I care deeply about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,

Correspondence: Topic Question 1:

Since wolves are needed to keep moose populations under control, I strongly support the option that will restore more wolves to the area.

Topic Question 2:

Care must be taken to prevent any future wolf/moose balancing operations such as allowing either animal to be over hunted. Creating an imbalance in the population mix will be more costly to recover from.

Topic Question 3:

I would hope seeds of native species of plants might be carried in and planted where revisitation is needed.

Topic Question 4:

Careful monitoring of the area to see if it is recovering.

Correspondence: Topic Question 2:

I think it is important to consider how nature has handled these issues whenever considering how we can fix things after we've created an imbalance.

Topic Question 3:

Wolves should be reintroduced to the area, as needed, to balance the number of moose with the amount of natural vegetation.

Topic Question 4:

It may become necessary to propagate more vegetation on the island, if food becomes scarce due to reasons beyond the moose & wolves.

Topic Question 5:

Wolves are being hunted in so many places and I like the idea that this is a place where they are needed and will be welcomed. I do not like the idea of killing anything as a form of management.

One option NPS is considering- -Alternative Concept B- -includes introducing new wolves to the island to balance the delicate ecosystem, preserve the native plant life, and keep the moose population in check. So I am urging NPS to bring new wolves to the island so this iconic species does not become extinct at Isle Royale and they continue to fulfill the critical role of balancing the island's natural environment.

Topic Question 2:

It's a natural ecosystem and all animals should live in balance rather than simply letting the wolves die off or culling the moose.

Topic Question 3:

See answer #1

Topic Question 4:

Anything that helps Nature and balances the environment rather than benefiting industry is always a better choice.

Topic Question 5:

All I know is that just letting the few remaining wolves die off is a bad idea and will alter the balance and cause too many moose to live, human intervention of culling the moose is also cruel, so introducing more wolves and maybe planting more native vegetation will probably help.

Topic Question 6:

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

Correspondence: Topic Question 1:
Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only.

Topic Question 2:
I urge the Park Service to do this as needed, rather than one time only.

Topic Question 3:
Restoration level intensity.

Topic Question 4:
Conservation, with consideration of predicted outcomes. For example, knowing that climate change will encourage changes in the directional extents of animal populations, a plans that prepare for these eventualities can be made. Very intense efforts should be made to conserve or restore key-stone species and apex predators. Likewise, the bottom of the food chain needs to be addressed with meaningful metrics and research designs that have holistic approaches. For example, is browse vegetation going to be further affect by leaf eating or bark boring insects normally kept in check by cold weather?

Topic Question 5:
As of August 26, 2015, I can not find the entire EIS on the homepage of the the <http://parkplanning.nps.gov/projectHome.cfm?projectID=>

As such, it is difficult to speak to any preliminary plan. I can say that removing the wolves, and culling moose is a poor idea. To get an idea how cost effective and humane that process is, critically examine the BLM policy of Wild Horse and Burros. I speak from first hand experience as a former Cultural Resource employee, having worked in the same environments (island environments) as contracted hunting organisations, like ProHunt. It is a better, more cost effective, humane, alternative to bring nature back into balance until the island ecosystem can manage itself. Managing in this way also reduces the possibility of unforeseen consequences.

Topic Question 6:
Thank you for your due diligence, and that you for allowing public comment early in the process.

Comments: Dear Superintendent Green,

Correspondence: 3 wolves

Click Here by August 29 to Help Save Isle Royale's Wolves!

(This link will take you to the National Park Service's Planning, Environment, and Public Comment website.)

Take Action

Dear Amy,

Isle Royale National Park, a remote and beautiful island in Lake Superior, is home to a famous community of wolves and moose. These two species have

an important predator-prey relationship and are critical to the overall health of the island ecosystem.

But with only three wolves left on the island, the character of Isle Royale is in jeopardy.

If wolves die off, the island's moose population will continue to increase, consuming the native vegetation and eventually running out of food, disrupting the natural balance of the island. We don't want that to happen.

The National Park Service (NPS) is responsible for protecting and managing the beautiful natural resources and wildlife at Isle Royale. NPS is seeking your input by August 29 on how best to manage the wolf and moose community, as well as plants and other wildlife in the park.

One option NPS is considering- -Alternative Concept B- -includes introducing new wolves to the island to balance the delicate ecosystem, preserve the native plant life, and keep the moose population in check. After many years of consulting scientific experts and conducting extensive research to determine what we view is the right response, we at NPCA support this option.

We are urging NPS to bring new wolves to the island so this iconic species does not become extinct at Isle Royale and they continue to fulfill the critical role of balancing the island's natural environment.

Take Action: Tell the National Park Service to bring new wolves to Isle Royale National Park to help balance the park's ecosystem.

Here's how to submit your comments to the Park Service.

Step 1: Go to <https://parkplanning.nps.gov/commentForm.cfm?documentID=> and carefully follow the form instructions.

Step 2: Submit your comments by copying and pasting the sample message below into the "Comments" box on the web form. Questions 1-6 on the form are optional. Remember to personalize your comments by adding personal observations or stories.

Step 3: Once you have completed all of the required fields on the form, click the gray "submit" button at the bottom of the page.

Sample Message/Comments

Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Correspondence: Topic Question 1:
Nature has been forced so out of balance that we must step in a help once in a while. I think reintroducing wolves to the island is a wise move. Wolves are a beautiful predator that will enhance the whole island with their presence.

Topic Question 2:
There should never be hunting allowed on the isle. With a little boost nature can balance things out.

Topic Question 3:
For sure the island should be designated as wilderness. Any wilderness should be preserved and maintained as much as possible. It is a dwindling asset that we must protect.

Topic Question 4:
The climate change should be a prime topic of NPS. After all, all wilderness sand animals will be affected by climate change. Nature will persevere but we might be gone before it will be able to save itself. Anything we can do to aid the health of nature, we must do.

Topic Question 5:
It makes me sad that this is even an issue. Why can't man understand that nature is such a valuable asset. We have no need to expand or hunt or burn fossil fuels at the rates we do.

Topic Question 6:
I was raised visiting National Parks and taught to appreciate nature and the animals that reside there. We must get back in touch with the wonders of nature before we mess things up even more.

Comments: Dear Superintendent Green,

Correspondence: Topic Question 1:

If the report is true that only 3 wolves are left in this environment after so many years and the moose population is healthy, then it follows that either there is a disease attacking the wolf population, a lack of genetic diversity or you have a poaching problem. Each of these has their own set of considerations.

Topic Question 2:

I strongly believe in a "hands off" approach in wildlife management. The less we interfere the more likely a balance is achieved. The only management intrusion should be scientific monitoring to establish trends like what is being seen in the wolf population.

Topic Question 3:

Same as above with the addition of increased law enforcement capabilities to watch for and stop poaching of wolves if in fact the reason for the wolf population decline is not disease or inbreeding. If the case is, let's say inbreeding, the only solution is to either artificially introduce new individuals (as is proposed), or, to reestablish the link that wolves need to other populations on the mainland. The easiest of these two is the former.

Topic Question 4:

How dose one stop a tornado, a 100 yr flood, or the cycle of peak wildfires? You can't. When the climate changes in places like Isle Royale, all we can effectively do is trust in the miracle of adaptation to change.

Topic Question 5:

The introduction of "outside" wolves would strengthen the genetic diversity which is good. What I don't like (and please excuse my ignorance here) is that if the whole reason there are moose and wolves on the island is because we put them there in the first place it becomes a no win scenario in that it cannot be sustained artificially. If not and there has been an ebb and flow of wildlife to the island from the mainland, then that should be the focus of management to maintain.

Topic Question 6:

I am confident that to your staff of biologists what I've said here is nothing new. My only hope is that what I have contributed is my backing of the concept that change is inevitable and any management should be the preservation of places where it is allowed to happen by it's own course with as little of man's intrusion as possible.

Correspondence: Topic Question 1:

I believe that Alternative Concept B, which includes introducing new wolves to the island to balance the delicate ecosystem, preserve the native plant life, and keep the moose population in check, is the most prudent and responsible action.

Topic Question 2:

Allowing the moose population to go unchecked and eventually exhaust the vegetation of the Isle until they perish will alter the ecosystem of the island forever and it may never recover. Denuding entire strands of vegetation could make it easier for invasive plant species to establish and thrive.

Topic Question 3:

Staying within the Wilderness area rules and regulations is important. Observing and recording/documenting the wolf and moose populations within those rules and regs should be your approach.

Topic Question 4:

NPS management obviously cannot control climate and should allow the park to function in whatever conditions exist, with the exception of allowing introduction of new varieties of wolf genetics for the perpetuation of the pack since ice bridges in winter appear to be a thing of the past. Because Isle Royale NP's history and ecosystem depends on healthy wolves and the balance they are a part of, this is a necessary concession.

Topic Question 5:

I like alternative B for the reasons listed above.

Correspondence: Topic Question 1:

The alternative of introducing new wolves to Isle Royale should be considered. Having a sustainable moose/wolf/vegetation balance is critical to the immediate future of Isle Royale National Park.

Topic Question 2:

Human actions (climate change) have already caused changes to the Park and will continue to do so. However, at this time, we can only predict what those changes will be based on current trends and predictions for the future. In the meantime, if wolves are absent from the Park, a growing moose population will destroy the current vegetation. There needs to be a predator/prey balance.

Topic Question 3:

I do not think that it is inconsistent with wilderness designation to introduce additional wolves to the Park.

Topic Question 4:

There are few things that NPS can do from the management perspective that will affect climate change. However, right now, we have a predator/prey imbalance on Isle Royale that will only exacerbate the issues brought about by a changing climate.

Comments: Please take action soon.

Correspondence: Topic Question 1:

We support management Alternative B to bring new wolves to the island.

Further, we urge the Park Service to do this immediately and continually, rather than one time only.

This is vital because the existing 3 wolves have inbred to the point of genetic run. The pup is unhealthy, hunchbacked and frail.

Wolves must be brought in regularly to repopulate the park with healthy wolves over a period of time.

Immediate action is also necessary to preserve some of the remaining genetics of the wolves who are native to this area.

Further, without a sufficient number of wolves, the moose population on the island will continue to increase, eating until the food sources are gone.

Bringing new and diverse wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park for all of our benefit, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem.

We therefore support the Park Service taking action to bring new wolves to the park immediately and consistently over the coming years.

Further, without a sufficient number of wolves, the moose population on the island will continue to increase, eating until the food sources are gone.

Bringing new and diverse wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park for all of our benefit, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem.

We therefore support the Park Service taking action to bring new wolves to the park immediately and consistently over the coming years.

Topic Question 5:

We support management Alternative B to bring new wolves to the island.

Further, we urge the Park Service to do this immediately and continually, rather than one time only.

This is vital because the existing 3 wolves have inbred to the point of genetic run. The pup is unhealthy, hunchbacked and frail.

Wolves must be brought in regularly to repopulate the park with healthy wolves over a period of time.

Immediate action is also necessary to preserve some of the remaining genetics of the wolves who are native to this area.

Further, without a sufficient number of wolves, the moose population on the island will continue to increase, eating until the food sources are gone.

Bringing new and diverse wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park for all of our benefit, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem.

We therefore support the Park Service taking action to bring new wolves to the park immediately and consistently over the coming years.

Topic Question 6:

We support management Alternative B to bring new wolves to the island.

Further, we urge the Park Service to do this immediately and continually, rather than one time only.

Correspondence: Topic Question 1:
To control the number of moose by hunting might be too dangerous because of the human tendency to select the specimens to be removed by less-than-natural criteria (e.g. by the hunters' trophies to be expected - transforming the area, with time, into a breeding station for hunters' trophies, or the opposite). Thus, better to introduce some additional wolves (or other predators, such as wolverines?), but taking care that these are free of new diseases or parasites.

Topic Question 2:
Climate change might result in the occurrence of new parasites, new diseases, invasive species of plants and similar. Against this, possible countermeasures have to be considered (and to be prepared) in time.

Topic Question 3:
Considering that tourists will not easily see anything worth while in true wilderness, while "development for tourism" might be rather expensive and also a disturbance of the system, perhaps only scientists and film makers (with experienced and responsible guides) should be admitted to the island. The "nature experience for nature lovers" could then be delivered via TV.

Topic Question 4:
The details one will have to leave to experts who are familiar with the conditions in the system. Otherwise see Question 2.

Topic Question 5:
I live in Finland, where there is also a discussion about wolves going on. But to have much of an opinion I really should know more.

Topic Question 6:
No additional comments.

Correspondence:
Dear Superintendent Green,

I work with Wolf Ways, a program in Oregon which educates young people about wolves. We emphasize the vital role of wolves in the ecosystem. With only three wolves left in Isle Royale, the only option that will prevent a decline to the overall ecosystem health of this iconic national park is to reintroduce wolves.

Therefore, I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

Correspondence: Topic Question 1:

I live in the State of WI. I have been watching the political games concerning the wolves for a long time. It is inevitable that the wolves will once again be open to the slaughter they call a "hunting sport".

Why can't the Isle Royal area capture some of our wolf packs who are destined for horrible deaths and place them in the Isle Royal National Park?

Topic Question 2:

Wolves need large areas to hunt and raise their young plus clean natural water ways. I'm sorry, I don't know anything about Moose, but I am sure they need open areas to roam and graze for themselves and their young.

Topic Question 3:

Keep the area safe from hunters and poachers.

Topic Question 4:

Both species, as far as I know, can adapt.

Comments: Dear Superintendent Green,

Correspondence: Topic Question 1:

Introducing a few other healthy wolves to the island may be a good solution. It would allow for at least another wolf pack to inhabit the island and would help in effective elk management.

Topic Question 2:

It's critical to remember that each species is dependent on the other - a real interdependence. When one species is drastically reduced - be it from illness, hunger or human-caused circumstances - it effects them all and they all suffer.

Topic Question 3:

NPS Rangers / wilderness personnel should be assigned to patrol the island regularly to constantly monitor the health and well-being of its wildlife. That way, should any adverse circumstances occur, the NPS would be able to be on top of it and not allow it to get critical.

Topic Question 4:

Be aware that climate change will foster food and water scarcity or dramatic decreases in these. The NPS will need to help supplement and/or create artificial alternatives for the island's wildlife to be able to survive and adapt.

Topic Question 5:

Too little almost too late.

Correspondence: Topic Question 1:

The alternatives include culling moose, removing moose from the island, or having to replant native vegetation once the moose consume. None of these will promote the increase in the existing wolf population.I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Topic Question 2:

Climate change no doubt will impact the island. Given the extant and nature of that change, the NPS will have to re-evaluate on a periodic basis whether or not the long-standing flora and fauna ultimately will remain viable. As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem.

Topic Question 3:

Management to restore an adequate wolf to moose population ratio seems reasonable. Beyond that, the effects of climate change should dictate what should

be done to maintain this area as largely a wilderness area.

Topic Question 4:

The long-term data on the Isle Royale flora and fauna should be examined wrt assessing the potential impacts of climate change. That should ultimately dictate management policy. If climate change appears likely to alter the flora and fauna in ways that will notably make it increasingly difficult to maintain an adequate moose population, then management policy should periodically ensure that wolf populations are kept minimal - - transferring wolves off island if needs be, and culling moose herds if needs be. If climate change appears likely to alter flora and fauna in a way that supports a larger moose population, then management policy should periodically ensure that wolf populations are periodically increased.

Topic Question 5:

Decisions should be based on good periodic studies to assess and project affects of climate change on flora and fauna. It wouls seem that assessment should include determining how climate change is affecting flora and related moose populations, and on the basis of that determination managing the wolf population. This approach would be the least intrusive as it ultimately means the top (apex) predator is the only species that may need to be actively managed. In addition, it has a side benefit. The occasional surplus wolves can be introduced into other National Park Wilderness areas where appropriate, thereby increasing the genetic diversity of wolves in those areas. The occasional importing of wolves means the Royal Isle population also will maintain genetic diversity.

Comments: I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

Correspondence: Topic Question 1:
See Comments section.

Comments: Dear Superintendent Green,

Right now there are only three wolves left at Isle Royale - - the fewest wolves in more than 50 years - - and that threatens the health of this iconic national park's ecosystem.

I support management Alternative B to bring new wolves to the island, but I urge the Park Service to do this as needed, rather than one time only.

Without wolves, the island's moose population will increase, having too much of an impact on the native vegetation. New wolves brought to the island will help keep the moose population in check and minimize impacts to the native vegetation.

This option is much less intrusive and less expensive than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Correspondence: Topic Question 2:

Maintaining a natural balance - one that would occur in nature. For instance, in this case, if the natural predators die off, other predators would ordinarily move in. While culling is an option, it should be a last resort. Especially when the encroachment of humanity on wild spaces means that there are always animals that would benefit from relocation.

Topic Question 3:

Whenever possible, I think it's best to have a hands-off approach to the animals inhabiting a park. The management of visitors to a park should be tightly controlled - particularly making some areas off-limits for humans that are not working the park. This would allow the park to concentrate on making human-animal contact safer in those areas where humans are allowed. (I do want to be clear that I think park employees should regularly evaluate the park to be sure that balance is being maintained.)

Topic Question 4:
That would depend entirely on the effects being felt.

Topic Question 5:
I like the option of bringing in more wolves since even small increases in wolf populations cause many people to clamor for their removal and relocating is better than killing. That will also eliminate the need to kill moose.

Comments:

As minimal as possible.

Topic Question 4:
Wilderness will change with the climate naturally.

Topic Question 6:
All management of this and all wilderness should be based on solid scientific study and consensus...

Comments: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Correspondence: Topic Question 2:
If they re-introduce new wolves they should take care of them if they contact some disease, sick ones should be taken off

Topic Question 3:
The island should still be inspected for old wells and other potentially dangerous spots for wolves

Topic Question 4:
what type of vegetation do moose eat and would there be enough for more moose in the future and would this be sustainable with only moose living there, if there is ever another ice bridge it would only benefit the wolves to have new ones come over and maybe some of the moose would choose to leave

Topic Question 5:
If nature ran its course and no wolves are brought back it will be an island of moose and that could be studied as well but if the vegetation dies out then the moose would just starve to death and people would wonder if we should step in and help with that situation too. I think wolves should be brought back one more time and then if they all die off the island should be left to the moose and let that run its course

Comments: Dear Superintendent Green,

Correspondence: Topic Question 1:

One option NPS is considering- -Alternative Concept B- -includes introducing new wolves to the island to balance the delicate ecosystem, preserve the native plant life, and keep the moose population in check. After many years of consulting scientific experts and conducting extensive research to determine what we view is the right response, we at NPCA support this option.

Topic Question 2:

If wolves die off, the island's moose population will continue to increase, consuming the native vegetation and eventually running out of food, disrupting the natural balance of the island. We don't want that to happen.

Topic Question 3:

We are urging NPS to bring new wolves to the island so this iconic species does not become extinct at Isle Royale and they continue to fulfill the critical role of balancing the island's natural environment.

Topic Question 2:

If wolves die off, the island's moose population will continue to increase, consuming the native vegetation and eventually running out of food, disrupting the natural balance of the island. We don't want that to happen.

Topic Question 3:

Across the nation, NPS has been too aggressive and wrong-headed in wildlife management.

Locally, we endure the loss of predator populations and habitat destruction causing ecosystem disruption.

Other than to support a healthy ecosystem with adequate healthy predators, why is there a desire to manage an isolated wilderness?

Topic Question 4:

It is becoming increasingly clear that the impact of changing climate is producing unforeseen consequences.

Alien insects and pathogens are spreading and it may be likely to destroy wildlife or vegetation that NPS cannot predict.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it. Having lived in an area with a genuine overpopulation of deer and watching them starving and becoming ill was an eyeopening, and very disturbing introduction to this problem. I would hate to see the moose population meet the same fate.

Isle Royale's wild wolves have fascinated me for many years, and I've enjoyed reading the experiences of the naturalists and journalists who have spent time with them in the past. It has been my hope to one day visit the island myself, and I am sad to see the possibility of its destruction.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Correspondence: Topic Question 2:

Bring new wolves to Isle Royale to help balance the park's ecosystem.

Comments: Dear Superintendent Green,

The wolves and moose at Isle Royale are so precious and I care very much about them as I do about all the animals in our national parks. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

I believe that the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,

Correspondence: Topic Question 1:

None that I know of. My opinion is that the moose and wolves should live as naturally as possible. There should be no "trophy hunting" for moose as that is causing a lot of problems with endangered species. It will be interesting to see what changes occur in wolf and moose ranges due to climate change. Weather parameters should be included in the studies.

Topic Question 2:
Human impacts and weather changes.

Topic Question 3:
Only management that is really necessary. As the land is designated wilderness there should be little harvesting of either wolves or moose and to protect people and animals no target practicing. A good friend of mine was killed by a drunken hunter years ago.

Topic Question 4:
That depends on what happens to vegetation as the moose may have to move further north to have access to the plants they prefer. Areas of preferred vegetation need to be protected.

Topic Question 5:

Did not see that part before I started the questionnaire. Will have to submit another write-up.

Topic Question 6:

It is a shame that climate change has advanced as much as it has because too many people were and still are not being rational about it. Fossil fuels belong in the ground. Our representatives do not listen to the truth about climate change. Obama has made a huge mistake to allow Shell to drill for oil in the Arctic. I am not optimistic for the future of the earth given all the endangered species that are going extinct. The underlying problem for the future is too many peopleespecially in Africa.

Correspondence: Topic Question 1:
It is obvious that more mating pairs of wolves need to be introduced to the area, before culling the Moose.
Nature will balance things out and save the wolves, moose and vegetation.

Topic Question 2:
Without wolves the Eco system will suffer,please introduce more wolves on a ongoing basis as needed.

Topic Question 5:
I do not like that there are only 3 wolves left. Their numbers need to be increased immediately.

Topic Question 6:
The Isle Royale needs a proper balance. This can only be maintained by introducing more wolves to keep the-ecosystem in balance.
If you do not introduce wolves, (apex predators) to contain the moose herds; the moose will destroy all of the vegetation.
The easiest way is to maintain an ongoing introduction of wolve pairs to the Isle Royale.
there are only 3 wolves left! My question is why is there only 3 left and what can we do to sustain their numbers once new pairs are reintroduced?

Comments: Please read above # 6 for my comments regarding this critical situation.

Correspondence: Topic Question 1:

Alternative B. I support bringing in more wolves to keep the balance of prey and predators so that you don't have to cull moose or plant new vegetation. You need to bring in wolves as needed; not just on a one time basis. (And don't allow HUNTING of either wolves or moose; as that will critically interfere and undermine the natural balance as both science and the Lord concur)

Topic Question 2:

The issue of balance and harmony as Designed by the Lord. Science is in complete agreement. You don't need to kill moose or plant new vegetation. Just bring in wolves and continue to bring in wolves as needed; not just on a one time basis. Don't allow HUNTING of either wolves or moose or the balance will be critically adversely affected.

Topic Question 3:

A great deal of intensity as the entire ecosystems are about to collapse because of the lack of wolves. DONT LET ANYONE HUNT WOLVES...have your park rangers vigorously ENFORCE the ban. Punishment should be imprisonment (felony for violent crime) and subsequently upon release, NEVER ABLE TO LEGALLY OWN A FIREARM AS A CONVICTED VIOLENT FELON.

Topic Question 4:

Bring in wolves and DONT ALLOW HUNTING.

Topic Question 5:

I ONLY LIKE BRINGING IN WOLVES

Topic Question 6:

Problems solved when you bring in wolves as needed and DONT ALLOW HUNTING. Use rangers to vigorously ENFORCE the ban.

Correspondence: Topic Question 1:

None. I do not believe that the wolves should be allowed to simply die off.

Topic Question 2:

Culling of the moose should be the natural job of the wolves. Taking care of this top predator should provide for the prolonged survival of both the moose and the natural vegetation of Isle Royale.

Topic Question 3:

I understand your reluctance to intercede regarding the wolf population. However, the park itself will "die" if the wolves are allowed to die. I would consider careful, concise, scientific management of the wolf population to be the major factor in keeping the park functioning as a wild area. Allow enough wolves to manage the wild moose, and only introduce more if/when needed.

Topic Question 4:

As I mentioned in Question 3, scientific management is required. The changing climate will bring about intrusions to Isle Royale, but the intensity of those intrusions through time is when re-evaluation of management will be needed. I would take a minimalist approach to allow the wildlife and fauna their own chance to adapt, if possible, where climate change is concerned.

Topic Question 5:

Please refer to Question 6 and my Comments. Thank you.

Topic Question 6:

Alternative Concept B includes introducing new wolves to the island to balance the delicate ecosystem, preserve the native plant life, and keep the moose population in check.

I am urging NPS to bring new wolves to the island so that this iconic species does not become extinct at Isle Royale and they continue to fulfill the critical role of balancing the island's natural environment.

Comments: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

Correspondence: Topic Question 1:

I support Alternative Concept B, where wolves would be introduced as needed. Not a one time only introduction, but when more wolves are needed to control moose populations.

Topic Question 2:

The one wolf is inbred, which is very sad. I suggest that introduction of new genes is necessary. The introduction of wolves is the least disruptive solution to moose overpopulation & vegetation destruction by increased moose.

Topic Question 3:

With the introduction of new wolves, the wilderness doesn't really need management. Wolves are a keystone species that improve habitat, control overpopulation of moose, or other species. Long term planning & thinking must be implemented to save the wolves & Isle Royale's unique environment.

Topic Question 4:

I cannot comment on this as I am not familiar with this area. Anytype of improvement that the wolves would do for vegetation & water management would probably help ease the scourge of climate change. I have seen a video of how the wolves of Yellowstone have improved the environment, & habitat for all the animals. So once again more wolves would help with climate change.

Topic Question 5:

I am only familiar with Alternative Concept B, & I feel it provides for long term management of the wolves & other species of this ecosystem.

Topic Question 6:

Please save the wolves & use Alt. Con. B

Comments: Support Alternative concept B, as bringing more wolves to the Island would be the least intrusive management tool, good for the habitat & improve the gene pool of the wolves. Introduction must be done when needed, not a one time introduction. Please save this unique ecosystem, by accepting Alternative Concept B.

Correspondence: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,

Correspondence: Topic Question 1:

Generally, I am in favor of augmenting natural predators until predator/prey balances are established. Mankind has severely hampered nature in his desire to be the only predator on the food chain. In National Parks, we should give nature a hand to get that balance back whenever possible. I would support

alternatives B, C, and D, though B seems to be the best alternative for balancing the desire to avoid actively managing wilderness while giving a hand to the predator/prey dynamic. However, I believe wolves should be introduced whenever feasible if their populations dwindle again.

Topic Question 2:

I believe in the case of wolf/moose/vegetation management at ISRO, the best management is not that which manages least, but that which helps to heal the food web from the rifts caused by human predation over the last 2 centuries.

Topic Question 3:

Generally, wilderness areas should be as hands off for management as possible. However, with predator/prey relationships as skewed as they have become, those relationships need more managing than most.

Topic Question 4:

Climate change is inescapable and as a wilderness area, I do not believe that ISRO should do much of anything to actively manage park resources.

Topic Question 5:

I like the introduction of wolves to balance the equation. I dislike reducing moose densities using any tools other than natural predation by wolves unless wolf populations prove completely unsustainable over time. Add the wolves back into the picture and let nature do its job.

Comments: Dear Superintendent Green,

As a natural resource specialist myself, I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management (as noted in alternative B) to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive AND MORE NATURAL in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Correspondence: Topic Question 1:

Only the ones I mentioned in the comment. I see no other natural way to accomplish the goal of a stable environment on the island.

Topic Question 2:

Being careful not to introduce vegetation that will ruin native plants. Also care should be given to the health of the wolves introduced so not to bring a disease that could devastate all wild life on the island.

Topic Question 3:

I would suggest more care and watchfulness in the beginning of wolf introduction so any diseased animal or problem with wolf interaction can be monitored.

Topic Question 4:

Mercy! Who can answer that question when government agencies can't agree.

Topic Question 5:

I like the wolf introduction alternative, not one that would remove all animal and wild vegetation.

Topic Question 6:

Correspondence: Topic Question 2:

I'd say finding the right balance between the food supply of the island to the Moose population and understanding that the wolves are vital in controlling the Moose population from over-running the Island or having too many Moose could result in too little food to sustain the herd.

Topic Question 3:

Trapping or hunting should NOT be considered as options in this National Park due to the potential dangers that could result to campers or outdoors lovers who visit the area to enjoy the wildlife living there.

Topic Question 4:

Depends on how it will effect the food supply on the Island to the critters living there. If drought results vegetation could shrivel and dry up which means less food being available to the wildlife as could extreme heat cause wildfires that could damage the habitat. Severe snowstorms could also make survival of the wildlife living there much more difficult.

Topic Question 5:

I love wolves! I admire them and care about their survival.

Comments: Dear Superintendent Green,

Correspondence: Topic Question 1:

Of the alternatives in the preliminary draft, Alternative Concept B is the best but it should be modified to include additional introductions when the moose population substantially exceeds the long-term average. Note that the present moose population of about 1200 is above the average for the last 15 years.

Topic Question 2:

Ignore short-term variations in population of wolves and moose but be prepared to immediately act if stronger variations occur.

Topic Question 3:

Continue to observe the restrictions of no hunting or predation to control the populations.

Topic Question 4:

Don't interfere with nature in the absence of a catastrophe.

Topic Question 5:

No provision for additional wolf releases.

Topic Question 6:

In the past, three packs have coexisted on IR. Include provisions for more than one pack, for example, by staged releases when needed. When the initial pack is well -established, then release another 6-8 wolves to form another pack.

Answers shown below, thank you.

Topic Question 6:

I personally believe that Isle Royale is very special and rare. The island is very important to continue studies of the wolf. Science, observation and public education will increase awareness of what is critical in the health of this and other species in this rare and isolated habitat.

When our son was quite young we took a trip to Isle Royale and it was the most magnificent experience, to be so close to wildlife, that had never seen a road, and cars, and hunting. It was magical. We saw a cow moose with calf in the river, and a large one on our walking path, healthy, silent, majestic. We knew to let it pass peacefully. We knew there were wolf packs out there, but were not afraid to camp or hike. It was extraordinary to be a part of nature the way God intended, and know that the critical management of the wolves were being cared for. Bringing over more wolves is very important to their future, as well as the moose', in understanding climate change, the evolutionary process and the web of life as taught in the schools to our son, and all the other children. We believe that the continuation of bringing wolves to Isle Royale is critical.

Comments: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

Correspondence: Topic Question 1:

Reintroduction of a genetically diverse group of wolves onto Isle Royale should be a priority.

Topic Question 2:

Reintroduction of wolves to maintain a healthy population that can easily be supported by the current moose population will help preserve a healthy ecosystem. The current moose levels will further decimate the vegetation on the island. A balanced predator-prey relationship is the only reasonable alternative.

Topic Question 3:

I believe that reintroduction of wolves to establish a healthier population will be the best solution to maintain a healthy ecosystem. Isle Royale is an ideal, isolated habitat to reestablish a healthy balance between wolves and moose which will naturally balance their respective numbers. Considering that in many areas where cattle ranchers fear predation by wolves, wolves are actively managed by lethal measures - some of these wolves could be relocated to Isle Royale. In addition, we have breeding facilities for wolves that could provide a new genetic source material to reestablish a viable wolf population.

Topic Question 4:

Man has drastically impacted our natural environment. Between habitat loss, climate change and political gerrymandering to manage our resources, I believe we have a responsibility to preserve as much genetic diversity in our wildlife populations as possible. Unfortunately human impact on our environment is undeniable and stresses natural populations so that they can't maintain themselves so our intervention is crucial.

Topic Question 5:

Reintroduction should be the only realistic alternative considered.

Topic Question 6:

I strongly believe that we are responsible for negative effects on wildlife populations and that we have an imperative to mitigate these effects as much as possible. Isle Royale is a prime wolf habitat and will ensure a healthier population of moose and preserve excessive loss in vegetation. Reintroduction should be done immediately to preserve the struggling wolf population on Isle Royale.

Comments: I strongly believe that we are responsible for negative effects on wildlife populations and that we have an imperative to mitigate these effects as much as possible. Isle Royale is a prime wolf habitat and will ensure a healthier population of moose and preserve excessive loss in vegetation. Reintroduction should be done immediately to preserve the struggling wolf population on Isle Royale.

I myself visited Isle Royale on two occasions to view wildlife and found it a beautiful locale. We traveled to Isle Royale with the hopes of spotting wolves and spent thousands of dollars, stimulating the local economy. A vibrant wolf population will encourage others like me to partake in a once-in-a-lifetime journey.

Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,

Correspondence: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

Correspondence: Topic Question 1:
As the keystone predator species on Isle Royale, wolves occupy a crucial niche in the well being of the area's ecology and health. Scientific studies in Yellowstone National Park have shown how a healthy population of wolves has restored riparian areas to their natural state and increased the vigor and health of elk herds.

Topic Question 2:
To maintain the health of the moose, the vegetation, and the riparian zones, a viable population of wolves is necessary. At present there are too few wolves.

Topic Question 3:
If the land is designated wilderness, then absolutely allow it to be just that - - wilderness! - - with its intricate web of predators and prey in balance. Humans have a way of upsetting this balance with improper and intrusive management.

Topic Question 4:
The changing climate will create more stress on the land and its animals. This stress will require much less interference from humans so that the animals can be allowed to adapt to the changes.

Topic Question 5:
The park has too few wolves for a proper balance in the environment. It needs a strong pack in order to restore the wilderness setting.

Correspondence: Topic Question 1:

We support management Alternative B to bring new wolves to the island.

Further, we urge the Park Service to do this immediately and continually, rather than one time only.

This is vital because the existing 3 wolves have inbred to the point of genetic run. The pup is unhealthy, hunchbacked and frail.

Wolves must be brought in regularly to repopulate the park with healthy wolves over a period of time.

Immediate action is also necessary to preserve some of the remaining genetics of the wolves who are native to this area.

Further, without a sufficient number of wolves, the moose population on the island will continue to increase, eating until the food sources are gone.

Bringing new and diverse wolves to the island will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park for all of our benefit, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem.

We therefore support the Park Service taking action to bring new wolves to the park immediately and consistently over the coming years.

Topic Question 2:

Correspondence: Topic Question 1:

I think that new wolves should be introduced to keep the moose population healthy.

Topic Question 2:

When the wolf and moose population are in balance the moose will continue to have enough browse to consume.

Topic Question 3:

That is easy. By importing some new healthy wolves the moose and vegetation will remain healthy.

Topic Question 4:

That is why you may have occasionally reintroduce new wolves. The lake may not freeze as it used to so new wolves will not show up as they have in the past.

Topic Question 5:

I think that there is just one solution, and that is to reintroduce the new wolf or wolves.

Topic Question 6:

It really is a no brainer, because of climate change new wolves will not automatically be able to show up and introduce new blood. We should bring in a new wolf or wolves.

Comments: I already responded above ,but I'll again say that wolves should be added to the remaining population of wolves.

Correspondence: Topic Question 1:

I support Alternative B to bring wolves back to Isle Royale. Instead of doing it only once, however, it should be done as needed - and certainly until a healthy wolf population is in place. With that, the moose will also be held in check.

Topic Question 2:

Nature knows best. We learned that at Yellowstone when wolves were eliminated there - with deer and other ungulates becoming overpopulated, eating vegetation at the rivers, destroying riparian habitat. We have seen there how reintroduction of wolves has reversed this and is restoring the natural balance to the area. Let Nature do what it does best - so bring back the wolves and let Nature heal the area.

This option is much less intrusive in this wilderness park (and less costly) than culling moose, removing moose from the island, or having to replant native vegetation once the moose have eaten it.

Topic Question 4:

The less intrusive - beyond restoring the wolf population - the better. Humans consistently seem to muck things up.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,

Correspondence: Topic Question 1:
Wolves should be brought in as needed. Yellowstone Ntl Park is a great example of wolves managing populations and bringing the ecosystem into balance.

Topic Question 3:
I believe less is more. if it is a wilderness area nature has always shown it is better at management than man is.

Topic Question 5:
I like Alternative B bringing wolves in to keep the moose in check. I am originally from Alaska. I have seen first hand moose and wolves and nature in balance. Again look at Yellowstone Ntl Park and the ecosystem brought back in balance due to wolves being reintroduced. If wolves numbers are at sustainable levels and moose are kept in check at sustainable levels the plants that other species need to survive on can be kept in balance and their is greater diversity for a wilderness area.

Correspondence: Topic Question 1:

There don't seem to be any, really. An alternative proposal that would probably be popular with some would be to "cull" the moose population, probably by open hunting season, or similar. This, however, would still not preserve the ecosystem, as grasses and shrubbery in general are "culled" by the moose, and still other species depend on the natural control of these for their needs. Consider the dependency of the prairie ecosystems on the presence of bison.

Topic Question 2:

Maintaining, as much as possible, the natural ecosystem, for the future enjoyment of park visitors.

Topic Question 3:

Wilderness is just that - leave it alone and don't "manage" it. Prohibit all access other than backpacking and, perhaps, horse or mule packing; certainly no motorized vehicles. The old saying "Take nothing but photographs, leave nothing but footprints" should rule.

Topic Question 4:

What COULD be done? If Congress would provide a budget, it would be nice to establish a gene bank, with as much variety within species as possible or feasible, so sometime in the future it might be possible to recreate the habitat to what has been the norm in the last two centuries.

Topic Question 5:

See Question 1. The notion of replanting the natural vegetation is a non-starter, in my opinion, since the moose would love the nice tender new plants, and the manpower requirements would be astronomical.

Comments: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park. Isle Royale is one of the jewels in the National Park system, as important, in my eyes, as Yellowstone, Yosemite, or the Grand Canyon, as representative of an ecosystem that once covered most of the US east of the 35" rain line, and north of the Ohio river.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Correspondence: Topic Question 1:
increase in wolf population to create a diverse self sustaining gene pool should be high priority

Topic Question 2:
global warming and change in vegetation
keeping a diverse genetic pool in wolf population by possible augmentation in future years to mimic migration

Topic Question 3:
Minimal human management/interference is preferred.

Alternative Concept B to freshen the wolf population and prevent more inbreeding,
followed by monitoring the wolf and moose populations and
increasing the wolf population again if they fail to impact the moose population within the next 5-10 years

Topic Question 4:
Alternative Concept B to freshen the wolf population and prevent more inbreeding

it is the closest to natural wolf/moose management given the fact that a stop to global warming is not a short term control method and natural migration of wolves across a forming ice bridge is unlikely

current moose population is so high that it can sustain increased predation without the wolves turning onto each other because of scarce prey

Topic Question 5:
Concept A, E and F do not address the dwindling wolf population nor the inbreeding/weakening of the current pack

Concept C does not allow natural population management

Concept D fails to allow the wolf population to freshen its gene pool since natural migration is unlikely due to global warming, also less prey by reducing moose will increase the likelihood of the wolves starving or killing each other for food

Topic Question 6:
Alternative Concept B to freshen the wolf population and prevent more inbreeding,
followed by monitoring the wolf and moose populations and
increasing the wolf population again if they fail to impact the moose population within the next 5-10 years

reduce visitor access to allow for undisturbed population self management for at least the next 5 years
visitors also have an impact on the vegetation destruction in addition to global warming impact

Correspondence: Topic Question 1:

It appears to me there is only one logical management element to be considered and that is to bring the wolf, natural predator, back to a healthy standing on the Isle Royale and that does not mean eliminating moose first - let the wolves do that the natural way.

Topic Question 2:

I think the example of what took place in Yellowstone National Park by reintroducing the wolf is self explanatory... from the reintroduction the moose were kept in check and the vegetation returned and the waters alive again. I thought it exciting the way Yellowstone Natural came alive again in a healthy way. Introduce more wolves which keeps the moose moving and their population in check and allows the overgrazed vegetation to return. This will create a healthy wilderness area on Isle Royale.

Topic Question 3:

If the wolves were allowed to have the numbers needed to make a healthy ego system then the wilderness would take care of itself and we as humans would not mismanage as we often do. Nature was there before us and probably does a better job than we could do.

Topic Question 4:

That is really difficult to answer as we are all facing the same problem were we are and find it ever changing. How do we really know where the climate changes are taking us... Trying to second guess the climate might create more problems than there was in the beginning. It seems to me you focus on what needs to be taken care now and be open to change according to what the climate dictates. As humans we are capable to change and adaptability it is only hoped we use it wisely.

Topic Question 5:

A designated wilderness area needs to be treated as such and that means the least amount of intrusion by humans so it seems that if there is a healthy predator-prey eco system the rest will take care of itself. The overgrazed vegetation will return from more movement of the moose because of the wolves. It seems the least intrusive is to introduce more wolves onto the island. There would be no need of killing off moose in that case to bring balance to the island.

Topic Question 6:

I believe that we as humans often get in the way instead of letting the natural progress of nature take place. Nature sometimes does not work as quickly as we dictate but in the end there is balance. We as humans have done enough, already, to upset the natural way by thinking we know better. Living on the land gives me an opportunity to observe the way in which nature governs. I do not always like it but in the end result there seems to be rhyme and reason why everything happens as it does.

Comments: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island as needed. That need can be served doing it as to how the situation warrants over a period of time. It might be that it has to be done more than once to bring the balance back in check. Better that way than introducing too many and having

to cull the wolves. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns and thank you for the previous questions that have been asked...makes it rather easier to address what is important to each one of us and to you and your staff.

Correspondence: Topic Question 1:

I support management Alternative B to bring new wolves to the island immediately before the population vanishes completely, but urge the Park Service to continue doing this as needed, rather than one time only.

Topic Question 2:
Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

Topic Question 3:
As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. Bringing new wolves to the island as needed will help keep the moose population in check and will minimize impacts to the native vegetation. This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

Topic Question 5:
I like bringing new wolves to the island, but dislike the idea of doing this only once, rather than as needed. I support measures that will sustain a balanced ecosystem, and in a minimally intrusive way. I dislike more intrusive measures, such as culling the moose, removing them from the island, or replanting native vegetation once the moose consume it.

Comments: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Click Here by August 29 to Help Save Isle Royale's Wolves!

(This link will take you to the National Park Service's Planning, Environment, and Public Comment website.)

Take Action

Dear Michelle,

Isle Royale National Park, a remote and beautiful island in Lake Superior, is home to a famous community of wolves and moose. These two species have an important predator-prey relationship and are critical to the overall health of the island ecosystem.

But with only three wolves left on the island, the character of Isle Royale is in jeopardy.

If wolves die off, the island's moose population will continue to increase, consuming the native vegetation and eventually running out of food, disrupting the natural balance of the island. We don't want that to happen.

The National Park Service (NPS) is responsible for protecting and managing the beautiful natural resources and wildlife at Isle Royale. NPS is seeking your input by August 29 on how best to manage the wolf and moose community, as well as plants and other wildlife in the park.

One option NPS is considering - Alternative Concept B - includes introducing new wolves to the island to balance the delicate ecosystem, preserve the native plant life, and keep the moose population in check. After many years of consulting scientific experts and conducting extensive research to determine what we view is the right response, we at NPCA support this option.

We are urging NPS to bring new wolves to the island so this iconic species does not become extinct at Isle Royale and they continue to fulfill the critical role of balancing the island's natural environment.

Take Action: Tell the National Park Service to bring new wolves to Isle Royale National Park to help balance the park's ecosystem.

Here's how to submit your comments to the Park Service.

Step 1: Go to <https://parkplanning.nps.gov/commentForm.cfm?documentID=> and carefully follow the form instructions.

Step 2: Submit your comments by copying and pasting the sample message below into the "Comments" box on the web form. Questions 1-6 on the form are optional. Remember to personalize your comments by adding personal observations or stories.

Step 3: Once you have completed all of the required fields on the form, click the gray "submit" button at the bottom of the page.

Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I was in Yellowstone NP this summer - - and was lucky enough to see the Hayden Valley wolves (albeit on a high powered scope). My understanding, as a layman, is that the reintroduction of wolves into Yellowstone has had a wonderful impact on various forms of wildlife and ecology. You should do everything possible to keep wolves in Isle Royale National Park, as well!

Correspondence: Topic Question 2:

Natural processes should be allowed to continue. Wolves should not be introduced because this is manipulation of the wilderness values. It should be stressed that wolves were not on the Island before. Wolves came across the ice in the 40's and ice has been prevalent also lately, so it could be done again. Recently one wolf went back to Minnesota from Isle Royale. Moose must not be managed for wolf population control by introducing more wolves. We must also question the reason that wolves died off in these last few years. It is not good management to reintroduce wolves. Wolves must come back on their own. This is also designated wilderness and we should have a hands off attitude. We should not be manipulating this great wilderness which I have walked and canoed in 7 times. I would support the position of the wilderness advocacy group, "Wilderness Watch".

Correspondence: Topic Question 1:

Introducing new wolves to the island to balance the delicate ecosystem, preserve the native plant life, and keep the moose population in check. I wholly support this as being the best option.

Topic Question 2:

Preserving the delicate balance of predator-prey would help in the recovery and continuity of botanical diversity. If herbivores exist without alpha predators, this could only lead to degradation of the vegetation, and eventual die-back of the herbivores. Balance is necessary.

Topic Question 3:

Continuing as it does but adding to the wolf population to preserve a better predator-prey relationship. Allow the natural balance to re-stabilise.

Topic Question 4:

Less human intervention unless the climate conditions dictate life support to preserve the diverse species (flora and fauna) that inhabit the area. A balanced ecosystem will improve the chances of favourable natural adaptive behaviours - - something that will never naturally occur in a imbalanced system.

Topic Question 5:

If wolves die off, the island's moose population will continue to increase, consuming the native vegetation and eventually running out of food, disrupting the natural balance of the island. No one wants that to happen.

Comments: Please consider very carefully any action that allows any species to die out in habitats to which they are naturally suited. The state of the climate is such that no exclave, however small, can afford to sacrifice the balance and diversity of species natural to the area. The only chance we have of encouraging natural adaptations to the challenges of climate change is by preserving the natural balance of relationships in all habitats possible. Isle Royale is in a unique position of offering its species that small advantage of survival.

Additional wolves will lessen inbreeding, provide a better predator-prey balance and allow more latitude for evolutionary adaptation to take its course.

Correspondence: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Correspondence: Topic Question 1:

There is no need to "manage" healthy species and their interactions with their environment and other species. The environments have worked for thousands of years and you do not need to meddle, just because some people are afraid of predators or pretend that they will lose livestock, or wildlife. A balanced environment allows every species to take its place.

Topic Question 2:

Stop Managing.

Topic Question 3:

No manangement.

Topic Question 4:

Learn what can be done to support all species of wildlife and vegetation. Stop "fixing" things, just follow the rules of nature in your island.

Topic Question 5:

No "alternatives" need to be considered.

Topic Question 6:

No "alternatives" need to be considered. Let the island rebalance without your interference or the interference of livestock owners, hunters, politicians or other awful people.

Correspondence: Topic Question 1:

One option NPS is considering- -Alternative Concept B- -includes introducing new wolves to the island to balance the delicate ecosystem, preserve the native plant life, and keep the moose population in check. After many years of consulting scientific experts and conducting extensive research to determine what we view is the right response, we at NPCA support this option.

Topic Question 2:

We are urging NPS to bring new wolves to the island so this iconic species does not become extinct at Isle Royale and they continue to fulfill the critical role of balancing the island's natural environment.

Topic Question 6:

Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

As an advocate for Mexican Gray wolves in New Mexico, I am sympathetic about the difficulty of finding the most workable balance for a fragile ecosystem like Isle Royale, but I do believe that allowing wolves to disappear from the island is not the best alternative.

Thank you for considering my concerns.

Sincerely,

Correspondence: Topic Question 1:
The wolf population on Isle Royale needs new DNA. Several pairs of mainland wolves need to be introduced to the island before the 2016 breeding season.

Topic Question 2:
Ecosystem health.

Topic Question 3:
Wolves need to be monitored for genetic erosion. New wolf introductions should be conducted when the island wolf population loses its ability to maintain itself.

Topic Question 5:
In my opinion, there is only one solution to the Isle Royale wolf/moose situation. The land area is not large enough to maintain a genetically healthy wolf population in perpetuity. Therefore, new wolf DNA needs to be added to this population every few generations. Without wolves, the moose population will cause serious harm to the ecosystem.

Correspondence: Topic Question 1:

Perhaps you should introduce additional wolves to the island. I think it is very important to maintain the ecological balance of the island by having wolves to keep other wildlife in check.

Topic Question 2:

I think you should have several reevaluation points so you can adjust your plan. If you go forward with adding more wolves then if the plan shows more are needed then that should be done. The moose should not culled. That is the job of the wolf.

Topic Question 3:

I think you should do as little as possible and let the ecosystem self regulate.

Topic Question 4:
You should let the ecosystem do its job.

Topic Question 5:
I don't like the thought of the moose being culled.

Bringing new wolves seems the best and most natural solution.

Topic Question 2:
Species survival, avoidance of unnecessary culling, natural prevention of overpopulation.

Topic Question 3:
Natural solutions favoring a balance of species.

Topic Question 4:
Objective experts should be consulted.

Topic Question 5:
Alternative B should work best and is least intrusive, but not as a one-time solution.

Comments: Sample Message/Comments

Dear Superintendent Green,

There are three wolves left at the park- -the lowest number in more than 50 years.

I support management Alternative B to bring new wolves to the island, but not for one time only. One-time introduction of new wolves would not solve the problem of moose overpopulation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

The best alternative is the least intrusive. It's a good idea to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

How about YOU JUST STOP KILLING ALL THE WILDLIFE?

Topic Question 2:
ONLY ONE. THE WELFARE AND WELLBEING OF THE WILDLIFE!

Topic Question 3:
How about you just leave it alone? NATURE GOT ALONG FINE WITHOUT US. WHAT ARE YOU CONCERNED ABOUT? PAYCHECKS AND FUNDING FOR BUREAUCRATS?

Topic Question 4:
What difference would "intensity of management" make if our planet goes into an ice age or the oceans rise a foot? NONE!

Topic Question 5:
This is intellectual masturbation. There isn't a bureaucrat alive who can accomplish ANYTHING in the face of our planet skidding into an ice age or melting its polar ice caps and inundating the bulk of our coastal capitals. The pretense that politicians can do anything about this, except what they've already done - build huge fortified underground cities for themselves and their cronies, while leaving the bulk of us homo saps (I think the French term is "les bouches inutiles") to die on an untenable surface - is risible. I'm a middle-class working stiff, college drop-out. If I can find out about this, what's your excuse?

Comments: Will you just STOP slaughtering our poor animals? Like their lives aren't hard enough as it is. How dare we call animals brutes, when their simple hunting and killing pale when compared to our horrific collective brutality. Seen any factory farm videos? If, I mean WHEN our planet next convulses - - super volcano, plus worldwide tsunamis, anyone? - and wipes us out, I mean, renders our species extinct, it would be simple justice.

Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,

Correspondence: Topic Question 2:

I am in favor of reintroducing wolves to strike a balance in the predator/prey relationship, and this reintroduction of wolves should be allowed to continue until the ecosystem recovers on Isle Royale. We must remember how the wolves changed Yellowstone by curbing the ungulates, restoring rivers, feeding other species, allowing the trees to regenerate, and ultimately reversing the over-grazing, along with balancing the food chain.

Topic Question 3:

The goal of the NPS should be to allow the ecosystem to recover itself once the wolves are introduced. Certainly provide researches access to study the impact on the moose population, which impacts the ecosystem.

Topic Question 4:

The entire planet is facing changing climate issues. Do nothing in this case.

Topic Question 5:

Am totally against culling the moose population. We should not allow hunters to step in and manipulate a species. This can be done naturally, with an open mind with a natural predator introduction.

Topic Question 6:

To guarantee the integrity of the wolf population, new wolves will need to be introduced to promote genetic diversity. Follow the scientific approach the researchers have used in Yellowstone. Have teams of biologists in the field and monitor how every level of the ecosystem is altered by the wolves.

Correspondence: Topic Question 1:

The introduction of additional wolves in a measured amount to maintain the balance with the moose is the best solution.

Topic Question 2:

A level in which all will survive in a healthy manner.

Topic Question 3:

Limit the number of people that can visit the area.

Topic Question 4:

Scientific study done by real scientists and not bureaucrats from Washington will hopefully come up that answer.

Topic Question 5:

I like only the introduction of additional wolves.

Topic Question 6:

Common sense solutions are simplistically obvious here. My wife and I were licensed by Fish and Wildlife and we save creatures for 34 years. I never, in all that time, met one person in the field who knew anything about animals, their behavior, their habits, this habitat, etc. And yet these people had a bad and a gun. Most of them did not like animals. It was like the wolf watching the chicken coop. They were ill mannered, uncouth and rude as could be. They gave F&W a bad name and developed unfriendly relationships with people like my wife and I who gave up vacations and all other expensive things just to save birds. I only hope that NPS is different and more sensitive to animal issues. I was forced to enlist my Washington representatives to get them to treat us with civility. And I did just that.

Comments: I have heretofore stated my feelings and I have nothing to add.

Thanks,
buzz

Correspondence: Topic Question 1:

You could trap wolves and put them somewhere else. How about stopping any more development on the island so more wildlife can be there. Also analysis of how the balance of nature existed on the island before there was management of this beautiful island.

Topic Question 2:

How they existed before humans so called managed this area? Do the research! Data helps and this is your job isn't it? Killing animals seems to be the go to solution for states and the federal departments who are not creative and have no imagination or compassion. Remember the web of life, it is sacred.

Topic Question 3:

Gather data, talk to other countries. Do not make the mistake of the other countries in managing these type of places as the one Darwin explored. Use your grey matter and talk to as many people in this field as possible. Do your homework and research this.

Topic Question 4:

How does climate change affect this area? Write all the info down and analyze. How is the food supply affected? Do not use killing as the first line of management. That is for cowards and lazy paper pushers. Do not surrender to this way of thinking.

Topic Question 5:

Always killing such as bison in Yellowstone. Not a good option. Think, think, think! DO NOT KILL the wolves.

Topic Question 6:

I think the Departments in the US government are not doing their due diligence and researching all the alternatives. Killing is the answer of a lazy society. Do your job and investigate and ask questions.

Correspondence: Topic Question 1:

Some other factors that should be considered is the ability to open the island up to hunters, and the ability to plant more vegetation and possibly to introduce more types of vegetation not preferred by moose to keep erosion in check. With hunting and additional vegetation being introduced, the levels of vegetation could be kept normal whilst the need for wolves would be practically eliminated.

Topic Question 2:

The major issue that should be considered is the balance of population between wolves and moose. While the populations should be able to balance each other, this may not be feasible due to the declining population of wolves. As a result of this, I believe that we should mainly focus on solely the vegetation and the wolves. This way we will be able to keep the vegetation at normal levels, until perhaps a new population of wolves comes to the island.

Topic Question 3:

The management should be more laid back as to preserve the wilderness, and subsequently the type of management should solely be focused on augmenting the vegetation and the wilderness and not focused on the animals themselves.

Topic Question 4:

Whilst the climate is changing to be more supportive of a vegetation that is not preferred by moose, this is not necessarily a bad thing. If the vegetation for moose were limited than the population of moose would be naturally limited, causing a decrease in erosion.

Topic Question 5:

While I dislike any idea that believes in heavily influencing the population of other animals, I do agree with the alternative that states we should let the

environment be. With the changing climate and a natural way for more wolves to come eventually, it seems that the wilderness needs no aid in sustaining itself.

Topic Question 6:

Lastly, I believe that while we should let the environment be, I also believe that highly regulated hunting could help to keep the moose population in check until more wolves are naturally introduced.

Correspondence: Dear Superintendent Green,

I have long admired and loved wolves for their strength, family unit and beauty. I first got introduced to wolves by watching the Dutcher's documentary Living with Wolves which shows what smart, social creatures they are, all with their role in a pack.

I really care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park - - the lowest number of wolves in more than 50 years - - threatening the overall ecosystem health of this iconic national park.

Please look at what the introduction of wolves to Yellowstone National Park has done for the ecosystem there, it's amazing! There's a short video online where you can see that just because wolves were brought back the streams, wildlife all flourished. By not introducing more wolves to the Isle Royal National Park it will really hurt the ecosystem there.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

I really hope you do introduce more wolves.

Sincerely,

Correspondence: Topic Question 1:

The best way for any natural habitat to thrive is for humans to help restore a balanced ecosystem and then do their best to stay out of the way while nature does what it does best. Consider the example of Yellowstone where the reintroduction of wolves has had profound implications on the waterways as deer and elk have been forced to spend less time along the banks of streams. This was completely unexpected yet it happened when we revived a healthy population of wolves causing the population of elk to change their behavior.

Topic Question 2:

There needs to be a place for wolves, without them, the moose population will surpass its carrying capacity and all of the moose will suffer. Vegetation will decrease substantially resulting in greater erosion, thus further reducing vegetation levels and further impacting the moose population.

Topic Question 3:

Rebuild the wolf pack and then observe the results. If the moose population is still too large, then consider adding a second wolf pack (or more if needed). Beyond that, humans should mostly play an observational role with the idea that nature will slowly balance itself.

Topic Question 4:

I am not certain exactly what changes will occur in the Isle Royale area.

Topic Question 5:

I think that alternative B is the best option since it will most likely lead to a restoration of the balance that existed on Isle Royale before man's intervention.

Correspondence: Topic Question 1:

A natural means of management which means no human stupidity. Whenever man gets involved all order goes awry. Either we get an overpopulation of moose we get an overpopulation of wolves. We are ill-equipped to do Nature's work. We didn't create the predator-prey phenomenon and so we should keep our hands off of what has worked for ever. It is mandatory to introduce new wolves to the meager wolf population that now exists and then to let them the [expletive] alone and let them work it out.

Topic Question 2:

Man is a clumsy know-it-all. He believes in God and yet screws around with his God's order. We can't even manage our own populations so how do we have the [expletive] nerve to attempt to manage another species. I say leave them to their own resources for surely they are better at it than we are.

Topic Question 3:

Keep man out except when intensely regulated. We are nuisance to all Nature and have no responsibility except to our own amusement and self-entitled quest for adventure. And no HUNTING ever!!!

Topic Question 4:

Pass a Carbon Tax and issue enormous penalties on anyone who refuses to pay. And to the deniers, hang them for they are hanging the rest of us in their lack of action.

Topic Question 5:

Not much!

Correspondence: Topic Question 1:

As nature intended, balanced prey and predator mix. Keep the unique genetic DNA of the Isle Royale animals, healthy and balanced. Do not attempt to

tweak the ratio for increased hunting fees or politics. Keep the DNA protected.

Topic Question 2:

Keep politics and the Wildlife Kill Teams away from any input, their records are bloody and not a benefit to any living thing.

Topic Question 3:

Make it 100% dsignated wilderness, with only a few screened tourist allowed to visit or scientist to study the natural forces at work. To help others enjoy the area, day/night web cams to allow viewing without human pollution.

Topic Question 4:

Let nature take its course, monitor the data, keep it pure and do not try to help except to keep the natural balance of hunter and hunted.

Topic Question 5:

Alternate plan B is the best choice, it seems there is enough study behing the idea of keeping the wolf population at a healthy level.

Topic Question 6:

This could be a success story for the NPS with web cams for the world to see nature in action.

Correspondence: Topic Question 1:

Introduction of grey wolves to the Isle Royale National Park so that the natural healthy balance can be restored there. Instead of culling the Moose, introducing additional wolves would be the proper alternative and allow nature to control as opposed to the hunting and killing of the Moose.

Topic Question 2:

nonlethal management by introduction of additional grey wolves to the park, thus bringing the necessary nonlethal tool of managing the growing moose population. Killing of wildlife should never outway good nonlethal management tools. As far as the vegetation, with the introduction of additional grey wolves, it will reduce the size of the moose herds and therefore, vegetation would once again flourish and not overgrazed. In the meantime. seeding like in kind vegetation would help until the moose herd is brough back into balance.

Topic Question 3:

nonlethal management of wildlife. control the number of two track trails in the park and keep human access to a minimum so that the soil and vegetation can restore itself.

Correspondence: Topic Question 1:

The wolf population should be augmented (concepts B, C, D) with wolves from Canada or northern Minnesota to mimic the metapopulation dynamics that would occur if human actions had not created artificial barriers (development in Thunder Bay and milder winters preventing the formation of ice bridges).

Topic Question 2:

The increased development of Canada's Thunder Bay region, coupled with climate change that makes it unlikely that an ice bridge will develop between Isle Royale and the mainland, make it extremely unlikely that wolves will cross to the island unassisted as they did in the past. Both circumstances are human-caused, and management plans must mitigate for them.

Topic Question 3:

Management should be at the lowest level sufficient to restore the park's functioning ecosystem, and should focus on mitigating human impacts (i.e. development in Thunder Bay and milder winters preventing the formation of ice bridges).

Topic Question 4:

Management must recognize that milder winters in the northern Great Lakes region creates new barriers to natural colonization by terrestrial wildlife.

Topic Question 5:

Alternatives B, C, and D are all viable, although B is not preferred, as one wolf augmentation may not be sufficient over the long term. C gives NPS the most flexibility but may leave the park vulnerable to politics and funding cuts if the desired outcome is not more clearly expressed. D is the most detailed an appropriate alternative. Alternatives A, E, and F are unacceptable; A accomplishes nothing, while E and F are partial solutions that will need to be continued in perpetuity and will not be cost-effective.

Comments: I am a wildlife biologist (M.S. expected December 2015, coyote and white-tailed deer population dynamics) and a repeat visitor (backpacking) to Isle Royale National Park.

Correspondence: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,

Correspondence: Topic Question 1:

The interactions of wolves and moose on Isle Royal have been important to the ecosystem for many years. It's important to import new wolves to keep the moose from browsing all new greenery to the ground. The gene pool should be as large as possible, so wolves should be imported from several different places in the US.

Topic Question 2:

As long as the wolf population balances the moose population, they should be allowed to balance each other naturally. The current loss of wolf population is due to the lack of genetic diversity.

Topic Question 3:

Whether the wolf population is large enough to have enough genetic diversity for long-term viability is unknown. It may be necessary to import a few additional wolves now and then to maintain a healthy population.

Correspondence: Topic Question 1:

Monitoring and studying the effects of climate change on the fauna and flora of the park

Topic Question 2:

Keeping an optimally-sized, stable wolf population in the park will require less NPS involvement in the direct management of the moose population. This should include replenishment with outside wolves when necessary.

Topic Question 3:

A natural predator/prey balance should require less intense management by NPS, save time and money, and allow more resources to be devoted to other important projects as needed.

Comments: Dear Superintendent Green,

Currently only three wolves remain at Isle Royale Park. That is the lowest number of wolves in more than 50 years and it threatens the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Correspondence: Topic Question 1:

I have visited Isle Royale at least three times, beginning in 1967, when I spent a week, camped around Siskiwit Lake and hiked the Greenstone Trail from above there to Rock Island. While not enchanting wolves, I had an "up close and personal" contact with a very large bull moose!

On another visit, I stay for a time as Windigo Lodge, then hiked the full length of the island from there via the Mining Manway and connecting at Chickenbone Lake to the Greestone Trail.

And I was the chief lobbyist working for many years (first for The Wilderness Society then for the Sierra Club to obtain wilderness designation for the park. At that time, the director of the NPS was fervently anti-wilderness and thus sent out a much flawed proposal excluding large areas for no legitimate reason. I worked with Michigan and national conservatin leaders, and my friend Senator Philip A. Hart (D-MI) and Representative Phillip Rupee (R-MI), the local congressman, to have a far better wilderness map approved by Congress in 1976.

I've written three books focusing on the history of the Wildenress Act and the proper interpretation of its provisions. As an expert, I have no trouble with the introduction of carefully selected, genetically disease-free wolves from nearby Canada (I assume) onto the island. Otherwise, the moose will multiple beyond the capacity of their browse and alter the ecosystems of the island in tragic ways.

Topic Question 2:

What is going to provide for the most "natural" ecosystem - - based on the long scientific studies - - with the least artificial impact possible, and particularly to get the wolf-moose relationship into balance.

Topic Question 3:

With the exception of wolf reintroduce, your management must be as light-on-the-land and on the visit as possible ... that is the requirement of the Wilderness Act.

Topic Question 4:

This is not a problem that park management can alter in any significant way. Long-term studies are needed, of course, with sound monitoring of both the icepack on Lake Superior and the changing water regimes in the inland lakes, and such.

However, we will only alter the dreadful outlook for climate change by addressing the huge load of greenhouse gases we - - particularly in so-called "First World" societies pump into the atmosphere.

Topic Question 5:

I've not been able to study them.

Topic Question 6:

I treasure my two seasons as a park ranger (Carlsbad Caverns - 1963-1964) as a life changing turn which set me on the course for my career working fro wilderness protection across the country, notably the huge areas in Alaska. I hope the men and women of the National Park Service at every level in the highest regard for the dedication shown to the challenges of giving our national parks needed stewardship ... but with an educated, light hand as noted above.

Correspondence: Topic Question 1:
The primary, and best tool would be the introduction of new wolves to Isle Royale NP.

Topic Question 2:

The main issue is the unchecked growth in the number of Moose if there are not enough wolves to keep the Moose population in check. Overpopulation of Moose will damage the riparian environment.

Topic Question 3:

The new wolves introduced should be tracked, and the Moose population should be monitored. These could both be done via collars for a representative sample of both populations.

Topic Question 4:

Those doing the management would have to be sure that the changing climate will not alter the habitat so that it is no longer a place where Moose can live. If Isle Royale becomes a place where Moose cannot live and reproduce, all bets are off.

Comments: The preliminary problem presents an outstanding research situation. The relationship between top predators, their main prey, and the physical environment has been studied, but needs to be understood far better. The situation in Isle Royale is perfect for such study.

Correspondence: Topic Question 1:
add a few more wolves and the population should develop and the moose will be put into check and then so to the vegetation. Make it a natural process. however what ever caused the imbalance should be addressed. If it has anything to do with greed then those responsible give half their profits to developing a balanced natural system.

Topic Question 2:

Keep it natural they will manage themselves. We always think we need to manage. we manage because the abuse of the natural order by profiteers forces "management." How really ignorant

Topic Question 3:

what is the cause? If the cause is man made then eliminate that cause. reinstitute the wolves they will survive and the eco system will redevelop.

Topic Question 4:

Maybe the least intrusive is to replace a vegetation. It's cheaper. I would send a bill to all the polluters, cars, oil, coal to pay for the cost of creating the eco system and keeping it natural.

Topic Question 5:

New wolves need to be introduced quickly as the established wolves will train them.

Topic Question 6:
good luck

Correspondence: Topic Question 1:

If the introduction of new wolf breeding stock is accomplished I don't think other methods will be necessary.

Topic Question 2:

Right now the primary issue is a lack of balance in the ecosystem caused by too few wolves and too many moose impacting the vegetation. Close study of all three is the best way to determine future issues as they come up.

Topic Question 3:

Observation and close monitoring of the wolf pack with radio collars and cameras is the simplest and most effective in a wilderness situation.

Topic Question 4:

I am not able to comment on how climate change will affect the wildlife in Isle Royale.

Topic Question 5:

The things I like are: 1) to build up the wolf pack population by introducing new breeding stock, 2) allow the wolves to control the moose population, 3) allow the island to remain as wild as possible. This seems to be the simplest and most natural way to return balance to this area.

Topic Question 6:

Keep it simple. Nature is magnificently simple.

Correspondence: Topic Question 1:
I believe in balance of nature and conservation by allowing the numbers of predator and prey to solve any population problems.

Topic Question 2:
I would like to see some environmental studies done to show the areas of vegetation; the numbers of moose and wolves in the surrounding areas.

Topic Question 3:
Protect the wolves by naming them as endangered species. Do not allow permitted hunting of the wolves. Bring in new wolf packs to help strengthen the numbers as I understood that there were only three wolves left in the area.

Topic Question 5:
I am not sure what this question means. Doing nothing would allow one species to become extinct in the area thereby allowing the moose population to grow unchecked. Wolves don't kill just to kill; they take down the sick and weak within a herd of moose to survive and control numbers naturally.

Topic Question 6:
I did not hear any comments with regard to previous hunting of wolves. I suspect there is a definite reason for the dwindling number of wolves on the Isle. No trapping or hunting of wolves should be allowed until the numbers increase by birth within the existing pack and also by bringing in a new pack.

Problems arise in wilderness areas when humans take a hand by messing with the 'Natural Balance of Nature'. Brings to mind over hunting of Buffalo in some areas. Over hunting/trapping of wolves will throw the natural balance away. Climate change will perhaps lower the growth of foraging food for Moose; then declining populations of Moose will curtail the numbers of wolves. This is nature's way and has been for hundreds of years.

Comments: There is a lot of research that has been done about, Grey Wolves, Red Wolves, etc. The wolf packs are a healthy part of any wilderness environment. I suggest if the NPS hasn't done so that they do some in depth studying of these subjects.

Man is the only species that just kills in violence without need or use for his kill. Restore the balance of wolves and moose to allow the area to 'manage' itself.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once

the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,

Correspondence: Topic Question 1:

I think Alternative B is the best hope as the wolves are a key element in the ecosystem here. Getting rid of moose is a situation not to be considered as questions would arise as to which moose should be killed, then which moose are readily available to be killed, frequently not the same population. In the meantime, the lives of the three wolves would still be at risk, so that is why it's necessary to view the problem as it relates to the wolves, not the moose. With a healthy wolf population the moose will be in check.

Topic Question 2:
Every effort should be made to remove invasive plants that seem problematic.

Topic Question 3:
It will be important to monitor the wolves without disturbing them. Drones could possibly be used for some surveillance.

Topic Question 4:
A study of the shorelines should be made to determine that these areas show native characteristics regarding plants in these zones and terrain in the coastal areas needs to approximate what has been historical here

Topic Question 5:
Plan B is the only sustainable plan as the wolves are key to success.

Correspondence: Topic Question 2:
It is better to develop a plan that will help the island naturally return to a balance between predator, prey, and vegetation rather than just disposing of or relocating moose. When vegetation naturally rejuvenates itself in a natural environment it is healthier and tougher.

Topic Question 3:
Whatever plan is adopted for the island, it should be left as wild and natural as possible.

Topic Question 4:
Whatever plan is adopted for the island, it should be left as wild and natural as possible.

Topic Question 6:
The wolf reintroduction in the wilds of Idaho is considered one of the most successful ESA programs in history. I wish it had a happier ending, but the irrational fear and hatred of wolves in our state has led to the wholesale slaughter of entire packs, even in wilderness areas. However the NPS decides to handle wolf introduction on Isle Royale, please be sure they are managed in such a way that is humane and best for the wolves and the ecosystem of the Island.

Comments: Dear Superintendent Green,

I care about the wildlife in our national parks, including the wolves and moose at Isle Royale. The situation right now on Isle Royale threatens the overall ecosystem health of this island park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If new wolves are brought to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive for the wilderness park than trying to manipulate the number of moose on the island or having to replant native vegetation once the moose consume it.

The National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for reading this.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,

Correspondence: Topic Question 1:
We should either bring wolves to the area or protect this land in every way possible

Topic Question 2:
If the wolves die off, which would be horrible already, the moose will over populate the area and the land will be devastated. It's the circle of life and we will lose this if we don't protect the wolf Population!!

Topic Question 3:
We should protect the land & the wolf population at any cost

Topic Question 4:
We should fight to fix our earth so that we can slow down and eventually stop climate change. We all need to step up and do our part to fight for our planet and all the animals that live here. It's our responsibility

Topic Question 5:
I just hope that something positive is done! I worry that they may go about bringing wolves there in the wrong way. They need to be sure that the wolves that go there will thrive in that area and that they aren't breaking up any packs in the process. If wolves are not brought then they need to be very serious about protecting the remaining wolves that live there so they can breed.

Correspondence: Topic Question 1:

Add wolves to the Island as needed to keep some kind of balance in the moose and vegetation. Moose culls do not remove the weak and diseased like wolves will, also the moose will lose their wildness if they do not have a predator like the wolf.

Topic Question 2:

Use nature's methods to keep nature healthy as much as possible. Reduce the impact of people on this island we have enough developed places and do not need to damage this wild place.

Topic Question 3:

Keep 99% wld as possible and try to reduce the human footprint even more on the island. Intervene carefully and seldom and try to do natural type changes.

Topic Question 4:

This wolf issue on the island was caused by warmer climate preventing new wolves from moving out over the ice so bringing wolves out is the best we can do - now that we have prevented the chance of ice forming to allow wolves to go on their own.

Topic Question 5:

My concern is that politics or business concerns will pervert this island like they have at all the super fund sites, highways, malls, Walmarts and abandoned factories. This is a small part of the world make a buck where it is already screwed up.

Topic Question 6:

It would be nice to think that this type of issue would be handled without some kind of scheme from crooked politicians and their owners. I hope so, but I won't hold my breath. The jerks running this country have destroyed mountains, streams and drinking water over vast areas to get to some coal that is obsolete and only kept in business by massive taxpayer subsidy and externalizing virtually all the significant costs to the environment and human health.

Comments: Most of the uses of resources, impoverish the close neighbors to the mining or drilling. The sickest and poorest people live in the disaster areas created by rich bastards who take the profit to their nice clean neighborhoods where they bitch about the needs of the very people they made poor and sick.

purchase of more land. Government support so no private or corporate profits by exploitation of public properties or resources should be allowed.

Topic Question 2:

wildlife of all kinds is & should be of upmost importance. This is the most valuable asset for tourism & it is under pressure & attack. Absolutely no hunting, culling or killing should be allowed, especially in the name of "management".

We need to step back & let nature set the balances. I don't know who is profiting from these "hunts". But they need to stop.

Violent humans with guns & bows & poachers should be prosecuted, fined & jailed.

Topic Question 3:

total protection & heightened intensity of making sure humans do not spoil wilderness areas with development of ANY kind

Topic Question 4:

humans can not control weather changes or land failures where wildlife & birds migrate & live. Attempts to relocate or provide alternative plantings may not be successful, relocation also may just stress areas & wildlife further.

Topic Question 5:

Survival of fit wildlife is wrecked by culling & selling hunt

Licenses. This is not good management. Step out of these barbaric practices that do nothing but disrupt fragile development of species facing extinction from human populations.

Topic Question 6:

stop human access to all wildlife & wilderness areas that are endangered by human housing, development . We have no right to enter & destroy their home. Yes it is beautiful. Let's keep it that way

Just add wolves. They'll take care of the place.

Topic Question 2:
Isle Royale's status as an International Biosphere Reserve should be considered. Wolves and moose were an important reason for including Isle Royale in the IBR program.

Topic Question 3:
Re-think your definition of wilderness to include people who act in concert with the processes of nature.

Topic Question 4:
Nobody knows what climate change will mean for Isle Royale..... do what you can to keep the ecosystem healthy. For the immediate future, bring in wolves.

Topic Question 5:
I don't like any of them. It is hard to believe that these alternatives came from the email messages sent to the park during the past 2 years.....

Topic Question 6:
I TRIED TO SUBMIT THESE COMMENTS EARLIER but didn't receive a message that my comments had been received..... if this is a duplicate, forgive me! I've made the same points in both, so either one is OK to use. Thanks!

Comments: Comments regarding future of the Isle Royale ecosystem

- 1) None of the alternatives is satisfactory. Isle Royales ecosystem has been managed by wolves ever since they arrived in 1948, and it can be so again, if the NPS policy is to maintain a viable wolf population.
- 2) Letting nature take its course involves humans, who are, by nature, active, intelligent, social, and spiritual animals who try to do the right thing. When we engage in open, science-based, civil discussions about our public lands, we make good decisions. (ISRO management has ignored the Blue Ribbon Panel report - ISRO_Strategic_Plan_2009 - which advised/prioritized scientific research on the island.)
- 3) We can and should mitigate for mistakes weve made in the past (bringing disease to the wolves, changing the climate, leaving old mine pits to serve as animal traps.) We know what the island needs - a top predator - and we can easily ensure that this goal is realized.
- 4) NPS staff often refer to the caribou-lynx system that existed in the past. Caribou and lynx are not a system - lynx prey on snowshoe hares, not caribou. Even if caribou were re-introduced to Isle Royale, they would need a predator, and the appropriate predator would be the wolf.
- 5) Isle Royale is a haven, and just about the only haven, for moose, a species that has been proposed as a threatened species. Without deer, Isle Royale offers life without the threat of brainworm, a parasite that is lethal to moose.
- 6) NPS staff also repeat the statement that the island will be moose-free in 30 years, if climate change means hotter, drier summers. The current plan covers the next 20 years. Lets deal with that time frame. Nobody knows what will exist here in 30 years. Right now, we have moose.

- 7) Prey such as moose, confined as they are on Isle Royale, need a predator to cull the old, sick and weak. This should be my first point and is the most important consideration when we are trying to manage Isle Royale.
- 8) Wilderness needs wolves. Of what good is a wilderness when its impaired?
Isle Royale is an International Biosphere Reserve, largely because it has been, until recently, an intact, healthy ecosystem.
- 9) The environmental movement has lost the support of the next generation because of its negativity. Young people want an opportunity to fix mistakes made by their elders, including lifestyle choices that have contributed to climate change. Isle Royale offers a great opportunity to do something right- to say, We made a mistake by not rescuing the Isle Royale wolves when we had the chance, but we can now introduce new wolves who will perform their vital role in ensuring the health of the islands ecosystem.
- 10) Many people submitted comments to the NPS via email over the past 2 years. These messages should have been made public and should now be included in the current public scoping process as they contained well-thought-out suggestions. I cannot believe that the current 6 alternatives arose from that email input.

minimal impact to maintain control

Comments: Dear Superintendent Green,
I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.
I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.
This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.
As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.
Thank you for considering my concerns.
Sincerely,

Correspondence: Topic Question 1:

After reading your Preliminary Draft I would be in favor of Alternative Concept A or Alternative Concept B. If there were no people on this planet nature would take it's own course. If the island can not support a growing moose population then moose will die. If wolves do not find the island a good home they will leave. The vegetation will change as climate does, no need to try to keep it the way it was for hundreds of years if the planet is changing. This is about all I have to say. Keep up your good work.

Thank You

Correspondence: Topic Question 1:
The proposed alternatives seem to cover all the reasonable possibilities with respect to the moose wolf issues

Topic Question 2:
Wolves (and moose) should be maintained in sufficient population to allow the observation of their interactions and the consequences on the ecology of the park. This would probably mean the occasional simulation of in migration of wolves and possibly moose.

Topic Question 3:
The park should be left as wilderness with as little interference by the Park Service as possible and yet is consistent with the wolf moose predator prey studies.

Topic Question 4:
There will be effects due to the climate changes. The park service should not try to mitigate them. Isle Royale should be a living and thus changing wilderness, not a museum of its past (now current) natural history.

Topic Question 5:
Were it not for the wolf-moose studies I would prefer Alternative A, let nature takes its course. Alternatives B and C together allow for the studies to continue, taken together I prefer them, D through F do not. (See Comments below)

Topic Question 6:
Please see Comments below

Comments:

Dear Superintendent Green and members of the NPS at Isle Royale,

I am writing in support of the proposed Alternative B, with the caveat that Alternative C may need to be combined with B if at some time either the wolf or the moose population falls to a critical level such that prey-predator studies are not possible.

I support these two alternatives because they allow for the continuation of the important prey-predator study. The multi-generational nature of that study has given weight to its already valuable conclusions. The relatively closed nature of Isle Royale has reduced the variables in the prey-predator study allowing clearer conclusions than in an environment with fewer constraints.

Humans are top predators in most situations. The Isle Royale Prey-Predator study has the potential to shed light on subtle aspects of our species relationship to our prey and how these connections with our prey (including husbanded animals) result in interactions which provoke changes to the environment. With the coming of significant climate change the ability to maintain the current quality of the local flora will be compromised, independent of the circumstances of the moose and wolf populations. The research from the prey-predator studies and the observations of their scientists will enhance the mandate of the Park Service to maintain the quality of the park and its environment.

Alternatives D, E and F preclude significant research by introducing many variables into the prey-predator ecological/environmental system. Thus I oppose the Alternate Proposals D, E and F which complicate the work and dilute the force of the conclusions of the work product of the research zoologists and wildlife ecologists. It is this work product which creates the understanding that enhances the Park Service's management and maintenance of the wilderness.

I've enjoyed my five visits to Isle Royale National Park since 2004, when my now spouse introduced me to the park. I've greatly enjoyed long solitary walks through the northeast section of the park, observing, photographing and enjoying its natural wonder. A great intellectual pleasure is added by knowing of the quality of the research being done in the park and its importance of the Isle Royale National Park Prey-Predator study.

Finally I want to thank you, your staff and the National Park Service organization for all the great work maintaining the parks and creating the opportunity for great enjoyment and pleasure in nature.

Sincerely,

Correspondence: Topic Question 1:
Can an alternate pack be added without them killing off the three wolves left? What the [expletive] happened to the wolf population? There was a long running study of just these wolves on Isle Royale. Didn't anyone notice or did you run out of money to conduct the study? Did they leave the island in winter or did they die? Someone should have noticed before this crisis.

Topic Question 2:
They need to be balanced. You need the wolves as predators to take out some of the moose. If the vegetation is down too far, plant some more. The moose will obviously need culling by the wolves, not some trigger happy group of "trophy hunters".

Topic Question 3:
Not too much, but enough to get the wolves reintroduced. Again, there was an intensive study for years. You people should know how to manage them.

Topic Question 4:
Read above answer. Where did all the wildlife specialists go? Did you dump them for bureaucrats?

Topic Question 5:
I don't like any suggestion about getting rid of the wolves. They were doing fine before we came along.

Topic Question 6:
We need fewer people and more animals to rebalance parks. Limit the idiots on jet skis and noisy ass off roaders or let the wolves thin them too.

Correspondence: Topic Question 1:
None

Topic Question 2:
If the moose population runs unchecked, the islands vegetation will be heavily impacted. This will impact the whole island as a National Park. More competition for food will create crankier animals which could result in negative animal encounters and cause visitors to stop coming to the island.

Topic Question 3:
Bring in more wolves from various areas of the Upper Peninsula for genetic diversity so the wolves can make a comeback and help keep the balance on Isle Royale. This is a win win for both environments.

Topic Question 4:
Mother Nature has been allowed to take her course. By encouraging low to no impact camping and clean waters to maintain cleanliness and avoid invasive species, it's about all you can do. Perhaps post more signage at campsites about how easy it is to impact the pristine conditions found on Isle Royale.

Correspondence: Topic Question 1:
Introducing wolves more than once, perhaps? Because if only a few are introduced once, in a short amount of time we will be faced with the same problem of genetic inbreeding. Secondly, maybe plant more plants for the moose to eat when almost reaching the 'bust' in 'boom and bust' to help maintain them at a more constant level.

Topic Question 2:
Whether or not it's even our place to interfere or not because sometimes you just have to let nature do its thing and if the wolf population dies out on one island then that's just what happens, and it leaves room for other species to come and thrive in their place.

Topic Question 3:
cautious management and minimal intensity. if there is change that is wanting to be made for the management of it, then it should be as little as possible (the still can help) so that it doesn't end up the animals relying on us to balance things out every year.

Topic Question 4:
That sometimes one solution that would work in one climate at one point in time, may not work in a future climate at a future time. so trying to be able to make a middle intensity plan that can shift easily with the changing climate is crucial.

Topic Question 5:
I like that they seem to cover pretty much all the bases, although I wish there was an option to introduce wolves and plant moose plants to help them and so

in essence everything would balance out.

Correspondence: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,

Correspondence: Topic Question 1:
Maintain the predator/prey balance in that ecosystem.

Topic Question 2:

You need all components of the food chain in order to sustain a healthy ecosystem. Why am I telling you that? That's biology 101.

Topic Question 3:

It's an island. You must oversee the balance of a somewhat closed system.

Topic Question 4:

Oh god help us all.

Topic Question 5:

I dislike stupidity posing as a solution. In order to maintain the food chain and not have depletion of necessary foodstuffs you must keep the prey (grazers, usually) at a certain level and that means predators have to thrive as well.

Topic Question 6:

Please, don't mess this up.

Comments: Thanks for attending to my opinion.

Correspondence: Topic Question 1:

The wolves have been a vital and integral part of the Isle Royale ecosystem, allowing the vegetation communities to flourish under a tolerable and manageable population of moose. The long geological history of the island very likely includes the presence of predators, replenished whenever ice bridges were durable enough to facilitate migration, long before the colonization of recent history in 1949. However, due to anthropogenic climate influence toward less winter ice in the Great Lakes and fewer wolves in the surround parts of US and Canada, such migration is unlikely to occur again naturally in the Anthropocene. The predator-prey relationship on Isle Royale has become an iconic textbook example of such relationships taught in high-school biology. If wolves are allowed to die, an outstanding northern mixed-hardwood forest will suffer excessive, unsustainable grazing pressure, and become more akin to the over-grazed, predator-free lands that characterize much the urbanized, fragmented eastern US. I urge the Park Service to transplant a new founder group of wolves from the nearest convenient population.

Comments: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. With only three wolves left at the park- -the lowest number of wolves in more than 50 years- - there is a threat to the overall ecosystem health of this national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,

Correspondence: Topic Question 1:

Please adopt Alternative C. Alternative elements are presented below.

Topic Question 2:

Issues that should be considered evaluating future management: For a Millennium, the wolf, moose, vegetation symbiosis has managed itself without human intervention.

Topic Question 3:

Any type of management should have a minimal impact on the designated wilderness. Management should allow time for the pack's acclimation to newly introduced wolves, as needed, rather than be limited to an arbitrary one time introduction. The paramount concern should be facilitating the survival of both the wolves and the moose, which will self-adjust as they always have, and the vegetation will follow, as in a trophic cascade.

Topic Question 4:

In addition, to acknowledge the effects of climate change on the isle, there are two factors to consider: the extension of the tick's range which impairs the health of both wolves and moose, and the extension of the temperate forest range which impacts the food source of the moose.

Topic Question 5:

The intensity of management should be expedited before the end of 2016, at the latest. Also, the proposed cull of moose deviates from the designated natural wilderness of the Isle. One concern is that the wolf would only cull the young, weak, ill and the old to keep the herd strong. Another concern is the impact of the hunt itself e.g. terror from the air or from snowmobiles; habitat destruction from removal of cadavers or the resultant population growth of other carnivores sustained on increased availability/non-removal of cadavers.

Correspondence: Topic Question 2:
Adequate number of wolves. Healthy wolves. Immediate restoration.

Comments: Dear Superintendent Green,

I live in Michigan. Even if I didn't, I would care about the wildlife at Isle Royale, especially the poor sickly 3 wolves remaining on the island. The moose are far outnumbering them, and moose are vastly disturbing the ecological balance of the park. Wolves are needed to cull old and injured moose. Because that isn't happening, moose over-forage and the entire ecosystem suffers shock waves.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only.

This option does the most to restore the ecological health of the park. It is most like nature. It is efficient. There shouldn't be manmade moose killing to cull their numbers. Nor should moose be transported from the island. Nor should the park leave everything as is (no wolves, tons of moose) but have to continually replant native vegetation once the moose consume it.

I urge the National Park Service to take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service bringing new wolves to the park immediately, before the 3 wolves become zero.

Thank you for the opportunity to comment. Please take immediate action in this 11th hour.

Sincerely,

Correspondence: Topic Question 1:

I like alternative 2

Bring more wolves to the Island. This will help the moose and the Island plants.

Topic Question 2:

Future management needs to include population monitoring.

How and why do the wolves leave the Island?

Did they leave for lack of food or for diversity? Do wolves need more choice for a mate?

How healthy, or unhealthy, are, or were, the moose?

We're there enough moose to feed the wolves?

Will we need to bring in moose too, someday?

Topic Question 3:

Monitor from the edges. 4 places.

Use cameras.

Topic Question 4:

Lack of ice should keep wolves there.

Topic Question 5:

Doing nothing is no good.

Keep studying the interaction. Keep defending the wolf.

Topic Question 6:

I am deeply saddened by the country as a whole gunning down wolves. They're made out to be bad animals.

Isle Royale may be the best place to educate and change that perception.

Correspondence: Topic Question 1:

Concept C appears to be the best alternative, however, it does not go far enough. There must be sufficient flexibility to allow for wolf reintroductions as necessary over the next 20 years to insure genetic diversity for wolves and sustainable populations of both wolves and moose into the foreseeable future.

Maintenance or culling of moose is not necessary if wolves are allowed to fulfill their ecological role. Absent wolf immigration, which no one can predict, there is no likelihood of having a wolf population without human action.

Topic Question 2:

The NPS must consider the data collected through 57 years of research conducted on Isle Royale. These researchers should play a key role in the discussions.

Topic Question 3:

The culling of moose and the use of motorized equipment is unacceptable. An immediate introduction of wolves should be performed to increase the wolf population.

Topic Question 4:

Climate change poses a fundamental threat to species and places. The only way to slow the impacts of climate change is to globally reduce carbon emissions. NPS could produce an informational flyer explaining the negative impacts climate change is having on Isle Royale such as the changes in the duration and frequency of the ice bridge, winter ticks, bird species etc. NPS could engage with businesses and private entities that use the island to reduce carbon pollution. Encourage visitors to reduce their carbon footprint by not bringing / disposing of water bottles.

Moose are not likely in any direct danger of being reduced by climate change, however, wolf predation is needed to limit the growth in their population.

