moose and other wildlife to sustain the eco system in a thriving manner.

Topic Question 2:

Enough wolves and moose to keep all thriving in the complete ecosystem. A sustainable system for all wildlife in the area.

Topic Question 3:

Whatever it takes within the limits and reason of people and costs necessary and available. Without the people to manage the area, it's a moot point. Make sure there are enough resources to maintain the ecosystem is the entire wilderness area.

Topic Question 4:

This is a major concern for everyone on then planet, not just in wilderness areas. Again, the intensity of management should be whatever it takes to keep the area thriving within the reasonable limits of people and costs allowed. We need to allot more money to these areas, so keep that in mind when deciding how intensely to manage these wilderness systems.

Topic Question 5:

I like the idea of introducing new wolves to the area - this is the right approach to keep the moose/wolf populations at normal numbers so all species thrive and so the wolves do not go extinct in the area.

Comments: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

Comments: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns and for your service.

Sincerely,

Correspondence: Topic Question 1:

I have heard both sides of this situation and I believe that new wolves should be introduced on Isle Royale.

Topic Question 2:

Climate change has made a large impact on the amount of ice that freezes in the Isle Royale region. Previously wolves from the mainland could cross the ice that formed and take up residence on the Isle. The ice hasn't been stable enough for these crossings in the last few years and the wolves are becoming inbred and dying off.

Topic Question 3:

If you will check a video that I have watched about the wolves being reintroduced to Yellowstone, you will see that the ecology of the region is benefited by the wolves being there.

Topic Question 4:

If enough wolves are transported to Isle Royale, the wolves will keep the moose in check and the ecology will improve.

Topic Question 5:

Allowing the pack to die off is really not a positive move. Introducing a new bloodline to the pack will help.

Topic Question 6:

I believe the wilderness designation of Isle Royale is a positive thing and that the wolves help to keep the ecosystem there in good order.

Comments: Thank you for taking comments from the public.

Correspondence: Topic Question 6:

I believe that when things are in balance things take care of themselves better than humans can. Having enough wolves would keep in check the over populations of other animals that could hurt the environment by their unchecked presence. Yes, wolves do kill animals that we don't want them to, but that is the way that nature is. Man has so over burdened our lands that the results are running roughshod over the top of us. We need to get back to doing things that may not be so great for us, but will get back to begin to balance things so nature can succeed at doing what it does best- taking care of the planet and the only home we have.

Reintroduction of more wolves, or taking samples to mainland to test for other comparable wolves for cross breeding / artificial semination?

Topic Question 2:

Climate change, vegetation biomass, disturbance, visitation, and quality of ecological habitat. In channel islands Nation park, we are lucky to have a pretty good hold on visitation and the ecological restoration is promising. But some islands are in such bad shape in some areas, that it will take some time before we achieve good ecological health again. Assessing this is important in managing isolated population further up the trophic pyramid.

Topic Question 3:

Are the wolves tagged with a GPS? Can you fly into the area with a helicopter? These are roadless areas, correct? Perhaps just like the island foxes on the channel islands, you should consider intensive breeding programs on the isle itself... Are there any accessible boat landing areas to offload water, food and equipment easily? Are there other predators of the wolves i.e. eagles they prey on the pups? If so, you may need to build distinct fenced off compounds for active breeding - which would limit you to that 1% nn-wilderness... Perhaps flying all of the equipment and personnel to the non wilderness area is the easiest way to develop the captive breeding program?

Topic Question 4:

You can't run away from climate change. Is it destroying the existing ecosystem quality? what invasive species are out there? Is there any risk of the moose population dropping rapidly? You should consider getting the wolf populations back up as soon as possible.

Topic Question 6:

What are the existing roles of the moose? Are they the only ungulates on the isle, or are there others who also play some role in vegetation management?

Correspondence: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,
[your name here]

Thank you for taking the time to help protect Isle Royale's fragile environment.

Correspondence: Topic Question 1:

Wolves are essential keystone predators giving balance and health to wildlife and rivers and ecosystems, but have a right to be protected from man. You already know this as state and federal agencies are funded by killing licenses and staffed by killing apologists - generally apologists for trophy killing natural mid-range and top predators. As a journalist who writes a living wildlife column (the Madravenspeak column) for the Capital Times and a long-time predator protectionist, I realize the challenges of appealing to agencies who want an outsized population of ungulates for trophy hunters to brag about. We have seen the general citizen awakening to trophy hunting - and the scientific community exposing the damage that excessive trophy killing is doing to our world: <http://readersupportednews.org/news-section2/312-16/31991-human-super-predators-should-change-hunting-fishing-habits> They recommend, given the imbalance created by man's obsessions with identifying his ego with killing - that we reduce the killing of large mammals and natural predators on this planet by 80-90%. n is the "super-predator" who is unlike any other predator and serially kills this and that large animal for his or her own (pathetic) "aggrandisement". Ugh.

Topic Question 2:

As seen in Yellowstone, wolves regenerate the landscape to full health along with beavers and bears and mid-range predators and the balance of life. This balance has been DESTROYED by hunters and habitat loss. Hunters are second only to habitat loss in destruction of biodiversity. Animal agriculture is, of course, the major culprit. 70 billion farm animals displacing wildlife habitat and all the land that it takes to feed and water them is obscenely destructive. But hunters have ruled and now trapping is being expanded to take its toll. We need to back off and let nature recuperate. American Indians called the

beaver "the sacred center of life" because beavers create habitat for half of the rare and endangered species on earth. American Indians called wolf "brother" because the wolves helped them survive. The agricultural model of the North American Wildlife Model is NOT the "gold" standard but the LEAD standard, as wolf biologist Paul Paquet stated at the 2013 International Wolf Symposium in Duluth, MN. "Way too much testosterone" said he. The power of the animals themselves converts biologists who have worked with wolves and other natural predators. Biologist Dick Thiel, who worked with the DNR in Wisconsin as a wolf specialist for 30 years, said on Wisconsin Public Radio before the first torture and slaughter of wolves in Wisconsin, "I have worked with wolves for 30 years. I have pushed them off of deer carcasses. I have had them walk right up to me. I never felt the need to carry a firearm and I never did." That is pretty powerful testimony for the character of wolves - and a comment on the lack of character and lack of grace and mercy of man. Same thing with bears. Lynn Rogers is getting endless flack from the Minnesota DNR because he has educated the public with his North American Black Bear Education Center that "You are never so safe as in the woods with a black bear." Of course, the hunting license intense funding of the state agencies, means the DNR in MN, tries to block his video cams of bear dens, conspires with hunters to kill his radio-collared bears and will not legally protect them, and wants the public to remain ignorant of the extremely peaceful nature of bears. It is a crime against nature to have state agencies funded on killing licenses instead of ample general public funds brought directly to state and federal state agencies by wildlife watchers.

Topic Question 3:

Wilderness is best served by controlling man. And keeping his destructive killing out of wilderness. UNTRAMMELED BY MAN is a definition of wilderness which includes no roads, no motorized vehicles, no weapons and as little intrusion by man as possible.

Topic Question 4:

Prepare for massive loss that may lead to human extinction. We are causing a faster change of climate on earth than led to the Permian extinction of 95% of life on the planet. Save all you can - respect all you can and bring wolves the help they need by giving them genetic diversity. The three "C"s of conservation (Michael Soule's work with the ReWilding Institute) are: The larger the CORE area of land protected, the more diversity protected. CORRIDORS for migration and genetic diversity, and returning LARGE CARNIVORES to the environment in NATURAL NUMBERS (not man-arbitrated bias of farming for a lot of moose and deer trophy kill numbers).

Topic Question 5:

I do not like that you seem to be unwilling to count the preliminary comment period which generated a lot of support for wolves.

Topic Question 6:

I write the Madravenspeak living wildlife column for the progressive Wisconsin newspaper, the Capital Times. The Wisconsin DNR is destroying our wildlife as fast as possible to try to recruit more killers. Hounding wildlife year-round - trapping expanded 24/7 to all public lands, market trapping on \$5 recruitment licenses. You have to stop. Your exclusive power over our public lands for killing is destroying life on earth and contributing to CWD, prion diseases, Lyme disease, white-nosed bat fungus, and avian flu. These are diseases of IMBALANCE. Turn around 180 degrees and let the general public in. We need an educated, involved and participatory democracy in governing our commons and we desperately need it now. HELP US DEMOCRATIZE THIS VERY CORRUPT SYSTEM - NOW. Or continue to leave a legacy of destruction. ERADICATE WILDLIFE SERVICES AND THE USE OF POISONS ON OUR WILDLIFE SYSTEMS. This is truly crazy. Earth is in an entirely human-caused fast-moving wildlife and life extinction that threatens human survival as well. We are not exempt from the mass extinction we have created - and we are DEPENDENT on the web of life to support us. Respect that and make way for all citizens to be involved and a first time democracy in governing and funding our commons. Respect life enough to leave this legacy.

Correspondence: Topic Question 1:
For now the introduction of additional wolves seems to be what is needed. But as global warming continues, many beneficial insects go extinct, and possibly nearby water levels rise (or the island itself suffers drought), reevaluation may be necessary.

Topic Question 2:
The island is beautiful, and efforts should be made to change it as little as possible. But if the ecosystem gets out of balance, more or all of the alternatives you have considered may be useful, or even necessary.

Topic Question 3:
It seems that leaving it alone as much as possible makes sense, but there should be monitoring (as you have already done to realize that so few wolves are left).

Topic Question 4:
This may be a large problem, but if some types of plant life start to die out, it might be necessary to find other types, better adjusted to heat, but which can also be sustenance for the moose and smaller animals.

Topic Question 5:

Culling or moving moose seems like a large, and difficult choice. Replanting native vegetation is probably always good, but may be difficult in the face of climate change, or if the moose population grows too fast. I am always against the killing of moose, wolves, or even humans (i.e. death "penalty"), but do understand the predator/prey relationship, know how necessary it is, and see how restoring the wolves totally reestablished the ecosystems at Yellowstone.

Topic Question 6:

Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,
[your name here]

Thank you for taking the time to help protect Isle Royale's fragile environment.

Comments: As you can tell, I am hardly an expert, and I answered the first 5 questions only because you required them. My answers seem to make sense to me, but I would hardly wish to attempt to force them on you if you have better solutions.

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,
[your name here]

Thank you for taking the time to help protect Isle Royale's fragile environment.

Correspondence: I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. I understand that right now there are only three wolves left at the park, the lowest number of wolves in more than 50 years. This is threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. And then you'll have the problem of starving moose. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it. It is also a more "natural" solution.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns. I hope you will take them seriously.

Correspondence: Topic Question 1:
Reintroducing Canadian wolves, through DNA testing, that are closely matched to the few existing Isle Royale wolves.