Because of climate change, it is unlikely that wolves will be able to repopulate Isle Royale without NPS intervention and we ask for immediate action to augment / reintroduce wolves.

Topic Question 5:

Evidence suggests that the few wolves on the island will not be able to keep moose populations in check which will further degrade the island's vegetation. Every effort must be made by the NPS to expedite the decision.

Topic Question 6:

Wilderness is important and should be protected. Wolves should be introduced into this area to assist the existing population in controlling the moose population and also boosting the genetic soundness of the island's wolf population. No hunting of any species should be allowed on this wilderness.

Correspondence: Topic Question 1:

Reintroduce and maintain Wolves on Isle Royale, to keep the moose population, from destroying the vegetation on Isle Royale.

Topic Question 2:

If any part of this ecosystem is lost, it may be gone forever. Wolves need to be reintroduced and maintained now.

Topic Question 3:

Reintroduction and subsequent maintenance of the wolf population on Isle Royale will keep the moose population in balance and preserve the vegetation, and is the least intrusive and least intensive way to keep the ecosystem stable, for future generations to enjoy.

Topic Question 4:

Wolves need to be reintroduced now, before species of vegetation are completely lost.

Topic Question 5:

A one time reintroduction of wolves will probably not be enough to keep the ecosystem balanced into the future.

Comments: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Correspondence: Topic Question 1:

I would encourage the park service to introduce new wolves to the region. Wolves have been successfully reintroduced in parks, such as Yellowstone, to great environmental benefit.

Topic Question 2:

Ecosystems have evolved to reach either an equilibrium or break down completely. Should the park service work toward re-balancing Isle Royale's predator / prey numbers through the addition of more wolves, I believe the moose population will come into check and this will allow vegetation more time to establish itself, leading to a more prodigal total ecosystem.

Topic Question 3:

Management should be limited to ecological preservation, safety precaution, and wilderness research. Any management of animals and plants should be limited to protective or repair roles.

Topic Question 4:

The changing climate makes designated wilderness all the more important. I would hope that park services would work doubly hard in such areas to keep them free of illegal logging.

Topic Question 5:

I am afraid I am unaware of the preliminary alternatives, but I do favor Alternative Concept B.

Topic Question 6:

The work the park services do is vital. I commend you all for your efforts.

Correspondence: Dear Superintendent Green,

As someone who cares deeply about our wildlife, I am concerned that there are only three wolves remaining at the Isle Royale National Park. Such a low number of predators threatens the Park's ecosystem, resulting in long-term consequences, including decimation of food resources by the increased moose population.

Therefore, I support management Alternative B to introduce new wolves to the island, recommending that the Park Service do this on an as-needed basis, rather than one and done. Choosing this option provides a less-invasive and more proactive alternative to culling and / or removing moose from the island and replanting native vegetation.

I encourage the Park Service to act immediately, before the wolf population vanishes completely, leaving this national park vulnerable to decimation and disease.

Thank you for considering my concerns.

Let it run it's course.

Topic Question 2:

Do we want to keep Isle Royal as a natural wilderness as much as we can or do we want to the island as a planned and managed experience for people. Both types of areas have there benefits and are needed. Which one do we want Isle Royal to be. Wilderness already has has a good start here.

Topic Question 3:

It is a wilderness area. Only the the effects of what man does should be managed to lesson human impact having an adverse effect on the wilderness. Let nature run it's course.

Topic Question 4:

Climate changes. Let's see how nature handles it. It has changed before and nature survives. If we start messing with it it is no longer nature.

Topic Question 5:

Somewhere between A and E. Limit our hand on managing nature. The other option interfere to much with the wilderness.

Topic Question 6:

I would love to see the island stay the way it is with moose and wolf. Is it our place to do it. Let's wait awhile and see what nature does. It might solve all the problems. We always can stick our hands in later on.

Correspondence: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,

Correspondence: Topic Question 1:

I support introducing more wolves to the area to restore the balance on an as needed basis.

Topic Question 2:
Consider the impact of reintroducing wolves in California in the United States. Other species flourished, even certain vegetation rebounded because wolves helped restore balance.

Topic Question 3:
I believe the wolves should have a protected status to insure balance restoration.

Topic Question 4:
I believe reintroduction of wolves will keep the moose population in check, which will keep vegetation healthy. This is a much better alternative than culling moose.

Topic Question 6:
Wolves have unfairly been under attack for many years. Although they are predators, they do provide a needed balance in the wilderness. This is primarily a wilderness area, so the reintroduction can only strengthen the eco system without the worry of ranchers in the area.

Correspondence: Topic Question 1:

What a shame that the island is down to just three wolves not a viable breeding group and hardly a functional pack. Hopefully new wolves can be introduced to the island to restore predaptr prey balance and prevent the loss/extinction of wolves on the island from which there would be dire consequences for the entire ecosystem.

Topic Question 2:

Balance of an ecosytem is essential and the predator prey equilibrium of wolves and moose prevent devegetation and over crowding to the point of starvation for the moose and plants on the island.

Topic Question 3:

Hopefully the NPS can consider in put from scientific studies and groups that provide factual information in the interest of supporting self perpetuation of ecosystems in our National Parks for future generations to enjoy like we have.

Topic Question 4:

Again consideration of scientific studies and input from conservation groups that prioritize preservation of our National Parks over financial gain of some businesses seems the wisest for the welfare of our National Parks.

Topic Question 5:

having to cull the moose and do extensive replanting seems expensive, time consuming and not as sensible as introducing additional wolves to maintain a balanced ecosystem that can be self sustaining.

Topic Question 6:

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

Correspondence: Topic Question 1:
Maybe when wolves aren't wanted around Yellowstone they could be relocated to the Isle. Put radio locators on them so they can be studied and you would know when they try to leave the island.

Topic Question 2:
The moose should be left alone. The wolves should be re-introduced at a level that would bring balance. Then they should all be left alone as much as possible.

Topic Question 3:
As it is wilderness, the focus should be on the creatures who live there, not visitors to the park. We need to determine if the human presence is effecting the wolves, causing them to leave, be killed, etc.

Topic Question 4:
The climate may prevent the ice bridge from forming which would keep the wolves on the Isle. So bring them in by helicopter, in pairs, and then leave them be.

Topic Question 6:
We are changing the climate, so we need to help the environment. Re-introducing wolves would be the most natural way. We can't help the plants but we can limit the human effect by limiting visitors, pollution, etc.

Perhaps we should not try re-seeding and but let the plant life evolve. Moose in different areas eat different things. They would probably adapt. Messing with the vegetation may cause more harm than good.

Correspondence: Topic Question 1:
Bringing in healthy wolves in sufficient numbers to introduce new blood lines and revive the dwindling pack on Isle Royale has potential to reverse the damage man has done in introducing parvo virus to the the island. The warming of the climate has prevented formation of an ice bridge that allowed wolves from the main land reaching the island and contributed to the inbreeding we see today.

Topic Question 2:
Restoring the wolf population will help control the moose population and reduce their impact on the islands vegetation.

Topic Question 3:
It is man's introduction of parvo virus that reduced the genetic diversity of the islands wolf population. Restoring that diversity will help bring the system back into balance. Maintaining the Island as a designated wilderness area with limit roads and accessibility limited to hiking and watercraft is important. Once balance is restored, the wildlife, including the wolves and moose, should have limited contact with humans.

Topic Question 4:
If the usual ice bridge between the island and the mainland disappears, the genitic diversity of the wolf and moose population will be affected in the long run. It may be necessary to bring in animals with different blood lines in the future. The moose are suffering from tick that are no longer killed by the winter cold. The tick infestation is severe enough to actually kill young or injured moose. The change from boreal forest as the climate warms will provide less food for the moose. Decreasing there number by reestablishing the wolf populations will help them survive.

Topic Question 5:
I prefer options C or D. We have had a hand in creating the problem and we should help restore natures balance while maintaining the island as one of the few true wilderness areas left in our country.

Topic Question 6:
We visited Isle Royale for the first time this summer. It is a treasure. We heard Rolf Peterson speak at an evening presentation sponsored by the NPS. We also visited Candy Peterson at her cabin and saw the extensive moose bone and antler collection. Their willingness to share there knowledge of the island and the results of the wolf/moose research is heartening and needs to be supported. We would like to make another trip to Isle Royale and stay longer the second time.

Correspondence: Topic Question 1:

Please see my point # 1 in statement below, noting particularly my comments about ongoing monitoring, flexibility, and inclusion of the researching scientists with the park rangers.

Topic Question 2:

As I mention in my comments below, the fact that Isle Royale is an island/archipelago influences the moose, wolf and other animal populations, and this has a huge effect on the flora of the islands. We must keep this in mind at all times if a balance of all elements on the island is to be maintained. In addition, we must now always keep in mind that climate change will affect everything - we can only make educated guesses on how it will affect everything, and that takes us back to constant monitoring, flexibility, and many knowledgeable minds working together for the good of the archipelago.

Topic Question 3:

In order to arrive at my answer I looked up the legal definition of wilderness used by the NPS [http://www.blm.gov/wo/st/en/prog/blm_special_areas/NLCS/wilderness2/Wilderness_FAQ.html]. "Wilderness is a legal designation designed to provide long-term protection and conservation of Federal public lands;" "Federal land ... protected and managed so as to preserve its natural conditions... may also contain features of scientific, educational, scenic, or historical value." Herein ["long term ... conservation of Federal public lands," "protected and managed so as to preserve its natural conditions"] are the goals for the NPS on Isle Royale, and given what we know of the devastating effect moose-without-predators have on the flora of Isle Royale, these definitions certainly allow for Alternatives A, B, and C. The prey/predator study fits the description of "scientific value" in the definition. I'm sure that each national park has unique qualities that require unique-to-that-park responses. The most obvious unique quality of IRNP is that it is an island/archipelago, and distant from mainland flora and fauna. IRNP is fortunate that it doesn't face the unique difficulty and unhappy response we recently saw in Yellowstone.

Topic Question 4:

We know change will happen. Since we have yet to learn the details of how change will manifest itself on IRNP, the decisions on management should not be fixed in place for years ahead, but will require the monitoring, open-mindedness, flexibility, and inclusion of many observers and opinions, as mentioned in my response to the alternatives, below.

Topic Question 5:

My answer is in my comments below (especially my points 3, 4, 5, and 6).

Topic Question 6:

Please see comments below.

Comments: To: Phyllis A. Green, Superintendent, Isle Royale National Park; NPS team

From:

Re: Alternative Concepts A through F with regard to the management of moose, wolves, and vegetation at Isle Royale;

Date: August 26, 2015

Superintendent Green,

Thank you for the opportunity to offer observations on the management of moose, wolves, and vegetation at Isle Royale, and thanks also for the clear outline of Alternatives A-F, with background information, that you've presented online.

1. I strongly believe that, above all, any choice of action must be understood as a continued learning experience, carefully observed and monitored for effects, so that the chosen action may be terminated or altered at any time, as deemed necessary. Let us not, as has happened so often in the past, launch ourselves on a nearly immutable and quite possibly destructive course of action, and especially because we're dealing with an island, an environmental microcosm with its many differences, both for good and for ill, from a section of a larger mainland.

2. Obviously the very best persons to observe and monitor the results of any action are those scientists who have already dedicated their personal and professional lives to observing, knowing and understanding the island (Peterson, Vucetich, et. al. - the work of these scientists has broadened and deepened the whole Isle Royale experience for me and for my family and friends who've visited Isle Royale over the years). The park rangers, whose knowledgeable commentary during the many hikes I've taken on the islands has also enhanced my Isle Royale experience, would be excellent observers/monitors as well. The scientists and their volunteers, and the park rangers, all working together, would make a thoughtful and dedicated group of observers.

3. Because we already know to some extent the damage caused by moose when their numbers are not naturally controlled by wolves, I believe Alternative

B would be a good choice for the immediate future. On my many trips to Passage Island (where I understand the moose have never been, and where the vegetation therefore differs from that on the rest of the island) and on many other ranger-led hikes around the island where I've noticed the sections of trees fenced-off to protect them and their growth, I have been impressed by the profound effect moose have on island vegetation, and I have seen the steps the NPS has already taken to preserve the diversity of island vegetation.

4. Alternative A might be worth exploring for a very brief time, with the thoughtful and constant input of Peterson and Vucetich, who have the most comprehensive view of the relationships among wolf/moose/vegetation on the island. If no new wolves arrive or are born on Isle Royale within a couple years, and the effect of no wolves/a lone wolf has been observed on the flora and has been shown, once again, to be detrimental, I would encourage a move to Alternative B.

5. I would certainly encourage holding open the option of Alternative C, if wolves need to be introduced on the island more than once.

6. I would discourage Alternatives D, E, or F at the present time, for two reasons. First, we don't yet know how climate change is going to affect the moose population on Isle Royale, and, second, we do know that the presence of wolves on the island (helps) control the numbers of moose on the island. Thus Alternatives D, E, and F represent too much intervention without the need for it at this point in time.

My interest in the issues addressed, and my remarks, are informed by frequent visits to Isle Royale over the past 15 or 16 years (I've lost track of the exact number), including 2014 when we took my grandchildren to the island. My interest and remarks are also informed by the knowledgeable comments of park rangers on many hikes on the island, and by the thoughtful and detailed research of, and the excellent presentations by Rolf Peterson and John Vucetich. Finally, my own teaching experiences of more than 40 years, together with my from-childhood interest in science and especially the relationship of humans and their environment arouse my concern and influence my remarks on the issues you are addressing.

Correspondence: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,

Correspondence: Topic Question 1:
Restoring a natural system, and maintaining it seems cost effective, instead of trying to impose a new system other than nature. If you don't support the wolves and help increase their population to control moose, the moose will likely destroy all animal habitats and vegetation, and eventually die off themselves.

Topic Question 2:
Natural system analysis.

Topic Question 3:
In a wilderness, wolf packs control Moose populations. Moose control weeds and shrubs and control waterways by keeping them clear. When wolf packs inflict harm on a moose population wolves may have to be relocate, or birth control feed and other non violent action should be taken.

Topic Question 4:
Watch the herd/ packs in both species. Maintain a rational science based management program. Look to plants and birds to inform you of the balance achieved.

Topic Question 5:
Killing moose or wolves, I assume is the first option, which does nothing to help Nature. Relocation or birth control foods are preferable. Moose and wolves are intelligent species, we now know this. That being so, human's are no longer ignorant, they must account for what they do to the planet to each other, and any multiple universes out there, as well as to the animal populations. According to quantum mechanics we are all observers, even bacteria, viruses, etc. Animals operate in the that general space time as we, meaning we are entangled with life on earth and non life based materials. Therefore, what we do to them we will be doing to ourselves.

I strongly suggest the Non Human Rights Project,for an update on the increasing pressure on humans to recognize the right of other species to co-exist on the planet.

Topic Question 6:
Develop stable populations for the even ecosystems. Develop plans to manage these population given the various effects of climate change. That may mean replanting food sources that can tolerate the changes, or limiting populations further by relocation.

Comments: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

Correspondence: Topic Question 1:
I believe that the DNR should be directly involved in this situation and that they should interact by releasing as many as 4-6 wolves from a different gene pool to change the wolves breeding habits making them not inbreed, this would be the biggest issue for the wolves dieing or moving because they are

disatisfied.

Topic Question 2:

We should keep them in balance and not change anything that is happening, all we need to do is reintroduce different genes of wolves in to the island.

Topic Question 3:

They should keep the island 99% wildness this is the part that keeps the island how it is, they should protect it and not let people go on it unless guided by a isle royal guide

Topic Question 4:

They should try and help the wolves with a changing climate because without the wolves the island would be a bare sand pile, because of the number of moose and small game they do kill.

Topic Question 5:

I very much like the alternative B because a migration like that is very much possible and would help the island sufficiently!!

Correspondence: Topic Question 1:

The responsibility of the National Park Service is to maintain Isle Royale's natural ecosystem which includes wolves. The wolves should be protected. Furthermore, the government should curtail urban sprawl and allow these animals to roam.

I believe that tracking devices, drones with video cameras and studies with local universities and the government can be excellent collaborative technologies and organizational synergies that can complement each other to protect our environment and its species. The goal should be to protect endangered species and maintain the natural ecosystem. Science should be used to study and understand these species and our environment to improve the ecosystem to its natural state, as required. By tracking the park and its species, university and government professionals will know and understand the environment enough to take action with natural solutions, when nature is not in balance.

Topic Question 2:

Maintaining a natural ecosystem with little human intervention should be the goal which means including wolves, as part of the ecosystem. Of course, all endangered animals should be protected with the goal of fostering environments that will bring a region back to its natural state. By protecting endangered animals, this allows the protected population to increase to the point where it is no longer endangered. We have an ethical responsibility to ensure that a health ecosystem can be passed down to many generations to come. The goal should be to always improve the environment from human error and abuse and natural disasters to restore the environment to its natural and original state. In other words, if humans alter the lands to farm country, a portion should be restored to its pre farming natural state.

Topic Question 3:

Restore this park to its natural state with all animals that inhabit this land with a natural ecosystem. The intensity should depend on how mismanaged this park is...

Topic Question 4:

The intensity should be great to manage and work with scientists to ensure that legislation is passed to protect this region and attempt to prevent changing climate.

Topic Question 5:

I have no comment at this time because I could not locate the preliminary alternatives. I am not sure where they are listed.

Topic Question 6:

I am very dissatisfied with the current trend to treat animals as trophies and the abuse of our lands for tracking, pollution and profit generation. The goal should be to preserve our lands for future generations with the intent of curtailing urban sprawl and protecting animals. Wolves are a critical part of the ecosystem. When humans begin to alter the ecosystem, we harm the natural balance of our own environment.

Comments: Recently, the people of Michigan voted to save the wolf. Therefore, I do not understand why the wolves on Isle Royale are not being protected as well. This is a technicality. Wolves are indigenous to the region. Therefore, wolves should be protected. We, as humans, have a responsibility to the environment to maintain its natural beauty and ecosystem. Failing to do so is failing humanity. I am saddened that wolves are the target of human killings and trappings. Please save these wolves. They have just as much of a right to be on Isle Royale as the Moose.

Correspondence: Topic Question 1:
Please adopt Alternative C. Alternative elements are presented below.

Topic Question 2:
Issues that should be considered evaluating future management: For a Millennium, the wolf, moose, vegetation symbiosis has managed itself without human intervention.

Topic Question 3:
Any type of management should have a minimal impact on the designated wilderness. Management should allow time for the pack's acclimation to newly introduced wolves, as needed, rather than be limited to an arbitrary one time introduction. The paramount concern should be facilitating the survival of both the wolves and the moose, which will self-adjust as they always have, and the vegetation will follow, as in a trophic cascade.

Topic Question 4:
In addition, to acknowledge the effects of climate change on the isle, there are two factors to consider: the extension of the tick's range which impairs the health of both wolves and moose, and the extension of the temperate forest range which impacts the food source of the moose.

Topic Question 5:
The intensity of management should be expedited before the end of 2016, at the latest. Also, the proposed cull of moose deviates from the designated natural wilderness of the Isle. One concern is that the wolf would only cull the young, weak, ill and the old to keep the herd strong. Another concern is the impact of the hunt itself e.g. terror from the air or from snowmobiles; habitat destruction from removal of cadavers or the resultant population growth of other carnivores sustained on increased availability/non-removal of cadavers.
Moose populations would be more effectively addressed by contraceptive measures.

Correspondence: Topic Question 1:
It seems to me the only viable option is to bring in new wolves to the island, as needed, to keep the moose population from increasing in numbers so great that the vegetation is completely consumed.

Topic Question 2:
Finding a good balance in numbers of moose to wolves in order to maintain healthy populations of both species without destroying too much of the vegetation would seem to be the main objective of good management.

Topic Question 3:
This is really a tough question. Keeping track of the numbers of both wolves and moose would be necessary in order to determine what a good ratio would be to keep the ecosystem healthy. Then if the number of wolves need to be increased, a few more could be brought in.

Topic Question 4:
In the future there may not be an ice cover on Lake Superior so there may be less chance for the wolf population to move off the island. If that happens, inbreeding may genetically weaken the wolves, so it may be necessary to bring more new wolves in to keep the population strong.

Topic Question 5:
I like the option of bringing in new wolves because it seem like it would do the job which needs to be done, much better than culling moose or removing moose from the island and also much better than trying to replant native vegetation.

Topic Question 6:
Our national parks are very important to me and my husband, and Isle Royale holds a very special place in our hearts. The wolves and moose of Isle Royale are a very important part of the island and we are so thankful that something which preserves both the wildlife and the ecosystem of the island is probably going to happen.

Comments: Dear Superintendent Green,

Along with the natural beauty of our national parks, the wildlife is probably the next biggest reason people love to visit. Isle Royal, with its beauty, moose and wolves is one of those very special places. The trouble is, there are only three wolves left on the island, and that leaves a lot of moose to go unchecked while they devour the vegetation. That's the lowest number of wolves in more than 50 years, and the ecosystem of the island is suffering because of it.

Management Alternative B, which would bring new wolves to the island (but urge the Park Service to do this on an as -needed basis, rather than a one-time-only) has both my husband's and my support. Unless wolves are brought in, we understand that the moose population will continue to grow, unchecked. If wolves are brought in, they will keep the moose population from rapidly expanding and minimize their impact on the native vegetation. Alternative B will be much less intrusive to this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation after the moose have devoured that which had been growing there.

The National Park Service, as good stewards of this park, should take the least intrusive action, which results in the biggest benefit to the wildlife and ecosystem of the island. We fully support the Park Service taking action immediately to bring new wolves into the park, before the existing wolf population

vanishes completely.

Thank you so much for considering our concerns.

Very truly,

Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,

Topic Question 4:

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Topic Question 6:

If wolves die off, the island's moose population will continue to increase, consuming the native vegetation and eventually running out of food, disrupting the natural balance of the island. We don't want that to happen.

Comments: Isle Royale National Park, a remote and beautiful island in Lake Superior, is home to a famous community of wolves and moose. These two species have an important predator-prey relationship and are critical to the overall health of the island ecosystem.

But with only three wolves left on the island, the character of Isle Royale is in jeopardy.

Correspondence: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,

Correspondence: Topic Question 1:

None that seem consistent with maintaining balance, inflicting as little possible harm/disruption/trauma to fauna and flora.

Topic Question 2:
Maintaining a reasonable healthy balance.

Topic Question 3:
As little as possible since we know from experience that there are often unanticipated consequences from human intervention, no matter how well intentioned.

Topic Question 4:
I do not feel qualified to answer this question.

Topic Question 5:
I like the idea of maintaining a large enough wolf population to keep the herds healthy and the plant life sufficient to sustain a healthy moose population.

Topic Question 6:
The current number of three wolves is not enough to keep the moose population from growing too large and over-grazing the plant supply. Removing moose is not desirable because of their large size, how costly and labor-intensive a "moose roundup" would be, and because the root of their over-population in the face of insufficient predation to keep their number in check and their health vigorous would not be addressed.

Correspondence: Topic Question 1:

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

Topic Question 2:

Without wolves, the moose population on the island will continue to increase, eating until the vegetation food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

Topic Question 3:

Adding wolves would be the least intensive solution and would bring about immediate results. It should be done immediately.

Topic Question 4:

Climate change will make the island more susceptible to degradation due to human usage.

I know there is already limited use of the park but it might have to be curtailed even more. Install webcams maybe for visitors to keep track of the wolf packs and the moose.

Topic Question 5:

The park should continue to add wolves as needed not just one time.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

Comments: Please bring new wolves to the island so this iconic species does not become extinct at Isle Royale and they continue to fulfill the critical role of balancing the island's natural environment.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone.

Correspondence: Topic Question 1:

use different types of people who are proper better type animal healers & guides & angels & mystics .

Topic Question 2:

try to increase the numbers because there has been too much hunting & culling generally.

Topic Question 3:

keep it wilderness, with maybe small walking trails fenced off . no evils or madness.

Topic Question 4:

allow rain & snow to occur . do not politicise or bring in the satanical types that we know tamper with water.

Topic Question 5:

I dislike human arrogance & death policy .

Comments: you have to have spiritual immortal angels & guides to preside all the wildlife & naturally regulate their population through divine grace . eventually in the right atmosphere all the animals -will be in harmony & not suffer death or hunger pangs . there should be no drugs or culling or hunting . the animals must all have full spirit paradise awareness & in the cold weather be in bliss.

If there is enough space fenced off - maybe a fenced off place for people to walk, hike & even have their pets or dogs or horses who need exercise. but only iff possible.

sometimes the wilderness areas are too dogmatic about anti-people & anti-dog-walking , sometimes.

Correspondence: Topic Question 1:
I think, it's very important to see middle time, or long time sighted. You must not only 1 concept to choose, but see what would it cause about 15-35 yearsin future. A healthy ecosystem need time. We will have succes only with long time projects! I agree with the NWC Newsletter:
"Only 3 of the 6 alternative concepts mention wolf reintroduction or augmentation and none with any specificity. Concept B and Concept D only allow for wolves to be reestablished once which may not be sufficient and is very short sighted. Concept C allows for maintaining populations of wolves and moose which "could" include wolf reintroduction or augmentation."

Topic Question 2:

I think, the NPS should consider and evaluate the ecological benefits wolves provide. When only few wolves live in the wilderness, it is impossible to talk about genetic diversity of wolves. A healthy population of wolves is the first, what You need, to keep balance again.

"The NPS must consider the data collected through 57 years of research conducted on Isle Royale. These researchers should play a key role in the discussions."

Topic Question 3:

You must protect the wilderness qualities of Isle Royale through monitoring of habitat for wildlife, including wolves and moose. Otherside is important to controlling water quality and ecological stability of plant and animal communities including the control of invasive species. The NPS Management must protect Isle Royale with all of the top carnivores. I think, it will be unacceptable, the culling of moose and the use of motorized equipment.

Topic Question 4:

The NPS Management must plan with reduced environmental pollutions. Visitors will allowed only when they keep the rules. I think, the moose population is not in extinction-danger, caused climated change, wolves have more problem with it.

Topic Question 5:

I think, You haven't time for wait, or discuss about alternatives. Now on Isle Royale the moose population is so huge, You need to act at time! You must prefer 1 alternative, it's good, but it must be done quickly or You will have the biggest huntseason of the World. My opinion be based on the National Wolfwatcher Coalition Newsletter.

Topic Question 6:

I think You have at Isle Royale a wonderful wilderness, with amazing animals, like wolves. You must keep them so, a whole, healthy ecosystem and then all visitors would admire Your work.

Correspondence: Topic Question 1:

I am glad the IRNP is almost all wilderness-designated and would not change that. Humans can never "manage" Mother Nature - - we work for the MIS-Management Department.

Topic Question 2:

http://earthjustice.org/blog/2015-july/how-wolves-saved-the-foxes-mice-and-rivers-of-yellowstone-national-park?utm_source=crm&utm_content=Minesbutton&curation=ebrief

How Wolves Saved the Foxes, Mice and Rivers of Yellowstone National Park

"... As a top predator, wolves are one of Yellowstone's linchpins, holding together the delicate balance of predator and prey. They even impact the physical landscapes around them. Their removal in the early 20th century disrupted food webs and set off something called a "trophic cascade," in which the wolves' natural prey (in this case, elk) multiplied, all the while consuming increasing amounts of foliage. The phenomenon occurred again in reverse when the wolves were reintroduced and the natural balance was restored.

When wolves were brought back to the park, they not only killed elk but also changed their prey's behavior patterns. The herbivores started to avoid areas like valleys and gorges where they could be easily hunted by predators. As a result, those areas began to regenerate, and species such as birds, beavers, mice and bears returned. Plant life once again thrived along the riverbanks and erosion decreased significantly. The stabilization of the riverbanks actually made the rivers and streams change course. With the reintroduction of just a small population of wolves, the landscape of the whole park transformed."

Topic Question 3:

Again: I am glad the IRNP is almost all wilderness-designated and would not change that. Humans can never "manage" Mother Nature - - we work for the MIS-Management Department. Leave the IRNP be - - with enough wolves to do the job. They are the perfect wildlife managers - - as Nature intended.

Topic Question 4:

There are no resources for a "management" job of that magnitude and to pretend mere humans could (and would) handle it well is laughable.

We would all do better to push, prod, demand and act to force our government "leaders" to view climate change for what it is: a threat to every living thing on the planet, one that humans can only "manage" by managing OURSELVES and our emissions very strictly. If we can take ourselves and our emissions in hand, we will aid Nature in keeping everything else in balance. If we let things go to [expletive] to keep chasing after the almighty dollar (status quo), then nature will eliminate humans as surely and efficiently as evolution has always done.

Topic Question 5:

E.g. Alternative B leaves no options open to reintroduce or add more wolves if the first resettlement isn't enough. Why not leave an option open to continue the program?

Topic Question 6:

Thanks for your time & consideration.

Comments: To Superintendent Green,

Like you, I care greatly about the wildlife at our national parks, including the wolves and moose at Isle Royale.

As you well know there are only three wolves left at Isle Royale - the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

Because you care about wildlife, you know that the presence of wolves benefits every single ecosystem they inhabit, both fauna and flora. So letting the wolf population drop to just three individuals is a catastrophe that must be rectified.

So I definitely support Alternative B in your management proposal: to bring new wolves to the island.

However, since wolves are so vital to a thriving ecosystem, I strongly encourage the Park Service to keep the option open of adding more wolves later should they be needed, instead of presuming once will be enough. We all know that the moose population on the island will continue to increase without enough wolves present to keep their population (and thus their food sources) in balance. Bringing new wolves to the island *whenever needed* will obviously help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive and labor intensive than culling moose, removing moose from the island, or having to replant native vegetation after the

moose have consumed it.

As stewards of this park, I call on the National Park Service to take the least intrusive, most productive action that will result in the biggest benefit to the island's wildlife and ecosystem. Before the wolf population dies out altogether, I sincerely hope the Park Service will take immediate action to bring new wolves to the park - and will continue to do so whenever needed.

Thank you for your time and for considering my comments.

Correspondence: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,

Correspondence: Topic Question 1:

Having followed this story for quite some time, I can think of no other viable alternatives. Genetic rescue seems the best way to save the island as a whole.

Topic Question 2:

Frankly, humans caused this problem, so the suggestion that we should let "nature" follow its own course is absurd. This is akin to trying to rescue polar bears. Unless humans are willing to cut back on carbon emissions and try to ameliorate global warming, the polar bears don't stand a chance. As it is, they are probably doomed.

Here, the wolves are stuck. Their population was earlier decimated by a person who brought a dog on the island; now, they're dying out because the winters aren't cold enough to reliably support ice bridges and even when one gets across, it's just as likely to be killed (as happened two years ago). At this point, if we're really to be stewards, we need to face the fact that we caused this and the moral imperative must be to vigorously address it.

Global warming isn't going away. We need to accept that.

Topic Question 3:

I'm not sure what this question really addresses. So it's wilderness. So what? That hasn't stopped the NPS from sanctioning bison hunts to protect Yellowstone (as one example). Here, perhaps thinning existing moose populations for the time being would protect native flora while, hopefully, the wolf population rebounds via genetic rescue. The problem, of course, is that Isle Royale is so pristine precisely because it's so isolated. Bringing in hunters would surely damage flora, but probably no more so that a moose population run rampant.

Topic Question 4:

I think I've already answered that.

Topic Question 5:

Part of me thinks that genetic rescue might only forestall the inevitable. But the wolves did rebound after a male made it onto the island years back. I think that the wolves need a fighting chance, and rather than gun down wolves in various states, why not take wolves from packs in Wisconsin and Minnesota and turn them loose on the island?

Topic Question 6:

I have visited Isle Royale. More to the point, I've written about it. The island figures prominently in MONSTERS, the last volume of my young adult ASHES trilogy. One of my characters likens the island to heaven on earth, and having sat atop Geenstone Ridge and looked out across the island and Superior . . . that character was right. I've heard from readers, many of them kids, who wanted to know if the island's a real place. Getting a teenager interested in the natural world is gold.

What I love about this island is its isolation, and I wouldn't want that spoiled. I like that it's hard for people to get to; I like that a lot of people don't visit it. I relished the fact that I could go for days without seeing anyone.

This is truly a magical place. The ongoing wolf and moose study is a one-of-a-kind, too. This island will be devastated and irrevocably altered if we don't act to try to reverse the damage we've already done.

Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

People go to Isle Royale for the moose and the wolves. It would be a shame to lose either one and clearly the continued health of the island requires both majestic animals.

Thank you for considering my concerns.

Sincerely,

Comments: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

Correspondence: Topic Question 1:

I like your idea of introducing more wolves. It would be great if you could introduce some that would integrate with the existing three, but I know that may not work. Good luck with your efforts.

Topic Question 2:

What is best for the environment. And interesting information and experiences for people that encourage appreciation for nature.

Topic Question 3:

Moderate intensity - focus it on the areas humans use to ensure they have a good experience, but keep it natural and native. The most important thing is to make sure people appreciate it so that it remains a national park.

Topic Question 4:

Climate is changing, so there is no point in trying to keep things as they were. Just do your best to help the island adapt in a healthy way.

Topic Question 5:

I like that it is a "natural" solution to the moose situation. I don't like that it may displace the existing three wolves (if the new ones don't integrate and are more competitive), but that is an emotional feeling.

Topic Question 6:

Please do more marketing communications for national parks so more people appreciate them. Through videos/photos/social media, people can appreciate and support them without even having to visit them.

Correspondence: Topic Question 3:

Restoration to the sustainable balance of wolves and moose is the desired goal, with reintroduction of additional wolves to achieve that balance being the least intrusive method of management.

Topic Question 4:

With the advent of climate change, the likelihood of winter ice bridges across Superior become less viable, so natural reintroduction of wolves onto the island is highly unlikely. Active relocation by NPS will be the most effective method, and insure genetic viability of the remaining native wolves.

Topic Question 6:

I spent eight days in 1976 on Isle Royale backpacking from one end of the island to the other. We encountered one moose, beavers, and many other animals on our trek from the ridge trail down to the interconnected lake passage trail. We must do everything possible to preserve this beautiful example of the fantastic balance played out on this isle.

Comments: Dear Superintendent Green,

Correspondence: Topic Question 1:

I cannot think of any alternate management options.

Topic Question 2:

I usually prescribe to the management strategy that allows for nature to take its course, but in this case, as in many in modern society, humans have had too much of an impact to simply step aside and let things take their course. Situations should be handled case by case. In this case, we should help to preserve a healthy population of wolves and moose, as well as a healthy ecosystem overall, on Isle Royale. Especially since both wolves and moose are relatively rare.

Topic Question 3:

Whatever is needed to succeed.

Topic Question 4:

Whatever is needed to succeed.

Topic Question 5:

A: Not an option ... apathetic. B: The least that should be done. See what happens and allow for change if this does not work. C: The option I believe would be the best for the island, its ecosystem, and the public. D: Moose reduction would be a last resort in my opinion. E & F: Definitely not an option in my opinion. This would not result in a place I'd like to visit and be proud of.

Topic Question 6:

Please manage the island in a way that keeps the wolves and moose there.

Comments: Dear Superintendent Green,

Correspondence: Topic Question 2:

The historic balance between moose, wolve and vegetation must be maintained on Isle Royale - - to ensure a sustainable healthy ecosystem. IN FACT ... the balance between moose, wolves and vegetation is the very HEART of the Park's identity.

Topic Question 6:

See "Comments" section.

Comments: It is very important to maintain a balanced system on Isle Royale. The park's primary identity is completely founded on the balance between vegetation, moose and wolves. It is vital that the wolf population be brought back to a healthy level. I am STRONGLY recommending that the population of wolves on the island be augmented by the introduction of wolves from outside the park. This will help establish a healthier (and hopefully) sustainable population on the island. It is also important that this is not a 'one time' event. It will likely require the repeated introduction of numbers over a 5 to 10 year period.

The option of introducing new wolves to the island is MUCH BETTER than the idea of culling moose or replanting vegetation. The idea of culling moose is actually abhorrent - - given the tenuous situation of moose populations in the United States. And replanting vegetation is not as easy (or successful) as it sounds.

Correspondence: Topic Question 1:

Management Alternative B - to bring new wolves to the island, but I urge the Park Service to do this as needed, rather than one time only. This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose

consume it.

Topic Question 2:

Management Alternative B is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

Topic Question 3:

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem.

Topic Question 4:

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem.

Comments: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Correspondence: Topic Question 1:
obviously the DNR and hunters would be happy to slow the overpopulation of moose with an open season. That does not take the wolf issue into consideration at all of course. Their argument would be- and there is validity to it- that hunting is better than starvation.

Topic Question 2:
reduce the population perhaps with one hunting season and then reintroduce enough wolves to form several packs. The overpopulation of Moses is going to decimate the vegetation and then there will be no moose, wolves or vegetation. The only thing that will eventually come back is the vegetation. Since wolves cannot get there on their own, I argue for reintroducing them as soon as possible.

Topic Question 3:
the years of study of predator / prey relationship have been good but useless at this point with three wolves left . It is time for human interference even

though that is difficult to say. My fear is co spidering the slow time it takes to come to a decision, by the time you act there will be no vegetation, starving moose and no wolves. What kind of wilderness will you have then?

Topic Question 4:

moose will over the years decline I am afraid as the climate warms. Wolves have little change of accessing the island in the winter. Wolves will survive and with enough moose to keep them alive. It not an excess, the vegetation will survive. What vegetation will come back as the climate warms is another issue and one I have no idea about as I am more familiar with big woods ecology - which is probably what will grow and will that be enough browse for moose?

Topic Question 5:

Seems to me there is add wolves or don't. The way the government dithers, this issue will be decided before any action is taken. At that point I am sure the states will pressure for open hunting! I am not against hunting but prefer to leave that to wolves if possible.

Correspondence: Topic Question 1:

Only 3 of the 6 alternative concepts mention wolf reintroduction or augmentation and none with any specificity. Concept B and Concept D only allow for wolves to be reestablished once which may not be sufficient and is very short sighted. Concept C allows for maintaining populations of wolves and moose

which "could" include wolf reintroduction or augmentation.

Concept C appears to be the best alternative, however, it does not go far enough. There must be sufficient flexibility to allow for wolf reintroductions as necessary over the next 20 years to insure genetic diversity for wolves and sustainable populations of both wolves and moose into the foreseeable future.

Maintenance or culling of moose is not necessary if wolves are allowed to fulfill their ecological role. Absent wolf immigration, which no one can predict, there is no likelihood of having a wolf population without human action.

Topic Question 2:

We believe the NPS should consider and evaluate the ecological benefits wolves provide; The only pup observed in 2015 was visibly deformed; 100% owolves examined since 1994 (over 30 of them) have spinal anomalies. The weakened state of the remaining wolves is likely interfering with reproduction and survival.

The NPS must consider the data collected through 57 years of research conducted on Isle Royale. These researchers should play a key role in the discussions.

Topic Question 3:

NPS must protect the unique wilderness qualities of Isle Royale through monitoring of habitat for wildlife, including wolves and moose; maintenance of soil and water quality and ecological stability of plant and animal communities including the control of invasive species. Management is necessary to maintain important wilderness values including the presence of a top carnivore which is vital for ecosystem health. The culling of moose and the use of motorized equipment is unacceptable.

Topic Question 4:

Climate change poses a fundamental threat to species and places. The only way to slow the impacts of climate change is to globally reduce carbon emissions. NPS could produce an informational flyer explaining the negative impacts climate change is having on Isle Royale such as the changes in the duration and frequency of the ice bridge, winter ticks, bird species etc. NPS could engage with businesses and private entities that use the island to reduce carbon pollution. Encourage visitors to reduce their carbon footprint by not bringing / disposing of water bottles.

Moose are not likely in any direct danger of being reduced by climate change, however, wolf predation is needed to limit the growth in their population.

Because of climate change, it is unlikely that wolves will be able to repopulate Isle Royale without NPS intervention and we ask for immediate action to augment / reintroduce wolves.

Topic Question 5:

Along with the ecological benefits wolves provide, they also have intrinsic value. You may not see a wolf or hear them howl but it is important to know there are still wild places where wolves exist.

For years, researchers have been sounding the alarm about the plight of wolves on Isle Royale. Yet, the NPS has chosen to take no action until now. The public scoping period ends 8/29, however, the Record of Decision is not expected until Fall 2017 at the earliest. Two and one-half years is simply too longâ • —This foot dragging on the part of NPS is unacceptable.

Topic Question 6:

The human species has tried repeatedly to "manage" the wild with little success. It's time to allow nature to do what she does without human interference. Where there is a will, there is a way. Humans are NOT the top of the food chain. It's time to humble our species appropriately. Wolves Belong.

Correspondence: Topic Question 1:

For moose population control, NPS can also consider having a moose hunting season on the island once few years.

Topic Question 2:

Overall, Isle Royale is a national park, that is preserved for the future generation, so that they can enjoy as much as we have today. In this case, the vegetation should be on the higher priority. Moose should never allow to make sever damage on the forrest that the forrest can no longer recover on its own. Moose population should be strongly controlled.

Topic Question 4:

Don't know if there's much to do here... Climate change is unpredictable. The plan should vary upon every year's situation.

Topic Question 5:

Concept C is much more suitable than rest of the plans. Both moose and wolves population should be monitored and controlled. Definitely not Plan A. Sit back and do nothing is absolutely the worst that you can do when come down to the small and fragile eco system like Isle Royale. Yellow Stone let the wild fire burn out 70% o the forrest, which will take hundred years to recover. Do not repeat that mistake again.

Topic Question 6:

To be honest, I don't really think there is a direct population correlation between moose and wolves population. But, moose and wolves are both key elements on the island. They become the image of the park, a hot topic, even a legend. Without wolves, the park will never be the same again. I'm not a professional on this study, but please bring back wolves and keep them on the island just for the sake of the culture and history. That being said, wolves should not be used as the preliminary way of moose population control. Human effort should be introduced as well. Vegetation change has already been seen on the island due to over populated moose. Action need be made as soon as possible. Please please don't wait too long on this before it's gone beyond control. Please protect the only national park in Michigan.

Correspondence: Topic Question 1:

I think we need to look to the research that has already commenced in Canada. We should also look to other Parks like Yellowstone. We need to not make this too much of a burecratic process and work together for the benefit of the island's ecosystem.

Topic Question 2:

I think we need to consider what happened in Yellowstone, the ecosystem was totally failing until the reintroduction of the wolf. I understand that some believe we should not interfere with the natural process, but we have already interfered with our presence on Isle Royale. How can we know what impact we have already had? The research needs to be done.

Topic Question 3:

I have no way of answering this question properly. This question needs to be answered by through the cooperation between the researchers and NPS. Again, we should look to the research of others that have implimented similar programs.

Topic Question 4:

I am not sure that climate is applicable to this program. I know that ultimately climate affects everything, but in this situation I am not sure it has impacted the decline of the wolf presense.

Topic Question 5:

I believe this question is a deterrent for people to finish this survey.

Topic Question 6:

I hope that bureacracy does not get in the way of saving the ecosystem of Isle Royale. It would be a shame for the ego of a few to be the demise of such a magical place. Please let us work together to preserve Isle Royale and its balance in nature.

Web Form

Please support Alternative B, the plan to reintroduce wolves in Isle Royale to preserve the fragile ecosystem.

Comments: Dear Superintendent Green,

I'm concerned about the changing nature of wildlife at Isle Royale. Though Isle Royale is designated wilderness, there is a need for more wildlife

management than has previously been undertaken. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Correspondence: Topic Question 1:

It is my understanding that Canada has in order a seriously considered and researched wolf program. I think the Isle Royale park system should seriously consider working together with Canada in order to rebuild and restore the deperately needed wolf population back to a sustainable and thriving community.

Topic Question 2:

It is apparent that a ballance of wolves and moose is needed in order to rebuild a natural and comunal existernce that thrives once again on Isle Royale. I belive that human intervention is required in order for this to happen. Perhaps working with the Yellstone Park service and there succesful intervention program could prove to be successfull for Iasle Rolale as well.

Topic Question 3:

That would be guess work. Again worjking with the Yellowstone roject is research available to you

Topic Question 4:

Focus on the immediate challange at task, the wolf decline.

Topic Question 5:

Could that question be more vague? How could I possibly answer this?

Topic Question 6:

There is no question that immediate work is needed. It feels to me that there are some burecratic road blocks, especiallay in superintendant levels of the NPS. This needs be a community effort, driven by a passion to consereve and rebuild the amazing wolf population that once was. We need to come together as community to preserve community.

Correspondence: Topic Question 1:
Alternative B

Comments: Dear Superintendent Green,

Every animal has a purpose in nature. Some animals are more cute and cuddly and therefore more easily loved.

But cute or not, every animal has a purpose.

What has been done to wolves in this country is a travesty.

The cruelty, the downright animosity is unbelievable.

We cannot let a few vocal anti-wolf lobbyists do any further damage to the wolf population.

Someone must step in and do the right thing. It is therefore up to you to stand strong and protect the wolf before it is too late!!!!

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,

Correspondence Type: Web Form

Correspondence: Topic Question 2:
The NPS should be constantly reminded that this is a designated 'wilderness'
area and that 'less is better than more'

Topic Question 3:
Man, in this case the NPS, should not attempt to control nature in a designated
wilderness area except through the elimination of non-natural events. Had the NPS
prohibited taking dogs to the park, perhaps the canine parvovirus would not have
been introduced "inadvertently" in the 1980's.

Topic Question 4:
What argument persists that management of any wilderness area should be intensified? Would it still be a "wilderness" area if nature was 'managed'
by the NPS? While we appear to be experiencing hotter summers, we also are
seeing colder winters...perhaps the colder winters will work to reduce the
tick population which appears to intensify after mild winters.

Topic Question 5:
As a Florida native, I have seen the positive results that can come about
through the introduction of 'new' DNA through the introduction of animals
from a different geographical locale (i.e. the Texas panther introduced to
the Florida panther population). I like the idea of introducing new wolf
DNA into the Isle Royale wolf population.

Thoughts of culling the moose population would only open for discussion a
hunting season in a wilderness area (there are probably a number of government representatives who would 'love' to hunt moose on the island!

Comments: Dear Superintendent Green,

As an Advocate for Wilderness(The Wilderness Society), a Guardian of the
Wild (the National Wildlife Federation), a member of the John Muir Society
(The Sierra Club) and a Trustee of (the National Parks Conservation Assoc-
iation)I am a constant financial contributor and supporter of our National
Parks and wilderness areas.

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the
lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without
wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will
help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

One can equate this to the successful introduction of wolves into Yellowstone
to control the elk population, which subsequently resulted in the comeback
of the poplars along the streams which the elk were decimating.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once
the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and
ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Correspondence: Topic Question 1:
What harm are a few wolves doing on an ISLAND????

The fact is wolves are endangered of becoming extinct. The out-of-control rancher and farmers in the western states are killing them faster than the wolves

can reproduce. Why? Because these ranchers/farmer want to use PUBLIC LAND where wolves live to graze their private herds.

Alternative? LEAVE NATURE ALONE! THE ECOSYSTEM NEEDS WOLVES.

Topic Question 2:

DITTO. LEAVE NATURE ALONE. Nature did a fine job for thousands of years before half-witted humans started taking matters into their hands.

Topic Question 3:

NO MANAGEMENT. STAY AWAY. LEAVE NATURE ALONE.

Topic Question 4:

NONE.

Topic Question 5:

NOTHING.

Topic Question 6:

Yellowstone made a huge mistake over a decade ago by killing all the wolves. The Park then had major problems. The deer multiplied to the point that vegetation was becoming non-existent. This presented other problems and the Park realized they needed the wolves. So they had to spend hundreds of thousands of dollars for a re-introduction of wolves; to replenish the bare hills and valleys with plant life, and to control the rodent problem. This is what you will face if you don't butt out and LEAVE NATURE ALONE.

Correspondence: Topic Question 1:

Alternative Concept B is the best scientifically reasonable course of action. A Genetically diverse population of wolves will help ensure that these wolves thrive and survive. It is essential to keep the natural balance that is necessary to maintain a well managed and healthy ecosystem. Follow the best science. Do not bow to political pressure.

Topic Question 2:

The cumulative impacts of allowing these wolves to disappear from this region would continue down a road that has scientifically been shown to be detrimental to a balanced environment for all flora and fauna in the region. If the wolves are allowed to thrive the ecosystem will be a healthier place.

Topic Question 3:

A genetically diverse wolf population will require very little management. Wilderness areas should be left along, except to increase diversity of the wildlife there to ensure all wildlife are healthy and secure in that area.

Topic Question 4:

A balanced approach must be used to lessen the effects of climate change. A hands off approach should always be the first approach-once a diverse and genetically viable population of wildlife is established. Intervention by humans is primarily what has caused the imbalance in this region. If the wolf population is healthy, the rest of it will take care of itself.

Topic Question 5:

Culling moose or replanting vegetation will only increase the traffic and will not reflect the true natural order of the predatory prey dynamic. That dynamic is important to maintain a healthy population of moose, and recovery of the flora caused by human intervention-specifically the killing of wolves.

Topic Question 6:

Look at the scientific reality of the reintroduction of wolves to Yellowstone National Park. That experiment has shown that ecosystems recover when wolves are healthy and genetically diverse. The Yellowstone is the healthiest it has been in generations. The wolves have helped in a way that cannot be accomplished in any other way.

Comments: Wilderness areas must remain Wilderness. The less traffic the better. Replanting vegetation and culling moose are a very poor alternative to a healthy and genetically diverse wolf population. The scientific studies must be carefully studied and followed to ensure a wilderness experience for all visitors. Political pressure must be ignored when it contradicts the science.

Correspondence: Topic Question 3:

I think that just bringing back the wolf population will be adequate. This should not have to be done on a regular basis, because the moose and wolf populations have fluctuated, but always returned to an equilibrium, until now. At this point, more wolves are needed. If the population drops too low in the future, reintroduction should be done again.

Topic Question 5:

The alternative of doing nothing ignores that the parks are for the people. While not creating an amusement park, since the beginning wolves and moose have been a main attraction. Doing nothing will make the park much less appealing to visit.

Comments: Dear Superintendent Green,

Correspondence: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

Topic Question 2:

I think we should introduce more wolves, but generally try to stay out of the situation after that. I think a bigger, genetically diverse wolf pack can manage the moose population on its own, once established. Humans tend to mess things up so I think once the wolf population is big enough relative to the number of moose, we should let nature take its course on the island, and let both populations stabilize on their own.

Topic Question 3:

NPS should introduce new wolves, but after that, I think we should leave the land alone as much as possible.

Topic Question 6:

I just hope that the solutions the NPS takes will be that of the least destructive, without killing wolves or moose by our own hands, and letting the wilderness be wilderness as much as possible. I do support introducing wolves, but other than that, I believe we should keep human involvement to a minimum.

Correspondence: Topic Question 1:

I admire very much the thoughtful way you have approached this challenge and the fact you ask for our input, too.

Alternative Concept B that you have developed that emphasizes balance seems a most wise and wonderful choice.

Thank you for your great work and for asking.

Topic Question 2:

Balance in nature

Topic Question 3:

that which continues to sustain balance and wilderness.

This does not sound like the perfect vacation spot for family and friends.

Topic Question 4:

whatever will best continue to offer the wisest options for balance, taking into consideration the changes and shifting as necessary to include this in the balancing act.

Topic Question 5:

I am delighted that you are introducing new wolves into the shrinking population on the island, enough to maintain that fine balance between moose, plant food, and wolves.

Topic Question 6:

Thank you for asking. I do not have your knowledge, so like many or most of us answering this, i would first want to know how you are looking at options. If you were all about killing off the wolves, for example, and under especially these conditions, i would vehemently disagree, because i do not see that as supporting and sustaining the fine balance nature will tend to manifest. In these strange times, it often means human intercession is necessary. What a transformed world it would be if more professionals in your roles throughout the country and world approached their various challenges with your wisdom and concern for how best to support nature.
thank you again.

Correspondence: Topic Question 1:
Dart the moose with pzp to keep their numbers in check, absolutely no cull.

Topic Question 2:
Recently the Humane Society of the United States mentioned reintroduction of only problem wolves (wolves which were to be "euthanized" for depredation or human conflict. I am in agreement with this. The ecosystem desperately is in need of large carnivores. I do not agree with sourcing wolves in any alternative manner. Please see my comment below regarding this issue.

Topic Question 3:
This is a difficult question, as the natural order and original well functioning, delicate balance was completely disrupted at the hands of man long ago. I would suppose an attempt to return this area into a well functioning ecosystem again would be nearly impossible.

Topic Question 4:
Again, another dilemma! With lack of an ice bridge for wildlife to use to disperse, genetic diversity will be lost without continued human intervention. Isolated species always eventually die off. I would say you do have a serious dilemma.

Topic Question 5:
No Comment

Topic Question 6:
Should wolves be reintroduced to Isle Royale?
Really this is a difficult question. For the sake of the ecosystem, then yes, the wolves should be reintroduced. But what about the wolves. One aspect in all this discussion needs to be the welfare of the wolves themselves. Wolves for re-introduction in Isle Royale would have to be sourced from multiple populations to give an initial genetic diversity. More wolves would possibly have to be added later to maintain this genetic diversity and prevent inbreeding.
Then, there is the physical collection of wolves which would pose difficulties and is likely to result in some deaths. Would they be collected by trapping,

snaring or be incapacitated by dart from a helicopter?

During the collection of animals for the Yellowstone re-introduction programme at least 10 wolves died early in the process through trapping and snaring and at least one died during incapacitation from the helicopter. Perhaps techniques have evolved and improved since then, but some losses would almost certainly occur.

Removal of the alpha animals from a pack would cause huge upheaval, and studies show that it would almost certainly lead to the break up of the pack. Packs that may have been in existence for generations could literally be wiped out by the removal of perhaps just one animal.

Wolves may also attempt to make their way back to their own territories. Relocation of wolves in Alaska's Denali National Park has led to them returning hundreds of miles to their previous locations. Obviously wolves reintroduced to Isle Royale would be unable to do that, but the instinct to return home could, to say the least, be troubling for them.

For the wolves sake, perhaps reintroduction is not a good idea

Correspondence: Topic Question 1:

I support Alternative Concepts B and C. That is, I believe that the wolf population should be sustained and the gene pool should be replenished periodically (when necessary) to keep the population fit and productive.

Topic Question 2:

The genetic viability of the wolf population should be monitored occasionally to determine whether intervention is necessary.

Topic Question 3:

Management should be low intensity, and should primarily involve maintaining the wolf population. Other types of management, such as fencing to protect plant areas from moose herbivory, should be considered as well.

Topic Question 4:

Introducing wolves is one natural consideration in the face of climate change. Because of reduced frequency of ice bridges to the island due to climate change, less wolves have been able to migrate to the island and rejuvenate the gene pool.

Topic Question 5:

Use of mechanized equipment such as helicopters is an absurd alternative management option. It is inefficient, costly, highly interventionist (more so than simply introducing wolves), and unsustainable.

I support the introduction of wolves because it is a simple alternative that is relatively low cost and is very beneficial to the ecosystem and to research about predator-prey systems.

Correspondence Type: Web Form
Correspondence: Topic Question 1:
N/A. See other comments below, please.

Topic Question 2:

The decline in the wolf population is primarily a man-made problem. Over the decades, humans have created situations that have resulted in the loss of wolves. For example, we introduced the parvo epidemic, dug the mine shafts into which wolves fell and could not escape, caused the global warming that has reduced the development of ice bridges to surrounding land forms that harbor potential migrant wolves and, in turn, caused the genetic isolation that resulted in inbreeding which produced genetic deformities and the lack of mating and reproduction among the few remaining wolves. To harbor a notion that we should not interfere with the "natural" course of events is purely fictional given the unintended impact we have already had on the wolf population and related species on Isle Royale. The question now is what we will intentionally do (which includes doing nothing) in the future to preserve the wilderness flora and fauna of Isle Royale.

Topic Question 3:

A place without a predator simply is not a wilderness. I cannot think of a wilderness, whether forested, desert, grassland, or aquatic, that totally lacks a major predator species. It is hard to imagine a predator that is more suitable for Isle Royale than the timber wolf. They avoid human interaction and eschew raiding human food stores. The coyotes and bobcats that once were present on the island were not able to control the moose population. Omnivorous bears would create a host of problems that wolves do not present.

Recall that the time when the presence of wolves on Isle Royale can be documented is essentially co-extensive with the time that Isle Royale has been operated as a national park. Attempting to manage Isle Royale as a national park without wolves would be to conduct an experiment in itself, but not an experiment consistent with a balanced wilderness ecosystem. Moreover, we could discover that the moose become to Isle Royale what the feral rabbits are to Australia.

Topic Question 4:

The least intense but effective management plan is preferable, but the trick is in identifying that effective management plan. It is possible that alternative concept B is the concept that might be sufficient to achieve the goal of restoring the balance between the wolves, moose and vegetation. A reinvigorated wolf pack (or packs) potentially would be able to hold the moose population sufficiently in check to allow the moose browse to survive at levels sufficient to support the moose and other species dependent on those vegetation types. If alternative concept B fails to produce the needed results within five years or so, then it would be necessary to transition to alternative concepts C or D.

Topic Question 5:

See above. Moose relocation/translocation and moose culling are extremely inconsistent with a wilderness national park. The mechanics of accomplishing moose population reduction by such means would be an incredibly complex logistical nightmare and would have to be repeated at intervals. Wolf reintroduction or augmentation would be a comparatively simple process and foreseeably produce longer lasting results.

Comments: In making decisions for the future of Isle Royale we need to recognize that we do not know all that there is to know. For example, until recently we did not know that one or more wolves had migrated to Isle Royale without us humans noticing the event (Old Grey and who else?). That fact alone should make us strive to be more humble in formulating our plans for Isle Royale then we humans tend to be ordinarily.

Yet, events that have brought us to the current situation make intervention on Isle Royale a necessity to preserve its future. It is not practical, much less desirable, to go back to the pre-national park era of woodland caribou and coyotes. It is not appropriate to let the current situation - - to which we have contributed greatly - - to continue to degrade the island flora and fauna populations to the point where much of the vegetation is decimated and the carcasses of starved moose abound. As stewards of the park, we must act cautiously but effectively to rectify the predator-prey imbalance that we did so

much to create. Failing to act is just as much a breach of our duty of stewardship as over-reacting. If our initial efforts at intervention are less than successful, we must be willing and able to revise our approach. We owe nothing less than our best efforts to both future generations and the island wilderness itself.

Correspondence: Topic Question 3:

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

Comments: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

Correspondence: Dear Superintendent Green,

I am a Michigan artist/author and illustrator. I have been an artist-in-resident for Sleeping Bear Dunes National Lakeshore and the Porcupine Mountains Wilderness State Park both of which are now designated wilderness areas. I teach children about the parks with my art and books. Children I have encountered at schools are concerned over the wolf vanishing from Isle Royale. Furthermore, they understand what the unchecked moose population will do to the island if wolves are not there to fulfill an active role in the food chain. Concern for fox, bat, toad, squirrel, and beaver has been voiced. Even if that child will never visit Isle Royale to hear a wolf howl or see its scat and tracks or the grunt of a cow moose, they feel it is important. These kids are our future in wildlife management, the voters, the park visitors. They care. I care.

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it. Which to me, sounds like even more human intervention and more costs.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I wholeheartedly support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether. I sincerely hope that when I next visit the island that there will be the hope of wolves returning. They are crucial to the draw of the park. I want to hear a

howl. Those visiting the island want to hear the howl. I waited 27 years to visit the park and did so in 2014. I will apply again for the artist-in-residence program once it is reinstated and if selected I plan to share the story of the island for all ages.

Thank you for considering my concerns.

Sincerely,

Correspondence Type: Web Form

Correspondence: Topic Question 1:

Rather than reintroducing the wolves one at a time, they could be brought in en masse to mimic a mass migration event.

Topic Question 2:

The primary concern should be the well-being of the animals involved, and the management of their populations should reflect that. Maintaining the original nature of the environment is also important, however, and the management should therefore be carried out in a manner as non-invasive as possible.

Topic Question 3:

Alternative Concept B appears to be the ideal solution, as it reintroduces wolves to curb the moose population while not having a drastic effect on the environment. As wolves have, in the past, migrated to the island on their own, it is not unrealistic for more wolves to be introduced to the ecosystem.

Topic Question 4:

As the climate changes, more significant actions may need to be taken. As more time passes, it becomes more evident which ideas will work and which ideas will not work, which can pave the way for more effective solutions.

Topic Question 5:

Concepts such as A and B appear to be minimally impactful on the environment, leaving most of the results up to nature. The remaining solutions seem to be more hands-on, leaving a natural beauty at the mercy of what humans believe is best.

Topic Question 6:

While the primary consideration for nature management should be conservation, the fact remains that humans often have the opportunity to improve the situations in the world around us. In these cases, human intervention is moral. However, when this is carried out in an overly invasive manner, it threatens the integrity of the natural world.

Correspondence: Topic Question 1:

Alternative Concept B - - import wolves

Topic Question 2:

Keeping a balance between the wolves and moose - - - for just one species to flourish will endanger other species in the Park.

Topic Question 3:

Concept B

Topic Question 4:

Keep human influence at its current level or less and maintain the type of research that has been done on the Isle for 30 years.

Comments: I care about the wildlife at our national parks, but especially the wolves and moose at Isle Royale. Having known this park since the mid-70's, its ecological balance has changed. With only three wolves left at the park - the lowest number of wolves in more than 50 years - the overall ecosystem health of this iconic national park is threatened.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards as identified in your mission, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Correspondence: Topic Question 1:

Allowing local Native peoples (Ojibwe, Odawa, etc.) to participate in a moose hunt should be considered. I say local Native peoples, because they would honor the land, the animals, and the use of the gifts of the moose. And such a hunt could help heal their cultures.

Topic Question 2:

What is sustainable? What can be done to really assist the ecosystem in being whole, healthy, and adaptable in ways that do not alter natural processes but enhance and support them? What are the unintended consequences? Will any of the proposed actions create further damage to the island?

Topic Question 3:

It should always be wilderness, therefore only actions that enhance the wilderness should be considered.

Topic Question 4:

I don't know. By the way, this is out of your realm surely, but the island would benefit from human activity that blesses the land.

Comments: Dear Superintendent Green,

As a native Michigander and former resident of the Keweenaw Peninsula, I deeply care about Isle Royale, its fragile ecosystem, and the forces that balance the wolf:moose relationship on the island. I've hiked and camped on the Feldmann Ridge Trail and come face to face with several moose. Moose abound on Isle Royale, and the presence of wolves, as you very well know, are key to keeping the moose population and the whole island's ecosystem healthy and thriving. It definitely is a source of pride, for me, to tell people that yes, there really are wolves on Isle Royale. And, as an aside, that yes, there really are wild elk in northern lower Michigan.

I care about the wildlife at all of our national parks, including the wolves and moose at Isle Royale. The fact that there are only three wolves left at the park - the lowest number of wolves in more than 50 years - definitely threatens the overall ecosystem health of Isle Royale.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it. And really, this is the only sustainable option, in my opinion. Our ancestors call for this action, as their voices tell us, sometimes quietly to our hearts, to heal our lands and all the life they support.

As stewards of this park, the National Park Service should take the least intrusive action (and ultimately the most powerful and effective action) that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,

Correspondence: Topic Question 1:

Reintroduce wolves to Isle Royale immediately, per the plan to be developed and scheduled per the expert biologists Rolf Peterson, John Vuchatic, others. We have been studying the wolves of Isle Royale for over fifty years, and we have enough data, trends and knowledge to predict their demise without an additional 2-3 year study.

Topic Question 2:

The moose/wolf study has 50 years of data. NPS policy allows for management. Impacts of doing nothing will have a detrimental impact on both wolves and moose, vegetation, visitors, funding and overall ecology of the Island.

Topic Question 3:

The biological and ecological balance of the Island is in critical condition. It needs to be managed. Within a dynamic, living situation, doing nothing IS a management option.

Let's remember that IR was NOT a true wilderness in the first place; it was designated by man to become one. It is managed. As with wolf and moose management, the NPS policies and practices of managing the historical and cultural aspects of IR have also been short sighted. Important elements of these aspects have been lost, and have become "extinct" as well.

Topic Question 4:

I have been on IR seven times over the past 30 years and have seen NO impact of climate change on the Island. The only exception is the less frequent occurrence of ice bridges. This is more about the cyclical nature of winter weather patterns, and is not climate change.

Topic Question 5:

The alternative below is the only one I would approve of - but it only allows ONE wolf, ONE time. This is not a one time problem, but does allow a study of what impact one animal would have. Which sex and timing of release would be critical to the experiment's success.

Alternative Concept B (introduce wolves once): Reestablish wolves on the island by bringing in new wolves one time to mimic a migration event; no moose management.

@@

In addition, I think the other options of managing the moose/reducing population are totally unrealistic, and likely added as options only to fuel the agenda of the NPS goal of no management, period.

Topic Question 6:

I believe the NPS is being irresponsible to state that they need another 2-3 years of study. This issue HAS been studied, IS actively being studied by scientists who have dedicated their lives to this issue. THEIR minds have been changed from a "do nothing" stance to one that involves wolf reintroduction. I have heard these presentations for years, every year. We have learned from the study, provided data, seen trends. To ignore this well supported research is a slap in the face to all natural resource scientists and advocates.

Comments:

I have a BS in Forestry, with an option in Forest Management and Wildlife Biology from Michigan Tech. I have worked as a natural resource professional for over thirty years. The whole basis of my career, and the premise of a natural resource education and research is to manage the balance of all interests - the web of life. Concepts such as sustainability, multiple use, wilderness, ecological health, public use, intrinsic values - ALL play a role in living on the Earth. And on Isle Royale. To put one value over another is not in the best interest of sustainability.

The arrogance of the NPS and Federal government stance - and the political need to do nothing - should not be the final determinate factor in this critical situation.

Dear National Park Service,

Thank you for considering my opinion. I would urge you to accept Alternative B.

Topic Question 2:

It has been noted that when the top predators are returned or strengthened in an area, the entire ecosystem has the opportunity to return to a peak condition, as in the return of the wolves to Yellowstone.

Topic Question 4:

Given climate change it is extremely important for humans to provide for the animals.

Topic Question 5:

The idea of culling moose would not be needed if wolves are added to the area.

Topic Question 6:

My son and I have visited dozens of national parks and forests and monuments. Everywhere we go we see American citizens thrilled to see wildlife and to photograph animals. The American public wants animals and ecosystems preserved, not destroyed.

The Balance of Nature does so much better when human hunters are not in the picture. Humans take the biggest & best which leaves the sick & the weak to breed. Wolves take the opposite, which keeps healthy animals to breed.

Thank you for considering my concerns.

Correspondence: Topic Question 1:

Stop trying to MANAGE THE ANIMALS, God gave us everything in balance, but mankind has tried in his own bumbling way to manage but in every way possible, managed to interrupt, corrupt, and poison every right way. Leave the Islands and animals along and they will either reproduce the correct way or die out naturally. Look at what mankind has done to humans with chemicals, bombs, and micromanage entire civilizations. Is this what was the intent of our creator - to "micromanage" to extinction as the early creatures put on this earth?

Topic Question 2:

Get humans out of the equation and leave it for a thousand years. The moose will eat what they were intended to, the wolves will breed and feed on the sickly, weak ones and keep in check the proliferation of all creatures. Listen to the wisdom of the ages and stop meddling.

Topic Question 3:

See reasons given above. Get mankind out of the picture totally. Photograph from a distance, but leave it alone.

Topic Question 4:

Revamp what mankind has done wrong with the world he has polluted, destroyed, poisoned- -and get out of the way. If it is to be restored properly, mankind cannot do it, only Our Creator.

Topic Question 5:

None have considered STOP MEDDLING.

Correspondence: Topic Question 6:

Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without

wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,

Correspondence: Topic Question 2:
#1, STOP DELAYING A DECISION!!!

#2 and #3 go together; Hunt the moose population down, then add more Michigan-only wolves to the island.

#2 Start hunting the moose, and use the meat to feed the local public schools.

#3 Introduce Michigan-only wolves to the island to control the hooved population.

If you don't have predators (wolves) then much of the island ground will turn to marsh. This happens when hooved animal populations (moose, deer) are not kept in check by predators, eat all the vegetation, and noxious nitrogen excess from their urea changes the ecosystem and the ground becomes marsh.

#4 Give the remaining 3 wolves Parvo, Distemper & Corona Vaccines to protect them from dog diseases.

#5 Start planting balsam and other native plants in areas that are sectioned off, on rotation.

Correspondence: Topic Question 1:

I absolutely do not believe that wolves,of all wildlife should be managed! Mother nature put them in the wilderness just like all other animals! Wolves were put on earth for a purpose just like all wild creatures!Wolves have a natural built in ability to keep the wilderness areas and forests healthy. They are the key to a healthy and productive eco system! They are the engineers of the forest in a sense because they balance the habitats along with the other wildlife who also have individual functions!Yellowstone is an example of what takes place when you allow nature to do their job! Cattle need management and boundaries to see the amazing transformation that will take place if wildlife are NOT managed!

Topic Question 2:

These wildlife need no management and will balance themselves if their habitat IS NOT overrun with cattle! Cattle need BOUNDARIES! Our government land belongs to the people and the cattle need boundaries or their will be no feed for anyone! Cattleman must take the responsibility of keeping their cattle in their boundaries. The wildlife will handle the rest of the forest and you will see it evolve like it has not been since the settlers came and took away nature's way of keeping our land balanced and healthy! Do not restrict our wolves...do restrict the cattle within their own boundaries and you will see great improvement for everyone! Wildlife have rights and take a look at Yellowstone National Park if you want to see the engineering that wolves can accomplish! All animals and birds have returned, beaver build dams again, the whole river changed its course the elk do not over run the area, trees are healthier, and the whole forest of animals does well because all is balanced and healthy because the wolves returned!

Topic Question 3:

NONE.

Topic Question 4:

Speak to schooled conservationist with degrees and please don't allow anyone who has not studied anthropology, biology etc with college degrees who love all animals!

Topic Question 5:

I don't think people should be allowed to randomly shoot wild creatures. They will easily go extinct. We need to save wildlife and have professionals see that they are treated right but NOT managed above cattle!! Cattle should not be our responsibility and too much involvement with cattle will ruin the balance of nature!

Topic Question 6:

I do not believe wolves should be restricted! The government pays for incidents that might involve wolves and cattle BUT I know for a fact that the cattlemen often lie and collect money! Give the wolves credit, they are smart, after all they are the ancestors of our dogs. DO NOT ALLOW TRAPS, DO NOT ALLOW POISON!

Comments: I am fed up with cattlemen who complain, lie, shoot wolves and have no consideration for the health of our forests, wilderness areas and the wonderful wild creatures who keep that land alive and beautiful! I want wolves to be protected so that they can live like all other wild creatures. We don't manage our bears! Give Wolves and other wildlife a chance and allow them to do their work for the forest! Then look around and you will witness astounding beauty because these animals KNOW what to do to keep our forests healthy! Help them by leaving them alone except for checking to make sure that the cattle people are not encroaching on the wildlife! That is what YOU should manage..Manage the cattle and cattleman. It has been associated with cattle and cattle growing all my life and they are the ones you need to manage..especially in these times!

Correspondence: Topic Question 1:

Concept C appears to be the best alternative, however, it does not go far enough. There must be sufficient flexibility to allow for wolf reintroductions as necessary over the next 20 years to insure genetic diversity for wolves and sustainable populations of both wolves and moose into the foreseeable future.

Maintenance or culling of moose is not necessary if wolves are allowed to fulfill their ecological role. Absent wolf immigration, which no one can predict, there is no likelihood of having a wolf population without human action.

Topic Question 2:
NPS should consider and evaluate the ecological benefits wolves provide; The only pup observed in 2015 was visibly deformed; 100% of wolves examined since 1994 (over 30 of them) have spinal anomalies. The weakened state of the remaining wolves is likely interfering with reproduction and survival.

The NPS must consider the data collected through 57 years of research conducted on Isle Royale. These researchers should play a key role in the discussions.

Topic Question 3:
NPS must protect the unique wilderness qualities of Isle Royale through monitoring of habitat for wildlife, including wolves and moose; maintenance of soil and water quality and ecological stability of plant and animal communities including the control of invasive species. Management is necessary to maintain important wilderness values including the presence of a top carnivore which is vital for ecosystem health. The culling of moose and the use of motorized equipment is unacceptable.

Topic Question 4:
Climate change poses a fundamental threat to species and places. The only way to slow the impacts of climate change is to globally reduce carbon emissions. NPS could produce an informational flyer explaining the negative impacts climate change is having on Isle Royale such as the changes in the duration and frequency of the ice bridge, winter ticks, bird species etc. NPS could engage with businesses and private entities that use the island to reduce carbon pollution. Encourage visitors to reduce their carbon footprint by not bringing / disposing of water bottles.

Moose are not likely in any direct danger of being reduced by climate change, however, wolf predation is needed to limit the growth in their population.

Because of climate change, it is unlikely that wolves will be able to repopulate Isle Royale without NPS intervention and we ask for immediate action to augment / reintroduce wolves.

Topic Question 5:
For years, researchers have been sounding the alarm about the plight of wolves on Isle Royale. Yet, the NPS has chosen to take no action until now. The public scoping period ends 8/29, however, the Record of Decision is not expected until Fall 2017 at the earliest. Two and one-half years is simply too longâ •—
This foot dragging on the part of NPS is unacceptableâ •—

Evidence suggests that the few wolves on the island will not be able to keep moose populations in check which will further degrade the island's vegetation. Every effort must be made by the NPS to expedite the decision.

Topic Question 6:
Those who visit Isle Royale do so for the wilderness experience which includes wolves and moose. I do not support any human management of the moose

population. For 50 years, the wolves have been able to regulate the moose population.

It is disappointing that NPS has chosen to disregard the hundreds of comments submitted prior to the opening of the official comment period. Those comments must become part of the official EIS.

Isle Royale isn't untouched by man.

Topic Question 3:
Limited.

Comments: I prefer Option B. I thought the wolves were impacted by parvovirus (man-made impact) so replacing a few wolves to help recover from that would be a mulligan.

Correspondence: Topic Question 6:

I visited Isle Royale 25 years ago and was enchanted by the unique ecosystem there. I do hope that the wolf population can be restored in order to maintain a healthy system on the island.

Comments: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park - the lowest number of wolves in more than 50 years - threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely

Correspondence: Topic Question 1:

I don't know.

Topic Question 2:

It's such a unique place, and so fragile. I hope to see a healthy population of wolves there again. My first trip of many to the island was in the early 1990's, and we got to see tracks and hear the wolves at night. Such a fabulous opportunity.

Topic Question 3:

Intervention to save a declining part of the islands ecosystem is important to me.

Topic Question 4:

I'm not sure.

Topic Question 6:
Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Correspondence: Topic Question 1:
I think wolves should be reintroduced, along with management of the moose population until such a time as the wolves are keeping the moose under control.

Topic Question 2:
The moose can't be allowed to eat the island down to nothing, no matter how it's done.

Topic Question 3:
The disappearance of the wolves was brought on by a man-made event, when parvo came to the island with a pet. It only makes sense that the NPS attempt to rectify what man damaged, to restore the balance of the park by reintroducing wolves.

Topic Question 4:
Due to climate change there will be less opportunity for wolves to make their way to the island naturally over the ice bridge, even though the wolf population in the UP has greatly increased in the last few years. Again, NPS shouldn't feel bad correcting as best they can a bad situation created by people, even if they have to bring more wolves in and occasionally introduce new genetics if there is no ice bridge and natural introduction of new wolves.

Topic Question 5:
I support option 3, introducing new wolves in combination with management of the moose population, whatever it takes to keep the island and wolf and moose populations healthy.

Topic Question 6:
Thanks for giving this issue considered thought!

Correspondence: Topic Question 1:

I think that other life on the island should be taken into consideration when action is being taken. Reintroducing wolves could interfere with the way the ecosystem has adapted to the lack of wolves over the past few years. Care should be taken to make sure that the management of wolves does not negatively impact any other species on Isle Royale.

Topic Question 2:

When thinking about management of moose, wolves, and vegetation it is important that it is not forgotten that Isle Royale is a designated wilderness area. If humans are given permission to tamper with the ecosystem at Isle Royale, this opens the door for hundreds of other issues involving people wanting to interfere with other wilderness areas. Wilderness is defined as, "an area where the earth and its community of life are untrammelled by man, where man himself is a visitor who does not remain." Wilderness is supposed to be a place where humans do not leave any sort of impact on the ecosystem. By reintroducing wolves or culling moose, humans would be taking massive steps into a wilderness area that should really be left alone. Another problem with managing moose and wolves is that it would interfere with the moose and wolf study that has been going on for over 50 years on Isle Royale.

Topic Question 3:

Because 99% of the land on Isle Royale is designated wilderness, the NPS should not take much action to help with wolf, moose, and vegetation management. Management should be kept to a minimum. Like I mentioned before, wilderness is an area where the earth and its community of life are untrammelled by man. Wilderness is set aside for a reason and humans taking action would completely defeat the purpose of the wilderness area being set aside.

Topic Question 4:

Climate change is ultimately human caused. Climate change being the reason for some of the issues with the wolf and moose populations makes the ethics of management more complicated. Climate change made it so that ice bridges rarely form between Isle Royale and the mainland. This is one of the primary reasons that the wolf population on Isle Royale is struggling so much. Because humans were the cause for this, it seems that we should try to help solve the problem. We could do this in a few ways. We could build a land bridge that connects Isle Royale to the mainland. I have seen these used in Canada and other countries to allow animals to safely cross highways and a similar concept could be used on Isle Royale to allow wolves to come from the mainland to the island. Another idea is to reintroduce a few wolves every year for about 10 years, or until the wolf population has stabilized. We should do either of these things in the least invasive way possible

Topic Question 5:

Alternative Concept A allows the scientific study to continue and gives nature a chance to take its course. It also lowers human impact on Isle Royale and would be the most cost effective option. On the other hand, concept A could cause wolves to disappear from Isle Royale completely and the moose population to get completely out of control. Alternative Concept D gives no backup plan. All the other concepts have at least one other idea for if the first one doesn't work out. It is a very constricting plan with little flexibility. Alternative Concept E is good because it gives the chance for vegetation to be restored but would take a lot of human effort. Alternative Concept F does not really have anything to do with the wolf problem so I don't see how it will help anything. Sure, the moose are going to hurt the vegetation but it's all a part of the process.

Correspondence: Topic Question 1:

One thing that should be considered when dealing with the Isle Royale situation, is that while the NPS is not technically supposed to intervene with wilderness areas, or bring in more animals, they brought more wolves to Yellowstone. Re-introducing has been done in the past, so the decision should not be based off of that particular rule being broken. Isle Royale is an isolated environment, so the decision to let wolves survive or not is completely up to us.

Topic Question 2:

If wolves survive, every other aspect becomes balanced. If wolves don't survive, moose will quickly grow in population, until the island is essentially barren. After that, the moose population will fall greatly. There will be no wolves, no moose, and no vegetation. Letting nature take its course is the wrong option. Isle Royale is a hidden gem that should be preserved. If wolves die out, Isle Royale will be a barren rock.

Topic Question 3:

I agree that areas that the federal government has deemed designated wilderness should stay so, and that no motorized vehicles or machinery should be used in them. When those wilderness areas are threatened with extinction, however, human intervention is essential. It is better to break the rules for one day, and restore wilderness, then to let a beautiful piece of land crumble and die.

Topic Question 4:

Climate change is a growing threat. The world is gradually heating up because of humans. In the case of not intervening because of park rules, we have already broken the rules. We have already done a great job of ruining our planet, so the only option is to attempt to fix what we have done.

Topic Question 5:

As discussed in previous answers, I believe that letting nature take its course is the WRONG option. Isle Royale will no longer be the stunning display of nature that it is now. I think that we should re-introduce as many wolves as it takes to create a healthy pack that can produce viable offspring.

Topic Question 6:

Long live the wolves.

Correspondence: Topic Question 1:

After looking through your options that are listed, the one base that you haven't seemed to cover is the idea of introducing wolves for sure more than once. It is an important fact to face that the wolves may not take off with one reintroduction attempt because there are too many variables as to what can go wrong. Option C does say it could possibly introduce wolves, but it sounds too open ended for my liking.

Topic Question 2:

An issue that should be considered is that the current population of wolves could very well be gone by the time whatever plan you choose is implemented in two years. With the spinal issues, low population and low genetic diversity, these three wolves have a very small chance of making it these next two years. With the rare plants that are on the island it is very important that the moose are managed quickly before they over browse because they have little to no predation.

Topic Question 3:

Considering that most all of the land on the National Park is designated wilderness I believe the NPS should make an effort to choose some of the least invasive plans to help preserve this wilderness. If wolves are introduced again it would be a human interaction that is usually not allowed in such a place, but if no interaction is done at all then there will be no wolves and the moose will overeat all of the native plants. Some of the plans suggest killing the moose instead of bringing in more wolves, but it seems that in a way this is even more invasive since we will always have to manage the herd with no predators to control it.

Topic Question 4:

With this changing climate it takes out a critical element that was present in the past with regularly that brought genetic diversity to the wolves; the ice bridge. Since this link to the land no longer forming as often as it once did, there is a very slim chance that wolves will travel over to the island to reproduce and alleviate the stress on the inbreeding for a few years. This shows us a need for human interaction to keep these wolves from getting the spinal deformities of inbreeding by introducing new wolves to the island.

Topic Question 5:

The alternative that I like the most is plan C for many reasons. It allows the NPC room to adjust the plan and introduce more wolves if the first attempt fails. I don't care for how plans C, E and F only suggest that we control the moose population on our own and let the wolves die off. I discussed in previous answers that this plan is very invasive of the natural area but it also brings more work to the people to control the herd when the wolves could just be doing it on their own naturally. I'm not sure how you could make translocation of the moose a cost effective solution since they're such large animals and moving them off the island would need to be done often.

Topic Question 6:

My one big comment is that all of these plans should be done sooner than in two years. In two years, the wolves on the island could be all gone because of the low number and inbreeding. Whatever is done, it should be done soon before it's too late.

Correspondence: Topic Question 2:

What is the most efficient, yet natural method of management? Why impose an artificial and expensive management system when you can have the natural predator/prey balance that is, in the long run, probably the most cost effective solution? Otherwise, there are continuing problems of moose and vegetation.

Topic Question 3:

Wilderness should mean something. These areas are some of the last that are available to large predators. These areas are some of the last where the ecosystem can be maintained in something close to the original format.

Topic Question 4:

This diversity of plants and animals may be needed someday. Preserve it where you can.

Topic Question 5:

I dislike the artificial nature of the other alternatives. It feels like giving up.

Comments: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Correspondence Type: Web Form

Correspondence: Topic Question 1:

I realize how it could be important to save the genes of the wolves currently on the island, however in two years there is a strong likelihood that the wolves will have perished. Thus I believe that a new pack of wolves should be introduced. These wolves should be from areas where their diet is also moose, as opposed to wolves from Wisconsin which dine more on deer, and from regions that have similar habitat to that of the island. Other things to consider when bringing in these wolves are the stress level that they will have to endure, and that the handlers do not introduce a disease like Canine parvovirus introduced around 1980. I do not think that the moose population should be managed by humans, but perhaps we could seed the vegetation to help that recover.

Topic Question 2:

Issues to consider when evaluating the future of the island and its ecosystem are that in two years, when the plan would be put into action, there is a strong chance that the three wolves will not exist anymore. If they are gone there is less of a chance for negative pack interactions. Thus it would do no good to only manage the moose population, as that would continually depend on our interference.

Topic Question 3:

Considering that Isle Royale is 99% wilderness, I believe that intervention still needs to fall into the Wilderness Act of 1964 and other wilderness protection. For instance, if a plan involving eradicating some of the moose should be chosen, it should still not be allowed to hunt moose, as that is not allowed on regions marked as wilderness. I do not know how wolves would be brought to the island if that plan would be chosen, but the law that no motorized vehicles are not allowed on wilderness should still be respected. I believe the protection of wilderness should still be in place for whichever plan is chosen, because if the laws are bent, it opens up a door for people to disregard the rules in cases in which they deem necessary, but could actually be harming the environment.

Topic Question 4:

Please consider the most environmentally sustainable plan for the future. To do this I think you must focus on the root problem to avoid human interaction. Aside from saving the wolves, I think Isle Royale should be left alone.

Topic Question 5:

I do not like that in plans which resolve to managing the moose population it does not fix the root problem: the lack of predation. In just controlling the moose population, there is a long term need for human intervention, which is more opportunity to bring in diseases, but it would also corrupt the study of the natural occurrences, and it would instead depend on human interaction.

Topic Question 6:

In concept F I do like the idea of helping the vegetation through seeding, however I do not think that just the moose population should be managed. So perhaps seeding vegetation could also be coupled with introducing more wolves.

Comments:

Correspondence: Topic Question 1:

I believe that a no-action plan should be taken in regards to the moose and wolves on Isle Royal. The possibility of wolf reintroduction, wolf augmentation, and the culling of moose all go against the Park Services practice of not intervening in designated wilderness areas. Although exceptions have been made to this rule in the past, such as at Yellowstone, it is not a practice we should make habit of, or the integrity of the designated wilderness areas and the hands-off policy will be severely compromised.

Topic Question 2:

We should consider that the course that nature takes is not up to us. We, as humans, are part of the earth, and despite popular belief are not the ones in charge of everything that happens on it. This being said, the NPS's policy calls for us to leave the issue alone. If this means that the remaining wolves die out, so it is. If the wolves go, there will be no natural controls set in place for the moose, which will soon overgraze, having drastic implications for the vegetation on the island. With their feeding source depleted, the moose population will suffer a dramatic decline. However, this is the course that nature takes. We have interfered enough on Isle Royal, with the introduction of the canine parvovirus and ticks.

Topic Question 3:

The NPS should follow their policy and still consider that 99% of the island designated wilderness, and therefore a no interference zone. Any other option goes against the policies and procedures already in place.

Topic Question 4:

There is no way to completely undo the damage already caused to our planet by climate change. The best policy in a place such as Isle Royal is to let the island take its natural course at this point. This will leave resources open for the NPS to battle climate change in ways that will be more significant.

Topic Question 5:

I believe that Alternative A is the only alternative that has any solid reasoning behind it. A onetime reintroduction of wolves, such as that proposed by Alternatives B, C, and D, will not provide enough genetic diversity to save the island in the long term. That solution will only delay this problem, and this is an issue we will have to revisit. The management of the moose population does not solve the problems faced by the wolves, and a hunting season would completely destroy the legitimacy of the NPS hands-off practice.

Topic Question 6:

Please think carefully about the provisions set out in the Wilderness Act of 1964.

Correspondence: Topic Question 1:
Only alternative C seems to allow multiple introductions of wolves, I think adding that possibility to some of the other alternative suggestions enables a more enhanced flexibility in species management. A singular introduction might not go well, and it is important to react in that case. All the other alternatives are too restrictive in that sense.

Topic Question 2:

Several issues come to mind, mostly based on the long term consequences of intervention, or lack thereof. One is whether or not the chosen course of action is in the best interest of the park. Alternatives A, D, E, and F will all most likely lead to the extinction of wolves on Isle Royale. I've seen some arguments that allowing that extinction to take place is a scientific opportunity to study the aftermath of such an event. That is definitely accurate, but letting a population die out simply because it would be interesting to observe what happens seems irresponsible. Since humans have heavily contributed to the decline of the park (climate change leading to higher tick counts, introduction of the parvovirus around 1980), sitting back and watching the wolves die for the sake of curiosity is inappropriate.

Topic Question 3:

Wilderness areas represent an incredibly valuable facet of humanity. Our love of wild places, seemingly untouched and raw, offer a chance to build a deep connection with nature. Wilderness fosters a love of the outdoors, as well as a desire to protect it. If alternatives D, E, or F are selected, moose populations on Isle Royale will be reduced, either through culling or translocation. Both of these options have their individual negative and positive impacts, but both require the use of motorized or mechanized equipment on the island. If we allow that type of activity in a Wilderness area once, it sets a dangerous precedent. Future management proposals that include motorized vehicles will be more easily justified, and the impact will most likely be negative in the long run. We need to respect the law that stands in protection of Wilderness areas, and follow it accordingly. If that means a lack of culling moose, then so be it.

Topic Question 4:

Climate change is undoubtedly affecting the moose population through high tick counts due to milder winters. In regard to future action, the NPS should think carefully about the impact any action could have on the park and surrounding areas, and act in a way that benefits the environment, not humans

Correspondence: Web Form

Correspondence: Topic Question 1:

I think Alternative Concept D should be considered. I think the Alternative Concept D is the best option out of the six provided. I feel it is the best option because it has a backup plan built in. Wolves will be introduced to Isle Royale which is what needs to happen. There is a chance the three wolves already on Isle Royale would reject the new wolves. If this happens there is a backup which is the reduction of moose. If the wolves introduced does not work out there is a backup plan to save the vegetation. The wolves kill moose, and the moose kill the vegetation on the island. In a way the wolves are saving the vegetation on the island. In conclusion I think Alternative Concept D is the best choice. It reintroduces wolves, it lessens the number of moose on the island, it protects the vegetation, and it has a backup plan built in.