Topic Question 2:
A balanced echo habitat should be the main goal.

Topic Question 3:
When I visited in July of 2010, I thought the right balance was achieved. Even though, it was the week following the 4th of July, other than the main welcome area from Copper Harbor, we saw very few tourists/hikers during our 7 day back country camping/hiking/fishing trip with wife, her sister, and brother-in-law.
I don't think there was a limit on the number of visitors at that time, although since then, I have recommended this trip to numerous friends. Impose limits on the number of visitors; if can't meet the demand, have lottery for groups of 4-6.

Topic Question 4:
This question is over my ability to answer since I am not a scientist.
I would follow the recommendations of climate change specialist for this region of the country. Their judgment would be best.

Correspondence: Topic Question 2:

"The philosophy of nonviolence which I learned from Dr. Martin Luther King, Jr., during my involvement in the civil rights movement was first responsible for my change in diet...Under the leadership of Dr. King, I became totally committed to nonviolence, and I was convinced that nonviolence meant opposition to killing in any form. I felt the commandment 'Thou shalt not kill' applied to human beings not only in their dealings with each other - war, lynching, assassination, murder and the like - but in their practice of killing animals for food or sport. Animals suffer and die alike. Violence causes the same pain as the same arrogant, cruel and brutal taking of life." - Dick Gregory

Topic Question 6:

"Aren't humans amazing? They kill wildlife - birds, deer, all kinds of cats, coyotes, beavers, groundhogs, mice and foxes by the million in order to protect their domestic animals and their feed. Then they kill domestic animals by the billion and eat them. This in turn kills people by the million, because eating all those animals leads to degenerative - and fatal - health conditions like heart disease, stroke, kidney disease, and cancer. So then humans spend billions of dollars torturing and killing millions more animals to look for cures for these diseases. Elsewhere, millions of other human beings are being killed by hunger and malnutrition because food they could eat is being used to fatten domestic animals. Meanwhile, few people recognize the absurdity of humans, who kill so easily and violently, and once a year send out cards praying for "Peace on Earth."~ David Coates

Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Topic Question 2:
Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Topic Question 3:
Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Topic Question 4:
Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Topic Question 5:
Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Topic Question 6:
Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Correspondence: Topic Question 1:
Introduce more wolves for a number of years, and replenish the gene pool occasionally.

Topic Question 2:

Global warming is our fault and it has caused wolves to be unable to do anything other than leave the island. Therefore we need to restore the balance and bring more wolves in.

Topic Question 3:

I'm not a biologist so I can't give specific numbers, but I believe that introducing wolf pairs for a number of years on the island would result in a restored balance, with minimal human management. No hunting moose, keep the wild places wild.

Topic Question 4:

Again, bring in wolf pairs to reestablish wolves on the island. Periodically new wolves should be brought in to keep the gene pool viable. Look to experts and, when this should be done. Yellowstone has a great model to go off of as well.

Topic Question 5:

I like how little human involvement this method has (other than initial startup). It's also more natural and will leave the area a wild place. I dislike other methods, for the exact opposite reasons. They require more human involvement and have the potential to be more damaging to the environment.

Correspondence: Topic Question 1:
They don't need "management". Leave them alone. It's the psychological mania of human beings that needs management.

Topic Question 2:

All life deserves respect. We need to have empathy and put ourselves in their places before any so-called management is put into place. We also need to keep in mind there are 7 billion humans and very few of them. Only those willing and brave enough to speak up for them can give them a voice in this world that believes they need "management".

Topic Question 3:

If it's designated "wilderness" then it's one of the very few spaces left on earth that is there for them and not for us. Please leave it so. Animals will take care of themselves. If the plant life "must be managed" then do it only when most necessary. However, keep in mind that plants are also life deserving of respect. It should be nurtured as well.

Topic Question 4:

The climate change is our fault. We should not allow the plants and animals to suffer because of our selfishness and greed. If they need food, water, or any other life-sustaining aid as a result of the negative effects of climate change then we should give it to them.

Topic Question 5:

I think I've made my ideas clear. I also think my ideas save money and, therefore, there's also no need for states or county's to sell hunting licenses with the excuse of needing money. Leave the apex predators in place to do their jobs and leave wild spaces for habitats, with food resources to sustain the raising of young and we won't find them pushed out of their habitats looking for space to live and food.

Employ this everywhere and we won't have issues.

Correspondence: Topic Question 2:
The rich diversity that exists with the flora and fauna on the island. Removing wolves can upset the delicate balance and lead to more drastic (i.e. costly) and intrusive measures taken in the future.

Comments: Dear Superintendent Green,

As a frequent visitor to many of our nation's national parks, I care about the preservation of wildlife at our national parks. As a life-long citizen of the state of Michigan, I have special concern over the future of wolves and moose at Isle Royale NP. As your studies have shown, there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I recognize that you and your staff are studying this important issue and are looking to identify the best option for the park. You are currently evaluating a number of specific options and the purpose of this note is to strongly urge your support of management Alternative B to bring new wolves to the island. Without wolves, the moose population on the island will no longer have a natural predator, likely resulting in a significant negative impact on the plant diversity within this delicate ecosystem. If we bring new wolves - - with new genetic diversity - - to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once

the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,

Correspondence: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

Correspondence: Topic Question 1:
Leaving the experiment up to Nature. We do not know how many times wolves have migrated to Isle Royal in the last few thousand years, in the winter, over the ice. If the last three cannot reproduce, we are down to Zero. I would monitor the situation, and let the Malthusian scenario play out until you have an undernourished muddle of moose. New wolves can be imported at any time; it is not critical when we might decide to change priorities. I see no need" to act now.

Topic Question 2:
It may be like forest fires: we now know that you need forest fires now and then. It may be the the Isle needs a large number of mose to thin things out for a few decades, and that it has happened before. I admit I am not familiar with the vegetation, and any endangerment to species on the Isle. Without monitoring the situation over a period with zero wolves, we do not know quite what to expect. The Isle is a wonderful laboratory!

Topic Question 3:
Take that designation seriously until an existing, not just feared, threat requires action. Leave it wild. Do not import any wolves now, and not for about 10 moose gnerations, then evaluate the situation again.

Topic Question 4:
Ditto.

Topic Question 5:
Thinking "we can do it better" every time we see a change that offends our idea of the balance of nature.

There is nothing we can do about the effects of climate change in most cases. On the Isle we can deal with a change in this one respect (though it is presumably not due to climate). But that does not mean that we should try.

Topic Question 6:
Thank you for bringing this subject to our attention. It is not a problem that biologists can unambiguously respond to, it is a question now of perceived priorities, so you do need input from the public.

I will follow news from the Isle Royale more closely in future!

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island or having to replant native vegetation once the moose consume it.

Topic Question 2:
A realistic optimal balance must be determined at which predators & prey animals can coexist on the island. Human intervention could occur to achieve this goal if natural selection is not working.

Topic Question 3:
Minimal management intensity is best here.

Topic Question 4:
Active intervention would be called for if there is a collapse of vegetation available for Moose.

Topic Question 5:
Alternative Concept B is certainly preferable since it includes introducing new wolves to the island to balance the ecosystem, along with efforts to preserve

the native plant life. This seems to be the best way to keep the moose population in check.

Topic Question 6:
Please pick Alternative Concept B.

Correspondence: Topic Question 1:

How about taking them temporarily to a protected site where they are safe to mate and bring up their numbers until such time that a pack can be reintroduced to the island. Perhaps a protected site can be created on the island itself. In the meantime, either neuter some male moose for birth control, and or move some to other larger area sites.

Topic Question 2:

What is the human factor in all of this? Why are the wolves not able to reproduce in reasonable numbers? Who are natural predators to the moose? Can a number of moose be allowed to be killed for meat to feed animals at shelters? It's the good protein that dogs are meant to digest, not the turkey, cow, and chicken proteins that have wreaked havoc on their immune systems.

Topic Question 3:

Again, why is it out of balance? Is it just a natural process? What can be done to empower wolf breeding? What other animals and plant life are involved? Yes, it's wilderness, but we humans have impacted the atmosphere (real wilderness) and we need to make sure that we and all other forms of life here will be able to breathe. We all invasive (plants, animals) in some degree (immigration, over population, seeds carried by wind or by shoes, disease carried by insects, etc.) intended or unintended. Since humans by far have unbalanced nature, why shouldn't we be intrusive whenever it's for the good.

Topic Question 4:

Do whatever we have to do to protect the innocent victims of wildlife. I've been ranting for year about mandating a temporary ban on humans at National Parks and wildlife areas. This includes backpacking, mtn. climbing, and hiking. It includes Yosemite Valley and the Grand Canyon! Look at the pollution on Mt. Everest alone; RV "camping" is cleaner. Hikers are tracking all sorts of invasive seeds along the trails and in meadows the trails are knew deep sometimes from so much traffic. This would be done a one site at a time on a rotation basis issued according to air quality/traffic (Lake Tahoe, Yosemite Village), water quality, wildlife no longer fearing people and abandoning their natural food sources/habits for human food while endangering humans, etc.

Topic Question 5:
Read above.

Topic Question 6:
National Parks and wildlife designated areas are not only created for human use but for protection from humans. We've done more than our share of damage. We need to sacrifice our immediate pleasures for the well-being and promotion of nature until we become responsible caretakers deserving of it's gifts. Anything we can do preemptively and for recovery, whether we are directly at fault must be done, and now.

Comments: You have a hard job and little to no resources. I feel for you. But, even though tourism brings in money where taxes don't, many of our problems at the parks stem from accommodating do many tourists; think air pollution and traffic in So. Lake Tahoe, Yosemite Valley smog, bear attacks on human food and at humans). How much natural earth have been covered in pavement to make room for more parking lots? If Nat. Parks and wildlife areas were meant to accommodate large populations, well they wouldn't be Nar. Pks. or wildlife areas; they would be big cities or Disneyland. Keep them small and manageable.

Correspondence: Topic Question 1:

We support management Alternative B to bring new wolves to the island.

We urge the Park Service to do this immediately and continually, rather than one time only.

This is vital because the existing 3 wolves have inbred to the point of genetic run. The pup is unhealthy, hunchbacked and frail.

Wolves must be brought in regularly to repopulate the park with healthy wolves over a period of time.

Immediate action is also necessary to preserve some of the remaining genetics of the wolves who are native to this area.

Further, without a sufficient number of wolves, the moose population on the island will continue to increase, eating until the food sources are gone.

Bringing new and diverse wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park for all of our benefit, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem.

We therefore support the Park Service taking action to bring new wolves to the park immediately and consistently over the coming years.