Topic Question 2:

There are three issues that need to be considered when looking at Isle Royale. The three things to look at are: the moose population, the wolf population, and the status and health of the vegetation on the island. There is never going to be a perfect situation but the three issues can be managed the best. The wolves and moose populations need to be in numbers that are low enough to protect the vegetation on the island. The wolves are in control of everything. There is not enough wolves and there is too many moose therefore the moose over graze. With the right amount of wolves the moose population is low enough so the vegetation has time to recover.

Topic Question 3:

The National Park Service needs to really get involved in this issue. 99% of the island is wilderness. I believe we should over look that it is declared wilderness and think about what will happen if we don't get involved. The island is mostly wilderness but we need to still get involved. Isle Royale is important and if we don't intervene because it is wilderness the island is going to suffer tremendously.

Topic Question 4:

Alternative Concept D is the best one that corrects the effect climate change has had on Isle Royale. The reason Isle Royale is in the problem it is today is because due to climate change the ice bridge is not forming to the mainland. When the ice bridge would form the wolves could cross from Isle Royale to the mainland and back and forth. Since climate change has made it so the ice bridge does not form we need to physically bring wolves over. Wolves cannot cross on their own so the NPS needs to get involved and bring wolves over. Alternative Concept D corrects the problem the best because it deals with the problem of climate change.

Topic Question 5:

Out of the six alternatives provided Alternative Concept A is the worst. "A do nothing mentality" is not going to solve anything on Isle Royale. Alternative Concepts E and F were also out because they do not deal with the wolf problem. The concepts focus on the moose population but do nothing about the wolf numbers which is the main problem. Alternative Concept B was also out because it says introduce wolves only one time. The problem with only reintroducing wolves one time is the concept has no backup plan. It talks nothing about what will happen if the wolf reintroduction does not go as planned. The last Alternative Concept that can be eliminated is Alternative Concept C. The concept is too loosely worded and potentially says that there will be nothing done. It says the NPS will maintain the population of moose and wolves. The worst option is to maintain the populations. The problem on Isle Royale is because the populations are not balanced. We shouldn't maintain them. The best Alternative Concept is D. It manages the moose population, it reintroduces wolves, and it protects the vegetation. It also has a built in backup plan.

Topic Question 6:

The process of getting something done on Isle Royale should not take this long. It should not take until 2017 to make a decision. By 2017 the Alternative Concepts that were provided will be out dated. There is no guarantee that by 2017 there will be any wolves on Isle Royale. We need to make a change faster. When the decision is going to be made it might be too late.

Correspondence: Topic Question 1:

I believe the NPS should consider wolves as a resource for the long-term management of the moose population, and know that with wolves, the culling or translocation of moose would not be necessary. Reintroducing wolves, if successful, would impact the moose population gradually at first, but over an extended period of time, the natural process will most likely restore the balance between the predator and prey system that has existed for decades. Another thing to keep in mind is the importance of acting quickly, as too much time passing between now and the reintroduction of the next wolf pack could lead to deep damage to the island's foliage and ecosystem, as the moose population would continue to grow steadily.

Topic Question 2:

I believe that the NPS should intensify research on wolf behavior and the benefits wolves bring to the ecosystem, while also disrupting the natural process on the Island as little as possible once everything is within the range of healthy wolf, moose and foliage populations/distribution. It is important for humans as a species to conduct more research on the wolves, so they are more informed about the benefits they bring to the ecosystem while they continue to value their importance and fight for their protection.

Topic Question 3:

It may take more than one attempt to reintroduce the wolves, but after it happens (assuming it's not too late), the management on Isle Royale should mostly be gathering information. Lightly monitoring the Isle Royale populations through use of technology and the occasional researcher will give the entire animal relationship the time it needs to bounce back from its long period of endangerment, and return to a healthy, balanced ecosystem. Also, it is important that the NPS continues to uphold the ban on bicycles and motor vehicles within the boundaries of designated wilderness areas.

Topic Question 4:

The management of Isle Royale should ensure that the quality of the land and the natural processes should be as unaffected by humans as possible. Many wilderness areas will be especially affected by climate change regardless, so the NPS should maximize their efforts to be eco-friendly and reduce the carbon footprint of its actions and facilities. The ban on motor vehicles is accomplishing this, but there is more to do, such as banning disposable plastic bottles from the area and harnessing sources of clean energy to power facilities.

Topic Question 5:

I am strongly opposed to the idea of doing nothing. Humans are responsible for the tick infestation and the presence of the canine parvovirus, both of which had a role in impacting the balance that moose and wolves once had on the island. It is our responsibility to fix this problem, especially so since we were the ones who did the most to cause it. I also have concerns about the translocation of moose, which has the possibility to transmit diseases and invasive species to areas and populations that were previously uncontaminated. My final opposition would be to the culling of moose, which is totally unnecessary, especially in a wilderness area, if we are able to return the wolf population to a healthy level.

Correspondence: Topic Question 1:

1. The management of other life on the island needs to be considered. Not only the moose and wolf relationship but the vegetation and other animals. Any action needs to be carefully thought out not only in thought for the wolves and moose, but for all the island. One possible alternative could be to build a land bridge from mainland to the island. This could defeat the scientific study of the predators vs. prey, but it is known that wolves have already been coming and going from the island.

Topic Question 2:

2. The political and legal aspects of impacting the island in anyway should also be considered. The island is a federal wilderness area, wilderness meaning it is supposed to be a no human impact zone. Although, humans have unintentionally impacted the island many times throughout the study of the island. The 50 years of scientific study would be implemented if any action is taken considering unintentional impact isn't accounted for including climate change. Technically we've already interfered with the study and natural course of nature on the island.

Topic Question 3:

3. Don't re-vegetate or cull moose, for both would be extreme forms of wilderness interference. If new wolves were to be introduced, which is also interference, I agree with imitating a migration of wolves to the island. Don't use wilderness area unless mandatory.

Topic Question 4:

4. Climate change is much bigger than just Isle Royal. To manage the climate of the island we must manage the climate of Earth. We should still work on the whole managing Earth's climate but I feel Isle Royal's dilemma must be addressed directly sooner than waiting for climate change to be properly managed.

Topic Question 5:

5. I dislike the idea of interfering with the scientific study on Isle Royal, although we really already have in many ways including climate change and the unintentional introduction of invasive, harmful, species. To observe what would happen when no action is taken at all would be interesting, but also harmful to all island life. I do like the idea of reintroducing wolves to the island in an effort to preserve wolf and moose life on the Island. I feel we are taking action to preserve the island as it is considering the islands' deprecation is really from human impact and that could be a good thing. To leave the island, to take no action at all, would be interesting and a perfect example of human impact at its unintentional finest. To leave it would most likely end in the loss of all wolves on the island and overpopulation of moose which would ruin the vegetation. The predator vs. prey study would end but we would observe the running of nature's course, with unintentional human impact.

Correspondence: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,

Correspondence: Topic Question 2:
Experts have been studying the wolf/moose population for years. Their advice should be taken heavily into consideration.

Topic Question 3:

With the uniqueness of the moose/ wolf population that has existed for years at Isle Royale I feel alternative C is the best option. Maintain populations of moose and wolves on the island, which could include wolf reintroduction or augmentation.experts have been studying the wolf move most population for years. Verify should be taken heavily into consideration.

Topic Question 5:

The NPS claims that "effective management of moose may require the use of motorized or mechanized equipment, such as helicopters." They are actually considering shooting moose from helicopters to cull the population on Isle Royale. This is absurd - - introducing new wolves is a much more sensible option to manage the moose population and improve the health of the Isle Royale ecosystem.

Correspondence: Topic Question 1:
Let the wolves do what God intended & kill the moose, elk-deer & bison!! Why is it that only trophy hunters are allowed to kill?? there are mountain lions that deserve to eat & wolves & bear what in the [expletive] are people thinking?? People are so disgusting & need to learn how to live with nature & not kill off all the predators & then complain there are too many prey!! The ranchers need to invest in ways to protect their herds, after all they make money from them so be responsible & take care of your own property & quit telling me I must be responsible for your crap!!!

Topic Question 2:

Stop listening to the ranchers whine about how their herds are being effected & let the wolves take care of the moose in the first place!! Ranchers & homesteaders must realize they moved next to National Parks where there is wildlife, they were there first & the humans are the idiots that need to obey nature!! Stop killing off the predators & let them do their God given right to hunt & eat the meat!!!

Topic Question 3:

Stay out of it!! Leave Nature alone!! Predators & prey have taken care of themselves for eons & when humans get involved we mess everything up!!!

Topic Question 4:

Let Nature take care of Nature & just enjoy Nature for the beauty!! Don't touch anything!!!

Topic Question 5:

Humans are horrible & mess everything up!! They are thinking they know everything & can fix every problem but have never realized they are the major problem to begin with & need to move to Mars!!!

Correspondence:
Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. I fondly recall my first trip to Isle Royale with my wife and son and the first closeup view we got of a moose. But right now there are only three wolves left at the park - the lowest number of wolves in more than 50 years - threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Correspondence: Topic Question 1:

The NPS should listen to and seriously consider the suggestions of the leaders of the Isle Royale Wolf-Moose Study that has been in place for more than 55 years. John Vucetich and Rolf Peterson of Michigan Technological University have enough data to show trends over time.

Topic Question 2:

The success of reintroduction of wolves to Yellowstone National Park provides a tract record or viable model of what went well in that situation. If the wolf population rebounds at Isle Royale, the moose population expansion rate would be slowed, and the vegetation would have an opportunity to expand and recover from over browsing by the moose.

Another issue to consider is removing manmade obstacles such as filling in abandoned mine shafts where wolves have been known to drown.

Topic Question 3:

The NPS should consider Alternative Concept B and allow the current wolf/moose research study to continue. The simulation of a migration event would limit the impact to one change. Hence, the study results would indicate the outcome of that one change, the simulated migration. The NPS would monitor changes through the annual reports of the ongoing Michigan Technological University research study without having to be involved.

Topic Question 4:

Regular monitoring of the annual research reports should provide sufficient data over time. As there are fewer ice bridges formed on Lake Superior, at some point the changing climate may require re-evaluation of the need for future migratory events.

Topic Question 5:

Concept A (do nothing) guarantees that the vegetation will be depleted further until the overpopulation of moose reaches a crash point caused by disease, lack of food (vegetation) during a harsh winter, or similar stress event.

Concepts C, D, E, F either change more than one factor at a time, a poor scientific procedure, or introduce a type of management that would result in changes of the wilderness status of Isle Roayle National Park.

Topic Question 6:

Please consider introducing additional wolves soon. As for a specific number, please follow the suggestions of John Vucetich and Rolf Peterson of the Wolf-Moose Study, Michigan Technological University, Houghton, Michigan.

Correspondence: Topic Question 1:
re-introduce Wolves and Moose with different DNA from other areas to strengthen what is in the park.

Topic Question 2:
the NPS should consider and evaluate the ecological benefits wolves provide; The only pup observed in 2015 was visibly deformed; 100% owolves examined since 1994 (over 30 of them) have spinal anomalies. The weakened state of the remaining wolves is likely interfering with reproduction and survival.

The NPS must consider the data collected through 57 years of research conducted on Isle Royale. These researchers should play a key role in the discussions.

Topic Question 3:
NPS must protect the unique wilderness qualities of Isle Royale through monitoring of habitat for wildlife, including wolves and moose; maintenance of soil and water quality and ecological stability of plant and animal communities including the control of invasive species. Management is necessary to maintain important wilderness values including the presence of a top carnivore which is vital for ecosystem health. The culling of moose and the use of motorized equipment is unacceptable.

Topic Question 4:
Climate change poses a fundamental threat to species and places. The only way to slow the impacts of climate change is to globally reduce carbon emissions. NPS could produce an informational flyer explaining the negative impacts climate change is having on Isle Royale such as the changes in the duration and frequency of the ice bridge, winter ticks, bird species etc. NPS could engage with businesses and private entities that use the island to reduce carbon pollution. Encourage visitors to reduce their carbon footprint by not bringing / disposing of water bottles.

Topic Question 5:
Along with the ecological benefits wolves provide, they also have intrinsic value. You may not see a wolf or hear them howl but it is important to know there are still wild places where wolves exist.

Topic Question 6:
Additional Comments: Those who visit Isle Royale do so for the wilderness experience which includes wolves and moose. Explain what you value about wilderness and why. I do not support any human management of the moose population. For 50 years, the wolves have been able to regulate the moose population. it is disappointing that NPS has chosen to disregard the hundreds of comments submitted prior to the opening of the official comment period. Those comments must become part of the official EIS.

Comments: For years, researchers have been sounding the alarm about the plight of wolves on Isle Royale. Yet, the NPS has chosen to take no action until now. The public scoping period ends 8/29, however, the Record of Decision is not expected until Fall 2017 at the earliest. Two and one-half years is simply too longâ •—This foot dragging on the part of NPS is unacceptable.â •—

Evidence suggests that the few wolves on the island will not be able to keep moose populations in check which will further degrade the island's vegetation. Every effort must be made by the NPS to expedite the decision.

Correspondence: Topic Question 1:
introduce new wolves into the ecosystem so that balance between prey and predator can be maintained. A healthy ecosystem requires biodiversity. This should be done as outlined in alternative B, but done as needed. One time only may not bring the genetic diversity needed to create a healthy population. Wilderness with healthy populations of wild animals can be an attraction. If you provide the opportunity for wolves to repopulate with healthy packs, people will want to come to the island to catch a glimpse.

Topic Question 2:
As mentioned above, preserving our wild spaces will have a profound effect on our future generations and our continued ability to enjoy the beautiful biodiversity that inhabits our wild spaces.

Topic Question 3:
As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether. Please do not use culling to "manage" wildlife. Introducing wolves is much more humane and natural way to control the over abundance of moose in the park.

Topic Question 5:
If that includes culling then that is what I do not like. Killing and mass slaughter of non-human animals as a management system is abhorrent.

Comments: I am in full support of bringing wolves back to health at Isle Royale. introducing healthy wolves to address the issue of genetic diversity as soon as possible. With a healthy pack or two the moose population will quickly decrease to a level the park can sustain. With a balanced ecosystem, other

life will flourish.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

Correspondence: Topic Question 1:
Only three wolves left on the island, the character of Isle Royale is in jeopardy.

If wolves die off, the island's moose population will continue to increase, consuming the native vegetation and eventually running out of food, disrupting the natural balance of the island. We don't want that to happen.

The National Park Service (NPS) is responsible for protecting and managing the beautiful natural resources and wildlife at Isle Royale. Horrible!!!! Help them.

Topic Question 2:

insure the vegetation eaten by the moose is plentiful which will ensure the wolves well being. Maybe sometime of shelter for winter that the wolves could use to get out of the wind and elements.

Topic Question 3:

No hunting of anything ever...monitor the wildlife and vegetation and if something needs help...step in. Come on it isn't rocket science.

Topic Question 4:

That could be tricky...will there be droughts? Watering areas will have to be set up...hard to say what will be needed but plan for anything.

Correspondence: Topic Question 1:

1. I believe that the vegetation option with the seeding, in the last alternative, should be considered in all of the alternatives, only because either way the vegetation is going to suffer because of the big imbalance of the wolves and the moose. If you introduce only 2 more wolves, they can't kill 1200 moose all by themselves. This process will take a couple years, and in the meantime, the vegetation is being killed and I don't think that is right. You shouldn't wait.

Topic Question 2:

2. I think the natural way of things should be considered only because this is a wilderness area and you don't want to take too drastic of measures because that can have the opposite effect then what you may want it to. So you should try and mimic a natural process, by bringing wolves from a surrounding area or that at least wolves whose diet is moose because otherwise this entire process would be pointless.

Topic Question 3:

3. Considering that Isle Royale is designated wilderness just gives you all the more reason not to do some intensive management because people come there to see the scenery and the sights, which won't be kept intact if you intensively manage everything on the island. It will become more like a zoo, or museum then an interactive place to go and visit.

Topic Question 4:

4. I don't believe that there should be any intensity management at all because this process is natural, and although I do think that we should reintroduce wolves so that this island is not overrun by moose, I don't believe that the management should continue to be that intense. Just watch what the dynamic is between the moose and the wolves to make sure that this doesn't get out of hand again. There is no need to freak out every time a number fluctuates a wolf down, or a moose up. When the difference is so extreme that there is more cons letting nature run its course is when you should intervene. There also is no way to create an ice bridge, so all you really can do is cross your fingers and hope that it starts to stay longer.

Topic Question 5:

5. I don't like how only the seeding of the vegetation only shows up in the last alternative, because I feel that either people start doing that now, because in the meantime of you making these decisions the vegetation is suffering. Also, that's some people come to the island, is for the scenery, which includes the vegetation, so by only really caring to replant the vegetation in the last option. I also don't like how some of the wording is, I understand the need to be brief, but I feel like it was a little too brief and I am not fully understanding what you mean by some of the different sayings, for example, "managing wolves and/or moose." That could mean a number of different things, such as killing off most of the moose, or managing their diets so they don't eat more vegetation.

Topic Question 6:

6. When you say, "reintroduce wolves," how many wolves do you planning on reintroducing and are you making sure that their diet matches that of what is on Isle Royale? Also, how much management were you planning on doing with the wolves if the reintroduction doesn't work out? Like if the wolves don't get along, or they leave, etc. Would it really be worth it to keep the gene of the original wolves when they are so inbred that they aren't really even healthy wolves?

Balanced

Topic Question 5:

Trapping and poisoning as well as arial shooting are unacceptable , being unsportsman-like as well as unbalanced.

Topic Question 6:

Maintaining ecologically balanced natural mix of fauna also protects the the flora of a wilderness region as well.It's "win-win."

Correspondence: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,

Correspondence: Topic Question 1:

I believe that one of the best ways to manage the island would be to have many new introductions of wolves. One thing to consider with bringing in wolves is that they could sustain themselves on a diet of moose. Perhaps bringing wolves from upper Minnesota would be a solution to that. By bringing in wolves not only would the number of wolves increase, but the moose would also regain their predator thus lowering the number of moose and allowing the vegetation to grow back.

Topic Question 2:

The impact humans have had over the years should always be in consideration. In the 1980's we introduced canine parvovirus, causing the wolf numbers to crash. By warming the planet we have decreased the number of ice bridges forming and how long they stay. We must be ever aware of how are movements and wishes affect the world around us.

Topic Question 3:

Wilderness has a broad definition and there are many ways to interpret it. We can still keep the park a wilderness while also starting to manage. The reintroduction of wolves would be a great place to start a management plan then perhaps moving on to a more long term, sustainable plan. As hands off as possible is of course the best option, but in today's rapidly changing climate we still want to give the wolves, moose, and island the best chance of thriving.

Topic Question 4:

Humans, whether we like it or not, have had a huge impact on the whole earth. Wilderness is not untouched by humans as climate change has altered the island's natural working order. In the face of this realization, I believe that it is ok to begin to manage the island. Again, the reintroduction of wolves is vital to the islands health.

Topic Question 5:

The fact that almost all of the alternative only include a single introduction of wolves or no introduction is very distressing. I like that alternative C had an more of an open option for the number of times wolves could be brought over. However, this could also result in no introduction of wolves. None of these alternatives are perfect.

Topic Question 6:

I have no additional comments only questions. How many wolves would be introduced at one time? Where would the wolves be coming from? If no wolves are introduced how would the moose be managed?

Comments:

Correspondence: Topic Question 1:

1. The long-term effect should be considered with every plan. The environmental and social effect mainly. Bringing wolves back into the island and before that happens the moose population is culled. If there is an unforeseen consequences before or while the wolves are on the island, there will be more time before the moose over browse their vegetation.

Topic Question 2:

2. The location of Isle Royal is an issue because with a changing climate the moose are starting to have problems in the heat and that will only get worst with time. That isn't necessarily a bad thing because that will also manage the moose population.

Topic Question 3:

3. Ideally, a plan that is high in intensity but has a low impact will work the best, but something that has a higher chance to work can have a higher impact. The worst case scenario is a low impact plan is put forth and doesn't work and more destruction occurs in the next plan.

Topic Question 4:

4. The fact that the earth has been proven to go through heating and cooling means that in many years the earth will cool down. I think whatever is done has to be a long term and sustainable.

Topic Question 5:

5. In preliminary alternative C, I like that the moose will be managed. This will benefit the vegetation and give more time for the wolves to come till the moose need to be managed again. I think each year selling 50 hunting permits to people to come to Isle Royal and bow hunt and take 1 male moose is a reasonable idea.

Topic Question 6:

6. I think that starting with option E and moving to option C after 2 years. I also think that option E should not start till after the last 3 wolves on the island are dead. As I stated, bow hunting should be considered because of the low impact bows provide, the money the permits can be sold for, and the management of the moose so they don't over browse their vegetation.

Correspondence: Topic Question 1:

I think that introducing wolves once and then reducing the moose population would be the best option available. If you introduce wolves one time to the island it would allow the NPS to continue the study it has been doing for almost six decades now. At the same time it would be a relatively small infringement on the idea of the wilderness area. As for reducing the moose population after that, hopefully the wolves would help to achieve those means.

If not then I believe that hunting the moose would be the best option. It could be done in ways that does not break the rules of a wilderness area, such as bow hunting. Also you could sell tags to hunt the moose which could raise a large amount of money to offset all of the expenses that are going into the management of Isle Royale.

Topic Question 2:

A big issue that I believe should be considered is the cost to the whole project. How much would each of the different concepts cost? I don't believe that continuing to study an issue such as this (the study of predators and prey) is a good use of money when it is such a specific issue. Because of the fact that it is in this controlled environment it is not very applicable to other situations. I think the money that is being spent could be put to better use. I think that almost any solution to the problem would be a short term solution. As such more and more money would have to be poured into the management. I think instead of continuing to spend money on this the NPS should put the money towards other wilderness areas or just other national parks in general. Also it would be nice to know how long wolves have been on Isle Royale. The study has not been going on long enough to know that they have been there forever. If wolves have not always been on the island then there seems to be little reason to try and continue to keep wolves on the island.

Topic Question 3:

I don't think that the NPS should do anything that would violate the designated wilderness in a large way. If the rule were broken for Isle Royale then it would set a precedent that would then be in place for other wilderness areas. Also if the public saw the government breaking their own laws in a way like this then they may decide to be a little less cautious themselves. Once again it sets a bad example. Monitoring the intensity of management is something that I think is very important to how this project should be run.

Topic Question 4:

I don't think that climate change is something that should affect what the NPS decides to do about Isle Royale. Rather than trying to counteract the results of the problem they should put the effort into counteracting the problem itself. I just don't believe it is reason enough to infringe even more on the idea of a wilderness area.

Topic Question 5:

I like how they cover most of the alternate solutions that are available. However I don't like how vaguely they are worded. For example when talking about introducing wolves once, how many wolves would that be? Would it be four wolves or four packs? I think it would nice to know what the expected amount of wolves would be. Also I think it would be nice to know what sort of moose management techniques would be likely to be used.

Topic Question 6:

I think it is very important to not over manage the wilderness of Isle Royale. I think it is also very important to think about the amount of money that is being spent on this and ways that it could be better spent. Thank you for allowing us to comment.

Correspondence: Topic Question 1:

The NPS should consider the reintroduction or augmentation of wolves whenever their population drops too low to impact the population of moose. This management strategy should not be implemented alongside a strategy for moose management which includes direct human involvement, as allowing moose hunting or relocation could have a negative impact on the wolf population of Isle Royale.

Topic Question 2:

The potential for unexpected side effects should always be considered, as humanity has a history of recklessly altering the environment and thereby bringing about undesirable consequences. The management strategies used should thus involve as few unpredictable variables as possible.

Topic Question 3:

The NPS should consider managing Isle Royale using only hands-off methods which mimic natural events, such as the reintroduction or augmentation of the wolves. Wilderness areas should be treated as such, and managing Isle Royale in an intensive manner could set a dangerous precedent for other such locations across the country.

Topic Question 4:

The NPS should consider methods which simulate as closely as possible the state of Isle Royale before it was impacted by global climate change, without increasing human involvement to levels which are best suited to a non-wilderness area.

Topic Question 5:

I prefer Alternative Concept B, as it seems most likely to encourage a hands-off approach to Isle Royale management, without disregarding the fact that humans have a responsibility to maintain the island's ecosystem. I would prefer Alternative Concept C, as it allows for the possibility of wolf augmentation in the future, but the wording of this option seems vague. I am concerned that future NPS officials might interpret Concept C in a manner which was not intended by its authors. I dislike the idea of allowing moose culling on the island, as a sizeable wolf population will manage the moose population as or more effectively. Encouraging hunting on the island would decrease the cleanliness of the environment due to inevitable littering. It would also increase the risk posed both to wolves and to tourists mistaken for prey.

Topic Question 6:

If Alternative Concept B were selected, how many wolves and how many packs would be introduced onto the island?

Click Here by August 29 to Help Save Isle Royale's Wolves!
(This link will take you to the National Park Service's Planning, Environment, and Public Comment website.)

Take Action

Dear George,

Isle Royale National Park, a remote and beautiful island in Lake Superior, is home to a famous community of wolves and moose. These two species have an important predator-prey relationship and are critical to the overall health of the island ecosystem.

But with only three wolves left on the island, the character of Isle Royale is in jeopardy.

If wolves die off, the island's moose population will continue to increase, consuming the native vegetation and eventually running out of food, disrupting the natural balance of the island. We don't want that to happen.

The National Park Service (NPS) is responsible for protecting and managing the beautiful natural resources and wildlife at Isle Royale. NPS is seeking your input by August 29 on how best to manage the wolf and moose community, as well as plants and other wildlife in the park.

One option NPS is considering- -Alternative Concept B- -includes introducing new wolves to the island to balance the delicate ecosystem, preserve the native plant life, and keep the moose population in check. After many years of consulting scientific experts and conducting extensive research to determine what we view is the right response, we at NPCA support this option.

We are urging NPS to bring new wolves to the island so this iconic species does not become extinct at Isle Royale and they continue to fulfill the critical role of balancing the island's natural environment.

Take Action: Tell the National Park Service to bring new wolves to Isle Royale National Park to help balance the park's ecosystem.

Here's how to submit your comments to the Park Service.

Step 1: Go to <https://parkplanning.nps.gov/commentForm.cfm?documentID=> and carefully follow the form instructions.

Step 2: Submit your comments by copying and pasting the sample message below into the "Comments" box on the web form. Questions 1-6 on the form are optional. Remember to personalize your comments by adding personal observations or stories.

Step 3: Once you have completed all of the required fields on the form, click the gray "submit" button at the bottom of the page.

Sample Message/Comments

Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Correspondence: Topic Question 1:

I like option B (reintroducing wolves once) but, it is only a short term solution, after a few years the wolf population will begin to suffer for inbreeding again. We should consider reintroducing wolves every 10 years or to in order to maintain genetic diversity. On the topic of moose reduction I think that options other than hunting should be considered to maintain the moose population. In Australia they had a problem with goats over browsing the vegetation so they caught some of the males and neutered them. Overtime the population was reduced significantly. A similar approach may help the moose, without the need for a hunting season that could hurt the natural, untouched state of the island.

Topic Question 2:

We should try to keep Isle Royale as natural as possible, while still maintaining the health of the ecosystem. Also a long term management plan should be established so as not to leave the fate of the island unknown. This is especially important when considering the fate of the wolves because they will need access to a new gene pool every few years as long as the ice bridges are not forming.

Topic Question 3:

The management should be done in the least invasive fashion. The management should be confined to a small group of naturalists instead of opening it up to the public AKA open hunting seasons. However it is clear that something needs to be done as it is clear that the current wolf population will soon die out.

Topic Question 4:

Climate change is affecting the wolves and moose differently. The wolves no longer have access to new genes because the ice bridge isn't forming. I believe that this means that we need to bring in new wolves. The hot summers and ticks are also killing off many moose which is helping maintain their population at a reasonable level, considering how few wolves there are. I believe that if we can bring up the wolf population we won't have to interfere with the moose.

Topic Question 5:

I like option B however it is only a short term solution. I disagree with any ideas of hunting the moose unless the wolf population cannot be reestablished for some reason. I found that most of the options were vague and I found this very worrisome.

Topic Question 6:

I would like to point to the success they've had reestablishing wolves in Yellowstone national park. I feel that we should follow their example.

Comments: I really appreciate that the NPS opened this discussion up for comments, it was a great idea.

Correspondence: Topic Question 1:

Instead of one set of wolves one time have 3 separate times when wolves are introduced. This brings a more genetically advanced and diverse which means a stronger generation and less chances of disease.

Topic Question 2:

Some issues that should be considered are that the vegetation will not grow unless the wolf population increases or the moose population decreases.

Topic Question 3:

No hunting period.

Topic Question 4:

It would be hard for wolves to travel especially if they have pups who aren't ready for a swim that intense and really not if there inbred.

Topic Question 5:

Most of the re-introduce efforts are all one time things which is not good enough, and second the new and old wolves won't make a dent into the moose population.

Comments:

Correspondence ID: 2176
Moose-Wolf-Vegetation Management Plan/EIS

Outside Organization:

Affiliation:

Received: Aug,27,2015 14:53:07

Correspondence Type: Web Form

Correspondence: Topic Question 1:

A management tool that was not stated in any of the Alternate Concepts is to introduce wolves to Isle Royale multiple times. Taking care of the wolf population also manages the moose and vegetation, taking care of all three problems being discussed regarding the island. Introducing new wolves offers a chance at revitalizing the wolf population with new genetic diversity, however there is little certainty that it would be successful on the first try. There

could be negative pack interactions or other unsatisfactory outcomes, leaving these problems unsolved. Therefore an alternative management tool that should be considered is the introduction of new wolves to Isle Royale multiple times.

Topic Question 2:

Issues that should be considered when evaluating future management of moose, wolves, and vegetation at Isle Royale include how much human intervention is acceptable in wilderness and the use of management as an excuse for recreational hunting. Too much human intervention could rid Isle Royale of its status as wilderness, though something that should be considered is that wolves are the most natural way humans could manage the moose and vegetation. The use of management as an excuse for recreational hunting is worrying because it could allow for sloppy or unscientific management with unsatisfactory outcomes.

Topic Question 3:

The NPS should not use a high intensity of management because most of Isle Royale is designated wilderness. High-intensity management would include the culling of moose and similar activities. Moose population and vegetation should be managed, but at the lowest intensity possible, an example being with help to the wolf population because they would manage the moose and therefore vegetation naturally.

Topic Question 4:

Climate change gives the NPS more leeway in terms of the types and intensities of management acceptable for use. Reluctance to take intensive management action in large part stems from the desire to minimize human impact on wildlife, however with climate change that reluctance almost becomes irrelevant because humans already have such a huge impact everywhere on the planet. Therefore some management does not seem as large of a problem in comparison.

Topic Question 5:

I like the ideas in the preliminary alternatives of managing the moose population and vegetation through the process of managing the wolf population, like in B and possibly C. I like the reluctance towards intense human intervention some of the preliminary alternatives show, like in A and B. I dislike the lack of specificity many of the preliminary alternatives show because they seem to invite possible loopholes and irresponsible management action.

Comments:

Correspondence Type: Web Form

Correspondence: Topic Question 1:

Some alternate Ideas that should be considered are adding more wolves more than once or twice. I believe that wolves should be added at least three times. The number should be boosted to at least thirty wolves with no maximum number.

Topic Question 2:

Some issues that should be considered about vegetation, moose, and wolves would be that the moose will eventually destroy the vegetation that other animals on Island Royal need in order to survive. If there were more wolves this would not be a problem but there is an insufficient number of wolves at this time to control the number of moose. The decision of what to do about this problem will be decided after it is to late for the inhabitants of this island to survive.

Topic Question 3:

Option B is the choice for me because it is the most "natural" except for Option A. in this option we are mimicking the natural process of migration. Hence leaving the human meddling at a minimal.

Topic Question 4:

I believe that Option B would be the best choice of action except for the fact that I have one problem with its wording. The problem I have is that it says the words "one time." This "one time" is in direct correlation to the amount of times we would be bringing wolves to the island.

Topic Question 5:

There are a multitude of things I don't like about the other options. One being lots of loop holes. Two being adding wolves only once. And others like mass moose hunting, too much flexibility in the wording, and things that could have negative reactions.

Topic Question 6:

I like the fact that there are so many options but, option E and F seem like they are mostly for people who want to kill a lot of moose. I think this because there is nothing to help the wolves in these options.

Comments:

Affiliation:

Received: Aug,27,2015 14:54:15

Correspondence Type: Web Form

Correspondence: Topic Question 1:

In addition to the options provided, introducing wolves twice to imitate two migration events should be considered. Wolves could be introduced in groups of 4 to 6 to mimick a small pack, and individuals of mating age should be included to produce offspring. Two introductions of wolves will increase the chance of successful mating and reduce the chance of inbreeding among the first pack of wolves to be introduced. Because of the skeletal deformity gene in the three wolves currently living on Isle Royale, waiting until those wolves die off could prevent this gene from carrying into the offspring and ensure that

the wolves will be capable of hunting and reducing the moose population. In the event that the re-introduction of wolves is not timely enough to prevent mass over browsing of Isle Royale's vegetation, park volunteers could be recruited to help restore plant life to a healthier state.

Topic Question 2:

When evaluating the future management of Isle Royale's delicate ecosystem, the wellbeing of the vegetation should be considered especially. If moose are allowed to consume large portions of the island's plant life, no part of the food chain will be able to be sustained. Neither wolf nor moose could exist on Isle Royale without adequate food for the moose, so steps like manual planting should be taken to ensure that vegetation on Isle Royale does not become depleted.

Topic Question 3:

Isle Royale's status as a designated wilderness area constitutes a hands-off approach to wildlife management in most situations. However, the three remaining wolves on the island are not likely to survive the winter, and therefore won't be able to naturally control the moose population. This would lead to depletion of plant life and mass starvation of the moose population, which would leave Isle Royale barren and reduce the integrity of the park as a whole. Because Isle Royale is a wilderness area with a unique ecosystem that is enjoyed by many, steps should be taken to preserve its wildlife. This being said, opening the island to moose hunting would likely do more harm than good and could result in irresponsible use of the parks resources and the accidental introduction of canine diseases by hunting dogs.

Topic Question 4:

Global warming has increased the temperature of Lake Superior a considerable amount in the past few years, and has prevented strong ice bridges from forming regularly. For this reason, a natural wolf migration to the island is unlikely and cannot be depended on to maintain the wolf population. Since human activity is largely to blame for changes in earth's climate, the current situation on Isle Royale is a problem we have created for ourselves and should take action to reverse.

Topic Question 5:

It seems a bit late for the no-action alternative, the remaining wolves are very unlikely to sustain their own population. The idea of introducing wolves seems like the most effective, but one group of wolves is not likely to be enough. If wolves from the mainland are successfully integrated into Isle Royale's ecosystem, human management of the moose population won't be necessary and should be avoided so as not to overstep the boundary of responsible forest management. For these reasons, alternative options A, D, E, and F don't seem like the most responsible options. The wording of alternative option C uses "could", which doesn't provide a clear plan and puts off the implementation of a plan of action for the island.

Correspondence: Topic Question 1:
Why has it come down to only 3 wolves left? And why in the world is an open season on wolves even being considered?

Topic Question 2:

This is not my area of expertise, however, I believe in harmony and balance. We need to maintain that balance between the moose, wolves, and vegetation. Monitoring would appear to be the only viable way to manage this ecosystem...

Topic Question 3:

In spite of the fact Isle Royale is designated wilderness, again my question would be, what are the reasons for the demise of the wolves? If it is disease, it needs to be managed, if it is human intervention in the form of poaching, it needs to be addressed.

Topic Question 4:

It should be taken seriously, and should be considered.

Comments:

Correspondence Type: Web Form

Correspondence: Topic Question 1:
Consider Option B, bringing wolves once limits there survival, but if every few years the population is managed the moose population will be automatically managed. The more we intervene the less of a wilderness it will be.

Topic Question 2:

When managing, wolves control the vegetation by controlling the moose numbers creating a healthy system. With less wolves people need to manage more changing the wilderness. By controlling moose or vegetation we are putting too much management. Laissez Faire!

Topic Question 3:

There should be as little intervention as possible to avoid any change in the natural patterns. The only way to do this is to introduce wolves, otherwise there will be an over growth of moose and a shortage of plants forcing human intervention in a designated wilderness.

Topic Question 4:

Minimal intensity: Both populations will struggle with temperature, but they will eventually adapt. If there are slight adjustments to the scale, like adding wolves, the populations may go back and forth, but, it will keep the ecosystem in balance and as a wilderness.

Topic Question 5:

It encourages hunting which encourages people to come to designated wilderness, no longer making it a wilderness. It is a human foot print that would be left on the Island. It would also be hard to move moose off of the island so relocation is not an option.

Topic Question 6:

Please consider only adding wolves every few years if necessary balancing the entire system. Human intervention also plays a massive role in Island Royale. As Humans we have made footprints in every part of the world. As a designated wilderness area, its purpose is to and remain wild. The more we manage, the more we put our footprint on our earth. To keep the wilderness we need to do as little as possible to make the biggest and best changes.

Correspondence: Topic Question 1:

I believe concept B should be put into effect because if we mimic the migration there will be genetic diversity in the wolf population. That will raise the chances of survival for the wolves because if they bring in strong healthy wolves and they breed together the genetic pool will be stronger.

Topic Question 2:

Some of the issues that should be considered is that if they bring in the new wolves they need to make sure that the wolves' diet is moose because if they do not eat moose it would be changing their whole way of living and that could kill them.

Topic Question 3:

It should be a very low management because if people get too involved in the immigration and management of the wolves and moose it could change the cycle and way of life on the isle. The isle should stay as natural as possible because that is how it has been for many years and the animals are used to that.

Topic Question 4:

They may have to consider maybe adding more wolves or moose in the future because if something happens to one of the species on the isle it could unbalance the order of life on the isle again.

Topic Question 5:

I think that concept E is not a good concept to consider because if people start hunting on the isle for moose it would not change the problem we have with the wolves. The wolves could still die off and the moose could still over browse the vegetation. Even though they are hunting the moose it could change the ecosystem and dynamic of life over time.

Aug.27,2015 14:59:35

Correspondence Type:

Web Form

Correspondence: Topic Question 1:

Proposition B I feel like is going in the right direction for it is only reintroducing wolves. However an alternative to B is first taking a new pack from somewhere around the great lakes region about the size of 20 wolves and placing them on the Island. Then every 10 years for the next 60 years add two more wolves genetically uncommon to the island to mix up the gene pool. I feel this would still be a mimic of the natural world if the ice bridge formed more often like it used to.

Topic Question 2:

The wolves on the Isle Royal are the keystone species of the island. With the addition of wolves to the island, the moose population would become more skittish resulting in less grazing and foraging allowing the vegetation to grow back. A similar occurrence can be seen at Yellowstone National Park.

Topic Question 3:

The only type of management the NPS should consider is the reintroduction of wolves to the island once the last three wolves have died out. This allows the faulty genetics in the three wolves that are left to not be passed on. Also the introduction of wolves is not as an invasive of a procedure as managing the moose population. Also managing the moose population could require more resources and money.

Topic Question 4:

Isle royal is and always should be a wilderness area protected by hunting. It should be one of the few places left in this country that is truly wild. The human interaction should be minimal with no taking from the island and only adding whether it should be wolves or moose in the future.

Topic Question 5:

5 I feel that the best option would be b. It helps restore the Island to its natural state through a natural process. If option b is deemed incompatible or

impossible to do, then option A should then take place. Option A is my second choice due to the most natural of the options, but it has the possibility of wolves dying out on the island. Option C, D, E, and F do not seem to have enough information for me to comment at the moment. The wording is too vague with not enough information to make an educated choice. For example C, D, E, and F are calling for moose management, however there is no information on how that is going to go about. Will it be hunting, relocation, or defertilization of the female moose on the island?

Topic Question 6:

I would also like to add that whatever what option is voted on to use, I hope that the NPS will do their best to make to carry out whatever option in the most natural and hands off way possible to manage the problems on Isle Royal.

Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,

Correspondence: Topic Question 1:
The NPS should actively study the flora and fauna of the island but not manage it.

Topic Question 2:
Being designated as wilderness means no management.

Topic Question 3:
NPS should manage the 1%.

Topic Question 4:
The climate cannot be kept from changing. Studies of plant and animal trends should be undertaken which may be likened to the canary in the coal mine.

Topic Question 5:
I do not like the idea of management in a wilderness area.

Comments: Isle Royale is a wilderness area and any attempt to manage will detract from this designation. The moose/wolf have been studied for a long time and the current situation of inbreeding and decline of the wolves is part of the cycle. Our compulsion to manage Nature to our own expectations is not wilderness and not natural.

The chart provided shows the number of moose doubled after 1990 while the wolves did not experience a similar spike. A precipitous decline in moose between 1996 and 1999 did not drastically affect the number of wolves either. This reading would suggest that moose populations are managed more through disease, starvation and other factors than by wolves.

In 65 years the wolf population is dying out, do you expect to reintroduce the wolves in 65 more years?
Isle Royale is not a closed system. The wolves that crossed the ice bridge last year retain that knowledge and will exploit it if in their interest to do so.

Comments: Dear Superintendent Green,

Wild life is the very breath of our national parks, including the moose AND wolves at Isle Royale. And there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -a dearth that threatens the overall ecosystem health of this iconic national park. I am sending this letter in favor of an alternative, and I have copied it from that of NPCA, as it clearly states my thoughts and feelings on the matter- -I have only begun to travel to the Upper Peninsula in the last couple years, though never to Isle Royale, and in that time I have learned of so much beauty and wildness on that island that I long to be near there, and I support the balancing of that ecosystem.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

Correspondence: Topic Question 1:
Please see comments following Question 6. Thank you.

Comments: I've been thinking a lot about the situation on Isle Royale, anticipating the absence of wolves, and considering what a couple of Canadian national parks are doing to maintain vegetation in places where they don't choose to have wolves. It's not what I consider the same as the NPS's objective of conserving natural processes.

An old phrase comes to mind: Those who do not learn from history are bound to repeat it. I hope we can avoid having either to resort to hunting moose and converting Isle Royale to a tree plantation, when instead wolves can be an essential part of the moose population dynamic if we just put them there. Ice bridges forming to Isle Royale every tenth year on average does not reassure me to depend on spontaneous immigration soon, given the ever-expanding town of Thunder Bay, increasing traffic on the Trans-Canada Highway, and skyrocketing temperatures worldwide.

I am hard mailing copies of two articles that illustrate the difficulty, labor intensity, and expense of retrieval of national park ecosystems in the absence of wolves. I hope they will be useful to you in planning your options for moose-wolf and vegetation management at Isle Royale. I wonder how eager Congress will be to fund retrieval measures that could have been rendered unnecessary by timely action.

Correspondence: Topic Question 1:

Option C for augmenting wolf population of Isle Royale is the best, but does not go far enough. Isle Royale can support enough moos to maintained genetic diversity, but researchers have warned for years that wolf population augmentation may be needed, and it should in future be augmented before the population is nearly zero.

Topic Question 2:

Beside augmenting the wolf population and working to control, eliminate invasive species, management should consist largely of monitoring environment for effects of climate change on this unique natural laboratory. The wolves can manage the moose population far better than culling by humans.

Topic Question 3:

The wilderness qualities of that 99% othe island must be maintained, and motorized vehicles should be excluded.

Topic Question 4:

NPS should encourage visitors to reduce their carbon footprints. In general, interference should be minimal. However, in some regions, climate change is already resulting in serious increases in tick populations which may be life-threatening to moose. Given that this is a problem greatly exacerbated by human activity, action to protect some or all of the moose population should be considered. No culling of moose or wolves or and native vertebrate species should be undertaken.

Topic Question 5:

Beyond the ecosystem services wolves provide, they have great value to perhaps the majority of citizens of the US, just because they are out there and show that we have not mercilessly extirpated the wild from all of America. This value and these non-destructive stake-holders have been too much and for too long ignored by, for example USFWS officials. Isle Royale is a unique environment where this value has no reasonable conflict.

Topic Question 6:

The public scoping period ends 8/29, however, the Record of Decision is not expected until Fall 2017 at the earliest. Two and one-half years is simply too long. The wolf population of Isle Royale should be augmented as soon as possible with the advice of the best wolf biologists.

Correspondence: Topic Question 1:

An alternative to the problem stated above would be to introduce the new wolves to the area but lay back on the human interaction. Introducing the wolves (if successful) would allow for the moose population to decrease allowing the vegetation to rise up providing a balance.

Topic Question 2:

Some issues that should be considered when evaluating the future management of the wolves, vegetation, and moose population would be; will the solution last, who will be effected by the decision and how far will the decision go until the solution is clear. If the solution seems short term (such as diminishing the moose population) the problem is just going to arise again, so why do it? Deciding on whom/what will be effected by the decision is also a big role as the final decision nears. If they leave the situation as it is, the plants will be effected by the large moose population and diminish greatly causing the moose to starve. However will the decision (if they decide to go to the extreme) to not intervene cause a greater side effect than intervening?

Topic Question 3:

National Forests are a place for nature to run its course and humans to learn from its beauty. By not intervening in the issue the wolves would most likely diminish and gradually die out. This would be considered nature's course. However, climate change has greatly impacted the decision allowing for a controversy over human involvement. Wolves may have made their way over on the ice bridges if the weather was cooler allowing for a new diversity of wolves. However because of global warming migration is not a natural alternative. Because this is not an option human involvement would make sense. In this sense I would introduce new wolves on the island mimicking a migration. Solution B.) Introduce wolves once.

Topic Question 4:

Climate change has a strong effect on the situation. Because of the warmer winters the ice bridges have not had a chance to form as strong and as long as they used to. This is causing a very low chance of a natural migration occurring. In this way climate change could be considered one of the main reasons the wolf population has been decreasing along with ticks and health related diseases.

Topic Question 5:

I like the fact that they covered several different ideas and allowed the community that cares about the preservation of the natural environment decide the verdict, or at least have an input. However I disagree with the alternative of killing of the moose population because it would only be a temporary solution. Eventually the population would rise again causing a greater stress on vegetation.

Correspondence: Topic Question 1:

By the government's own definition, Isle Royale is a national Wilderness. No management action is required or desired.

The data on the apex predator-prey relationship is now 60 years old. How much more data do you need to know that inbred populations are unsustainable?

Topic Question 2:

The cost of such management versus the benefit.

Costs in dollars and man hours. Benefits in terms of the evolving, natural wilderness ecology which would occur absent any management action.

Topic Question 3:

Type of management: trail and campsite maintenance.

intensity of management: same level as now.

Topic Question 4:

What, you mean in the next two hundred years? Or do you mean the natural changes in the ecology of the island flora due to the normal variation in temperature?

The temperature regime determines the ecological structure of the plant communities, there really isn't much "managers" can do about that.

Topic Question 5:

I like option A; do nothing. the rest are of them are foolish.

Topic Question 6:

I know that these comments will be read with consternation and dismay but the Island is supposed to be a wilderness, so let it be one and monitor the results. The laboratory is there. If NPS must manage something, manage the conditions to make access to the park safe and reasonable.

If Wildlife management types need a laboratory, then declare the Island one and shut down the pretense that the Park is for the enjoyment of all citizens.

Comments: The Detroit Free Press carried the story of the three remaining wolves and the high mortality of the population due to inbreeding this past June. It is ironic that the same newspaper lobbied for the Island to become a national park in the 1930's because the editors felt the Island should be protected from exploitation by the summer residents. Now that the summer residents have died off from active management, the next population under scrutiny for management is the moose. At least the summer residents and fishermen could get off without being culled.

Good luck with the study. The requirements justify a lot of time reading and cross referencing comments. Lets hope a rationale plan comes out of it all.

Correspondence: Topic Question 1:

I believe Alternative Concept A is the best option. Leaving things as is will make certain of no change because change can be beneficial or deadly to the island. For example, introducing more wolves or taking out moose affects the island in its own way. Taking out moose will cause less forest cover for vegetation. Other alternatives would be introducing another predator to the moose population to sustain the increasing moose population.

Topic Question 2:

Other animals would be affected by change in habitat. The amount of people coming in to Isle Royale will change due to changes in populations of wolf and moose. Also harming moose and wolf populations by taking them out or putting more in.

Topic Question 3:

The NPS needs to make sure they don't overpopulate or under populate because it can cause a change to the other wildlife at Isle Royale. They also need to make sure they don't damage other animals habitats.

Topic Question 4:

The NPS needs to make sure the climate change doesn't affect any plants like orchids. Also they need to make sure it doesn't affect streams and hydrology.

Topic Question 5:

I like the different approaches each of the alternatives take. I like Alternative C and that maintaining both species would be a good plan. I dislike introducing a population or decreasing a population because it can be either beneficial or deadly.

Topic Question 6:

I believe the NPS will proceed with a great management plan but need to consider all the other areas such as other wildlife, habitats, and manage increasing population and decreasing population when introducing more animals or taking out the animals.

Correspondence: Topic Question 1:

Things that need to be considered are the fact that if we step in to a natural habitat to help preserve the nature. It could turn out for the worse. EX: if we start to kill animals or bring predators then this could cause major extinction in that area which will cause plants to over grow or might even cause random vegetation in unwanted areas.

Topic Question 2:

Some of the issues that they need to look at is what the moose are doing to the vegetation. Moose right now are destroying the vegetation at Isle Royale so bringing wolves as a predator is a good and bad idea. A good reason to bring a predator into a natural habitat is that the predator will slow the growth rate of moose. why it could be negative is because wolves can get rid of all moose not just some.

Topic Question 3:

In my opinion I think the best alternative concept is A. Reasoning behind this is because if you just let nature take its course rather than messing with it then nature could fix itself over time.

Topic Question 4:

A changing climate could result in no migration of wolves by ice bridges for several of years. If this happens then nature is basically resulting in overgrowth of moose. In that case if so then bringing wolves from different areas to Isle Royale might not be a bad idea.

Topic Question 5:

Like I said in the the third question I like the idea of concept A the most. Concept E on the other hand I think is not right in a way because it is talking about hunting instead predatory killing.

Topic Question 6:

To preserve a wilderness area just let nature take its course.

If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,

Correspondence: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Correspondence: Topic Question 1:
Another alternative willing to consider is allowing seasonal hunting of the moose if the moose population continues to get out of hand and has a substantial effect on vegetation.

Topic Question 2:
Issues that should be considered when evaluating future management is the prevention of low wolf populations by closer evaluation and involvement. Considering wolf reintroduction or wolf augmentations before the wolves reach a calculated minimum level, such as a standard wolf to moose ratio needed to be obtained for island stability. Using this method, problems concerning the moose, wolves, and vegetation of island Royale will be solved before they become to problematic.

Topic Question 3:
NPS should conduct intense management of the island through the use of wilderness cameras, trackers, or essentially any sort of device or methods that allows them to intensely monitor the island while remaining they distance unless needed.

Topic Question 4:
I would recommend NPS use intense management in regards to changing climate, such as reintroducing certain vegetation accumulated to the climate changes so the moose and wolf populations are allowed to thrive on the island.

Topic Question 5:
I dislike that the preliminary alternatives concepts don't consider the territoriality of the existing wolves if they augment new wolves into the population to stimulate a migration event.

Correspondence: Topic Question 1:

Try to come up with solutions that would increase the chances of the wolves being successful in surviving on the island.

Topic Question 2:

At what point will the vegetation not support the grazing animals (including moose). How many wolves would it take to keep the moose population in line with the available forage? Since usually only one female in a pack will produce a litter, and wolves tend NOT to overbreed, that should make it comparatively easy to balance the predators and prey with the available grazing available.

Topic Question 3:

Could animals be tagged? There should be some way to get a fairly accurate count of whatever animals you are watching. Radio collars?

Topic Question 4:

Since these animals are on an island, there should not be too much problem with arrival of outside animals. However, it could well change the type and amount of grazing available, as well as problems from parasites on the animals.

Topic Question 5:

I feel that there is a little bit of "jumping to rash conclusions" going on here. I do not feel that decisions made without all the possible outcomes considered is in the interest of either people or animals.

Topic Question 6:

Just that you are dealing with a unique situation and very special piece of creation here. We need to do what is possible to avoid extinction of ANY biological entity. Climate change is going to make things difficult enough without hasty decisions on the part of humans making the situation worse.

Correspondence: Topic Question 1:

I think the study could still go on, even if new wolves were brought in. But, if no new ones are introduced, then the pack there will die, and there won't be any predator-prey relationship to study at all. After that, the moose could overgraze, become even more overrun with ticks, and perish too. When managing the wilderness, of course they should try to disrupt the area as little as possible, but no intervention at all is not a good idea in my opinion.

Topic Question 2:

I think those in favor of doing nothing should think about the future consequences of the study and the animals on that island in general. If nothing is done, the island ecosystem will most likely collapse. With that in mind, they should move forward with relocating new wolves onto the island.

Topic Question 3:

Although the area is designated wilderness, humans have still affected it. The virus that lowered the wolves' numbers was unintentionally caused by humans, and one could also argue that human caused climate change has allowed ticks to have a larger feeding season, therefore hurting the moose population. If most of the reasons the Isle is suffering are human caused in the first place, it makes sense to say that we should manage it at whatever intensity it takes to reinstate an equilibrium between the species.

Topic Question 5:

I like the fact that they are making an attempt to keep their hands off the situation, and let nature take its course, as in Concept A. But at this time I don't think that's the right course of action, because the wolves could very easily die out. Concept C seems as if it might be hard, but maybe if we did that and kind of reset the equilibrium, then the ecosystem would be fixed again, and easily balance on its own. The parts of Concepts E and F with no wolves being brought in will most likely not work. The small pack there is already on its last legs, and without some new genes, there is little doubt in my mind that they will perish.

Topic Question 6:

I didn't answer Number 4 because I think climate change has already greatly affected the Isles. The area is almost not a 'wilderness area' anymore, because human caused climate change affects it every day. Management should reflect the fact that it is not a completely untainted area. Isle Royal should be restored back to the population balance it once was, and if that involves human technology going into the area for a time, then so be it. As long as no species is either close to dying out, or running completely rampant.

Correspondence: Topic Question 1:

In my opinion, one of the better alternatives is Alternative Concept A. It basically leaves no trace, costs less money, the scientific study can continue, and we can let nature run its course. Another alternative that is very interesting is Alternative Concept B which also has its pros such as genetic diversity, the wolves could recover genetically, and there is a moderate human impact. Yet these alternative do come with some negative, for example it's only temporary, the wolves could die out, and/or the study could end.

Topic Question 2:

The issues that should be considered for future evaluation should be the climate. the vegetation on Isle Royale has adapted to the climate for quite some time now, but the mammals have not. The moose need a cold climate to survive. Without moose on the island the wolves would not be able to feed which could lead to a very harsh year for the wolves as well.

Topic Question 3:

The NPS should keep Isle Royale a national park and still have researchers come and investigate the healthiness of both moose and wolves. This would bring more information to the outside world on Isle Royale and this could also help with future calamity.

Topic Question 5:

I like how there are different options for the preliminary alternatives because this can lead to a greater and more sufficient answer. These options can lead to a combination answer to all the problems on the island. In my opinion some of the preliminary alternatives are not very robust, but to many other people they believe that they can be what will heal Isle Royale.

Topic Question 6:

I strongly believe taking a shorter amount of time to get this project done would majorly effect this experiment.

Correspondence: Topic Question 1:

Another alternative concept or management tool that should be considered is adding an additional moose predator in attempt to control the moose population without impacting the wolves.

Topic Question 2:

Issues that should be considered when evaluating future management of moose, wolves, and vegetation at Isle Royale include the health and well being of the remaining animals living there. Incest could become more of a problem, leading to worse deformities among the moose and wolves.

Topic Question 3:

The NPS should consider using as little management as possible. Instead, the NPS can continue to observe how the moose, wolves, and vegetation evolve in the next few years. Seeing what would happen to Isle Royale without much human intervention would be a great learning tool for future students and scientists.

Topic Question 4:

If the climate will be changing at a rapid rate, the NPS should consider stepping in to relocate the moose and wolves to a location with a more constant climate that is suitable for their needs. If the climate changes at a more gradual rate, the NPS should stay out of the situation and observe how the animals react and adapt.

Topic Question 5:

I like that so many preliminary alternative concepts are being considered and evaluated to ensure the best outcome for the animals and vegetation at Isle Royale. I dislike the idea of intensively managing the moose population, because then the moose might not be able to survive without help from humans.

Topic Question 6:

I appreciate the fact that students can offer their opinions and comments on the moose and wolves study at Isle Royale. This is an amazing learning opportunity for us.

Comments: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,

Correspondence: Topic Question 1:

1. Coupling the idea of vegetation restoration on surrounding islands from Alternative Concept F should be considered in tandem with whatever option the NPS decides is the most prudent. This would help preserve delicate plant populations while also potentially aiding to reduce moose population swings.

Topic Question 2:

2. The cost of the various plans, affect to the Isle royal flora and fauna of the various plans and the effect on the Isle Royale research program in relation to each management concept.

Topic Question 3:

3. The NPS should try to use the least disruptive tactics considering the parks designation as a wilderness area while doing its best to preserve the unique and delicate environmental system on the island, after all Isle Royale is one of the only areas in the US where moose, wolf and plant populations can remain relatively undisturbed and can exist without the threat of being hunted or killed, directly or indirectly because of humans.

Topic Question 4:

4. The NPS should consider introducing wolves in light of less ice bridges forming, the NPS should also consider collecting and planting various boreal seeds on surrounding islands and the mainland Isle Royale to provide additional food to moose and to maintain the plant communities.

Topic Question 5:

5. In my limited opinion the most logical course of action given the information presented by the NPS and research data seems to me to be Option C. This course of action would preserve the delicate plant species from over browsing as well protecting the wolf and moose populations while leaving the NPS with the option of controlling moose populations and reintroducing wolves in the event that a first introduction failed. This Option would also allow for the continuation of the hugely important predator prey study on the island. Finally this option would allow the NPS flexibility to do what they need to do in light of unseen variables and hurrles.6. I dislike Alternative Concept A because of the negative effect the lack of a predator will have on the plant and moose populations and many other Isle Royale inhabitants that could reflect the 1999 population crash as well as the fact that ice bridges are forming less making the natural emigration of new wolves unlikely. I dislike Alternative Concept B and D because though they do allow for the reintroduction of wolves on the island they do not account for the possibility of a failed introduction that would require further actions as well as the fact that direct moose management would not only be costly but would infringe on the park as a wilderness area. Finally the Alternative Concepts D and F would protect the delicate plant life on Isle Royale but would be highly costly, seemingly unnecessary since wolves could easily control the moose population naturally and would intrude on Isle Royale as a wilderness area.

Topic Question 6:

6. I understand that the NPS's system of official procedure is very important and legally binding but if there is any way for the NPS to expedite this process it would definitely help a wilderness area in trouble, by the time those two years have come the remaining wolves will be dead and moose populations will continue to heighten.

Correspondence: Topic Question 1:

Timely action needs to be an element. I believe a decision and its implementation needs to be made more quickly than the current forecast of two years. The moose and wolves on Isle Royale have been studied for decades by scientists, so there should be plenty of facts to help develop and begin implementation of a solution more quickly.

Topic Question 2:

Humans should not become zookeepers of the island's wolf and moose. But if we value the type of wilderness the island has been, then we need to recognize the need for some human intervention. I think there's a lesson in the return of wolves to Yellowstone, which has helped restore elements of the ecosystem so that it is in better condition than it was without the wolves.

Topic Question 3:

Human intervention should be kept to a minimum, aside from helping to ensure a prey-predator balance within scientifically determined parameters.

Topic Question 4:

Lack of ice bridge formation may require more frequent intervention to support prey-predator balance.

Topic Question 5:

I like Alternative C because it would help to maintain a unique wilderness for visitors, and does it without culling. I also like the idea of restoring vegetation, if necessary due to climate change or temporary overabundance of moose, mentioned in Alternative F.

Topic Question 6:

The Humane Society of the United States has pointed out that "problem wolves" from other locations could be brought to Isle Royale, providing a more humane alternative than culling so-called "problem wolf" populations.

Correspondence: Topic Question 1:

A possible and plausible management tool to be considered is to bring new wolves to the island so this iconic species does not become extinct at Isle Royale and they continue to fulfill the critical role of balancing the island's natural environment and the park's ecosystem.

Topic Question 2:

Isle Royale National Park, a remote and beautiful island in Lake Superior, is home to a famous community of wolves and moose. These two species have an important predator-prey relationship and are critical to the overall health of the island ecosystem. But with only three wolves left on the island, the character of Isle Royale is in jeopardy. If wolves die off, the island's moose population will continue to increase, consuming the native vegetation and eventually running out of food, disrupting the natural balance of the island.

Topic Question 3:

The National Park Service (NPS) is responsible for protecting and managing the beautiful natural resources and wildlife at Isle Royale. I think NPS needs to everything they can in order to manage the wolf and moose community, as well as plants and other wildlife in the park.

Topic Question 4:

Anything that needs doing, needs to be done that helps maintain the balance of this ecosystem..

Topic Question 5:

I like anything that supports maintaining a thriving ecosystem for the wolves, anything other than that is not a solution.

Topic Question 6:

One option NPS is considering- -Alternative Concept B- -includes introducing new wolves to the island to balance the delicate ecosystem, preserve the native plant life, and keep the moose population in check. After many years of consulting scientific experts and conducting extensive research to determine what we view is the right response, we at NPCA support this option.

Comments:

Correspondence Type: Web Form

Correspondence: Topic Question 1:

One alternative is to introduce wolves to the island multiple times to make sure the wolves are able to survive in the new environment, acclimate, and figure out the food supply and hunting grounds. Another alternative is to relocate some of the moose to another habitat off the island, and a third is to augment the current wolf population, or, if new wolves are introduced, augment that population. Introducing wolves will allow for genetic diversity among a new wolf pack or packs, which could allow the wolves to survive longer.

Topic Question 2:

If no action is taken to introduce or augment wolves, moose populations will grow because of the lack of wolves on the island. The vegetation will suffer, and eventually the moose will die of starvation. However, because Isle Royale is a wilderness, the NPS should try to alter the natural environment as little as possible.

Topic Question 3:

The NPS should consider introducing or augmenting wolves, but should not need to hunt or manage moose populations because the wolves have been able to manage the moose populations relatively well in the past. However, because it is a wilderness, the NPS should consider trying to introduce or augment wolves with as little change to the natural environment as possible. Culling of moose should not be considered, except as a last resort, because of the amount interference of the wilderness area. In addition, relocating moose should not be considered right away because of the amount of wilderness interference.

Topic Question 4:

The NPS should consider lower intensity of management because the higher temperatures are, or will, affect the moose populations on the island. The NPS should also consider the number of wolves introduced or augmented to Isle Royale because the climate change can, and will, affect the moose population as well as the wolves. The balance of the wolves and moose will change with the climate change, so a lot of decisions in the future will have to be based on how the wolves and moose interact with the land and each other in the changing climate.

Topic Question 5:

I dislike the idea of Alternative Concept A because it is highly likely that the remaining wolves on Isle Royale are going to die in the next few years, and vegetation will suffer and moose populations could increase. I dislike Alternative Concept B because introducing wolves once will probably not work, because the potential for disease, the wolves leaving on an ice bridge, or fighting with the current wolves and having the possibility of killing each other is too high. I like Alternative Concept C because if you maintain wolf population, moose population will be regulated as well. I also dislike it because if there are enough wolves on Isle Royale they should be able to control the moose population and it should not be necessary for the NPS to maintain the moose. I dislike Alternative Concept E and F because of the amount of human change that is suggested. Even if the moose density is decreased, the moose will reproduce and the problem could occur again. There is a possibility of overhunting moose with Alternative Concept F as well, which could lead to wiping out the moose population completely.

Topic Question 6:

Depending on how many wolves are introduced, the amount of times wolves would be brought to the island could change.

The wording for the alternatives is very vague for many of the options. There are many other things to consider because we don't have specifics, and it is hard to find the right, or good, option.

Correspondence: Topic Question 1:

The fall of the wolf population on Isle Royale National Park has created an uprising on what needs to be done to deal with the problem. Three important things to remember what thinking about the topic is the wolf population, moose population, and vegetation. Alternative Concept C is the most effective in my opinion. The ability to reintroduce a wolf population to the island along with maintaining the moose population so it doesn't become out of hand. With the scarce amount of wolves currently on the island, I predict the moose population to rise dramatically. This may cause vegetation to get damaged which is a factor that needs to be considered when debating the issue. What kind of vegetation is in the National Park that is not on the mainland? This is where I like the part located in Alternative Concept F where it states that to restore vegetation through seed gathering and planting on off shore islands.

Topic Question 2:

There are a lot of concerns involving the future management of moose, wolves, and vegetation on Isle Royale. The extremely low population of wolves along with an increased spinal deformity among wolves on the island is one of them. Another concern would be the fact that the moose population is expected to rise out of control if nothing is done to prevent this from occurring. Finally, the vegetation can be damaged to create an entirely different habitat for the animals currently living in the National Park. The time frame before a final decision is made is good in my opinion, because the people studying the data on the island can see how the moose population and wolf population will change and a large rise in population wouldn't occur before a decision is made anyways. There is a lot to consider what debating what should be done with the issue that has arose on the island.

Topic Question 3:

The management of the island brings up issue due to the fact that most of the island is designated wilderness. I believe that to go upon and break some of the rules in this kind of an area would be good in maintaining the populations. There is no one to really attack the situation without going forward to act on the issue. I think that culling of moose is not necessarily a bad idea. This would help keep the moose population relatively steady while the wolf population is becoming established if that is the option chosen to move forward with. The human involvement wouldn't be extremely large, but is need no matter what if you want to keep wolves on the island. The chances that the wolf population increases to a suitable number without human involvement is very low. The management of the island in the areas designated wilderness need to be more involved for the time being to deal with the issues on Isle Royale.

Topic Question 4:

The climate change on Isle Royale National Park has affected many animals on the island. The large portion of this would be the moose population. The warmer summers have changed the way moose eat which has caused them to eat less and receive less nutrients they need for a harsh winter. This meaning that they are not prepared to the winter until it hits them in the face. Also, the tick population has been thriving on the island and has attacked the moose. There isn't a whole lot we can do about the climate change on the island, but as a whole, we can all do something to help out our environment.

Topic Question 5:

The six preliminary alternatives are a good start in helping decide what needs to be done with Isle Royale National Park along with the wolf population, moose population, and vegetation on the island. I don't like that the only plan of action that includes the possibility of trying to reintroduce wolves more than once is Alternative Concept C. I think to reintroduce wolves to the island would take more than one attempt to accomplish the feat. I do like that Alternative Option F includes the possibility of vegetation restoration, but with that in mind, it would also mean more human involvement in the area designated as wilderness. The ability to have the public voice their opinions on the issue and take their arguments into consideration when deciding what is

going to be done is something I respect very much. The wolf population needs help, and without a predator, the moose population is expected to increase rapidly which is likely to cause vegetation damage.

Topic Question 6:

Wolves are a cool thing that Isle Royale National Park has on the beautiful island. Without wolves, the possibility of tourism may decrease, but also the moose population will become out of control. I had the ability to complete a backpacking trip on the island two years ago. We were fortunate enough to witness moose on several occasions on the trip. Without the wolves, there would be no chance of seeing on the island, but also would completely change the way people viewed the island. The vegetation has the ability to change with an over whelming moose population. A return in the future would be pretty cool to be able to not only witness moose, but also be able to witness wolves when adventuring on the island.

Correspondence: Topic Question 1:

Since this is a national park, I think it's important to remember that when we make an exception for one park, it becomes easier to make exceptions down the line. Bearing that in mind, I don't believe that much, or possibly any, management should be done. As far as alternatives go, I think we should consider reintroducing both species if or when they die out on the island. This would allow us to finish the experiment on the islands, but in the end would allow the island to return to its former state.

Topic Question 2:

I think the most obvious thing to keep in mind is that what is done to one (moose, wolves, vegetation) will have a direct effect on all the others. This is a delicate system, as research has shown, and extreme actions will have extreme effects. Delicate though it may be, since creation nature has done fine on its own without human intervention. And sometimes it's better just to leave nature alone and let it replenish itself.

Topic Question 3:

The management and intensity should be as low as possible. As afore mentioned, when you make exceptions with one park it becomes easier to make future exceptions. However, if truly catastrophic effects (such as the total loss of all moose and wolves, or extreme erosion caused by out-of-control grazing) I think it would be appropriate to take action.

Topic Question 4:

Let nature take its course. It's hard to tell what type and intensity of management should be taken in a changing climate when you're not sure exactly how the climate is going to change. I think that climate change is not yet an issue, and with wisdom we should be able to avoid dangerous climate changes in the future.

Topic Question 5:

I like that there are many options given, and the flexibility of those options. I don't like the amount of emphasis put on the management of moose. There is no problem with there being too many moose, the problem is that there aren't enough predators. If any action is taken, I think it should focus on restoring the wolf population, not lowering the moose population

Topic Question 6:

If I had to come up with a plan that benefited both the environment and the NPS, I would say to wait and see what happens, continue the experiment, and if the populations both die out, reintroduce both and start over. This would allow us to conclude the experiment, and for us to learn from our mistakes. If the populations do come back, we can learn from how, and no intrusion is needed.

Correspondence: Topic Question 1:

The wolves and the moose are not the only things on the island, but their health effects a lot of things. The vegetation and the rest of the ecosystem should be considered when making a decision on what to do and how to help Isle Royale. Bringing machinery and fire arms (to hunt moose) could be very disruptive to the ecosystem of the national park.

Topic Question 2:

Researchers have been observing these animals for many decades. The research is a predator/pray study, if the wolves die out there will no longer be a predator/pray relationship to study, and the half a century worth of research will be put to a halt. Even though reintroduction of wolves would be considered human intervention to a wildlife research project and to a nation forest, it is our best option. There are some things that could go wrong with introducing new wolves to the island. The wolves could not survive on the island due to stress from relocation or, assuming that there are still wolves on the island in two years, the new wolves could have conflict with the existing wolves on Isle Royale. Given these factors I don't think that the reintroduction of wolves to the island should be limited to a onetime thing, and researchers should spend time observing the process and making sure that things on the island are on their way back to stability.

Topic Question 3:

If we do nothing the help the balance of predator/pray on Isle Royale the wolves will die out and the moose population will be out of control. With an overabundance of moose they will devour all the herbage, completely destroying the vegetation and habitat for anything else living on the island. To prevent moose overpopulation without wolves people will have to come hunt the moose or relocate them, which both would involve the use of machinery and would be a great disturbance to the wilderness area. Either way, human intervention is going to be needed to maintain the balance in the national park and the best way to do that would be to bring more wolves to the island.

Topic Question 4:

Because the climate is getting warmer there may soon no longer be ice bridges from the island to the mainland, which means that if the population of wolves that are currently populating Isle Royale die off there will be no way for new wolves to get there without our help.

Topic Question 5:

The best option presented is Concept C, maintain population of moose and wolves which could include reintroduction or augmentation. It seems disadvantageous to limit ourselves to only one reintroduction of wolves. It is possible that something would go wrong with the admittance of new wolves and if the process isn't allowed to be repeated until it makes a difference than this whole thing is a waste of time. Concepts D, E, and F don't make much sense to me. The wolves have their niche on the island, to eat the moose and keep their population in check. If the wolves die there will be nothing there to fill their niche, except us. I think that it would take a lot less human effort if we brought in wolves to do their jobs instead of bringing in people to do the wolves jobs.

Comments:

Correspondence ID: 2241
Moose-Wolf-Vegetation Management Plan/EIS

Outside Organization:

Affiliation:

Received: Aug.27,2015 19:49:07

Correspondence Type: Web Form

Correspondence: Topic Question 1:

Only 3 of the 6 alternative concepts mention wolf reintroduction or augmentation and none with any specificity. Concept B and Concept D only allow for wolves to be reestablished once which may not be sufficient and is very short sighted. Concept C allows for maintaining populations of wolves and moose which "could" include wolf reintroduction or augmentation.

Concept C appears to be the best alternative, however, it does not go far enough. There must be sufficient flexibility to allow for wolf reintroductions as necessary over the next 20 years to insure genetic diversity for wolves and sustainable populations of both wolves and moose into the foreseeable future.

Maintenance or culling of moose is not necessary if wolves are allowed to fulfill their ecological role. Absent wolf immigration, which no one can predict, there is no likelihood of having a wolf population without human action.

Topic Question 2:

We believe the NPS should consider and evaluate the ecological benefits wolves provide; The only pup observed in 2015 was visibly deformed; 100% of wolves examined since 1994 (over 30 of them) have spinal anomalies. The weakened state of the remaining wolves is likely interfering with reproduction and survival.

The NPS must consider the data collected through 57 years of research conducted on Isle Royale. These researchers should play a key role in the discussions.

Topic Question 4:

NPS must protect the unique wilderness qualities of Isle Royale through monitoring of habitat for wildlife, including wolves and moose; maintenance of soil and water quality and ecological stability of plant and animal communities including the control of invasive species. Management is necessary to maintain important wilderness values including the presence of a top carnivore which is vital for ecosystem health. The culling of moose and the use of motorized equipment is unacceptable.

Topic Question 5:

Along with the ecological benefits wolves provide, they also have intrinsic value. You may not see a wolf or hear them howl but it is important to know there are still wild places where wolves exist.

Correspondence: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,

Correspondence: Topic Question 1:

When considering management of Isle Royale I believe that it is important to remember that Isle Royale is home to many other plants and animals besides the wolves and moose that could be greatly affected by the actions we take on the island.

Topic Question 2:

I think the most important issues to be considering when evaluating the future of Isle Royale are the health of other plants and animals and the possibility that when introducing new wolves there is a possibility of negative pack interaction.

Topic Question 3:

I believe that it is important to abide by the rules that are set in place for designated wilderness areas. Humans are part of the reason that the wolf population is in danger and out of respect for the natural order I think we have to remember the rules we have in order to protect the animals of Isle Royale.

Topic Question 5:

When considering the possible preliminary alternatives I dislike the high risk of failure when it comes to reintroduction and augmentation of wolves and moose on the island. I believe that the risks for reintroduction and augmentation is not worth the resources that would be used. I think that the NPS could use the resources from Isle Royale for other research and to help other important environmental locations with a higher likelihood of success.

Topic Question 6:

I think that if action is going to be taken to save the wolves then we need to take action fast, there is a very high chance that the wolves will die out before the NEPA process is complete.

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,

Correspondence: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

Living in the thick of a deer population explosion in the suburbs of Cleveland, I see firsthand the negative effects of letting a species overbreed with no predators. We have deer wandering across roads causing accidents, eating up gardens and starving in the winter.

Alternative B is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Correspondence: Topic Question 1:

Proposition B I feel like is going in the right direction for it is only reintroducing wolves. However an alternative to B is first taking a new pack from somewhere around the great lakes region about the size of 20 wolves and placing them on the Island. Then every 10 years for the next 60 years add two more wolves genetically uncommon to the island to mix up the gene pool. I feel this would still be a mimic of the natural world if the ice bridge formed more often like it used to.

Topic Question 2:

The wolves on the Isle Royal are the keystone species of the island. With the addition of wolves to the island, the moose population would become more skittish resulting in less grazing and foraging allowing the vegetation to grow back. A similar occurrence can be seen at Yellowstone National Park.

Topic Question 3:

The only type of management the NPS should consider is the reintroduction of wolves to the island once the last three wolves have died out. This allows the faulty genetics in the three wolves that are left to not be passed on. Also the introduction of wolves is not as an invasive of a procedure as managing the moose population. Also managing the moose population could require more resources and money.

Topic Question 4:

Isle royal is and always should be a wilderness area protected by hunting. It should be one of the few places left in this country that is truly wild. The human interaction should be minimal with no taking from the island and only adding whether it should be wolves or moose in the future.

Topic Question 5:

I feel that the best option would be b. It helps restore the Island to its natural state through a natural process. If option b is deemed incompatible or impossible to do, then option A should then take place. Option A is my second choice due to the most natural of the options, but it has the possibility of wolves dying out on the island. Option C, D, E, and F do not seem to have enough information for me to comment at the moment. The wording is too vague with not enough information to make an educated choice. For example C, D, E, and F are calling for moose management, however there is no information on how that is going to go about. Will it be hunting, relocation, or defertilization of the female moose on the island?

Topic Question 6:

I would also like to add that whatever what option is voted on to use, I hope that the NPS will do their best to make to carry out whatever option in the most natural and hands off way possible to manage the problems on Isle Royal.

Correspondence: Topic Question 1:

I suggest a one week moose hunting season on Isle Royale each fall. This will help keep the moose population under control and will warmly received by Michigan's many hunters.

Topic Question 2:

I have no problem with wolves being on Isle Royale if they arrive on their own four feet, but we do not need to add them just to pretend we understand how nature works. There are at least 100 years of hunting experiences that provide evidence that human hunters can and do control large herbivores. If the park service offers moose hunting, there will be a long line of happy applicants. Yes, others will be shocked when a hunter kills a moose rather than a wolf - but to the moose, does it matter? That leaves us with this question: which is more important to the park service - wolves or people?

Topic Question 3:

I advocate an annual moose hunting season.

Topic Question 4:

This is a specious question. If you are really a scientist, then you know that the climate has been oscillating with a 1000-year periodicity since the end of the Pleistocene Era. Wolves and moose have existed much longer than a thousand years, and certainly much longer than the warmer temperatures during the past couple decades. These organisms have seen this before!

Topic Question 5:

Introducing more wolves to Isle Royale will control the moose population; however, there is so much more to this simplistic action. The situation will be used by others to falsely claim that wolves are a great benefit to an ecosystem. Well, this might be true if humans didn't exist in the ecosystem, but wolves kill livestock and pets and they terrorize people who must live amongst them. If the park service introduces wolves to Isle Royale, it will have a negative affect on those of us who live in the Upper Peninsula and have to deal with wolves on a daily basis. Your park action isn't limited to Isle Royale, and I hope you keep this in mind as you contemplate your actions.

Topic Question 6:

I worked on Isle Royale in 1967 and 1968, and I am familiar with the island and its ecosystem. With regard to Isle Royale and the wolf/moose populations, these provided a "real world" example of the very simple Lotka-Voltara differential equations for simple predator-prey interactions. The tragedy is that a few population biologists took this simple small island two organism system and projected it across North America. Any person with common sense would realize that wolves on the "mainland" would have alternative prey and that their populations would therefore increase dramatically at the cost of those prey. The wolves in our area (near Calumet-Kearsarge, Michigan) have killed cattle (<http://uppermichiganssource.com/news/local/wolf-kills-two-calves-and-a-cow?id=1060704>) not only in June but even again this week. And the wolves have killed many dogs, including the male mate to my female black lab. I suggest this experiment: release a pack of wolves in Central Park, New York City, and put up signs indicating (a) wolves once lived on the island and are

being reintroduced to reflect pre-european occupation, and (b) the wolves are an endangered species and that they cannot be killed except in the extreme situation of saving one's own human life. Let me know how well this is received by the local peoples.

Comments: As I said above, I have worked on Isle Royale and I enjoy visiting Isle Royale. It is a very special place. The wolf-moose interactions on that small island have substantiated simple predator-prey interactions that were proposed by theoretical population biologists and ecologists. One could show the same with Gaussian equations using any variety of paired predator-prey organisms. But the real difference is this - Isle Royale is a wonderland and much of the rest of North America is where humans live. Thus, you must be careful what you do on Isle Royale because it can carry over to the near totality of humans in North America. Wolves behave very differently when they can roam across North America, and these differences impact the lives of many, many humans. You might argue that a farmer or rancher that loses a cow and calf to wolves is not important in your life, and perhaps that is true for you. But imagine if suddenly an "event" took two thousand dollars from your annual income for this year, and you were told to accept it without concern. Wolves are a nasty predator and if you live with wolves in your midst, it is life changing. Isle Royale has led to many life changing events because fools - no other word fits - thought that wolves across North America would act as they do on Isle Royale. Thus, we are back to Isle Royale - this tiny island isn't a vacuum because it has already impacted the lives of a great many people. Thus, I urge you to consider the re-introduction of wolves to Isle Royale with great care. It would be much easier to have a week-long hunting season in the fall of each year to control the moose population rather than pretending that wolves are a wonderful balancing factor in ecosystems. They may be balancing when humans are not in the ecosystem, but wolves are definitely a serious problem for people who must live among wolves. Please put Walt Disney back on the shelf and accept the fact that the northern hemisphere - over many centuries - eradicated wolves for some very solid reasons. Would you argue for the release of small pox viruses or ebola viruses into the human population? I am confident that you wouldn't because it is likely that you yourself might be infected. If you propagate wolves with the idea that you will be unaffected, what does that mean about your views for those of us who are affected? Are we second class citizens? We don't count in your world?

Correspondence: Topic Question 1:

Ideas to be considered in management of the Wolves, Moose, and vegetation include introducing more predators, which could help in the beginning but hurt in the long run. The scientist will not know how this will affect the animals there until they try. Consider bringing in new plants. Each new alternative should impact all 3 categories(wolves, moose, vegetation).

Topic Question 2:

NPS should keep in mind the possibility of inbreeding, if new wolves/ moose are not introduced. Inbreeding causes recessive traits to accumulate and are more likely to carry the same recessive traits. This could result in further mutations in the genes, which could negatively impact the population. NPS should also be aware of the moose to wolf ratio, as too many moose could cause the available vegetation to decrease.

Topic Question 3:

Although several of the alternatives have merit, I would select Alternative Concept D for restoring the MooseWolfVegetation balance at Isle Royale National Park (IRNP).

Since the wolf is the only predator to a thriving moose population on IRNP and the wolf population is dwindling, it seems reasonable to introduce more wolves. It also seems reasonable to take further action to manage the moose population should the introduction of more wolves not be effective. The research shows that the moose population has risen and fallen over the years, however with so few wolves on the island it is likely the moose population will continue to rise. It is impossible to know how successful the introduction of more wolves will actually be. What if the newly introduced wolves fail to thrive or leave the island during the next ice bridge? What then? That is why I believe it is also important to have a plan to manage the moose population to ensure there is sufficient vegetation to maintain a healthy moose population. If you also factor in the changes in vegetation at IRNP due to the recent warming trend, that certainly intensifies the need to better manage the moose population to ensure sufficient vegetation to support a healthy MooseWolfVegetation balance on the island.

Topic Question 4:

In times of climate change when more variables come into play, I believe NPS should do what is necessary to maintain both populations and keep the study going (Alternative Concept C). In addition to maintaining both the moose and wolf populations, NPS should also consider aggressive vegetation restoration to enable the moose and wolf population to thrive at IRNP. If there are significant changes in the climate, the animals may need to be introduced to new locations where the vegetation is consistent with their needs for survival.

Topic Question 5:

What I like about the current alternatives is that we have many ways to try to positively impact the MooseWolfVegetation on IRNP. In the spirit of the Wilderness Act of 1964, it is important that we try to keep our wilderness areas wild by preserving their uniqueness not only for today but also for the future. I also like the fact that there is no mention of introducing a different kind of predator to manage the moose population nor any mention of introducing a different type of vegetation. Adding new, untested elements to the equation may have short term success but could be catastrophic to the long term health of IRNP. One thing I dislike about the alternatives is that not one of them addresses all three matters: the dwindling wolf population, the growing moose population and the dwindling vegetation. While I like Alternate D best, I think it could be improved by also undertaking direct vegetation restoration through seed gathering and planting on offshore islands.

Correspondence: Topic Question 1:
Make sure that no dogs ever again enter Isle Royale, bringing diseases with them that can be transmitted to wolves.

Topic Question 2:
Keeping it wilderness.

Topic Question 3:
None - keep it wild.

Topic Question 4:
Since there likely will never again be an ice bridge from the mainland, reintroduce animals that would have been able to cross over on an ice bridge.

Topic Question 5:
I like the idea of bringing in more wolves to repopulate the island. It is obvious that they keep the balance. Without predators to hunt them, moose will again devastate the vegetation, destroying the landscape and eventually dying of hunger.

Topic Question 6:
I spent many years as a volunteer, educating the public about the importance of wolves in our ecosystem. Scientific studies at Isle Royale have been of utmost importance in learning about predator/prey relationships. That was all destroyed due to a human bringing a devastating illness to the wolves. Please do the right thing by replenishing the wolf population, and continuing to do so as necessary, to bring the island back into balance.

Comments: A trip to Isle Royale has been on my Bucket List for many years. But if there are no wolves, and the moose have destroyed the vegetation, then

what is there to visit?

Correspondence: Topic Question 1:
NOne

Topic Question 2:

One issue is how the ecosystem and habitats on Isle Royale can be managed the most naturally, ie letting the animals regulate and respond to changing conditions, with the least amount of human interference. For instance, reintroduce wolves and then continue to monitor the number of wolves and moose on the island over time. If the wolf numbers decrease for whatever reason again and the moose numbers rise, bring in more wolves again. Ideally this would be before all the wolves die off in an effort to maintain the established population.

Topic Question 3:

The National Park Service should work closely with the researchers and scientists who know Isle Royale and it's ecosystems the best to determine the most effective way to manage the wolf and moose population naturally. By naturally, I mean without humans hunting or killing the moose to keep their numbers low enough to prevent over browsing of the vegetation on the island. Wolves are known to keep the population of their prey species in check. The wolves also keep the prey population healthy by only killing oldest, sickest and weakest animals. Humans on the other hand would either kill the biggest, healthiest moose or kill indiscriminately, thereby reducing the overall health of the moose herd. Since 99% o Isle Royale is designated wilderness, the ecosystem should be managed with a limited amount of human input/interference.

Topic Question 4:

I don't see what the National Park Service can do if the climate changes and the ecosystem on the island transitions from a boreal forest to a temperate forest. Humans cat force plants to grow in a climate that they are not adapted for. If the plants in the ecosystem change because of changing climate conditions, the animals will respond accordingly and either adapt to the new food sources, leave or die off. If the moose lose their food sources due to climate change, then they will leave, and then the wolves will follow suit. No matter what forest ecosystem is present on the island, the National Park Service should continue to manage the park as a wilderness area.

Topic Question 5:

I dislike all of the preliminary alternatives that rely on humans directly reducing the moose population by way of moving or culling the herd by mechanical means or direct human killing of the moose. I like Alternative C, as long as the intent is to continually monitor the size of the wolf population and reintroduce new wolves if the number falls below a level able to maintain a healthy moose population.

Topic Question 6:

In 1995 and again in 1997, the National Park Service reintroduced wolves into Yellowstone National Park for the purpose of managing the elk population in the park. This action was met with a lot of resistance from ranchers in the area. Nevertheless, the wolves were reintroduced and are still present in the park today. According to the Yellowstone National Park Service webpage there were 95 wolves in Yellowstone as of December 2013. If the National Park Service reintroduced wolves in Yellowstone, why would they not reintroduce wolves on Isle Royale. Unlike Yellowstone, there is no livestock that would be threatened by the presence of wolves on Isle Royale. In addition, many people come to Isle Royale with the hope of at least hearing a wolf during their visit. As visitors, we are not afraid that the wolves will do us harm during our visit and consider ourselves lucky to hear or see tracks left by wolves, let alone see a wolf.

In 1944 Aldo Leopold wrote his essay, "Thinking Like a Mountain" in which he describes his transformation from wanting to shoot wolves to recognizing the important role that wolves play in an ecosystem. Leopold had learned that wolves as natural predators of deer are essential to maintaining a healthy prey population and thus a healthy ecosystem. Humans are not capable of doing this by hunting animals such as deer, elk and moose. On Isle Royale, humans need to be part of the solution by reintroducing wolves who will in turn manage the moose population.

Durward L. Allen began the study of wolves and moose on Isle Royale in 1958 to find out what could be learned from an ecosystem with only one major predator population and one major prey population. This study continues to this day because researchers continue to learn more every year and have new insights as to the interaction between these two populations. The knowledge of today's researchers on Isle Royale and the understandings they have gained through the years should be used to help inform the decision managing the wolves and moose on Isle Royale. One thing that has been observed over time is that when the number of wolves decrease, the number of moose drastically increase and the end result is damage to the vegetation. It seems to make sense that the number of wolves on Isle Royale should be maintained so that the wolves can manage to moose.

Since the reintroduction of wolves to Yellowstone, scientists have come to a better understanding of the important role wolves play in an ecosystem as a keystone predator. It makes sense to apply this knowledge, along with the knowledge gained from 57 years of research on Isle Royale itself to manage the wolf population.

Additionally, most of Isle Royale is designated as a wilderness area. My understanding of this designation is that there is as little human influence as possible. We get to visit the wilderness, but have as little impact as possible. Humans hunting moose or capturing the moose to transport them off the island, seems contradictory to the designation as a wilderness area. If a wilderness is supposed to preserve the ecosystems and all the plants and animals that are a part of it as close as possible to what would happen without humans around, then it makes sense to let the wolves manage the moose population and not the allow humans to directly manage the moose population.

Earlier this year, my 13 year old daughter had to write an informational essay for English class. She chose to write about the current situation of wolves and moose on Isle Royale. This summer we had the opportunity to spend 8 days backpacking Isle Royale. During our trip we discussed the issue of the wolves and moose on the island and the roles these animals play in the ecosystem. My family's opinion, which includes my husband and our 13 and 10 year daughters, is that the a wolf population should be reintroduced on Isle Royale as soon as possible. In the future, humans should maintain the wolf population at a level that will allow the wolves to maintain a sustainable population of moose.