Topic Question 2:

Introducing new wolves seems the easiest and most naturally sustainable

Topic Question 2:

Careful observation and management

Topic Question 3:

Try to let it be as wild as possible

Comments: Dear Superintendent Green,

I care about the wildlife at all of our national parks, including the wolves and moose at Isle Royale. Since now there are only three wolves left at the park, the overall ecosystem health of this national park is threatened. Nature's balance is so threatened in so many places that being able to manage it and keep it healthy by boosting the wolf population seems a no-brainer, and would strengthen the wolf pack remaining by bringing in new blood.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

Correspondence: Topic Question 1:
Careful stewardship using least intrusive methods should always be the first choice.

Topic Question 2:

That preservation of ecological balance is best achieved by nature itself. If active management is needed, "do no harm" is the best course. Moose, wolves and vegetation all have equal priority.

Topic Question 3:

wilderness is wilderness. Stand back, observe, see what is going on. Refrain from tampering, and see what happens over time. If active management is required, take least intrusive course.

Topic Question 4:

Observation of how climate change will affect wildlife and vegetation may indeed require additional management. But listen to naturalists and all those who wish to preserve, not exploit.

Topic Question 5:

Active intervention should be the last, not the first alternatives. responsible stewardship means seeking advice from disinterested experts, not from those who seek benefit. It is the wilderness itself, the wildlife and the vegetation that is the sole concern.

Comments: care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Correspondence: Topic Question 2:
All predators historically present on the island (cf. wolves, wolverines, fishers, bobcats, cougars, bears, etc) should be present in this, the Anthropocene Age.

Topic Question 3:

Don't let the ungulates overpopulate, make sure the wilderness is maintained with a healthy balance of predators to control the ungulate and other plant eating species (humans with firearms don't count as predators).

Topic Question 4:

Adaptive management. Go with the flow.

Topic Question 5:

Interesting question. I don't appear to have access to a description of the 'preliminary alternatives'. My input was solicited via an email asking me to sign a petition supporting a fresh stock of wolves being introduced to Isle Royale to reinforce the three wolves remaining on the island, which is one of my favorite places. So I'm winging it. Assumption: predators (other than humans with firearms) are good, and in typically short supply in human dominated environments.

Correspondence: Topic Question 1:

I have been a regular visitor on Isle Royale for years and have some understanding of the unique ecosystem there. I also appreciate the difficult decision you all are facing about whether or not to introduce new wolves to the island, apparently an alternative option that is being supported by the National Parks Conservation Association. I can't pretend to understand all of the analysis that has been done. But I think finally that it is important to attempt to maintain the balance between moose and vegetation, and between wolves and moose, so I support introduction a new wolves to the island.

Topic Question 2:

The long-term health of the island as we know it depends on management of all three- -moose, wolves and vegetation.

Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park. One thing I want to know is why there are only 3 wolves left? It can't be for lack of prey.

I'm not sure I completely support management Alternative B to bring new wolves to the island, but something must be done. What will the reaction of the new wolves be to the current residents? Will they attack and kill them? However, without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If new wolves are brought to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

I believe this option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Correspondence: Topic Question 1:

Help as many moose as possible get off the island so they can escape the heat and ticks and you.

Topic Question 2:

You failed to manage anything, but simply watched the wolves die out, the moose become overrun by ticks and now the vegetation will disappear.

A prime example of too little too late. You've had your fun, now leave the animals alone. Not all projects need go on year after year.

You've found all you need to know and doing nothing has destroyed the island. Pack up and go home.

Topic Question 3:

Just leave it alone and let nature take its course. You've done enough damage.

Topic Question 4:

Help some of the moose swim off the island. But you won't you'd rather watch them become more miserable and have all their blood sucked out of them with no chance for escape.

Topic Question 5:

Years ago when first these questions were raised you failed to act. Now it's too late. Leave the island alone or stand around and watch the moose die. In other areas they are moving north.

Topic Question 6:

I've been a member of NPCA forever and visited Isle Royale just a few years ago. I became purely disgusted with what you have done and are doing there. Take the money you earn and go someplace else. You destroyed something good.

Correspondence: Topic Question 1:

I am in favor of introducing new wolves to the island. It seems to be the logical and cost effective solution. If this needs to be done more than once, it is still the easiest solution.

Topic Question 2:

Nature will balance itself if man stays out of the equation. We can totally throw off the balance even if trying to help. Please help restore that balance by moving in new wolves. The wolves keep the moose population in balance and the vegetation will thrive.

Topic Question 3:

Balance, balance, balance. Just make sure the animal (predator and prey) population is balanced. And keep the human interference at a minimum.

Topic Question 4:

That's a hard one and I'm sure will vary from location to location. It seems to me that we all have some hard decisions to make! I favor having a planet for my children and grandchildren to live on so I'm for holding down the amount of carbon emissions from vehicles in the parks. Have you ever been to the Smoky Mountains? So sad.

Topic Question 5:

I'm more in favor of the animals and what's best for them so I'm all for restoring the balance and then letting Nature do her thing. I don't like the idea of moving the wolves off the island or destroying them.

Comments: Thank you for doing a good job of stewarding our wild lands!

Information gathered in study for all flora and fauna of the island and the chance for students to gain knowledge.

Topic Question 3:

As appropriate, no hunting of any species

Topic Question 4:

Since the plan is laid out for the next 20 years, research should continue for all species

Topic Question 5:

I do not like the suggesting of species removal through hunting

Comments: Thank you for this time,

I became fascinated with Isle Royale National Park while preparing a report on wolves while in high school. Wow! There were wolves right here in Michigan! How magical and hopeful that wilderness, or the idea of it, was so close at hand. At that time, wilderness to me embodied a place where an endangered animal could live and hunt.

Later as I earned my MFA the idea of wildness was always a theme of my art projects, and research was an escape to wilderness to draw, write and think.

While on Isle Royale, I discovered the thrill of walking in wolf tracks as they followed a moose, and the loon's

song to the stars at night. Very simply, without the moose and wolf, Isle Royale would lose a great part of what keeps people returning to the park.

A family visit to Yellowstone and Rocky Mountain National Park this summer clearly enforces the fact that people need and seek out wilderness. Huge numbers of tourists even in early June sought some spiritual need to bask in the spectacular mountain landscape and view the amazing wildlife; elk, sheep, bear, wolf, moose, eagle- and all the rest. They were willing to wait in a line miles long on a gorgeous Saturday morning, we observed on leaving Rocky Mountain NP. For the same reasons we go back to Isle Royale, for the chance to see moose and wolf and all the rest, the beauty of the moss and rock and wildflowers.

I support Concept C at this time as it gives the options for many things to continue on in the park. The wolves have more time to be successful, more options for moose, and continued inspiration and research. This concept should also include no hunting of either wolves or moose on Isle Royale. (as a hunter myself, I believe some places need to be left alone.) Now that wolves have become a game animal in some states, due to politics, the wolf populations step back from the brink of extinction in this country, and while still being researched as part of our well-controlled wilderness, also now a wolf can step in front of a rifle scope and be shot even while wearing a radio collar.

Concepts B and D only allow one chance for wolves to make a comeback, and thereby helping control the moose herd. Concepts E and F would totally change the Park, and taking of moose would involve many things that do not go along with the Wilderness Act, such as road building and helicopters used for this purpose. Concept A may seem to many as the way of letting nature take its course, with out human interference, however there is not a wilderness area in this country that is successful that has not been managed. By no action taken, we are interfering the most. We have become stewards of our wilderness resource, and it would not exist without us.

I am grateful and proud to live in the generation that allows wolves and moose to run free. The ideas and experience of these things has impact on art and life in countless ways, and gives a spirited hope about great things, great gifts, and also reflects on how beauty can save the world. I pray my son and his generation have this amazing opportunity as well, as Isle Royale is in his backyard. Thank you for this time to comment, and for your continued hard work,

Correspondence: Topic Question 1:
New wolves should be introduced to repopulate Isle Royale.

Topic Question 2:
The need to have healthy populations of both wolves and moose, which will in turn result in healthy vegetation..

Topic Question 5:
Adding wolves is good for wolves in general and fulfills nature's need for predators to balance the moose, which will in turn maintain the flora.

Comments:
I care deeply about the wildlife at our national parks, including the wolves and moose at Isle Royale. Having only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatens the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

3 wolves

Click Here by August 29 to Help Save Isle Royale's Wolves!

(This link will take you to the National Park Service's Planning, Environment, and Public Comment website.)

Take Action

Dear [...],

Isle Royale National Park, a remote and beautiful island in Lake Superior, is home to a famous community of wolves and moose. These two species have

an important predator-prey relationship and are critical to the overall health of the island ecosystem.

But with only three wolves left on the island, the character of Isle Royale is in jeopardy.

If wolves die off, the island's moose population will continue to increase, consuming the native vegetation and eventually running out of food, disrupting the natural balance of the island. We don't want that to happen.

The National Park Service (NPS) is responsible for protecting and managing the beautiful natural resources and wildlife at Isle Royale. NPS is seeking your input by August 29 on how best to manage the wolf and moose community, as well as plants and other wildlife in the park.

One option NPS is considering- -Alternative Concept B- -includes introducing new wolves to the island to balance the delicate ecosystem, preserve the native plant life, and keep the moose population in check. After many years of consulting scientific experts and conducting extensive research to determine what we view is the right response, we at NPCA support this option.

We are urging NPS to bring new wolves to the island so this iconic species does not become extinct at Isle Royale and they continue to fulfill the critical role of balancing the island's natural environment.

Take Action: Tell the National Park Service to bring new wolves to Isle Royale National Park to help balance the park's ecosystem.

Here's how to submit your comments to the Park Service.

Step 1: Go to <https://parkplanning.nps.gov/commentForm.cfm?documentID=> and carefully follow the form instructions.

Step 2: Submit your comments by copying and pasting the sample message below into the "Comments" box on the web form. Questions 1-6 on the form are optional. Remember to personalize your comments by adding personal observations or stories.

Step 3: Once you have completed all of the required fields on the form, click the gray "submit" button at the bottom of the page.

Sample Message/Comments

Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

I also would like to say that I am quite dismayed that in my 54 years on this planet, I have watched the plight of, and cried for wolves since I was a boy in the 1960's, and to be honest am quite tired of doing so. By now, I believed, that we as the "smartest species on Earth", would have figured out a way to live more harmoniously with nature. I recall television shows, books and magazines, and even meeting wolves who were brought to my grammar school, so I know "we" have been working on this seemingly insurmountable problem since at least then; but it is NOT insurmountable at all. We humans only have to become more compassionate and realistic in our expectations and become the stewards of the planet as we have been charged to do. We must begin to treat animals specifically, and nature generally in a more humane manner than we ever have before, if not I fear the consequences will be dire, not only for all the rest of the natural world but for we humans as well.

Thank you for considering my concerns.

Sincerely,

Thank you for taking the time to help protect Isle Royale's fragile environment.