Correspondence: Dear Superintendent Green,

We have been visiting national parks the last several years, over many vacations; my son has ~60 Junior Ranger badges and patches from various parks across the country. I remember at Teton, it was so exciting and thrilling to see both wolves and moose in the wild. We were hoping to see wolves at Yellowstone as well, but did not. Seeing the wildlife at the different parks is one of the great and wonderful things about our vacations. We really care about the wildlife in the parks, and want them to thrive and continue to be there for future visits and future generations.

While we visited Pictured Rocks NL last summer, we didn't make it up to Isle Royale, but it remains on our list to visit in the future. The possibility of seeing wolves and moose is quite exciting, but the health of the ecosystem at Isle Royale needs some thought and care. With only three wolves left at the park- the lowest number of wolves in more than 50 years, this delicate balance of predators and prey is at risk.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Correspondence: Topic Question 1:

Importing wolves in a number sufficient to eventually produce a stable wolf population.

Topic Question 2:
The overall stability of the entire Isle Royal ecosystem.

Topic Question 3:
Once a stable wolf population is achieved, allow natural ecological processes to produce a sustainable balance. Human intervention should only be attempted if any significant imbalances aren't eliminated naturally.

Topic Question 4:
I don't know what the effects of climate change will be on Isle Royale, let alone what could be done about them.

Topic Question 5:
I strongly support Alternative B.

Topic Question 6:
Thank you for considering public input.

Comments:
I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone.

If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation. This is the traditional role of the wolf, as an apex predator, of stabilizing the population of its immediate prey species, which in turn stabilizes the populations of all the plants and animals in the entire food web.

Correspondence: Topic Question 1:

NPS should adopt Alternative C and maintain both moose and wolves, with these conditions:

Wolves are reintroduced/augmented more than once, if necessary.
Moose populations are managed by contraception and/or sterilization and not by lethal culls.
The NPS must expedite its final decision by the end of 2016.

Topic Question 2:
The wolves of Isle Royale are nearly extinct, with only three remaining. A predator-prey dynamic that was in check for decades is now out of balance, with an increasing moose population and irreparable harm to the forest. A cull to kill moose is a crude, inhumane and unsustainable method of addressing the imbalance and must be dropped from consideration.

Topic Question 5:
A cull to kill moose is a crude, inhumane and unsustainable method of addressing the imbalance and must be dropped from consideration.
Sterilization/contraception achieves the goal without these objectionable issues.

Correspondence: Topic Question 1:
Wolves should be reintroduced as and when necessary over the coming years in order to maintain genetic diversity.

Topic Question 2:

Researchers have been studying the wolves for 50 years and they should be included in any discussions. With regard to the moose, wolves and vegetation reference should be made to the findings in Yellowstone National Park where the wolves have 'rebooted' the ecosystem. They have made the browsing animals move on so areas are not decimated by over browsing. This has allowed trees to regrow, which has stopped soil erosion. Wolves are a necessary predator. If there was no hunting the numbers of each animal would stabilise and the area would be healthy again. However the wolves there at the moment need introduction of new genes in order to strengthen them so that they are able to do the job they need to do to balance the eco-system.

Topic Question 3:

Scientists and researchers should be requested to suggest what can/should be done. In order to maintain the area as wilderness the balance of animals needs to be maintained. The wolves need to be there as top predator and if the moose are damaging the vegetation because there are too many some culling could be done, but only if necessary to maintain a balance.

Topic Question 4:

This is a global problem. Every country should be trying to reduce emissions and encouraging the development and use of alternate technologies. In the area of Royale National Park there should be strict penalties for littering and perhaps limiting motor transport. As the failure of the ice bridge is reducing the influx of new wolves and thus creating deformed offspring new wolves should be introduced by man. The wolves are necessary for the functioning of the system.

Topic Question 5:

There seems to be no urgency in the 'preliminary alternatives'. There is a great urgency. If the powers that be wait until 2017 the wolves will be gone. I am not a US citizen and unless lucky enough to visit will be unlikely to hear or see wild, free wolves, (I am 66 and retired), BUT for me the knowledge that these beautiful animals continue on is enough. As a child I watched the 'cowboy' films which invariably had a wolf/coyote howling in the night when the cowboys were around their campfire. The wolves are an icon of the US. Without them what would the world be? Everything that is possible should be done to save them and protect them.

Topic Question 6:

I am unable to comment on this question as it is not shown.

Comments: Please, please, do not wait until it is too late.

All I read about is animal extinctions and loss.

Please save these wolves and help them to flourish.

Correspondence: Dear Superintendent Green,

I have hiked across Isle Royale twice and one of the things that drew me to the island is the wolf and moose population. I intent to return again at some point in the future. But, right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park. Although it's very unlikely to ever see a wolf, there role in the ecosystem of the island is critical!

I have been keeping an eye on the status of wolf population over the past couple of years, and it seemed to me that this situation was eminent. I believe without periodic introduction of new wolves to the self-contained packs on the island, this situation will undoubtedly occur again (due to in-breeding, which I believe to be a significant factor in the wolves' demise). So, I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. For the past few years, Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Correspondence: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and

ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,

Correspondence: Topic Question 6:

I believe the mission of the NPS is to preserve, unimpaired, the ecological integrity of the lands that they manage on behalf of the American people. Wolf predation is a vital element of ecological integrity in parks inhabited by large ungulates, such as moose.

Wolf predation on Isle Royale became impaired to the point of being negligible about four years ago. The loss of wolf predation was caused by a series of human actions. Climate change is the most important impact. However, disease that was originally brought by humans has also likely contributed to the loss. (The wolf population declined importantly on two occasions immediately following the appearance of disease, once in early 1980s and once again in 2009, which marked the beginning of the most recent decline.) Another human impact that has exacerbated the loss of predation involved the death of three wolves in 2011 when they fell into a mine pit that had been created by humans.

While non-intervention is often a solid strategy for protecting ecological integrity, there are instances where active protection or restoration is necessary to mitigate inadvertent human impacts. The appropriateness of active protection or restoration is acknowledged by policies associated with the NPS and the wilderness act (At the EIS meeting that took place in Houghton, an audience member asked whether there were any examples of intervention in a wilderness area to mitigate human impacts. Several NPS employees said that they could think of no such examples. I think exotic species management in Theodore Roosevelt National Park and fire management in Buffalo National River would count as examples.)

For these reason, I believe the NPS should restore wolf predation as quickly as possible.

I disagree with notions that it would be better to refrain from restoring wolf predation on grounds that climate change is expected to make Isle Royale inhospitable for moose. The explanation for why this is poor reasoning is explained in Vucetich et al. (2013; The George Wright Forum, vol. 30, no. 1, pp. 101-102).

I also disagree with notions that it would be better to refrain from restoring wolf predation on grounds that extinction is a natural process on islands. Suppose for a moment that it is fair to say that the extinction of wolves on Isle Royale and predation are both natural processes. Then the decision about whether (or not) to restore predation on Isle Royale would pit two natural processes, one against the other. What basis could we have for picking among them? Maybe we should opt for extinction, because of the two processes, extinction is more closely associated with islands than predation. That is, extinction (more than predation) represents Isle Royale's most essential feature - its insular nature. Hold that thought for a moment and recall the kind of place that Isle Royale most recently had been - inhabited by a top predator, a large ungulate, and a forest; the wolves un-persecuted, the moose un-hunted, and the forest un-logged. The only locale in all the contiguous United States where those conditions hold is Isle Royale. You might quickly think of Yellowstone National Park. But these wolves leave the park just often enough to be subject to legal hunting that is a non-trivial force against the wolf population. And the decline in elk abundance that began when wolves were introduced was driven, especially during the first decade following wolf reintroduction, by human hunting that occurs when much of the Northern Range elk herd leaves the park each fall. The elk have still not recovered from that decline. Isle Royale may be the only forest in the world where this particular kind of untrammled condition holds. If I am wrong, the list of such places is short and exceptional. Perhaps these conditions hold in the high arctic farther north than there are trees or people. And why is Isle Royale one of the last places - if not the last place - on Earth that was (until very recently) inhabited by these conditions? Because it is an island. We would have trammled the heck out of Isle Royale. Before it was protected by the NPS, we tried to trammel the place. But it was too difficult because Isle Royale is an isolated-land. The only places we allow non-human life to carry on untrammled and unimpaired are islands - literal islands and metaphorical islands, like National Parks. Sad. The lesson of island biogeography is not an explanation for why extinction is a natural process on an island. The lesson is not an explanation for why islands are insufficient for conservation (though they may be). No, the lesson of island biogeography is a prescription for how to keep those processes alive once we confined them to islands. Extinction has been given plenty of play in recent centuries. The same cannot be said for predation. Moreover, the loss of predation on Isle Royale is a kind of extinction more insidious than the extinction of a species. And this particular extinction is one to which humans contributed with introduced disease, mine shafts, and climate change. (Pre-eminent conservation ecologist and island biogeographer, Daniel Janzen famously wrote, "what escapes the eye, however, is a much more insidious kind of extinction: the extinction of ecological interactions." (Janzen, D. 1974. The deflowering of Central America. Natural History 83, 48-53.))

Restoring wolf predation on Isle Royale would set an excellent precedent for NPS's approach to managing climate change. The precedent would be: Mitigate losses due to climate change, when the cost of protection or restoration outweighs the harm that would be caused by doing nothing. There will be many cases in the near future where the calculus of weighing costs and benefits is difficult (e.g., Sequoia trees). The Isle Royale case is not a difficult case. If we stumble on this case, it will set a precedent for dithering. Climate change will not be kind to us if we dither.

Correspondence: Topic Question 1:
Bring some wolves from the Upper Peninsula Michigan. The state recently voted to not kill wolves. I am surprised they have not crossed over to Isle Royale during the recent cold winters.

Topic Question 2:
The moose need to be managed by the wolf population. They will kill off the old and sick animals. Sick and old animals still eat vegetation.

Topic Question 3:
Even wilderness needs some help occasionally. Doesn't the federal government do controlled burns in Yellowstone to control undergrowth that contributes to fires.

Topic Question 4:
Michigan will have more storms.

Topic Question 5:

I like the introduction of more wolves. I dislike having the breed die off due to no males. One male may be enough.

Correspondence: Topic Question 1:

I favor bringing in wolves to Isle Royale to enlarge the depleted wolf population. In the early 1970s, when I was on the staff of the Wilderness Society, I visited Isle Royale and was awakened by wolf howls when I was in my sleeping bag - my memorable first contact with wild wolves. Other visitors should be enabled to have a similar experience.

Topic Question 3:

I strongly favor permanent protection of the Isle Royale wilderness area as part of the National Wilderness Preservation System.

Correspondence: Topic Question 1:

Alternative Concept B offers the best chance to sustain the balance of moose-wolf populations. Monitoring the natural access of wolves to the island and supplementing any deficit makes sense.

Topic Question 2:

Clearly, the lack of ice bridging due to warmer winter waters needs to be evaluated for its effects on the formerly balanced ecosystem. The impacts of humans continue to require study and regulation.

Topic Question 3:

Les is more when it comes to management of the wilderness areas, but maintaining existing species of plant and animal life to encourage re-establishment of a fully functioning ecosystem would seem to merit at least a decade of trial and study. Fragmentation by roads should be avoided at all costs.

Topic Question 4:

Maintaining the existing species is desirable unless/until a viable adaptational scenario can supplant the most recent successful ecological "recipe." Further study is needed.

Topic Question 5:

A one-time action is short-sighted. The commitment to address the natural balance issues requires responding to ongoing conditions, not merely reacting to emergency situations. A long-view policy to encourage and support the existing wolf=moose balance as required would be best.

Correspondence: Topic Question 1:

Tap into Rolf Peterson's expertise - he's been studying the wolf-moose population for over 50 years on Isle Royale. Continue the Peterson's wolf-moose population studies. Make use of his data, collected annually summer and winter. Consider carrying capacity of both populations as well as plant surveys.

Topic Question 2:

Human interference through accidental introduction of the Parvo virus negatively affected the wolf population. Another such impact could happen again with another disease. Allowing the population to decline below breeding availability resulted in a female being shot crossing the ice to look for a mate. Earlier intervention could have prevented the decline and introduced more variety into the gene pool. This is why both populations need to be maintained (Option C) as well as plant life monitored.

Topic Question 3:

Predator-prey (wolf-moose) populations should naturally control the carrying capacity barring human interference such as introducing Parvo virus that affected the wolf population. Control burn or selective lumbering may be necessary to maintain deciduous plants for moose feed.

Topic Question 4:

Since moose feed on deciduous plants that thrive in warmer temperatures and wolves feed on moose, climate change may not be a critical factor. However Isle Royale is an ideal laboratory for studying climate change impact.

Topic Question 5:

Alternative A repeats the Kaibab Plateau mistake and ignores the human interference factor that contributed to the wolf population decline.
Alternative B does not take into account future possible problems caused by human interference and needing intervention.
Alternative D is unnecessary if enough wolves are introduced immediately but may be needed if this doesn't happen.
Alternative E relies on human rather than natural predator-prey control and eliminates a big PR draw to the park.
Alternative F relies heavily on intensive man-power and expense rather than natural control.

Topic Question 6:

The Isle Royal wolf-moose study has been a standard case study in high school biology books for many years. As a science teacher I used the annual report as STEM material. I also used the Kaibab Plateau, Grand Canyon example: Theodore Roosevelt removed the native Americans and predators, deer overpopulated, ate most of the vegetation then crashed, as an example of wildlife management before we knew about carrying capacity and predator-prey relationships. I would hope the NPS will not repeat history.

Comments: Isle Royale is unique in wolf-moose studies. As an isolated island, outside factors are limited thereby allowing a more controlled environment for study, unlike any other National Park. It is also the longest wolf-moose study in the world.
If anyone reading this has not visited Dr. Rolf Peterson's research station on Isle Royale, I recommend doing so if at all possible before making a decision.

My husband and I have back-packed Isle Royale over 15 years. I remember hearing wolves at Feltman Lake and Musky Basin - there is nothing like it. I have also witnessed the decline of the wolves and the increase in moose-human interaction. On our last visit in mid-August a group of Boy Scouts tried to walk up to a moose just off the asphalt path in Rock Harbor and a moose walked past the Lodge and Greenstone Grill. If the moose population increases, there may be more of a risk for human injury.

Correspondence: I support the Alternative Concept B, which will bring gray wolves to NY. it is basically only one place in NY where we still have wolves left. Wolves are the best natural guardians of the environment. They will take care of the moose populations and the park plants. You need to have enough wolves, only the group of several wolves can take care of one moose.

I just came back from Alaska. They are doing great job in beautiful Denali park where all species are coexist in the nature. They follow the best Alaskan botanists recommendations and it work well.

Correspondence: Topic Question 1:

The Humane Society of the United States (HSUS) recommends that the National Park Service (NPS) translocate wolves from the Upper Peninsula (UP) of Michigan to restore genetic integrity to the population and help restore the Isle Royale wolf population. Moreover, The HSUS is opposed to lethal culling of the moose population and instead recommends that the NPS consider more humane methods of population control including sterilization and/or contraception.

Generally, The HSUS supports the Preliminary Draft Alternative Concept C (maintain both species). We request the following elements be specifically outlined within Alternative Concept C:

When translocating wolves, the animals are taken from the UP of Michigan and are those animals classified as problem wolves.

Wolf reintroduction or augmentation would not necessarily be a one-time only action but would be undertaken as necessary to maintain both moose and wolves.

If the moose population needs to be managed, contraception and/or sterilization should be used instead of lethal culls.

Regardless of the final alternative chosen by the NPS, the three elements outlined above should be incorporated if the NPS is considering reintroduction or augmentation of wolves and/or managing the moose population. Additional details are given in our general comments (Question 6) below.

Topic Question 2:

In addition to the nine issues identified by NPS for consideration, The HSUS asks that these additional issues, which are detailed in our general comments (Question 6) below, be considered and addressed in the Plan/EIS:

Timeline: NPS expects a Record of Decision (ROD) by the fall/winter of 2017, at which time it is likely that there may be no wolves left to manage on Isle Royale. The NPS needs to expedite this process by, at the latest, issuing a ROD by the fall/winter of 2016, in addition to taking immediate steps to augment wolves on the island on an emergency basis (i.e., next season) while the Plan/EIS process proceeds.

Ecosystem Services Wolves provide: Wolves significantly influence biological diversity and ecosystem function on Isle Royale including limiting moose populations and indirectly protecting forests and other ecosystems in the park. NPS must explicitly analyze this issue in the Plan/EIS.

Ethics: NPS must address the ethics of the alternatives and of its final decisions in the Plan/EIS including the ethics of failing to maintain the wolf population in the face of human-caused climate change and of lethal actions to manage the moose population when nonlethal alternatives exist.

Value of research: The NPS needs to address the impact each alternative concept would have on the research relating to predator-prey relationships taking place on Isle Royale. The value added and knowledge gained from continuing this long running study is invaluable to the scientific community and wildlife managers.

Social impacts: Social impacts beyond just the impacts on park visitors need to be addressed. National Parks belong to all Americans, who fund their operation through tax dollars. UP communities benefit from tourist travel to Isle Royale and will be impacted by NPS actions taken as a result of the Plan/EIS. All impacted stakeholders, including these, should be considered in the analysis.

Topic Question 3:

For many people, wolves, moose, and their interactions and conservation are a central feature of Isle Royale's wilderness. To preserve and protect Isle Royale's special wilderness character, NPS must help wolves persist on Isle Royale. Additional details are given in our general comments (Question 6) below.

Topic Question 4:

The NPS must act swiftly to augment the wolf population on Isle Royale because the decline of wolves is caused, in large part, by human-caused climate change. Climate change has resulted in ice bridges forming much less frequently and no longer providing a reliable route for wolf migration. Additional details are given in our general comments (Question 6) below.

Topic Question 5:

See our answer to Question 1 (above) and additional details in our additional comments (Question 6) below.

Comments: Superintendent Phyllis Green
Isle Royale National Park
Attention: Moose-Wolf-Vegetation Management Plan
800 E Lakeshore Drive
Houghton, Michigan 49931

Re: Moose-Wolf-Vegetation Management Plan/EIS, Isle Royale National Park

Dear Superintendent Green:

On behalf of our supporters of The Humane Society of the United States (HSUS), we submit these comments regarding the National Park Service (NPS) Notice of Intent to Prepare an Environmental Impact Statement for Moose, Wolves, and Vegetation, Isle Royale National Park, Michigan. 80 Fed. Reg. 39,796 (July 10, 2015). The HSUS recommends that NPS translocate wolves from the Upper Peninsula (UP) of Michigan to restore the Isle Royale wolf population.

The HSUS continues to recommend that NPS coordinate with federal and state authorities to translocate problem wolves or packs (i.e., those wolves targeted for destruction) to Isle Royale from the UP of Michigan. Trophy hunting and trapping are now banned by voter referendum in northern Michigan, however, authorities are still allowed to kill wolves designated as problem animals. By translocating problem wolves from northern Michigan to Isle Royale, public concerns regarding these animals will be tempered and at the same time, these animals would help restore the Isle Royale ecosystem and promote tourism within the park.

Moreover, The HSUS is opposed to lethal culling of the moose population and instead recommends that the NPS consider more humane methods of population control including sterilization and/or contraception. Below are more detailed comments responding to the specific questions posed by the NPS.

The Plan/EIS Decision Timeline Should be Shorter and Immediate Steps Taken to Keep Wolves on Isle Royale

According to the timeline provide by NPS, the Record of Decision (ROD) will be issued by the fall/winter of 2017. This timeline is unacceptable. For far too long, the NPS has tarried over how to manage the wolf population, but immediate action is needed before it is too late. The wolf population has dwindled to three individuals, is inbred, and the moose population is irrupting. If NPS waits until the end of 2017, it is likely that there may be no wolves left to manage on Isle Royale. The NPS needs to expedite this process by, at the latest, issuing a ROD by the fall/winter of 2016, in addition to taking immediate steps to augment wolves on the island on an emergency basis (i.e., next season) while the Plan/EIS process proceeds.

The Plan/EIS Should Include Analysis of the Ecological Importance of Wolves

From the study of predator-prey relationships conducted at Isle Royale for more than 50 years, we know that wolves provide remarkable benefits by limiting prey populations, culling very young or old or sick animals, and indirectly protecting forests and ecosystem function in the park (Peterson 1977; Brandner, et al., 1990; McInnes, et al., 1992; McLaren & Peterson, 1994; Vucetich & Peterson 2004a; Vucetich & Peterson, 2004b; Vucetich & Peterson, 2013). While several factors influence moose numbers on Isle Royale, the wolves have been recognized as the primary one (Peterson, 1977; Vucetich & Peterson, 2004). Moose, in turn, exert a major influence over the composition of the parks plant communities. Dramatic changes in vegetation have been documented due, in large part, to moose (McInnes, et al., 1992; McLaren & Janke, 1996; McLaren & Peterson, 1994; Paster, et al., 1998; Risenhoover & Maass, 1987; Snyder & Janke, 1976; Brandner, et al., 1990).

Wolves significantly influence biological diversity and ecosystem function wherever they are found (Hebblewhite et al. 2005, Beschta and Ripple 2006, Ripple and Beschta 2007, Beschta and Ripple 2009, Ritchie and Johnson 2009, Estes et al. 2011). Ecologically-functioning populations of wolves have been instrumental in restoring biological diversity in the Northern Rocky Mountains, including increasing the number of song birds, pronghorn, lynx, and other species, while simultaneously improving the ecology of vital riparian systems (e.g., Smith et al. 2003, Fortin et al. 2005, Berger et al. 2008, Beschta and Ripple 2009, Ripple et al. 2011). More recently, researchers found that wolves in the Great Lakes region have the same trophic-cascading effects on their ecosystems (Callan et al. 2013, Peterson et al. 2014). Wolves contribute to scavengers (Wilmers and Getz 2005, Stahler et al. 2006, Constible et al. 2008), check the effects of mesopredators (e.g., Berger et al. 2008, Ritchie and Johnson 2009, Estes et al. 2011, Ripple et al. 2011), and even affects soil nutrients, soil microbes, and plant quality (Bump et al. 2009). Small populations of wolves, however, cannot affect ecological function; they need to be restored to ecologically-functional population sizes sufficient to influence ecosystems (Belant and Adams 2010).

The impacts on moose population from hunting or culling would be different from the impacts of wolf predation-guns are not a substitute for wolves. For example, hunters kill different prey animals than wolves, typically young adults rather than calves and older adults resulting in a different age structure (Kunkel et al. 1999, Wright 2006) and human selection can even influence wild preys genetic traits due to selective pressure (Darimont et al. 2009, Darimont et al. 2015). Hunter-killed carcasses are more concentrated in time and location than wolf-killed carcasses, resulting in differences in the scavenger species benefiting (Wilmers et al. 2003a, 2003b), and will not have the same beneficial effects to soils, and ultimately to plant communities (Bump et al. 2009).

The end of wolves on Isle Royale will be followed by an increase in moose numbers to the point that significant harms to the forest will result, including a loss of biological diversity. There are many other places where the absence of predators has led to large numbers of herbivores-moose, elk, or deer. We already have plenty of such places, but we have very few places like Isle Royale (Previant, et al., 2013).

If wolves are present in ecologically functional populations, they can mediate ungulate populations, which then confers greater biological diversity and

function to ecosystems. Additionally, wolves indirectly benefit numerically rare species in the face of climate change. Wolves are a critical component to ecosystem health. Because of wolves enormous effects on their ecosystems from their various trophic cascades, the Plan/EIS must acknowledge and incorporate the best available science about the benefits wolves confer on their ecosystems and to biological diversity.

NPS Should Use Nonlethal Humane Methods to Manage Moose Population

Wolves create the well-documented ecology of fear that keeps their prey constantly on the move and prevents overbrowsing thus allowing greater ecosystem function and biological diversity (e.g., Ripple and Beschta 2012). Also, unlike humans with guns, wolves kill sick, weak, and old animals making the herd more vital (Vucetich et al. 2005, Wright et al. 2006, Darimont et al. 2015).

With merely three known wolves on the island, wolves are not acting in an ecologically-functional manner to control the moose population. They desperately need augmentation in order to fulfill this vital role. Such a population should be restored as swiftly as possible. However, if in the meanwhile, it is necessary to manage moose population numbers, only humane nonlethal management options such as sterilization and/or contraception should be undertaken.

Female moose can be surgically sterilized by ovariectomies which remove the ovaries - a technique similar to, but less invasive than, typical spay surgeries used to sterilize domestic dogs and cats. When performed on a similar ungulate species (white-tailed deer), preparation and surgery take approximately 20 minutes, is 100 percent effective, and mortality rates associated with the procedures are less than 1 percent (Boulanger et al. 2012). Typically, population stabilization is rapid and population reduction is gradual (10-30 percent per year) (Boulanger et al. 2012).

Immunocontraception vaccines activate the immune system to block a crucial aspect of reproduction. The porcine zona pellucida (PZP) vaccine is not a hormone and does not affect other body processes. The effects of PZP on moose and other animals are very well known (Shideler et al. 2002, Rutberg et al. 2004, Patton et al. 2007, Kirkpatrick and Turner 2008, Rutberg and Naugle 2008, Kirkpatrick et al. 2011, Massei and Cowan 2014). Treatment of white-tailed deer with PZP, for example, typically reduces pregnancy rates by 80-90 percent (Miller et al. 1999, Massei and Cowan 2014)-rates for moose would be expected to be similar. PZP management has successfully altered entire populations, stopped population growth, and even decreased populations of wild horses, urban deer, wapiti, and African elephants (Turner et al. 2008, Kirkpatrick et al. 2011). Similar results would be expected for moose.

NPS Should Analyze the Ethics of its Decision in the Plan/EIS

The ethics of the human relationship to wolves should be addressed by NPS in the EIS. Typically, current discussions about wolf management are flawed by bias toward overrepresentation of the natural sciences and underrepresentation of the social sciences and ethical discourse (Lynn 2002, 2006, 2010). Many ethical approaches to understanding the human relationship to wolves have already been explored such as deep ecology (Naess 1974), wolves as symbols (Midgley 2001), ethics of ecological restoration (Sharpe et al. 2001), assumptions about science and management (Jickling and Paquet 2005), ecofeminism (Emel 1995), and the ethics of animal welfare as it relates to wildlife conservation (Paquet and Darimont 2010). These approaches, the last in particular, should be included in NPS examination of potential actions on Isle Royale.

Further, NPS should consider the ethics of lethal control of moose, if that option remains on the table in the absence of wolves. Ethical considerations should not be left out of the decision process (Schmidt and Salmon 1991, Eggleston et al. 2003, Littin et al. 2004, Littin and Mellor 2005). The decisions before NPS present difficult ethical questions requiring weighing duties to the current and future public, the animals, and the ecosystems impacted by those animals. Therefore, NPS should explicitly analyze the ethics of the alternative actions NPS might take (Minteer and Collins 2008, Minteer and Collins 2005a, Minteer and Collins 2005b).

NPS Must Include the Positive Value of Predator-Prey Relationship Research in Analysis

The NPS needs to address the impact each alternative concept would have on the research relating to predator-prey relationships taking place on Isle Royale. The value added and knowledge gained from continuing this long running study is invaluable to the scientific community and for wildlife managers.

Predator-prey relationships and moose impacts on vegetation have been studied on Isle Royale for more than 50 years (i.e., Snyder & Janke 1976, Peterson 1977, Risenhoover & Maass 1987, Brandner et al., 1990, McInnes et al., 1992, McLaren & Peterson 1994, McLaren & Janke 1996, Paster et al. 1998, Vucetich & Peterson 2004a, Vucetich & Peterson 2004b, Vucetich & Peterson 2009, Vucetich & Peterson 2013, Previant et al. 2013). Scientist, wildlife managers, and the public have gained significant understanding of those relationships from the science that has come out of these long-term studies. The opportunity to continue this unique and valuable research should not be undervalued.

NPS Must Consider the Impacts of its Decision on the Public Beyond Park Visitors

Social impacts beyond just the impacts on park visitors need to be addressed. National Parks belong to all Americans and the NPS acknowledges that wilderness can be valuable to people whether or not those individuals actually visit (Wilderness: Gateway to National Park Service Wilderness webpage). Our review of recent public comments on genetic rescue of the Isle Royale wolves provided by NPS show that the public is overwhelmingly in support of a continuing wolf presence on Isle Royale and these views need to be considered. Also, thousands of people are drawn to the UP of Michigan on their way to Isle Royale because of the lure of seeing a wolf. If wolves vanish, tourists are likely to go the same way causing economic impact on the park and on UP communities. The NPS should consider the findings of Lute et al. (2012), who conducted a statewide survey of 973 Michiganders, and found 82% of Michiganders value wolves and most Michiganders wanted Michigan wolves managed using sound science.

Americans hold widely divergent attitudes about wildlife, but most value their conservation and protection (Kellert 1996, Sponarski et al. 2013). The North American model of wildlife management, which embraces the public trust doctrine, holds that wildlife belongs to everyone (Horner 2000, Jacobson et al. 2010, Nelson et al. 2011). Therefore, public agencies holding responsibility for wildlife must include the views of all who benefit from and care about that wildlife and must consider future stakeholders who are not alive today to voice their opinion-not just the views of that small number of people who are fortunate enough to be able to visit Isle Royale (Hare and Blossey 2014).

Seeking the views of a wider range of stakeholders, not limited to Park visitors, is necessary (Bruskotter et al. 2011, Organ et al. 2014). Considering just the people who live in the Michigan, an overwhelming majority of Michiganders value wolves and most want sound science to be used to manage them (Lute et al. 2012). But the broader public has a stake in this decision, as they fund NPS activity through their taxes. Approximately 94 percent of total funding for wildlife conservation and management come from the non-consumptive users, lending significant weight to the need to listen to the general public and not just consumptive users, state wildlife agencies who promote consumptive use, and park visitors on wildlife issues (Smith and Molde 2014). Park visitors shouldn't be overlooked, of course, since wildlife watchers boosts local economies far beyond the contributions of consumptive users. In the

Greater Yellowstone Ecosystem, for instance, wolf-watching tourism nets \$35 million annually to local communities (Duffield et al. 2008).

NPS Must Preserve Isle Royales Wilderness with Wolves and Moose

For many people, wolves, moose, and their interactions and conservation are a central feature of Isle Royales wilderness (Fischelli, et al., 2013). One of the stated purposes of Isle Royale National Park is to preserve and protect the park's wilderness character for use and enjoyment by present and future generations (Isle Royale National Park website). To preserve and protect Isle Royales special wilderness character, NPS must help wolves persist on Isle Royale.

The history of wolves on Isle Royale has always been closely tied to humans. The moose themselves were brought to the island by people (Scarpino et al. 2015), and the islands plant and animals communities are being harmed by human-caused climate changes (Burns et al. 2003, Sheikh et al. 2007), including severely reduced frequency of ice bridge formation (Post et al. 1999, Fischelli et al. 2013). Therefore, NPS must recognize the human aspect to the decline in the wolf population and step in to help translocate wolves in light of the impact anthropogenic climate change is having on their population numbers.

NPS Must Consider that Human-caused Climate Change has Negatively Impacted Wolves

The NPS must act swiftly to manage the wolf population on Isle Royale. The declining numbers of wolves on Isle Royale are due in large part to climate change caused by anthropogenic sources. (Huff and Thomas 2014, Grimm et al. 2013, Kunkle 2013, Trumpickas et al. 2009, Lofgren et al. 2002). Traditionally, ice bridges formed in the winter allowing for wolf migration and much needed genetic variability. As temperatures continue to be, on average, warmer, fewer ice bridges have formed and no longer provide a reliable source for wolf migration.

Moreover, the wolf population acts as a buffer to the effects of climate change by creating more carrion for scavengers and making it available year round, to the advantage of numerically rare species such as bald eagles (Wilmers and Getz 2005, Constible et al. 2008). By modulating moose populations, wolves prevent the overbrowsing of plant communities that are needed by a variety of species (McInnes, et al., 1992; McLaren & Janke, 1996; McLaren & Peterson, 1994; Paster, et al., 1998; Risenhoover & Maass, 1987; Snyder & Janke, 1976; Brandner, et al., 1990).

Thus, because the wolf population is key to the ecological integrity of the park and its rapid decline is caused by human induced climate change, the NPS should act expeditiously to augment the wolf population.

Conclusion

Thank you for the opportunity to provide these comments on the NPS Notice of Intent to Prepare an Environmental Impact Statement For Moose, Wolves, and Vegetation, Isle Royale National Park, Michigan. The HSUS strongly urges the NPS to incorporate our suggested alternative action of transferring wolves identified as causing conflicts on the UP to Isle Royale to rebalance the predator-prey relationship there. Further, we urge NPS to incorporate contraception and/or sterilization as management tools for moose if wolves are temporarily insufficient to check moose population growth and not further consider lethal moose control. We urge NPS to examine the additional issues of ethics, value of research, and broader social impacts in the Plan/EIS in addition to the issues NPS identified. Most importantly, we urge NPS to take immediate action on the critical need to augment the wolf population on Isle Royale and not to postpone action for the lengthy time NPS has indicated it will take to complete the Plan/EIS.

Sincerely,

Vice President
Wildlife Protection
The Humane Society of the United States

Correspondence: Topic Question 3:
Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Correspondence: Dear Superintendent Green,

As a biologist concerned about future biodiversity, I care about the wildlife found at American national parks, including the wolves and moose at Isle Royale.

However there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

Consequently I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than only at one time.

Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If new wolves are brought to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,

Correspondence: Topic Question 1:
I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation. This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

Topic Question 2:

The overall healthy population ought to be considered. As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. Given the current situation, I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Topic Question 3:

Observation and very selective and well-thought management, concentrating on the overall health of the park.

Topic Question 4:

What measures are needed in order to ensure the wild ought to be considered, leaving out the idea of development and over-intrusion.

Comments: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will

help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

Thank you for considering my concerns.

Correspondence: Topic Question 1:
The NPS should continue to use this as a learning experiment for decades to come. Allow room for mistakes and other human involvement.

Topic Question 2:
For the future, we want to consider that we we wrong, allow room to recover. Learn the most that we can from the excellent MTU long going studies, what a gift!

Topic Question 3:
Although designated, when a ice bridge allows a wolf to leave and be shot and killed on the mainland, humans are involved and we may never know to what level. Be flexible and realize that climate change, either human involved or not, will impact the island. Humans are going to be involved, make mistakes and learn. Let's get the wolves back on the island and at least be able to watch what once was. Let's learn how our involvement can impact a wilderness.

Topic Question 4:
Either way, by introducing more wolves or not, let this be a long term experiment about how climate change is affecting us. Continue the great MTU studies and learn and spread the information

Topic Question 5:
Just put some more wolves on the island...watch what happens

Comments:

Correspondence: Topic Question 1:
Concept C is the best option, but if you don't assist with wolf reintroductions, inbreeding will continue to plague the Isle Royale wolves until you need to start this whole process over again, and maybe next time consider reintroductions more seriously. Help wolves the first time around, rather than dooming them to the same fate 50 years from now.

You wouldn't need maintenance of moose population or island vegetation, just help monitor the wolves. There is no likelihood of having a wolf population without human action.

Topic Question 2:
Consider and evaluate the ecological benefits wolves provide; The only pup observed in 2015 was visibly deformed; 100% o wolves examined since 1994 (over 30 of them) have spinal anomalies. The weakened state of the remaining wolves is likely interfering with reproduction and survival.

The NPS must consider the data collected through 57 years of research conducted on Isle Royale. These researchers should play a key role in the discussions.

Topic Question 3:
NPS must protect the unique wilderness qualities of Isle Royale through monitoring of habitat for wildlife, including wolves and moose; maintenance of soil and water quality and ecological stability of plant and animal communities including the control of invasive species. Management is necessary to maintain important wilderness values including the presence of a top carnivore which is vital for ecosystem health. The culling of moose and the use of motorized equipment is unacceptable.

Topic Question 4:
Climate change poses a fundamental threat to species and places. The only way to slow the impacts of climate change is to globally reduce carbon emissions. NPS could produce an informational flyer explaining the negative impacts climate change is having on Isle Royale such as the changes in the duration and frequency of the ice bridge, winter ticks, bird species etc. NPS could engage with businesses and private entities that use the island to reduce carbon pollution. Encourage visitors to reduce their carbon footprint by not bringing / disposing of water bottles.

Because of climate change, it is unlikely that wolves will be able to repopulate Isle Royale without NPS intervention and we ask for immediate action to augment / reintroduce wolves.

Topic Question 5:
This problem has been a long time coming. Why has there been such a delay in making a decision? Only on the brink has action been considered. And why is a decision pending for 2017? Action needs to be taken more quickly. I'm disappointed in how NPS has been handling this situation. If the goal of NPS is

to maintain the health and integrity of the Isle Royal ecosystem, why have they waited until the current wolf population couldn't be saved due to inbreeding? Please expedite the process and take action more quickly.

Topic Question 6:

Wolves are incredible, beautiful animals. Western culture has such strong negative biases towards them because of fairy tales and children's stories, but they have also been a symbol of all the is free and wild for as long as humans have interacted with them. I personally do not want to live in a world without wolves, and we have to remember that with more and more people being born and needing to take up resources, no species is safe from extinction. We must preserve the species wherever we find it, especially in a place as wild and unmarred as Isle Royal. Keep it wild, help the wolf population that lives there.

Correspondence: Topic Question 1:
alternative concept B

Topic Question 2:
it should be natural approach, no the killing of moose

Topic Question 3:
just follow the steps what the best wilderness conservation areas are doing, like Denali in Alaska

Topic Question 4:
try to follow the nature footsteps, bring new gray wolves to the park

Topic Question 5:
I like alternative concept B, it is really good approach

Comments: I support the alternative concept B, which will use the natural resources. When you bring the new wolves to the area, they will take care of moose population and plants. People of Michigan are so concern about their park and they would like to conserve the real wilderness with natural resources. The best parks are doing it already, just follow them. Look at Denali, they preserve the wilderness on so large territory.

Please bring the new wolves, they are so important for the healthy ecosystem!!!

Correspondence: Topic Question 1:
None -- Alternative B is the best.

Topic Question 2:
Balance!

Topic Question 3:
Keep the wolf population at a level that will balance the moose population and thereby protect the native vegetation.

Topic Question 4:
Alternative B -- introduce more wolves to Isle Royale.

Topic Question 5:
Alternative B is far and away the best solution!

Topic Question 6:
To me it is a no-brainer to introduce more wolves to this island, (Alternative B) -- the balance of nature works!

Comments: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Correspondence: Topic Question 1:

There IS no other alternative. You have to interduce new wolves to Isle Royale from Canada. In the late 90;s The Mosse ate themselves out of house and home. Over 2000 starved, and died. I was there in 1998,,there wasn;t much for plant life, BUT it did come back in a few years. We are there now, again. This time will be differant,because there will be NO wolves to repopulate, to control the moose numbers. Its enhumane to watch an anamal starve to death.

Topic Question 2:

To many moose,,No vegetation in time. They eat alot. You still have some time yet. MAYBE some wolves will cross in the next 3 or 4 years. With 1250 moose now,,It would take 5 or 6 years before you have to many moose, and they may start to go hungry. Wolves now would keep a healthy head today. BUT,,is there enough food in the winter. Will to many moose kill off the trees that they eat on in the winter. winter food doesn;t grow back nearly as fast.

Topic Question 6:

As you can tell, I,m not much at writing, but I do have input. KEEP the POLITICS out of it. Reinterducing wolves to Yellowstone is working,,,But Isle Royale is not Yellowstone.

Correspondence: Topic Question 1:

Alternatives which include reintroduction of Woodland Caribou should be examined, both for feasibility and effects. Alternatives examined should include replacing Moose with Woodland Caribou as well as augmenting Moose with Woodland Caribou, to determine whether they can coexist on the island.

In addition, if human introduction of extirpated or declining species is considered, there should also be consideration of what other species, including new species, might be desirable (see discussion in "Additional Comments" below).

There should be no consideration of alternatives which include relocation of "problem wolves" from the mainland to Isle Royale. The reasons for this should be self-evident, but include the inadvisability of intentionally locating "problem wolves" to an island where wolf/human contact is a frequent and valued part of the visitor experience.

Topic Question 2:

The first question to be considered is whether the primary management goal is vegetative or animal, explain why that is the case, and examine the management options to achieve that goal. For example, reducing over browsing of vegetation by moose has frequently been cited as a reason to assure a healthy wolf population which can control moose numbers and the attendant over browsing.

However, this implies that the primary goal is vegetative, not mammalian. If this is true, it should be specified as the primary goal, with explanation of why this is the primary goal, and management options should flow from that, whether or not such options include wolves, or are more effective than wolves in achieving said goal.

If, on the other hand, continuation of wolves is in fact the primary goal, then this should be specified, with an explanation of why this is the case, and management options should flow from that goal.

If the primary goal is some sort of "balance", then the reasoning for that as goal should be explained and justified, and a very concrete, measurable definition of "balance" should be specified (see discussion in "Additional Comments" below).

Topic Question 3:

In general, the "least heavy hand" approach should be employed. What constitutes the "least heavy hand" is a complicated question (see discussion in "Additional Comments" below).

Topic Question 4:

The first consideration should be whether or not climate change may cause a management proposal to be moot. For example, if climate change may eliminate moose within the foreseeable future (such as causing browse vegetation currently at the south end of its range to become extirpated from the Island), then introducing or augmenting wolves to control moose would make no sense.

It is entirely unclear what management should be considered to either mitigate or adapt to climate change, and is directly related to question 3, regarding management compatibility with Wilderness designation (see discussion in "Additional Comments" below).

Topic Question 5:

We note that none of the alternatives involve direct vegetative management. If stability of low moose numbers is desired (in order to prevent "boom-bust" browsing/population impacts), then perhaps direct vegetation management should be considered (in order to minimize moose food sources and keep moose numbers low). It is not clear that controlling moose numbers through food source manipulation is more "heavy handed" than achieving the same moose numbers through human introduction (or re-introduction, or augmentation) of a predator species (see discussion in "Additional Comments" below).

Alternative Concept A: This is a viable alternative, and would be even if not an alternative required by law. It would provide a valuable opportunity to further study the effects of island biogeography. While negative effects of "boom/bust" cycles of over browsing by moose have been predicted, it should be noted that moose were on the island with no predators for nearly a half century, and the vegetation has survived.

In addition, any deviation from this Alternative must be explicitly and exhaustively justified (see discussion in "Additional Comments" below, especially "Purpose and Need").

Alternative Concept B: Analysis should be conducted with a focus on whether or not a one time reintroduction would result in the same genetic issues faced today. If that is deemed likely, then this alternative seems pointless. In addition, the "least heavy hand" management concept should be discussed regarding human import of an entire species of wildlife to the island (see discussion in "Additional Comments" below). Whether or not imported wolves will have the (learned) skills necessary to prey effectively on moose should be a consideration.

Alternative Concept C: Serious discussion should be centered around the feasibility of essentially continuous import of new wolves to the island, as well as the "heavy handedness" of such a commitment. There may be considerations of enhanced visitor experience if there is a continuous wolf presence on the island. This should be discussed explicitly, along with considerations of how this experience might be tempered by the knowledge that the experience of wolf presence on the island is a result of ongoing human manipulation.

Alternative Concept D: Definitions of what constitutes "moose herbivory having a demonstrated effect on park resources" should be made clear, as well as the rationale for the necessity to avoid such effects (see discussion in "Additional Comments" below). If necessary to reduce effects, the combination of wolves and moose culling seems unnecessarily complex - either wolves can control moose numbers (and herbivory) or they cannot. If they cannot, then wolves would seem superfluous, except as part of the visitor experience (see discussion in "Concept C"). Any discussion of moose culling should include methods and expected numbers. It should also include effects on visitor experience. Some visitors may experience negative impact from the knowledge that moose numbers are being controlled through culling, even if such activities happen in the off season, with no visitors on the island.

Alternative Concept E: Definitions of what constitutes "moose herbivory having a demonstrated effect on park resources" should be made clear, as well as the rationale for the necessity to avoid such effects (see discussion in "Additional Comments" below). Any discussion of moose culling should include methods and expected numbers. It should also include effects on visitor experience. Some visitors may experience negative impact from the knowledge that moose numbers are being controlled through culling, even if such activities happen in the off season, with no visitors on the island.

Alternative Concept F: This alternative seems very similar to Concept E, except for proactively managing moose population to a low level instead of waiting for "demonstrated impacts". If vegetative management, and avoidance of "boom/bust" herbivory is the main consideration for management (see discussion in "Additional Comments" below), then this Alternative would seem more effective in accomplishing that than Concept E. More detail should be provided on the need and effects of "seed gathering and planting on offshore islands".

Topic Question 6:

Purpose and Need: The need for a management plan which addresses the question of actions to take (or not) and justifications for such actions in response to the changing wolf/moose/vegetation situation is clear. What is entirely less clear, however, is the need for any actions as a result of, or to address, this changing situation.

The overriding factor which makes Isle Royale special is the fact that it is an island. This was a major reason IRNP became a National Park in the first place. Not only is it an island, but it is a relatively large island in relatively close proximity to the mainland, and it sits at an ecotome between two ecotypes.

As such, Isle Royale can be expected to experience effects common to islands of this type. These effects include local extinction/colonization events, dispersal to and from the island, and boom/bust resource consumption.

Many of the calls for action regarding Isle Royale seem aimed at avoiding or mitigating the ecological effects of being an island. It is ironic that the very factor which makes Isle Royale so special (being an island) is also the direct cause of many of the effects which people are finding troubling, and proposing to act to mitigate. It may be that as a relatively large island, relatively close to the mainland, these effects are not as swift or sudden as on smaller, more remote islands. As such, when they occur, many may perceive them as "unusual" or "unnatural", when in fact they are neither.

It is our contention that any actions which are proposed to counter or mitigate the effects which are the direct result of being an island ecosystem must be very carefully considered, and fully justified. There must be clear, understandable, and defensible rationale for any deviation from "letting an island be an island".

Major Management Goals: There appear to be different, and intersecting, management considerations. These are vegetative, mammalian, and visitor experience. It is important to specify and justify the hierarchy of goals in these areas.

For instance, as described above, vegetative stability is frequently cited as rationale for importation of wolves, on the grounds that wolves are needed to control moose browse. This implies that the vegetative goal is paramount, and that mammalian considerations are in service to this goal.

Alternately, sometimes visitor experience is cited for continued management of a wolf population on the island. If this is the rationale for having wolves, then vegetative management should be addressed as a benefit of having wolves, not as the reason.

In addition, "ecological sustainability" as a goal needs clarification. The ecosystem on Isle Royale may be changed by various actions (including no action), but there will be a sustained, albeit changing, ecosystem on the island. Any goal which is designed to sustain a particular ecological makeup of the island should specify what that makeup is, and why it is the preferred state, and why relatively static ecosystems may be preferable to those which island conditions might produce.

Wilderness Character: Wilderness, as defined by Congress, includes the concept of "untrammeled by the hand of man". Isle Royale, which has been in constant human use for almost 10,000 years, is not "untrammeled". Consequently, most, including Sierra Club, interpret Wilderness designation to imply application of the "least heavy handed" management possible. What this means in the current circumstances is a complicated discussion.

Any proposed management which is designed to be compatible with "Wilderness" must specify why the action chosen is less intrusive than others. As an example, some of the alternatives are designed to mitigate moose over browsing of vegetation. Possible actions include culling of moose directly, and/or importation of wolves to control moose numbers. Given the choice between direct culling of moose and the importation of another species to prey on moose, it is entirely unclear which option constitutes the "least heavy hand".

All discussions of various alternatives should examine this question closely. In general, Sierra Club supports choosing the least "heavy handed" alternative. In cases where deviation occurs from this principle, significant discussion and justification should be clear.

Comments: 1. What other alternatives, alternative elements, or management tools should be considered?

Alternatives which include reintroduction of Woodland Caribou should be examined, both for feasibility and effects. Alternatives examined should include replacing Moose with Woodland Caribou as well as augmenting Moose with Woodland Caribou, to determine whether they can coexist on the island.

In addition, if human introduction of extirpated or declining species is considered, there should also be consideration of what other species, including new species, might be desirable (see discussion in Additional Comments below).

There should be no consideration of alternatives which include relocation of problem wolves from the mainland to Isle Royale. The reasons for this should be self-evident, but include the inadvisability of intentionally locating problem wolves to an island where wolf/human contact is a frequent and valued part of the visitor experience.

2. What issues should be considered when evaluating future management of moose, wolves, and vegetation at Isle Royale?

The first question to be considered is whether the primary management goal is vegetative or animal, explain why that is the case, and examine the management options to achieve that goal. For example, reducing over browsing of vegetation by moose has frequently been cited as a reason to assure a healthy wolf population which can control moose numbers and the attendant over browsing.

However, this implies that the primary goal is vegetative, not mammalian. If this is true, it should be specified as the primary goal, with explanation of why this is the primary goal, and management options should flow from that, whether or not such options include wolves, or are more effective than wolves in achieving said goal.

If, on the other hand, continuation of wolves is in fact the primary goal, then this should be specified, with an explanation of why this is the case, and management options should flow from that goal.

If the primary goal is some sort of balance, then the reasoning for that as goal should be explained and justified, and a very concrete, measurable definition of balance should be specified (see discussion in Additional Comments below).

3. What type and intensity of management should the NPS consider given that approximately 99% of the land area of Isle Royale National Park is designated wilderness?

In general, the least heavy hand approach should be employed. What constitutes the least heavy hand is a complicated question (see discussion in Additional Comments below).

4. What type and intensity of management should the NPS consider in the face of a changing climate?

The first consideration should be whether or not climate change may cause a management proposal to be moot. For example, if climate change may eliminate moose within the foreseeable future (such as causing browse vegetation currently at the south end of its range to become extirpated from the Island), then introducing or augmenting wolves to control moose would make no sense.

It is entirely unclear what management should be considered to either mitigate or adapt to climate change, and is directly related to question 3, regarding management compatibility with Wilderness designation (see discussion in Additional Comments below).

5. What do you like and dislike about the preliminary alternatives?

We note that none of the alternatives involve direct vegetative management. If stability of low moose numbers is desired (in order to prevent boom-bust browsing/population impacts), then perhaps direct vegetation management should be considered (in order to minimize moose food sources and keep moose numbers low). It is not clear that controlling moose numbers through food source manipulation is more heavy handed than achieving the same moose numbers through human introduction (or re-introduction, or augmentation) of a predator species (see discussion in Additional Comments below).

Alternative Concept A: This is a viable alternative, and would be even if not an alternative required by law. It would provide a valuable opportunity to further study the effects of island biogeography. While negative effects of boom/bust cycles of over browsing by moose have been predicted, it should be noted that moose were on the island with no predators for nearly a half century, and the vegetation has survived.

In addition, any deviation from this Alternative must be explicitly and exhaustively justified (see discussion in Additional Comments below, especially Purpose and Need).

Alternative Concept B: Analysis should be conducted with a focus on whether or not a one time reintroduction would result in the same genetic issues faced today. If that is deemed likely, then this alternative seems pointless. In addition, the least heavy hand management concept should be discussed regarding human import of an entire species of wildlife to the island (see discussion in Additional Comments below). Whether or not imported wolves will have the (learned) skills necessary to prey effectively on moose should be a consideration.

Alternative Concept C: Serious discussion should be centered around the feasibility of essentially continuous import of new wolves to the island, as well as the heavy handedness of such a commitment. There may be considerations of enhanced visitor experience if there is a continuous wolf presence on the island. This should be discussed explicitly, along with considerations of how this experience might be tempered by the knowledge that the experience of wolf presence on the island is a result of ongoing human manipulation.

Alternative Concept D: Definitions of what constitutes moose herbivory having a demonstrated effect on park resources should be made clear, as well as the rationale for the necessity to avoid such effects (see discussion in Additional Comments below). If necessary to reduce effects, the combination of wolves and moose culling seems unnecessarily complex - either wolves can control moose numbers (and herbivory) or they cannot. If they cannot, then wolves would seem superfluous, except as part of the visitor experience (see discussion in Concept C). Any discussion of moose culling should include methods and expected numbers. It should also include effects on visitor experience. Some visitors may experience negative impact from the knowledge that moose numbers are being controlled through culling, even if such activities happen in the off season, with no visitors on the island.

Alternative Concept E: Definitions of what constitutes moose herbivory having a demonstrated effect on park resources should be made clear, as well as the rationale for the necessity to avoid such effects (see discussion in Additional Comments below). Any discussion of moose culling should include methods and expected numbers. It should also include effects on visitor experience. Some visitors may experience negative impact from the knowledge that moose numbers are being controlled through culling, even if such activities happen in the off season, with no visitors on the island.

Alternative Concept F: This alternative seems very similar to Concept E, except for proactively managing moose population to a low level instead of waiting for demonstrated impacts. If vegetative management, and avoidance of boom/bust herbivory is the main consideration for management (see discussion in Additional Comments below), then this Alternative would seem more effective in accomplishing that than Concept E. More detail should be provided on the need and effects of seed gathering and planting on offshore islands.

6. Please submit additional comments here.

Purpose and Need: The need for a management plan which addresses the question of actions to take (or not) and justifications for such actions in response to the changing wolf/moose/vegetation situation is clear. What is entirely less clear, however, is the need for any actions as a result of, or to address, this changing situation.

The overriding factor which makes Isle Royale special is the fact that it is an island. This was a major reason IRNP became a National Park in the first place. Not only is it an island, but it is a relatively large island in relatively close proximity to the mainland, and it sits at an ecotone between two ecotypes.

As such, Isle Royale can be expected to experience effects common to islands of this type. These effects include local extinction/colonization events, dispersal to and from the island, and boom/bust resource consumption.

Many of the calls for action regarding Isle Royale seem aimed at avoiding or mitigating the ecological effects of being an island. It is ironic that the very factor which makes Isle Royale so special (being an island) is also the direct cause of many of the effects which people are finding troubling, and proposing to act to mitigate. It may be that as a relatively large island, relatively close to the mainland, these effects are not as swift or sudden as on smaller, more remote islands. As such, when they occur, many may perceive them as unusual or unnatural, when in fact they are neither.

It is our contention that any actions which are proposed to counter or mitigate the effects which are the direct result of being an island ecosystem must be very carefully considered, and fully justified. There must be clear, understandable, and defensible rationale for any deviation from letting an island be an island.

Major Management Goals: There appear to be different, and intersecting, management considerations. These are vegetative, mammalian, and visitor experience. It is important to specify and justify the hierarchy of goals in these areas.

For instance, as described above, vegetative stability is frequently cited as rationale for importation of wolves, on the grounds that wolves are needed to control moose browse. This implies that the vegetative goal is paramount, and that mammalian considerations are in service to this goal.

Alternately, sometimes visitor experience is cited for continued management of a wolf population on the island. If this is the rationale for having wolves, then vegetative management should be addressed as a benefit of having wolves, not as the reason.

In addition, ecological sustainability as a goal needs clarification. The ecosystem on Isle Royale may be changed by various actions (including no action),

but there will be a sustained, albeit changing, ecosystem on the island. Any goal which is designed to sustain a particular ecological makeup of the island should specify what that makeup is, and why it is the preferred state, and why relatively static ecosystems may be preferable to those which island conditions might produce.

Wilderness Character: Wilderness, as defined by Congress, includes the concept of untrammeled by the hand of man. Isle Royale, which has been in constant human use for almost 10,000 years, is not untrammeled. Consequently, most, including Sierra Club, interpret Wilderness designation to imply application of the least heavy handed management possible. What this means in the current circumstances is a complicated discussion.

Any proposed management which is designed to be compatible with Wilderness must specify why the action chosen is less intrusive than others. As an example, some of the alternatives are designed to mitigate moose over browsing of vegetation. Possible actions include culling of moose directly, and/or importation of wolves to control moose numbers. Given the choice between direct culling of moose and the importation of another species to prey on moose, it is entirely unclear which option constitutes the least heavy hand.

All discussions of various alternatives should examine this question closely. In general, Sierra Club supports choosing the least heavy handed alternative. In cases where deviation occurs from this principle, significant discussion and justification should be clear.

Importation of Animals to the Island: There has been much discussion of importation of new wolves to IRNP, either to augment existing wolves, or to replace them if extirpation occurs.

This opens a wider door than many may expect. Once we consider human importation of a large mammal to the island, we must consider why that mammal and not others should be imported. Should we import species which were on the island but no longer are (such as woodland caribou and lynx)? Should we only import species which have been on the island in living memory (such as wolves). Should we consider importation of species which are unable to recover elsewhere in Michigan (such as woodland caribou and possibly snowshoe hare, but not lynx or wolves). If control of moose numbers is the rationale, should we consider importation of parasites which reduce moose fecundity (such as brainworm)? Or should we only import species which people like to see?

As can be seen from the above, once the door to active, human importation of species is opened, it is unclear how far that door should go. Any decision to import any species to IRNP must include rationale for why that species and no others. We urge significant caution in this area.

Correspondence: I fully support every word in the form letter below.

Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and

ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,

Topic Question 6:

my feeling is let the moose and wolves take care of themselves. It is wilderness. The notion that we can figure out what to do because of changing climate conditions seems impossible. I think we should let Isle Royal continue as wilderness. I also believe the Park service should continue to monitor the island, make people treat it with respect, and let nature take care of the future. I have great respect for the Park Service and the Rangers I've meant over the years who have kept Isle Royal a wonderful and natural place. Their work and the work of the scientist and many others who have watched and learned from the moose/wolf study has been fascinating and educational to the public. Thanks to all.

Correspondence: Topic Question 1:
Alternative Concept B - One time wolf reestablishment on the Island

Topic Question 2:
The issue of why wolves are not naturally migrating to the island (and staying) on a regular basis should be examined. Are there so few wolves on the mainland? If that's the case, that's a problem. Maybe we should be protecting wolves on the mainland too.

I think too much meddling is a mistake. Reintroduction of an apex predator is one thing (and bad enough), messing with the moose and the vegetation is too much meddling. It is a dangerous conceit to believe we can actually improve nature. Just look around at how regularly we mess up wildlife 'management' because we don't understand all the interconnections within the ecosystem.

Topic Question 3:
Hands off the wilderness

Topic Question 4:
Hands off...let the chips fall as they may

With climate change the ice bridges may not form and movement of wolves between the mainland and island may not occur. Eventually we may have the same problem we have today. In addition, changes in vegetation may not support the moose population.

How long do we continue to compensate for our actions and their impact on the environment? How sustainable is this?

Topic Question 5:
I like Alternative Concept B - One time wolf reestablishment on the Island
I say this with some trepidation as the wolf pair that traveled the ice bridge to Isle Royal recently, returned in short order to the mainland. One has to wonder why this happened given an abundant moose population on the island. Perhaps there is something amiss that we don't understand.

Topic Question 6:
Question: Would the 3 remaining wolves on the island be removed prior to moving new wolves in?

My first reaction to this 'problem' was to step back and do nothing. I think eventually this is the correct decision. On the other hand, the 'problem' is probably directly related to our own actions (introduction of zoo wolves to the island, bounty on mainland wolves) which have disrupted natural processes that have occurred for a thousand years. So in a way, maybe trying to correct our bumbling is a noble quest despite our ignorance. Only time will tell if we have helped or hindered... and we don't have a good track record.

Correspondence: Topic Question 1:
While none of the alternatives are ideal, concept C is closest to it. For a considerable period of time, wolves and moose were kept in a state of balance. While periodic introductions would not be "natural", they SHOULD be done. In the past, wolves were able to keep the moose population in check, as nature intended. They should be allowed to do so again.

Topic Question 2:
The past success of the wolf/moose equilibrium (for lack of a better term). This is far better than human culling and/or mechanized manipulation in a Wilderness. Periodic reintroduction as necessary would once again allow this to continue.

Topic Question 3:
The more natural condition which existed in the past, needs to be continued, even if it requires periodically supplementing the wolf population. We interfere with nature all the time. However, I see this as the least harmful way to manage the situation.

Topic Question 4:
Since the future formation of an ice bridge, which would allow a natural reintroduction is unlikely to occur due to climate change, it will be necessary for human intervention, aka reintroduction.

Topic Question 5:
Why has it taken so long to even start the process of doing something to correct this situation? NPS inertia? Action needs to be taken much sooner than planned.

Topic Question 6:
Why do people go to Isle Royale? For the Wilderness experience and the wolves are a major part of that experience. I know there are some who will be highly critical of wolf reintroduction, but mankind has so altered the natural processes on this planet, that I believe we have no choice but to give nature a helping hand.

Correspondence: Topic Question 1:

I support the careful introduction of wolves to the island.

Topic Question 2:

A careful, studied approach that includes the consideration of all aspects of the life on the island should be taken.

Topic Question 3:

Being that it is an island, it seems to me that management is of the utmost importance in order to maintain a healthy balance, and yet be the least intrusive as possible.

Topic Question 4:

Changing climate should be considered in any management plan.

Topic Question 5:

I support Alternative B, but would like to see wolves brought to the island in an ongoing manner.

Topic Question 6:

The addition of wolves over time in order to maintain a healthy moose population which would help to lessen the over-grazing of vegetation seems to me the most prudent path to take.

Correspondence: Topic Question 1:

A dramatic alternative- --What about introducing a second predator like the cougar? Do they not tolerate warming temps? I prefer just the wolf-moose, but maybe a 2nd predator is beneficial.

Topic Question 2:

As much as I like to leave nature handle itself, I would prefer to see the NPS bring in more wolves at this point. How many would be needed to help avoid the same problem of inbreeding. Could wolves be brought in more than once? Or, as mentioned above, bring in another predator too.

Topic Question 3:

Management that includes re-introducing wolves, maybe an addtl predator, and if the forest shows climate change is going to dramatically alter it, then add vegetation that works with the climate (as I assume humans will do in other forests). I realize that sounds like a lot of mgmt but the kind of mgmt I would dislike seeing is that which would turn the island into more of a people place and not a wildlife wilderness. Of course if nature decides nothing will survive there, then I guess it may not matter.

Topic Question 4:

Maybe apply similar forest management to Isle Royale as would be applied to northern MN forests, Canada, etc., due to climate change, such as planting trees that will survive the changing climate. Would those trees be favorable to moose- -I am not knowledgeable about trees. Or would moose evolve to forage on non-favorable tree species??

Topic Question 5:

I prefer option B. Reestablish and augment wolves and try not to mess too much with the moose. If wolves do not impact the moose population, consider adding a 2nd predator, though I would hope the wolf increase would take care of the issue since the research rather supports that. I support vegetation restoration thru seed gathering and planing on offshore islands. Translocating live moose sounds difficult and possibly unsuccessful considering they are dying off in other areas and we are not sure why. What is special about IR that they are surviving there? The idea of killing off moose seems a bit extreme, but what do I know.

Topic Question 6:

At this point, I think just getting more wolves on the island is the best next step. Thank you!

Correspondence: Topic Question 1:

I believe given the NPS studies and those done by Michigan Tech, we have a good background of information on the wolf and moose population and interactions. One thing that seems to stand clear is that more is continually and constantly being learned. This will all come to an abrupt end when the last remaining wolves are gone. This being said, I believe that "now" is the time needed for action.

Topic Question 2:

That this is an ongoing process. It would be nice to fix things once but that you should not limit yourself for the future. In the years to come more management may need to take place. Of course, ideally this would be minimal if any, but don't force yourself into a corner with a "one time fix".

Topic Question 3:

We should be using the knowledge we have gained to help this rare ecosystem to continue to thrive. Given man's effects on this ecosystem with global warming and the introduction of parovirus, we now need to also be involved with a fix. Yes, we want to keep this minimal, but more wolves need to be introduced in order for the original trend to continue had man not been a factor.

Topic Question 4:

I understand that this is a very difficult question given potential changes to vegetation and the possibility of fewer ice bridges. I do not believe that we can answer this particular question at this time. However, while we are trying to determine the effects of changing climate, we need to continue to do what is best to keep the wolf/moose cycle going. In 20, or 50, or whatever amount of years we will come to understand more about climate change and as we learn the effects, then we can make sounder management decisions. In the meantime, because of man's impact, we should be bound to keep the wolf population in as healthy of a state as possible.

Topic Question 5:

I do not like the idea of just letting nature take its course. I would also like to avoid man's manipulation of the moose population by culling - that would be a very extreme and unnatural effort. I am glad to see the concern about the coming effects on vegetation, and thus the effects on other Isle Royale animal populations. I strongly believe that only by the reintroduction of wolves can this unique ecosystem continue as it should. That is truly the optimal way for our National Park Service to be the best possible stewards of Isle Royale.

Topic Question 6:

We need to keep in mind that people have had a profound effect on the wolf population in spite of our attempts not to. Parovirus certainly has played a role and changed the playing field of this unique Isle Royale biogeography. Global warming is another man-caused issue needing consideration. If man must make an impact on an ecosystem, let it also be in a positive manner. Allow the reintroduction of wolves to take place and keep the wonderful research going in this globally one of a kind environment. I strongly urge the NPS to pursue Alternative Concept C. At a minimum, Concept B could be employed.

Correspondence: Topic Question 1:

Other alternatives for the Isle Royal could be to close it off to the public. Human error was the cause of the parvovirus epidemic. If we closed this park off to tourists but let scientists carefully examine and continue the study until the Wolves die out or walk across the ice bridge. IF we decide to re-introduce wolves to the area and we are able to stabilize the population then maybe we could open the park back up to the public. But yet at the same time, would this happen in another 60 years IF it succeeded by having wolves walk the ice bridge and stay? To me, the best choice is to let nature take its course because if it works, and wolves do come over without human intervention then it proves that nature has its own way of maintaining a predator vs. prey.

Topic Question 2:

Some issues or events that should be taken into account is that if we don't introduce wolves or manage the moose, then the moose population would most likely stay the same because of the tick that is so dangerous to moose. Even though the tick isn't a predator, it also is in a way because it will maintain the population. Also, why don't we put more focus into climate change because that is the reason why the ice bridge isn't forming? If I think we will find the answer to many more problems if we put focus into the problem of climate change.

Affiliation:

Received: Aug,28,2015 12:47:37

Correspondence Type: Web Form

Correspondence: Topic Question 1:

Another alternative besides reintroducing wolves back to the island would be to introduce another native species that keep the wolf population in control. Instead of wiping out and intensively managing the moose population, it would be smarter to just weed out the weak, old, and sick so that the herd stays healthy. The best option of management would be to leave the island alone for a time-being without closely monitoring the animals and see what course nature decides to take.

Topic Question 2:

Issues to consider for future management especially for vegetation would be to control if there are invasive species coming onto the island. For wolves, it would be trying to control the inbreeding. If the island were to reintroduce wolves, it could work to have more of a variety to work against inbreeding, therefore cutting out most diseases and genetic deformities.

Topic Question 3:

The NPS should have minimal management because it is a wilderness. The animals and the populations should be left to sustain themselves unless a dire situation occurs. Nature has managed to handle itself for many years before it was tampered with, so the moose and the wolves should be left alone because it is a wilderness area. That's exactly what is should be: wild.

Topic Question 4:

In the face of a major climate change, the NPS should let the island for the most part sustain itself. If the fact happens that almost all animal life is wiped out because of climate, then changes should be made and animal life should be reintroduced in a natural manner. They should keep it as a natural wilderness that is not tampered with immensely unless the direct health of the ecosystem is in question.

Topic Question 5:

I agree with the fact that wolves should be reintroduced in a natural manner but only for the health of the island and the ecosystem. That should come before the study. Neither of the populations should be managed unless wolves are not reintroduced. If there aren't any wolves left on the island, the moose population should be managed not intensively all the time, but when it becomes a threat to itself. I disagree with managing the moose population if wolves are reintroduced. The best answer would be to leave nature alone to do what it is meant to do, even if that means that the wolves die out completely.

Topic Question 6:

Personally, I think the best option would be to leave the island and the populations alone. Wilderness and animals have managed to sustain itself for thousands of years before it began to be tampered with, so it should be left to do what it is meant to do. At the same time, people have an ethical obligation to protect the ecosystems, and if reintroducing wolves is good for the overall health of the island- and the moose- then that should be the plan of action. If the island ecosystem is over tampered with, the whole system and wilderness aspect will collapse.

Correspondence: Topic Question 1:

I think that a way that the moose population could be controlled without having the wolves come in direct interaction with humans is to introduce a separate predatory species. There have been previous animal inhabitants of the island prior to the wolves and moose, and it should be recognized that the

island isn't even the original habitat of the animals. While it may be a difficulty for those researching the relationship between the wolves and the moose, a species whose habitat is the same biome of the island and would hunt the moose instead of the wolves could be beneficial to keeping Isle Royale a healthy ecosystem.

Topic Question 2:

The poor health of the wolves should be examined when trying to manage the population. 100% of the wolf population on Isle Royale have spinal deformities, due to inbreeding within the low population. Additionally, if the population of the wolves continues to be insufficient, then the moose population will continue to gradually increase. This will result in overgrazing of the vegetation, which would be very damaging to the ecosystem of Isle Royale. Isle Royale is known for its biodiversity in vegetation, and it would be harmful to research for the biodiversity to be ruined.

Topic Question 3:

The National Park Service does not have the responsibility to alter the population of existing species on Isle Royale. The absence of the wolves or the overpopulation of the moose on the island would be a natural occurrence in a wilderness area that the government doesn't have the right to impact by means of culling. The moose came to the island on their own means and shouldn't be killed off, as that would deter from the protection that the term "wilderness" identifies with.

Topic Question 4:

Climate change is having an impact on Isle Royale and should be considered by the National Park Service when deciding on a course of action. Using motorized vehicles on Isle Royale is completely unacceptable and would be destructive to the biodiverse ecosystem established. They should make human visitors more aware of the carbon footprint that they leave by encouraging them to reduce carbon pollution. The ice bridge that used to form on a regular basis has now become unpredictable as a result of climate change, which has a direct impact on the possible population of the wolves.

Topic Question 5:

Alternative Concept A accomplishes keeping the human impact on the ecosystem as minimal as possible. The problem with Alternative Concept A is that eventually the wolves will all pass away, and the moose will eventually overgraze the vegetation of the biodiverse island. Alternative Concept B would introduce new genes to the wolves and would reduce the moose population by introducing more predators, yet it only has the possibility of introducing new wolves and then having the new wolf population decrease again. Alternative C would maintain a healthy moose population and wolf population, yet humans would greatly impact the island and it would detract from research. Alternative Concept D, E, and F would involve the culling of the moose population, which is not acceptable in a place deemed a wilderness.

Comments:

Correspondence Type: Web Form

Correspondence: Topic Question 1:

Something that should be considered is the current state of the wolves' genes. If the wolves' genes have been proven to be ineffective at sustaining a population on Isle Royale the genes might just be passed down from one generation to the next. Also as time goes on inbreeding may occur and the wolf population may drop to devastatingly low numbers once more.

Topic Question 2:

An issue that should be considered for the future management is that of the effects global warming has on the moose population. Global warming may also cause Isle Royale to be an unsuitable habitat for wolves. Moose overgrazing may cause soil deprivation and eventually soil erosion.

Topic Question 3:

Because Isle Royale is 99% designated wilderness, I think we should have as minimal intensity of management as possible. I think this because wilderness is seeming to become more scarce as we progress into the future. Designated wilderness spaces in my opinion should be kept as wilderness with as little human interaction as possible. Hunting moose or bringing in heavy machinery to move the moose would ruin the purpose of having a wilderness area on Isle Royale.

Topic Question 4:

They should keep track of the Moose and wolf populations and investigate any rises in mortality rates. If any new conditions appear to decrease the health of the wilderness area then people can try to intervene, but should try to only do so when necessary. If the NPS does take action then they should make sure to continuously monitor the situation on Isle Royale because we can never be certain of what the future may bring. If they take action on this problem then they should do so properly and take responsibility for any problems that occur.

Topic Question 5:

I like that the preliminary alternatives are trying to get the Island to have a healthy ecosystem. It would be better if the choices clearly were planning to keep track of and maintain the health of Isle Royale. To improve the health of the island there needs to be some sort of predator to help balance the populations of predators, prey, and plants.

Topic Question 6:

The choices should be more flexible so they can adapt to any problems that may arise like reintroduced wolves returning to the mainland using the ice bridge that sometimes forms on Lake Superior. People need to monitor the island and from there help balance the Moose, wolves, and vegetation. Killing off the Moose is not as natural a selection as wolves. Human hunters may not be the best indicators of which moose are old, sick, weak, or young. no matter what action is taken research can be done to study its effects. Just reducing the Moose population does not help the state of the wolf population or the long term health of the island. Without any predators the moose population would still be able to flourish unchecked and overgraze.

Correspondence: Topic Question 1:

I do believe that we should wait for the Isle Royale wolves should die off first and then add a new pack of wolves to the island that have gotten used to hunting and eating moose previous to their arrival so that it wouldn't be as difficult for them to adapt. If we continue to have wolves living on the island we can continue the wolf moose population research.

Topic Question 2:

If new wolves are introduced to the island they should be monitored to make sure that they will not escape the island. When adding wolves there should be the proper amount of wolves added so the moose population decreases enough to give the vegetation time to grow back. Something also to think about is will climate change affect the island and the moose so much that all of this work will be done for nothing. If we want to continue to have life on the island then we would also have to work on ways to reduce climate change in the area.

Topic Question 3:

I believe in an issue such as this the NPS should take any step possible to save the wolf population and all of the wilderness on the island. For the sake of intrinsic value the island and its creatures should continue to exist for the enjoyment of the people.

Topic Question 4:

The NPS should do what they think they have to in order to keep the wilderness of Isle Royal alive. If there is nothing done about the climate change then there is no use in introducing new wolves because the moose will continue to die off at a faster rate.

Topic Question 5:

I do agree with concept B, that wolves should be reintroduced to the island after the other wolves die out. This should be done as soon as possible to keep populations and resources of the island at a reasonable amount.

Topic Question 6:

We shouldn't wait too long in order to fix the wolf population for the sake of the vegetation, the moose and the whole island in general. That may also mean taking the remaining wolves out now and replacing them. The old wolves can go to a type of facility to be cared for until they die and the new wolves can become acquainted with their new environment

Correspondence: Topic Question 1:

The alternative, alternative elements, or management tools that should be considered are mostly about the impact of any decision. The NPS needs to go through and realize that any decision will make an impact and is that an impact they are okay with. Also will that impact be one that goes along with what they perceive as wilderness.

Topic Question 2:

You have to consider the impact of the decision. If you allow the wolves to die out that might create an over population of moose causing the vegetation to deteriorate rapidly due to the eating habits of moose. Really take the time to understand what could possibly happen to either the wolves, the moose or the vegetation if you try and manage any of them in any way

Topic Question 3:

The NPS is really going to have to consider what measurements they are allowed to take with wilderness areas and if their decision could severely impact what they call the wilderness. Wilderness is not supposed to be altered because we want it to be we should allow it to take its course but also find ways that we can allow it to flourish without much interference

Topic Question 4:

They should consider that humans have brought on some of this change in climate and yes it has affected the wolf and moose populations of Isle Royal but you can't try and force something that isn't naturally possible anymore. The wolves came over on an ice bridge that would form for long periods at a time, today the ice bridge only forms for maybe 2 weeks. That is just the course nature is taking due to climate change and that might just have an impact of populations on this island.

Topic Question 5:

I like how the first alternative is kind of hands off, because, wilderness changes. It does not always stay the same but because we are so used to it being one way with certain animal populations we are now trying to keep it like that even though sometimes that is not how nature intended it to be. Yes Humans impact on climate change have affected the moose and wolves but there's nothing we can really do to fix it. I don't think reintroducing wolves to Isle Royal is a good idea because you shouldn't force an animal to live somewhere where it is not familiar. Also the fact that they wouldn't have known how they got there could affect their sense of direction and could make them frustrated because they now only have so much area to roam.

Correspondence Type: Web Form

Correspondence: Topic Question 1:

None of the preliminary alternatives include the potential for multiple reintroductions of wolves. Given that only one reintroduction might fail for multiple reasons (the reintroduced wolves don't stay or die off), I think it's quite important to leave the option open for multiple reintroductions if it becomes necessary. Also, if wolves reintroduced from one location fail to adapt to the diet of Isle Royale, or if they fight with remaining wolves on Isle Royale (if there are any), then the option should be available to reintroduce wolves from another location. In short, there needs to be enough flexibility with the wolf reintroductions that if the reintroduction does not go as planned, have the desired effect, or insure enough genetic diversity to make the reintroduction worthwhile to allow for other options.

Topic Question 2:

If wolves are not introduced, they will all most certainly die off given that the number is down to three, and the remaining wolves are so genetically damaged as to make it questionable if they might reproduce. It is also unlikely that they will repopulate the island by themselves, given that the ice bridge is reforming less and less often due to human caused climate change. We must consider the detriment caused to the environment of Isle Royale in the absence of wolves (loss of vegetation, soil erosion, moose disease and starvation, etc...). Regarding the issue of reintroduction, we must consider how many wolves are needed for a viable population to keep the moose in check and to have enough genetic variability as to prevent inbreeding. We need to consider whether or not reintroduced wolves will eventually die off as well. Regarding management, we need to be conscience that managing animals, especially with the use of motor vehicles, might set a dangerous precedent of human interference for wilderness areas in general. In addition, we need to consider the intrinsic value of either intact wilderness (possibly requiring human intervention) or degraded wilderness (from moose over browsing, as well as the intrinsic value of wolves. Finally, we need to consider what is more valuable for the study: to not interfere, or to restore the subjects of the study (wolves), given that we are at least partially responsible for their decline in the first place through climate change.

Topic Question 3:

Some management might be necessary, even though it is designated wilderness, in order to keep the ecosystem intact and healthy. This will also keep people caring about the natural world. However, excess management (possibly including the use of motorized vehicles) might destroy the intrinsic value of wilderness area. It also must be considered that moose should not need to be managed any if at all if there is a viable population of wolves on the island.

Topic Question 4:

Climate change is primarily human caused. Therefore, we have both a duty to reverse climate change and to reverse occurrences that have happened because of climate change. If we do nothing in Isle Royale, and wolves do not return because the ice bridge stops reforming due to climate change, then it is our responsibility to reintroduce them. To reverse climate change, Isle Royale could set up some green programs (such as zero waste, compost, clean energy, recycle, etc...) in order to help globally reduce emissions.

Topic Question 5:

It worries me that NPS is planning not to act for another two years. It is important to make an informed decision, but if we wait too long, irreversible damage might have been done to the ecosystem. The preliminary alternatives are also incredibly short sighted. If we confine ourselves to only one wolf reintroduction, and it doesn't work for whatever reason, than we have effectively gotten ourselves nowhere. It is important to keep our options open. I also dislike how the preliminary alternatives do not take climate change into account. Climate change is indirectly responsible for much of the problems facing Isle Royale, and therefore should be considered when making a decision.

Topic Question 6:

Overall, I want to stress the importance of reintroducing wolves. Wolves are a keystone species, and they are essential to the health of the ecosystems on Isle Royale. Some people are worried the reintroducing wolves would mean meddling too much in a wilderness area, but ultimately we will end of interfering much more in the absence of wolves in order to do the job wolves do so well. I believe the study will be more valuable with wolves, partly because a predator prey study like this cannot be replicated anywhere else in the world. There is also simple the peace of mind many of us will have knowing that wolves still live in Isle Royale, and that they will be there for future generations to enjoy.

Correspondence: Topic Question 1:

Dave Mech said that "If we don't do anything now, we can always do something later if it's necessary. But if we do something now we can never undo that." I believe that we should wait to see what happens, and then decide if we want to introduce wolves, lynxes, or coyotes.

Topic Question 2:

If the wolves die out something needs to be done. And if the wolves die out the moose will run uncontrolled. Climate change is also a limiting Factor.

Topic Question 3:

I feel that the NPS should not manage the wolves and moose intensively. If we start breaking rules with excuses we continue breaking rules with less valid excuses.

Topic Question 4:

If global warming is going to effect the moose via ticks, then you should not need to manage to intensively. Also it is a wildlife area where there should be little to no management. Because climate change is indeed affecting the ice bridge, we should not expect more wolves to come over.

Topic Question 5:

I don't like any of the preliminary options. I believe that we should let the wolves die out before we do anything else. I feel that we should learn as much as we can about the wolves right now because no one knows what's going to happen. Once they die out we should explore the options of repopulating Isle Royal with a species that was originally there. This could include Coyotes, or lynxes. If this doesn't work we can always go back to wolves. For the most optimal effects we should take wolves from Canada because they already know how to hunt moose.

Correspondence: Topic Question 1:

Other elements that should be considered include what methods that will be used to manage the populations if that is the alternative chosen? The methods should impact the environment as little as possible to maintain the wilderness status of the island. Also before reintroducing wolves we should consider where the wolves are coming from. The new wolves should come from an area that is similar to Isle Royal to minimize the stress of a new habitat and give the wolves the best chance of survival. Another alternative that could be considered is introducing a different species such as coyotes, which are less impacted by climate change.

Topic Question 2:

The biggest issue to consider when thinking of future management is how to not destroy the wilderness area. The preservation of the land as a wilderness should come before continuing the study on the moose and wolves. If that entails letting nature run its course with the species on the island we should let that happen. If it is possible to reintroduce wolves with minimal environmental damage that is the best option.

Topic Question 3:

The park system should try to stay as hands off as possible once the situation has been resolved. The purpose of maintaining the wolf and moose populations on Isle Royal was in part for scientific research on the predator prey interaction without human intervention. By taking further measures to ensure the numbers of moose and wolves stayed in balance, future studies would be pointless. If it is not possible to continue the original research project we should attempt to preserve the wilderness.

Topic Question 4:

The NPS should do its best to limit its contributions to climate change wherever possible. This could entail no longer allowing motored vehicles on or around the island and cutting down on the islands waste. Other than that they should continue to leave the wildlife untouched. Maintaining populations on the island won't solve the problem of climate change it will only prolong the current study. The only true solution is to stop climate change which is not a process that can happen in a few years.

Topic Question 5:

I like that the preliminary alternatives give a large range of options. I do not like the fact that many of the choices leave loop holes for the NPS to interpret them how they wish. There are no mentions of the what measures will be taken to avoid damaging the wilderness area. There are also no mentions of what population management will entail. What will be done to decrease the number of moose? Where will the new wolves come from?

Correspondence: ear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Correspondence: Topic Question 2:

2. This study has in the past been very important to learn about trophic relationships between moose and wolves, but the island can teach us much more than just that. If we let the study move to a new stage in its life, studying other symbiotic relationships. It can tell us new things about how nature regulates population, what effects population growth other than predators, how overgrazing would effect a community, and more that we have not even thought of yet.

Topic Question 3:

3. The NPS should remain hands off, they should continue to study the environment and how it changes there. As a wilderness we should allow nature to take its course, even through all the twists and turns. Even if it has negative effects on the island, we can learn about stages of succession and the life of an ecosystem.

Topic Question 4:

4. In the face of a changing climate, letting nature run its course will help the island remain a place that allows us to learn. We can see how the forest is effected by warming temperatures, if it becomes a habitat for new kinds of animals or how long it takes for animals to fit in with a different environment. We are not able to stop climate change in this decision, but we can learn about what might happen to nature if it continues.

Topic Question 6:

5. The preliminary alternatives need to remain as uninvolved as possible. Even if the NPS decides to maintain the island as it is now, it needs to make sure that it is not changing the ecosystem there into something that wouldn't happen naturally. Options like alternative C would undermine the idea of a wilderness area as a whole.

Correspondence Type: Web Form

Correspondence: Topic Question 1:

First they should be more focused on the goal, the researchers and the scientists should know what they are trying to reach which are the wilderness itself or the experiment. And also they should really find out the solution which could solve the problem and try to make sure that it's not going to happen again in the future.

Topic Question 2:

Basically we should consider human's interferences including if we should reintroduce wolves population or control moose's' population. Hunting should be prohibited. We should let the nature decide what should be done. I don't know if the scientists or the officials wish to maintain the Isle Royale as a

wilderness area, but if the answer is yes, there would be so much to think about.

Topic Question 3:

They should consider what their goals are by managing the conditions, what they are looking for or expecting to happen. And also they should decide what they will have or need to do in the future if they make the decision. If they decide to focus on the experiment, they should consider what will do to the overpopulated moose which will happen in the coming future. If they decide to just leave the island behind and do nothing, they might have to consider the outcomes.

Topic Question 4:

There might not be ice in the winter times anymore, and there won't be more wolves coming across the lake on the ice bridge. So the population of moose would be a problem in the future if they do have any predators. I don't think there are much to do to the climate change, NPS should try to preserve the wilderness areas and protect the places like that not to be contaminated or damaged by human so we could slow down the climate change.

Topic Question 5:

None of the preliminary alternatives could solve the problems, they could have some control on the moose's population and help with the environmental conditions for a short period of time, but what will happen in the future, are humans going to interfere in the nature constantly?

Topic Question 6:

I think we as people should protect our nature, and we should and have to protect the wilderness areas like Isle Royale not for our own enjoyment, but also for the future generations. People will have to spend much longer time on this planet and we cannot just watch the nature getting destroyed by our mistakes.

Correspondence Type: Web Form

Correspondence: Topic Question 1:

According to isleroyalewolf.org, (http://isleroyalewolf.org/overview/overview/at_a_glance.html) under the About the Overview, it is stated that, "Their lives are historic because we have been documenting their lives for more than five decades. This research project is the longest continuous study of any predator-prey system in the world." We should consider the fact that this has be the longest continuous predator vs. prey experiment, and remember that it is an experiment. All experiments must come to an end to determine their final results.

Topic Question 2:

As far as future management, humans should not interact with the experiment and let it play its toll. If nature's true truth was for the wolves to die out, so be it. If that is to happen, and the study is over, then humans should finally get involved and reintroduce wolves. Once the of conclusion of the study is reached, human involvement should be used to even out population of wolves, moose, and vegetation but only after the experiment has played out all the way.

Topic Question 3:

There are too many aspects that we are unsure of. There are too many questions that are unanswered. There is nothing we can be sure about. There are too many "ifs" "ands" or "buts". As for now the national park service should sit back and let the experiment play its role. Although it is a national park, Mother Nature should be allowed to play out what she intended for.

Topic Question 4:

There are many people out there trying to better the climate changes that we, humans, caused. People will try and no one will really know what will happen. Earth will play out its course, with or without human interruption. Changing climate will always have a cause and effect on a topic like this, and we will just have to learn about it while still trying our best to do our part.

Topic Question 5:

Alternative Concept A is the best choice. No human interaction should be taken place. Mother Nature should be played out. After the experiment has been concluded without human interaction, we should introduce Alternative Concept C. This is just to maintain the National Park and the wolf and moose population after the experiment has concluded.

Correspondence: Topic Question 1:

Sometimes the best action is no action. Letting nature run its course and not interfering should be strongly considered. In the long term, it shouldn't be up to humanity what happens to the island. In a thousand years the island may or may not be there, but at least we will know that we had no part in interfering for better or worse.

Topic Question 2:

There are too many unknowns to consider. Reintroduction or augmentation of wolves is a very unpredictable option. Managing moose population could have impacts on the island that are impossible to foresee. Who are we to decide what lives and dies? All of these issues prove that even with the knowledge

of experts and scientists, we still are unsure of all the possible positive and negative outcomes.

Topic Question 3:

The whole point of a wilderness is to have an area untouched by the progress of man. Trans-locating the wolves would result in the use of motor vehicles on the island and would disrupt the vegetation. Interfering with the natural order defeats this purpose by controlling what is not ours to control.

Topic Question 4:

In winters to come, who can say there will not be another ice bridge? After we reintroduce the wolves to island and more cross over, the new wolves may impact the island in negative ways. Some may argue that it is our duty to reintroduce the wolves because we are responsible for climate change. I agree that it is our duty to take care of the earth, but I do not believe that this is the solution.

Topic Question 5:

The only thing I like about the wolf and moose management is the will to keep the island alive. Keeping the island vegetated benefits the public for visiting. However, interfering in nature's course for our intrinsic value is purely based on selfishness.

Correspondence: Topic Question 1:

The possibility of the relocation of moose in a non infringing manner. If the Isle Royale didn't have any wolves or moose the problem may possibly be solved. This would be with the given that the ecosystem could still flourish with the elimination of moose.

Topic Question 2:

What kind of precedence that would set for wilderness in the future. If we allow this much human interference on Isle Royale how will we be able to put restraints on when and what kind of interference is acceptable in the future. This would not only apply to Isle Royale, but also wilderness areas across the United States.

Another issue is that if there were no intervention, what would become of the physical island itself? With the moose inevitably overgrazing, how much soil erosion would the island experience? Would Isle Royale be able to live on with such a large population of moose?

Topic Question 3:

The management could vary on a large range of intensities. As long as the management has only positive effects that were clearly agreed on and approved by NPS, the intensity should be such that NPS can achieve whatever their goal ends up being. Obviously the least amount of intensity and management is ideal but if you're going to intervene, you might as well put in whatever it takes to reach your objective.

Topic Question 4:

I don't believe that the fact of climate change should have a role in dictating how great or little of management the NPS takes. The intensity and importance of the given situation should directly correlate to the intensity of the management. Climate change may make a situation more dire, meaning more intense management would be necessary to maintain existing ecosystems, but just the fact that climate change is part of the equation should not automatically make the management more or less intense.

Topic Question 5:

None of them seem to fully solve the problem or clearly display how they will be executed. If we only reintroduce wolves once, we don't know if those efforts will be at all fruitful. If we reintroduce wolves multiple times, odds are we will have this same problem on our hands at some point or another and then humans will have to keep intervening with the wilderness area.

The alternatives also leave a lot of grey area. Some examples of this would be if NPS were to decide to reintroduce wolves, how many would they introduce? How would the moose density be reduced if that were to be the solution chosen?

Correspondence: Topic Question 1:

To preserve the diverse plants species on Isle Royal the NPS should consider documenting the species of plants and animals on the island in case the moose population gets out of hand regardless of the management plan. Another possibility would be to create a seed bank for the same reason. I also think the final management plan should avoid as much noise making or otherwise disruptive equipment as possible.

Topic Question 2:

In past years with mild winters and warmer summers the moose populations didn't experience much growth even with low numbers of wolves. If in the future the moose population declines the NPS should not augment the population because there is little consequence to anything other than wolves if the moose die out. Loosing the moose and wolves would remove the possibilities of the unique study opportunities and could make the island less interesting to visitors, but in my opinion the sustainability and conservation of the island is more important.

Topic Question 3:

I don't think that any management of the moose population is necessary or appropriate given the machinery required to move the moose. Additionally the setting the president of wildlife population management involving heavy equipment in a Wilderness Area should be avoided unless no other reasonable options remain. Any management other than complete removal of the moose population would likely be delaying an actual plan and would disturb the environment far too much to be sustainable.

Topic Question 4:

In recent years Lake Superior hasn't been freezing as often or for as long as before, so natural migrations of wolves will be far less likely. Along with the immediate effects to the moose and wolves the changing temperature and the potential shift to temperate trees could affect the plant-life and therefor the population of moose and wolves.

Topic Question 5:

I'm not completely satisfied with any of the preliminary alternatives. I think the NPS should let the current population of wolves die out, then reintroduce wolves to the island as soon afterwards as possible. The NPS should try to reintroduce wolves from Canada if possible since the wolves there are used to hunting moose as opposed to local wolves that primarily hunt deer. The NPS should continue introducing wolves in waves until the population is restored to former numbers. The NPS should monitor the population for a short time after this to ensure the population doesn't die out soon after.

Correspondence: Topic Question 1:

Collecting seeds from around the island and keeping the plant species alive might be the only thing I can think of. The best thing would be to drastically deplete the moose population but there isn't a possible way of doing that without making big changes to the island. If you try to remove the moose you would need to have trucks or machinery come to the island. That would ruin the wilderness of the area. The same thing applies with mass killing. You would have to have a removal system in place and neither solution works well.

Topic Question 2:

Whether or not you want the wilderness of Isle Royale to be at risk. Whatever you do, it will change the ecosystems forever. Even if you introduce new wolves into the environment, there is no assurance that the wolves would stay. Whatever system you put into place for the moose would have massive problems as seen in question 1. You just really need to think about whether or not you want to keep the wilderness area wilderness.

Topic Question 3:

Try to be as low impact as possible. No cars, or trucks, or big machinery. Just try to follow the rules of a wilderness area as much as possible.

Topic Question 4:

Try to work fast. Also try to be as low impact as possible. There isn't much you can do otherwise. You cant make the ice bridge form or help the moose get more food before winter without making it not a wilderness area.

Topic Question 5:

I don't think any of them are the best. They all have pros and cons. The first one may cause most of the flora on the island to be wiped out. B is a mix of A and C, but without the benefits of either. C puts the wilderness of the Isle into question. D is waiting until last minute, when we know that something will happen soon. E is D without helping the wolves. F seems the best to me, at least it seems to be the best for protecting the fauna. The true best alternative would probably be a mix of a few of them.

Hunt predators, grow more and better vegetation, spraying the wolves with something so predators don't want them

Topic Question 2:

Where they are located so wolves and moose are separated. Two different parts of vegetation

Topic Question 3:

High intensity so they can help all parts of the wilderness and not just a little at a time

Topic Question 4:

Concept f because it includes restoring the vegetation so it will help the food coming for the animals

Topic Question 5:

I don't like a because it isn't changing anything so nothing is going to improve.

Concept B is a good idea because it's having more wolves come in so wolves will claim it as their territory over moose

I don't like concept c because the species aren't going to interact well

I like concept d because it brings in wolves slowly and takes moose out gradually. I don't like that it has to remove the moose

I don't like concept e because they are reducing the moose

I like concept f because they are improving vegetation

Correspondence Type: Web Form

Correspondence: Topic Question 1:

I would recommend alternative C that the present wolves and moose be allowed to live on the island, but that new wolves be introduced multiple times if deemed necessary.

I would also recommend that if the wolf population cannot keep the increase in the moose population or over browsing in check that the moose population be managed with contraceptive means, not by culling until the wolf/moose population reaches a balance.

Topic Question 3:

To keep this National Park true wilderness, I would not recommend the management tools of hunting or trapping, by any means.

Topic Question 4:

If you haven't already, I would enlist the aid of botanists and eager volunteers to assess and monitor the island's vegetation. This could be a very good cooperative effort with the NPS and the "gardening" public. The "Wild Ones" come to mind, but there are many other groups that may be very interested in participating in a program.

Topic Question 5:

Please note that I have added to Plan C that wolves should be introduced more than once if necessary and again, if necessary, that the moose population be controlled for a while by contraception.

Topic Question 6:

PLEASE - come to a decision very soon. By the graphs, one can see that moose population lowers when wolf population increases. At this point, it appears that the wolves on the island are in a serious decline in numbers, as well as in health. If you wait longer, the moose population will indeed swell and the vegetation will be impacted. (It would be a shame if invasive plants would take their place.)

ALSO, PLEASE USE MICHIGAN GRAY WOLVES to repopulate. The farmers and ranchers that complain about wolves would no doubt love to have the "bad wolves" removed from their vicinity. This would be a win-win for all parties.

Comments: In summary:

1. reintroduce more wolves more than once if necessary
2. do not cull moose, but use contraceptive means, if necessary
3. Act soon. There is nothing to lose - except more wolves to inbreeding and more vegetation to over browsing.

Thank you for inviting us to participate in this study. I enjoyed your background information website. It was very user friendly and colorful. I certainly love the national parks and all of their natural inhabitants. Please keep them wild as possible for future generations.

Correspondence: Topic Question 1:

With such a low population no hunt is scientifically viable as an option for management. Wolves on the island are endangered at best and probably won't survive any natural events due to their extremely low numbers.

Topic Question 2:

If there's sufficient numbers of wolves present to require any management intervention at all. As there are not, no intervention is necessary.

Topic Question 3:

How about a "hands off" approach to allow the predator-prey relationship play itself out in a natural fashion? It's a self-regulating system.

Topic Question 4:

If it was polar bears in question, it might be a valid question. I don't see how it applies to the island's biome.

Topic Question 5:

I don't like the hunting wolves option.

Comments: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,

Correspondence: Topic Question 1:

I will leave this question to the experts, but would like to say that Isle Royale and it's Wolf/Moose study should keep going. If one of the reasons the wolf population is so very low is in fact genetics, then we not only need to address the wolf side, but keep an eye on the moose population as well.

Topic Question 2:

The unique environment of Isle Royale to keep wolves and moose a part of its ecosystem.

Topic Question 3:

I will leave this to the findings of the past 50 year study and what has been learned along the way through it.

Topic Question 4:

Again, I will leave this to the experts.

Topic Question 5:

Even if one selection is made and the conditions require a change, that is possible.

Topic Question 6:

My primary comment as a visitor to Isle Royale NP is that the wolf and moose study should continue. Thank you for asking for the public's thoughts. The environment/habitat there is perfect for the combined living of both species, and with no chance of outside interference as happens in the Yellowstone area. If moose were left alone, with no predators, what would happen to the vegetation and other animal populations if the moose population became too large?

Correspondence: Topic Question 1:

Modern humans evolved as cooperative hunter-gatherers whose cultural and technological evolution enabled them to slay prey much larger than themselves, across many species groups. While one might think hunting skills have faded since the advent of agriculture and animal farming almost 10,000 years ago. However, research clearly shows that globally, humans we are still the unique superpredator. In fact, humans take up to 14 times as much adult prey biomass as do other predators. Several recent studies have tracked the adverse impact people have on wildlife populations that adversely impact balanced ecosystems. A more balanced and holistic venue should be adopted. Ongoing assessments rather than response planning; more effective management.

Topic Question 2:
Moose, wolves, and vegetation act as a balanced ecosystem and this is key at Isle Royale. Culling the wolves means vegetation is impacted due to moose. The wolf population needs to be returned to 10 wolves, then the pack should be allowed to manage the moose population. **DO NOT KILL THE WOLVES.**

Topic Question 3:
Allow for a natural balanced ecosystem after the wolf population reaches 10. Then, the ecosystem should be monitored in an ongoing basis.

Topic Question 4:
Climate change is impacting resources at Isle Royale National Park, so ongoing monitoring is key.

Topic Question 5:
As a consummate user of the wilderness, I care deeply about the wildlife in our national parts, including the wolves and moose at Isle Royale. Currently there are probably three wolves left at the part, and this threatens a balanced ecosystem. I support management Alternative B (bring new wolves to the island), but the Park Service must continually monitor the ecosystem. Bringing wolves to the island may be more than just a one-time event. Sustainable ecosystem on Isle Royale will help minimize the impact to native vegetation.

Topic Question 6:
As stewards of Isle Royale, the NPS should take a minimally intrusive role. I fully support the Park Service taking action to immediately bring new wolves to the island, before the population vanishes and the ecosystem lost.

Comments: There is no easy answer, no easy fix. NPS must be proactive and bring a sustainable wolf population back to the island to help ensure the

moose population remains in-check and that the native ecosystem thrives.

Correspondence: Topic Question 1:
MUCC supported naming moose a game species in Michigan back in 2010 and is always in favor of scientifically based, regulated hunting opportunities rather than culling; however, it is understood that Isle Royale National Park's founding legislation expressly prohibits hunting at this time. Hunting with a

regulated quota could easily be implemented by the Michigan Department of Natural Resources with a change in statute and NPS policy to manage the population, similar to how our small Lower Peninsula elk population has a highly regulated hunt. While this is outside of the ability of NPS to implement, we believe that the administration should consider supporting a change to legislation if it were introduced.

Topic Question 2:

Free labor: Hunters and trained volunteers could be used to manage both wildlife and improve/plant vegetation.

Expense and unintended consequences to the rest of the UP: Relocation of moose to the Upper Peninsula from Isle Royale is expensive and may negatively impact the existing deer and moose herd.

Topic Question 5:

MUCC's members do not favor the artificial, human relocation of wolves to Isle Royale or the relocation of moose off of Isle Royale. We support culling of the moose to a level that can be sustained and it is our preference to see that done with permitted/trained hunters through a limited entry drawing rather than agency staff.

Topic Question 6:

If moose are culled, it is expected that the meat will be utilized by food banks or other willing charitable entities.

Comments: Michigan United Conservation Clubs (MUCC) is the largest state-specific conservation organization in the country. Its mission is to conserve, protect and enhance Michigan's natural resources and outdoor heritage. Since our founding in 1937 to protect conservation from politics, we have defended the right to hunt, fish and trap in Michigan. MUCC is a grassroots organization, which means that our policies are decided by our members, which include over 42,000 hunters, anglers, trappers and conservationists, and over 250 local and statewide sportsmen's clubs and conservation associations.

Our MUCC Wildlife Committee, made up of Board members, has submitted the following resolution that summarizes our position on the future of Isle Royale moose management.

Interim/Emergency Resolution - Isle Royale Moose Management

Respectfully Submitted by the MUCC Wildlife Committee, August 27, 2015

Whereas, the moose population at Michigan's Isle Royale National Park is currently estimated at 1,250 animals and that moose population is expected to continue to increase with only three wolves remaining on the island, and

Whereas, the growing moose population on Isle Royale will soon reach a point where they damage the island's vegetation, reducing favored winter moose browse along with the capacity of the habitat to support as many moose, and

Whereas, should science-based research determine that moose populations have exceeded, or are likely to exceed, the carrying capacity of the island to the detriment of the overall herd health, vegetation and bio-communities of the island then a culling system should be implemented; and

Whereas, considering the wilderness designation of Isle Royale National Park, culling moose is the best way to manage that population and reduce damage to the island's vegetation and maintain a healthy moose population; and

Whereas, involving the public in culling moose at Isle Royale through a limited entry drawing can generate revenue to help cover the cost of that type of management through the sale of moose culling permits; and

Whereas, MUCC supported naming moose a game species in Michigan and is always in favor of scientifically based, regulated hunting opportunities rather than culling; however, it is understood that Isle Royale National Park expressly prohibits hunting at this time. NOW,

THEREFORE, BE IT RESOLVED, that MUCC supports culling moose on Isle Royale National Park to manage the population and protect the island's vegetation and that the public be permitted to do the culling through a limited entry drawing from groups of two to four participants that would purchase a moose culling permit, and

Be it further resolved that MUCC supports such measures as an alternative to artificial relocation (human placement) of predator species to this island, such as wolves.

Correspondence: Topic Question 1:

All realistic alternatives seem to have been previously considered.

Topic Question 2:

Although it would be preferable to remain as uninvolved as possible, the factors affected by the diminishing wolf population are more varied than just the moose, wolves, and vegetation. The entire island is interconnected and declining vegetation can affect many other animals on the island. Thus, it must be considered that any actions directly affect the entire island. Additionally, many of the problems with the moose population, are affected because of increasingly warm summers, due to global warming. Therefore it must be considered that human interaction may become necessary to correct human-caused problems.

Topic Question 3:

The NPS should, considering the factors listed above, wait until the current population of wolves are entirely extinct from the island, and then, mimicking a migration event, reintroduce wolves to the island. From that point on, however, human interaction with the wildlife should remain extremely limited.

Topic Question 4:

The moose and wolf population seem to directly linked to climate. Considering that the populations, the moose population in particular, don't do particularly well in hot climates, (and low moose levels make survival for wolves more difficult), it can be assumed that global warming has had a significant effect on Isle Royale. As previously mentioned, all the life in the ecosystem is interconnected, and it can be determined that man-made global warming has had a direct, generally negative, effect on the island. Bearing this in mind, it is the responsibility of humans to correct the issues on Isle Royale. After the extinction of the Isle Royale wolves, wolves should be re-introduced to the island to maintain the health of the entire island.

Topic Question 5:

Because Isle Royale is 99% dsignated wilderness, the preferable answer to these problems seems to remain uninvolved. However, in the spirit of righting human wrongs, it seems appropriate to interfere. That being said, many of the alternatives propose significant or long-term interferences that would have humans remaining extremely involved in the life on Isle Royale after initial maintenance. Isle Royale is designated wilderness, and beside sporadically necessary involvements, humans should maintain a low-impact relationship with the island.

Comments:

Correspondence: Topic Question 1:

I believe that it should be considered for new wolves to be introduced to the island for a limited period of time, then removed. Thus, researchers can evaluate how the wolves reacted to the new environment as well as make a final decision on whether or not to reintroduce wolves to Isle Royale for good. After these steps have been taken, I firmly believe that human hand should be completely removed from all natural processes regarding the island. It is called a natural wilderness for a reason, and humans have no right to be stepping in.

Topic Question 2:

The real issue here is that man-kind has interrupted the natural processes of almost every square inch of this earth. What I believe should be done regarding management is to take a step back and let nature run its course.

Topic Question 3:

Again, I strongly believe that no management measures should be taken no matter the intensity, especially since this area is considered a designated wilderness. It have been proven time after time that almost everything that has been touched by man has either dissolved or changed drastically. What we are debating on is whether to interfere with the natural flow of things or not- which I believe is ridiculous. Like I said earlier, the natural flow is natural for a given reason- and should not be tampered with by human kind.

Topic Question 4:

A changing climate is inevitable. This is all because of mankind's impact on the world. The best thing we can do is to stay out of it as much as we can, especially for areas that by law we have designated to have minimal human influence. Human kind will manage for themselves as the inevitable changing climate comes around, but we have no right to make decisions for these animals on how they should live their life.

Topic Question 5:

There are definitely some pros and cons to all alternatives mentioned. For letter A, a major pro is that humans do not get involved and let nature run its course. Whereas for letters B and F, human involvement is included, which jeopardizes the safety of a majority of the population on Isle Royale. Of course, everyone has their own opinion, but I personally thing that any kind of human involvement has a strong chance of ending poorly.

Topic Question 6:

As whomever is reading this by now already knows, I strongly believe in the fact that humans should not be "managing" the well-being of animals on this earth. We have enough problems within our own species than to be tampering with others .

Correspondence Type: Web Form

Correspondence: Topic Question 1:

There has to be a balance when considering the expectations of people using the island while still caring for the nature and the land that not only helps the wildlife, but also creates the unique wilderness experience. I think that an alternative would be to just let the animals reach their demise. They clearly aren't particularly meant to live on the island anyways. It can also go the other way around. The island wasn't meant to inhabit these animals. They're eating all the vegetation. Maybe we should just focus on putting all our effort into restoring the remaining wilderness on the island, and restoring the vegetation. Also, when people visit, it might help to have a maximum limit of people in certain areas, to prevent overcrowding and invading.

Topic Question 2:

When considering future management of moose, wolves, and vegetation, we should consider why life may be better for them outside the island. On alternative land, they aren't faced with the issue of single-predator single-prey. The wolves would be surrounded by other wolves, which would stop the

inbreeding and spinal deformity. The island doesn't have the proper amount of vegetation for the animals, and they're just eating it all away. There's simply more resources and options for the animals outside of the island.

Topic Question 3:

Just enforce more strict rules regarding human use of the island. I think that our focus should be to create the Isle Royale as being a healthy, preserved wilderness area. The island has a lot of potential to be a wonderful place, and these species are obstructing that from happening. Once the island is in better condition, it could be a great place for explorers to come and admire, with harsher rules and regulations. As aforementioned, it could be beneficial to allow a small amount of people in one setting for a certain amount of time. Continue having motorized vehicles banned. Perhaps have limitations on the sizes of campfires. Pets might not be a great idea. I think that canoes and kayaks are fine, but not a boat that requires a motor.

Topic Question 4:

A changing climate can affect a lot of things. Winter, especially, can make life more difficult for the animals. However, climate change will still occur outside of the island. I think that it's best not to interfere with that and just let nature run its course. Animals have their natural instincts and defenses. They are capable of dealing with the climate change themselves. They will eventually adapt or find other solutions.

Topic Question 5:

I like that this issue is bringing so much awareness and that so many eager people are willing to help it. It's an incredible ongoing study, and a very intriguing one to learn about. It shows a copious amount of things that need to be considered when dealing with such a large, wilderness issue. But, somewhere there's a line that we could eventually cross over and begin putting too much effort in trying to control and manage a natural process.

Correspondence: Topic Question 1:

An alternative element to consider would be the introduction of new wolves to the environment. The introduction of new wolves would save the ecosystem through introducing new diversity in the genes of the wolf population. The genes would help counteract the problems the wolf population has had with inbreeding. Once the wolf population is sustained, the positive repercussions would be felt through the ecosystem.

Topic Question 2:

The main issue to take into consideration when changing aspects of the ecosystem is reflecting on the purpose of a designated wilderness area. The whole point of a wilderness area is to have the effects of humans be extremely minimal to preserve truly natural areas. The whole concept of playing god in this scenario counteracts this directly. Although this may be the case, we should argue that it is humans problem to fix because our cause of climate change is the reason behind the problems on the island and therefore our place to fix.

Topic Question 3:

The NPS should never have any extreme impact on the ecosystem to preserve its place as a wilderness area. Constant grooming of a wilderness area would change it to merely a state park or even zoo. Once new wolves are released into the ecosystem the NPS should let nature take its course.

Topic Question 4:

The clear problems happening as a result of climate change raises a few questions on our role to correct them even in wilderness areas. The higher temperatures of lake Superior in recent years has prevented a sturdy ice bridge to form across the lake for a long enough time so that wolves would migrate over. In a situation like this where the fault is clearly in the hand of climate change, the NPS should intervene solely to introduce new wolves. Although in this certain case intervention should happen, it should not be taken as normality among other wilderness areas.

Topic Question 5:

I dislike the fact that any intervention is taken at all because the fact that it is a wilderness area, but it is a necessary displeasure. The alternative to introduce new wolves to the population is not a drastic move as to groom the ecosystem to the want of humans completely, nor too little as to watch the ecosystem die because a simple alternative was not introduced.

Correspondence: Topic Question 2:

Although human activity is currently affecting the populations of moose, wolves, and vegetation at Isle Royale, until now direct and influential human interfering has not been seen on the island. Isle Royale is still a "wilderness" area and any management at all almost immediately strips away that title. Moose, wolves, and vegetation will in the end probably balance each other out and come to a natural equilibrium, whether that takes years, decades or a few centuries. Either way, human management opens a gateway for management in other wilderness areas, rendering them not wild, and therefore no longer wilderness.

Topic Question 3:

The NPS should consider no management, designated wilderness should remain wilderness and human meddling in the natural world should be kept to a minimum with researchers keeping tabs and monitoring populations, monitoring-but not managing. Considering that approximately 99% of the land area is wilderness, the thought of management shouldn't be considered.

Topic Question 4:

Instead of assuming that climate change is an unshakeable force that's destined to happen, efforts should be put towards reversing the effects of climate change rather than trying to pick up the pieces with the mindset that it's inevitable. In a way it is, but with the support of the people new laws and regulations can be passed keeping the effects and intensity of climate change to a minimum.

Topic Question 5:

The alternatives involving management do exactly that, management. Wilderness is not to be "managed" by man, we do not have that right. And excluding climate change and the introduction of canine parvovirus, people haven't had a directly negative impact on the island. Not in any way defending the actions of people, canine parvovirus could easily have been introduced later on, perhaps by a migratory wolf crossing the ice bridge. Playing god and instituting culling of the moose populations is no better than opening up the island for open season. It's not the place of the NPS or any organization to kill off these precious animals directly. Intense "management" of the moose population opens the door for intense management of the elk populations in Yellowstone and Glacier, next thing you know prizes are being handed out for the largest shot bighorn. What may start as management in the name of conservation will end up years from now as a shooting range with live targets. Let nature play its hand, and eventually either the ecosystem will right itself, or evolve, as are almost all ecosystems.

Correspondence: Topic Question 1:

Ecofriendly management should be considered when dealing with the wolf and moose populations on Isle Royale, in this way we can make sure not to further harm the ecosystem through climate change or pollution.

Topic Question 2:

The issue of the moose on the island eating away the vegetation and hurting the ecosystem on the island should be greatly considered. If the wolves completely disappear off the island, the moose will have no predators and their population will continue to grow, and continue to eat. The vegetation on the island is not unlimited and it is vital to the health of the ecosystem. The vegetation supports all of the animals and living things on the island and without it, the ecosystem will be unhealthy and crash. Also, the 50 year long study of the moose and wolf population should be considered. Researchers have learned a lot about the relationship between the wolves and moose on the island, and if no action is taken, the study will end once the wolves die off.

Topic Question 3:

When considering the wilderness on Isle Royale, we should remember that this land is wilderness and that human involvement to this area should be limited. We should also focus on the ways that humans have already effected this area, whether it be directly or indirectly. Humans introduced a disease to the wolf population in 1980, this caused the population of wolves on the island to drop dramatically. Since this incident, the wolf population has been steadily declining. Humans have also effected the relationship with wolves and moose on the island with climate change. The warmer weather has brought more ticks to the island and has made the ice bridge, which connects Isle Royale to the mainland and provides a gateway for wolves to reach the island, not be able to form. The ticks in past years caused the moose population to decline which steered wolves away because of their dwindling food source. Since humans have already effected this island and predator-prey relationship so much, it is only right that we should help the ecosystem and moose/wolf relationship to be better supported on the island.

Topic Question 4:

The changing climate has already effected the island in big ways. It has created a tick problem on the island, which made the moose and therefore the wolf populations decline. Climate change has made the ice bridge, in which the wolves reach the island, not be able to form because of the warmer weather. Ecofriendly management and quick acting will be necessary in the face of the changing climate.

Topic Question 5:

In Alternative Concept B I like that it keeps the moose population in check by bringing in wolves once. This would limit human involvement to the wilderness area, while also taking action to keep the ecosystem healthy. The problem with Alternative Concept C is that it uses the word "could" include wolf reintroduction or augmentation. This leaves the concept unclear and full of loopholes. In concept A, concept E, and concept F, the wolves would most likely die off on the island which would cause the researchers to lose their predator-prey study. In concept D, there is human involvement on both the wolf and moose populations, which means more human disturbance in the wilderness area.

Correspondence: Topic Question 1:

I believe that reintroducing wolves multiple times to create a sustainable population as the most pragmatic option available. The interbreeding of the new wolves with the original population is not necessarily relevant as long as the wolves continue to hunt the moose as their primary source of food. This would also allow further predator-prey relationship research even though the new wolves would not have migrated of their own accord.

Topic Question 2:

Because the effects of climate change on Isle Royal are inevitable, I believe small scale management of vegetation to help maintain the island while moose population's sky rocket is appropriate. However, I believe this management should be accompanied by wolf reintroduction.

Topic Question 3:

The point of wilderness is to remain untouched by humans, while climate change makes that technically impossible, the mindset should stay. Management through the culling of moose does not fit those ideals. Although the reintroduction of wolves would not happen through a naturally occurring migration, its impact would be less dramatic, and would not entail the use of vehicles otherwise not permitted on the Isle. A less severe approach is our best option at the moment

Topic Question 4:

While Isle Royal cannot beat climate change on its own, it should do all it can to reduce its negative impact on the climate. Because it is a wilderness area, the prohibition of plastic water bottles on the island should be easier. Perhaps setting up a system to further educate the public on climate change and the impact an individual has could be helpful for the island as well as the world.

Topic Question 5:

The issue I find with the current concepts proposed is that none seem to view the reintroduction of wolves as a legitimate option. Each concept that does mention wolves states that they will only be introduced once or does not specify whether or not the reintroduction is a required aspect of the concept. Option C for instance, states that it could include wolf reintroduction. In the Earth's current state, there is no inch of our country that we have not impacted through climate change, there for humans have already affected Isle Royal. By reintroducing wolves multiple times to create a sustainable population we can revive the island in the most natural way.

Correspondence: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,

Correspondence: Topic Question 1:

I believe the introduction of more wolves should be strongly considered. This is because it is the way that the Moose have naturally been managed on Isle Royale for a long time. For now Moose should not be managed by humans for two main reasons. First of all, this would involve much more human interaction in the designated wilderness area. This could have a possibility of setting a precedent of wildlife management in wilderness areas. Secondly, the natural predator of the moose on the island are wolves. As a preliminary plan I believe wolves from Canada (that are used to eating moose) should be introduced.

Topic Question 2:

Certain issues should be considered in the management of moose, vegetation and wolves in the future. First of all, because the ice bridge rarely forms anymore in between Canada and Isle Royale there is a slim chance of more wolves coming to the island naturally. This means that if wolves will continue to keep moose population and therefore vegetation health in check humans will have to essentially stock the island with wolves. Once stocked eventually in breeding will weaken and kill the wolves on the Island and the same problem we are currently facing will come back on the table. Alternatively, if the island isn't stocked with more wolves the moose population will spike, destroying vegetation, and eventually overpopulation of the moose causing many to die. I believe wolves should be re-introduced as an experiment and attempt to save the unique predator pray relationship that Isle Royal is famous for.

Topic Question 3:

The less humans can intervene the better, this is why wolves should be re-introduced instead of moose management by hunting. If we intervene too much it may set a precedent of restoration in National Wilderness Preserves. If we manage the moose ourselves the hunting would have a greater impact on the land then the reintroduction of wolves. Alternately, if we introduce wolves and they die, do we restock the island with more wolves? Or will that just create a zoo like setting? For this reason I believe we should re introduce wolves once and re-evaluate if the die.

Topic Question 4:

This problem is primarily are fault as humans because of the rising temperature on earth. If an ice bridge could still form the gene pool would have more variation than it has for the past 50 years. I think we should simulate wolves coming over from the land bridge by bringing more wolves to the island. It doesn't solve the problem but is the most low impact option for protecting the vegetation and maintaining a healthy moose population on the island.

Topic Question 5:

I think that mimicking wolf migration from Canada is our best option at this point in time because it has the lowest potential impact. The one major downside to this is that we are it is a major interference by humans in a wilderness area and everyone would like to stay away from that. Although it is usually the NPS's philosophy to not intervene, we as humans already have intervened by essentially destroying the possibility of more wolves to migrate to the island. This being said it is time for us to slightly change our mindset and attempt to fix the problem we created.

Correspondence: Topic Question 1:

Because the plan of action will not be enforced for another two years, it is basically being decided that the remaining three wolves will die off. With the moose population increasing so rapidly, I believe it is important to bring more wolves onto Isle Royale. In my opinion, bringing in two wolves alone would not be enough and would definitely lead to future generations being inbred. Even bringing in one pack could potentially be too few of wolves to survive and repopulate the island. This is why I believe two to three packs should be brought on to Isle Royale.

Topic Question 2:

While making this decision, there are many factors that need strong consideration. To begin with, the study between the wolves and moose on Isle Royale is the longest study between predator and prey that have known scientific records of. Because of this, the significance of the issue is greatly increased due to the national and international recognition that is being placed on it. It would be a shame to put an end to this study simply because of the extinction of the wolves due to the negative impacts of humans such as climate change and introducing deadly diseases. Next, when thinking about the effects of losing the wolves, attention needs to be given to the other living things on the island. A large increase in moose without the wolves to regulate them would lead to a lack of vegetation on the island and certain plants and animals would no longer be able to survive due to the over-browsing of the moose.

Topic Question 3:

Because the majority of Isle Royale is designated wilderness, certain precautions need to be taken. For example, wilderness is not ours to tamper with. However, we are always, though unintentionally, affecting it's ecosystem through climate change and the introduction of a deadly disease that killed off a good portion of the wolf population. Because of this, I feel we are responsible to bring back wolves that would most likely still be there if it weren't for our negative impact. It's our responsibility to try to reestablish the natural balance between wolves and moose that would still be intact if we truly had left the wilderness alone.

Topic Question 4:

Due to the changing climate, other factors are adding to this situation that also need consideration. Moose will not survive as well in the warmer weather that is starting to occur on Isle Royale. That is why I believe it is not necessary to "manage" the moose population at all. It would do more harm to decrease their population ourselves when both the climate and the reintroduction of the wolves will take care of it naturally. Also, it is very unlikely for more ice bridges to form due to the warmer weather which means wolves would not be able to enter the island themselves. This is another reason we should help reintroduce them.

Topic Question 5:

5. Option A (no action alternative) is a very bad idea. Though it may seem like it is in favor of letting nature run its course, that course has already been altered with and will continue to be altered with. This option guarantees that the wolves will not return, and the current conditions of the island's vegetation will only be decreasing. Option B (Introduce wolves once) is not very practical. Whether they decide to bring in one male and one female or an entire pack, it is very unlikely that they would survive alone. Also, this raises the risk of new wolf generations struggling with being inbred. Option C (maintain both species) is a good idea in regards to the wolves but not as much so for the moose. As I explained earlier, the moose population will be decreasing naturally so it is best to not interfere. Option D (introduce wolves once and reduce the moose population) raises both risks of not enough wolves and unnaturally reducing the moose population. Option E (reduce moose population) and F (intensively manage the moose population) also go against what I believe would be the best solution for the moose. In conclusion, I believe Isle Royale should reintroduce the wolves in large enough numbers so that the two species can go back to living in balance.

Correspondence Type: Web Form

Correspondence: Topic Question 1:

It would be possible to introduce wolves onto the island by enticing them to migrate, instead of bringing them by force. During the time that the ice bridge is present, meat, or other bait, could be used to get wolves from around the lake to cross onto the island. This would more closely mimic a migration event, and prevent the wolves from having direct human contact.

Topic Question 2:

The cause of the current imbalance of moose and wolf population can be seen as the result of previous human interventions on the island. Research teams introduced a virus that devastated wolf populations, and global warming is causing the deaths of many moose. While looking forward, and deciding how to remedy the current issue, it is important to remember that any intervention could cause unforeseen damage to another aspect of the ecosystem.

Topic Question 3:

Any action that is decided upon, and is taken must occur within the wilderness area and not the 1% o other land. It is important not to set the precedent that it is acceptable to influence or alter wilderness areas by introducing change on the border of such areas and waiting for said change to spread into the wilderness area. If all change must directly take effect in the wilderness area, it can be much more heavily monitored.

Topic Question 4:

The NPS should be cognizant of the fact that any decision made now will most likely be applied to other ecosystem imbalances caused by climate change. It is also important to note that, as we continue to influence the climate, we will most likely cause more ecosystem imbalances, and that any decision made

now, should be applicable to future occasions.

Topic Question 5:

I dislike that alternative A does nothing to stabilize the current imbalance in the moose, wolf populations. It also sets the precedent that we shouldn't intervene to fix a problem that we cause in a wilderness area.

I like that alternative B sets a policy of minimal intervention. By restricting wolf introduction to one time, the population difference would be reset, much in the way that nature would alter it.

I do not like the last four options, as they include too much intervention by the parks service. Reducing the moose population is not necessary if the wolf population is restored to a sustainable level.

Correspondence: Topic Question 2:

The main issue that should be considered with Isle Royale is the root of the problem, not merely one of the symptoms. Managing wolves, moose, or vegetation, whether introduction or reduction, may help for a short-term solution to maintaining the ecosystem on the island, but will not be a sustainable long-term solution. The real cause of the problem is in climate change, which, among other things, is causing Lake Superior to not freeze over. When this happens, no new wolves can naturally be introduced, leading to a lack of new genetic material, thus creating inbreeding and decreased wolf populations. With no wolves, the moose population explodes for lack of a predator, and there is nothing to keep the moose population from over eating the vegetation on the island, and then eventually, with no food left, the moose also die out. In short, the wolves dying out leads to the ecosystem collapsing within the island.

Topic Question 3:

Wilderness is a beautiful thing, something that almost all humans enjoy and love. Ironically, wilderness is almost the opposite of what we have made the world. Wilderness is seen to be uninhabited by humans, undeveloped, and generally unchanged by us. So the prospect of interfering in the endeavor to sustain wilderness is quite the paradox. However, other facts must be taken into account; with the currently incredibly low population of wolves, they will almost surely die out unless new ones are introduced one way or another. And if the wolves die out completely on the island, most of the ecosystem will collapse. So, introducing wolves into the wilderness may create a short term solution and bring a balance to nature, at least for a while. However, it is undeniable that consistent interference from humans no longer makes this a "wilderness area." Perhaps for the immediate issue at hand, introducing a few more wolves onto the island might bring a balance. But in the end, if we want this wilderness area to truly stay a wilderness area, we must find a way for nature to be able to sustain itself, not only on this island, but everywhere on earth.

Topic Question 4:

The root of the problem on Isle Royale is the fact that new wolves cannot be introduced by natural means, because Lake Superior is not freezing over enough to let this happen. So to find a sustainable, long-term solution, and to bring a balance to the ecosystem, we must confront the problem that created this issue in the first place: Climate change. If the world continues to warm due to humans, the wolves, and indeed the entire environment, on Isle Royale cannot naturally sustain itself, and perhaps nature should find a new set of species that can live on the island in the face of warmer climate. But if we, presumably, want to maintain the current ecosystem on the island, we have to first reduce, and eventually stop and hopefully reverse the effects of global warming. Obviously, this cannot simply be done just because we want it to, or just because some wolves are dying. But this is an issue much bigger than a single island in a lake. This is an issue that poses a threat to the entire earth, and all of its species. So, no matter what sort of management, if any, occurs on Isle Royale, we, as humans, need to do everything in our power to stop this worldwide concern.

Topic Question 5:

What I like about the prospect of managing the populations on the island is that it does provide some sort of solution the the problem just on the island. What I dislike about merely managing the island is that it fails to address the larger issue, climate change. In the end, all of our efforts should really be focused on stopping climate change. Not that we should ignore the island; far from it. But Isle Royale will be the least of our worries if we do nothing about global warming as soon as possible.

Comments:

Received: Aug,28,2015 14:50:46

Correspondence Type: Web Form

Correspondence: Topic Question 1:

When the ice freezes over in Superior, we should bait wolves across the ice to the island, allowing a more natural occurrence to get wolves to the island. We need wolves on the island, and this is a highly more ethical alternative than bringing in wolves through other means.

Topic Question 2:

When evaluating future management of moose, wolves, and vegetation, certain issues must be taken into account. Each species is necessary and affects the entire ecosystem. The wolves keep the moose population in check. When wolves aren't there to decrease the moose, the moose eat away all the vegetation.

Smaller animals who live on the island and depend on the plant life of Isle Royale, decrease in population when the moose eat all the vegetation. Wolves are essential the balance of the ecosystem, for without them, the life of the island falls apart.

Topic Question 3:

Because Isle Royale is mostly a Wilderness Area, human management of the area should be as minimal as possible. However, one may argue that we as humans have already inadvertently impacted Wilderness Areas, through acts of climate change, diseases, invasive species, etc. that have changed our Wilderness Areas. The NPS needs to manage, but they must do so while keeping a respectful distance, by not decreasing the amount of moose. Wolves are not only important to the ecosystem, but they are essential to it; we need them to be on the island for the sake of all other life on Isle Royale.

Topic Question 4:

Although we'd like not to think about it, humans have altered every Wilderness Area. We have cause our earth to warm, and in doing so, drastically changed ecosystems everywhere. The moose are dying due to ticks that survive the winter only because of climate change. Each year, Superior freezes for a shorter period of time, if at all. Management of Wilderness areas should be kept at a minimum, but if we caused the problem, we ought to fix it.

Topic Question 5:

The best course of action for the NPS in Isle Royale is Alternative Concept B, bringing in wolves once to mimic a migration. The other options require more management than necessary, and the ecosystem changes even more drastically than before. To not introduce wolves would allow the moose to spiral out of control and deplete the vegetation on the island, and ultimately, themselves. To cull the moose would be more management than what should be allowed in Wilderness Areas. Hunting is not allowed on the island, and to allow it for even a short time would be unethical. Wolves are necessary to the balance of the ecosystem on Isle Royale. However, for future scientific research that would benefit both Isle Royale and other areas faced with a similar problem, the wolves should be allowed to die out naturally. When the wolves are no longer on the island, wolves from the surrounding area, or wolves that have similar eating habits to that of the Isle Royale wolves, should be introduced. It is important for the introduced wolves to either be from a nearby area or have similar eating habits. This will allow for the wolves to thrive on the island and return its ecosystem to the balance it once was.

Correspondence Type:

Web Form

Correspondence: Topic Question 1:

1. Although Option C, in which the National Park Service reintroduces wolves, is the best option, there are a few additions to this proposal that I think should be made. First, the option proposal says it "could" include the reintroduction of wolves on the island. The language of the plan should be clear that wolves will be reintroduced as a definite and major step to maintain both the wolf and moose populations. Second, wolves should be reintroduced more than one time. Due to warmer winters and the ice bridge across Lake Superior not forming for as long, new wolves no longer migrate to the island. Also, a number of mutations caused by inbreeding decrease the wolves' survival rate. In order for the reintroduction of wolves to make a positive impact on the wolf and moose populations on Isle Royale, there would have to waves of wolf reintroductions to support a new, growing wolf population. Last, the wolves reintroduced to the island wilderness area should be wolves from Canada, where they are accustomed to hunting moose. If the wolves were taken from Michigan or Wisconsin, they would be accustomed to eating deer and might take longer to adapt.

Topic Question 2:

2. When evaluating future management of moose, wolves, and vegetation at Isle Royale, past Isuccesses in reintroducing wolves should be considered. The most famous area where wolf reintroduction has had a major, positive impact is Yellowstone National Park. The wolves were hunted and extirpated out of the park, which greatly decreased biodiversity, letting deer populations skyrocket and vegetation near lakes and rivers be eaten at an unsustainable rate. The lack of vegetation in riparian areas led to decreased water quality and decreased biodiversity in the lakes and streams. When wolves were eventually reintroduced in Yellowstone, they brought them back in more than one step. After years of research, scientists found that the issues they found when wolves were absent were beginning to fix themselves. The deer population was controlled, vegetation came back, water quality improved, and sensitive fish returned to the streams. This future success should be used as a model to help the wolf population on Isle Royale, even though Isle Royale is an island ecosystem and different from Yellowstone.

Topic Question 3:

3. Although much of Isle Royale National Park is designated wilderness, the NPS should still make reintroduction efforts for the wolf population. Plans to do so should be urgent and intense, considering that the wolf population is very quickly decreasing to only a couple left. Humans have changed the global environment immensely through climate change, which has left its impact on Isle Royale National Park already. Also, humans have introduced parasites and viruses onto the island that impact the moose population. In these ways, humans are largely responsible for the suffering wolf population and relationship between the moose and wolf on the island.

Topic Question 4:

4. In the face of a changing climate, the NPS should consider acting on this issue with more intensity and urgency than they might without the added factor of climate change. As previously stated, humans are responsible for much of the harm done to the wolf and moose populations. Our actions, done to benefit the economy and not the environment, have led to rising global temperatures and warmer winters on Lake Superior. The ice bridge no longer forms for long periods of time, which does not allow new wolves to come to the island to build up a falling wolf population. In addition, warmer temperatures have led to the breeding of more ticks and a falling moose population. Because the wolves only have one major prey on Isle Royale, they cannot survive with no moose. We are responsible for the negative changes occurring to this ecosystem and we are responsible for fixing them.

Topic Question 5:

5. I do not like the preliminary alternatives because many of them leave room for neglecting the ecosystem on Isle Royale, which has been altered by humans through climate change. Not reintroducing wolves and letting the moose population will negatively impact the vegetation. On the other hand, some of the options manage moose populations too much, decreasing mammal biodiversity and letting plants become overgrown. I like that some of the options are similar with more detailed differences, which gives those deciding more options. For example, there are three options involving reintroduction of

wolves on Isle Royale.

Correspondence: Topic Question 1:
All options are well covered.

Topic Question 2:

The long term issues of climate change should be considered when evaluating the future management of populations. Even if we introduce Wolves once, genetic issues related to inbreeding will still be common. The tick that plagues the moose also cannot be changed. One of the requirements for a healthy ecosystem is new genetic material, which no longer naturally occurs because of climate change.

Topic Question 3:

Designated wilderness areas should be left alone unless there is a major threat to humans, such as invasive species, or wildfires.

Topic Question 4:

Even in the face of a changing climate, the NPS should not interfere with designated wilderness areas. There are bound to be consequences of climate change, but that does not mean that we should start trying to micromanage wild animals and natural spaces to try to undo what we have already done. I feel that if human intervention became more common, the negative impacts on the environment would outweigh the positive ones.

Topic Question 5:

I like how concerned the plans are for preserving the equilibrium on the island, but in my opinion plans C through F would not be viable in the long term. Plan B, monitoring wolf and moose populations, is a successful long term plan, but I feel that it is not our right as humans to do that and that if defies the very reason wilderness areas were ever created. I also feel that it sets a bad precedent for major human intervention in wilderness areas in the future.

Topic Question 6:

In short I support plan A as I feel that plans B,D,E, and F would not fix the long term issues of the populations, and I feel that plan B is unmoral and not our prerogative.

Correspondence: Topic Question 2:

The issue that stands out the most in my mind is that global climate change is the initial cause of this environmental dilemma. The origin of this problem is the gradual warming of Lake Superior, this has led to prolonged summers and mild winters. The reasons these two effects are harmful to the ecosystem are that it makes it difficult for the wolves to be nourished because they thrive during the winter time when it is easier to hunt, and because it allows for intense tick outbreaks during the longer warm season (this leads to the death of many moose). It should be considered that introducing wolves is only treating a symptom to a very complex and dangerous disease, once the ecosystem is stable it will only be a matter of time before it crashes once again. One way to truly prevent this is by taking measures to fix and control the effects of climate change, only then will the moose and wolf population be legitimately unharmed by humans.

Topic Question 3:

The significance of 99% of Isle Royale being designated wilderness, is that (in theory) wilderness areas should not be assisted or altered in any way by human beings. However we must take responsibility for the problem that we have created. Nature's Course has already been affected by people (the warming of the lake), it only makes sense that we now help what we have already hurt. I believe that the ideal way to do this is by introducing a small number of north Canadian wolves who are accustomed to hunting moose already. The number of wolves introduced must be small, but large enough to breed and potentially give birth to enough pups to eventually create two packs, three males and three females could be a good number. The National Parks Service should then be prepared for this attempt to fail, and be open to the idea of multiple introductions of wolves to the island. Once on the island the immediate ecosystem should no longer be experimented with in hopes of more assistance, and tourism should be held to the same restrictions as currently stated, this is because the growth of human development could result in limited progress.

Topic Question 4:

The most important part of the entirety of this issue is to prevent scenarios similar to this from happening in the future. Environmental collapses like this could be avoided by efforts to, reduce the carbon footprint, use more renewable energy, reducing human activity in the lake that involved motorized boats, and many more ideas with the same objective as these, to keep the effects of climate change to a minimum.

Topic Question 5:

I like the options that involve taking action, but have a large chance of creating minimal disturbances. Introducing a small but sufficient number of healthy wolves to the island (to simulate a minor migration) has the largest chance at success in my opinion. This way the wolves an opportunity to reproduce and give birth to less inbred young, which would lead to the stabilization of the out of control moose population, which then finally keeps the islands plant life

at an ideally healthy level so that it can sustain all other living and nonliving aspects of the island. Taking action and getting involved in solving this problem that we have created is necessary, however extensively and constantly managing the wolf and or moose populations is counterproductive in my opinion. Fixing a manmade problem in a wilderness area is one thing, but once humans are continuously involved, it because less of a wilderness area and more of a zoo or tourist attraction.

Correspondence: Topic Question 1:

Isle Royale needs wolves, and however that can be made to happen - one time, or ongoing reintroduction - it needs to happen.

Topic Question 2:

We have to intervene at this point. It sounds good to say "let nature take its course" - esp. in a wilderness area, but humans, unfortunately, have already messed things up by letting parvo-virus onto the island, building big cities where wolves once crossed, and warming the climate to the extent that ice bridges are rare. If we let the wolves die out, the moose population will explode (more than it already has), over browse, and likely die from disease and lack of food. The island needs predators who can balance the ecosystem.

Topic Question 3:

It would seem that the re-introduction of a healthy, genetically diverse wolf population would provide the needed management. In addition, ongoing monitoring of the wolf and moose population would seem to be necessary.

Topic Question 4:

A warming climate will mean that ice bridges form less often which will necessitate the above intervention. A warming climate does not seem to mean, however, that wolves and moose cannot coexist on the unique wilderness island that Isle Royale is.

Topic Question 5:

If the NPS objects to re-introducing a healthy wolf population, how can they possibly justify "intensively managing" the moose population?! The wolves have managed that population for decades quite well! Would this just become an excuse then to hunt moose on a regular basis? With no predators, it would have to happen on an on-going basis. What a statement THAT would make about the Park Service! All the alternatives that don't include reintroducing wolves, except for 'A', include other human interventions - killing moose and manipulating vegetation. How is this better?

Topic Question 6:

I first came to Isle Royale as a teenager with my parents back in 1966. Since then, I have visited many times staying both at the Lodge and backpacking. From that very first visit, the island has amazed me as to how much has *not* changed. The numbers of wolves and moose have fluctuated, of course, but the overall "feel" of the Island has remained much the same...that of Wilderness. It breaks my heart that we are now at a point where we are losing the wolves, but something can be done to change that. Imagine having a real wilderness on an island in the midwest! Imagine that for decades the ecosystem on that island has remained pretty much in balance. Imagine that because of humans that balance is now terribly threatened. Imagine that we choose to do nothing and the effects of our past mistakes turn this once incredibly unique and beautiful park into either a hunting ground, or a much less dynamic and diverse jewel in the park system. I know many people go to Isle Royale not just for the hiking and the flowers and the solitude. They go because there are

wolves on the island. Most never see one - but just knowing that they're sharing the same space with them makes their experience almost magical. Isle Royale is wolves. So imagine being able to bring the wolf back and keeping this special special place in balance with itself without necessitating even more intrusive manipulation. Yes - reintroducing wolves is a form of intervention - but once the numbers increase, the island has shown that it can do a pretty darn good job of taking care of itself.

Correspondence: Topic Question 1:

There are no attentional alternatives that have not already been presented.

Topic Question 2:

In the future, introducing more wolves at an earlier stage (before 99% of the population has died off on the island) could have prevented the need for a large amount of action to be taken. Overtime, allowing the wolves to adapt one pack at a time to the island while other wolves are already inhabiting the island would increase the chances of the wolves survival and prevent the possibility of drastic change to the island.

Topic Question 3:

Isle Royale is a protected wilderness area and there are many laws preventing human interference with designated wilderness. Therefore the least amount of action should be taken that will produce the maximum benefit and minimum amount of damage to the island. For this reason, in order to protect the wilderness intervention is needed to protect the wilderness from being destroyed. Management is needed to reintroduce wolves to prevent the Moose from dominating the island and possibly causing irreversible damage.

Topic Question 4:

Since the climate has been warmer and the ice bridge to the island frozen for a much shorter time the possibility of wolves accessing the island on their own is doubtful. While the moose will dominate the island without a predator, warmer temperatures results in more ticks to effect the moose population. Due to the changing climate, both species will be effected greatly. For this reason, a large amount of management is needed to ensure that an equal balance of vegetation and species are acquired.

Topic Question 5:

The preliminary alternatives that do not involve sustaining a balance in the wolf and Moose population I dislike because they could endanger the entire dynamic of the island. Since there are barely any wolves, the Moose will have time to repopulate and affect the vegetation. In turn this will affect the entire ecosystem including the soil which will effect lake superior. Managing the Moose so that their numbers are not overpopulating the island would require heavy management and result in the death of many Moose.

Topic Question 6:

While there are a lot of uncertainties in each possible solution, we have experienced and know what Isle Royale is like with both Moose and wolves inhabiting the island. It is impossible to predict what will happen, but allowing Moose to flourish or even containing them without the presence of wolves is a great risk to not only Isle Royale but the surrounding areas.

Correspondence: With only three wolves left at the park- -the lowest number of wolves in more than 50 years- -the overall ecosystem health of this iconic national park is in danger.

Management Alternative B, to bring new wolves to the island, should be done as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. New wolves will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

The idea of culling moose is disgusting to me, removing moose from the island is fine as long as they are not hurt or separated from their families and are placed in a supportive environment. Replanting native vegetation once the moose consume it is also fine if it's actually feasible.

Probably the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem is the best way to go. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thanks for considering my concerns.

Correspondence: Topic Question 1:
Keep with concept C, but also stress the importance of scientific research and education.

Topic Question 2:
Above all, it must be compassionate and considerate of the wildlife.

Topic Question 3:
I would normally say that a "hands off" works best for wilderness areas. Isle Royale is an exceptional wilderness area. It is an island, after all. I have trouble with the term "management" as it usually means "killing" wildlife. If we can just keep "killing" out of it, then I believe something aggressive must be done to keep moose from eventual starvation.

Topic Question 4:
Due to our changing climate, the ice bridge did not form for many years. Humans are at the very least somewhat responsible for the warming. Humans should take responsibility for this and intensely manage some of the problems that have been created.

Topic Question 5:
Concept A: would be cruel, causing moose to eventually starve
B: would cause the same situation later on
C: humans caused some of the problems (climate change, introduction of Parvo virus, and build the mine shafts that caused wolf deaths). Humans must help the environment they wrecked.
D: Is just kicking the can down the road.
E: How is this not meddling with nature?
F: This is most troubling. An excuse to kill, kill, kill

Topic Question 6:
First, I have to admit that I no longer trust the NPS to do the right thing. From what I have observed, anytime any government agency has anything to do with wildlife, animals end up dead. At the whim of a rancher, an entire pack of wolves can be/has been killed. I'm all for a "hands-off" approach regarding nature, but man has messed up so many things involved with wilderness, that man should now step-up and try to correct some of the things man has destroyed. Wildlife habitat is being constantly destroyed. Climate change science is laughed at (the senator with the snowball), or ignored. Things have to be changed before it's too late. The time to do something is now. My heart sang when wolves were reintroduced in Yellowstone, only to be broken again and again when the park's wolves were lured from the safety of the park and killed. Too often NPS turns a blind eye to the plight of wolves. The image of the three remaining wolves, with the obvious deformity in the smallest one, is so very troubling. It convinces me that something must be done genetically to let the wolves persevere. Bring in new DNA, help the wolves, and the moose will not starve and the island will not become a desert. Cover the mine shafts, allow few visitors, educate people.
I have a question: I have long believed that moose first swam to the island, but have been told that is not the case. I was told that some businessmen brought moose to the island so they could have something to hunt. Could this possibly be true? Was there a time when elk and lynx lived there?

See my comments below.

Topic Question 2:
See my comments below, which conclude with:

Having said all of the above, I am leery of the slippery-slope into management excess. Good guidelines need to quickly be established for dealing with problems like this. I would suggest basing them on fire policy, ie: correct human caused problems, but consider the following before acting:

A. Does it mimic and/or re-establish natural processes?

B. Does it have a good chance of working; are there places where it has?

C. Does the law of unintended consequences loom large or small with the considered options?

D. Can we afford it (afford to include cost to ecological integrity, not just dollars)?

E. Can we afford not to do it?

F. Heavy weight in decision making should be given to specialists/scientists with the most intimate knowledge of the specific problem and its location. The will of the public that owns the Parks should also have significant weight..

Topic Question 3:

See my comments below.

Topic Question 4:

See my comments below.

Topic Question 5:

See my comments below.

Topic Question 6:

All my comments are in the "Comments" section below.

Comments: Concept B, which just re-establishes wolves, is the only concept that actually gets at the problem - - which is the ecological integrity destabilization resulting from inadequate moose predation by wolves. However, Concept B is doomed to failure because it simply kicks the can down the road, with its one time re-establishment restriction. Concept B would work, and in comparison, be elegantly simple if it was changed to read: Re-establish wolves on the island by bringing in new wolves as often as needed to maintain adequate genetic diversity, mimicking historic migration events over ice bridges. No other moose management.

I have come to Isle Royale since 1984, approaching 50 backcountry 2-week trips, and 27 shorter visits leading Elderhostel/Road Scholar courses for MTU/Isle Royale Institute with my wife Ann. Having long been a staunch hands-off advocate for management of Isle Royale, I find myself firmly in favor of re-establishing wolves on Isle Royale for the purpose of preserving the islands ecological integrity. I dont come to this view lightly, and do find it consistent with my belief that allowing natural ecosystems to function as naturally as possible is the best policy, for the following reasons:

1) We broke it, we have a responsibility to fix it. The argument that designated wilderness doesnt allow for human intervention is specious at best when we caused the problem by causing climate change, introducing parvovirus, and leaving open mining pits on the island - - all major contributors to the current problem of too few wolves that are not reproducing and too many moose.

It is distressingly ironic, and at cross purposes that wilderness designation doesnt keep us from breaking ecosystems, but is used to keep us from repairing them.

2) Wolf re-establishment is the most effective, most natural, least risky, least expensive solution to inadequate moose predation. Wolves work tirelessly for free. They are very effective at culling moose, without guns, helicopters, ATVs, and all of the attendant risks and expenses incurred when humans try to do the wolves job. Wolves can smell gum abscesses and cancer, detecting and culling out these and other problems and weaknesses that completely escape humans attempting to do the wolves job. Result of wolf re-establishment? A smaller and healthier moose population done naturally, and on the cheap. Re-establishing wolves mimics natural processes; culling by humans doesnt even come close.

3) As long as moose are on the island, wolves are necessary. Just giving up, doing nothing, and not taking responsibility for destabilizing ecological integrity is irresponsible and unacceptable. It makes wilderness designation a sham.

4) This would not be the first intervention in species management at Isle Royale. Brook trout have been planted in several Isle Royale areas because humans caused their absence. The same was attempted with peregrine falcons. Human fingerprints are all over Isle Royale, both in terms of degradation and repair of our mistakes.

5) Isle Royale National Park has established a precedent in its fire policy. Although there are many qualifiers, the Park Services fire policy is basically to stop human caused fires, and , where possible, let natural fires burn. Since human activity is responsible for the current wolf/moose instability, is it not logical and consistent to use the same approach here and try to repair the problem as naturally and simply as possible?

6) Concatenating Instability. The problem of excess moose is one of concatenating ecological integrity destabilization. Balsam fir is one aspect. Balsam fir is rapidly declining from moose predation. This is especially distressing since Isle Royale, surrounded by the cooling effect of Lake Superior, may be the best refuge for moose and balsam fir in the entire lower 48 states. What has me even more concerned are all the other, seldom discussed effects of moose overpopulation. Pages could be written on this, but the disappearance of underwater vegetation in Isle Royales inland lakes is terribly ominous. Researchers this summer (2015) have documented denuded shorelines and muddy, turbid water, and disappearing underwater vegetation in several lakes from overuse by moose. This can easily be seen in the lush vegetation inside the one remaining lake moose exclosure on the island, with virtually absent vegetation in the water surrounding it.

This has profound implications. It affects the food chain at the very bottom: reduced macro-invertebrates that rely on this vegetation results in starving fish fry, which results in reduced fish populations, which results in reduced food for loons and their chicks. Absent vegetation and silty water also results in degraded spawning grounds, compounding the problem. There are far, far more species dependent on healthy lake ecosystems than we are probably even aware of. The law of unintended consequences of not re-establishing wolves looms large here.

7) I am not in favor of intensively managing anything on Isle Royale (other than our own self-discipline). It reflects an unfounded and indefensible confidence that we have more knowledge and ability than we actually do.

8) Genetic Rescue should have been done 2 years ago when the two scientists with the Isle Royale wolf-moose study were recommending it. There was real value to an infusion of new genes in Isle Royale wolves that would also have preserved any unique and advantageous genes in Isle Royale wolves. This is not an unproven approach. It has been a huge success in Florida panthers, and in at least two other species. In the last few years, those scientists have been proven accurate as the pace of decline in wolves on Isle Royale has accelerated, as have the far-reaching interrelated degradations.

Quite frankly, there is no problem so large it cant be made worse by simply studying it longer when we already have sufficient knowledge to act on. We need to re-establish wolves NOW. They need to continue to be re-established on an as-needed basis. This is the simplest, most natural, least risky, most cost-effective concept.

9) Having said all of the above, I am leery of the slippery-slope into management excess. Good guidelines need to quickly be established for dealing with problems like this. I would suggest basing them on fire policy, ie: correct human caused problems, but consider the following before acting:

A. Does it mimic and/or re-establish natural processes?

B. Does it have a good chance of working; are there places where it has?

C. Does the law of unintended consequences loom large or small with the considered options?

D. Can we afford it (afford to include cost to ecological integrity, not just dollars)?

E. Can we afford not to do it?

F. Heavy weight in decision making should be given to specialists/scientists with the most intimate knowledge of the specific problem and its location. The will of the public that owns the Parks should also have significant weight.

Correspondence: Topic Question 1:

Please bring additional wolves to the island. Apex predators are vital to keep the rest of the ecosystem healthy.

Comments: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,

Correspondence: Topic Question 1:

You need an alternative that simply calls for OCCASIONAL reintroduction of wolves AS NEEDED TO MAINTAIN GENETIC DIVERSITY, and ALLOW THE WOLVES TO MAINTAIN THE MOOSE POPULATION - - which is what they do better than any human "management" techniques. The wolves are much more sensitive to detecting weakness, illness, and infection in moose, and those are the moose that they cull. If that is what you intend in Alternative C, then I would suggest it be more clearly worded to define exactly what you mean by "maintain populations of moose and wolves on the island."

Topic Question 2:

As I wrote in the "Comments" section: "...cold Lake Superior surrounds Isle Royale, the archipelago is likely to maintain a colder microclimate than the rest of the temperate-boreal forest transition zone; just as Isle Royale harbors arctic/alpine disjuncts plant species, it will likely be able to sustain moose longer than any of the surrounding mainland areas. Already I have been reading of calls to put moose on the endangered species list, because their populations have diminished so significantly in Minnesota and Ontario. As long as moose are on Isle Royale, wolves need to be there to maintain healthy moose populations and island ecosystem."

Topic Question 3:

No intense management is needed. Simply reintroducing healthy wolves to the island, and enabling them to maintain their genetic diversity, will provide moose with the best possible management to maintain a healthy moose herd. Given the 99%-wilderness designation, your following statement is totally inappropriate and unacceptable: Effective management of moose may require the use of motorized or mechanized equipment, such as helicopters.

Topic Question 4:

As I wrote in the "Comments" section: "I have always been a strong supporter of the 'hands-off' attitude the Park Service has had regarding wildlife on Isle Royale. But when it comes to problems caused by climate change, I would support a new policy - - one comparable to the Park Service's fire-fighting policy that lets fires with natural causes burn, but fights fires that are human-caused. Thus, if wildlife face problems that are natural and not caused by humans, then it makes sense to see what creative responses nature will develop; but if wildlife are endangered as a result of human actions, then it is appropriate to remedy whatever can be done." In this case - - inability of wolves to maintain genetic diversity due to lack of ice bridges - - the type of management needed is (as I mentioned in Question #1) OCCASIONAL reintroduction of wolves AS NEEDED TO MAINTAIN GENETIC DIVERSITY, and ALLOW THE WOLVES TO MAINTAIN THE MOOSE POPULATION - - which is what they do better than any human "management" techniques.

Regarding the intensity of management, no "intense" management is needed. Simply reintroducing healthy wolves to the island, and enabling them to maintain their genetic diversity, will provide moose with the best possible "management" to maintain a healthy moose herd. Not only because of the wilderness designation, but also because of safety and noise concerns for park visitors and the logistics of removing "culled" moose bodies from this rugged wilderness, your following statement is totally inappropriate and unacceptable: "Effective management of moose may require the use of motorized or mechanized equipment, such as helicopters."

Topic Question 5:

Alternative Concept A (no-action alternative) - -DISLIKE - - this does nothing to resolve the problems facing the wolves, moose, and entire island ecosystem.

Alternative Concept B (introduce wolves once) - - I agree with: "Reestablish wolves on the island by bringing in new wolves ... to mimic a migration event; no moose management." I DISAGREE with the commitment to only introduce wolves ONCE. Research indicates that such an introduction might result in a decade or so of genetic health, but it is likely that lack of genetic diversity would eventually become an issue again, and it is quite shortsighted to commit to never having to do another such introduction. I don't even see the point in including the word "once." The phrase "as needed to maintain genetic diversity" would be much better. My recommended re-wording: "Reestablish wolves on the island by bringing in new wolves as needed to maintain genetic diversity to mimic migration events; no moose management." I am assuming here that "no moose management" refers to management by the NPS. The reestablished wolves should be able to manage the moose well, and can continue to do so if occasional reintroductions are done as needed to maintain the wolves' genetic diversity.

Alternative Concept C (maintain both species) - - the wording of this alternative is strangely vague, and I'm not sure exactly what you mean by "Maintain populations of moose and wolves on the island, which could include wolf reintroduction or augmentation." The long-term predator-prey study on Isle Royale has shown that healthy wolves do an excellent job of maintaining a healthy moose population. If wolves' genetic diversity is maintained by occasional reintroduction, it is unlikely that any other human intervention would be required to "maintain populations of moose and wolves." If that is what you mean, then I would support this alternative, but it would need to be more clearly stated. If "maintaining" means more active interventions (such as culling of moose), I would not support that (see further comments in Alternatives D, E, F).

Alternative Concept D (introduce wolves once and reduce the moose population) - - DISLIKE - - I have already explained in my comments above why it is a mistake to plan to only introduce wolves once. This is a short-sighted plan, to give wolves one attempt at reintroduction but not allow for them to

maintain genetic diversity as ice bridges remain rare. Then it would only be a matter of time before you would have to "reduce moose density," using methods that are contrary to wilderness ethics, may affect visitors' aesthetic experiences and even their safety, and have so many more costly logistical problems (mechanized equipment, helicopter use, removal of "culled" moose carcasses, etc.). Reintroducing wolves as needed is a much more effective, simpler, safer, and less costly plan.

Alternative Concept E (reduce moose population) - - DISLIKE - - the current struggling wolf population is already barely impacting the moose population. It is ridiculous to consider using expensive, noisy, non-wilderness-compatible techniques to reduce moose when reintroducing healthy wolves has already been proven to effectively maintain a healthy moose population.

Alternative Concept F (intensively manage the moose population) - - DISLIKE - - again, the current struggling wolf population is already barely impacting the moose population. It is ridiculous to consider using complicated, expensive, noisy, non-wilderness-compatible techniques to reduce moose when reintroducing healthy wolves has already been proven to effectively maintain a healthy moose population.

Topic Question 6:

All of my comments are in the "Comments" section below.

Comments: I understand that the National Park Service is again requesting input on the pending decision regarding the future management of wolves and moose on Isle Royale, and I have seen the alternatives being considered. I submitted comments in October 2013, and wonder why nothing was done with those comments since I am being asked to submit them all over again - - seems like nearly two years and a lot of public input was wasted while the wolves plight went from needing genetic rescue to being nearly extinct. So again I am writing with great concern for not only the wolves and moose of Isle Royale, but for the entire island ecosystem.

My husband John and I have visited Isle Royale countless times since 1984 - - traveling by foot, canoe, and kayak. Many of these were family trips, some were part of work on our book Lake Superior: Story and Spirit, and since 2002 we have also been leading Elderhostel/Road Scholar trips on the island for MTU/Isle Royale Institute. We have witnessed firsthand the wide swings in the moose and wolf populations over the last 30 years.

We saw the moose population swell after boaters brought parvovirus to the island and the wolves were struggling to recover; in the summer of 1995 we saw 64 moose in 2 weeks. But they were clearly unhealthy; we saw cows the size of calves, a calf with one eye missing, and several moose with large tumors. And the foliage was clearly over-browsed. After the long winter of 1995-96, we sea kayaked to Isle Royale that May and saw more dead moose than live. The starvation and huge die-off of 80 per cent of Isle Royale's moose was a tragedy that I would not want to see happen again.

In my comments submitted in October 2013, I urged the National Park Service to take quick action on the proposal to conserve Isle Royale wolves with an action known as genetic rescue by bringing some wolves to the island to mitigate inbreeding." Now, nearly two years later, I am disappointed to see that no action was taken and this issue is still only being studied, as the wolves now are facing extinction and the moose population continues to swell. Forest and aquatic plant devastation by moose is already underway, and the stage is set for another eventual huge die-off. The fragile entire island ecosystem is already being affected, as this over-browsing widely affects the other flora and fauna - - in forests, ponds, and lakes.

Genetic studies by Isle Royale's wolf-moose study have shown that the genetic health of Isle Royale wolves has been significantly improved in the past when new wolves were able to cross an ice bridge from the mainland and breed with island wolves. We have personally noted the decrease in ice-cover on Lake Superior in recent years, and there has been clear documentation that ice bridges to Isle Royale are forming less often. There is little doubt that climate change brought about by human activities has resulted in this increasing rarity of ice bridges.

I have always been a strong supporter of the "hands-off" attitude the Park Service has had regarding wildlife on Isle Royale. But when it comes to problems caused by climate change, I would support a new policy - - one comparable to the Park Service's fire-fighting policy that lets fires with natural causes burn, but fights fires that are human-caused. Thus, if wildlife face problems that are natural and not caused by humans, then it makes sense to see what creative responses nature will develop; but if wildlife are endangered as a result of human actions, then it is appropriate to remedy whatever can be done.

I do want to comment on a couple of points in your newsletter. First, you state: This boom and bust cycle has occurred in both the presence and absence of wolves; however, the magnitude of the fluctuation is likely to increase without wolves. While I do not disagree that the boom and bust cycle has occurred in the presence of wolves, I would like to point out that the boom and bust cycle of 1995-96 can be specifically linked to the poor health of the wolves who were struggling to regain health after their population crashed from parvovirus; it was a natural genetic rescue (wolf crossing ice bridge) that finally helped them rebound from that parvovirus incident. Wolves may have been present during that boom-bust cycle, but their ability to effectively control the moose population was severely affected by their own health problems. Implying that boom and bust cycles are likely to happen even with (healthy) wolves present is misleading to the casual reader.

Secondly, you also write: Recent warming favors temperate over boreal species and early signs suggest a shift from boreal to temperate species in the region. Since moose favor some boreal tree species such as balsam fir for food in the winter, this change may alter the available moose forage in the future. I would like to point out that boreal tree species such as balsam fir are already suffering on Isle Royale from over-browsing by moose, and that fact should not be ignored as a causative factor when observing a decrease in healthy balsam on Isle Royale. This statement implies that moose may not do well on Isle Royale, with or without wolves. I acknowledge that this may be true in the very long run as global warming increases; but in the meantime, because cold Lake Superior surrounds Isle Royale, the archipelago is likely to maintain a colder microclimate than the rest of the temperate-boreal forest transition zone; just as Isle Royale harbors arctic/alpine disjunct plant species, it will likely be able to sustain moose longer than any of the surrounding mainland areas. Already I have been reading of calls to put moose on the endangered species list, because their populations have diminished so significantly in Minnesota and Ontario. As long as moose are on Isle Royale, wolves need to be there to maintain healthy moose populations and island ecosystem.

In fact, it appears that it is the National Park Services responsibility to maintain healthy populations of wildlife. Writing about early use of Isle Royale by North Shore Ojibway, historian Timothy Cochran stated that Isle Royale wildlife and fish were so plentiful that Minong gained an early reputation as a reservoir of animals. From nps.gov (use of capitals for emphasis is mine): On August 25, 1916, President Woodrow Wilson signed the act creating the National Park Service & WHICH PURPOSE IS TO CONSERVE the scenery and the natural and historic objects and THE WILD LIFE THEREIN and to provide for the enjoyment of the same in such manner and BY SUCH MEANS AS WILL LEAVE THEM UNIMPAIRED for the enjoyment of future generations." So there is historical precedent for Isle Royale to be a reservoir of animals and the National Park Service has a responsibility to conserve wildlife unimpaired.

Isle Royale National Park is fortunate to have as a resource the vast amount of information learned over the 57 years of its internationally-acclaimed wolf-moose study. A delay to study this further seems totally unnecessary. A healthy wolf population has been shown to be the most effective control for a

healthy moose population. Now that only three wolves remain on Isle Royale (and one is obviously unhealthy, if it even is still alive), it is time to take quick action to maintain a healthy ecosystem on Isle Royale. You have already delayed nearly two years since your first request for public input - - please act quickly now!

Correspondence: Topic Question 1:

I believe the Draft Alternative Concepts presented in the Management Plan/EIS cover the management alternatives quite adequately.

Topic Question 2:

Absent wolf predation the moose population will probably increase and forage will be negatively affected. It follows that the moose population might then require active management to prevent over-browsing and moose starvation. That course of action is probably prohibitively expensive and may not be logistically feasible, given the geography of the island (Culling isn't popular with certain NGOs and translocation of part of the herd doesn't sound feasible). Maintaining predation on the moose is probably the most cost-effective strategy.

Topic Question 3:

Continue to maintain campsites, trails, public access, and cooperation with the scientific community, but otherwise leave it to Mother Nature.

Topic Question 4:

Monitor and document the changes in forest habitat (ecology) but otherwise there's not much that can be done about climate change.

Topic Question 5:

The Future Without Project/No-Action Alternative is obviously unacceptable, but required by NEPA. Alternatives D and E are confusing - "... if/when the moose population is no longer impacting the moose population and..." doesn't make sense, however the subheadings for each concept clearly convey the objectives.

Topic Question 6:

See box below.

Comments: I believe that Concept B is the best initial alternative. Given the present low wolf population, there may be no population to augment by the time the plan is executed. If the present wolf population is still extant introduced wolves will improve the gene pool, but it may be too late to reverse the decline of the "natives." If the moose population continues to increase to where herbivory is impactful then adaptive management should kick in and the plan should shift to Concept D. Introducing Texas cougar genes into the inbred Florida panther population helped it recover, but Isle Royale is a very different environment. Hopefully, a new wolf pack (how many wolves is beyond me) can make enough impact on the moose population to avoid the need for moose management - they never struck me as being very cooperative animals.

Correspondence: Topic Question 1:

Wolves or any wild animal do not need to be killed, trapped, or harmed in any way just because mankind can not figure out how to get along with wildlife.

Topic Question 2:

NONE. There is no need for mankind to manage wildlife. Wildlife has it's own way to balance nature due to predators and prey. So let wildlife alone.

Topic Question 3:

Keeping mankind out of the way of the wildlife and wilderness would be the 1st big step and making sure no trails, no snowmobiles, no hiking, no camping, no roads, no vehicles, no building, no drilling, no fracking, nothing is allowed in the area.

Topic Question 4:

Protect the water to your best, prevent any logging of trees, plant more trees and native plantlife, maybe try collecting whatever rainwater you can for the area, prevent water runoff, prevent any erosion of land into the water.

Topic Question 5:

no comment

Comments:

Correspondence: Topic Question 1:

The wolf population should immediately be supplemented. It is a known fact that the moose have already overgrazed the winter balsam. If the moose continue on their growth trend, it will change the Island forever.

Topic Question 2:

Isle Royale should continue to manage the wolf and moose populations for the overall benefit of the Island. This has been shown in Yellowstone to be a good thing for the environment.

Topic Question 3:

The NPS should be doing controlled burns on Isle Royale. If a fire occurs there it is going to be difficult to control. Small parcel burns in the fall, as the Island closes.

Topic Question 4:

If Climate Change continues, the NPS should have a plan in place to deal with Climate Change. Wolf population should be maintained, then you will not have to "manage" the moose population.

Topic Question 5:

I think the wolf population should be supplemented now, not the 3 years minimum it will take to get this plan rolling. While I think having an adaptive plan in place is desirable, implementing the plan is another issue. How much will it cost to manage invasive vegetation. Once the balsam are gone, there will be large scale starvation of moose. When the Island opens in the Spring, who will want to come there with hundreds of rotting moose carcasses.

Topic Question 6:

I fail to understand why the NPS does not have more public scoping sessions outside of the UP and The North shore. There are plenty of people in the Lower Peninsula, Illinois, Indiana, and Wisconsin who love Isle Royale and would come to the sessions to hear the NPS plans, discuss the plans and then voice their opinions on the plans.

Comments: If I have to pick one choice of the alternatives I would choose Plan C.

Aug,28,2015 19:31:53

Correspondence Type:

Web Form

Correspondence: Topic Question 1:

The list of alternatives is detailed, specific and complete. Maybe consider the following change for Alternative E: No wolf reintroduction or augmentation; reduce moose density if/when the wolf population is no longer impacting the moose population OR moose herbivory is having a demonstrated impact on park resources.

Topic Question 2:

We need to be cognizant of the fact that the park lies within a temperate-boreal forest transition zone. Changing climate appears to be making it warmer on the island and shifting vegetation to more temperate species, likely to the detriment of the wolf and moose populations. The National Park Service can't "manage" away the effects of changing climate on the current ecosystem. It is not the best use of resources to attempt to sustain animals that don't appear to be native to the island in an ecosystem that may already be changing due to the climate modification. It is likely not even sustainable to maintain the native boreal vegetation. This should be considered when developing management plans and distributing resources in the park.

Topic Question 3:

The National Park Service's goal should be low intensity and minimal management of the island, which is consistent with Alternative Concept A for this plan.

Topic Question 4:

As above, the National Park Service's goal should be low intensity and minimal management of the island, even considering climate change. The National Park Service may not be able to preserve the current ecosystem through management. The National Park Service should let nature take its course and manage the changes as best they can with established policy and protocols. Just because the nature of the wilderness changes, it does not mean that it is no longer wilderness or that it should not continue to be managed like wilderness. We will all have to adjust our expectations appropriately, which should be doable as this change will likely occur over time.

Topic Question 5:

Alternative A: I like Alternative A because it is in keeping the Wilderness Act of 1964 and National Park Service policies and procedures (Reference Manual RM 41: Wilderness Preservation and Management).

Alternative E: I am not entirely opposed to Alternative Concept E, because moose are recent immigrants to the island and affecting native vegetation. Animals should not be considered more valuable than plants. Direct vegetation restoration could be added as part of this alternative, if practical. Although, I do believe that the current imbalance will take care of itself naturally, and that efforts to preserve the boreal species, which moose prefer for browsing, may be futile due to climate change.

Alternative F: See Alternative E. I am not sure what the difference is in managing moose to "a low level", as compared to "reducing moose density" in Alternative E. I am generally opposed to over management, but not opposed to using tools, such as culling moose or using motorized or mechanized equipment, if more active management is what is ultimately decided.

Alternatives B, C, & D: I dislike Alternatives B, C, & D mainly with respect to the proposed actions for wolves for the following reasons:

Wilderness Act of 1964, states that an area of wilderness should be protected and managed so as to preserve its natural conditions and "which (1) generally appears to have been affected primarily by the forces of nature, with the imprint of man's work substantially unnoticeable"... The reestablishment or augmentation of wolves is not a force of nature and leaves a substantial imprint of man's work. It is arguable whether the presence of wolves is a natural condition on the island.

The island was formally designated as a U.S. biosphere reserve in an effort to protect examples of major ecosystems that provide a baseline of conditions against human impact can be assessed. The extirpation of wolves is a natural process that can be expected to occur on an isolated island. We know that the major ecosystem on the island may change, or is already changing, due to climate change that is likely human induced. Reestablishing or augmenting wolves alters the baseline condition against which this human impact can be assessed.

It seems that the reestablishment or augmentation of wolves is heavily advocated by members of the scientific community. In accordance with Reference

Manual RM-41, the National Park Service has a responsibility to support scientific activities in the wilderness and to use science to improve wilderness management. The National Park Service is to recognize that wilderness can and should serve as an important resource for long-term research study and observation of ecological processes and the impact of humans on ecosystems. Scientific activities listed in this reference manual include inventory, monitoring, and research. The reestablishment or augmentation of wolves by humans does not fall under any of these approved scientific activities. The extirpation of wolves on the island is natural. It is not a result of the impact of humans on the ecosystem, in which case might require scientific study or action.

In accordance with Reference Manual RM-41, the National Park Service is tasked with allowing natural processes, in so far as possible, to shape and control wilderness ecosystems. Management has been directed to seek to sustain natural distribution, numbers, population composition, and interaction of indigenous species, and intervention should only be undertaken to the extent necessary to correct past mistakes, the impacts of human use, and the influences originating outside of wilderness boundaries. The wolves have only recently populated the island; some of which were introduced. They hardly qualify as an indigenous and endemic species. Moreover, the natural extirpation of wolves can be expected to occur on an isolated island. The current distribution, numbers and population composition of wolves reflects the progression of natural processes. There is no need for management intervention, and the reestablishment or augmentation of wolves would, in fact, interfere with the natural processes that are currently shaping the wilderness ecosystem. The natural extirpation of wolves does not have anything to do with impacts from park management action, visitor impacts, or outside human influence, which might trigger management intervention.

The National Park Service is directed to preserve and protect wilderness. These alternatives do not support the wilderness resource in its entirety and attempt to maximize an individual, non-indigenous resource. Implementation of these alternatives would allow human activity to dominate natural conditions and processes. These proposed alternatives do not preserve wilderness resources and character, as much as re-engineering it for human consumption.

Common sense dictates that the continuous presence of wolves on the island is an unrealistic and unsustainable goal. Repeated human intervention would likely be required to achieve a constant presence. Wolves are a relatively recent occurrence on the island, and cannot be considered indigenous. The island is isolated, thus local extirpation is natural and can be expected. Climate change would likely make it more difficult to sustain this species on the island. The efforts to introduce, augment and/or sustain this species contradict with the intent of Wilderness Act and National Park Service policy. Resources, which are in short supply, should not be devoted to this endeavor.

Topic Question 6:

The reestablishment or augmentation of wolves is heavily advocated by scientists who work on the island. These people might be considered "men of outstanding authority" in the vernacular of the early days of the park. There were other people that lived and worked on this island prior to it being established as a park. Little consideration was given to the continuation of their work or way of life as it was deemed as an interference and a detriment to the park. I respectfully request the National Park Service consider whether the interference so heavily advocated by scientists is any different than the interference of those people that lived and worked on this island before it became a park, and then act accordingly.

Correspondence: I am most in favor of Alternative Concept A (no-action alternative). Nature has its own way of dealing with things and if nature has determined that the wolves should not survive on the island (for now, at least), so be it. If nature decides that wolves should remain on the island, life will find a way and there will once again be wolves on the island, even if it means the existing island population dies out and new wolves cross over on new ice in the future. Also, being that 99% of the island is designated wilderness I believe the park should have as much of a hands-off approach as possible when it comes to managing the wildlife of the island. The continuing evolution of nature on Isle Royale should be left to nature itself, at least as much as we can allow it to be left to itself.

If the wolves are no longer on Isle Royale and the moose population gets out of control, why not allow Ojibwe tribal members to come over and participate in a moose hunt to help control the population. Isle Royale was a traditional use area of the Ojibwe people, and that use included fishing and hunting. Some may question this method, saying that hunting should not be allowed in a wilderness area. But, wilderness areas have always existed through time with Indian people on them, and as long as the hunting being done is for subsistence and not sport, this method would fit within the historical usage of Isle Royale and other wilderness areas.

Correspondence: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park - the lowest number of wolves in more than 50 years - threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,
[your name here]

Correspondence: Topic Question 1:

Your Plan B to introduce additional wolves to Isle Royale is the best option I have heard of to maintain the balance between moose, vegetation and wolves. This is a special place for visitors which will not long remain if the moose overwhelm the vegetation. In the icy winters on Lake Superior moose who are undernourished will perish from the severe cold.

Topic Question 2:

No hunting should be allowed unless the moose become infected with some disease which will harm them to the point of death. Wolf populations must be monitored to ensure sufficient healthy animals to control the moose population through attrition of elderly animals, but also not permitted to overwhelm the stock available for wolf sustenance.

Topic Question 3:

Simple roads for ease of NPS staff movement and fire suppression, and trails for park visitors to walk on should be kept in good condition. Wilderness is meant to be wild. Please don't pretty it up. Birds and butterflies and other temporary visitors to the island need places to feed, breed and rest. A wilderness setting makes that possible.

Topic Question 4:

Management intensity will need to be reviewed every 3 to 5 years in the face of climate change, especially as it becomes more overwhelming to the island itself.

Correspondence Type: Web Form
Correspondence: Topic Question 1:

Only 3 of the 6 alternative concepts mention wolf reintroduction or augmentation and none with any specificity. Concept B and Concept D only allow for

wolves to be reestablished once which may not be sufficient and is very short sighted. Concept C allows for maintaining populations of wolves and moose which "could" include wolf reintroduction or augmentation.

Concept C appears to be the best alternative, however, it does not go far enough. There must be sufficient flexibility to allow for wolf reintroductions as necessary over the next 20 years to insure genetic diversity for wolves and sustainable populations of both wolves and moose into the foreseeable future.

Maintenance or culling of moose is not necessary if wolves are allowed to fulfill their ecological role. Absent wolf immigration, which no one can predict, there is no likelihood of having a wolf population without human action.

Topic Question 2:

We believe the NPS should consider and evaluate the ecological benefits wolves provide; The only pup observed in 2015 was visibly deformed; 100% of wolves examined since 1994 (over 30 of them) have spinal anomalies. The weakened state of the remaining wolves is likely interfering with reproduction and survival.

The NPS must consider the data collected through 57 years of research conducted on Isle Royale. These researchers should play a key role in the discussions.

Topic Question 3:

NPS must protect the unique wilderness qualities of Isle Royale through monitoring of habitat for wildlife, including wolves and moose; maintenance of soil and water quality and ecological stability of plant and animal communities including the control of invasive species. Management is necessary to maintain important wilderness values including the presence of a top carnivore which is vital for ecosystem health. The culling of moose and the use of motorized equipment is unacceptable.

Topic Question 4:

Climate change poses a fundamental threat to species and places. The only way to slow the impacts of climate change is to globally reduce carbon emissions. NPS could produce an informational flyer explaining the negative impacts climate change is having on Isle Royale such as the changes in the duration and frequency of the ice bridge, winter ticks, bird species etc. NPS could engage with businesses and private entities that use the island to reduce carbon pollution. Encourage visitors to reduce their carbon footprint by not bringing / disposing of water bottles.

Moose are not likely in any direct danger of being reduced by climate change, however, wolf predation is needed to limit the growth in their population.

Because of climate change, it is unlikely that wolves will be able to repopulate Isle Royale without NPS intervention and we ask for immediate action to augment / reintroduce wolves.

Topic Question 5:

Along with the ecological benefits wolves provide, they also have intrinsic value. You may not see a wolf or hear them howl but it is important to know there are still wild places where wolves exist. or years, researchers have been sounding the alarm about the plight of wolves on Isle Royale. Yet, the NPS has chosen to take no action until now. The public scoping period ends 8/29, however, the Record of Decision is not expected until Fall 2017 at the earliest. Two and one-half years is simply too long. This foot dragging on the part of NPS is unacceptable. Evidence suggests that the few wolves on the island will not be able to keep moose populations in check which will further degrade the island's vegetation. Every effort must be made by the NPS to expedite the decision.

Topic Question 6:

I do not support any human management of the moose population. For 50 years, the wolves have been able to regulate the moose population.

It is disappointing that NPS has chosen to disregard the hundreds of comments submitted prior to the opening of the official comment period. Those comments must become part of the official EIS.

Additional Comments: Those who visit Isle Royale do so for the wilderness experience which includes wolves and moose. Explain what you value about wilderness and why.

Correspondence: Topic Question 1:

Alternative concept B seems like the best plan in my opinion. Introducing new wolves once would indeed simulate a migration and help reduce the moose population more naturally and keep it at a steady level.

Topic Question 2:

Issues that should be considered when evaluating the future of wildlife and plants on the isle are if the wolf population would out number the moose population, causing for another plan to be taken to control the wolf population.

Topic Question 3:

The NPS should have whatever plan they want to carry out as thought out as possible. Quick fixes do not work in nature and the major whole of the isle is wilderness. The NPS should keep a watchful eye on the progress of the plan they are enacting and have backups in case of something unpredicted.

Topic Question 4:

There is not much the NPS can do about the changing climate. I suppose they could try to have plans if major changes occurred in it, but they might be long until they are fruitful.

Topic Question 5:

Alternative Concept A is basically ignore it but keep an eye on it, which do nothing. Concept B is good because it would introduce wolves once, therefore not oversaturating it with extras. Alt. Concept C seems good but the idea of a non natural, man maintained wildlife does not appeal to me. Alt. Concept D and E are similar in that they both have plans to reduce the moose population. My question to this is how would the moose population be reduced? Would they be killed or be relocated to another area in a similar biome. My view is why reduce non naturally, when introducing wolves would. Alt. Concept F seems to go along the same lines as D & E but there is the plus of seed harvestation of plants on the isle, and planting them on other islands which sounds like a really good idea.

Correspondence: Topic Question 1:

Alternative Concept B is the way to fix things. I do believe that the poor, disabled wolves need to be taken from the wild. Perhaps not killed, but yes, taken so if new wolves are introduced then less deformities occur during reproduction. Once introducing healthy, new wolves into the population, they will kill off the old, and weak moose (so no need to take away or kill deformed moose). Less moose equal more vegetation. The NPS needs to consider that when most weak and vulnerable moose are gone, the wolves will turn to the stronger moose for food. At this point in time, will the wolves be so overpowering that the wolf population will flourish while the moose population decreases? We must consider how many wolves we put into the wild so the moose will have enough time to reproduce healthy, strong young.

Topic Question 2:

NPS should not disturb the balance of nature too much. There might be times that vegetation is lower than average, but that should not be the time for

humans to step in. The only time that we should step in is if something is in danger of reproducing at a fast enough pace. If not, leave things be and let nature run on its own course. Also, we should not manage the wolves and moose if Concept B is chosen. As said before, we should only intervene if things become drastic. We should though however, keep an eye on the deformed moose. The NPS should make sure that not too many deformed moose are reproducing, otherwise the wolves might outnumber the moose.

Topic Question 3:

The NPS should not be too concerned about the vegetation. The Earth has its ways of replenishing itself without the force of humans adding or taking away things. We should only manage if something is at risk of being endangered. Also, we shouldn't add more moose otherwise the vegetation will decrease.

Topic Question 4:

The NPS should be prepared in the future for animals moving out and migrating elsewhere. They also should anticipate new animals coming in if so.

Topic Question 5:

I do not like the thought of simply killing the deformed wolves and moose. If Concept B is taken into effect, yes, add new wolves but don't kill the former ones. Put them in a zoo or park, unless they are physically suffering, then put them to rest. Same goes with the moose too- let the moose stay and have the balance of nature take its effect on them or at least be taken somewhere else. If the vegetation is a problem, go ahead and add negation if need be. But don't add new plants, only the ones that are currently there so nothing out of the ordinary arises.

Topic Question 6:

Please make sure to read and consider all submissions. Also, please take into account that maybe none of the plans are the best plan, and that maybe some plans should be combined with others to have the best outcome.