I know there has been discussion about letting nature take it's course, but due to climate change and man made hazards that have impacted or killed wolves, it is appropriate for man to get involved in the strengthening of the wolf populations

Thank you for considering my concerns.

Sincerely,

Correspondence: Topic Question 1:
Wolves need to be reintroduced to supplement the population on Isle Royale. Geographic Information Systems (GIS) should be used to determine where the supplemental wolves should come from, how many should be relocated to the park, and where in the park the reintroductions should take place.

Topic Question 2:

The ecology of the park. With moose on the island, the only management strategy that makes sense is to keep a healthy wolf population in the park.

Topic Question 3:

Maintaining a healthy population of wolves is critical. Other than that, wilderness will manage itself.

Topic Question 4:

Climate change is the reason wolves must be reintroduced. With the climate warming, chances are slim that wolves will ever make it back to Isle Royale on their own via an ice bridge. Climate change is the driving factor that makes wolf reintroduction a requirement rather than an option.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,
[your name here]

Thank you for taking the time to help protect Isle Royale's fragile environment.

Comments: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Correspondence: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

There are numerous examples of the stresses that humans place on ecosystems and the resulting ecological imbalances. All too frequently, the manmade fixes and interventions don't adequately restore balanced native conditions because the key elements which are missing have not been restored. In this case, the wolf population is the key missing element, which if properly restored and protected from human stressors, will provide the best natural remedy for achieving a healthy ecosystem.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Correspondence: Dear Superintendent Green,

As a concerned citizen, and a frequent traveler to the area, I care about the wildlife at our national parks, especially the few wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I strongly support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Citizens who visit the park, rely on the Park Service to manage the species within the park wisely and keep a balanced ecosystem within the parks. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Correspondence: Topic Question 1:

Alternative Concept B- -includes introducing new wolves to the island to balance the delicate ecosystem, preserve the native plant life, and keep the moose population in check. After many years of consulting scientific experts and conducting extensive research to determine what we view is the right response, we at NPCA support this option.

We are urging NPS to bring new wolves to the island so this iconic species does not become extinct at Isle Royale and they continue to fulfill the critical role of balancing the island's natural environment.

Comments: Dear Superintendent Green,

Correspondence: Topic Question 1:

Bringing in additional wolves sounds like a virtual necessity if the pre-existing population of wolves is in fact only three animals. Given the fact that introduction of new wolves might mean the death of the remaining ones I would urge you to be as certain as is possible of the remaining population. Predator studies are an intense interest of mine and I'm well aware of the ability of wolves to "Disappear" when they want to. I speak from experience having taken solo excursions of my own both in the Boundary waters and Algonquin Park.

All that being said, there is an opportunity here. With new wolf introduction it will be possible to start the wolves off with a more diverse gene pool than the original pack would have been able to achieve.

Topic Question 2:

I'm guessing that the time window of minimal impact to the ecosystem on the island is relatively short. With all of the wolves gone, the moose and other animals increase in population and apply pressure to the already fragile ecosystem. If too many years go by, you could be looking at the same issue that occurred in Yellowstone with the elk, aspens all the way down to the trout streams. I would urge you to consider Yellowstone as a model to some degree and construct a management plan from there.

Topic Question 3:

Not only is it a wilderness but it is a very rare ecosystem. And with it comes almost endless possibilities of learning. My recommendation would be to have very stringent and concise regulations on camping fishing hunting etc. and I speak as a participant in all of those activities. Perhaps a sectionalized controlled entry and exit program. Something like the Boundary Waters has but maybe a little stricter. That way sensitive areas like wolf pup rearing areas and moose calving grounds could be closed off until the young animals have time to grow up with the stress of human presence.

Topic Question 4:

I think it should be studied closely. I'm not sure how you "Manage" climate change beyond my suggestions in Section 3. Limited access, fish and game limits etc.

Topic Question 5:

Like the wolf reintroduction idea a lot! Provided it is handled well and intelligently as Yellowstone was.

Topic Question 6:

I was planning to visit Isle Royale before this crisis occurred. Now, a primary reason (Wolves!) ecotourists and adventurers go there is almost gone. As most things do, there will be the issue of money. And there's no question that there will be prohibitive upfront cost. But that money will be recouped over time as the wolves repopulate and things balance out again. Leave the island as is and there could be major changes to the ecosystem risking a negative effect on economic interests in the area.

Wolves are a tourism magnet. Handled properly in ten years you could have a success story on par with Yellowstone.

Please accept all my wishes for more luck than you will ever need!

Correspondence: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once

the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,

Correspondence: Topic Question 1:

Wolf populations must be bolstered with rehabilitated captive wolves appropriate to the area and genetics of current population.

Topic Question 2:

If wolves are allowed to thrive, moose and vegetation management will not be an issue. Currently there is an imbalance in the biosphere, once the apex predator population is healthy again, moose, and concurrently vegetation will re-balance with time.

Topic Question 3:

Low intensity, only supporting wolf population growth to the point of creating healthy packs.

Topic Question 4:

Climate change is a huge issue, sadly beyond the scope of the NPS. In the short term I believe minimally assisting the balance of Isle Royale's predators will be the best and most effective management tool available.

Topic Question 5:

I fully support the plan, however believe that it will be necessary to support the predator population more than just one time. Climate change, and our own limitations in knowledge when it comes to wolves will require a light hand applied on an ongoing basis.

Comments: Dear Superintendent Green,

Wildlife at our national parks, including the wolves and moose at Isle Royale, is one of my great passions, and I appreciate that the NPS has a big task looming. Currently there are only three wolves left at the park- -the lowest number of wolves in more than 50 years, and the health of the park is in peril.