Correspondence: Topic Question 1:

I believe that alternatives such as selecting genetically problematic moose by humans and not Interfering should be considered.

Topic Question 2:

Many issues that should be taken into account when considering future management of island are firstly why exactly did the wolf population die out so much and what can be done to insure that it does not happen again, and whether or not continued intervention is a good idea giving the shift in climate.

Topic Question 3:

Because of the large amount of wilderness the intensity of the management should be less intrusive. Gratuitous amounts of management and human involvement could have unforeseen adverse effects on the environment of the island. Management should mainly consist of maintaining a stable moose/wolf population and ratio.

Topic Question 4:

Because of the face that there isn't really anything that they can due individual to stop the change of the climate, it should best not to try and manage the vegetation too much as many of the native vegetation may not be suitable for the changing climate. Attempting to preserve vegetation in an area where the climate is no longer suitable for it could have adverse effects.

Topic Question 5:

I like the solutions of C and D. Bringing wolves back onto the island is an excellent way to help maintain a healthy moose population. I also like the idea of hunting moose in order to help the population if the wolves do not impact it. I do not like the option of no management mainly because it leaves a large amount of unsolved issues that can have a negative impact on the environment.

Topic Question 6:

I think it's very important to consider bring in new wolves not only because it helps maintain a healthy population, but it get's rid of genetically inferior moose via natural selection, something humans cannot due as efficiently.

Correspondence: Topic Question 1:

NPS should maintain the wolf population, which might be accomplished by introducing a single wolf (genetic rescue), or which might require a larger-scale reintroduction - - and perhaps recurring efforts every few years. (Perhaps this is what is intended by Alternative C, but it is not apparent to me from the description in the newsletter.)

Topic Question 2:

NPS should consider the visitor experience and the health of the ecosystem. I believe the visitor experience is enhanced by the opportunity to see moose, and to see signs of - - and know one is in the presence of - - wolves. Similarly, I believe ecosystem health is enhanced by the presence of a healthy wolf population.

Topic Question 3:

NPS should take what actions are necessary to maintain the wolf population. I believe that reintroducing wolves can be accomplished without compromising the wilderness character of the island. Realistically speaking, the character of the island as a healthy (wilderness) ecosystem is better preserved by maintaining the wolf population than by letting the population dwindle into oblivion - - or by hunting moose, which seems to be an entirely inappropriate option.

Topic Question 4:

This is an important question. Maintaining ecosystem health in the face of human-caused climate change is probably going to require increasingly extensive human intervention in the years to come. Our legal and philosophical ideas of wilderness - - conceived in a different time - - will need to adapt to current and future realities. We need to make sure that legal devices intended to protect our natural world don't interfere with our best efforts to do so. NPS's traditions, and the tradition of the Wilderness Act, have generally served this country well. But at the end of the day, NPS's duty should be to the natural resources the Service protects and the people who visit and explore the parks - - not to tradition or outdated legal concepts. Creativity and educated action will be increasingly important in confronting climate change.

Topic Question 5:

At least three of the six alternatives involve hunting moose, which is an unnecessarily heavy-handed and inefficient form of human intervention that would significantly change the character of the island while costing NPS a large amount of money, and which would not restore the wolf population. These options should not be taken seriously. The only option that potentially would free the NPS to take appropriate action (but not to permit an inappropriate moose hunt) appears to be the little-explained Alternative C.

Topic Question 6:

NPS should maintain the Isle Royale wolf population. The Service faces real challenges in doing this. These challenges, however, are not so much in deciding what course of action is appropriate, but in figuring out how to maintain the wolf population while complying with applicable legal strictures. I am not convinced that the Wilderness Act presents a real stumbling block to genetic rescue/wolf reintroduction. However, the National Environmental Policy Act and the attendant Environmental Impact Statement requirement present real challenges.

NPS started the current decision-making process too late and I am not convinced that the Service is pursuing the process with appropriate urgency. NPS should immediately enlist the assistance of the talented attorneys within the National Park Service and the Department of the Interior and find a way to fast-track this decision-making process while still complying with the law. It would be inappropriate for NPS to use its NEPA obligations as an excuse to let the Isle Royale wolves die out, or to allow the wolves to continue as an ineffectively-small population, with no real impact on the moose population. NEPA does not require this. I am concerned that the current decision-making process seems already to have dragged on so long that genetic rescue - - the focus of the realistic alternatives - - may have become impractical, and larger-scale reintroduction may be necessary. NPS should not worsen the problem by permitting further delay.

Inaction in the current circumstances should not be viewed as an "easy way out." It amounts to giving the Isle Royale wolves a death sentence. Such a death sentence is no more "natural" than the warming winters we are experiencing or the human-introduced canine parvovirus that decimated the wolf population years ago and robbed it of much genetic diversity. The NPS should ensure that the Isle Royale wolf population is maintained.

Correspondence: Dear Superintendent Green,

Isle Royale National Park, a remote and beautiful island in Lake Superior, is home to a famous community of wolves and moose. These two species have an important predator-prey relationship and are critical to the overall health of the island ecosystem.

But with only three wolves left on the island, the character of Isle Royale is in jeopardy.

If wolves die off, the island's moose population will continue to increase, consuming the native vegetation and eventually running out of food, disrupting the natural balance of the island. Please don't let that happen.

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If you bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Correspondence: Topic Question 1:

Does anyone know the reason for the decline in wolf numbers? Is Dr. David Mech still around? In the short term, a few additional wolves would seem appropriate. However, the wolf population should be monitored to try to determine why the wolves are struggling so much.

Topic Question 2:

It would seem this problem would be a wonderful project for some University of Minnesota, Michigan, or Wisconsin Zoology graduate students. It is quite frightening to see the wolf population so depleted. Wither it is due to disease, in-breeding, weather, or other factors, zoology doctoral candidates could determine the reason(s) in a year or two.

Correspondence: Topic Question 1:

Firstly We need to look at the overall state of Wildlife in general. The outlook is grim. As for managing this issue we need to take the path of least destruction. The area is already a protected space. It needs to remain that way. When humans interfere things go wrong. It needs to remain a natural space and we need to approach it this way

Topic Question 2:
Moose are the obvious issue . This fix needs to be kept as simple and smart as possible. Suppose humans were not around to interfere. What would happen? So that needs to be the fix The most obvious fix

Topic Question 3:
This should be minimal impact

Topic Question 4:
Well this is an issue all over the world Again minimal human interference We obviously cannot change climate and Wildlife has existed through other periods of change.

Topic Question 5:
I honestly think this can be accomplished by the reintroduction of wolves Then of course the moose need to be monitored to be sure the wolves are doing their job. We may find this to be the path of least interference

Topic Question 6:
As a wildlife advocate I believe in nature's ability to take care of itself. I have never been in favor of human interaction. While we may need to make sure to keep a close eye on the progress I think we would be smart to take the path of least resistance. Reintroduce wolves. The most viable alternative is plan C. People love to kill and we see this everyday Stop the abuse of Wildlife and let these Animals take care of this issue on their own. Thank you for allowing me to voice my opinion

Correspondence: Topic Question 1:
Given that the wolf population on Isle Royale has essentially died out, wolves should be reintroduced onto Isle Royale as quickly as possible.

Topic Question 2:
Isle Royale should provide a rewarding wilderness experience for hikers, a safe haven for wolves, a place where wolves, moose and vegetation can exist in a balanced way, and a place where researchers can study the interactions amongst predators, prey and food supply of both.

Topic Question 3:
Park Service should follow the advice of those who have studied the ecology of Isle Royale, which I believe is to reintroduce wolves as soon as possible.

Topic Question 4:
Failure of ice bridges to form between Isle Royale and Minnesota has prevented easy passage of wolves to the island as has occurred in the past. NPS should reintroduce wolves as a way to offset this failure.

Topic Question 5:
Concepts E and F seem absurd and apparently propose an intense moose hunt to reduce the moose population. Doing nothing will result in a gross overpopulation of moose, overgrazing of the vegetation on the island, and unhealthy, underfed moose. Isle Royale will be less enjoyable for outdoor enthusiasts (hikers) and no longer a place where ecological studies are worthwhile.

Topic Question 6:
News stories seem to indicate that NPS policies require several more years to study this situation. That is absurd as Isle Royale has been the subject of intense ecological studies for more than fifty years.. The wolf population on Isle Royale is no longer reproducing and needs to be replaced now.

Comments: Wolf populations on Isle Royale have been studied for more than fifty years. It is time to reintroduce wolves now.

Correspondence: Topic Question 1:

I believe the three main characters at the heart of this issue are the moose, wolves, and vegetation of the island. However, the people that come to the national park should be considered as well. Being one of those people, I want to see a healthy ecosystem. If the wolves are allowed to die out the moose will reduce the vegetation to such an extent the beauty of Isle Royale will suffer.

Topic Question 2:

Wolves have been reintroduced in Yellowstone with amazing results. The populations of the wolves and moose need to be maintained with minimum and maximum levels watched and if the populations go above or below those determined sizes then Park Services needs to intervene to ensure a healthy ecosystem. Isle Royale is one of the most unique environments I have ever investigated, I want to come back many times to see this unusual and exciting place. Keep the wolves at a level that maintain the moose population that protects the vegetation.

Topic Question 3:

If any of the populations get too small, or too big the Park Service needs to get involved. Let the Park Service and scientist determine what those points are.

Topic Question 4:

Nature will tell us what needs to change as the climate changes, we need more study to determine what if anything needs to be done. This island is natural environment that is open for observation, we need to continue to allow scientist access to monitor the interrelationships that are taking place here.

Topic Question 5:

In central Ohio there are no predators and our deer populations have gotten so big they have eaten all the wildflowers in the woods that are left in our state. I would hate to see no predator on Isle Royale and watch the moose population get so big they eat the island vegetation so much that the island would loose species of plants that may never come back.

Topic Question 6:

Please keep wolves on the island, it will keep the island in a balance that allows all living creatures to enjoy this wonderful island.

Correspondence: Topic Question 1:

The moose & wolves are a huge part of Isle Royale (IR) and were one of the main reasons I was first drawn to this wilderness park. To lose either would be such an unnecessary disaster. It would have been wonderful if mainland wolves would have naturally made IR their new home, traveling there during the ice bridges formed the last 2 winters. But it didn't happen and to do nothing would be such a shame. With only 2-3 wolves left I feel it's time to take action. I favor alternative concept B but think it should be a two step process. First bring only a couple wolves to the island in hopes of genetic rescue (wolf augmentation) where we'd have a chance that new pups would have IR DNA. However it may be to little to late. If that doesn't work after a reasonable amount of time (determined by science not politics) wolf reintroductions should happen. But to do nothing at this point seems to spell disaster to the wolves and eventually disaster to the health of the unchecked growing moose herd, eventually leading to moose starvation and an adverse effect to vegetation due to over- browsing.

Topic Question 2:

I believe it's important to consider the uniqueness of this remote/isolated predator/prey wolf/moose environment. This year we watched a new privy being dug/moved and were told that before a privy is dug the new spot has to be analyzed and approved to make sure no special or endangered species of plants are disturbed. Which is all well and good; however, It made me feel like plants are given more consideration than the IR wolves! Per your documentation the moose population has "fluctuated dramatically over the past century" "in both the presence & absence of wolves; however, the magnitude of the fluctuation is likely to increase w/o wolves." I beg the NPS to take action and save the IR wolves if possible and reintroduce them if we are pass the point of saving them. To me to lose the wolves forever is unthinkable almost criminal!

Topic Question 3:

Translocation of live moose and culling of moose should only be thought of as a last restore if at all; as those tools are so extreme, to invasive and seem unnecessary if wolf augmentation & reintroduction are done. There is nothing that seems natural about thinning the moose herd from helicopters when

wolves could do it in a way conducive to a wilderness environment and have done it for decades. (Also translocation and culling must be more expensive, makes me angry to think about.)

Topic Question 4:

At this point no consideration to climate change. Per your documentation "it is unclear how sensitive moose on IR will be to the climate change"; however, it is quite clear that the IR wolves are endangered today! Although we should be kind to our planet/home we are not going to stop the climate from changing. That has happened since the beginning of time. We do have a chance on saving the wolves and in turn helping keep the moose population and vegetation in check and healthier. That should be the focus.

Topic Question 5:

The wolves & moose are "Isle Royale", to lose that would be such a shame. The only alternative that makes any sense to me is "Alternative Concept B" as this is the only alternative that might bring everything back in balance in the least intrusive, less intervention and the most natural way especially for a wilderness area. Alternative Concept A - do nothing seems like a for sure death sentence for the wolves. Concept C is more intervention than B. Concept D reduces the moose without giving the wolves a chance to do the job. Concept E like A spells disaster for the wolves. Concept F is way to much intervention.

Topic Question 6:

I've been coming to Isle Royale since 1985 boating, camping, fishing and day trip hiking. Photographing each vacation. I've seen moose (bulls, cows and calves in and out of the water), fox, otter, loons, bald eagles, rabbits (also squirrels and mice) and many types of flowers. My daughter was lucky enough to see a baby calf nursing and also photograph a wild flower that even the rangers had to do some research to identify! I've eaten lots of fish, thimble berries and blue berries. I've been there for 90 to 93 degree weather swimming in Lake Superior like it was the Caribbean and last year when I froze fully dressed with my winter coat on inside my sleeping bag! I've even smelt smoke one year when there were wild fires on the island and in years past heard wolves howling at night. The wolves and moose are "Isle Royale". In the beginning that was the big draw to going to IR. To lose that would be such a shame. (Can't say it enough.) I think it is so sad that NPS would wait to this point, only 2-3 wolves and hope that will be incentive to move quickly. The wolves are special and seem very endangered at this point. They are not just wolves but Isle Royale wolves! Rather than just waiting for the complete extinction of the IR wolf it would be nice if a couple wolves could be bought to IR in hopes of reproducing with IR wolves and keeping some IR wolf DNA so it would not be lost forever! But if that doesn't work I don't think we should just say good bye to IR wolves but instead try to reintroduce wolves to IR. It baffles me and frustrate me that things seem to be happening so slowly on this issue.

In closing thank you for the opportunity to comment and please save the IR wolves and moose!

Correspondence: Topic Question 1:

The NPS seems to have lost it's way. Killing Moose because we have decimated the WOLF is just another wrong decision on the part of the NPS. Your mission is to be stewards - it is really this simple: "On August 25, 1916, President Woodrow Wilson signed the act creating the National Park Service, a new federal bureau in the Department of the Interior responsible for PROTECTING the 35 national parks and monuments then managed by the department and those yet to be established." THE NPS NO LONGER PROTECTS! The plan to be established that meets the goal of the creation of the NPS is Alternative Concept B the introducing of new wolves to the island to balance the delicate ecosystem, preserve the native plant life, and keep the moose population in check.

Topic Question 2:

Much time and money has been spent consulting scientific experts and conducting extensive research to determine how to effectively evaluate and manage the area and there is no reason whatsoever not to follow the results that were found - use the tools you are given!

Topic Question 3:

The NPS should do EVERY THING possible to maintain this area of wilderness from further destruction of native plants and animals and FIGHT for this land and the animals and plants it has left. The NPS should be aggressive in its work to do what is was created to do. If the employees of the NPS cannot, will not or do not FIGHT as hard as they can to PROTECT our parks then they should be replaced, it is just that simple. The US should be the leader in showing the entire world how important the earth is to our humanity. I would work as hard as I could 24 hours a day if I had the opportunity that lies in your hands.

Topic Question 4:

The NPS is the agency we are all counting on to lead in the face of climate change and we are sadly being let down time and time again with the decisions being made. The NPS represents our country, and our citizens want the NPS to do what is right and humane for all of its animals and to stop even considering killing an an option on any list - protection should be the goal - being the PROTECTOR, THE ADVOCATE for our air, land, water, plants and animal species is what we want from the NPS.

Topic Question 5:

When it involves ANY wildlife specie that belongs on the land KILLING SHOULD NEVER BE ON THE LIST OF OPTIONS! It may be a fast way or a cheaper way but it is the right way, the humane way, the responsible way, the moral way.

Topic Question 6:

The NPS is not doing what they are supposed to do - "Directors" are simply over paid to make decisions of life and death for our native animals and they DAILY and consistently are choosing death. It should be considered a breach of duty. The decision to kill Blaze and orphan her cubs in Yellow Stone is just another example of the outrageous, sickening and simply immoral and WRONG answer that could have been solved a hundred other ways. What a total and complete lack of BETRAYAL for Blaze, her orphaned cubs and the citizens that love our National Parks. The PROTECTION AND PROPER MANAGEMENT of our animals is now in the hands of villains, egotists and traitors to the role of what the NPS is supposed to be doing.

Comments: The NPS is not fighting. They roll over time and time again. The decision to kill animals is constant and the more people that find out, the more [...] off they are becoming. I dont know if it is actual corruption, bribery, laziness, incompetence or morality. I do not have a 4 year degree but if I was put in a position in the NPS it would simply be a completely totally different place. I would fight until my dying breath to do every thing to PROTECT, and PREVENT the SENSELESS, NEEDLESS and CONSTANT killing of animals - period.

I would protect, defend the and bring all the power the government has to bear down on any person, group, corporation big, small, poor, corrupt or wealthy to CONSERVE, PROTECT, ASSIST, MAINTAIN and FUTHER the growth of native plants, protect our water and prosecute those that break the law.

If the laws are not there - I would aggressively work with our lawmakers to establish PROTECTIONS - and defend our parks - evidently nobody there cares any more and has no fight left in them, if they ever had it.

My staff and employees would be true advocates and I would use the scientific studies done by reputable scientists and environmentalists as a road map. When it comes to protections and stewardship we have so decimated our country's land and animals that no pro-environmental decision could actually turn out to be a mistake. It is about saving every single piece of land, every park and every animal, plant, bug, fish, bird, reptile that is left. We are in a HUGE crisis - and that still won't help all the plants and animals, air and water now.

Correspondence: Topic Question 1:
Bring in more wolves.

Topic Question 2:
The fact that this is designated wilderness land and balances must be maintained.

Topic Question 3:
The maintenance of that wilderness, by keeping a predator/prey relationship between wolves and moose balanced.

Topic Question 4:
I think that the intensity with which we manage our wild spaces should grow as the climate crisis grows more dire. Wilderness becomes only more important as the amount of it lessens.

Topic Question 5:
Letting the wolves die off would irreparably damage the entire ecosystem. the moose would overrun the island and decimate the plant population until there was nothing else for them to eat, causing a collapse of the moose population through starvation, and leaving a wasteland behind.

Comments: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,

Correspondence: Topic Question 1:
None. Concept C is the only viable choice for maintaining a healthy wilderness ecosystem.

Topic Question 2:
Management should be minimal as possible, driven by our scientific knowledge of ecosystems, and with as little human intervention as possible to

maintain a healthy ecosystem.

Topic Question 3:

Wolves should be (re)introduced and maintained as necessary as a top predator in a healthy wilderness ecosystem (Concept C). There is no scientific question that top predators are essential to healthy ecosystems. Regardless of the history of human influence and natural events on the island, wolves are the only viable top predators given the current state of things. The only alternative to possibly consider is Concept A and let things be what they will be. Concepts D, E, and F are completely incompatible with a designated wilderness.

Topic Question 5:

It is inconceivable that culling could even be considered in a designated wilderness area.

The idea of attempting reintroduction once, and only once (Concept B), seems short sighted. I believe that hope of everyone is that a single reintroduction would be sufficient for many years, or even decades, but I think that to make this determination a priori would be a mistake.

To maintain the current approach of doing nothing (Concept A), would almost certainly result in significant degradation of the vegetation and ecosystem as a whole. Although we can hope for a natural migration of wolves across ice, that optimism has not proven fruitful.

Topic Question 6:

Listen to the scientists, especially those who have studied these issues for decades.

Correspondence Type: Web Form

Correspondence: Topic Question 1:

I support a plan that basically follows alternative Concept D - - introduce wolves once and reduce the moose population if and when needed for the health of the island vegetation. I would prefer that the moose population be reduced by removal rather than culling.

I also support Alternative C but to a lesser level than D. I am not sure what is meant by a "one-time" augmentation of the wolf population. As mentioned below, wolf researchers should contribute heavily to the plan to re-establish the population and if that means a gradual introduction over the 20 years of the management plan, that should be on the table.

Topic Question 2:

If such a plan goes forward, it is obviously critical to bring genetic diversity into the island's wolf population. Planning for the number, method, genders, and timings of the introduction of additional wolves should be left to the researchers who are most knowledgeable about wolf characteristics.

I'm wondering about a couple of things: first, have the human visitor population levels on the island been steady or increasing or declining during the current decline of the wolf population? If so, could that be having an impact on the wolf population? Second, have the current pair of wolves on the island been reproducing regularly? I'm wondering how old this pair is and might reproduction issues be at the heart of the population decline?

Topic Question 4:

I find it puzzling that more than half of the wolves observed in 2014 are unaccounted for. I believe it's quite important to learn the reasons for their disappearance since it could have an impact on a population of introduced wolves. Have any of the wolves on the island been radio-collared over the years to aid in the research? If not, could this action be put under consideration if it is deemed to help track future populations.

Topic Question 5:

Wolf researchers should be tapped about the best way to bring wolves to the island - - whether by a one-time introduction or by a gradual or staged introduction.

I do not think that Alternative A - - no action - - should be considered. That would seem to lead to extreme overbrowsing and damage to existing vegetation.

Topic Question 6:

I have hiked Isle Royale two times in my life, and both of those trips have been highlights of my 74 years living in the north. The island is a special place, but I think it is important that the experience of visitors be a lower priority during the 20 year span of whatever plan is put in place and that the focus of the plan be on the health of the moose and wolf populations as well as on the vegetation of the island.

Thank you for undertaking this project.

Correspondence: Topic Question 1:
Wilderness Management should be in the forefront of all management decisions on Isle Royale National Park.

Topic Question 2:
The value of all the decades of wildlife research and data collection that has occurred on the island will all be wasted if future management involves human manipulation of these species. The NPS may permit Michigan Technological University to continue to make scientific observations of the upcoming

changes in species and climate change. However, the research and politics should not be influencing the NPS management. The island species will continue to fluctuate and possibly be extinguished, and we must leave it alone.

Topic Question 3:

The wilderness designation of Isle Royale National Park should be the first order of management decisions for the NPS to consider. The NPS must make better decisions based on this wilderness designation.

Topic Question 4:

Same as for wilderness management. With no human manipulation.

Topic Question 5:

Alternative Concept A, with an extra emphasis on recognizing the NPS and the wilderness management role.

Topic Question 6:

The only human manipulation that should be considered is a moose hunt by the people of the Grand Portage Band of Minnesota.

Correspondence: Topic Question 1:

I found the following paper to be very informative. Besides an excellent review of what happened on Isle Royale before the wolf, population growth then population crash, Murie list several methods of management. Options proposed included hunting by the public, transporting of moose off the island, and hunting by park rangers. Specifically one option quoted below seems most sensible and is confirmed by over 50 years of study of wolves and moose on Isle Royale by Mech, Peterson, Vucetich and others.

The Moose of Isle Royale by Adolph Murie. University of Michigan Press July 7, 1934

"Were it known if and to what extent our larger predators such as the bear, cougar, or timber wolf prey on moose, a possible solution to the overpopulation on the island would be to introduce an effective' predator. The usefulness of predators in this connection is being recognized in the Kaibab Forest. Here the cougar is now tolerated in order that it may assist in reducing the number of deer in this badly overcrowded area. Since one of these predators might possibly do good work in keeping the moose herd in check, and since there are few places where large carnivores are tolerated, it would seem desirable to introduce one or more of these predators on the island. Aside from the possible utility of the predator as a check on the moose population, such an introduction of a native species would add materially to the animal interests of the island."

Topic Question 2:

In my opinion the primary issue in management should be the maintenance of a natural ecosystem despite the influences of "man" caused disruption. Climate change, park use, and introduction of "foreign" plants, animals, and viruses will certainly be an issue. The best way to provide a sound base of maintaining a natural ecosystem would be to provide a balance of predator, prey, and prey diet. To ignore any component of the "group" would be to the detriment of the entire group. In the case of Isle Royale, a moose/vegetation cycle without the wolf would detrimental to the vegetation (over browsing) and the moose (population crash from over browsing).

Topic Question 3:

The simplest, least intrusive intervention would be the introduction/reintroduction of a known, competent predator to Isle Royale. The wolf fits this bill based on historical research.

Topic Question 4:

Given that historical ice bridges between Isle Royale and the mainland will be less common or non existent, genetic rescue may be needed periodically to maintain a vibrant wolf population should reintroduction be chosen as the method of choice. In addition to the wolf another potential "predator" would need to be managed. The "predator", fire, should be considered in maintaining the dynamics and diversity of the vegetation.

Topic Question 5:

Concept A - Given historically documented boom and bust cycles this does not seem to be valid option. From the wildlife standpoint, the ecosystem would be imbalanced and not sustainable. From the visitor stand point, denuded vegetation and starving moose would not do well for the parks reputation and I would expect decreased visitation.

Concepts E and F - Without a natural predator these two intervention, similar to Concept A, would create an artificial ecosystem regulated by "man" rather than a natural ecosystem with a naturally balanced predator/prey cycle.

Concept B and D include one time introduction with possible management of moose (D). To limiting in regard to the wolf.

Concept C Would be my best choice in that it includes wolf reintroduction (not defined as a single introduction) and augmentation. "Augmentation" would provide multiple future options including genetic rescue, and other appropriate interventions as defined by sound biological concepts.

Comments: Thank you for considering my thoughts.

Correspondence: Topic Question 2:

The interaction of all aspects of the ecosystem: climate change (and the rate of change ... just how fast will the change occur); what is the balance? Clearly the Island is in a state of imbalance. Keeping the moose population under control may be the easiest and fastest and cheapest way of regaining balance.

Topic Question 3:

Although a designated wilderness, there is the visitor to consider. I think one of the reasons people do come (and why we have come 6 times) is the presence of wolves. We have never seen one at Isle Royale, but have heard them twice. Also, supplementing the current wolf population may be the fastest and most successful way to keep the moose under control and maintain as much of the boreal forest as possible.

Topic Question 5:

Alternative 3 (supplementing current wolf population or introducing new wolves after expiration) seems to me to be the alternative with the most possible success.

Topic Question 6:

As my answers above indicate, I and my partner have been to Isle Royale six times since 2001. In that 14 year period we have seen some change in various areas (although being paddlers we have not spent a large amount of time in the interior of the island.) Neither moose nor wolves have been on the island forever (so to speak), so what there is now is an ecosystem that is been around for only 80-100 years. However, it is unique and well worth trying to keep. Since human populations are the root cause of the climate change and its speed of change, there is no long term reason why we should not intervene to keep the wolf population viable. And it may be the cheapest and most effective way to rebalance the ecosystem.

Comments: As my answers to the questions indicate, I and my partner have been to Isle Royale six times since 2001. Since human populations are the root cause of the climate change and its speed of change, there is no long term reason why we should not intervene to keep the wolf population viable. And it may be the cheapest and most effective way to rebalance the ecosystem.

I do believe that the on-going wolf-moose study provides the Park Service with a unique and valuable educational/research service. The knowledge of what has happened and might happen in the future is advanced hugely over what the Park Service could do itself. Their recommendations and findings are incredibly valuable and should be given an inordinate amount of weight in making the final decisions. It's an excellent example of a public/state college/private partnership.

Correspondence: Topic Question 1:

If the moose are allowed to effect the vegetation uncontrolled there will be few who will find the park one to visit. It could very likely starve the moose or lead to humans controlling the moose population at some point and if that is the case, it may as well be done naturally as it has been for so many years by wolves. This would mean wolf reintroduction or augmentation.

Topic Question 2:

Moose management should be not be done through human predators. Natural predators such as wolves should be used.

Topic Question 3:

To use wild predators such as wolves with as little human involvement as possible. Using motorized or air vehicles should not be an option in the wilderness areas.

Topic Question 4:

Low intensity of human involvement while working to balance the wolf/moose population and vegetation.

Topic Question 5:

There needs to be flexibility in the management of the wolves. The moose population is basically unchanged outside the fact there are less predators and therefore does not require management.

Topic Question 6:

Continue the ability for public to comment.

Correspondence: Topic Question 1:

The management tools should have been in place years ago. I would like an explanation on why the NPS waited for the wolf population to drop to 3 before considering the future of the island's ecosystem. Now that time is precious the Park has decided to make a decision within the next two years. Bringing wolves to the island sooner than later is the best possible solution to insure a healthy island ecosystem.

Topic Question 2:

Time. Plan now for future of the island, not after the consequences have taken hold.

Topic Question 3:

Try to keep it a Wilderness. To be Wilderness, an ecosystem needs a predator and a prey. Isle Royale without wolves is not Wilderness. The island will turn into a moose petting zoo, with little vegetation and a non-functioning ecosystem. If we do not intervene now, we will have to take drastic action in the near future.

Topic Question 4:

Not sure the purpose of this question. Pass.

Topic Question 5:

If the Park recognizes the island as Wilderness how can culling moose even be an option. This truly cannot be an alternative.

Topic Question 6:

Most likely it is already too late, but bringing wolves to the island without further ado is the best possible solution. Sad to see the decision process stall and delay. Make a decision. Expedite the process and please stop the procrastinating. This should be an incredibly exciting time for the National Park Service. A time to shine and take pride in a unique ecosystem that is becoming more rare with time. Healthy ecosystems are endangered, let's work together in keeping this one intact. Isle Royale brass has an opportunity to lead Wilderness management and set the example for other wild landscape caretakers to follow. Do something instead of nothing.

Correspondence: Topic Question 1:

The options proposed are adequate.

Topic Question 2:

I think all the issues outlined on page 3 of the Public Scoping Newsletter are applicable. Overall, a healthy ecosystem is a balanced ecosystem. The successful environmental impact of wolf reintroduction to Yellowstone is a great example. The challenge is we are dealing with an island ecosystem which may require more intervention that we may like.

Currently, the ecosystem is out of balance. With so few wolves, we know they haven't had an influence in managing the moose population in recent years. And wolf extinction is a likely without genetic rescue of wolves.

Topic Question 3:

Ecosystems usually balance themselves the best, so I would favor minimal intervention that seeks to mimic a natural state as much as possible.

Topic Question 4:

As it relates to Isle Royale, it's likely NPS may have to intervene periodically due lack of ice bridges allowing for migration (gene flow) to and from the island.

Topic Question 5:

Alternative Option A - I'm not opposed to a 100% hands off approach, but the impact of that should be clear - likely wolf extinction, moose population explosion followed by collapse (starvation, disease), and vegetation decimation. While we would learn from watching it happen, I think we learn far more from the continued studies of wolves-moose-vegetation that has been going on more than 50 years at Isle Royale. And to sit back and watch an island ecosystem collapse would be irresponsible.

Alternative Option B - This is the only option I fully support for 2 reasons. 1) It most closely mimics a wolf migration event, offering immediate & superior genes into the wolf population to overcome the impact of the inbreeding the wolf population has been experiencing for some time. 2) Option A aside, it is the least interventionist of the remaining options, allowing the ecosystem to balance itself, just like we saw in Yellowstone.

Alternative Option C - this option is the least descriptive and probably requires too much intervention, which I wouldn't support.

Alternative Option D - I wouldn't support this Option as a first step. NPS should try option B first, see how that works over the next decade or so, and then re-evaluate. Option D requires more intervention than I'd like to see initially.

Alternative Options E & F - I strongly oppose both options as each amounts to ecosystem cherry-picking. If you want to manage moose, maintain a healthy wolf population, as that most closely mimics nature.

Topic Question 6:

It's important to keep in mind that moose and wolves are recent arrivals to the island, ecologically speaking. We know without a predator (wolves), the moose have and will continue to decimate the vegetation without intervention.

Comments: Isle Royale is a unique ecological laboratory that we have learned much from since the wolf-moose-vegetation studies began. It is vital that we allow that to continue, but it likely cannot without NPS intervention. However, that intervention should be as minimal as possible, most closely following natural events, and allowing the island ecosystem to balance itself.

Introduce wolves from neighboring areas to ensure the genes introduced would be like those of a natural wolf migration event. Introduce enough wolves to allow for a healthy island population. It's a genetic kick start...and then we can watch what plays out and continue to reap the benefits of this ecosystem that is virtually untouched, except for human impact (canine Parvovirus in the 80's, vacant mine shafts, climate change).

Isle Royale is an ecological treasure that must be preserved with as minimal intervention as possible, using the elbow grease of nature (wolves) to bring it back into balance, and also by allowing it to continue virtually untouched. I think of it as an island Yellowstone. This approach aligns with the mission of the NPS.

Thank you for the opportunity to comment on this important issue.

Correspondence: Topic Question 1:

Bring new wolves to Isle Royale National Park to help balance the park's ecosystem.

Topic Question 2:

These two species have an important predator-prey relationship and are critical to the overall health of the island ecosystem. The National Park Service (NPS) is responsible for protecting and managing the beautiful natural resources and wildlife at Isle Royale.

Comments:

Dear Superintendent Green,

I care about the wildlife at all of our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park - the lowest number of wolves in more than 50 years - threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone then starving to death. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize the impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

I feel that the National Park Service should take the least intrusive action which would result in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Correspondence: Topic Question 1:

Please restore the natural balance that mother nature intended via predator and prey relationships. Wolves will keep the moose population in check, will cull old, sick and genetically inferior moose from the ecosystem. Allowing man to come in to hunt the moose into balance will remove the healthy and exceptional moose from the population. Not managing the moose numbers will result in changes in vegetation and an overall upset of the balance of this ecosystem.

Topic Question 2:

The population should be kept in check with as natural of methodology as possible. Not keeping the population in check could lead to overpopulation and suffering of moose, overgrowth of vegetation, eradication of wolves and a shift in the natural balance of the ecosystem.

Topic Question 3:

Let mother nature be in charge.

Topic Question 4:

Let mother nature be in charge.

Topic Question 5:

See comment for answer 2.

Topic Question 6:

Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park - the lowest number of wolves in more than 50 years - threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Correspondence: Topic Question 1:

The reintroduction of wolves either to the existing population or after the existing population dies, is necessary. To establish a viable wolf population, this may require more than one reintroduction over a number of years. Genetic diversity within this wolf population is necessary as seen by the existing wolves which have become inbred. Culling of moose is not necessary if the wolves are allowed to fulfill their ecological role.

Topic Question 2:

Genetic diversity within the wolf population needs to be considered when evaluating for future management of moose, wolves and vegetation. The researchers who have collected and analyzed 57 years of data need to be included in the discussions.

Topic Question 3:

The unique wilderness qualities of Isle Royale need to be protected. The culling of moose and the use of motorized vehicles is not acceptable. The top carnivore, the wolf, is vital for ecosystem health.

Topic Question 4:

Climate change needs to be addressed on a much bigger scale than just in the US. Education flyers could be available on the island, which address the specific changes which will occur on IR due to climate change. Because of climate change, wolves are unlikely to repopulate IR so intervention from the NPS is necessary.

Topic Question 5:

Every effort must be made to expedite the decision about wolves on IR. The NPS has drug its feet on this issue for years which only adds to the problem. The few wolves presently on the island will not be able to keep the moose population in check and consequently the island's vegetation will be highly degraded. We need to act quickly!

Topic Question 6:

I have been to Isle Royale specifically to see or hear wolves or see their sign. I also visited to experience true wilderness. These values can not be compromised.

Correspondence: Topic Question 1:
None.

Topic Question 2:

A guiding principle of any management program for Isle Royal should be to minimize direct (e.g. on the island) human impact, intervention and, interference.

Topic Question 3:

NPS should maintain a non-interference management plan; maintain existing campgrounds & infrastructure for visitors but leave the designated wilderness area as-is.

Topic Question 4:

Maintain a policy of non-interference.

Topic Question 5:

I dislike concepts B thru F since they involve some form of intervention that will alter the natural course of Isle Royale's ecosystem.

Comments: Isle Royale has served as a unique biosphere to study with a focus on the predator-prey relationship. Its isolation from the mainland limits many variables because the ecosystem is largely fixed. Much has been learned because of this.

Much more can be learned by allowing nature to run its course - which likely means the extinction of wolves on the island. Yes, Isle Royale is likely to undergo substantial change because of this: lost vegetation, impacts to other mammalian populations, changes in hydrology & forest structure, etc. But this happens all the time in nature and should be studied. We know this from prior oscillations in the population of moose & wolves.

As options are evaluated, please consider if we are we doing what's best for nature or humans.

Thank you.

Correspondence: Topic Question 1:
Augment the wolf population by mimicking an ice bridge migration while continuing to monitor both populations.

Topic Question 2:

Consideration of climate change and the impact that has on the vegetation, which will impact the moose population and the wolf population.

Topic Question 3:

Minimal management, including augmenting the wolf population and monitoring both populations. Continuing the wolf-moose study indefinitely as a tool for monitoring.

Topic Question 4:

Same as question 3. As changes become more impactful to the vegetation mix on Isle Royale, some type of re-evaluation may need to be considered, especially if it impacts the moose population negatively, and in turn effects the wolf population.

Topic Question 5:

I am drawn to Alternative number 2, as it addresses the need to re-balance the populations with minimal interference and impact on the wilderness character of the island, but is realistic in consideration of climate change as a man-made event which requires some counter action to re-balance what has

become unbalanced due to our actions. Whatever actions are taken there needs to be long range consideration of how to revisit and adjust actions as conditions change.

Topic Question 6:

Isle Royale is a very special place and as a wilderness park that specialness needs to be preserved as much as possible. I believe Wilderness is a primary consideration, but realistically, the impacts of our non-wilderness world are being felt in our wild places as well. The changes end up unbalancing ecosystems world-wide, and there are times when we will need to do something to try to manage the changes that our actions have caused. Isle Royale presents one of those situations. The on-going Wolf-Moose study provides a unique way of monitoring the changes and the unbalancing of populations on the island. I believe that the options that have the least impact on the wilderness character of the island, yet have the potential to eventually re-balance the populations while mimicking natural changes (ie. ice bridges opening the way for wolf migrations to the island as a somewhat regular event) that would occur if climate change didn't interfere.

Correspondence: Topic Question 1:

Reintroduce or augment wolf population to reestablish the predator/prey balance. This relationship seems key to many of the other issues and elements identified.

Topic Question 2:

Keep wilderness designation prominent. Any management that includes mechanized access beyond what is done during the winter study or what would be needed to reintroduce/ augment the wolf population should be a very last resort and kept to a minimum . Minimal management, continual monitoring.....

Topic Question 3:

Minimum management but continual monitoring with reassessment of the balance of natural populations and vegetation. Any plan needs to include an option for determining if other management is needed to keep wilderness components balanced. Since it is human actions that have impacted climate and contributed to the changes being seen at Isle Royal and other wilderness ares throughout the globe,it is our responsibility to ensure that wilderness areas be maintained.

Topic Question 4:

Considering that climate change is due largely to human actions then management to preserve the wilderness quality of Isle Royale (and other wilderness ares) is indicated. Again, minimal management and continual monitoring then reassessment.

Intensity can be quantified in many ways and it is not clear how it is defined specifically in the 5 concepts presented (dollars, manpower, time).

Topic Question 5:

Like:Any alternative that emphasizes a natural balance of predator/prey with a minimum of human interference. Humans as a facilitating influence but with minimal hands on management but ongoing monitoring with periodic reassessment.

Dislike:

Alternatives that require intrusive human management- use of mechanized vehicles, hunting as a culling tool.

No-action as this will seemingly allow big swings in the moose population and vegetation and have a huge affect on park resources and visitor experience.

Topic Question 6:

Isle Royale is a very unique and special place. It has been interesting and alarming to follow the winter study and the steep decline in the wolf population since visiting the park in 2010. As we humans impact the climate and the environments we live in and visit, it is our responsibility to minimize any negative consequences of our actions, to foster the natural processes of ecosystems and to be good stewards.

Comments:

Correspondence: Topic Question 1:

An assessment of the overall health of the island ecosystem, within the context of a changing climate and special characteristics of islands, is needed. Islands, by their very nature, are more vulnerable, less resilient, susceptible to damage from invasive species, have greater occurrence of disjunct and endemic species and can only support perhaps less than half the number of species as a comparable mainland area. Islands cannot be managed the same as the mainland and management plans need to focus on the special nature of an island ecosystem. For example, Dr. Emmet Judzewicz found that a Wisconsin island held about 100 species while a comparable mainland area 250 (Vigmostad 1999).

Topic Question 2:

As has been witnessed on Isle Royale, ungulates on islands tend toward populations crashes and die offs. At first their numbers grow, especially when no predators are present, but over time their number crash after they consume the vegetation they can reach. The negative impact of deer on one of the Manitou islands compared to the South that has not had deer has been documented by D.J. Flaspohler (IAGLR 2005). If ungulates are to have a future on Isle Royale, then a predator must be present in sufficient numbers and health (genetically diversity) to keep the moose population within the carrying capacity of the island. I think the health of the island's biodiversity should be the primary measure of success, thus the monitoring the status of and maintaining the vegetation should be of primary importance and mammals managed within that framework.

Topic Question 3:

Because it is of critical importance to maintain the wilderness character of the Isle Royale, managing within the framework of the special characteristics of an island should be of primary importance. This implies moose populations needs to be managed so that they do not over browse thus greatly diminishing island ecosystem health. I see the augmentation of the wolf population- to greatly increase genetic diversity and chances of survival- -as a critical component of improving and maintaining the wilderness character of Isle Royale.

Topic Question 4:

Plant and animal communities that thrive in a warmer growing zone will prevail no matter what actions are or aren't taken. I suggest monitoring and documenting these changes because islands are important living laboratories for issues of critical importance including that of a changing climate. Due to the moose preference for a boreal forest, this suggests moose populations will decline over the next several decades on their own. Another aspect is that islands may serve as important refugia for species in a changing climate.

Topic Question 5:

I believe there is a moral, legal and biophysical imperative to manage Isle Royale National Park as a wilderness area using the most scientifically sound best-management practices for island ecosystem. Thus I do not agree with a no-action alternative for an island ecosystem. I suggest an adaptive-management approach be used so that steps taken are monitored to ensure that moose populations do not over browse the vegetation. I do not see an either/or to options B through F but to start where best practices suggest and increase management actions over time if and when needed. For example, with current moose populations and only several wolves left it's quite urgent to reintroduce new genetically diverse wolves as quickly as possible (Concept C). But using adaptive management move to Concept D if overall island ecosystem suffers (accounting for fact that some will be the result of larger climate changes rather wolf/moose population dynamics). In the long run, using an adaptive management approach and with a changing climate, Concepts E and F will need to be considered.

Topic Question 6:

The U.S.-Canada Great Lakes Islands Project, which I've led since 1995, supports efforts to actively yet carefully and adaptively manage wolf and moose populations to maintain overall island biodiversity as best possible over time. Ungulates cannot survive without predators overtime and will destroy an island ecosystem so must be managed to maintain the wilderness character of this critically important island ecosystem. We have confirmed that Isle Royale is one of the most important of the 32,000 Great Lakes islands in terms of biodiversity conservation. Please feel free to review Great Lakes islands reports at <http://greatlakesislands.net/resources/> including the most recent "Islands of Life" (2010) with Isle Royale identified as one of a handful of Lake Superior islands that are key for biodiversity conservation (see pg. 20).

Correspondence: Topic Question 1:

I strongly support following the advice of scientists who have been studying the island for years- -they are in the best position to provide sound, evidence-based recommendations on what the best alternative is.

Topic Question 2:

I am a strong supporter of our National Parks in general, and favor very much any efforts to maintain their pristine state and natural beauty. Isle Royale is an important part of the NPS- -it provides a living laboratory for study, a remote and unique experience for human visitors, and a sanctuary for large predators. Given shrinking ecosystems in the UP and the struggles for large predators living in areas with human presence, it is increasingly important to maintain settings like Isle Royale as sanctuaries for the wolf, where those who visit may do so precisely because of the unique opportunities to see these animals in their natural state.

Topic Question 3:

I am opposed to any strategies that are contrary to NPS policies- -for example,I am not in favor of hunting as a method to thin the moose herd.

Topic Question 4:

I think that NPS should proactively and with urgency intervene according to guidance of the scientists who have studied this population and ecosystem for a number of years (Peterson et al). I do not feel that additional deliberation or study will serve either population well- -time appears to be of the essence. Further delay may only have additional negative impact on the populations. Peterson et al have studied this ecosystem for many years and have scientific evidence to support any recommendations they would make.

Topic Question 5:

I strongly support the idea of maintaining both wolf and moose populations on the island, and would defer to the experts on which option is best for doing so. I am not in favor of not intervening- -humans have in fact, already intervened by hiking there, and accelerating climate change (and subsequently negatively impacting ice bridge development and natural migration of the wolves).

Topic Question 6:

Please, please do what you can to preserve both populations (wolves and moose) on the island. While I have not yet visited Isle Royale myself, it is on my bucket list precisely because of the unique sanctuary and living laboratory it provides. I hope that the wolves and moose will be there for generations to come, so that my children and grandchildren can experience them in their wild setting.

Please read and reflect on your own mission statement as you make this important decision for this and future generations, and make Isle Royale a shining beacon for the world in how to live our values to their fullest.

"Our Mission

The National Park Service preserves unimpaired the natural and cultural resources and values of the National Park System for the enjoyment, education, and inspiration of this and future generations. The Park Service cooperates with partners to extend the benefits of natural and cultural resource conservation and outdoor recreation throughout this country and the world."

Correspondence: Topic Question 1:
None; the alternative concepts A through F seem to cover all realistic possibilities.

Topic Question 2:
Preservation of natural lands, minimal human intervention.

Topic Question 3:
For designated wilderness, the best management is hands-off management; let nature take its course.

Topic Question 4:
Although climate change is an extremely serious issue, there do not seem to be any clear action items in terms of NPS management. For wilderness areas, management should continue to be as minimal as possible.

Topic Question 5:
A is by far the best of the alternatives. Leave things alone and let natural processes occur.

B and C should be considered as second choice alternatives, although I have serious doubts that wolf reintroduction will be a good thing. The proposals for B and C appear to be somewhat similar, except that C seems to be worded to allow a wider range of options.

D, E, F are clearly less desirable than A, B, C. The moose represent a unique, valuable, and magnificent species in our natural landscape. Reducing the moose population through culling is absolutely unacceptable; we need to preserve our large herbivores, not kill them off. If absolutely necessary, moose relocation could be considered as an extreme last resort.

Correspondence: Topic Question 2:
Long-term health of the island

Comments: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,

Correspondence: Topic Question 1:

I can't think of another alternative. I think wolves should be repopulated on the island.

Topic Question 2:

I think if the number of wolves are increased then there may not be any other issues. If the natural balance of predator prey is reestablished, nature normally keeps everything in check.

Topic Question 3:

The land should remain a designated wilderness and no hunting permitted.

Topic Question 4:

The vegetation should be left alone - the environment undisturbed by man.

Topic Question 5:

I like the fact that the NPS is considering doing the right thing and increasing the wolf population that should be there anyway by natural rights. I don't dislike anything about it - at least not as far as I know about it. If hunting or managing the wolves by killing them is part of it, then I don't like that.

Comments: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

Correspondence: Topic Question 1:

The element, the management tool, of time: ie. the effect of not acting in time to render that alternative viable; the importance of acting very quickly (NOW, this winter).

Topic Question 2:

Science, wilderness integrity, education, financial burden, public interest and involvement, applicability of scientific findings from Isle Royale to support ecosystems in other areas of the world.

Topic Question 3:

Whatever type and intensity science indicates will offer the highest benefit-to-risk ratio and the least chance of unintended outcomes, for the restoration of functional predation; support of natural balance rather than predisposing to continued active human management.

Topic Question 4:

Management that relies on guidance through science, and is as dynamic and as complex as climate change demands.

Topic Question 5:

I very much like that they are being put forward, and the public view on them considered.

I dislike their means of presentation: they are unclear, they overlap, parts of several are the same but in different circumstances, parts of several go against each other, they are worded in an overly complex and somewhat ambiguous manner which may make it difficult for some people to understand and respond to them.

Topic Question 6:

Thank you very much for this opportunity to contribute my response. Please also include in your consideration my additional comments in the box below.

Comments: Dear National Park Service,

Ref. Moose- Wolf-Vegetation Management Plan/EIS

Isle Royale National Park, MI

Alternatives put forward by the National Park Service for the future management of IRNP:

Alternative Concept A - 'no action'

Alternative Concept B - 'introduce wolves once'

Alternative Concept C - 'maintain both species'

Alternative Concept D - 'introduce wolves once and reduce the moose population'

Alternative Concept E - 'reduce the moose population'

Alternative Concept F - 'intensively manage the moose population'

I am delighted and honoured to have this opportunity for my views to be recorded and considered: delighted, for the contact it brings once again with the island, and the opportunity it offers for my involvement, however slight; honoured, because - while my physical visits to Isle Royale National Park, and ensuing interest in the Moose-Wolf research there, have given me tremendous pleasure and great satisfaction over the years - I know that the part I individually play is infinitesimally small.

I am not a scientist, but my views are the result of long study and deep thought on this research and its place in the world. Since 1995 I have visited the

island a total of 6 times, from May to August, up to two weeks at one time. (I would have visited far more often if my financial situation had allowed - necessarily including travel costs from the UK, where I live). In between visits I have tried to keep in touch and up to date by, for example, reading books on Isle Royale history and ecology, each Annual Report of the Moose/Wolf research, regular copies of the magazine 'International Wolf', many books including 'Of Wolves and Men' by Barry Lopez, 'The Wolves of Isle Royale' by David Mech, 'A Broken Balance' by Rolf Peterson, and a variety of on-line material including watching 2013's forum at Northland College. I hope my views can thus be considered fairly well informed for a lay-person.

Each of the National Park Service options, above, has the possibility of opening up new or further scientific understanding - and at the same time has the possibility of limiting or ending existing research. Each also raises further, deeper, more complex questions to be answered and choices to be made. The best option may therefore need to be the compromise which allows most future scientific benefit, whilst losing least ongoing scientific progress, and risking the lowest likelihood of unintended consequences. Those who must ultimately make the decision have my admiration and appreciation, for not only will they have to live by it, but there will be many knock-on effects on other lives: the whole ecosystem on the island, the current scientists, the visitors, many other scientists, students, and indeed ecosystems/visitors/ scientists/students around the globe, not to forget those whose livelihoods depend upon the island's visitors.

I would imagine there is concern that sufficient numbers of people may not continue to visit an Isle Royale with no wolves? This would be a sad development indeed. From the point of view of one such member of the public, the island's visitors are of intrinsic value and need to be properly considered in the making of this crucial decision. It is but a small percentage of the population that visits any National Park, and an even smaller percentage of these that visits Isle Royale; but it is known that there are more multiple-returning visitors here than anywhere else. Surely it will be recognised that most if not all of those of us who have stayed, camped, sheltered, hiked, canoed, listened, breathed, watched, sensed, and immersed themselves on the island, felt they played some small but valuable part in the moose-wolf science. We have helped by reporting, through the official channels, any signs, sightings and finds - and even what we didn't find is of interest and value. We have obliged by following the 'leave no trace' policy, by not disturbing moose bones or antlers, by avoiding wolf denning areas, by keeping to trails and campsites, by taking away nothing but photographs and memories. We have contributed questions, photographs, time, effort, support - as well as contributing financially to the Park and perhaps also to the research. We have enjoyed this connection with the study and personally gained much from it, and are concerned to find the best way forward for it. It forms an inextricable link between the island and our far-away selves.

I would anticipate that visitors past and - now more importantly than ever - future, will be as keen for the science to continue to benefit, and as interested in the answers to the questions posed, as I am. After all, even though the vast majority of Isle Royale visitors have never seen a wolf there, nor even expected to do so - yet still they come, and love the island for many reasons, and for the sum of those reasons taken as a whole, not one over another.

The reasons for my own multiple visits, which I find are shared by the many people to whom I have spoken about the island, include:

Beauty - nature living in a more complete, properly functioning and balanced way than we are generally privileged enough to witness

Intrigue - the ongoing study of the natural balance of a wilderness ecosystem; the sense of humans as part of the natural world; a sense of involvement in science, no matter how small

Education - the opportunity to experience an ecosystem with every trophic level represented, with a top carnivore in control rather than human managers

Remoteness - personal challenges met in the wilderness; other folk you meet, like-minded souls, who made the same effort as you to be there, for the same reasons and interests

Lack of change - the natural world is slow in its effects compared to the rush of human desires, demands, fashions, technology, etc., in our daily lives, and this offers a comforting familiarity, imbues a strength with which to cope in our fast-paced, rapidly changing lives

And yes, the wolves. I believe most Isle Royale visitors would be very keen to support and to follow an ongoing moose-wolf study. Though driving through Yellowstone we may have a better chance of seeing a wolf, for many of us that would be far less satisfying than hiking on Isle Royale and NOT seeing a wolf, just knowing they probably saw us. We walk the same trails, cross the same swamps, shelter under the same trees, drink from the same lakes and sleep on the same ground as the wolves - this teaches us much about ourselves, about how we too are 'natural', just one part of an environment upon which we have such an impact.

Considering the proposed options

A, E, and F - Do nothing to maintain a wolf presence, allowing its imminent extinction?

That the science carried out over the past half a century on Isle Royale has been sound, and of enormous use and importance to the planet, is very clear. Indeed for the benefit of our own species, humans need to learn enough, soon enough, about how our planet works. The island has proved to be an almost perfect 'laboratory' for carrying out scientific studies which have relevance across the globe (remote but accessible, a simplified ecosystem). Would it be foolish to deprive ourselves of this much-needed facility? What advances in understanding could it offer if without predators, that cannot already be found in other places without predators? Would taking a step back, opting out, at this time, be a waste of this valuable study, be a luxury we can ill-afford? Or, do we take the option that offers the most fruitful opportunities for science to continue? The moose and wolves of Isle Royale have continued to surprise us and to teach us over the many years of the study; they may yet have much to teach us - shall we give them or deny them the opportunity to do so? Far from a process of diminishing returns, or entirely running out of things we need to study, the research on the island (Moose and Wolves, and many other studies) continues to expand and grow, and make its useful findings known. The science carried out here is, for the world, a window into wilderness.

One of the main advantages of this 'laboratory' is in its uniqueness - being the only place in the world where a predator/prey relationship can be studied without the direct impact of human activity affecting the results. Uniquely here, neither the moose nor the wolves are hunted by man, compete with man, or are directly managed by man. This wilderness sanctuary then provides a unique opportunity for vital science to be carried out: only by knowing what are the effects of a natural system, can we understand what are the human effects. If we let this opportunity go, we have nothing else to replace it, anywhere, whether for current studies to continue or to answer new questions presenting in the future.

Personally I can think of two additional reasons which can only add to the importance of this 'laboratory' on into the future. First, might ongoing Isle Royale moose/wolf research not prove of high value and, at the same time, of low risk, for understanding how we can help other 'islanded' ecosystems cope and remain in sufficient natural balance for a sustained future? Throughout the world one of the biggest threats to biodiversity is the increasing incidence of 'islandisation', as human demands on the environment lead to the fragmentation of natural ecosystems and their subsequent collapse. Second, would there not be an important role for the moose/wolf study in the emerging scientific field of neuroconservation, investigating how natural environments could be essential for human well-being?

Without wolves, would visitor numbers fall to a level whereby the island is no longer viable as a National Park, unless it brings in more well-recognised, modern 'attractions' of some other kind? (It is worth bearing in mind here, that the comparatively small number of visitors to this National Park represents a comparatively high number of returning visitors.)

D (C) - Introduce a new wolf population after extinction?

See above.

So much to decide, to try to get just right, to trip over, and possibly regret for ever: which wolves? when? how many? M:F ratio? ages? genetic input? disease? anomalies? success/failure? etc.

How long would we need to allow for things to settle into a more natural pattern, before any meaningful science is once again possible? At what cost? How/where would this take the research? Always afterwards there would be so many, unknowable, human effects to factor in - perhaps almost as many variables as for mainland studies.

May we not, further down the line, discover things that would have been better done differently, and which we find have left any scientific opportunity much poorer?

Presumably, eventually the same decision would have to be made again? And again....

B (C) - Conserve remaining Isle Royale wolf population with a 'genetic rescue', by bringing some wolves to the island?

I do not see the genetic rescue option to be necessarily as deeply 'meddling' as it first may appear. After all, man has affected the island's 'wilderness', and the science, already and to a considerable degree - for example climate change and the lack of ice-bridges, for example the introduction of parvo virus and the ensuing wolf population crash, for example the known deaths of three wolves that fell into an old mine pit. Without these man-made factors the wolf and moose populations may well be at a very different stage at the present time, and in no need of any of these current considerations. Genetic rescue is the most fitting, suitable and appropriate recompense for these unintentional human impacts.

Also, nature has itself intervened by the 'genetic rescue' option, when a male wolf took the opportunity of crossing to the island by a more recent ice bridge. The study of the island's wolves discovered, coped with, and indeed learned from this significant variable thrown into the mix. Wouldn't giving nature a 'helping hand' in the same way as it would itself operate, be the most natural way to both ensure the longevity of the valuable 'laboratory', and at the same time mitigate for known unintentional, unwanted human 'interferences' and their effect on scientific study?

It would be unfortunate indeed to lose the entire Isle Royale wolf genome at a time when genetic studies are becoming so much more telling and useful. Again, how much might we lose?

Genetic rescue could be carried out as naturally as possible, with as little 'human effect' as possible - leaving the continued scientific studies largely untrammelled by ensuing human choice and decision making. It would be possible for a genetic rescue introduction to be very close to the 'ice-bridge effect' - literally just as if existing loners, or a pack, from the right part of the mainland, at the right time of year, indeed found an ice-bridge and chose to make good use of it. (This of course may happen, totally naturally, before a human decision is made or action can be taken - and in fact the remaining wolves may thus leave the island.)

Of the three choices, the 'genetic rescue' option follows most closely the mandate for "prioritising ecological integrity" in a National Park or any ecosystem.

D, E, and F - Actively manage the moose population on the island?

Certainly, without a wolf population on the island, and moose numbers consequently allowed to self-control, there would be a major impact on the island, affecting the vegetation, the overall ecology, and inevitably the Park's appeal to visitors. Nature would surely sooner or later lead to a moose population crash, perhaps even worse than the '96 event, which would have its own notable effects on the island, both short- and long-term.

Any effective management of this situation would require considerable human input, not least of which would be the ongoing necessity for debate and decision-making, in order to adapt continually to prevailing situations as they arose. It would also lead to considerable financial cost to the Park - a service provided free by wolves, would instead require live trapping, care of any captured moose, and means of transportation, or helicopters, pilots and marksmen. This type of management would be continuous, on into the foreseeable future.

Information could be learned from management experience with an uncontrolled moose population - but this can already be gained in other locations where large ungulates roam without control by natural predators.

To manage a National Park, as an ongoing policy, 'by human', rather than 'by top predator', would lead far away from Isle Royale's current identity, and its main attraction, ie. as a wilderness area - as well as reducing to an insignificant level its capacity as a scientific laboratory, currently unique.

With such a degree of ongoing intervention by humans so necessary, would Isle Royale not become simply a zoological park, essentially a non-wilderness? How could this fit with the mandate to 'prioritise ecological integrity' - taking 'integrity' to not only mean completeness but also the quality of that whole?

We, as humans, need to understand far more and much better what 'nature' does and why, before we can assume WE know more and better, or think we can take over from 'nature' without harming our own future. We need to experience being, ourselves, just another species - within nature, and under its influence.

In conclusion

As there has been such value in having Isle Royale as an ideal scientific 'laboratory' for the widely recognised Moose/Wolf study, amongst others, there must equally be great disadvantage in not having it. One of the many things this study has taught us is how much more we need to study, how rash it is to think there is nothing more to learn! We don't know what we may miss by ending this unique and specific study now, perhaps just when the length of time observing and gathering data may begin to truly teach us something vital about the world and about our part in it. Science is our best guide to finding the most beneficial and least damaging way forward.

For these many reasons, I believe that the best Concept is B.

However, with wolf numbers already at a critical level, by the time a decision is made and properly scrutinised and actions are ready to be implemented, according to the anticipated timeline, we may have significantly passed the point at which this Concept is applicable. It would thus seem necessary to implement Concept B immediately if it is to be fairly included as an alternative on offer. In the event that the Isle Royale wolf population has already been lost while these alternatives are being considered, Concept C or Concept D may become the more relevant.

I shall be grateful if you will please consider my views before making your decision about the future of the moose, wolves, vegetation, science, and status of Isle Royale National Park.

Thank you.

Yours sincerely,

Minimal development.

Topic Question 4:
We are in the Anthropocene and must do some intelligent tinkering at times.

Topic Question 5:
I appreciate your inquiry to the public.

Topic Question 6:
Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,

Thank you for taking the time to help protect Isle Royale's fragile environment.

Correspondence: Phyllis Green, Superintendent
Isle Royale National Park
800 East Lakeshore Drive
Houghton, Michigan 49931-1896

Superintendent Green,

I am writing, as an American citizen and a wolf advocate, to strongly urge the National Park Service to fulfill its duty to protect and responsibly manage the wildlife and natural resources at Isle Royale by opting to

As a tourist, I am deeply concerned about the preservation of our national parks and their unique wildlife, especially the wolves and moose of Isle Royale National Park. I am shocked to learn that a mere three wolves remain in the park, the lowest number of individuals in 50 years. Due to the low number of these apex predators, the population of moose has understandably risen, and with so few wolves to keep them in check, moose are causing negative impacts to the native vegetation which in turn is threatening the overall health of this ecosystem.

I am deeply disturbed, however, that the NPS is proposing to deal with the situation by calling for the culling of moose instead of promoting the more sensible solution - - to release new wolves to the island, on a regular basis when necessary, to achieve ecological balance to the area. This more natural, less intrusive and commonsense solution, Alternative B, will benefit this environment and the wildlife who live there much better than the unnatural

management choice of hunting moose while allowing the present tiny genetically unsustainable population of three wolves to become extinct. By promoting a healthy population of wolves through the introduction of new animals, the species will have a chance to recover healthy numbers and subsequently take their rightful place as top predator, keeping moose populations in check and contributing to the long-term health of the ecosystem.

Moreover, this alternative will result in greater tourism which will benefit the area economically by attracting more tourists, such as myself, to Isle Royale and providing more opportunities to view wolves and moose in their natural habitat. If these unique wolves are allowed to die out and the moose are wiped out in an effort to compensate for the lack of predatory wolves a significant incentive for visitors to Isle Royale would be eliminated, its wildlife.

Therefore, I strongly urge the NPS to choose the alternative that would best benefit the wildlife and ecosystem of Isle Royal, management Alternative B, which calls for bringing in new wolves to the island to help restore the current nonviable population of only three wolves to a more sustainable number, an action that will, in turn, help restore the predator-prey relationship between wolves and overpopulated moose and restore balance to this ecosystem in a natural unintrusive way.

Thank you for your serious consideration of my comments on this most urgent issue.

Correspondence: I've lumped my answers to the questions above in one comment:

I went to Isle Royale in 2011 and have been back several times. Words really can't describe my feelings about Isle Royale-it's a special place. During my first trip to the island, I witnessed park employees trimming trees just off the trail outside Daisy Farm. I remember thinking to myself, "I thought this place was suppose to be natural." It occurred to me that parks are for people. So trail maintenance is essential. I don't have a problem with this. My problem is that some folks who make decisions about what happens in our Parks are wrapped up in the Wilderness Act and mainly the idea of "let nature take its course". With global climate change running our earth - the idea of "let nature take its course" is absurd. I'd like to suggest that new management tools be established that are innovative; management tools that were not established in 1964; management tools that reflect 2015. I'd like for people to start talking about what the difference is between maintaining trails and maintaining the wolf population. I'd like for people to start rethinking wilderness.

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Correspondence: Topic Question 2:

The correct answer for long-term sustainability - regardless of the question and regardless in which field - is always the one which increases diversity (biodiversity, cultural diversity, linguistic diversity etc.). Diversity increases robustness which is an important factor in allowing a system to respond to changes. Allowing the wolves to "disappear" decreases biodiversity; it is a step in the wrong direction.

Topic Question 3:

The more a "wilderness" is managed, the less of a wilderness it becomes. So minimal human intervention maximises the wilderness. The more we interfere (commonly known as "management") the more a wilderness turns into a farm or a garden or a park or a zoo. And the less attractive it becomes.

Thus considering the answer to Q2, the ideal type and intensity of management is that which requires the least "management", i.e has the lowest human impact and results in the greatest biodiversity, i.e. concept B or C.

Topic Question 4:

The NPS should compensate only for the effects that climate change have on the IR environment. E.g. if ice bridges form less frequently and/or for shorter durations, and if this prevents or reduces the exchange of wolves (or other species) between mainland and the island, then this exchange compensation could form part of the management plan.

Topic Question 5:

Concept A is fatalistic and an abdication of responsibility.

Concepts B and C appear viable, whereby C is preferable to B.

Concepts D to F are not viable, not sustainable, highly expensive and will probably result in much collateral damage to the environment (Motorised/mechanised equipment in this wilderness? Helicopters? ATV trails? Roads? What kind of wilderness is that!?). And they smack of the hunting lobby and human arrogance. Hunting, culling and translocation of moose have an unnatural and a vastly different impact on the moose population in particular and the rest of the landscape in general than does wolf predation. And there certainly won't be much of a wilderness experience left with all this activity going on...

Topic Question 6:

After more than 50 years of intensive studies of various aspects of the Isle Royale environment it is unclear to me what additional value an EIS will have. At best it will confirm findings which are already known from past research. At worst it will yield incorrect or contradictory results because the duration is of insufficient length to provide reliable data. Either way it will unnecessarily delay the decision which has to be made. The EIS seems to be a waste of time, money and effort. All the information one could possibly want for making the correct management decision for IR is already available in the public domain.

Correspondence: Topic Question 1:
I believe the correct options are being offered to the table in this complex situation.

Topic Question 2:

The overall health of the island as a whole, including it's wilderness areas and natural habitats while maintaining flexibility as weather patterns and climate patterns occur.

Topic Question 3:

As minimal as possible to maintain the natural habitats- we will inevitably step in, but let's do so with as much respect and as little damage as possible.

Topic Question 4:

It is a factor that cannot be ignored, and therefore no plan will ever be totally static for the island's management...Any plan should be able to fluctuate as needed to allow for climate changes.

Topic Question 5:

I disagree that 'genetic rescue' is possible. I have read the research and followed this project for some time, and the main concern is repeating this genetic inbreeding within a transplanted wolf population. I also disagree with culling of moose, but the alternative of transporting them off the island seems expensive and complex. I don't know what the answer is, but I whole-heartedly disagree with any moose being killed for sport, for 'culling', or any other man-made reason.

Topic Question 6:

I want the island to stay healthy more than anything, even if that means that we cannot visit year round, or camping becomes limited, or for any other reason. While this issue is emotional and complex, I understand that something must and will be done, and while it may not seem like the most optimal choice, I can only hope it is for the Greater Good of all the beauty and life the island supports and represents.

Correspondence: Topic Question 2:
Most importantly the well being and health of the ecosystem and the species that call it home. Long term management of reasonable populations of each species, to avoid population swings and starvation. Limiting mechanized vehicles and human intervention to keep the habitat as pristine and "forever wild" as possible.

Topic Question 3:

The least intrusive as possible No motorized vehicles, helicopters or culling please!!

Topic Question 5:

I like the idea of introducing more wolves, to simulate a natural occurrence, it also gives us a whole new area to study, and I also think there's something to be said for not letting the original population of the ISRO wolves to die out. They're so special, with such a long history. Non intervention is a great idea, but between the old wells, parvo and climate change, these wolves have already had plenty of human intervention already. Maybe its time we intervene for the good instead of the bad.

Topic Question 6:

I love this place, We've had so many adventures there. I brought my daughter here as a 15 year old kid. We did a Moosewatch expedition, she met Rolf and Candy, John and Leah, and ended up deciding on a career in wildlife management. A trip here can be that inspiring, changing the direction your life goes. Its so important to preserve that, for future generations. Who's to say our next great biologists won't be some 12 yr old kid out there visiting for the first time. But I never would have gone that first time with out the wolves, they're a huge draw for visitors, and undoubtedly the stars of the show. Even if you never see one, there's something mystical about knowing they're out there. As much as I hate to equate the almighty dollar with anything environmental... national park type people love wolves, they will draw visitors, which will draw park fees, which will increase revenue which will be beneficial to long term management.

I vote for genetic wolf rescue!!

Correspondence: Topic Question 1:

As a wildlife advocate and one who enjoys photographing wildlife at National Parks, I strongly support Alternative B, but on an "as needed" basis and not a one time only thing. With only 3 wolves left in the Isle Royale, why wouldn't you think that more wolves should be introduced to keep the moose population in check?

Topic Question 2:

There should always be a balance maintained in future management and 3 wolves is not a good balance, that's for sure.

Topic Question 3:

Introduce more wildlife, namely predators and increase the wolf population.

Topic Question 4:

We need the wilderness areas, the trees, the clean water and the wildlife to mitigate the bad effects of climate change.

Topic Question 5:

I favor Alternative B.

Correspondence: Topic Question 1:

I would recommend augmentation of the current wolf population (and/or reintroduction of wolves as needed), in order to maintain a healthy moose population (and by extension, a healthy vegetation population).

Topic Question 2:
What do the people want? This fundamental question was completely overlooked/ignored at the two scoping meetings that I attended.

Topic Question 3:
Augment/reintroduce wolves on occasion, as/if recommended by the wildlife biologists most familiar with Isle Royale.

Topic Question 4:
Augmentation/reintroduction of wolves as/if needed, so long as changing climate permits the continued existence of a moose population on the island.

Topic Question 5:
I don't like that most of the alternatives are obfusatory and/or ridiculous.

Topic Question 6:
I have been volunteering for the Isle Royale Wolf-Moose Study since 2005, and recently completed my twenty-fourth EarthWatch/MooseWatch expedition on the island. I have discussed the ongoing issues at length over the past few years with Dr. Rolf O. Peterson and Dr. John A. Vucetich, so feel that I have more than a passing familiarity with the situation. I feel that the public interest is best served by maintaining healthy populations of wolves, moose, and vegetation on Isle Royale. If that requires occasional augmentation/reintroduction of wolves over time, I feel that this would not be in violation of the spirit of "wilderness".

Correspondence: Topic Question 1:
Moose are not the only animal impacted by the wolf population. What consideration is being given to other animals on Isle Royale (e.g., beavers) if the wolf numbers are kept low or the wolf are eliminated?

Topic Question 2:

Climate Change
Maintaining a wilderness experience
Science (vs politics)

Topic Question 3:

Management should stay out of the way of science. This discussion of Isle Royale wolves has been going on too long with inaction being a contributor to the current situation. Previously the scientists/researches have articulated the importance of introducing wolves before the wolf numbers dropped too low. Get management out of the way so the scientists can do their work including bringing in more wolves in an effort to maintain Isle Royale's wilderness.

Topic Question 4:

Management needs to intensively seek out the science/research and then let the scientists/researches make decisions that ensures the health of the Isle Royale ecosystem.

Topic Question 5:

I'm wondering about the alternatives that indicate wolves would be introduced once. With the changes that are apt to take place with climate, why would there even be a suggestion that wolves only be introduced once. Wolves need to be introduced and then science should dictate future introductions as needed to maintain the wilderness character and health of the entire Isle Royale ecosystem.

Don't cull moose; introduce wolves and the moose population will be put back in check.

Topic Question 6:

As a 30 year backpacker on Isle Royale, I've experienced the highs and lows of the wolf and moose populations. I'm hopeful NPS will move quickly as time is of essence to bring these populations back in balance so we don't have the extremes of too much or too little of either animal.

Comments:

Correspondence ID: 2520
Moose-Wolf-Vegetation Management Plan/EIS

Correspondence: Topic Question 1:
Maintain a wolf population on the island, which could include reintroduction or augmentation, decided on the basis of need as determined by wolf/moose researchers.

Topic Question 2:

wilderness character/designation, wolf population size, , climate change

Topic Question 3:

In my opinion, the NPS should use the minimum tools necessary to delicately nudge the predator-prey-vegetation food chain within this area which is largely designated wilderness. I believe this can be accomplished by assisting the wolf population with hopes that this predator can continue to manage the

system top-town, as it has for decades.

Topic Question 4:

I generally support no management in a wilderness setting, however, if climate-driven factors were in the mix, I would support the management with the lightest hand (i.e., minimum tool). If this were the case, I'd support a separate management plan to consider the climate-induced factors at hand. I believe Isle Royale is fortunate in this regard, that due to the relatively simple predator-prey system, a small management action involving wolves may be all that is needed.

Topic Question 5:

Given the wilderness designation of nearly all of Isle Royale, I feel that alternatives D-F are much too heavy-handed and involve more tinkering that is likely necessary. Along the same lines, I think that the inclusion of moose management in alternative C does not support the minimum tool concept. I am in favor beginning with the lightest measure (either no action or wolf introduction or augmentation), followed by a period of observation before any additional action.

Topic Question 6:

Thank you for soliciting public input on this matter - I very much appreciate the efforts you have made to identify the issues as well as the opportunity to provide my own feedback. I suspect you will receive many similar and very personal comments. From my years at Isle Royale, largely as a researcher and most recently as a visitor, I have repeatedly been struck by just how enigmatic the wolf-moose relationship is to what people think of when they think of "Isle Royale". In my opinion, this is largely due to the knowledge and sense of wonder that has been conveyed by Rolf and Candy, John and Leah, to visitors, to help them understand these animals and their interactions, to respect them, and finally to call this relationship as well as the study of it special. These individuals have done a wonderful job of making science accessible, and though I find great value in submitting my own opinion, at the end of the day, I want you to know that I trust the opinion of these people more than I do my own on this matter. They are the ones I ask when I have questions about moose or wolves on Isle Royale, and their knowledge most-certainly informs my own. In that regard, I support whatever direction Rolf, John, Candy and Leah suggest.

Correspondence Type: Web Form

Correspondence: Topic Question 1:

1. Increasing the amount of vegetation should be considered, as the moose depend on it, as well as keeping the island cut off from the mainland, or opening it up to new wolves and moose.

Topic Question 2:

2. The major issues are the decreasing vegetation being a food source for the moose, the increasing population of moose, and the condition of the populations of both the wolves and moose i.e. the amount of inbreeding and defects.

Topic Question 3:

3. The intensity should not be so high that it interferes with the rest of the ecosystem on the island as it should be preserved. Wolves should be reintroduced because they are already on the island but are facing extinction on a small scale. The increasing moose population will drain the natural vegetation, which impacts other organisms on the island so their numbers must be closely monitored.

Topic Question 4:

4. They should remember that within a warming atmosphere, a land bridge such as the one wolves came across on, may not occur, also that the vegetation will most likely favor heat tolerance. The intensity must be increased to make up for what nature can no longer provide, such as the land bridge. Wolves should be reintroduced, possibly including the removal of the sick and weak wolves already on the island, because they can no longer reach it on their own.

Topic Question 5:

5. Concept B reintroduces wolves but does nothing for the inferior wolves on the island, their genetics would be passed on with those of the healthy wolves. To ensure fitness, the existing wolves should be removed. Concept D reintroduces wolves also without regard to the ones currently inhabiting the island, and also reduces the moose population. The issue with this, it that the number of variables is too large to be able to determine the results. Concept E simply reduces the moose population but pays no regard (again) to the sick wolves who live on the island. These wolves should at least be removed and replaced, if not in greater numbers.

Topic Question 6:

6. I think the option of going to the public for guidance was a step in the right direction to solving the problems in this situation, and I hope a solution comes out of it.

Correspondence: Topic Question 1:
Could a discussion about what types of wolves would succeed in the current environment be relevant? What factors would need to be dealt with to help with their ongoing success? For example, what is the carrying capacity of the Island for wolves. I saw mentioned that some of the wolves may have starved. Would this then be the reason that the wolves continue to dwindle in population? How could this be prevented? What is known about the wolf population on the island?

Topic Question 2:
I felt that the various alternatives presented were good ones. I do not know the island that well to know how to ask about managing vegetation in climate change so as to help the moose and wolves and vegetation. I am assuming it is a very complex problem. From a very brief reading of the EIS document I preferred alternative D. I had heard that some of the moose have had problems with starvation and wanted to make sure that both wolves and moose did not have to meet this fate. I also felt that the vegetation could benefit from management from a cursory reading of the document. However, with climactic changes it sounds as though there might be many other factors to consider.

Topic Question 3:
I would hope that whatever the NPS does to manage this complex ecosystem that they be as humane as possible. The public has shown many times that they are interested in humane practices. I would hope that the NPS would take time to consult with people who have "creative" solutions to problems such as the Humane Society of the United States, etc.

Topic Question 4:
As I had mentioned previously, because this is such a complex issue I cannot really speak to this problem. If the animals will be severely affected by the change in vegetation and the warmth then it seems that helping them to survive would be a top priority. However, I understand that without the proper vegetation survival rates will be affected. The level of intensity should match the level of potential changes.

Topic Question 5:
As mentioned in number 1 some of the questions regarding wolf behavior and success factors seems to be missing from the document so it makes it hard to answer. For example, would the wolves stay given changing climactic conditions or even the moose for that matter. Will this all be for naught if the area starts to warm significantly?

Comments: Thank you for the work that you do! I am sorry I have such little knowledge of the island ecology. I do know that there are several organizations that offer creative solutions to wildlife issues and I hope that you might seek them out. I am tired of the old solutions to problems that U.S. Fish and Wildlife offers at times. I would like to see some collaboration of all the various wildlife groups to see some "brilliant" ideas and collaboration develop. I visited the Island a very long time ago and felt somewhat threatened by the large moose on the trail. I had a young female chase me on the beach without provocation.

I mention this because I am wondering if the visitors need to know more about the dynamics of the wildlife and hikers/campers. The great beauty of the island are its moose and wolf population and its wonderful wilderness setting. Yet I felt rather uneducated as a visitor and would have liked to know what to expect and how to have proper wildlife watching etiquette.

Aug,29,2015 20:40:26
Correspondence Type: Web Form

Correspondence: I commend the National Park Service (NPS) for initiation of a Moose-Wolf-Vegetation Management Plan and Environmental Impact Statement (plan/EIS) for Isle Royale National Park. As noted in the plan/EIS public scoping newsletter, due to the extremely low wolf population, NPS needs a plan to address the impacts from "the potential extirpation of wolves."

The mission of the NPS is to "preserve unimpaired the natural and cultural resources and values of the National Park System for the enjoyment, education,

and inspiration of this and future generations." Wolves are very important cultural and educational resources to Isle Royale National Park. Moreover, fully functioning wolf predation is a vitally important natural resource for Isle Royale. In the parlance of modern ecological science, wolf predation is vital to the ecosystem health of Isle Royale.

As the NPS considers the range of management alternatives for moose, wolves, and vegetation at Isle Royale, I request that NPS complete the plan/EIS process and release a Record of Decision as quickly as practicable to best preserve all tools for managing wolf and moose populations, including augmentation to the existing wolf population. In addition, I urge strong consideration of preliminary draft management Alternative Concept C, as laid out in the public scoping newsletter, which would "maintain populations of moose and wolves on the island, which could include wolf reintroduction or augmentation."

While the near certain local extinction of wolves is important, the presence of unimpaired wolf predation is no less important. Wolf predation was essentially lost several years ago. My concern is not that we have a problem that is about to begin, but we have problem that began a few years ago. It is for this reason, that we urge the NPS to act as quickly as is reasonably possible.

I was encouraged by the public scoping meetings and the start of the comment period this summer following repeated calls for such a process. However, I echo many experts and members of the public by expressing concern over the low chance of survival for the three remaining wolves at Isle Royale, and the potential changes to the moose population and vegetative cover as a consequence. Wolves are recognized in official NPS planning documents as playing an important role in the Isle Royale ecosystem. As noted in the public scoping newsletter,

"[t]he moose-wolf-vegetation food web is tightly coupled. Given that the wolf population at Isle Royale is very low and their long-term survival on the island is in question, the moose population is likely to increase in the short term (5-10 years), which could result in impacts to vegetation and forest cover because of over-browsing."

In addition to the loss of an apex predator to keep moose numbers in check, an extirpation of wolves at Isle Royale will result in the loss of incredibly valuable research opportunities. Over the last six decades, ecological studies of wolves and moose on Isle Royale have produced significant scientific discoveries on predator/prey relationships and other key topics. It is critical that NPS implement a management plan for Isle Royale that maintains predation.

Wolf predation at Isle Royale has been impaired by climate change. Disease, brought by humans, has also had its impacts. Maintaining predation at this point is no more than to mitigate impairment that was inadvertently caused by humans.

Alternative Concept C, which would maintain both wolf and moose species on the island, deserves strong consideration in an effort to preserve and improve genetic diversity of wolves in North America, protect the unique backcountry values found at Isle Royale National Park, and continue important scientific research.

I realize that non-intervention is an important strategy for leaving natural resources unimpaired. However, non-intervention policies acknowledge that humans sometimes inadvertently impair a park's natural resource. In those cases, it is appropriate to intervene, as a means of mitigating the impairment. I have confidence that this management alternative can incorporate priorities identified by a variety of stakeholders in the public plan/EIS process and be developed in accordance with the National Environmental Policy Act. Finally, I believe this alternative can be implemented in a way that adheres to and honors the Wilderness Act of 1964 given that ninety-nine percent of the land area of Isle Royale is designated as wilderness.

Correspondence Type:

Web Form

Correspondence: Topic Question 1:

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only.

Topic Question 2:

The major issues to be considered when evaluating the ecosystem on Isle Royale include appropriate management of all animals and vegetation. This ecosystem needs to be put back into balance according to sound scientific principles. I would like the restoration of this system back to a healthy, natural state. Current research studies and data must be utilized to get the ecology back on track for this area.

Topic Question 3:

Culling moose or removing them from the island may not prove to be the best way to go, with regard to the moose population. I think it would be more effective and quicker to introduce more gray wolves (of the appropriate species, subspecies) to the area now. As far as the vegetation, replanting may have to be considered early on. All I know for sure is that something needs to be done to rectify this situation now, before the moose population goes into an irreversible collapse.

Topic Question 4:

I'm not sure what should be done in the management of this area with regard to changing climate.

Comments: Dear Superintendent Green,

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,

Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Thank you for considering my concerns.

Sincerely,

Correspondence: Dear Superintendent Green,

Isle Royale National Park is home to a renown community of wolves and moose. These two species have an important predator-prey relationship and are critical to the overall health of the island ecosystem.

But with only three wolves left on the island, the character of Isle Royale is in jeopardy.

If wolves die off, the island's moose population will continue to increase, consuming the native vegetation and eventually running out of food, disrupting the natural balance of the island. Please don't let that happen.

I care about the wildlife at our national parks, including the wolves and moose at Isle Royale. Right now there are only three wolves left at the park- -the lowest number of wolves in more than 50 years- -threatening the overall ecosystem health of this iconic national park.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If you bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

This option is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the biggest benefit to the island's wildlife and ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

Correspondence: Topic Question 1:

Just back from 8 days on Isle Royale and having spoken with numerous hikers, park officials and researchers the best path forward IMO is the re entry of a small pack of wolves in the Spring of the year to enable them to acclimatize themselves to the island and perhaps choose to stay.

Topic Question 2:
the most pressing issues is the balance of predator to prey which the experts told me is 30 to 1....right now its about 600 to 1 which is unsustainable.

Topic Question 3:
Give nature a chance to recover from the impact of dog virus on the wolves and continue to keep human impact at a minimum.

Topic Question 4:
Immediate action to increase the wolf population....and continue until the 30 to 1 balance is reached.

Topic Question 5:
there is only one alternative that I see will yield the correct outcome...humans caused the imbalance, now we need to repeat the damage.

Topic Question 6:
thank you for keeping me informed of your actions.
Isle Royale is an incredible resource and experimental laboratory for prey/ predator interaction...please don't hesitate on this

Correspondence: Topic Question 1:

The alternatives do not include a combination of reducing the moose population and reintroducing wolves more than once. Alternative D is the closest, but once may not be enough because the wolf population is so vulnerable. Alternative "D-Plus" should include augmenting and monitoring the wolf population to the point where it is sustainable for the long term.

Topic Question 2:

The overpopulation of moose is destroying a lot of the vegetation. Protection of vegetation needs to be given a higher priority in the balancing process.

Topic Question 3:

The wilderness status is unfortunately being used as an excuse for lack of responsible management. The notion that humans should just let "nature take its course" is ridiculous in the context of an ecosystem that has been subject to centuries of human alteration. Human activity on the island included mining, logging, agriculture, fishing, hunting, and transporting animals on and off the island. Much of the current imbalance in the moose and wolf population was the result of things that were set in motion or exacerbated by human actions. As a result, it should be our responsibility to intervene to help correct that imbalance,

Topic Question 4:

Climate change means that the winter ice bridge is going to be less predictable and reliable in the future. We cannot assume or rely on the prediction that the wolves will just wander over to the island on their own from the mainland when there is ice.

Topic Question 5:

There is too much emphasis on reintroduction of wolves only "one time," rather than monitoring and adopting the goal of making the wolf population become sustainable.

Topic Question 6:

Wilderness status should not be used as a rationale for hostility to the presence of humans generally.

Comments: I became aware of this issue as a result of a recent visit to Isle Royale.

Correspondence: Topic Question 2:

Isle Royale is one location where wolves do not impact human activity such as livestock and are an ideal location where they can be reintroduced. In addition they will help manage the moose population.

Topic Question 3:

Even "wilderness" is not free from human impacts since air pollution and global warming impact everywhere and cannot be stopped at the border of the park. Humans are now a part of nature and our influence has had an impact on the wolves decline. I believe the NPS should follow alternative B and bring additional wolves to Isle Royale to boost their population.

Topic Question 4:

Minimal management should be employed with the exception of a one-time reintroduction of wolves. Alternative "B"

Topic Question 5:

Increasing the wolf population will restore balance to the system and should make other intervention unnecessary.

Topic Question 6:

Thank you for this opportunity to provide comments as a concerned citizen. I recently visited Isle Royal and kayaked around the outer edge. While I was there I asked nearly everyone I met what they thought about the wolves and moose and what should be done. After gathering many different thoughts and positions, I have come to the conclusion that maintaining a population of wolves on the island along with the moose is the best alternative. Please consider extending the comment period to allow visitors from the whole summer season to learn about the issues and offer their comments as well. Until I had visited the island, I didn't fully understand the issue and wasn't able to formulate an opinion until now.

Correspondence: Topic Question 6:

Dear Superintendent Green,

We are pleased that the National Park Service is finally considering action to address the alarming, long-term decline of the wolf population on Isle Royale National Park and the implications of that decline and likely extirpation on elk, vegetation, the integrity of a renowned, decades-long scientific study, and on management and meaning of designated Wilderness. The Center for Biological Diversity is a national, 501(c)(3) organization dedicated to protecting and restoring endangered native plants and wildlife and their ecosystems. Many of our 900,000 members and supporters have visited Isle Royale National Park, in part to experience an ecosystem shaped by trophic cascades induced by wolves and affecting vegetation. Indeed, Isle Royale and its storied researchers have come to shape the scientific understanding of how ecosystems function.

The Center for Biological Diversity supports Alternative Concept C - reintroduction or augmentation of the wolf population as needed to maintain both wolves and moose. However, we believe that your proposed timeline to complete the NEPA process - into 2017 - will come too late to incorporate the existing pedigree of Isle Royale wolves as well as their knowledge of the landscape. We also believe that delaying the translocation and release of new wolves that could diversify the present population's depauperate gene pool until after the present wolves are dead unnecessarily deprives those justly-famous wolves of the basic sodality that is integral to wolf nature. It is inhumane.

We urge you to expedite this NEPA process greatly and begin to translocate wolves into Isle Royale during this Fall or Winter. Make up for the dilatory years by quickly developing an environmental assessment for a one-time translocation of several wolves into Isle Royale to perpetuate the genetics and lupine culture of the naturally-occurring wolves on the island. Then, after the EA is completed and several wolves have been released in 2015 or early 2016, finish the more thorough EIS. But first act on the National Park Service's existing authority in cooperation with your sister agency Fish and Wildlife Service, to quickly augment the present, dying wolf population - the population equivalent of emergency veterinary care for a single wolf, and not requiring an EIS.

The National Park Service has authority to act quickly under National Park Service Management Policies of 2006 and Isle Royale's 1998 Final General Management Plan Environmental Impact Statement. The 2006 policies provide that native species extirpated by human action shall be restored and state specifically: "The National Park Service will preserve and protect the natural resources, processes, systems, and values of units of the national park system in an unimpaired condition to perpetuate their inherent integrity and to provide present and future generations with the opportunity to enjoy them." Wolf predation and the trophic cascades that they precipitate are natural processes that have been extensively studied and enjoyed on Isle Royale, and should be preserved and protected. The 2006 policies further state: "The Service will not intervene in natural biological or physical processes, except . . . to restore natural ecosystem functioning that has been disrupted by past or ongoing human activities" (p. 37). And: "The Service will reestablish natural functions and processes in parks. . . Efforts may include . . . restoration of native plants and animals" (p. 39). Moreover, from the same 2006 policy: "Management is necessary . . . because a population occurs in an unnaturally high or low concentration as a result of human influences." Anthropogenic global warming is the primary cause of the infrequency of natural wolf migration to Isle Royale, because the lake no longer freezes very often. Management is necessary in this instance.

Isle Royale National Park's 1998 Final General Management Plan Environmental Impact Statement identifies the park's purpose as: "Preserve and protect the park's cultural and natural resources and ecological processes," and to "Provide opportunities for scientific study of ecosystem components and processes . . ." the EIS also acknowledges that "Isle Royale is world-renowned for its long-term wolf/moose predator/prey study."

Given these authorities, no more than an environmental assessment is necessary for an initial, expedited translocation of wolves to the park to save and rejuvenate the current park wolf population, and preserve the balsam fir trees and rare native plants that are threatened by unnaturally abundant moose. Wilderness designation is not an obstacle to translocations of wolves. Indeed, endangered Mexican gray wolves have been translocated into the nation's first designated wilderness area - the Gila Wilderness. Temporary pens have been constructed in the Gila Wilderness for wolf releases, pursuant to an environmental assessment. Translocating wolves into Isle Royale would not impinge on wilderness.

Thank you for your consideration.

Correspondence: Dear Secretary and Director,

I first became interested in Moose on Isle Royale after reading an article about mass starvation in the Ontonagon Herald. In 1997/1998 the moose herd went from about 2500 animals to 8 or 9 hundred. What a waste of a great resource. I wrote then Sec of Int. Bruce Babbit and Mr. Rolf Peterson about my disappointment and suggested a managed hunt to be less cruel and more logical.

Mr. Peterson informed me that Isle Royale was managed under a thing called "Natural Regulation" and that human intervention was not allowed. Their study was about predator/prey between wolf and moose and extinction was a possibility.

Soon the park was up for a management plan renewal and public meetings were held for input. I went to a meeting a submitted my ideas. I met many others with the same opinions. "Natural regulation" was reinstated for 20 more years and Mr. Peterson described hunters as a small group of people wanting to use the park for their own special interests.

A few years later the moose population rose again and Mr. Peterson proposed a controlled burn to promote Balsam growth, food for the moose to thwart starvation. I objected to the burn because if your going to let nature take it's course without human intervention for scientific study, a controlled burn was hipicritical.

Now there are only 3 wolves left and Mr. Peterson wants to introduce more wolves and again I say this is hipicritical.

In the late 1800's The Boone and Crockett Club lobbied for protection and enhancement of animal populations and wilderness habitat. The establishment of the National Park System, National Forrest System, and National Wildlife Refuge System were a priority. Polititions like Henry Cabot Lodge Stuart Udall, Military leaders William Tecumseh Sherman, General James Doolittle, naturalists and business leaders Charles Sheldon, Aldo Leopold, and Laurance Rockefeller were some of these Boone and Crockett members.

From 1901 to 1909 President Theodore Roosevelt created the foundations for these systems. His sons Archibald and Kermit were also Boone and Crockett members.

Today there are millions of hunters in America. They are as natural to the Earth as any flora or fauna. We deserve to be part of the management. 10 day a year is not too much to ask to help regulate a more balanced moose population in Isle Royale.

Correspondence: On behalf of the Great Lakes Regional Center of the National Wildlife Federation I submit the following comments regarding the proposed Isle Royale Moose-Wolf-Vegetation/EIS and proposed alternatives. The National Wildlife Federation (NWF) is the nations largest conservation organization, representing 4 million members and supporters. NWF has been actively engaged in community and school-based education, litigation, and policy discussions surrounding wolf recovery and management on a national, regional, and state scale since they were first listed for protection under the Endangered Species Act in 1973. Oddly enough, at the time of their listing, Great Lakes wolves only existed in the far reaches of northern Minnesota and on Isle Royale, a population the park service may allow to become extinct under one or more of the proposed alternatives we comment on here.

While no alternative provides a clear and direct path to producing a sustainable wilderness ecosystem on Isle Royale National Park, NWF believes that Alternative Concept B, with some modification, to be the best of the given alternatives. As will be mentioned later, it is naive to believe that future modifications/introductions will not be needed to sustain IRNP wolf populations. Climate change and island dynamics are likely to have unforeseen effects on wolf and moose populations. In determining that wolf reintroduction (or genetic rescue) is the proper course, the NPS must also build in guidelines for future action, should IRNP wolf populations again be imperiled. Such guidelines set forth a standardized system by which action can occur and offer clarity to both NPS staff and the conservation community about what actions will be taken and when. In essence, NPS must allow for future action to occur in a more expedient and clear manner.

In reviewing and commenting on the proposed alternatives, the park service has asked that we bear specific questions in mind. While NWF wont be addressing each of these in sequence, they will serve to guide my comments to the proposed alternatives below. The questions include:

1. What other alternatives, alternative elements, or management tools should be considered?
2. What issues should be considered when evaluating future management of moose, wolves, and vegetation at Isle Royale?
3. What type and intensity of management should the NPS consider given that approximately 99% of the land area of Isle Royale National Park is designated wilderness?
4. What type and intensity of management should the NPS consider in the face of a changing climate?
5. What do you like and dislike about the preliminary alternatives?

In 1974, Ninety-nine percent of the land area of Isle Royale Nation Park (IRNP) was designated as wilderness under the Wilderness Act of 1964.¹ Seen as one of the most rigid natural resource laws in existence, the Wilderness Act established a strong presumption that hands-off management was the best choice for these pristine natural areas and such passive management style would allow for the maintenance and restoration of a natural balance.² It is this hands-off approach that Alternative Concept A (no action alternative) follows.

Alternative Concept A (no action alternative)

In proffering this alternative, the park service is basically offering the status quo. No active management of wolves, moose, or the islands vegetation. A careful read of the 1964 Wilderness Act and subsequent amendments would note that the act does not demand this alternative as some groups are advocating.

While certain actions are prohibited by the act (i.e. permanent road construction, actions advancing a commercial interest) the law does leave open considerable leeway for administrators and managers to manipulate the landscape to restore or protect existing ecosystems and their associated biodiversity.³

Isle Royale NP is an iconic landscape, it is the site of the longest continuous study of a predator-prey system in the world (running since 1958) as well as a much loved destination for thousands of adventure seekers and families every year. In addition to being a living laboratory for world-renowned research, it is also a classroom, an opportunity for people from around the country to experience wolves, moose, and their environment up close.

It is important to bear in mind that IRNP is also an island, subject to the complications and dynamics typical of islands and the flora and fauna that inhabit them. Immigration and emigration of species is difficult and unpredictable, especially in the absence of reliable ice-bridges between the island and mainland Canada (lessened due to the effects of man-made climate change). In the time it has taken IRNP administrators to begin the plan review process, the islands wolves have all but disappeared, with only a handful remaining on the island. Researchers have documented a correlating spike in moose populations on the island in the absence of downward predatory pressures on the populations by wolves. In the absence of wolves, moose populations may rise to the point where severe ecological damage will occur to the islands flora. In the absence of wolves, moose will likely experience a boom and bust population cycle, causing immense harm to the natural landscape of the island in the boom years and potential public image issues with hikers and families exposed to innumerable starving moose in the bust years. This dynamic will surely hurt the image of the park and undercut its function as an ambassador to the country for wilderness as well as the charismatic megafauna it supports.

Alternatives B (introduce wolves once), C (maintain both species), and D (introduce wolves once and reduce the moose population)

I realize that alternatives B, C, and D differ on a number of points, but we have chosen to respond to them in concert as they all address one of the most controversial provisions of the proposed IRNP management plan; active management and reintroduction of Isle Royale wolves. Whether we are considering augmentation (bringing new wolves to the IRNP to add to the existing population) or reintroduction after the last of the wolves currently in IRNP disappear is somewhat academic. Only a few wolves exist on the island today. Any rescue of wolf populations will most likely include a full reintroduction effort.

There have been a number of well-documented wolf reintroductions into wilderness areas. In 1998, Mexican gray wolves were reintroduced into New Mexicos Blue Range Wilderness Area.⁵ Similar reintroduction efforts brought thirty-six gray wolves to Idahos Frank Church River of No Return Wilderness Area in 1995 and 1996.⁶ While not necessarily precedent for the current discussion, it is illustrative to note that the US Forest Service has provided internal guidance to its administrators on the topic of biodiversity within wilderness areas and wildlife reintroductions into such areas. These policies allow for reintroductions into wilderness areas for species extirpated by human influenced events.

Climate change, a human influenced event, has the ability to forever change IRNP and the species living there. Reduced ice bridges allowing for emigration and immigration between IRNP and mainland Canada has contributed to a bottleneck in the genetic diversity (likely reducing their fitness and reproduction potential). As temperatures rise, the islands moose populations also face increasing stress, unable to shed massive winter ticks and parasite loads and having difficulty regulating their body temperature. As climate change continues to affect IRNP, maintaining biodiversity and an intact predator-prey relationship between moose and wolves will be of vital importance.

Some will argue the wolves of Isle Royale are not native to the island, that they were not part of the fossil record of the island, so should not fall under the exceptions to the Wilderness Act allowing for reintroductions to protect biodiversity. Although not found in the fossil record of IRNP, the wolves of Isle Royale should be considered a naturally occurring population that, by all accounts have existed on the island for over 70 years.⁹ Although a few wolves were experimentally relocated to the island, no research or other data conclusively points to those individuals ever reproducing (two of the four wolves didn't survive the first year) or providing the basis for the current wolf population. It is likely that wolves would have occurred on the island sooner had it not been for high levels of persecution and harvests on the mainland surrounding the island (possible sources for immigration to the island) keeping wolf densities at very low levels. Absent genetic data to the contrary, we would urge park administrators to view wolves as native to the island, especially considering they are common to all lands surrounding the park. Had it not been for human intervention (direct and indirect) wolves may well have been established on the island for longer than the current 70 years.

While the common thread between Alternatives B, C, and D include active management of wolves, they differ in their prescribed treatment for moose populations. Moose were first documented on the island in the early 1900s, long before wolves were firmly established on the island. While research has identified a strong predator-prey relationship between wolf and moose populations, the boom and bust cycle of moose populations described earlier has occurred both in the presence and in the absence of wolves on the island. However, researchers believe the magnitude of the fluctuation between boom and bust years is likely to be much higher in the absence of wolves.

While it can be demonstrated that moose can have a negative impact on the islands vegetation even in the presence of wolves, a healthy, sustainable wolf population within IRNP should mitigate much of the potential damage as well as serve to spread the browse pressure out over larger areas. Under the minimum requirement analysis, parks must select a management method or tool that will have the least negative impact to wilderness (ID directors order #41). It could be argued that active management needs for moose populations on IRNP have been effectively met by healthy wolf populations on the island since the 1950s. As such, increasing managements profile on the island or use of tools outside the hands off approach previously applied to moose populations would not be merited under a minimum requirement analysis.

Minimum Requirement Analysis

In its notice of intent to prepare a moose-wolf-vegetation management plan, NPS notes that 99% of the IRNP has been designated as wilderness, therefore requiring the drafting of a minimum requirement analysis (MRA, under the Wilderness Act of 1964). Parks are required to draft MRAs to document a determination of whether a proposed action including a prohibited use under the Wilderness Act of 1964 is necessary to meet the minimum requirements for the administration of the area for the purpose of wilderness (16 U.S.C. 1133(c)). In addition to the above statutory requirements, park guidance also requires all actions within wilderness that could potentially affect wilderness character to undergo a MRA. While NWF would argue that the proposed actions are not prohibited under the wilderness act, the decision whether or not (and to what extent) to manage wolves, moose, and the islands vegetation certainly falls under this guidance.

In completing the analysis, NPS must first determine if the proposed action is necessary for the administration of the wilderness area, to realize the purpose of wilderness. While wolves are a part of the natural landscape of IRNP and interwoven into its wilderness character, mans impact on the landscape and environment have greatly impacted their survival on the island. Wolf populations in IRNP have fallen due to, and continue to be imperiled by human-caused disease outbreaks (parvovirus), climate change, and lasting scars from resource extraction, including abandoned mine pits. The purpose of a wilderness designation as spelled out in the 1964 act is to include the protection of lands where the earth and its community of life are untrammeled by man, with such protection to preserve its natural conditions to the extent it generally appears to have been affected primarily by the forces of nature, with the imprint of man's work substantially unnoticeable. (16 U.S.C. 1131) The maintenance of the islands biodiversity and ensuring the sustainability of moose and wolf populations surely falls within the purpose of wilderness. Absent NPS institution of active management of the islands populations, mans imprint will be shown for all to see as a root cause for absent predators and a need for far more intrusive and intense moose population management to keep IRNPs megafauna and flora from complete collapse.

Once the determination of necessity is made, NPS must then determine how to accomplish the desired outcome with the least negative impact to wilderness.¹⁰ In determining which alternative will cause the least negative impact, NWF would advise that NPS not only look at the actions in the abstract, but the cumulative effect of the actions as well as the number of instances and the span of time they are likely to be needed. Actions aimed at limiting the potential for over-browsing on IRNP by reducing the moose population via active management or culling may be successful in the short-term, but will likely require annual action to effectively maintain downward pressure on the population. Alternatively, Concept B (introduce wolves once) would be a preferred choice, offering the potential for long-term population control of IRNP moose with less active management. In essence it will have the least negative impact while preserving IRNPs wilderness quality.

Tools for Managing Moose Density

With the exception of Alternatives A, all the preliminary draft alternative concepts contain some level of moose management. Alternative B calls for no moose management, although the preliminary draft notes that the tools under consideration for moose management include wolf population augmentation and reintroduction, both available under Alternative B.

Alternatives C, D, E, and F all make some manner of direct moose management available to NPS managers. According to the preliminary draft provided, tools under consideration for managing moose density (and the associated damage on IRNP vegetation) include, wolf augmentation, wolf reintroduction, translocation of live moose, and culling of moose. The NPS also makes clear that the use of motorized vehicles may be used to effectively carry out any moose management plan.

As noted earlier, NWFs preferred action would be under Alternative Concept B, allowing the predator-prey relationship between moose and wolves to continue and requiring no active moose management by park personnel. However, if NPS determines that active management of moose is necessary through this planning process, NWF requests that NPS review the feasibility of a management hunt to reduce and manage IRNP moose populations. A lottery based system could be developed to cheaply and effectively and would be more palatable to the public than the use of sharpshooters or agencies such as USDA-Wildlife Services. Corollaries can be found in the use of management hunts in Michigans state parks and other preserves that do not allow traditional hunting outside very specific, lottery-based hunts to control burgeoning deer populations and their devastating effects on park vegetation. In addition to being more palatable to the public, such a program could be a new revenue stream for the park as well as continue to build new constituencies

pushing for long-term sustainability of the parks resources.

With the exception of augmenting or reintroducing (dependent on timing of when action may occur) wolf populations, each of the tools described will likely require annual or every-other-year manipulations. Under a less is more or hands-off approach to managing wilderness, options considering wolf population augmentation of some sort would be better advised.

Conclusion

In conclusion, while no alternative provided a clear and direct path to producing a sustainable wilderness ecosystem on Isle Royale National Park, the National Wildlife Federation believes that

Alternative Concept B, with some modification, to be the best of the given alternatives. In determining that wolf reintroduction (or genetic rescue via augmentation) is the proper course, the NPS must also build in guidelines for future action, should IRNP wolf populations again be imperiled. Such guidelines set forth a standardized system by which action can occur and offer clarity to both NPS staff and the conservation community about what actions will be taken and when. The National Park Service must allow for future action to occur in a more expedient and clear manner.

Correspondence Type: Park Form

Correspondence: What other alternatives, alternative elements, or management tools should be considered?

Keep the wolf gene pool healthy by periodically (over the long term) introducing new reproductive wolves to the park.

What issues should be considered when evaluating future management of moose, wolves, and vegetation at Isle Royale?

Need \$ for continual monitoring of the balance among moose, wolves, and other parts of the parks ecosystem.

What type and intensity of management should the NPS consider give that approximately 99% of the land area of Isle Royale National Park is designated wilderness?

Isle Royale is an island which takes greater attention to management of flora and fauna.

What type and intensity of management should the NPS consider in the face of a changing climate?

All management decisions should take into consideration climate change predictions.

What do you like and dislike about preliminary alternatives?

I like the following alternative: introduce new genes into the wolf population as soon as possible. Leave the new wolves on the island to continue breeding over generations.

Correspondence ID: 2539
Moose-Wolf-Vegetation Management Plan/EIS

Outside Organization:

Affiliation:

Received: Aug,08,2015 00:00:00

Correspondence Type: Park Form

Correspondence: What other alternatives, alternative elements, or management tools should be considered?

I dont feel that any other alternatives need to be considered. The need to replenish the wolf population has been present for years and it is frustrating that the slow machinery if the process is taking this long. Scientists have been studying the population and have already determined that repopulation of wolves is necessary for managing wolf, moose, and vegetation. Just do it!

What issues should be considered when evaluating future management of moose, wolves, and vegetation at Isle Royale?

Wolves and moose are the most important visitor draws to Isle Royale. My own familys experience was planned with the anticipation that these animals were possible to sight (and indeed our moose sighting was life changing)-it is critical that these animal populations be kept healthy for continued visitors. I feel that the vegetation is only important as it contributes to a health ecosystem, not a draw itself.

What type and intensity of management should the NPS consider give that approximately 99% of the land area of Isle Royale National Park is designated wilderness?

I dont think the wilderness designation significantly changes management. Isle Royale is touched and affected daily by human hands, regardless of classification. This is like any national park, I feel we have a responsibility to counteract the deleterious effects of humans on nature. I would like to see the wolf population rehabilitated with new wolves as has been done at Yellowstone and other parks. Ample wolves will prevent moose population overgrowth and landscape destruction. Wolves have been successfully re-introduced at other parks and Isle Royale is an absolutely ideal habitat. We have driven these animals to endangerment all over the globe- here is a proving group to allow them to flourish again without obstruction and without being a danger to farmers/ livestock or any other fears people living near wolves in non-wilderness might have. It would be a shame to waste the great opportunity here for wolves.

What do you like and dislike about preliminary alternatives?

I dislike doing nothing because it is a lazy and misplaced strategy considering all we have done to destroy wildlife on the planet. I am strongly against culling moose- such a rare and majestic creature deserves a natural death and couple support predator population. So few people even see moose on visits to the island, this would even further reduce the draw to visit.

My vote: Repopulate wolves and support healthy moose and ecosystem.

Correspondence Type: Park Form

Correspondence: What other alternatives, alternative elements, or management tools should be considered?

I think alternative B is the best option for the island. Introducing a pack of wolves once is not near as invasive as managing the moose population. Hunting moose via human intervention is disrupting the wilderness must more than reintroducing a pack of wolves.

What issues should be considered when evaluating future management of moose, wolves, and vegetation at Isle Royale?

I think the issue of human intervention is the biggest concern- how much is too much? We have the resources to save the island from the wrath of over-eating by the moose, and I think its fair to use those means within reason.

What type and intensity of management should the NPS consider give that approximately 99% of the land area of Isle Royale National Park is designated wilderness?

The intensity of management should corralate with what is happening to the species and how drastic the measures must be to encourage a stable and healthy relationship between both populations. With the current situation, I think it is necessary to have some management, though drastic measures such as reducing the moose populations are not yet necessary.

What type and intensity of management should the NPS consider in the face of a changing climate?

I dont think there is much the NPS can do in the events of the changing climates, but I think if there is/are things to do, it is fair to try to conserve and preserve the island.

What do you like and dislike about preliminary alternatives?

I like the idea of reintroducing wolves, but letting the current animals live out their lives. I do not like plans D-F; where managing the moose population means bring in huge human interactions of hunting.

Correspondence Type: Park Form

Correspondence: What other alternatives, alternative elements, or management tools should be considered?

The Park Service should re-introduce a population of Canadian wolves to the island and track the wolf and moose populations to attempt to achieve a balance.

What issues should be considered when evaluating future management of moose, wolves, and vegetation at Isle Royale?

Issues: Keep moose population in check to preserve island vegetation and moose health. Protect the identity of the park as a wildness where visitors may encounter wild animals. Strengthen wolf population so they dont die off.

What type and intensity of management should the NPS consider give that approximately 99% of the land area of Isle Royale National Park is designated wilderness?

Radio tracking devices for wolves, helicopters okay on a one time basis to introduce wolves but discouraged on a continuing basis.

What type and intensity of management should the NPS consider in the face of a changing climate?

Listen to the scientists. They know more about it than I do. If the island changes, it should be allowed to- so long as a balance is maintained.

What do you like and dislike about preliminary alternatives?

I like that they speak of balance and introducing/reinforcing the wolf population.

Correspondence ID: 2543

Correspondence Type: Park Form

Correspondence: What other alternatives, alternative elements, or management tools should be considered?

The island is lacking in predators. Black bear are natural predators of moose, esp. calves. It would not be unreasonable re-introduce wolves as needed to maintain their genetic diversity and black bear introduction should be considered. Of course, campers, hikers, and human related food sources must be carefully controlled. Food must be hoisted out of reach of bears- steel poles such as those used in Glacier NP are adviseable at back country or near campsites. problem bears can be culled also if they become repeat offenders.

What issues should be considered when evaluating future management of moose, wolves, and vegetation at Isle Royale?

-cost must be considered

-sometimes some (quite a lot) of animals must be killed or culled to accomplish a goal of managing a confined population

What type and intensity of management should the NPS consider give that approximately 99% of the land area of Isle Royale National Park is designated wilderness?

Sometimes in order to accomplish a mgmt.. goal some of the wilderness legs may need to set aside for a time. If not, then you may just be fooling around.

What type and intensity of management should the NPS consider in the face of a changing climate?

This is difficult to predict as we dont know how fast or how much climate will warm.

What do you like and dislike about preliminary alternatives?

-relocating moose likely is far too costly and inefficient. Helicopters are prohibitively expensive.

-hunting (to reduce moose population), as is fishing, a legitimate and appropriate activity as it is to in the BWCAW, regardless of what opinions some people have.

I suggest black bear introduction to IR as a natural alternative means of adjusting (reducing) the moose population.

Correspondence: I am a sixteen time visitor to Isle Royale National Park. The most recent visit was in June of this year. I am ready to return soon. Isle Royale is my favorite park because it is a unique archipelago with a special large predator-prey combination that maintains the forest ecosystem, and the topography of the islands rates superb.

Following the moose-wolf population trend on the island has been a long term interest of mine.

A basic ecology tenant regarding predator-prey relations is as follows: When a prey population flourishes, the predator population will rise commensurately until the prey population exceeds the capacity of the ecosystem to support it. The prey population then declines, followed by a decline of the predator population. The rise and fall happens naturally. Both populations normally avoid extinction. If there is a force acting on a population, like a severe genetic bottleneck (such as what exists in the wolves of Isle Royale), extinction is likely.

The mini science lesson in the previous paragraph is one I covered for nearly thirty five years with my high school science students. Nearly every high school biology textbook in the country devotes coverage of this basic ecology principle. To ignore this principle at Isle Royale National Park is inviting disaster. If a wolf rescue is not pursued, the moose population will increase exponentially followed by a collapse because their winter food, Balsam Fir, will become scarce.

The Park Service should follow the science and pursue an immediate wolf replacement effort, bringing the most genetically diverse population of wolves to the island possible. The action must be swift. The two or three wolves currently in the park are likely to perish soon. The third wolf in line on the wintertime photo taken months ago may have already died.

By being proactive on this issue and bringing rescue wolves to the island sooner rather than later, you will avoid a newspaper headline that reads "Thousands of Island Moose Perish of Starvation in the Absence of Wolves".

In the sixteen trips I have made to the island, I have only heard wolves once and spotted tracks several times. That doesn't matter to me. What does matter is the wolves are killing moose, keeping the vegetation in balance.

Correspondence Type: Letter

Correspondence: Dear Mr. Jarvis. Mr. Sholly, and Ms. Green:

Please accept this letter in response to the proposed Moose-Wolf-Vegetation Management Plan/EIS for Isle Royale National Park. I am somewhat familiar with the issues involved in this proposed management plan as I have followed The Wolves and Moose of Isle Royale study and website maintained by Dr. Rolf Peterson of Michigan Technological University. I have been interested in the wolf population in the United States and efforts to control it, reintroduce

it, and manage it for many years, and I used to think of Isle Royale as a safe haven for a stable wolf population. Not anymore.

My reaction to the issues that have arisen on Isle Royale regarding the diminishing wolf population, the increasing moose population, and the effects of both on the vegetation of Isle Royale is WHERE HAVE YOU BEEN? These issues have been known for some time, and it seems that the position of the National Park Service ("NPS") was to do nothing- maybe it was bureaucratic inaction or maybe it was deliberate non-action, but, whatever it was, the Isle Royale wild animal population has and will suffer more due to the inaction. And by doing NOTHING, the NPS has greatly affected what could have been done to help the island successfully recuperate from the imbalance that has developed between the wolf and moose/predator and prey relationship. And it will get worse before it gets better, no matter what plan of action is chosen.

Considering that there are 2-3 wolves left on Isle Royale and 1,200 - 1,500 moose, it is very clear that action should be taken RIGHT NOW, and not in 2017 and after, as the proposed timetable for decision-making contemplates. The timetable is actually insulting, considering that the NPS must know that the 2-3 vulnerable wolves left on the island probably will not survive until 2017 and thereafter, and the moose population will simply continue to multiply, badly affecting the island's vegetative health.

If the timetable cannot be greatly shortened, as I believe both US senators, Senator Debbie Stabenow and Senator Gary Peters, from Michigan have requested, perhaps temporary emergency action can take place to begin to stabilize what has been and is happening and will continue to happen that worsens conditions on the island. It cannot be that difficult or catastrophic to introduce 2-3 wolves onto the island, especially considering that there is a healthy population in the Upper Peninsula of Michigan due to successful reintroduction, to shore up the gene pool of the existing wolves, if that is even possible now, while the management plan is ploddingly formulated.

Furthermore, I think everything possible should be done RIGHT NOW to allow the 50-year study of Isle Royale's predator-prey relationship between wolves and moose to continue. It shows wanton disregard - maybe disrespect - to have known about the long-standing and greatly respected Michigan Tech study, as NPS surely must, and to have allowed the situation on Isle Royale to reach its current condition. I believe that temporary emergency action and/or permanent action that will allow for "genetic rescue" of the Isle Royale wolf population should take place IMMEDIATELY, so the study may continue its course for many more years, as it should.

My reaction to any proposal to reduce the overpopulation of moose ("culling of moose") on Isle Royale by use of "mechanized equipment," such as helicopters, is that that course of action is UNACCEPTABLE. I believe that this means hunters will fly around in helicopters and shoot moose from the air. ABSOLUTELY NOT. Find a way to get natural predators onto the island before this is necessary. It is so frustrating to think that NPS knew what was going to happen on the island as the wolves died off, did nothing, and NOW suggests that it may be necessary to shoot moose from helicopters to reduce their numbers to an acceptable population for the island. Have the big game hunters decided they need some fun on little Isle Royale? I suppose if the only way to control the starvation of moose on the island is to "artificially" reduce their numbers, that not even a healthy pack of wolves introduced on the island could help the moose overpopulation now. I would rather the moose die very quickly and painlessly by gunshot rather than starve to death, but I would be so disappointed and disillusioned that NPS would allow the situation to reach that point. It is terrible neglect, and it is guilt by omission.

So, in a nutshell, and with respect, I encourage the NPS to MOVE IT! NOW! Get wolves introduced onto Isle Royale RIGHT NOW, through emergency temporary action while the long-term management plan/EIS is formulated. The long-term plan should maintain a healthy wolf-moose-vegetative relationship for a very long time, even if it means bringing in wolves, moose, and vegetation from the outside (but they must match as closely as possible the conditions on the island that will sustain a healthy relationship- if moose eat balsam fir, don't replant decimated forests with lodge pole pine, replant them with balsam fir). Isle Royale is in the middle of Lake Superior where almost nothing else lives except the underwater aquatic life, and there is no viable reason why the wolf-moose-vegetation world on Isle Royale cannot be reestablished and sustained and studied for decades and decades. There are no other human or "natural" populations that might be disturbed. If the anti-wolf faction is griping, they are utterly delusional and paranoid. If there are people who are voicing a desire to allow "nature to take its course" (which in this case would seem to result in a destroyed Isle Royale- no wolves, starving moose overpopulation, and devastated vegetation), I think that they should consider the fact that human behavior has and will greatly "redefine " what is considered " natural" on our planet. Almost nothing is "natural" anymore. Isle Royale is a tiny microcosm of the Earth's "natural" world. It can and should be protected, and proper human thought and action can and should make sure that this happens. In conjunction with its own expertise, the NPS should access and be grateful for the highly professional guidance and advice that can be accessed through the Wolf-Moose of Isle Royale study maintained by Dr. Rolf Peterson and his colleagues and students at Michigan Technological University.

ACT NOW TO SAVE ISLE ROYALE AND ITS WOLVES, ITS MOOSE, AND THE ISLAND'S VEGETATION. DO THE RIGHT THING.

Thanks very much for considering my views.

Correspondence: Attending the public meeting held in Houghton on July 27 regarding the moose, wolf, and vegetation management plan for Isle Royale helped me finalize my thoughts about the suggest alternative that I prefer. My preference is for Alternative Concept E, which would be to do no wolf reintroduction or augmentation and to reduce the moose population to protect vegetation that are favored moose foods from being overbrowsed to the point the island's carrying capacity for moose would be reduced.

Since the wolf population on the island last winter was down to three animals, the point at which wolves no longer have an impact on the moose population has already been reached. Even if wolf pups are added to the population this year and next year, the predators would not be abundant enough to have a significant impact on moose numbers. Data collected during the island's wolf/moose study during the 1980s and 1990s clearly shows that even when there were from 20 to more than 40 wolves in the park, that number of predators were not able to prevent the moose population from increasing to the point where moose destroyed their habitat and suffered major dieoff.

I think it would be important to start reducing the moose population by removing a predetermined number of animals on an annual basis through human intervention starting as soon as possible after the Record of Decision has been reached. According to the schedule presented at the Houghton meeting, that decision will be made by fall/winter of 2017. The moose population is currently estimated at 1,250 and is expected to increase annually with the low rate of

mortality the population is currently subject to.

Assuming it would be 2018 before any decision to reduce the moose population could be finalized, it is my opinion that it would be critical to begin reducing moose numbers that year to limit vegetation damage as much as possible. Sooner would be better. What impact that moose are currently having on island vegetation was not discussed at the meeting, but I suspect by 2018 more animals will be negatively impacting their food sources.

I believe maintaining a healthy moose population and sustainable moose habitat on the island through management of the moose population is beneficial for Isle Royale National Park, park visitors and all park wildlife, including moose. Allowing the moose population to continue to increase unchecked, as they have in the past, until they destroy their habitat and the moose population crashes will reduce the value of the park experience for many visitors in the future. In my opinion, park visitors want to see healthy moose and moose habitat on the island, not the skeletons of dead moose and overbrowsed trees and brush.

The best way to provide what I think is the preferred experience for the long term is culling some moose on an annual basis in the short term to balance the population with its habitat. By balance I mean lower the population to a point where moose are not consuming more food than is produced on an annual basis. Based on my conversation with Isle Royale's chief of natural resources, Paul Brown, at the Houghton meeting, the Park Service's definition of culling moose would only involve park personnel in the process and would exclude the public. A "hunt," according to Mr. Brown, would involve the public.

In my opinion, culling and hunting moose are synonymous. They certainly can be. Since the enabling legislation that created Isle Royale National Park prohibits hunting, however, I think it is important to be consistent in using the terms cull or culling when referring to management of Isle Royale moose. Since the moose on Isle Royale belong to the public and public input is an important part of the planning process, I think the public should also be involved in culling of moose as well and here's why.

By involving the public in culling moose, the process can generate revenue in two ways. Since a limited number of moose would be culled, members of the public who want to be involved in culling moose could be charged a nonrefundable application fee to apply for a culling permit. Those who are chosen to participate would then have to pay a higher fee for the permit. Perhaps two permits would be required to participate in culling moose by the public on Isle Royale, one issued by the park and another issued by the state Department of Natural Resources (DNR).

As mentioned by park superintendent Phyllis Green at the Houghton Meeting, partnering with the DNR on managing moose on Isle Royale is part of the process, which is an excellent idea.

Michigan's DNR already has a license or permit allocation system set up for issuing limited entry elk licenses. Since reducing the moose population is the main objective of any cull, most, if not all, permits or licenses should be for antlerless moose and/or adult cows. Members of the public who would be interested in participating in culling moose for management purposes are already familiar with culling operations targeting antlerless deer only to manage those populations.

Providing the opportunity for the public to participate in culling moose on Isle Royale also fits in with the wilderness character of the park. I would suggest having members of the public apply for moose culling permits in groups from two to four to make the job of packing out the meat from moose that are culled more manageable. I know pairs of men who have packed out the meat from moose in other wilderness areas with no problem. The process usually involves multiple trips and can be work, but most members of the public who would choose to participate in a moose cull would be aware of the effort involved and would do so willingly.

Since Isle Royale visitation is low during September and October, I would suggest timing of late September or early to mid-October for a moose culling operation. The weather is usually cool enough then to reduce the risk of losing meat to spoilage.

In response to those who would argue that neither wolves nor moose should be "managed" on Isle Royale; that nature should be allowed to take its course free of the hand of man, it's important to understand that bridge was crossed years ago when park wolves were trapped and fitted with radio collars to learn more about them. The long-term research that has been conducted by staff of Michigan Technological University clearly shows that wolves alone are not capable of preventing moose from destroying their habitat and themselves. Intervention is necessary to better protect Isle Royale's ecosystem from too many moose.

Since the proposed management plan is for a period of 20 years, I don't think climate change at Isle Royale National Park is an important consideration in terms of managing moose. Since the park is surrounded by Lake Superior, moose have access to plenty of water and shade to help them stay cool during the limited hot weather that may occur. Recent winters have been extremely cold throughout upper Michigan and I don't think there will be a significant change in the climate over the next 20 years to negatively affect the park's moose population.

I am opposed to any effort by man to add to the existing wolf population on Isle Royale. Two wolves from the mainland crossed the ice to the park last winter and chose not to stay. A female wolf that was a resident of the island also chose to leave the park to go to the mainland last winter. Although some people are predicting that the current wolf population may become extinct without the addition of new animals, I think it is important to avoid any manipulation by man to find out if those predictions are true. I support continuation of the wolf/moose study by Michigan Tech to determine what does happen with both species of animals into the future.

Correspondence: What issues should be considered when evaluating future management of moose, wolves, and vegetation at Isle Royale?

I suggest a very long-term view. The wolves may vanish, and the moose may eat everything in sight, and that's fine. Consider it a cycle that plays out over decades or centuries. We should not try to maintain a system just because it looks balanced on human time scales.

What type and intensity of management should the NPS consider given that approximately 99% of the land area of Isle Royale National Park is designated wilderness?

Leave it alone. Don't touch it. The wolves, the moose, and everything else, let it be at it is.

What type and intensity of management should the NPS consider in the face of a changing climate?

If the climate changes the flora and the fauna, so be it. Manage as little as possible. Do not try to preserve Isle Royale as some kind of game reserve if the climate says otherwise.

What do you like and dislike about the preliminary alternatives?

The alternatives presented were thoughtful and considered most possibilities. I oppose the plans with intensive management. I don't mind a changing ecosystem. Anything with hunting, trapping, planes, and helicopters, etc., is a bad idea.

Correspondence: What issues should be considered when evaluating future management of moose, wolves, and vegetation at Isle Royale?

Thank you. Please see enclosed memo.

Thank you for holding public forums and requesting citizen input regarding the future management of Isle Royale. I have been to Isle Royale and several other National Parks, Monuments and Forests. The National Park System is one of the most valuable assets this country has and stewards, not only for US citizens, but also for the world.

The idea of maintaining wilderness in National Parks and especially Isle Royale is a significant value to maintain. The definition of what is meant by wilderness and how a wilderness evolves over time are the questions. Isle Royale is not a pure wilderness and has been impacted by humans before and since the islands were designated a National Park. There is fairly vague and incomplete data about the components of the Isle Royale ecosystem before the National Park system - caribou and lynx? Did people bring the moose? What else may have been on Isle Royale that was not documented in human records?

Island ecosystems isolated by water evolve more randomly than other places. The Galapagos Islands, a National Park for Ecuador, might be considered. Ecosystems and species on each Galapagos Island evolved as new plants, animals and seeds floated, swam or flew in from other places. Each island ecosystem also evolved because of some degree of isolation. Some of the Galapagos Islands may have evolved for a long time without terrestrial predators, but today most of the islands have an apex predator(s), although they are typically birds. The Galapagos Islands are not free of historic human impacts and

have been damaged and species lost due to human activities including the introduction of domestic animals and rats. Today, the ecosystems including top predators on each island are left to the forces of nature, while human impacts are strictly controlled.

The Keweenaw Peninsula might also be considered. Keweenaw and Isle Royale are sisters in terms of geologic formation, the influences of Lake Superior, climate and habitats. The Keweenaw has 17 species of documented mammalian predators and there are several more throughout the Lake Superior basin. The Portage Canal makes it more difficult for mammals to migrate into Keweenaw from other places but wolves have returned. It seems likely that if a predator void occurs on Isle Royale due to the demise of the existing wolf pack, some new wolves or other predators will eventually colonize Isle Royale and take advantage of the food sources available. This could take tens or hundreds of years and could involve a major moose die off, deforestation and expiration of vulnerable plant or other species.

What Isle Royale does have in addition to all of its natural values is a long running study on wolves and moose. This study is now older than one person's working life. This is very short in terms of geologic time, but very long in terms of time frames for most humans and human decisions. The information gathered about wolves, moose, other animals and plants and the overall Isle Royale ecosystem helps people understand an important aspect of our world with a longer frame of reference. US citizens are beginning to see the value of apex predators in natural ecosystems. Isle Royale is the perfect venue to continue this process for the benefit of human understanding of the value of predators in the healthy balance of ecosystems. Application of what is learned from the Isle Royale experience can be applied to decisions impacting other ecosystems and restoration efforts.

The decision about Isle Royale should be narrowed to:

1) Maintain the wolves.

2) Do nothing and let the natural process go forward without intervention.

All other alternatives such as reducing the moose heard should be eliminated. Under either of these approaches, the impacts of climate change will occur and should be observed and documented.

This decision should be more about wilderness, research and education and less about a park for people. For example, in the La Nina years, Galapagos sea lions and birds starve to death in large numbers because ocean currents change and food sources are not available. This process, while not pleasant for tourists, is part of the natural process of island life.

Following are a few additional thoughts about each option:

1) Maintain the wolves.

If this option is selected, a long-term commitment should be made and introduction attempts should continue for at least ten years or until wolves are successfully reestablished. A one-time try with a pack and/or individual wolves may not be enough. If the existing pack or members of the pack are still alive when the National Park makes the decision, introducing new wolves of complimentary sex, etc. should be strongly considered so the ongoing impact of the former and new wolf DNA/blood lines can be studied. The wolf-moose ecosystem study should continue indefinitely. The information gathered will help demonstrate the value of apex predators to ecosystems and encourage their preservation/reintroduction for ecosystem health in other areas.

2) Do nothing and let the natural process go forward without intervention.

If wolves are not maintained, they may not die off, but it seems probable that they will. The impact of this event, including destruction of habitat, moose die-off, entry of new wolves or other predators and eventual rebalancing of the Isle Royale ecosystem should be thoroughly studied and documented indefinitely as well.

Personally, while I lean toward maintaining the wolves, I understand the reasons for either option 1 or 2 as described in this document and believe both support the principal of maintaining wilderness. Right now, a model for reintroduction of wolves and other major predators to other places for ecosystem health would be useful. Largely complete ecosystems manage themselves more effectively than humans can and this concept should be used more throughout our world.

Thank you for giving citizens the opportunity to comment.

We look forward to the National Park Service's findings and decision regarding Isle Royale.

Correspondence Type: Letter

Correspondence: During the informal reply period, I submitted a letter to you, the body of which is attached. To that, I have a couple of additional comments.

1. The policy of the National Park Service to leave nature alone (rather than intervene like it did in the early part of the last century in Yellowstone National park, first removing wolves, then trying to control elk herds by shooting them) is basically a good one. However, the fact remains that humans have been altering native ecosystems for tens of thousands of years or longer. In the case in point, we have probably caused the warming trend that decreases the likelihood of natural gene flow between the wolf population on Isle Royale and the mainland.

2. I have just reread the paper by Raikonen et al on bone deformities in the wolves of Isle Royale. With the Mexican wolf in our state and Arizona, small pup litters, high pup mortality, and poor pack formation due to inbreeding depression have been noted. In addition to bone deformities, I would not be surprised if these additional problems also have happened on the island. All of these issues would no doubt disappear if gene flow from the mainland happened every few years. My recommendations on the way forward with the wolves on Isle Royale remains the same; genetic rescue by importing one or more wolves from the mainland. There have been reported in the scientific literature dramatic changes from genetic rescue. Thank you for considering my opinion.

Why am I commenting on the wolf situation on Isle Royale?

While I was a grad student at the University of California Riverside in the late 1960s, a government publication list came across my desk that listed The Wolves of Isle Royale by L. David Mech. I bought and read it.

I am very interested in preserving our native ecosystems. These need top predators like the wolf.

I have traveled to Yellowstone National Park to watch wild wolves starting in 1999 until recently (about 50 trips).

Around the year 2000, I also became interested in the reintroduction program for the Mexican gray wolf.

I'm a retired scientist and have followed wolf ecology in the scientific literature for the last 17 years. And, I've followed the history of the wolves of Isle Royale for many years.

Recently, the annual reports and some additional scientific papers have detailed the inbreeding problem of the Isle Royale wolves. I also have detailed knowledge of this same problem, although lesser in degree, with the Mexican gray wolf in my state and Arizona. Inbreeding is a very serious problem.

Apparently, the National Park Service for Isle Royale is seeking input on what to do about the wolf situation. I've learned that the choices are:

1. Do nothing, even if wolves go extinct,
2. Allow wolves to go extinct (if that is what they do), and then introduce a new wolf population,
3. Conserve Isle Royale wolves with an action known as genetic rescue by bringing some wolves to the island to mitigate inbreeding.

I strongly prefer choice number three (3). I would suggest getting wolves from Canada north of Isle Royale.
Thank you for considering my preferred option.

Correspondence Type: Letter
Correspondence: Dear National Park Service:

1. Alternative elements are presented below.
2. Issues that should be considered evaluating future management: For a millennium the wolf/moose symbiosis has managed itself without human intervention.
3. Any type of management should have a minimal impact on the designated wilderness. Management should allow time for the pack's acclimation to newly introduced wolves, as needed, rather than be limited to an arbitrary one time introduction. The paramount concern should be facilitating the survival of both the wolves and the moose, which will self-adjust as they always have, and the vegetation will follow, as in a trophic cascade.
4. In addition, to acknowledge the effects of climate change on the Isle, there are two factors to consider; the extension of the tick's range which impairs the health of both the wolves and moose, and the extension of the temperate forest range which impacts the food source of the moose.
5. The intensity of management should be expedited before the end of 2016, at the latest. Also the proposed cull of moose deviates from the designated natural wilderness of the Isle. Moose populations would be more effectively addressed by contraceptive measures.

Moose-Wolf-Vegetation Management Plan/EIS
Outside Organization: National Parks Conservation Association Conservation/Preservation
Affiliation: OfficialRep
Received: Aug,28,2015 00:00:00
Correspondence Type: Letter
Correspondence: Dear Superintendent Green:

On behalf of the National Parks Conservation Association (NPCA), we thank you for the opportunity to comment on the Moose-Wolf-Vegetation Management Plan/EIS Public Scoping document.

Since 1919, NPCA has been the leading voice of the American people in protecting and enhancing our National Park System, working together with our more than one million members and supporters nationwide to preserve our nation's natural, cultural and historic heritage for future generations. NPCA has a longstanding interest in protecting our national parks and their resources, including wildlife, and we are particularly concerned about the decline in the wolf population at Isle Royale National Park and the impact this decline has on the island's ecosystem.

We've reviewed the proposed alternatives in the scoping newsletter and support Alternative B, with modifications, as the preferred management alternative.

The wolf population at Isle Royale National Park numbers just three, down from nine wolves counted in the 2014 Winter Study. The threat is that the population of this important apex predator will become extinct on the island, which will result in significant changes to the entire ecosystem. Without a predator, the moose population will go unchecked and over-browse native vegetation, eventually running out of food, leading to a population crash.

NPCA Recommendation: Alternative Concept B, with modifications

NPCA recommends that NPS bring new wolves to the island to augment the current population or reintroduce new wolves if augmentation is no longer possible. This management response would help manage the moose population and should negate the need to resort to more intrusive and unpopular measures, such as culling moose, or to undertake intensive revegetation of the island's balsam fir.

This recommendation most closely aligns with Alternative Concept B; however, we suggest the alternative be rewritten as follows:

"Alternative Concept B (introduce wolves): Augment or re-introduce wolves on the island by bringing in new wolves to mimic migration event(s) as needed to re-establish their population and ecological function on the island; no further moose management."

NPCA believes this is the appropriate course of action for several reasons:

Wolves are essential for maintaining the ecosystem health given they are the only apex predator on the island and a keystone species;
The island is 99 percent designated wilderness, and NPS has acknowledged that wolves embody the essence of wilderness there/ so action to protect wolves helps preserve the wilderness character of the park;
In the absence of wolves, actions would be necessary to manage the moose population and/or undertake revegetation of balsam fir, which are both much more intrusive actions than wolf introduction and could undermine the wilderness designation;
The park's stated purpose and significance statements, as well as the International Biosphere Reserve designation, specifically note the importance of providing the opportunity for scientific study and recognize the world-renowned Isle Royale wolf/moose study;
Healthy ecosystems are more resilient to the effects of climate change;
NPS management policies support the restoration of native species and the natural ecological functions in an ecosystem; and
There is precedence for augmenting species on public lands.

ANALYSIS IN SUPPORT OF POSITION

Purpose and significance of Isle Royale National Park

In 1931, Isle Royale was designated as a national park "for the benefit and enjoyment of the people."

Today, the park is home to 18 species of mammals, although admittedly "the two best-known mammals on Isle Royale are the moose and the timber wolf." These species are the subject of the longest running predator-prey research and monitoring project in the history of wildlife management.

In 1976, most of the park's land was designated as wilderness, with later additions making 99 percent of the park land federally-designated wilderness. In 2011, NPS recognized in the Final Isle Royale Wilderness and Backcountry Management Plan that "[n]o animal symbolizes the essence of Isle Royale wilderness more than the timber wolf."

Isle Royale's unique ecosystem led to its designation as an International Biosphere Reserve in 1980. UNESCO notes that 11[t]he park offers outstanding possibilities for research in a remote ecosystem where human influences are limited. In this respect, Isle Royale is world renowned for its long-term wolf (Canis lupus)/moose (Alces alces) predator/prey study."

The General Management Plan for Isle Royale defines the purpose and significance statements for the park based on the park legislation and legislative history, other special designations and NPS policies.

The purpose of Isle Royale National Park is to:

Preserve and protect the park's wilderness character for use and enjoyment by present and future generations.

Preserve and protect the park's cultural and natural resources and ecological processes.

Provide opportunities for recreational uses and experiences that are compatible with the preservation of the park's wilderness character and park resources.

Provide park-related educational and interpretive opportunities for the public.

Provide opportunities for scientific study of ecosystem components and processes, including human influences and use, and share the findings with the public.

Isle Royale National Park is significant because:

This maritime park, an international biosphere reserve, encompasses a remote and primitive wilderness archipelago isolated by the size and power of Lake Superior.

Isle Royale is world renowned for its long-term wolf/moose predator/prey study. The park offers outstanding possibilities for research in a remote relatively simple ecosystem where overt human influences are limited.

Park waters contain the most productive native fishery and genetically diverse lake trout populations in Lake Superior.

Governing Laws/Policies

The National Park Service is charged with upholding the Organic Act and managing national parks pursuant to other relevant laws and policies. A review of these authorities indicates that NPS can and should augment or re-introduce wolves on Isle Royale in order to protect the ecological integrity and wilderness character of Isle Royale.

Organic Act

The key management-related provision of the Organic Act is as follows:

[The National Park Service] shall promote and regulate the use of the Federal areas known as national parks ... by such means and measures as conform to the fundamental purpose of the said parks ... which purpose is to conserve the scenery and the natural and historic objects and the wild life therein and to provide for the enjoyment of the same in such manner and by such means as will leave them unimpaired for the enjoyment of future generations. (Emphasis added).

In sum, NPS is charged with preserving park resources for use and enjoyment and in such a way that leaves these resources unimpaired for future generations.

Wilderness Designation

The Wilderness Act of 1964 defines wilderness as:

... an area where the earth and its community of life are untrammelled by man, where man himself is a visitor who does not remain ... an area of undeveloped Federal land retaining its primeval character and influence, without permanent improvements or human habitation, which is protected and

managed so as to preserve its natural conditions and which (1) generally appears to have been affected primarily by the forces of nature, with the imprint of man's work substantially unnoticeable

Most wilderness advocates have interpreted the Act to mean we must take a strict hands off approach in wilderness areas. However, these sort of management principles have been revisited in recognition of the environmental changes, including climate change, confronting our national parks.

The Revisiting Leopold Report sought to re-examine the park service management policies of the 1960s in the face of these changes. The report noted that "The overarching goal of NPS resource management should be to steward NPS resources for continuous change ... in order to preserve the ecological integrity ... provide visitors with transformative experiences, and form the core of the national conservation land-and seascape."

Isle Royale is a stark example of continuous change in terms of its wildlife and other resources. There is no doubt regarding the important role wolves play as apex predator in the ecosystem of this island.

However, since the wolf population was founded by three wolves in the late 1940s, the population has ebbed and flowed over the years. Much of the decline in population can be attributed to human activities, including the profound impact climate change has on the opportunities for the natural reestablishment of the wolf population via ice bridges. Prevailing thought about managing wilderness must evolve in the face of climate change.

Furthermore, management of wilderness areas is not precluded by the Wilderness Act. Agencies administering wilderness, including the National Park Service, are "responsible for preserving the wilderness character of the area and shall so administer such area for such other purposes for which it may have been established as also to preserve its wilderness character."¹⁶ In short, federal agency management of wilderness is allowed under the Act.

NPS Management Policies

Management of Wilderness:

"No animal symbolizes the essence of Isle Royale wilderness more than the timber wolf."

-Final Isle Royale Wilderness and Backcountry Management Plan (2011)

NPS recently considered the wilderness character of Isle Royale during the development of the park's Wilderness and Backcountry Management Plan. The plan noted that "No animal symbolizes the essence of Isle Royale wilderness more than the timber wolf." Wolves symbolize Isle Royale's wilderness character, and NPS is charged with preserving this character.

When it comes to wilderness, NPS is not precluded from taking any actions, but actions must be consistent with the minimum requirement concept, which NPS acknowledged in the scoping newsletter. This concept is used to determine if the proposed management action is necessary for the administration of the wilderness, and if so, how to minimize impacts. NPS management policies further state:

When determining minimum requirements, the potential disruption of wilderness character and resources will be considered before, and given significantly more weight than, economic efficiency and convenience. If a compromise of wilderness resources or character is unavoidable, only those actions that preserve wilderness character and/or have localized, short term adverse impacts will be acceptable.

Given wolves embody wilderness at the park, it would be difficult to argue actions taken to preserve their existence on the island would disrupt the island's wilderness character, particularly if you consider that bringing new wolves to the island could be as simple as bringing wolves to shore and letting them loose on the island. Bringing in new wolves to the island is far less intrusive than moose management techniques. NPS acknowledged that "[e]ffective management of moose may require the use of motorized or mechanized equipment, such as helicopters." Given this minimum requirements analysis, it would be difficult to justify the intrusions needed to actively reduce moose in this wilderness area when conserving their major predator can do the job naturally and much less intrusively. Finally, any management alternatives that do not consider restoring wolves as an option would arguably undermine the wilderness character of the island.

Restoring Native Species; Natural Processes:

There are several relevant sections in the current NPS management policies that help inform the management decision at Isle Royale. In particular, these management policies encourage the restoration and protection of the natural processes and resources of a park and the restoration of native species.

Under General Management Concepts, "The Service will not attempt to solely preserve individual species (except threatened or endangered species) or individual natural processes; rather, it will try to maintain all the components and processes of naturally evolving park ecosystems, including the natural abundance, diversity, and genetic and ecological integrity of the plant and animal species native to those ecosystems."

Under Natural Resource Management, "The National Park Service will preserve and protect the natural resources, processes, systems, and values of units of the national park system in an unimpaired condition to perpetuate their inherent integrity and to provide present and future generations with the opportunity to enjoy them."¹²³ A part of the preserve and protect mandate is that NPS must "reestablish natural functions and processes in parks ... " Efforts to do so may include the "restoration of native plants and animals."

Alternative B, with NPCA's recommended modifications, focuses on restoring a native species (wolves) and its ecological function, and is thus supported clearly by the current NPS management policies. On the other hand, some of the Alternatives being considered by NPS right now focus on only maintaining one species at the park and not on restoring native processes. Alternatives E and F focus on managing moose without restoring wolves or their ecological function. These Alternatives run contrary to these management policies

Human Influences:

Several management policies specifically call out the need for action in the event human activities lead to the disruption of natural processes or impact natural resources:

Under Natural Resource Management, "The Service will not intervene in natural biological or physical processes, except... to restore natural ecosystem functioning that has been disrupted by past or ongoing human activities; or when a park plan has identified the intervention as necessary to protect other park resources ... "

In discussing the management of native plants and animals, the policies explain that:

"Whenever possible, natural processes will be relied upon to maintain native plant and animal species and influence natural fluctuations in populations of these species. The Service may intervene to manage individuals or populations of native species only when such intervention will not cause unacceptable impacts to the populations of the species or to other components and processes of the ecosystems that support them. The second is that at least one of the following conditions exists:

"Management is necessary ... because a population occurs in an unnaturally high or low concentration as a result of human influences (such as loss of seasonal habitat, the extirpation of predators, the creation of highly productive habitat through agriculture or urban landscapes) and it is not possible to mitigate the effects of the human influences.'

Taken together, these policies emphasize the value of natural processes when maintaining species in an ecosystem. In other words, the NPS values natural processes over management of one species or the other. In this way, Alternative B, with NPCA's recommended modifications, is the best alternative in that it focuses on restoring the ecological function of wolves rather than managing one species or the other and perhaps letting one species become extinct.

Additionally, these policies emphasize action to restore native species that are extirpated by human activities. The current wolf decline is largely due to human causes. According to genetic research, the Isle Royale wolf population was founded by three wolves, one female and two males, in the late 1940s, and reached a peak in population in 1980. In the latter part of that decade, several human-related causes led to reductions in the wolf population. The deadly canine parvovirus made its way to the island via a visitor's pet dog and cut the number of wolves down to 12. In 2012, three wolves fell into a mine shaft, a remnant from previous human activity on the island, and perished, which caused a huge blow to the wolf population. And now, because of a warming climate, ice bridges between the island and the mainland do not form as often, which profoundly changes the opportunity for the re-establishment of new wolves.

Wolves are a native species at Isle Royale. 29 They provide an essential natural role as apex predator and keystone species, and their dramatic decline is largely due to human activities. NPS management policies support action to restore the wolf population at Isle Royale National Park. Therefore, NPS should adopt Alternative B, with recommended modifications, to restore wolves and maintain the ecosystem at this iconic national park.

Finally, the NPS scoping newsletter outlines a timeline for the overall process and indicates a final decision will be made by Fall/Winter 2017 (over two years from the close of this public comment period). Given the gravity of the situation and the fact natural resources are currently at risk at the park, we urge NPS to expedite the decision-making process.

We thank you for the opportunity to submit comments.

Correspondence Type:	Letter
Correspondence:	Below please find the Sierra Club's official Comments on the Isle Royale National Park Wolf Moose EIS Scoping process.

1. What other alternatives, alternative elements, or management tools should be considered?

Alternatives which include reintroduction of Woodland Caribou should be examined, both for feasibility and effects. Alternatives examined should include replacing Moose with Woodland Caribou as well as augmenting Moose with Woodland Caribou, to determine whether they can coexist on the island.

In addition, if human introduction of extirpated or declining species is considered, there should also be consideration of what other species, including new species, might be desirable (see discussion in "Additional Comments" below).

There should be no consideration of alternatives which include relocation of "problem wolves" from the mainland to Isle Royale. The reasons for this should be self-evident, but include the inadvisability of intentionally locating "problem wolves to an island where wolf/ human contact is a frequent and valued part of the visitor experience.

2. What issues should be considered when evaluating future management of moose, wolves, and vegetation at Isle Royale?

The first question to be considered is whether the primary management goal is vegetative or animal, explain why that is the case and examine the management options to achieve that goal. For example, reducing over browsing of vegetation by moose has frequently been cited as a reason to assure a healthy wolf population which can control moose numbers and the attendant over browsing.

However, this implies that the primary goal is vegetative, not mammalian. If this is true, it should be specified as the primary goal with explanation of why this is the primary goal and management options should flow from that whether or not such options include wolves, or are more effective than wolves in achieving said goal.

If on the other hand, continuation of wolves is in fact the primary goal, then this should be specified, with an explanation of why this is the case, and management options should flow from that goal.

If the primary goal is some sort of balance, then the reasoning for that as goal should be explained and justified and a very concrete measurable definition of balance should be specified (see discussion in "Additional Comments" below).

3. What type and intensity of management should the NPS consider given that approximately 99% of the land area of Isle Royale National Park is designated wilderness?

In general, the 'least heavy hand" approach should be employed. What constitutes the 'least heavy hand" is a complicated question (see discussion in "Additional Comments" below).

4. What type and intensity of management should the NPS consider in the face of a changing climate?

The first consideration should be whether or not climate change may cause a management proposal to be moot. For example if climate change may eliminate moose within the foreseeable future (such as causing browse vegetation currently at the south end of its range to become extirpated from the Island), then introducing or augmenting wolves to control moose would make no sense.

It is entirely unclear what management should be considered to either mitigate or adapt to climate change and is directly related to question 3, regarding management compatibility with Wilderness designation (see discussion in "Additional Comments" below).

5. What do you like and dislike about the preliminary alternatives?

We note that none of the alternatives involve direct vegetative management. If stability of low moose numbers is desired (in order to prevent "boom-bust" browsing/population impacts), then perhaps direct vegetation management should be considered (in order to minimize moose food sources and keep moose numbers low). It is not clear that controlling moose numbers through food source manipulation is more "heavily banded" than achieving the same moose numbers through human introduction (or re-introduction, or augmentation) of a predator species (see discussion in "Additional Comments" below).

Alternative Concept A: This is a viable alternative, and would be even if not an alternative required by law. It would provide a valuable opportunity to further study the effects of island biogeography. While negative effects of boom/bust cycles of over browsing by moose have been predicted, it should be noted that moose were on the island with no predators for nearly a half century and the vegetation has survived.

In addition, any deviation from this Alternative must be explicitly and exhaustively justified (see discussion in "Additional Comments below especially Purpose and Need").

Alternative Concept B: Analysis should be conducted with a focus on whether or not a one time reintroduction would result in the same genetic issues faced today. If that is deemed likely, then this alternative seems pointless. In addition, the "least heavy hand" management concept should be discussed regarding human import of an entire species of wildlife to the island (see discussion in "Additional Comments" below). Whether or not imported wolves will have the (learned) skills necessary to prey effectively on moose should be a consideration.

Alternative Concept C: Serious discussion should be centered around the feasibility of essentially continuous import of new wolves to the island, as well as the "heavy handedness" of such a commitment. There may be considerations of enhanced visitor experience if there is a continuous wolf presence on the island. This should be discussed explicitly, along with considerations of how this experience might be tempered by the knowledge that the experience of wolf presence on the island is a result of ongoing human manipulation.

Alternative Concept D: Definitions of what constitutes moose herbivory having a demonstrated effect on park resource" should be made clear, as well as the rationale for the necessity to avoid such effects (see discussion in "Additional Comments below). If necessary to reduce effects the combination of wolves and moose culling seems unnecessarily complex- either wolves can control moose numbers (and herbivory) or they cannot. They cannot, then wolves would seem superfluous, except as part of the visitor experience (see discussion in "Concept C"). Any discussion of moose culling should include methods and expected numbers. It should also include effects on visitor experience. Some visitors may experience negative impact from the knowledge that moose numbers are being controlled through culling, even if such activities happen in the off season, with no visitors on the island.

Alternative Concept E: Definitions of what constitutes "moose herbivory having a demonstrated effect on park resources, should be made clear as well as the rationale for the necessity to avoid such effects (see discussion in "Additional Comments" below). Any discussion of moose culling should include methods and expected numbers. It should also include effects on visitor-experience. Some visitors may experience negative impact from the knowledge that moose numbers are being controlled through culling, even if such activities happen in the off season, with no visitors on the island.

Alternative Concept F: This alternative seems very similar to Concept E, except for proactively managing moose population to a low level instead of waiting for demonstrated impacts". If vegetative management, and avoidance of "boom/bust" herbivory is the main consideration for management (see discussion in "Additional Comments" below), then this Alternative would seem more effective in accomplishing that than Concept E. More detail should be provided on the need and effects of "seed gathering and planting on offshore islands".

6. Please submit additional comments here.

Purpose and Need: The need for a management plan which addresses the question of actions to take (or not) and justifications for such actions in response to the changing wolf/moose/vegetation situation is clear. What is entirely less clear however is the need for any actions as a result of, or to address this changing situation.

The overriding factor which makes Isle Royale special is the fact that it is an island. This was a major reason IRNP became a National Park in the first place.

Not only is it an island, but it is a relatively large island in relatively close proximity to the mainland, and it sits at an ecotone between two ecotypes.

As such, Isle Royale can be expected to experience effects common to islands of this type. These effects include local extinction/colonization events, dispersal to and from the island, and boom/bust resource consumption.

Many of the calls for action regarding Isle Royale seem aimed at avoiding or mitigating the ecological effects of being an island. It is ironic that the very factor which makes Isle Royale so special (being an island) is also the direct cause of many of the effects which people are finding troubling and proposing to act to mitigate. It may be that as a relatively large island relatively close to the mainland, these effects are not as swift or sudden as on smaller, more remote islands. As such, when they occur, many may perceive them as unusual" or "unnatural", when in fact they are neither.

It is our contention that any actions which are proposed to counter or mitigate the effects which are the direct result of being an island ecosystem must be very carefully considered, and fully justified. There must be clear, understandable, and defensible rationale for any deviation from "letting an island be an island".

Major Management Goals: There appear to be different and intersecting, management considerations. These are vegetative, mammalian, and visitor experience. It is important to specify and justify the hierarchy of goals in these areas.

For instance, as described above, vegetative stability is frequently cited as rationale for importation of wolves, on the grounds that wolves are needed to control moose browse. This implies that the vegetative goal is paramount, and that mammalian considerations are in service to this goal.

Alternately, sometimes visitor experience is cited for continued management of a wolf population on the island. If this is the rationale for having wolves, then vegetative management should be addressed as a benefit of having wolves, not as the reason.

In addition, ecological sustainability as a goal needs clarification. The ecosystem on Isle Royale may be changed by various actions (including no action), but there will be a sustained, albeit changing, ecosystem on the island. Any goal which is designed to sustain a particular ecological makeup of the island should specify what that makeup is, and why it is the preferred state, and why relatively static ecosystems may be preferable to those which island conditions might produce.

Wilderness Character: Wilderness as defined by Congress includes the concept of untrammeled by the hand of man". Isle Royale, which has been in constant human use for almost 10,000 years is not untrammeled. Consequently, most, including Sierra Club, interpret Wilderness designation to imply application of the 'least heavy handed' management possible. What this means in the current circumstances is a complicated discussion.

Any proposed management which is designed to be compatible with Wilderness must specify why the action chosen is less intrusive than others. As an example, some of the alternatives are designed to mitigate moose over browsing of vegetation. Possible actions include culling of moose directly, and/or importation of wolves to control moose numbers. Given the choice between direct culling of moose and the importation of another species to prey on moose, it is entirely unclear which option constitutes the "least heavy hand".

All discussions of various alternatives should examine this question closely. In general Sierra Club supports choosing the least 'heavy handed' alternative. In cases where deviation occurs from this principle, significant discussion and justification should be clear.

Importation of Animals to the Island: There has been much discussion of importation of new wolves to IRNP either to augment existing wolves, or to replace them if extirpation occurs.

This opens a wider doors than many may expect. Once we consider human importation of a large mammal to the island, we must consider why that mammal and not others should be imported. Should we import species which were on the island but no longer are (such as woodland caribou and lynx)? Should we only import species which have been on the island in living memory (such as wolves). Should we consider importation of species which are unable to recover elsewhere in Michigan (such as woodland caribou and possibly snowshoe hare, but not lynx or wolves). If control of moose numbers is the rationale, should we consider importation of parasites which reduce moose fecundity (such as brainworm)? Or should we only import species which "people like to see"?

As can be seen from the above, once the door to active human importation of species is opened, it is unclear how far that door should go. Any decision to import any species to IRNP must include rationale for why that species and no others. We urge significant caution in this area.

Please feel free to contact me if you have any questions.

Correspondence Type: Letter

Correspondence: I am writing because I deeply care about the wildlife in our national parks, including the wolves and moose at Isle Royale. Isle Royale National Park is a remote beautiful island in Lake Superior, and is home to a famous community of wolves and moose. These two species have an important predator-prey relationship and are critical to the overall health of the island ecosystem.

Right now there are only three wolves left in the park- the lowest number of wolves in more than 50 years- threatening the overall ecosystem health of this iconic national park. If wolves die off, the island's moose population will continue to increase, consuming the native vegetation and eventually running out of food, disrupting the natural balance of the island. No one wants to see that happen.

I support management Alternative B to bring new wolves to the island, but urge the Park Service to do this as needed, rather than one time only. Without wolves, the moose population on the island will continue to increase, eating until the food sources are gone. If we bring new wolves to the island, they will help keep the moose population from rapidly expanding and minimize impacts to the native vegetation.

Top predators such as wolves play critical roles in maintaining a diversity of other wildlife species and healthy ecosystems. The disappearance of wolves (as well as great cats, bears, large fish, and flying raptors) around the world has upset the balance of numerous local environments. Now all but exterminated, many of these predators have been reduced to minor players in their respective environments, leaving chaos in their absence. This does not portend well for the future. Even the smallest fluctuation in predator populations in an ecosystem affects almost every other species with whom they share a habitat.

Alternative B is much less intrusive in this wilderness park than culling moose, removing moose from the island, or having to replant native vegetation once the moose consume it.

As stewards of this park, the National Park Service should take the least intrusive action that results in the most benefit to the island's wildlife and

ecosystem. I support the Park Service taking action to bring new wolves to the park immediately, before the population vanishes altogether.

I urge the NPS to bring new wolves to the island so this iconic species does not become extinct at Isle Royale and so they can continue to fulfill the critical role of balancing the island's natural environment.

Thank you for considering my comments.

Correspondence: In all the talk of a wolf reintroduction at Isle Royale, the effects on the ecosystem of an increasing moose population and the implications of designated wilderness limitations I believe we are missing a key element. The impact of the world's longest predator prey study on K-12 education.

The Isle Royale Wolf Moose study is followed by children and adults around the world.

The annual reports are downloaded, and shared with school children studying ecosystem related topics. Data and trends from the long term research are imbedded in state and national curriculums. Many lesson plans have been created and shared by teachers involved in graduate education classes taught on Isle Royale by other secondary teachers.

In many years of teaching ecosystem related topics I can attest to the interest and excitement generated in students by the topic. We follow winter study closely, when the annual report is released it is shared broadly. Pictures posted online and those I and other educators share with students create a sense of wonder beyond any other ecology related information we share. The topic is manageable for the teacher, and understandable, the relatively limited number of mammal species involved makes sense to secondary students. The predator prey relationship is not clouded by the politics and emotions generated when wolves and livestock share a range and hunting interests blame predators for lack of success.

Over 60 of my own students have traveled to Isle Royale. When they enter the research area around Bangsund cabin. (summer home of the wolf-moose study) handle the bones from wolf killed moose, view the antlered skull collection and more importantly interact with the Michigan Technological University researchers the sense of awe is palpable. The few hours spent in direct contact with the bones and the conversations with the people that learn from the stories they tell have changed lives. Be it pursuit of environmental related careers or an interest in medicine related to dental health, genetics, orthopedics or nutrition. All of this is possible because of the collections generated by the wolf-moose study and their accessibility to visitors.

Managing a national park is always a balance between education, recreation and protection of the resource. People will not love what they do not know. They cannot steward what they do not understand. There is an attraction to wolves and moose of Isle Royale that reaches way beyond the park shoreline and the National Park Service. Wolves and moose generate this interest., the project brings young people and families to a remote National Park. A visit to Bangsund cabin brings it all together in one of the most powerful exhibits available anywhere. Isle Royale's remoteness and the effort required generates the respect shown by visitors to this unique opportunity.

If we allow an absence of wolves at Isle Royale we will see the destruction of vegetation and witness many other large scale changes to the ecosystem. We know from past experiences around the world and on Isle Royale what happens when top predators are removed from a system. Do we need to repeat the experience? Will knowledge be gained by allowing the loss of the wolf? This is unlikely as we have seen it too many other times. But what about the loss of the educational potential, the sense of curiosity generated, the applications of practical ecosystem science it generates for our students. We have spent over 50 years supporting this study through the National Science Foundation, National Park Service and other sources both public and private. It has been money well spent. From this knowledge we know what needs to be done. Reintroduce wolves from an appropriate population and let nature be wild. The National Park Service is a premier conservation agency that should be able to proceed rapidly toward an obvious and enlightened decision to avoid a catastrophe for the moose and the loss of educational interest generated by the wolf moose interactions on Isle Royale.

Continue the education benefits of the wolf moose study, keep the study university based with a strong educational intent, respect the knowledge base already generated. Appreciate the educational impacts of the wolves and moose of Isle Royale National Park.

Correspondence: I'm writing to ask that you and your team seriously consider introducing wolves to Isle Royale. It would be a tremendous shame to allow the moose population to grow to such an extent that they devour the entire island- eventually leading to their over demise as well as several other species of birds, bugs, etc.

This island is a national treasure, and an amazing asset for our state. It is crucial to keep it that way. The hand of man played a key role in the dwindling of the wolf population on the island (introducing disease, digging mines). It is time for us now to play a key role in the reintroduction of the natural predator.

Correspondence: To whom it may concern,

About your problem on Isle Royale, I would suggest introducing the wolf population. I'm sure you already know about the moose population. Over the years, it has increased to nearly 1,000! That's a lot of moose. On the video I watched in class, I noticed that the person said there was only a few wolves left. Wolves usually hunt down weak and sick animals, but with the moose population thriving, the wolves can't get anything to eat. If the wolves can't get anything to eat, they will get sick and pass. These wolves are passing and not reproducing. The man in the video also said there are only two female wolves left, and if they pass, they can no longer reproduce. Isle Royale needs wolves to keep the moose population under control. If they have none, the moose will destroy the vegetation. It's just a thought, but I as a student, suggest to reintroduce the wolf population.

Thank you for your time,

Correspondence: My name is[...]. I am 12 years old, I visited Isle Royale this summer, and LOVED IT! I saw my first moose! I heard that there is lots of debate around whether or not to reintroduce wolves to Isle Royale. This concerned me because if your main predator does not attack prey, the whole food chain will go out of wack, making an unhealthy wilderness environment. Now, I know one of the options is to "let nature take its course (wilderness ranger pamphlet)." But human kind has done enough to cause the downfall of Isle Royale wolves, it'd be of to not fix what we'd caused.

I advocate for new wolf introduction to Isle Royale while there are still wolves here. Preferably ones that have common prey of moose. Because if the wolves do not know how to hunt moose they will hunt the healthy moose, not this sick of weak ones, also endangering the environment they call home.

I appreciate the opportunity to share my perspective with you, and hope you will reach your final conclusion soon. One which maintains a top level predator on Isle Royale. Thank you again.

Correspondence: To whom it may concern,

The awareness of Isle Royale has been raised more than you think. I have done my research based on the situation and formed my bias on what to do about this great dilemma. If no action is done, then the wolves will go extinct from the island and the moose population will rapidly increase and overpopulate the national park. That's why if wolves were introduced once and the moose population is reduced on the island, then the wolves could kill off the sick moose living for too long and thrive off of that. Reducing the moose population and leaving them to decompose will still provide sustenance for the wolves, because wolves will take what they can get. Any remains from the moose will decompose and increase the health of the island's ecosystem. So with option "D" as my choice, the moose population won't be too big and the wolf population won't go extinct and increase. I thank you for your time and would appreciate your feedback.

Correspondence: I advocate and urge the Park Service to reintroduce a healthy wolf population to Isle Royale. I find the argument that humans should not interfere with the current decline in wolf population disingenuous. Human interference has directly contributed to the decline in population via introduction of a virus that severely impacted wolves, copper mining pits down which wolves have fallen, etc. and threatens to undermine the ability of new wolves to get to the island via an ice bridge should global warming reduce the rate of incidence for such wintery walkways.

Please ensure a viable population of alpha predators on the island.

Correspondence: To whom it may concern

I think that we should be a little more cautious about the scenario at Isle Royale National Park. The fact that there is only two wolves left is kinda insane. We need to intervene and introduce some wolves into the habitat, to help them grow and keep the wildlife growing. So that the wolves can maintain the

moose population and they can both survive and keep the wilderness zone growing.

Thank you for your time,

PS My main idea is to maintain both populations.

Correspondence: I am writing to you because I am worried about the wolves of Isle Royale.

I have been reading that the wolves of Isle Royale have mostly died off, after many years of living on the island, because the wolves have lived together too long in one isolated place, and they have interbred and introduced certain weaknesses into their bodies that will not allow them or their babies to survive. I read that there haven't been opportunities like there used to be for new wolves to walk across the frozen ice of Lake Superior in winter to get to the island, probably because of climate change. So the wolves can't regularly get on or off the island.

I have read that the National Park Service is trying to figure out what to do about the wolves on Isle Royale, because if there aren't any wolves, then there will be too many moose on the island (there probably already are), because there are no wolves to hunt the moose, and the moose could do a lot of damage to the trees and grasses and plants on the island, because that's what they eat. The food chain will be all messed up.

I know there are lots of things to consider, but I think it makes sense to get some wolves back on the island as soon as possible, because if there are more wolves, then the wolves can hunt the moose, and the moose population would do less damage to the trees and plants, and things will be back in balance. I think putting wolves back onto the island will sort of restore the balance of the "natural order" on the island. Isle Royale is a good place for the wolves to live because they aren't around livestock like cows or humans. It is almost like a natural sanctuary for them.

I know this sounds weird, but I was told once that the wolf is my "totem animal," and it is sort of my "spiritual protector and guide" in the world. This probably isn't true, but I like to think about it, because wolves are smart and brave and loyal and very highly committed to their mates and packs. I like what wolves symbolize, and I would like them to be protected and saved, wherever they are (Isle Royale or Yellowstone Park or Canada or wherever). Maybe they would try protect and save me, too, if I needed it.

Correspondence: To whom it may concern,

I think you should introduce new wolves only once in the park. Only once but the wolves should be a hardy bunch cause with all the weak, young, and old moose there will be plenty of food for the 30 wolves and with an untouched environment by man except for this once. They will breed maybe excessively so you should also maintain the wolves to about may 500 and the moose maybe 1,000 if possible, and the problem shall be solved.

Thank you for your time,

Correspondence: To whom if may concern

I think we should maintain both the moose and wolf population by introducing the wolves more than once to make sure we don't get in the same position. We should maintain the moose population b reducing some of the moose to keep them from going over 2,000 moose. we should introduce about 100 wolves to keep them from going extinct and if this happens again we can introduce more wolves.

Correspondence Type:

Letter

Correspondence: Isle Royale holds a special place in my heart and I am saddened to see that the wolf population on the island has fallen to three. The following is my opinion on the course of action the Park Service should take regarding managing Isle Royale's wilderness.

Question 1 - what other alternatives, alternative elements or management tools should be considered?

My preference is Alternative C where management of both the moose and wolf populations including the reintroduction of wolves is in my opinion the most feasible option. Reintroduction of wolves is not new to Isle Royale and sufficient research and time has passed since the first attempt to bring new wolves to the island that a higher success rate of survival should occur. If the wolves introduced came from mainland regions currently impacted by wolf overpopulation there would be the additional benefit of eliminating the need to kill nuisance wolves.

Question 2 - what issues should be considered when evaluating future management of moose, wolves, and vegetation at Isle Royale?

1. The NPS should give serious consideration to the research and recommendations by the Michigan Tech researchers who have conducted the decades' long work on the predator-prey relationship on the island. These individuals have first-hand, scientific knowledge of the island and its inhabitants.
2. Research conducted by MTU shows that natural immigration of mainland wolf populations will not be sufficient to offset the decline or extinction of the island's existing wolf population
3. Without an apex predator, the moose population will continue to grow to a point where the island's vegetation will be compromised resulting in starvation in the moose population.
4. The island's wolves' role as predator supports and regulates other wildlife populations such as fox, beaver, birds and other mammals that share the island. The question needs to be asked what will become of these other species should the wolf disappear entirely from the ecosystem. The survivability of these animals is intrinsically connected to the wolf's role as predator.
5. Uncontrolled browsing of the island's vegetation may alter the existing ecosystems in irreversible ways that may harm plant species unique to the island.
6. For those of us who hiking, paddling and being in the wilderness, it was the chance encounter of seeing a wolf in the wild that brought us to this isolated park over parks on the mainland.

Question 3 - what type and intensity of management should the NPS consider given that approximately 99% of the land area of IRNP is designated wilderness?

This is my concern with the discussion regarding culling of the moose population. With the exception of the Rock Harbor area, accessibility to the island is rugged making the transporting of moose meat from the kill site to boat launches difficult and costly. The idea of having to create expanded pathways to allow motorized vehicles into isolated areas is abhorrent to those of us who love the rugged terrain and wildness of the island. What makes Isle Royale so special is that human impact and construction is so minimal. Humans are only tertiary visitors on the island after the wildlife and the vegetation. To construction "roads" in the wilderness areas in my opinion is contrary to the wilderness designation that Isle Royale possesses.

This is the second reason I have against the culling of moose. If the predator/prey balance is not restored naturally, we are looking at continual human culling of the moose population to maintain their numbers. Despite ever increasing research and knowledge on wildlife populations, we human still do a pretty poor job of wildlife management in comparison to the innate ability of nature to correct any imbalance that would occur if wolves remained on the island

Bringing wolves to the island may be considered human interference, but in my opinion, we are only giving the new wolves the opportunity to re-establish themselves in an environment that has sustained them in the past. Yes, there is always a risk that what is currently happening now may occur again in another 50 years. But the alternative of doing nothing and seeing the island denuded of vegetation and the mass starvation of moose isn't a good choice either.

Question 4 - what type and intensity of management should the NPS consider in the face of a changing climate?

Climate change cannot be confined to a particular area or can be treated in isolation from negative human behaviors that occur on the mainland. Unless we address our overdependence on fossil fuels and the exploitation of natural habitats and their inhabitants, the warming of our seasons and the severity of weather-related events will continue to increase. Expecting that mainland wolves will move to the island via ice bridges is unrealistic with the current trend of warmer winters that have resulted from climate change.

Question 5 -what do you like and dislike about the preliminary alternatives?

Alternative A - Yes, there is validity to the idea that the best course of action would be to do nothing and see how nature will or will not correct the balance. But in my mind, the underlying reasons that the wolves have disappeared from the island and mainland wilderness are human-based through climate change, selfish behaviors that brought canine parvo-virus to the island and the exploitation of wilderness areas for human development. It is our responsibility to do what we can to correct the situation we created. To do nothing just gives credence to the notion that we humans have the right to destroy wilderness and their inhabitants without recourse.

Alternative B- My concern is that by limiting the reintroduction of wolves to one event doesn't allow much room for error. Like anything else in nature, there are too many unknown variables to guarantee a successful reintegration. Should the introduction fail, then we are faced with Alternative A or another full scale discussion of alternatives. The NPS has delayed this discussion too long already; the time to act is now.

Alternative D - E - F - Managing the moose population only when it is demonstrated that the island's vegetation is in jeopardy puts the island at risk that it may never be able to re-balance itself. The idea of hunting excess moose would result in only a short term solution and still doesn't address the imbalance between predator and prey that is currently on the island. Then add the potential need to expand the existing trail system to allow motorized vehicle access to wilderness areas would not only cause destruction to the ecosystems not to mention adding potentially new environmental risk of air and liquid pollutants from these vehicles.

I grew up in the Copper Country, worked at Rock Harbor Lodge and have hiked and camped on the island. Isle Royale is a gem in the National Park Service family, having the benefit of its isolation from the mainland. Many who visit Isle Royale do so because it is so wild, yet accessible. There are so few places in this country where native plant and animal life rule and we humans are only the guests. Isle Royale needs its wolves just as it needs its moose and all the other animals that live there. The time to act is now.

Correspondence: Thank you for the public presentation on July 29th in Grand Portage of the Moose-Wolf-Vegetation Management Plan/EIS and for the opportunity to comment. Experiencing Minong (Isle Royale) has been and continues to be an important part of my life. My concerns are heartfelt and deep.

At this time I will not pick or choose between the proposed concepts A through F.

Instead, I will offer my opinion as to why I believe there is another alternative to all of them. This option has the potential to fit within the 20 year time frame of a management plan, honors the cultural and environmental legacy of Minong (Isle Royale) and adheres to the principles of wilderness. Although not an original idea, I sincerely believe as Minnesota wildlife biologist and author Chel Anderson states, "If we are to give places like Isle Royale the best long-term shot at surviving assaults such as global warming and atmospheric pollution ... then we must reintroduce and preserve as much as possible the original compliment of plants and animals that formed a complex, sturdy matrix of relationships in pre-settlement times."

The reintroduction of woodland caribou and lynx is the desired outcome in restoring an ecological balance that had sustained itself for thousands of years. But, this will not happen until the perpetual imbalance of moose and wolves plays itself out without any further human intervention. This failed experiment needs to end. With the prognosis not looking good for a viable pack of wolves and should they become extirpated, the inevitable result would be an overabundance of moose. This cycle has played itself out in the past with predictable and sometimes devastating results. When this moment arrives in what could be the foreseeable future, the Park would have a rare opportunity to uniquely vision a sustainable future by looking into the past.

I sincerely believe that such a plan is the greatest legacy one could work towards to ensure a vibrant and dynamic Minong (Isle Royale) for future generations.

Correspondence: My comments are provided from the following perspective. I became very interested in Isle Royale and the Moose-Wolf-Vegetation dynamics in the 1980s. Over the years I bought and read Charles Adams' 1909 "An Ecological Survey of Isle Royale", Adolph Murie's 1934 "The Moose of Isle Royale", and Lauritis Krefting's "The Ecology of Isle Royale Moose". I have obtained and read all of the Annual Reports of the Wolf/Moose study from the beginning, Durward Allen's book, Dave Mech's monograph, Rolf Peterson's monograph and book, and many of the scientific papers published about the study. I also purchased and read "Fauna of the National Parks Series No. 1 and No.2 by George Wright, et al to learn more about the National Parks and the scientific approach.

In addition to the above reading, I have participated 23 times as an Earthwatch or Moosewatch volunteer in the weeklong backpacking trips to gather bones and data. This has given me added insight into the wolf-moose-vegetation dynamics.

With the wolf population at an all-time low, the moose population is again on a fairly rapid increase. If nothing is done, it appears very likely the moose population will crash again, like it did in the 1930s, 1940s and 1996. The overpopulation of moose before the crash will have a detrimental impact on the island vegetation. I do not believe alternative A is a desirable option.

Human impacts, including introduction of canine parvovirus, climate change (directly affecting moose, vegetation, and frequency of ice bridges), and wolves falling into and dying in mine pits, have been major factors in the decline of the wolves.

You have noted the uncertainty of the future impact of climate change on the moose and the vegetation. It seems to me the best way to observe that impact is to have as natural an ecosystem as possible. That means having a predator for the moose. In alternatives E and F, it seems highly likely the wolves will eventually die out and you will just be trying to manage the moose population. It will be difficult to study the impact of climate change on the moose and the vegetation in such an artificial system. I do not believe Alternative E or F are desirable options.

That leaves Alternatives B, C, and D. These all involve wolf reintroduction, which I believe is important for a healthy ecosystem. I like Alternative B, except for the limitation to introducing wolves once. I think introducing wolves and then studying the impact on moose and vegetation would be desirable, but I would reserve the idea of possible further augmentation.

I'm not certain what might be planned regarding the moose in Alternative C. The only thing mentioned is wolf reintroduction or augmentation. If this is like Alternative B, except wolves might be added more than once, than this is the option I favor.

Alternative D seems like it might be complicated with increasing the wolves and reducing the moose and not knowing what impact each activity has or the impact of climate change on either the moose or the vegetation.

Recognizing the wilderness designation, I think the more natural the ecosystem, the better. I am working to try to restore or rescue some tall grass prairie in Iowa. One of the things some people do is: patch-burn-grazing. A property is divided into different areas and an area is burned. Then when there is lots of new growth it can be grazed by bison or cattle. Theoretically you could divide Isle Royale into areas and confine the moose to certain parts to let the vegetation regenerate. Then you could rotate them to a different area. Even more extreme, you could burn an area and potentially have lots of new growth for them. But these approaches, while possibly benefiting the moose, would certainly not fit a wilderness approach.

In summary, I favor a natural ecosystem approach in which the wolf population is augmented and the impact is studied. This is probably somewhere between Alternatives Band C. As has been shown by the study, unforeseen factors (canine parvovirus, climate change, mine pits) have had major impacts on the moose, wolves, and vegetation. If we are doing too much tinkering it may mask these factors.

Thank you again for the opportunity to comment. I will watch for further developments with interest.

Correspondence: I've read recently of the changing predator, prey balance on Isle Royale. This is a situation that should be addressed by sound wildlife management. Do not introduce wolves to try and diminish the moose population. The efforts to reintroduce and increase wolf numbers in the northwest and midwest have proven to be an absolute disaster! After spending thousands of taxpayer dollars to establish a management goal of (approximately 450) wolves in Michigan's upper peninsula the Federal Government foolishly let uneducated, anti-hunting animal rights people put a moratorium on state wildlife management. This foolish act allowed the wolf population to nearly triple the number determined by educated wildlife managers/biologists. To reduce the moose population on Isle Royale, a managed moose hunt with a drawing for sex specific licenses at a realistic price is the only proper way to treat the Michigan peoples moose resource. Do not suggest sharp shooters at a cost to taxpayers. The money realized from a management moose hunt would certainly help fund future management and controlled hunts.

I'm aware some national parks do not allow hunting but I urge you to change that. Letting an uncontrollable population of wolves hamstring moose and feed on them while they are still alive is very inhumane compared to being killed with a well placed bullet.

I kindly request a reply regarding your intentions.

Correspondence: I write regarding the proposed introduction of more wolves within the Isle Royale National Park.

In this instance I request you consider foregoing this action. Please manage wilderness strictly according to the intent of the Wilderness Act. No Action please.

My request is somewhat out of character. I am one of many fighting tooth and nail day after day to reintroduce wolves across their historic range within the lower forty-eight. The opposition is well funded and resolute. As you may be aware they are also strongly opposed to the very idea of wilderness reserves anywhere at all.

Therefore when we bend Wilderness Act law in the slightest way, such as artificially supplementing a declining species, that opens the door to additional rule bending. The enemies of nature have many lawyers. They will gleefully point to the NPS own proposals as justification for their ideas on how these last remaining natural places should be managed. That would be quite different.

Thank you for reading my letter and carrying out my request.

Correspondence: My name is [...] and I am a [...] teacher at Maine South High School in Park Ridge, IL. For the past two years, my Accelerated Biology classes have used Isle Royale as a case study during our Ecology Unit. We have used Northwestern University's Population Biology module (http://modelsim.tech.northwestern.edu/info/?page_id=761) in order to provide our students with an opportunity to apply what they learned about ecology and population dynamics.

The Population Dynamics module from Northwestern incorporates NGSS (Next Generation Science Standards) and computer modeling to engage students in discovery learning about essential ecological concepts such as: carrying capacity, stable populations, short-term disruptions, and long-term changes to populations. The learning module uses information from the Michigan Technological University wolf and moose study on Isle Royale as an overarching investigation of population dynamics.

Throughout the modeling activities, students are graphing the data collected during the 57 year study as well as applying the concepts from the computer model activities. Students watched a variety of YouTube videos from Drs. Vucetich and Peterson as well as news stories from the UP's ABC 10 Up. Our students read a number of articles from the Minnesota Post and learned about the reintroduction of wolves to Yellowstone NP.

The ultimate question our students needed to address in a letter to you is "What management strategy should be taken to address the failing wolf population on Isle Royale. Our classes identified three management strategies based on all of the primary resources they examined: 1] Do nothing, let nature take its course, 2] Wait until all of the wolves on Isle Royale die and then place a new population of wolves on the island, and 3] add new wolves to the island now in spite of the three wolves that are currently present on the island. After our students discovered through comments made by Dr. Vucetich that a genetic rescue was unlikely due to the low number of wolves on the island, they no longer considered it a viable management strategy.