I support management Alternative B, and urge the Park Service to do this as needed, rather than one time only. An increase in wolf population will eliminate the need for moose management, and consequently vegetation management. Isle Royal will thrive with a healthy balance of predators. It's biosphere will suffer greatly without wolves.

I do not at all support the human culling of moose. It is unnecessary, heavy handed, and will not solve the problem long term (unless moose are entirely eliminated).

It is a simple equation, and the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Correspondence: Topic Question 1:

We should bring more wolves to the island.

Topic Question 2:

Everything works together. We need all species thriving on the island to keep the environment balanced.

Topic Question 3:

It should remain wilderness with as little interference from humans as possible. NPS should be documenting and observing for future strategic plans, such as the need for more than one introduction of new wolves to make sure the gene pool is diverse enough to sustain a healthy pack.

Topic Question 4:

Climate change is affecting everyone, everywhere. We need to keep wilderness wild and balanced so it flourishes naturally.

Comments: Dear Superintendent Green,

Correspondence: Topic Question 1:

Introduce wolves in the future, as needed, not just on a one-time basis.

Topic Question 2:

How to keep a proper ecological and biological balance.

Topic Question 3:

An intensive management program should be in place to make sure that the balance of moose and wolves are maintained, and that no hunting of wolves is permitted.

Topic Question 4:

NPS needs to be vigilant in lightfoot climate change.

Topic Question 5:

See letter below.

Topic Question 6:

Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Correspondence: When I was 14 my Mother packed the family up and took us on a car camping trip visiting many of our western National Parks. That summer introduced me to and started my love of our national park system. Since then I have visited many of our parks on many trips, the most recent V.I.N.P. last winter while in retirement. I have enjoyed each park, especially Glacier where, as a zoology major, I did field work. Hence, I care deeply about both floral and fauna wildlife in our national parks.

My present concern is over the wolves and moose in Isle Royale N.P. I understand that only three wolves are left. Such a low number threatens the overall health of the complete ecosystem of Isle Royale. As a retired biologist, that bothers me greatly. Without wolves, the moose population on the island will increase while eating up their food sources, the island's flora. I feel that raising the wolf population will keep the moose population down, which will minimize the moose impact on the island's vegetation.

I support Alternative B management of the wolf population on Isle Royale. That plan would bring new wolves to Isle Royale. The wolves should be brought slowly, as needed, rather than many at one time. In such a wild park, that option is much easier and less intrusive than removing moose. Replacing native vegetation eaten by moose would be extremely difficult and more intrusive. In this situation taking the least intrusive action seems the best for the island's ecosystem.

I support bringing new wolves to Isle Royale immediately, before the last three wolves die. It seems the best, easiest, and least intrusive plan.

Thank you for considering my thoughts and concerns.

Correspondence: Topic Question 1:
The oil companies shouldn't have the right to go drill where ever they want to!! They need to stop all together because their destroying our planet!! Plus the huge windmills are a bad idea since they kill so many birds, there are insects that aren't getting eaten so they are in turn eating us!! There needs to be a different idea to help save our planet!! Solar power seems to be the best since it kills no animal!! The military needs to stop destroying the oceans & the huge ships also need to have sensors so they don't kill any whales or other marine life!!

Topic Question 2:
They need to roam & be free to move where ever they want to!! These lands should stay national parks because we have enough land as it is & we don't need any oil!! People have enough & they have very little & this planet needs the animals for balance!!

Topic Question 3:
The wilderness should stay wilderness for all who live there already & those that move towards the wilderness!! There should be no hunting allowed & if any hunting is done they should be charged with a felony!! Those that want to frack or drill should be charged fines as in 1,000,000. for each demand or every time they cut the mountain top off!!

Topic Question 4:
As I said before the huge windmills kill so many birds, there has to be another way less dangerous to birds because the insects are just increasing!! Solar power doesn't hurt anyone or anything that I know of so perhaps the windmills need to be different color or shape so the birds will be able to see them, or something totally different like water powered devices that won't harm any marine life or fish at all!!

Topic Question 5:
The windmills kill birds & we still need birds!!

Correspondence: Topic Question 1:
I fully support the initiative to bring in other species of wolves in order to expand the current population. Assuming this approach works, I don't believe any other remediation would be required.

Topic Question 2:

The goal, clearly, is to restore equilibrium between the species so that no one species can come to dominate and destroy the habitat.

Topic Question 3:

The management should be as unobtrusive as possible, doing as little as possible - - but enough to ensure that the balance is maintained.

Topic Question 4:

If it becomes impossible for some plants to survive due to changing climate and there are animals dependent on those plants who cannot adapt their diet, or who fall victim to pests that they had not needed to resist in the past, it's likely that the problems will be too intractable for the NPS to manage them. If things get to that point we will have to accept that man has simply destroyed this ecosystem beyond repair and let nature rebalance itself. Trust me, if it reaches this point we (humans) will have vastly bigger problems to deal with. The only option here is to manage GHG as aggressively as possible in order to prevent this outcome from occurring.

Topic Question 5:

I like that this approach seeks to reestablish the balance that had been dictated by nature rather than trying to impose an artificial one. I dislike that it is necessary in the first place.

Comments: I appreciate you reaching out to the public for comments, and I appreciate the thoughtful action that you plan to take. I sincerely hope that the program achieves its goals. Please keep me informed as to its progress.

Thank you,