I informed my students that the National Park Service was very interested in the public's views on this matter and that they as citizens of the United States are partial owners/investors of the National Parks in the United States. As a result they had an obligation to share their thoughts and ideas on the matters of Isle Royale. I hope that you have time and inclination to read the best of the letters from my freshman students. The letters were part of their ecology test and they put a lot of effort and pride into their letters.

Please feel free to contact me with any questions you may have. I would be happy to share any knowledge I have about our accelerated biology class.

Correspondence: Growing up in the suburbs of Chicago, I was never really exposed to nature and wild animals.

Being able to travel has allowed me to develop a deep appreciation for nature. I was first introduced to Isle Royale in my freshman biology class in our ecology unit. While we have only been discussing this study for a few weeks, I have already become interested in Isle Royale as well as human effects on ecosystems everywhere. I know that this short amount of time is nothing compared to the length of the study but I feel that wolves, as the keystone species in this ecosystem, need help and that we have the resources to do so. Before I make any statement I would like to thank you for everything that you do for Isle Royale. I do not believe I will be able to provide you with any Isle Royale history you would not know, but I do believe that we can all learn from the fluctuations of the wolf, moose, and vegetation populations. I believe that everyone wants wolves on the island. As of now, the wolf population is not stable. With only three wolves on the island, a dramatic drop from last years nine, the wolves are not doing their job in the ecosystem effectively (9, 1 0). If the wolves are not doing their job in the ecosystem, the other organisms will suffer. As a citizen of the United States and an owner of national parks through my citizenship, I would like to do all that I can to preserve our parks. Isle Royale is a unique ecosystem which everyone should protect to the best of their abilities. I feel that we should wait until the wolves currently residing on the island to die, and then reintroduce new wolves to the island.

The wolf population is constantly rising and falling in a see-saw relationship with the moose population they prey upon (7). The wolves of Isle Royale are at the top of their food chain, no animals prey on them. The abundance of moose to eat should allow for a large population of wolves but as you know, only three wolves currently reside on the island. The reason the wolf population is not stable is because of inbreeding. Inbreeding is caused by wolves mating with close relatives and the reason wolves have to mate with relatives is because the island is isolated. "Small, isolated populations exhibit high rates of inbreeding,"(CS #2, 15 Inbreeding within the Wolf Population). The wolves on Isle Royale have significant health problems as a result of this inbreeding. Inbred wolves often suffer from lumbosacral transitional vertebrae (LSTV). In a normal, outbred population, one in one hundred wolves has LSTV. On Isle Royale, one in three wolves suffer from LSTV (CS #2, 15 Inbreeding within the Wolf Population, 11). With these spinal deformities, the wolves are unable to hunt and unable to reproduce. The lack of moose predation on the island and the lack of wolves both contribute to the high moose population. The three wolves on Isle Royale are not doing their ecological job, and are too inbred to be able to produce healthy offspring. That being said, I believe that letting the wolves die and then reintroducing new wolves will help maintain lower rates of inbreeding on the island.

As we know, neither wolves or moose are native to the island. The moose arrived in the early 1900s. By the time wolves arrived in 1949 the moose had had more than enough time to do significant damage to the vegetation on Isle Royale (8). Years after the wolves arrived, the fir trees "were growing to heights that put them safely out of reach of moose" (9). This statement shows how crucial the wolves are to maintain a balance on Isle Royale. Before wolves arrived, the absence of wolves caused the moose population to rise, which caused the vegetation population to drop. The drop in vegetation changed the ecosystem and also changed the populations of organisms on the island. The wolves arrived to Isle Royale via ice bridge. Before wolf predation began, the only control on the island's moose was starvation (8). With the current wolf population of three wolves, the wolves are having no significant effect on the moose population. This drop in wolf predation has allowed the moose population to grow 22% each year for the past four years (1 0). In this case there are more moose to eat the balsam fir and aspen (7). Wolf predation dropped from an average of 15-24% to around 2% (7). This piece of information is from May 2013, two years ago, when there were nine wolves on the island. It is clear that the wolves play a major part in controlling the moose population but with three wolves on the island not much is getting done. According to a MinnPost article, "As Isle Royale wolves slide toward extinction, a call for 'genetic rescue'", "... Aida Leopold and the other scientists of similar stature urged that park managers import wolves to save the island's forests from fir- and aspen-eating moose," (7,9). Over browsing of vegetation could be detrimental to Isle Royale. We have seen the effects of having no controls for the browsing animals of Yellowstone. The elk and deer in Yellowstone were able to overgraze the vegetation which affected all of the other organisms there. For example, after wolves returned after a seventy year absence in Yellowstone, they changed the behavior of the deer so that they avoided some areas of the park. This allowed for vegetation to grow back in these areas. (3, 14). Ecosystems rely so heavily on producers. Every organism in an ecosystem relies on producers for their food, directly or indirectly, no matter what trophic level they may feed at. If nothing is done to stop over-browsing of vegetation, the ecosystem on Isle Royale will change irreversibly.

Up until recent years, ice bridges have not been forming. This means that wolves cannot travel to Isle Royale and wolves on Isle Royale cannot leave. John Vucetich knows how humans have influenced the formation of ice bridges as well as the wolf population, "The human imprint is written all over the dynamics of this wolf population" (1 0). Humans cause climate change which can have an influence on ice bridges forming or not forming. For the past two years, ice bridges have formed, but with climate change, there is no evidence to predict that ice bridges will form every year for wolves to cross. Some people argue that the nonintervention policy is the way to go. The wolves have found a way to the island before and there is a chance that they will do it again. The policy of nonintervention is based on the "best available science, law, and policy" (2). The problem with nonintervention is that it does not

necessarily make sense for our world today. As John Vucetich said, humans change everything ecologically, whether they try to or not. That being said, humans should do what they can to preserve and protect the parts of nature that are most untouched by humans, our national parks for example. I believe that most will agree that the presence of wolves are necessary on the island so long as moose are there. But, Leah Vucetich has learned that "... we are not in control and must embrace whatever Mother Nature has in store for us" (15 The People). Another pro-nonintervention argument is that once we start to control populations and other factors of nature, we won't be able to stop. Since Isle Royale is isolated, and can only support about twenty-four wolves, there is a high chance of inbreeding amongst wolves. Old Grey Guy was able to save the wolf population once but a genetic rescue would be hard to uphold seeing that there is never a guarantee that new wolves will come to the island. "What about the possibility that to genuinely mimic history, the rescue might have to be repeated again and again?" (8). This argument ignores the role humans have played in changes in ecosystems. The problem with leaving the fate of Isle Royale to Mother Nature is that humans have influenced normal patterns in nature.

As of 2014, both Rolf Peterson and John Vucetich believed that a genetic rescue could save the wolf population on Isle Royale (9). Unfortunately, John Vucetich thinks that it is now too late for a genetic rescue. It is explained in the MinnPost article "Down to Three Wolves on Isle Royale" that even if the two wolves who visited the island for about a week during the past winter study had stayed, genetic rescue would be very unlikely. The wolves numbers were down to three, and the Alpha mating pair would be reluctant to mate with the new wolves (10). Now that there is no guarantee that wolves will travel to the island by themselves and stay, a genetic rescue would not fix the problem. A genetic rescue would not prevent inbreeding either because a genetic rescue is associated with a small number of wolves. A small number of wolves in addition to the three already there would not sufficiently improve the situation.

I believe that it is in Isle Royale's best interest to wait until the current population of wolves dies to introduce new wolves to the island. The current wolves are too inbred to do their job because of their low numbers. The wolf population is so low because of inbreeding which is caused by isolation. Humans have played a part in Isle Royale's isolation problem through climate change. The biogeography of Isle Royale makes the island so unique. If the island was smaller, it could not sustain the wolf population. If the island was closer to the mainland, more animals would be on the island, changing every food web and all of the interactions between organisms. (15 The Place). Introducing a new group of unrelated wolves would be the most logical solution to Isle Royale's problem. This would help the wolves to avoid inbreeding for some time. Due to isolation and climate change, there is no permanent solution to this problem. As stated earlier, we should do all that we can to protect the beautiful and unique ecosystem of Isle Royale National Park.

Thank you for taking time to read my letter.

Correspondence: Dear Superintendent Phyllis Green:
My first time experiencing wildlife in its natural habitat was when I saw turtles while snorkeling in Hawaii. This experience helped me to develop a deep appreciation for nature. I first heard about Isle Royale while studying ecology in my freshman biology class. The island's unique situation sparked my interest. I was disappointed to learn about the low wolf population that currently resides on Isle Royale. As of winter 2015 only three wolves remain in Isle Royale National Park, a sharp decline from the nine wolves that inhabited the island just last year (10). John Vucetich, the study's current director, stated in a 2013 interview with the Minnesota Post that "studying the simple things fills a niche you can't fill any other way" (7). The 57 year study that has taken place on Isle Royale is an example of how studying a simple predator-prey relationship can help us to better understand our changing world. The wolf predation on the moose of Isle Royale is essential to maintaining the island's ecosystem. As a citizen of the United States and therefore an owner of the Isle Royale National Park, I feel that it is our responsibility to handle this situation to the best of our ability. In order to preserve the unique ecosystem of Isle Royale I think that it is essential that new wolves are introduced to the island without delay.

While the wolf and moose species are not native to the island their predator-prey relationship is an important part of Isle Royale's ecosystem. Moose came to the island in the early 1900s. Before wolves came to Isle Royale via an ice bridge, changes in the moose population were influenced only by weather conditions, disease and the amount of available food. The lack of predators on Isle Royale left the moose population free to over browse on the island's vegetation. Ron Meador in his article "No New Wolves: Isle Royale to Continue, for Now, a Policy of Nonintervention" wrote that "Moose browse so heavily on fir that ecologists ... were advocating for deliberate placement of wolves on the island as a control to the moose

population, for decades before the first wolf arrived" (9). Arriving on Isle Royale at the end of the 1940s, the wolf population has played a significant role in keeping the moose population down (7). Wolf predation has allowed fir trees on the western two-thirds of Isle Royale to grow high enough where they cannot be eaten by the moose. For the first time in this century the balsam firs on Isle Royale will have a chance to reproduce (9). Wolves are important to Isle Royale because without them vegetation on the island would be over browsed negatively impacting the other species that call Isle Royale home.

According to John Vucetich "it's not the presence of wolves that matters so much, it's whether the wolves are performing their ecological function" (10). Normally the percentage of moose killed every year by wolves is around 15% but the last two years it has been more like 2%". The steep drop in wolf predation shows us that the current wolf population is no longer affecting the ecosystem of Isle Royale. This lack of predation is causing the moose population to increase annually by 22% (10). The recent growth in the moose population is alarming because as the number of moose increase, the island's vegetation becomes increasingly at risk. Considering that wolf predation has been relatively non-existent on the island for a time now, the sooner new wolves are brought to the island the better. John Vucetich echoed this concern in his 2013 interview when he said "you can easily imagine a decade-long period that probably began last year, of essentially no significant wolf predation, and that might be a problem we'd have trouble reversing" (7). The longer we wait to take action the more time we risk irreversibly changing the current ecosystem of Isle Royale.

In the Minnesota Post article "Isle Royale Wolves Are Holding Steady as Researchers Make a Major New Find" it is written that "the National Park Service ... announced that it would hew to a hands-off policy unless the wolves became completely incapable of reproducing, at which point it would reconsider" (8). Based on the information in the 2014-2015 annual report this may now be the case. The group of three wolves currently on the island consists of two adults and one pup, possibly the pair's offspring (10). The pup is deformed and is not expected to live for much longer. Even if the two adult wolves on the island are a mating pair, their offspring are not likely to survive due to inbreeding (10). Allison Mills in her article, "Down to Three Wolves on Isle Royale", wrote that "all geneticists who have studied the current situation agree that recovery is unlikely without new genetic material" (10). We have now reached a point where human intervention is necessary if there is any hope of rebuilding the wolf population.

As of 2014 both John Vucetich and Rolf Peterson agree that the best way to increase the wolf population would be to attempt genetic rescue (9). Unfortunately however in the 2014-2015 annual report Vucetich stated "there is now a good chance that it is too late to conduct genetic rescue" (10). Genetic rescue is no longer an option because as a mating pair, the two wolves currently on the island would not be interested in mating with the new wolves (10). Being that genetic rescue is no longer a feasible option, I think that The National Park Service should add a new population of wolves to Isle Royale immediately. Instead of adding a few wolves to breed with the existing population, we now need to add a group of unrelated wolves to the island. We can be sure that these new wolves will be successful in increasing the wolf population because they will not be mating with wolves who are inbred. All the wolves that have lived on Isle Royale were descended from a single female and one or two males in addition to the few wolves that came to Isle Royale across ice bridges in more recent years (8). Reintroducing a whole new population of wolves from different packs will insure that amount of inbreeding will be greatly reduced.

Some people feel that The National Park Service should not intervene and wait and see what happens naturally. The current lack of wolves is already changing the ecosystem. Ron Meador in his article "Isle Royale Wolves Are Holding Steady as Researchers Make a Major New Find", pointed out "Wolves are the only control on the island's moose ... the moose herd has probably risen above 1,000 ... and the beavers are booming too, also because of the wolves decline" (8). If we leave the fate of the wolves up to nature there is no guarantee that new wolves will ever come over to the island. In the past, new wolves have come to Isle Royale by crossing ice bridges that form during the winter. But due to climate change the chance of ice bridges forming is decreasing (10). If new wolves do come to Isle Royale we cannot be sure that they will stay. According to Vucetich, "one of the Isle Royale wolves left on an ice bridge last winter and this winter two wolves visited the island and promptly traveled back across the ice bridge" (10). Since wolves live in packs it is very unlikely that if a wolf were to come to Isle Royale that they would remain there alone without a pack or a mate. If an entire pack crossed an ice bridge to Isle Royale, in several decades we would find ourselves dealing with another low wolf population again due to inbreeding. By introducing a select group of wolves to the island we can be certain that there will be a wolf population on Isle Royale and that there will be an increase in the amount of time it takes for another inbreeding crisis to occur.

There is no reason to wait until the current wolf population dies to introduce new wolves to the island. As Vucetich said "a genetic rescue or other response would require some logistical planning time and administrative time for something that's not just an afternoon project" (7). There is a good chance that the current wolves will be dead by the time new wolves are introduced to the island. Because we do not know what could happen in the future in regards to budget and other factors that would keep new wolves from coming to Isle Royale, it is important that we begin to make a plan for bringing more wolves to the island. Due to the fact

that the current wolf population is not affecting the ecosystem, waiting for the existing wolves to die before adding new wolves just increases the amount of damage done to the island's vegetation.

To summarize, it is in the best interest of the public and The National Park Service that new wolves are introduced to Isle Royale as soon as possible. As the keystone species in the Isle Royale ecosystem, wolves are needed to keep the island's ecosystem stable. The current wolf population has been ravaged by inbreeding and is not likely to produce any living offspring. The steep decline of the wolf population has already affected the moose and beaver populations, which in turn will have an effect on island's balsam firs. Introducing a new group of unrelated outbreed wolves to the island is our best option to grow the wolf population because this group will be able to successfully reproduce without inbreeding in the near future. If we let the current situation work itself out naturally we cannot be certain that enough wolves will come to Isle Royale to successfully create a stable population. Waiting to introduce new wolves until the deaths of the current ones is unnecessary because as a mating pair the existing wolves would not be mating with the new ones and the current wolves are not affecting the island's ecosystem.

Thank you for taking the time to read my letter.

Correspondence Type: Letter

Correspondence: The study of wolves and moose on Isle Royale is nothing if not fascinating. It is apparent from the data collected that those two populations are (or, at least, were) inherently connected. The relationship between wolves and moose as predator and prey would suggest this correlation to be direct, almost linear. However, that has not always been the case. There have been times in the past 57 years in which wolf population climbed despite a fall in moose population, and there have also been times in which moose population grew despite increases in wolf population (CS #1-3). Such a depart from the expected is exactly what is happening to the wolves on Isle Royale now. The number of moose is growing at an estimated 22% annually, and yet the number of wolves has not gone up along with them. Quite the opposite, the wolf population has actually decreased 88% over recent years to the present level of only 3 wolves (10; CS #3).

These alarming circumstances presently facing Isle Royale are unique in the history of the island. The three remaining wolves consist of one mating male-female pair, and one pup. This pup, however, appears to have a malformation that will make its survival highly improbable. For the first time since the beginning of their existence, the wolves on Isle Royale have a very high chance of going extinct (10). Even if the mating pair manages to have another, non-malformed pup, there would be no other wolf for that pup to mate with. Unless two healthy pups, one male and one female, are born within the next couple of years, the extinction of wolves on Isle Royale is guaranteed (10). Such an extinction would mean the removal of one of the keystones of the Isle Royale ecosystem. The potential results are unknown and completely unpredictable, but it is known that the species in the highest trophic level affects every single organism below it. It is also known that the reintroduction of wolves into Yellowstone National Park, after the ecosystem was negatively affected by their removal decades before, had effects nobody imagined. These included an increased beaver population and a change in the flow style of the rivers in the area in which the wolves were reintroduced (3). The connectivity of an ecosystem is clear in this example; the gain or loss of a species has an effect much greater than just what it eats and what it's eaten by. The loss of a wolf population on Isle Royale could have the opposite effect reintroducing them did in Yellowstone: the over-browsing and over-grazing by herbivorous creatures formerly eaten by the wolves would degrade the vegetation and, because of the connectivity of an ecosystem, all of Isle Royale (9).

It is quite clear that loss of wolves on Isle Royale would be catastrophic. Even a short period of time without wolves would let the moose (and other herbivorous creatures) browse and graze the vegetation so that the effects would last decades (9). Since the absence of them would destroy and destabilize Isle Royale's ecosystem, new wolves need to be brought there as soon as possible, preferably immediately. There are other ideas on management for the crisis on Isle Royale, but none of the them are as logical or efficient as adding new wolves immediately.

Over the past few years, many ecologists have argued in favor of attempting a "genetic rescue" on Isle Royale in which some new wolves are added to increase the genetic diversity of the already existing wolves. However, this idea had always relied on the assumption that a population of mature wolves that could mate with introduced wolves existed (7). This year, only two mature wolves exist on the island, and those two are mating with each other. Neither of them would mate with any other wolf introduced on the island, meaning genetic rescue is no longer possible (10). The antipode of attempting genetic rescue and presently the policy of the National Park Service is nonintervention. It is based on the idea that Isle Royale needs to be left in its "natural" state, and that species extinction is a natural occurrence. This argument has significant flaws, however, not the least of which is how "natural" Isle Royale truly is. Climate change, logging, disease, and many other human activities have been altering the supposedly isolated Isle Royale ecosystem for over a century (Miller; 10). Moose may not have been on Isle Royale if not for logging on the mainland. If someone truly wanted Isle Royale to be reverted to its most "natural" state, then all wolves and moose should be expunged in favor of caribou, coyotes, and lynx, as all of those lived long before moose and wolves invaded (Miller). This debate about naturalness is volatile, and all that can be learned from it is that the true "natural" state of Isle Royale cannot be known. What is known, however, is that the wolves and moose maintained a stable ecosystem for 57 years, and the loss of wolves would mean the loss of that stability (9).

In addition to the "natural" aspect, supporters of leaving Isle Royale alone often claim that species blink in and out, and that the wolf population could recover itself within a few years. This may have been true decades ago, but the frequency of ice bridges needed for wolves to cross onto the island has been on the decline. The chance of natural reintroduction of wolves has declined with this. Not only this, but just walking onto Isle Royale does not necessarily restabilize the population. This year, two wolves crossed an ice bridge onto Isle Royale but didn't stay; they left the island without breeding or changing the existing wolf population (10). Thus, the chances of the wolf population recovering on its own is very, very

small. A final point typically thought to be in favor of nonintervention is the monetary cost of a relocation operation. Logic dictates that non action would monetarily cost less than action. However, this may not be the case for Isle Royale. Yellowstone National Park relocated wolves in 1995, and performed cost analysis on its options before the relocation. The Fish and Wildlife Service estimated the total cost of "Reintroduction" to be approximately \$6,750,000. At the same time, the cost of "Natural Recovery of Wolf Populations" was placed anywhere between \$10,000,000 and \$15,000,000, potentially being double the cost of intervention (Morgenweck). Isle Royale is looking to perform a similar (though smaller scale) operation as the one on Yellowstone, and should expect proportional costs.

No matter what the cost is, the importance of speed in reintroduction cannot be stressed enough. It is assumed that damage in the ecosystem by predator-free herbivores wouldn't begin until their predator is truly extinct. There are still three wolves remaining on Isle Royale, but, for the moose, the wolves may as well be extinct. Typically, wolves kill around 15% of moose annually. In 2013, with a wolf count of 8, that figure was a mere 2% (7). Since the population has more than halved in the last two years (CS #3), so has the percentage of moose killed by wolves, leaving it at well below 1%. This means that wolves are less of a threat to moose than diseases like malaria (7). Moose population has exploded; moose appetite has grown in parallel. The balsam fir, finally beginning to recover from over browsing in the 1930s, is once again being over browsed (9). With this degrading fir population, the entire Isle Royale ecosystem could degrade in completely unpredictable ways, costing the National Park Service a lot more than just money.

Inevitably, the future of Isle Royale boils down to a very simple idea: intervention is the most logical and efficient of all policies being pursued. Data from similar ecosystems like Yellowstone along with data from Isle Royale itself point to the fact that the loss of wolves to check moose population would be catastrophic for the Isle Royale ecosystem, even in the shortest term. As such, wolves should be added to the island as soon as possible. Not intervening for fear of disturbing the "natural" balance of Isle Royale is absurd; humans have been disturbing that and every other ecosystem on Earth for centuries. Not intervening with the hopes of saving money would not make any sense, as intervening actually costs less than not. Finally, waiting until after the wolves go extinct before adding wolves is illogical because the ill effects of the wolves being extinct have already begun before the actual extinction; to the ecosystem, the wolves may as well not even be hunting moose, and so those moos are destroying the ecosystem.

Thank you so much for taking the valuable time out of your day to read my opinions. I am confident that you will make the most educated decision possible on the future of Isle Royale.

Letter

Correspondence: I am writing this letter to address the current wolf dilemma at Isle Royale National Park.

I am a biology student at Maine South High School, and in our studies of ecology, we came across Isle Royale National Park. The park is known for its moose, wolves, and other natural beauty. (11). The wolf and moose populations were first recorded in 1959 (Case study #1). The wolves had held steady until relatively recently, where the wolf population is now decreasing rapidly. In the year 2000, there were 29 wolves on the island (Case study #3). Now, in 2015, there are only three wolves left on the island (1 0). At this point in time, it is clear the wolf population is not stable. This is an all-time low for the study of the island (2), and it has and will have dramatic effects in the future. The drop in wolves in the past years caused wolf predation to drop to nearly nothing and causing the moose population to jump 22% (6). The increase in moose will have a dramatic effect on the balsam fir trees (the preferred food of the moose), which have only recently been able to become self-sufficient and produce enough cones to maintain the population of the trees (9, 12). There are many thoughts on how to save the wolf population, such as attempt to rescue the wolves by adding more before the current ones die (genetic rescue) (7), add more wolves after the current ones die, and continue with nonintervention (9).

This leads me to what I believe should be done to the remaining wolves on the Island. I believe that a new pack of wolves must be placed on the island once the current wolves die. This is beneficial because of many reasons. First, the new wolves will lower the moose population back down to a reasonable number, and can possibly save the trees on the island that the moose feed on (9, 12). Also, all three wolves on the island are inbred (1 0). Inbreeding is caused due to the mating of close relatives, which is now very common on the island due to the very low population of wolves. Inbreeding causes many hereditary problems in the wolves, in particular, "Lumbosacral Transitional Vertebrae". This disorder of the spine causes nerve damage to the nerves that control the wolves' tail and hind legs. This severely impairs their hunting abilities, which lowers wolf predation even more, when added on to the fact that there are only three wolves left (Case study #3). If more wolves are added to the island, the population would increase and prevent LSTV. To aid in the decision of adding new wolves, there is actual proof that the reintroduction of a species works and can have positive effects. In Yellowstone National Park, wolves were reintroduced after being completely extinct in the area, and worked wonders on the land. they controlled prey better than hunters could (elk, etc.), and even indirectly changed rivers (14, 3). A reintroduction of wolves would kickstart the wolf population once again and return the island to its normal state.

Some people also may object to the claim, insisting that the national park should remain free of human interaction and will do better off without the direct placement of wolves on the island. The problem with this theory is wolves may never be able to immigrate back onto the island as they could in the past, because of ice bridges forming less and less

frequently due to climate change (4). Wolves not being present on the island due to the decrease in the formation of ice bridges means the moose population will increase and consume most vegetation on the island, possibly ruining the landscape and beauty of the island itself (3). Also, human interaction has already occurred twice on the island. The first interaction is the global climate change affecting the ice bridges, due to the burning of fossil fuels. The second human interaction is the transmission of canine parvovirus onto the island. "Humans inadvertently introduced a wolf disease, canine parvovirus, to the island. The disease was prevalent for two back-to-back years" (Case study #2). The transmission of the disease from pets illegally brought onto the island arguably crashed the wolf population in the first place, dropping the wolf population from 50 wolves to 14 wolves in the two year period from 1980 to 1982 (Case study #2). The huge impact humans already have had on the island make it almost necessary to transport new wolves onto the island, as new wolves cannot naturally return to the island.

Overall, the population of wolves on the island is not stable, and more wolves must be placed on the island after the current ones die off. This will lower the already high moose population on the island and stop the moose from eating everything on the island. I hope for the best of Isle Royale and I have faith that the answer that will be chosen to solve the wolf problem will be the best solution.

Correspondence: After seeing the 2015 Isle Royale Report, it is obvious that the wolf population is quickly declining. The question here is not if the wolves should be helped or not, but how they should be helped. I believe that letting the wolves die and then reintroducing the wolf population can re-balance the Isle Royale ecosystem. With less wolves, the moose population is increasing. With so many moose, many animals' resources are limited and this could lead to many Isle Royale nature to suffer. This increase of moose is causing a decrease of balsam fir. Animals such as squirrels and birds eat the seeds from the cones of balsam firs, so not only would moose be affected, but other animal populations could suffer too. There are no other animals besides wolves that are predators of moose, so the only thing (similar to the early 1900s before wolves arrived on Isle Royale) controlling the moose population is starvation, which would likely be caused by the lack of balsam fir trees. The lack of a keystone species like the wolves causes a long-term disruption to the entire ecosystem (9). Isle Royale is a beautiful island and a great place for visitors to experience an interesting nature experience. Without the wolves, this experience would be vastly different. The island would have less species, since when one species fluctuates, many other species are affected. Without people paying to visit Isle Royale, the island will not have funds to pay for upkeep of the island. If the wolf population is not saved, the island could fall into disarray. (2, 7, 10)

My biology class has been studying Isle Royale for a while, and I know that the wolf population has been declining at a very quick pace. The decline started in 2009, and is becoming more drastic each year. From the 2014 report to the 2015 report, the number of wolves on Isle Royale went from 9 wolves to 3 wolves (CS Graph). Since 2009, the wolf population has decreased by 88% (10). If something isn't decided soon, the wolf population could die out very quickly, causing the island to really fall into an even worse state. The controversy of adding foreign wolves to the island is that it's not natural, which is understandable. This is why I believe that adding new wolves after the original wolves die out is the best option. These wolves would not have to compete or interact with any of the original wolves. The new wolves would carry out the same day-to-day life as the original wolves, but there would be much more genetic diversity throughout wolves on the island, leading to much less inbreeding. Inbreeding is the main cause for the drastic drop in the wolf population, since all the inbred wolves have many malformations. These malformations make it harder for the wolves to hunt, which can lead to starvation and death at a younger age (8).

By letting the wolf population die before reintroducing new wolves, it allows time for the parks committee to find the right wolves and fully plan the reintroduction. Finding healthy wolves that are at a good mating age, are a good balance of male and female, and are accustomed to living in an environment similar to Isle Royale can take a long time. Since finding these wolves can take so long, as soon as the decision to reintroduce is made, ecologists and other scientists can start looking for the new wolves while (if they haven't already died) the current wolves die out. When the right wolves are placed on the island, there won't be any wolves to compete with, and there will be many moose for them to hunt. I would put the new wolves on the island during the late summer so that they will be on the island long enough for them to get accustomed to it. Then, they won't want to leave the island on an ice bridge that could possibly form over the winter. Since wolf mating season is over the winter, the wolves can mate and the

wolf population will routinely restore itself every winter season. The pups will then be born in the spring and can thrive on the island. (15)

I briefly brought up the counterarguments for this situation but I'd like to go more into detail. The appeal to doing nothing is that it's the most natural route, and it's completely possible that wolves could return on an ice bridge over the winter. Although this is true, there's no way of telling if any wolves will ever come to Isle Royale on an ice bridge, and even if they did, wolves can also leave Isle Royale on an ice bridge. For example, last year two wolves came to Isle Royale on an ice bridge, but left not long after they arrived (10). With global warming becoming more of a widespread issue, some winters may be warmer than others and an ice bridge could never form. People don't want humans to intervene the natural progression of wolves on Isle Royale because it isn't natural, but without adding wolves the island will suffer and it will be too late to restore the island to what it once was. The other option is genetic rescue, which is adding wolves while the current wolves are still alive. What if the current wolves die tomorrow? We couldn't plan to add wolves to the island and expect a full ecological recovery if not all the wolves on the island are healthy. Also, although wolves typically mate for life, if the new wolves mate with one of the old wolves, the malformations could easily be passed down to the pup. If malformations are still present in wolves on the island, it is likely that they will remain present if a malformed wolf mates with a healthy wolf (8, 10).
By letting the current wolves die out and reintroducing new wolves to Isle Royale, any wolf sickness can be avoided as much as possible.

I truly believe that letting the current wolves die and reintroducing new wolves to Isle Royale is the best option. New wolves will reintroduce genetic diversity and prevent malformations and disease. It will balance Isle Royale's ecosystem, and can restore the original beauty of Isle Royale. The increase of wolves will allow the moose population to decrease, the balsam fir population can restore itself, and Isle Royale will become balanced again.

Correspondence: Hello, my name is [...], and I am a biology student at Maine South High School in Park Ridge, Illinois. We are currently learning about ecology and population biology, and one of our studies has included Isle Royale National Park. Since Isle Royale became designated as a U.S. National Park in the 1930s, the island has been known for its immigration of wolves, and the abundance of moose and other fascinating species. (11) In the last ten years, however, the wolf population has been declining at a fast rate. In 2005, the wolf population lay at 30, but in 2015, the wolf population lay at a startling three. (CS #3) It is imperative to rescue the wolf population in order to preserve it for many years in the future. The wolves have a large impact on the island in terms of the ecosystem. For example, the wolves control the moose population, which indirectly controls the balsam fir population on the island. As a result, with wolf predation at an all time low, the moose population will grow out of control and subsequently harm other organisms like the balsam fir. (9/12) Due to the fact the wolves have had such a large presence on the island since arriving via ice bridge in the 1940s, it is necessary we act now to save the wolf population in order to protect the ecosystem. (11) There has been many theories on how to save the wolf abundance such as, "let the wolves disappear", "let them disappear and then deliberately introduce a new population", and "attempt genetic rescue by adding a small number of new wolves. (7) Out of these three ideas, the most effective option is to let the wolves die out and deliberately add a new wolf population.

There are many reasons to support the idea of letting the wolves die out and introducing a new population. First of all, the three wolves that are left on Isle Royale are all inbred. This statement is supported in the Michigan Tech News, "Inbreeding has greatly impacted the packs over the past half century, which is clear with the three remaining wolves." (1 0) Inbreeding is defined as the mating of close relatives. Due to the fact closely related wolves have mated with each other, recessive disorders that may arise from inbreeding are more common now than before. The disorder that is rising among the wolves is "lumbosacral transitional vertebrae (LSTV)". Malformations that occur in the spine damage nerves that control the wolves' tail and hind legs. In effect, Supt. Green, LSTV is responsible for diminishing the wolves' effectiveness in hunting, which allows the moose population to grow out of control. (CS #3) Other arguments have stated the wolves must be added now to contribute new genes to the gene pool of the wolves on Isle Royale to help prevent LSTV in future wolf generations. On the contrary, it would be beneficial to let these three wolves die out first because chances are the newly added wolves would most likely not breed with the three weak wolves. Generally, the alpha-male wolf will only mate with the alpha-female wolf. (15) From this evidence we can see that these newly added wolves will not breed with the three other wolves

thus defeating the purpose of immediately bringing in new wolves to provide genetic diversity to the already inbred wolves. To conclude, it is best to let the wolves die out first, and then add the new wolves because the new wolves will likely not mate with the three inbred wolves that are remaining.

One argument many ecologists have made is the idea of "non-intervention". These ecologists believe humans should not interfere with the ecosystem on Isle Royale. To expand, ecologists claim that nothing should be done to help improve the condition of the wolf population on Isle Royale, and we should wait for more wolves to walk across the ice-bridge like the wolves did in the 1940s. (7) However, this particular concept has many flaws in it. Humans have already interfered with the ecosystem on Isle Royale. As humans, we are constantly burning fossil fuels, which inadvertently causes ice bridges to assemble less frequently. Due to the fact the ice bridges are not able to form as often, wolves cannot cross over ultimately stopping any new type of gene flow for the wolves in Isle Royale. (8) The second human interaction on Isle Royale was the transmission of the canine parovirus. "Humans inadvertently introduced a wolf disease, canine parovirus, to the island. The disease was prevalent in the wolf population for two back-to-back years." The pets that brought the virus by the humans probably started the fluctuations in the wolf population. The virus dropped the wolves from 50 in 1980 to 14 in 1982. After that event, the wolf population never fully recovered. (CS#2,#3). Humans have already created a large impact on the island, and if we follow the idea of "non-intervention", the wolf population will likely cease to exist.

Lastly, I wanted to tell you, Supt. Green, how other national parks benefited so much from placing the wolves back into their environment. For example, in Yellowstone National Park, wolves worked magic on the island. Since wolves are a keystone species, they are largely depended on by other species in the ecosystem. So, when the wolves were placed back on Yellowstone National Park after 70 years, amazing results occurred. The wolves allowed other species to flourish, controlled prey better than hunters, and even changed the way rivers worked. (3) So, by adding in new wolves with more "fit" genes after the current wolf population, the effects would be monumental!

As one can see, the best idea for the wolf situation in Isle Royale is to let the current population die out and introduce a new wolf population. The current population is not stable, and it would be wise to have a fresh-start with a new population after the current one goes extinct. Plus, the wolves are proven to cause desirable effects among the other species located on the island. I have confidence this issue on Isle Royale will be resolved, and I wish you and your staff the best of luck.

Correspondence Type: Letter

Correspondence: Isle Royale National Park is a place in the United States that can not be found anywhere else, which makes it special. The small enclosed ecosystem has been mostly untouched by humans and the wolves and moose have lived in the ecosystem there for about half a century in a predator-prey relationship.(11) The wolves bring a much needed niche for the Isle Royale ecosystem. Before the wolves came onto the island, there were too many moose, almost too many, and they ate the balsam firs, to a point where the firs could not sustain themselves well.(9) The only thing controlling the moose's population size was starvation. When wolves arrived at the island, they controlled the moose population and brought it to a size that the balsam firs were not in danger.

I firmly believe that the National Park Service should wait for the current three wolves on Isle Royale to die, then add a new pack of wolves. Doing so would have many outcomes for the wolf population, the moose population, balsam firs, and the ecosystem of the entire island. When one hears or reads about Isle Royale National Park, they might hear about how the island is in danger. Wolves play a big part of Isle Royale's ecosystem. They hunt moose and keep them away from a certain amount of trees so they don't eat all the balsam fir.(9) But now, the wolf's population on Isle Royale are not stable. There are only one breeding pair of wolves, and their one current offspring has a spinal deformity and can mostly like not hunt as well. (6)This also means that breeding pairs future offspring will most likely have the same deformity and will not be able to hunt either.(10) It is obvious that any offspring they have will not survive, which means when the current breeding pair die, there will not be any wolves left on Isle Royale.(11) Inbreeding has been a problem on Isle Royale for about five decades and the wolves had lost 32 percent of their heterozygosity .(8)

The fact that there will not be any more wolves on Isle Royale can also bring up a big controversy, more wolves may travel to Isle Royale during the winter across ice bridges.(4) For example, wolf no.93 or "Old Grey Guy", a wolf that came from the mainland, introduced much needed new genetic material in 1997.(8) His contribution of genetic material could have helped if there were more wolves, but the heterozygosity percentage lost was so high that it did not help

much, seeing as there is only three wolves left on the island. There is a major problem with the ice bridges, the bridges that usually form from Isle Royale to the Canadian Mainland have not been freezing over as frequently now because of global warming, not allowing wolves to travel over to Isle Royale during the winter.(4) Even if an ice bridge were to freeze over, the chances of a wolf traveling many miles from the mainland to get to Isle Royale would be slim. Also, one wolf or two wolves would not have much of an impact, seeing as the wolf that came during 1997 had little to no effect on their population. There would need to be a whole pack of wolves to travel over to Isle Royale to have a bigger effect on the population and even to rebuild the population of wolves.

The current population of wolves on Isle Royale is not a stable population, like I stated above. The wolf population on Isle Royale used to hunt 15 to 20% of the moose on Isle Royale when their population was stable. Now, the wolves only kill less than 1% of the moose on Isle Royale because there are only three wolves.(8) When the current wolves on the island die, the moose population may spring up, because there are no wolves killing them, but since there are limited natural resources on Isle Royale, especially of balsam firs which the moose eat the most of, the moose population would fluctuate up and down, because of the balsam fir population would not be stable either. The moose eating so much of the balsam fir would not be damaging to the tree population but also much of the ecosystem. The birds and other small animals that live in the trees would also be affected.

All of these factors lead up to the fact that the National Park Service does indeed need to intervene with Isle Royale. I understand that the National Park law is that nonintervention is what usually should happen. A good example of what is going on in Isle Royale can be represented about what happened in Yellowstone National Park.(14) At one point in time, wolves were naturally in Yellowstone, but farmers who had their livestock killed wanted all the wolves dead. So eventually, all of the wolves in Yellowstone dead. Yellowstone had no wolves for about 70 years, and the National Park was showing definite signs, there were less trees, less small animals, and way too many elk. When the National Park Service finally intervened by adding a few packs of wolves, the ecosystem improved. The wolves hunt the elk and kept them out of certain places in Yellowstone, so more trees could grow, bringing in more birds and small animals.(14) The reasoning for intervention in Yellowstone was that humans caused the wolf population to be extinct.

I think that the Isle Royale should deserve intervention by adding a pack of wolves when the current three wolves die because humans made most of the wolves on Isle Royale National Park die. In 1980, someone visiting the island brought a dog carrying a disease that must have had an encounter with one of the wolves that spread to a lot of the wolves, making the wolf population go from 50 all the way down to 14 wolves in just two years. Another reason that Isle Royale deserves an intervention of receiving more wolves is that there are no longer ice bridges forming across from Isle Royale to the Canadian mainland. This is also the fault of humans. Global warming is the cause of this type of climate change, caused by humans. Since National Parks are part of our country and belong to the people who live in the United States, I believe that the citizens should have a say in whether the National Park Service should intervene with Isle Royale National Park. Isle Royale is one of a kind in the United States of America, and I believe that people who want to visit it should deserve to enjoy the ecosystem as it should be, with stable populations of not only wolves, but moose, balsam firs, and all of the animals.

Correspondence Type: Letter

Correspondence: As the Isle Royale Manager and Superintendent, you probably get letters and comments like this on a daily basis, so I apologize. I am writing to you concerning the Isle Royale wolf, at this point, crisis. Initially, this was a problem that John Vucetich says he "could not find the right adjective for, but should almost be considered as urgent." (7) This was in 2013, when eight wolves remained on the island. Two years later, no measurable action has been taken regarding the Isle Royale wolf population, which is affecting everything else on the island. There are now three wolves left in the park, and time is up. In 2014, you released a park statement, saying that there was still time to explore consequences of any action that may be taken. (2) There is no longer time for exploration, but rather, we need a decision. Genetic rescue is no longer an option, because introduced wolves would not breed with the existing wolves, according to John, so the two options remain: let them die off or re-enter wolves. The latter is more favorable, and I hope you chose to take action soon. (10)

Wolves on Isle Royale would be considered a keystone species. While watching a video in my biology class about the idea of trophic cascades, I realized that Isle Royale has them too. Our video was focused on Yellowstone National Park, and how the reintroduction of wolves after the seventy year wolf deficit transformed the entire ecosystem. Isle Royale is not very different, in the fact that once the wolves are gone, which they will be unless we intervene, things will change. Not necessarily for the better. The whole concept of a trophic cascade is wildly

fascinating, and somewhat terrifying when considering the wolves that will soon be no more are controlling the entire ecosystem of a national park. "A trophic cascade is an ecological process which starts at the top of the food chain, and tumbles all the way to the bottom." (3) The wolves of the island hunt the moose, which then in turn eat the Balsam Fir trees. When less wolves are around to control the moose, the trees are destroyed, leaving them almost incapable of sustainable reproduction. When the trees are not there, soil erodes and land washes away. Rivers would be stabilized due to shoreline vegetation if there were not so many moose. Meant in context of Yellowstone, but still Royale relevant, Professor Monbiot says" ... the wolves, they changes rivers, really." (3) Wolves, having this big of an effect, bring their importance with them when they die. As of this year, the wolves should have been killing 15-24 percent of moose, but instead, due to dwindling numbers, they are only killing two percent. The moose population, on the other hand, has annually been increasing 22 percent for the past four years. (6,7) If this trend continues, the moose will be out of control, as they were before the wolves originally crossed the ice bridge to initially reach the island. Long ago, in 1950, park administrators urged scientists to import wolves- but they were beat out, having the wolves appear on their own. The forest has not been able to reach a substantial enough size that it can reproduce fully for 100 years. (7) The wolves are no longer effectively changing the moose population, increasing the carrying capacity of the moose and not holding their niche in the ecosystem. The other reason, besides being few in number, for the inability to catch prey, is that the wolves are severely inbred. Many of the wolves have tail and hip problems, making it hard, or impossible to hunt. The pup that came from a severely inbred pool of genes may not make it through winter. The wolf does not appear healthy, one expert says in an article released as of 2015. (10) The remaining question is, if these wolves are dying, what should we do?

I am in advocacy of introducing new wolves onto the island as soon as possible. With the island slowly returning to an unstable balance in the ecosystem, the main priority, in my opinion, should be to protect the naturally occurring things on the island, the trees, not the wolves or moose. To keep the trees healthy, however, wolves must be introduced. I think that the sooner this wolf establishment happens, the better. The more time spent waiting to do this, the more wolves are dying, and the higher the moose population rises. Vucetich himself said that the matter was urgent, in 2013. (7) Now, in 2015, we have virtually no choice if we want to save the native trees but to bring new wolves onto the island.

There are some issues that people might have with this which I would like to address. Isle Royale is best known for being the longest running isolated predator- prey study, in a wild area. People interacting with the wolves would reverse this. The island is considered to be "natural". "One must use the word naturally carefully ... the human imprint is all over the dynamics of the wolf population in recent decades." says Peterson. The island is technically not natural anymore. (10) Also, the study should really continue, but to be able to continue it, we have to be able to intervene." We can't learn anything new by documenting the precise point when Isle Royale wolves go extinct.", Vucetich says to Minnpost.(7) The second argument that could be made is that we could wait and hope for a new Old Grey Guy, infamous for migrating from Canada on an ice bridge, refreshing the gene pool. Sadly, the ice bridges are not appearing as often due to global warming, and in source 10, there is a paragraph about two wolves who came to Isle Royale by bride, and left. There is no guarantee that any wolves will migrate, and if they do, that they will stay. Lastly, the problem with the Isle Royale ecosystem is that it is completely isolated, meaning that even if we introduce new wolves, this problem will arise again. About every four generations, the wolves need gene pool variety. We can hope the ice bridge will take care of this, even though we cannot use the ice bridge as a hope of completely immediately restoring the entire wolf population. History may repeat itself, but this fix will keep the island going for now.

In your memo from April 9, 2014, you said that you will not interfere unless the wolves cannot reproduce. (2) The time has come to act. The island is in trouble, and we need to help it. I hope you will take my thoughts into consideration and keep in mind what is best for the island, for our park. Thank you for your time.

Correspondence Type: Letter

Correspondence: Hello , I am a highschool student and I have recently been introduced to the biology and history of Isle Royale National Park. I have decided to write to you about the issue concerning the wolf population on Isle Royale. I believe that this is a very important issue that must be addressed.

Through researching the ecological debate of the Wolves and Moose populations of Isle Royale, I have come to the conclusion that the best option to stabilize Isle Royale's ecosystem is to begin the preparations for implementing a new pack of Wolves into the park soon. If we wait for the three remaining wolves to die before we begin preparing for the new pack Isle Royale would be without a wolf population for a long time. This should be of utmost concern to the national park because of previous events that took place in 1995 in Yellowstone National Park where the wolf population became extinct leading to an unbalanced, failing ecosystem. (3) (Ted Talk)

For the past number of years, researchers have witnessed the consequences of another ecosystem without its keystone species. In 1980- 1997 the wolf population decreased due to the spread of canine Parvovirus disease. (15) The lack of a predator species there to regulate animal populations caused a dramatic increase in the number of moose in the national park, inadvertently, reduced vegetation, and eventually, decreased the size of the moose

population.

(7) "The balance of predator- prey on Isle Royale has clearly tipped." (10) From this, one can deduce that wolves do not only effect the stabilization of the moose population and vegetation growth; they have a huge impact on the prosperity of ecosystem as a whole. Thus, the "islands ecological health will not improve" without wolves performing their ecological function. (8)

The wolves helped to repair Yellowstone National Park ecosystem after experiencing a 70 year period without wolves. (3) The failing ecosystem was not a welcoming habitat for either birds or beavers and other organisms. Yellowstone was very barren due to all the vegetation being eaten by the unregulated elk population. (3) After Yellowstone National Park added wolves back into the ecosystem, that ecosystem flourished, the park was stable again. The wolves hunted the elk which then made the elk avoid certain areas like valleys and plains. This then led to these areas regrowth with more plants sprouting up. Bears came and started to eat the berries that grew on the new shrubs. These bears would help eat the carcasses of the elk that the wolves hunted down. The wolves ate the coyotes which led to rabbit and mice re-populations. The prevalence of mice and rabbits brought the hawks and weasels back. (3)

All this relates back to Isle Royale, if we let the wolves die out, a keystone species, and not do anything we have no guarantee that the ice bridges will freeze over, due to global warming, and if new wolves will cross over and stay. Since this happened during the 2014 winter, where two wolves crossed over, stayed for a week but decided to leave, it could most likely happen again. (10) This wasted time would lead to Isle Royale reverting back to what had happened to Yellowstone National Park before there were wolves put back into the ecosystem. We do not want to rely on luck for the health of the ecosystem at Isle Royale. Our job is to take care of the earth and if we let this happen then we have failed at our job.

According to John W. Duffield, Chris Neher and David Patterson the number of visitors, after the reintroduction of wolves, at Yellowstone National Park increased. They also stated that one of the top species that people wanted to see on their trip to Yellowstone National Park were Wolves. The news of wolves being reintroduced to Yellowstone spread word of a great traveling spot. By implementing wolves back into Isle Royale's ecosystem, based on the evidence of Yellowstone National Park, more people will come and visit Isle Royale. (16) From then on it will have publicity because of word of mouth from people visiting. Also there will be much advertising of the news that Isle Royale had wolves put back onto the Island which will lead to people becoming more familiar with Isle Royale and its beautiful ecosystem.

As I stated before the only way to make sure that Isle Royale is stable is to start planning on how to implement an introduction of a new vigorous wolf population on to Isle Royale as soon as possible. With the wolves on Isle Royale, with no time separation between when the three wolves die and when new wolves arrive , the ecosystem will be flourishing and will be stable once again according to the history of the Island. (10) Thank you for taking your time to read my letter. I hope that you will take some of my input into your decision on what you will be doing to solve this issue.

Correspondence Type: Letter
Correspondence: To whom it may concern,

In my opinion, the National Park Service should proceed with Option A and take no action. With climate and vegetation changing, moose will start to be killed off more by heat and a lack of preferred food. To introduce new wolves would simply provide a new form of death to moose that are already struggling, possibly eradicating moose from the island, then removing a major food source from wolves, repeating their current situation. Unusually warm winters also slim the chance of an ice bridge being created, stranding survivors of this cycle. In the end, it is not worth the time, effort, or cost it would require to constantly maintain these animals. Nature should be allowed to take its course so a cycle of the current situation is not created.

Thanks for your time,

Correspondence Type: Letter

Correspondence: I am writing to you as a concerned citizen for the wolves on Isle Royale. The number of wolves on the island, as of this year, has dropped down to its lowest ever, three wolves. This small pack consists of two inbred adults and a pup with a malformation, whom won't live to adulthood. The two adult wolves left on the island won't be able to reproduce a healthy pup that will live to adulthood, and eventually the two adults will die and the wolves on Isle Royale will go extinct, unless we intervene (10). The job of the National Park Service is to protect and preserve our National Parks. If we let the wolves die and disappear from the island, we aren't doing our job. In order to save the island's vegetation from the overgrazing of the moose, we need to introduce new wolves to the island now to control the numbers of moose on the island.

When the moose first migrated to the island in the early 1900s, there were no wolves to control their population, the moose's population was controlled by starvation. We don't know the numbers of moose on the island when they first migrated to Isle Royale, but there must have been a significant amount in order for the moose to destroy so much of the vegetation on the island. The moose overgrazed the balsam fir trees and it has taken over fifty years for the forest to finally get back to the size it was before the moose came to the island (9). If we let the wolves disappear from the island, it will likely destroy the forest yet again and we don't know when other wolves might come to the island so the forest might never continue to expand and grow again without the presence of the wolves.

The wolves' presence on the island doesn't only give life to the forest, it also gives life to the birds and smaller animals who live there. At Yellowstone National Park, the wolves were absent for 70 years. Without the wolves the park was overrun with deer and elk who overgrazed the vegetation and changed the physical appearance of the island. The elk and deer caused soil erosion down by the banks of the rivers and streams that flowed through Yellowstone. The overpopulation of elk and deer also caused other species to struggle to survive. Once wolves were reintroduced to Yellowstone, the birds came back to the forest, along with the foxes, the beavers, and the badgers. The wolves are controlling the number of elk and deer which allowed the forest to grow back and the streams to turn into rivers. The behavior of the animals changed too. The elk and deer started to stay in certain spots of the park because they

wanted to be in the safest place from the wolves. The smaller animals, like foxes and coyotes, and bigger animals, like bears, fed off the kills of the wolves. The entire park was affected by the presence of the wolves (3, 7, 14). Yellowstone is a bigger, more complex, ecosystem than Isle Royale. The wolves play a bigger part in the ecosystem of Isle Royale because it's smaller and more isolated than Yellowstone. The effects of the wolves leaving Isle Royale might be bigger than the effects of the wolves' absence from Yellowstone. If we let the wolves go extinct and then try to reintroduce them in the future, we might experience delays that can put us at a decade (ILLEGIBLE) then we might have a problem we can't easily reverse (7).

The problem of figuring out a way to preserve the island without interference is that the National Park's policy is outdated. This policy was formed in 1870, before we had to worry about global warming. Nonintervention is what we've always done but maybe it's time to change because we've already interfered. Without humans, there would be no global warming and the icebridge would be forming more often which would allow more wolves to come to island (4). It's our fault Isle Royale has lost its wolves and soon its vegetation and it's our job to fix it. Our handprint is already all over Isle Royale because our actions are causing global warming and now the ice bridges don't form as often because the lake is too warm during the winter. Without the icebridge, new wolves can't migrate to the island and increase genetic diversity among the wolves of Isle Royale (8). If we don't intervene and fix the problem we created, we can't preserve the island and it won't be a unique place people will want to go visit.

It's too late for genetic rescue, the remaining wolves are unable to produce healthy pups that will live to adulthood. The adult pair that is left on the island won't split up and mate with other wolves anyway (10). They both carry the gene for lumbosacral transitional vertebrae which is a deformity that causes the damage to the wolf's nerves that control its tail and hind legs (pg. 41). This birth defect is the effect of inbreeding between the wolves. Two years ago, John Vucetich said, "the window for a genetic rescue is closing quickly," and that we need to solve the problem now, and he was right. Now the window for genetic rescue has closed, we didn't treat this issue as urgent and now it's too late to save their population by genetic rescue. A genetic rescue would require logistical planning time, and administrative time, it's a project that could take a long time (7). Even if you decided to try a genetic rescue, the wolves will likely become extinct before we can formulate a plan and transport more wolves to the island (10). Our best bet is to introduce new wolves to the island as soon as possible and trust that their pack will increase in size and begin to control the moose population.

In an Isle Royale National Park News Release on April 9, 2014, you stated that if the wolf population became all males or all females, or if the moose over-browsed the vegetation, you would consider bringing more wolves to the island (2). We've reached this point, the two adults on the island cannot reproduce a healthy pup that will survive to adulthood and the moose population is rising but the carrying capacity of the island hasn't gotten bigger (10, 7). The island population is unstable and the only way to keep the stability of the island is to introduce more wolves to the island. The best time to bring the wolves to the island would be in the spring because the ice bridge has already melted so the wolves can't escape back to the mainland. The wolves will survive on the island and reproduce so there are more wolves on the island and they will begin to control the moose population once again (7). Wolf predation is currently less than 2% and in order for there to be an effect on the moose population predation needs to be between 15-24%. Moose population has increased at a rate of 22% for the past 4 years. In 2011, there were 515 moose on the island. Currently, there are 1,250 moose on the island, almost 2.5 times more than the 2011 population. We need to start working on a plan of getting wolves to the island now because if we wait too long and the moose population skyrockets, it would cause damage that we might not be able to reverse (7,10).

Thank you for reading my letter and I hope you take my thoughts into consideration when deciding what to do about Isle Royale.

Correspondence: After reviewing research from various sources, I would like to share my opinion on the issue of the small population of wolves on Isle Royale National Park. On Isle Royale, there are currently only three wolves on the island; two adults and one pup. The pup has a spinal deformity making it almost useless in hunting its prey, the moose. (10) Many people have visited the island in order to see these wonderful animals yet they face extinction here. This is the problem that Isle Royale faces. The National Park Service recognizes this urgent problem and plans to continue to monitor the ecosystem to determine if bringing wolves from outside is the best option. (2) The alternatives include leaving the wolves and letting nature decide, adding new wolves as soon as possible, or adding them when the current wolves die. I believe that the research shows that adding wolves now to Isle Royale National Park would be the best course of action.

On the moose and wolf population sizes on Isle Royale graph, it describes the food chain of foliage to moose and wolves. The moose and wolf population has fluctuated over the years from 1959 to the present day. Significant events include, the 1980 canine parvovirus infection which dramatically lowered the wolves population to approximately a third of its size. This was a huge drop for the wolf population which they never fully recovered. Once the wolf population dropped, the moose population increased over a thirteen year period to over triple their numbers. During this time, the island's vegetation was destroyed by the increased numbers of moose especially the young balsam fir trees, not allowing new foliage to grow. In 1996, the island had a severe winter which produced a very short growing season that further damaged the island's foliage. With limited and diminished foliage, the moose population dropped to approximately a third of its size. (CS 2) The moose's niche is to eat foliage and provide the essential food source for the wolves.

As seen on the moose and wolf population sizes of Isle Royale graph, up to the 1990's, the wolf population is stable at about two dozen (7) yet due to the inbreeding the wolf population drops again to lower numbers with as few as three wolves.(10) The inbreeding caused several different kinds of congenital malformations, for example, a dramatic curve in the spine. (CS 3) These physical defects may prevent

the wolves from hunting as effectively as possible.

The island received two visiting wolves this winter from Canada when an ice bridge formed connecting the island's ecosystem to Canada. (1 0) The wolves raised hopes that the Isle Royale wolves would receive the new genetic material to save them. Global warming may make it less possible for the ice bridges to form.(2) These wolves stayed a short time and it is unknown if they encountered the other wolves.

With this research data, I think that we should add new wolves as soon as possible to improve the wolves reproductive potential. If we do not add wolves and they all die then the moose will roam the island free of predators and start destroying all the foliage including the balsam fir. The environmental damage that can be done is immeasurable. "The moose need wolves, its as simple as that" said Rolf Peterson. (6) I think that Isle Royale needs these wolves now because the wolves should be killing about 20% of the moose population but they're only killing about 2%. CS 2)

The negative implications of my recommendations to introduce new wolves makes it possible that we will have to do this again, and we do not know how many times we will have to add wolves or how long until they may have inbreeding problems as well. (6) Sometimes when humans intervene then unexpected consequences occur like the virus that infected the wolves. (CS 2)

In conclusion, I believe the National Park Service should move forward immediately and introduce new wolves to Isle Royale National Park. The wolf population has decreased to a total of three wolves because of inbreeding, disease, and severe weather. Many people enjoy seeing these wonderful animals in their natural habitat.

Please consider moving forward with this plan.

Letter

Correspondence: I have been well informed about the decreasing populations of wolves on Isle Royale and I am becoming quite concerned. Ever since 2005, the Isle Royale wolf populations have been on a steady decline. As of today, there are at most three living wolves on the island, and the likelihood of their reproduction is dangerously low (Case Study 3). If and when they do fail, the moose that they prey upon will wreak havoc on the vegetation, and later that will boomerang back on themselves in the form of mass starvation. If nothing is done soon, there will be major consequences to the health of this magnificent national park. I suggest that, as soon as possible, Isle Royale National Park implement 20 to 30 wolves of mixed origin aside from one or two known mating pairs.

The first reason for my concern is the Island's history. Historians and environmentalists believe that a pack of moose migrated over an ice bridge during the early 1900s and thrived on the island. Later on, people began to realize how bad that situation was, as they were destroying the park's resources, so they wanted to add wolves to the population. Nature beat them to it, as wolves arrived on their own in the 1940s over an ice bridge as well, from Canada. Ever since, there has been a long history of inbreeding that has brought horrors to the population, multiplying the occurrence of a life-altering deformity by 30; from 1 in 100 to 1 in 3. A few visitor wolves, including the famous "Old Gray Guy," have stuck around to help dilute this deformity out by introducing new genes (11). Even so, this has not been enough to save the plummeting population. Due to human impact on the environment, the rate of ice bridge creation has dropped by 90 percent, so it has become highly unlikely for another wolf or wolf pack to hike the 18-mile trek and stay for life, much less reproduce there (10). The chances of saving the genes of the original wolves now is slim to none. Seeing as all hope is lost for the current wolf population, the choices of what to do now are either waiting to add more wolves at a good time, adding wolves immediately, or nonintervention. To best represent the data at hand, I present a decision matrix.

What can be shown from this? Starting with cost, we see that not taking action is the best option economically. Since nothing would be done in addition to current park maintenance, there would be no change in cost. Adding wolves later is similar; it grants more time to raise funds to add other wolf populations to the island. Adding wolves as soon as possible would require a stretch in budget, but it would not be too strenuous as to ruin all funding for the island itself. All that would be needed to actually get wolves is most likely a government approval, a clear vision on what wolves to take, and a way to transport them, which may just comprise of a stun dart and a cage.

Next, we have island health. The reason that the first two options scored so low is the knowledge of what can and will happen to the island if the wolves are not present. When there is no control over the moose population via predation, it is only limited by starvation.

This will cause an enormous reproduction of moose as they continually consume every resource on the island. The main foods that they eat, balsam fir and cedar, will mostly be destroyed; their ability to recreate squandered. And what then? Then, the moose experience a mass die out due to lack of food. This pattern will continue as an unstable and unhappy system. This does not only happen if actions aren't taken at all. One year is more than enough to let the moose consume all of the trees on the island. It is said that the balsam fir was not capable of sustaining itself until very recently. That could be tarnished if the moose populations thrive. Sooner is better in terms of wolf addition. If preying wolves could arrive within 6 months, Isle Royale will become a stable system again.

The public opinion can differ greatly, but it generally votes for the option that will end in the best result possible. As described in the latter paragraph, the best option logistically would be for wolves to be added now. Surveying members of my class, this seemed to be the popular answer amongst them, and that adding later sounds cruel to all parties.

As the National Parks Service has made clear, one of the highest priorities of all is to keep the parks as natural as possible, with as little human intervention as possible. Nonintervention would fit this need the best, but that, in this case, would mean the park would virtually be mandating to destroy itself. This does not seem like the most beneficial option. Waiting and eventually adding wolves and adding wolves now are direct violations of this rule, but rules can be changed just as easily as actions.

The whole operation of studying the effects of wolf and moose populations on each other was to learn more about complex systems in the world. As John Vucetich states, the Isle Royale Project is a learning experience. Nobody will learn anything from knowing exactly when wolves on Isle Royale went extinct (11). Hence, nonintervention would cause the researchers to learn nothing new, and would not be worth all of the potential information available if wolves were added. Also, waiting on wolves to be added could allow for many other factors to tip the already delicate balance of life on Isle Royale. As previously noted, moose populations would skyrocket and plummet, tree life would be more than decimated, and overall well-being of the island would be poor. Reintroducing wolves in this state would contribute to less "naturalness" of the island population, and if it's less natural, the less likely it is to occur in nature, and the less is learned from the experience. Adding wolves as soon as possible would provide the most natural effects on the island; moose would be controlled more quickly and have substantially less likelihood to overpopulate the region, saving countless organisms. What will be learned will be a continuation of what had been learned in the previous 56 years, but with new species of wolves (Case Study 1, Case Study 2, Case Study 3).

As the totals are added up, we find that, having the highest score, adding wolves as soon as possible is the best option. It has its stronger and weaker points, but overall it beats the competition by a relatively large amount. Seeing as it will benefit the island itself, the public appeal of the island and its service, and the learning experience, it will be an easy choice on what is the right thing to do.

Correspondence: I feel it is my duty as a citizen of the United States of America to inform you of the conclusion I have reached on what needs to be done to best benefit the Isle Royale ecosystem. Isle Royale National Park is, as Doug Smith, Yellowstone wolf project leader, describes, "One of the most remarkable large carnivore studies anywhere in the planet." In addition, saying, "I can't imagine the science of ecology without Isle Royale." (15). Indeed, the study of Isle Royale, since 1958, has been largely successful in the field of ecology serving as a baseline for further studies from the observations of relatively simple relationships in the environment (CS Introduction). As seen over a period of fifty-five years, the Isle Royale populations of both moose and wolves have had many fluctuations. (Graph). Unfortunately, the wolf population has recently been at an all time low with only three wolves left, beseeching the ultimate question of how to proceed: should we add more wolves as soon as possible, after the population dies out, or not add wolves at all? (7). As a result of the current condition of Isle Royale, genetically varying wolves need to be added to Isle Royale as soon as possible.

Adding genetically varying wolves to Isle Royale as soon as possible is needed to help Isle Royale's ecosystem in the long-run. One example of wolves' impact on an ecosystem is in the case of the Yellowstone National Park. At Yellowstone, the wolves were all killed leaving the ecosystem to survive without their top predator. The ecosystem did not flourish as was expected at the time, but deteriorated without the presence of wolves. The wolves were reintroduced to the ecosystem in 1955, however, and just six years later the ecosystem, including the rivers, was revived. The effect of the wolves in Yellowstone was because of the trophic cascade that occurred. (3). In my opinion, Isle Royale needs more healthy wolves to prevent the negative trophic cascade that will presumably occur. The reason the wolf population has gone down tremendously is because of the increased rate of inbreeding. The inbreeding has caused many bone deformations, especially lumbosacral transitional vertebrae (LSTV). The rate of LSTV in the wolf population, as of 2009, was a third of the wolves on Isle Royale had LSTV compared to, "One out of one hundred wolves in outbred populations." (CS#3). In the year 1997, a wolf researchers refer to as, "Old Gray Guy," traveled over an icebridge to the island and was able to cause the wolf population to lose, "About 32% of their heterozygosity."(7,8).

Unfortunately, with only three unhealthy wolves left, a genetic rescue, like the one Old Gray Guy provided, is no longer applicable. Even if wolves made it across the few ice bridges in winter, there is no guarantee they will stay. As seen in the most recent winter study, two wolves came across an icebridge and left within the week. "Vucetich and Peterson write in their report that even 'if the visiting wolves had been aware of the presence of Isle Royale wolves, it is far from certain that genetic rescue would have occurred.'" (7). Thus, proving that a new population of wolves, genetically varying and consisting of about nine wolves, needs to be added now to keep the ecosystem stable.

The United States of America has what many would consider to be exceptionally exquisite national parks. Part of what makes these national parks so remarkable is the non-interference policy in all the national parks. In the introduction of chapter four of the national park service policy it states that, "The National Park Service will strive to understand, maintain, restore, and protect the inherent integrity of the natural resources, processes, systems, and values of the parks while providing meaningful and appropriate opportunities to enjoy them." (16). In relation to Isle Royale, the island has been, to a certain extent, understood from studying the island for close to 56 years. (CS #1). In addition, Isle Royale has maintained an environment free of human impact. (13). Now is the time to restore and protect the ecosystem. (16). As stated before, more wolves need to be added to Isle Royale as quickly as possible to maintain the ecosystem's stability to prevent a major trophic cascade. (3). In order to restore Isle Royale, wolves need to be added and in the restoration the ecosystem will be protected from the negative impact of the trophic cascade that will occur if there are no wolves. (3, 7, 8).

Genetically varying wolves need to be added to Isle Royale as soon as possible to restore the Isle Royale ecosystem. (CS#3, 6). As stated before, the wolf population is at an all time low and in order to prevent a major trophic cascade that would have a negative effect on the island from happening, more wolves need to be added to Isle Royale. (3). Isle Royale has been studied for fifty-six years and that study, for the sake of all the living organisms on Isle Royale, needs to continue. (CS#1). In conclusion, genetically varying wolves need to be added to Isle Royale as soon as possible for the welfare of the entire ecosystem.

Correspondence: The lives of the wolves are in danger on the beautiful Isle Royale National Park and I want to voice my opinions on what I believe should be done. In Biology class at Maine South High School we have been learning about this ecosystem in class and the recent problems that have occurred. We have graphed the moose and wolf population since 1959 and we have learned about why these populations fluctuate. We have learned about the effects of short term disturbances and long term changes that have occurred on Isle Royale. We have read many articles and have used other resources to learn about Isle royale. Using the information from those resources and my own personal opinion, I believe that the best thing to do for this ecosystem is to add more wolves to the island as soon as possible.

I believe that adding more wolves as soon as possible is the best thing to do in this situation because if there are no wolves on Isle Royale then the populations of other animals and plants on the Island will be heavily affected. The moose which are the preferred prey for the wolves will be affected, there will be no restrictions for the moose, only starvation.(2) Since the population of the moose will increase then the population of the balsam firs, the moose's preferred food, will most likely decrease. When moose first came to the island there was no predators controlling their population. The moose were eating all the balsam firs and ecologists were concerned. Wolves came to the island naturally and they have been helping to stabilize the population of the moose.(8) Because of wolf predation the balsam firs have been able to grow to heights that are out of reach of the moose. The firs have its first chance since the moose came on the is land to actually reproduce and expand.(9) The wolves have decreased the moose population so that the balsam firs have a chance to grow, but as of 2014 the wolf predation is no longer having an effect on the moose population. The average of moose killed by wolves is 15% but in 2014 it was only at 2%.() The moose population has been growing annually at 22 percent in the past 4 years. (1 0) With this kind of ineffective predation there is a need for more wolves to hunt the moose since the moose's numbers are increasing rapidly. Just as the balsam firs were given a chance to reproduce the wolf population is in great danger. Without the wolves the moose will cause the balsam fir population to be in trouble again. This is why I believe that more wolves should be introduced as soon as possible.

Wolves are keystone animals in many ecosystems and losing them would hurt the Isle royale ecosystem. A good example that shows how wolves can affect ecosystems is the ecosystem in Yellowstone National park. In Yellowstone there used to be wolves , but then they were all hunted. Without wolves the beaver population increased and even when wolves were reintroduced Yellowstone couldn't be restored to its previous condition.(?) Although Yellowstone couldn't be restored to its previous condition, the wolves there are certainly helping to keep the ecosystem in a good situation. (14) Yellowstone is a large ecosystem and when wolves were reintroduced it helped this ecosystem very much. Isle royale is a much smaller ecosystem so just imagine what the introduction of just a few wolves could do for the ecosystem. When Yellowstone didn't have wolves the ecosystem was greatly affected and I don't think anyone would want that to happen to Isle Royale. Now that wolves are back in Yellowstone their ecosystem is in a much better situation and I think that this could be also true for Isle Royale if more wolves were introduced.

I believe that Isle royale should intervene and not hope that wolves will come across naturally. If we wait for wolves to come on naturally this could take years. Peterson said that the wolves of Isle royale are the most inbred wolves in the world and this creates many problems and causes the wolves to be deformed and less likely to survive.(1) The current wolves on the island, the 3 of them, don't have a big chance of producing a healthy offspring. The pup that is alive now is suffering from the effects of inbreeding. This pup will most likely not survive and any other pup that is produced from these mates will probably be unhealthy as well.(1 0) There is a need for new wolves on the island and there is no chance of genetic rescue now that the population is so low. Even if there was a wolf that naturally crossed over to the island, by means of an ice bridge, the wolf would most likely not mate with the wolves on the island now. This past winter 2 wolves came on the island but left a week later.(10) This shows that even if there are ice bridges for wolves to come over they may not stay. If the wolves on the island die then we don't know how long it would take for wolves to come on the island. If there were no wolves for a period of time

then this would allow the population of the moose to rise and cause the population of the balsam firs to decrease and the populations of both organisms would fluctuate and it would take years for their populations to stabilize.

I think that introducing wolves as soon as possible is the best thing to do in this situation. If we don't introduce the wolves then there may not be wolves on Isle Royale for years. This would cause the population of the moose to increase and the population of balsam firs to decrease. It is very unlikely that wolves will come across naturally so I believe it is better to introduce more wolves now before all the wolves on the Island die. Thank you so much for listening to my input on what should be done with the wolves on Isle Royale.

Correspondence Type: Letter

Correspondence: From studying Isle Royale in my biology class, I have learned that Isle Royale is a very important investigation of a prey and predator relationship. For many years, studying the ecosystem and relationships on Isle Royale has allowed people to contract a basic understanding of ecologic relationships. Like John Vucetich once mentioned in a Minnpost interview from May of 2013, "studying simple things fills a niche you can't fill any other way, and provides a stepping stone to further studies" (7). Holding a basic understanding of ecology, I believe that new wolves should be added to Isle Royale immediately, and in the coming years, small amounts of new wolves should also be added to create more variety to the gene pool on Isle Royale. The effects of global warming have added to the negative consequences of inbreeding, as a result there is a need for new DNA in the wolf population to stabilize the amounts of moose, wolves, and vegetation on Isle Royale.

Isle Royale presents a unique, isolated ecosystem due to the lack of human intervention, however, repercussions of our actions are beginning to affect the species on the island. Global warming has impacted how often ice bridges form. The formation of an ice bridge aids the addition of new wolves by providing an opportunity for them to reach the island. When the number of wolves dropped from "24 in 2009" to just "9 wolves in 2012" it seems that the decline - was most likely the result of inbreeding (case study #2). It is inferred that inbreeding is becoming more of a problem now than it was before due to the decline of ice bridges and low numbers of new wolves.

The effects of inbreeding and indirect human intervention present complicated questions regarding the populations of wolves and moose on the island. In recent years the amount of wolves on Isle Royale has been rapidly decreasing. "The wolves' numbers started plummeting in 2009, declining by 88 percent from 24 to 3 wolves, which Vucetich and Peterson think is a result of inbreeding" (10). Inbreeding on Isle Royale can be avoided in the future by the addition of new DNA into the ecosystem. Adding new DNA to the wolf population will help lower the chances of wolves produced to be unhealthy, like many on Isle Royale are, and have been for many decades. However, it's hard to decide how to add it. Many people suggest that saving the wolves needs to happen in a "natural" way. "But what's natural for moose and wolves on Isle Royale is a complicated question, because neither was present there until quite recently" (7). In the 1940's when moose first came to the island a group of scientists "urged that the park managers import wolves to save the island's forest from fir- and aspen-eating moose" (7). These scientists were motivated to maintain the stability of the already present living things on Isle Royale when they suggested this. "While iconic, a proliferation of moose could actually be harmful" (10). Moose populations without wolves go up to very high numbers. Large populations are presented with consequences: less resources, increased competition, and starvation. This very unstable cycle will continue due to the absence of wolves stabilizing the moose population. Additionally, other ideas to increase the wolf population include letting the wolves currently living on the island go extinct then, instead of adding more wolves, some people promote hunting the moose as a replacement of the wolves to stabilize the population of moose. John Vucetich objects to that idea: "If the goal is to protect the ecosystem health, no, because hunting is not considered to be a good substitute for things that wolf predation does. Not that hunting is bad by any means- it's just not suitable in preserving ecosystem health" (7). When considering as many factors as possible and looking out for the health of the Isle Royale ecosystem, the only logical solution is to add new wolves.

Wolves are predators, and can easily be viewed as nothing more, but must also be regarded as a stabilizing and life giving species on the island. It has been thought before that taking away wolves from an ecosystem would have a positive change but, like George Monbiot said "We all know that wolves kill various species of animals but, perhaps we're less aware that they give life to many others" (3). An example of wolves doing so is at Yellowstone National Park. At Yellowstone, Wolves were removed from the ecosystem but soon reintroduced in 1995. Scientists realized that they were needed to keep the ecosystem stable. Along with keeping populations stable, they also changed the behavior of many animals within the park. For example, when wolves were reintroduced to Yellowstone, major effects on the deer and the particular vegetation the deer ate were observed: "First, of course they killed some of the deer,

but that wasn't the major thing. Much more significantly they radically changed the behavior of the deer. The deer starting avoiding certain parts of the park, the places where they could be trapped most easily, particularly the valley and the gorges and immediately those places started to regenerate"(3). A number of species at Yellowstone experienced population growth in accompaniment with the wolves' return. Reintroduction of the wolves stabilized populations, affected behavior of species in the park and aided the park's beauty. Over time, without the wolves, many species became extinct from the area. When the wolves were added back, over time these species returned. This highlights a supported fact of why wolves should be added to Isle Royale immediately. There should never have to be a time where there are no wolves on the island. John Vucetich states that "conserving something is preferable to restoring it. If something's valuable, why wouldn't you try to keep it rather than let it go extinct and then try to put it back"(?). Wolves must be present on the island to maintain the populations of other species on Isle Royale; in order to maintain the wolf population, new wolves must be introduced to establish new genes and decrease inbreeding.

Inserting additional wolves on Isle Royale may have some negative effects. When new wolves are added it is very unlikely for them to mate with the current wolves and have a genetic rescue. "As a mating pair, neither is likely to be interested in other potential mates for a genetic rescue"(10). However, adding wolves while some are still on the island will ensure that there is never a period of time without wolves present. "Concerns remain that the upcoming increase in moose abundance will result in long-term damage to the health of Isle Royale's vegetation community"(1 0). The same problem that we are faced with now could possibly recur a while from now as a result of inbreeding. To avoid this, every decade more wolves should be added, however, with the addition of wolves comes cost. The unique characteristics of the island will warrant donations to fund the addition of wolves. A major downside of adding new wolves now would be never knowing how this would have ended in the hands of nature. But, intervening brings forward the risk of creating a very unhealthy ecosystem and should not be considered.

I wish the best of luck to you when making this big decision. I request you will consider these arguments when weighing the options at hand. I am very excited to hear about the news of Isle Royale and to learn what you decide.

Correspondence: Dear scientists,

I believe you should maintain both animals. The wolf is such a great predator and is just fascinating just like the moose. I'm sure a bunch of people could see where I'm coming from. The way I see it is once the wolves get comfortable, they will start killing the moose for food. At that point I think the population of both will maintain at the same level.

Sincerely,

A caring person

Correspondence: I am writing to you to address the problem of the diminishing wolf population on Isle Royale and its impact on the ecosystem of the island. After studying the history of the island in my 9th grade biology class at Maine South High School in Park Ridge, Illinois, I think that the best solution to this problem would be to introduce new wolves to the island immediately. The wolves are the keystone species of Isle Royale and the addition of new individuals would help to create a new, healthy gene pool and maintain stable populations of all species.

Wolves should be introduced to the island immediately in order to create genetic variation, an important factor in maintaining a healthy population. The three wolves currently on the

island all carry the genes for a spine disease called Lumbo-Sacral Transitional Vertebra (LSTV). Because of this, the production of healthy offspring is impossible, and the wolves will soon die out. Adding new wolves would bring back a healthy gene pool. This would allow for a very low probability of LSTV (1% vs 33% currently in each offspring) (Case Study #3). This was demonstrated in 1997 when a wolf that later became known as Old Gray Guy migrated to the island via an ice bridge (Case Study #3). He introduced new genes to the island, showing that genetic variation could stabilize a wolf population (Case Study #3). His genome was a very healthy one and helped to dampen the effects of inbreeding, to create a more diverse gene sample, and to bring back a wolf population that did not suffer from LSTV (Case Study #3).

In addition to creating genetic variation, the addition of more wolves to Isle Royale would stabilize the growing moose population very quickly, while indirectly helping many different species over time. With over 1200 moose currently on the island, wolf predation is extremely low and thus does not have a significant enough impact to stabilize the growing moose population. In the past, the wolves killed around 20% of the moose population each year, but recently, this rate has plummeted to just two percent (7). Adding more wolves will help to restore the wolf predation rates to a healthy level. If wolves are not added, however, the moose populations will initially skyrocket until they exhaust their food source, the balsam fir forests, at which point the moose population would become unstable or possibly die out. The loss of the balsam fir forests impacts other organisms too, as many species depend on these plants for shelter. As you know, before the wolves arrived at Isle Royale in the 1940s (7), the moose ravaged the balsam fir forests and their numbers were slowed by starvation (8). When wolves migrated to the island, the moose population decreased to a healthy level and the forests were replenished, restoring balance to the island's ecosystem.

While people may argue that adding wolves to the island would be a waste of money and resources, I believe that the benefits of adding them greatly outweigh the cost. Additionally, introducing new wolves to the island now makes more sense than adding them later. The moose population needs to be lowered as soon as possible to prevent them from further destroying the balsam fir forests. If wolves are reintroduced to Isle Royale after the current wolf population dies out, then the forests may be destroyed leaving the ecosystem severely damaged. Adding wolves now would also be a much better idea than not doing anything at all because it would allow for populations to stabilize. It would basically save the ecosystem of Isle Royale as all sustainable ecosystems require stable populations. I feel that preserving an ecosystem would be well worth the price tag.

While I know there are many factors to consider when deciding the fate of the island, I believe that the best course of action to address the depleting wolf population would be to add wolves immediately. This solution would create stability in the populations of all the species on Isle Royale and would also create a more diverse gene pool. I believe that the stability and diversity that will be brought about if new wolves are added will justify the cost and will be vital to the preservation of Isle Royale's unique ecosystem.

Thank you for considering my suggestion.

Correspondence: Superintendent Green, I am writing to you about the declining wolf population on Isle Royale. I believe that we should allow nature to take its course, and we should not interfere with the wolf population on Isle Royale. I understand there are negative consequences that this position would create, primarily that the wolf population may cease to exist on Isle Royale. This extinction could last for what could be a few years, a few decades or worst case scenario, forever. Although these negative consequences may seem drastic, there are reasons that I believe are in support of not doing anything to the wolf population on Isle Royale and letting nature take its course. The first reason is the policy of the National Park Service(9), and the second reason is that the wolves may come over to Isle Royale naturally sometime in the near future(7).

Isle Royale is a National Park, which means it will fall under the National Park Service (NPS) policy of non-intervention(2). The non-intervention policy prohibits humans from intervening in national parks. This policy has been in place since the creation of the NPS in 1916(17), and has been applied to all national parks. The only time that the NPS has strayed from this policy was when they inserted wolves into Yellowstone National Park in 1995(7). However, this re-insertion of wolves at Yellowstone was a different scenario than the situation of reinserting wolves on Isle Royale(14). The reason it would be different is that wolves were native to the greater Yellowstone Park area; they only became extinct from the area due to human intervention through hunting over the course of many years(14). In Isle Royale, as far as we know, wolves had only come to

the island during the late 1940s by crossing an ice bridge from Canada(?). For this reason, I feel that the way the wolf population can come back is naturally, via the ice bridge. As in the past, we should allow the wolves to migrate to the island naturally instead of inserting and placing wolves on the island of Isle Royale. Some people will assert that letting the wolves come to the island via an ice bridge, just won't happen because of the climate changing. To counter that argument, I believe that even with the global temperature heating up, ice bridges are still forming, as we just saw last year at least one ice bridge formed. The ice bridge actually allowed two wolves to come to the island but, within a week they left. Now, whether or not the wolves that came actually came in contact with the 3 wolves living on the island, we just don't know(10).

Wolves that are currently living on Isle Royale all stem from wolves that migrated onto the island on a ice bridge that connects Isle Royale with Canada(2). The way that I look at the wolves situation on Isle Royale is to see if we can have an ice bridge form, and then have a wolf naturally cross the bridge and stay on the island. If the wolves were to come to Isle Royale, they would have an abundant food supply of wolves, mainly because the wolf population has been so low, the wolves have only been killing about 2% of the moose population when they should be killing around 15%-20% of the moose population in order to have a healthy ecosystem(12). The definition of a healthy ecosystem is questionable, because the scientists will tell you that the ecosystem is healthy when all the organisms are thriving. However, the other side of the coin is that a healthy ecosystem may just be how nature plans for it to be, and not how us humans want it to be. Isle Royale may look nicer and possibly draw more tourism with the wolves living on the island, but at the end of the day the job of the NPS is not to make money; it is to protect our country's wildlife and natural beauty from human intervention. If we do nothing but protect and preserve the National Parks, then we will be doing our part in protecting our country's natural beauty. By inserting wolves on Isle Royale we are intervening with the wildlife, and that goes directly against what the National Park Service policy is when it comes to human intervention in our national parks. Although I believe that the National Park Service policy should be upheld, and therefore not insert any wolves on Isle Royale, there are some rebuttals to leaving the wolf population left alone to die.

The elimination of the wolf population does not come without its share of negative consequences. If we don't do anything, then more than likely the moose population will rise rapidly and then experience a steep drop. This drop in the moose population will occur because immediately after the wolves leave the moose population will grow rapidly and eat the trees on the island (L4 Model). Eventually the moose will end up eating all of the fir trees on the island, and because of this, their population will experience a very steep decline. This decline in population will be due to starvation. This decline is different than moose population declines in the past, as in the past the main cause for the population to decline would be a rising wolf population that need more food to keep on growing. Even after knowing that if we do nothing, the moose population along with the fur population will drop, I still support the NPS policy of non-intervention, because I believe that nature should be left alone as I have stated previously. The extinction of wolves creates a problem that will affect the ecosystem.

Another problem that will arise from not doing anything to the wolf population is that the wolves are a keystone species in Isle Royale. A keystone species is a plant or animal that plays a unique and crucial role in the way an ecosystem functions (16). The problem with removing a keystone species is that it will affect nearly every organism in its ecosystem. So, if the wolves were not to go extinct on Isle Royale, the effect would be felt throughout the island. An ecosystem is delicate system, and if you remove any species, let alone a keystone species, there are going to be effects to numerous species of organisms. I understand that the island will be affected by losing it's keystone species, but I believe that before detrimental damage is done to the ecosystem, wolves will migrate back to the island just like they did back in the late 1940s (7). The reason I believe that detrimental damage will not be done to the ecosystem is that there are some fir trees that are tall enough to be out of harm's way from the moose and the fir trees live around 60-80 years (15). My hope is that since wolves have come to island at least once every 12-15 years, that even with decreasing ice bridges, that there will be a high chance that wolves will make their way back to island (12). If the wolves return to the island within the next 60-80 years, then the fir trees will live and eventually new ones will grow and then the ecosystem can return to it fully functioning state, with its keystone species back in place.

I firmly believe that best thing to do on Isle Royale is to do nothing, and let nature take it's course instead of inserting wolves onto the island of Isle Royale. I understand the consequences of not doing anything on Isle Royale, but I think it is more important to stick to our policy that has worked for nearly the past 100 years and not allow human intervention on Isle Royale. I honestly hope and believe that wolves will come to the island, before the ecosystem is completely destroyed, just as Isle Royale did before the wolves migrated to the island.

Correspondence: Hello, I am a freshman attending Maine South High School in Illinois. My name is [...] and my biology class has been learning a lot about the Isle Royale ecosystem. We have studied the effects of organisms being present or not on the island and how populations can change based on this. We also made a graph showing the fluctuations of the wolves and moose from 1959-2014. I am aware that now there is an estimated amount of 1,250 moose on the island and only 3 wolves but these wolves are in trouble and death seems in the near future for them. The moose seem to be doing fine besides the fact they have no major predator. I am also aware of the terrible effects of inbreeding between the wolves. These moose and wolf populations are clearly unstable and something has to be done about it. Most importantly, I am aware that there is an on-going debate about what to do with these wolves which is why I believe the Isle Royale National Park should add wolves before the three currently living there die. I personally believe, the positive aspects to this outweigh the negative.

There are many reasons why Isle Royale should add the wolves before the three living there die. One reason is that these wolves living there are already affected by inbreeding. The pup on the island shows these effects: "It has a constricted waistline, hunched posture and seems to have a deformed tail,"(10). Another reason is, action has to be done immediately. This is because without successful predation against moose the whole ecosystem will be changed including the population of plants. Wolves are a keystone animal to Isle Royale. Lastly, I believe wolves should be added before the ones living there die just for the sake of learning new things. As John Vucetich said, "We won't learn anything new by documenting the precise point when Isle Royale wolves go extinct,"(7). I do know about the possible negatives to this process as well, such as the want for non-intervention and how it may be "too late" for a genetic rescue. These negatives are quite simple to solve though and I would like to share my thoughts on all these reasons why a genetic rescue is best for Isle Royale.

The three wolves on Isle Royale are clearly already affected by inbreeding and it is quite apparent that they are not living their lives at the best they possibly could. The breeding of closely related animals heavily affects the offspring between those animals. "But isolation and inbreeding have introduced vulnerabilities and canine parvovirus,"(7). This just shows that inbreeding caused the wolves to be weak. Something we had talked about in class was that because of the wolves deformed bodies their ability to hunt and survive is very limited. This is an issue because if the wolves can't hunt on their prey they will virtually have no way to live or get any food which will cause them to die off.

Action to this prey-predation ratio problem has to be dealt with immediately. Wolves are a keystone animal to Isle Royale. With healthy and thriving wolves, the populations of organisms will remain relatively stable. The wolves especially help the population of the balsam fir. "Thanks to wolf predation ... fir trees ... of Isle Royale were growing to heights that put them safely out of reach of moose,"(9). This shows that the wolf would kill enough moose to keep their population stable but also help the growth of the tree population. This just shows how wolves are a keystone animal because with their presence everything else seems to just improve for everything on the island. In 2013, John Vucetich explained how he wanted to do the genetic rescue and believed it was the best option out of the three. In his explanation he said, "We already know a lot about extinction processes,"(7). I think this is very important because the whole Isle Royale process is about studying the prey-predator relationship on the island, not about the extinction of an animal. Our knowledge will not expand if these wolves die. Even if the new knowledge may not necessarily be "popular" with the general public, we have to do what is right for the ecosystem.

This leads me to the negatives people may bring up to this situation. I know non-intervention is something that Isle Royale wanted to live by and seems like it the general public likes the idea of it as well. Non-intervention is not necessarily the best for the island though. For all we know, an ice bridge may never form again or maybe wolves just won't cross the ice bridge anymore. "... observed two visiting wolves, which came and then left across an ice bridge to the mainland,"(10). This shows that we just don't know. The wolves easily could have stayed but they chose to leave. I think it also shows that letting things run naturally by a potential ice bridge is a very unreliable way to think wolves will return back to the island. The next negative that may be brought up is that it may be too late for a genetic rescue. Regardless, the wolves living there would probably already be mating so they wouldn't find interest in any other wolves that came to the island. Also, if the current wolves were to die after the fact the new wolves came to the island it really would not matter much because there is already a healthy wolf population that would immediately work to keep things in order. These

negatives really a simple to solve and I truly believe adding wolves before the remaining ones die is the best option for Isle Royale.

The many reasons why Isle Royale should add wolves before the three currently living there die are very apparent. The only way for us to get new ideas, create hypotheses, and expand our knowledge is by using this method. I hope everything I had said was put into consideration. After learning about Isle Royale I became very interested and I want what is best for the wolves, moose and just for the ecosystem in general. I hope more people will look into learning about Isle Royale or just any ecosystem and get as interested as I am. One day I hope to visit Isle Royale and see a thriving wolf, moose and balsam fir population. Thank you for taking the time to read my letter.

Letter

Correspondence: My name is [...]. I am [...] a freshman at Maine South High School [...]. I am writing you this letter to discuss what I think should be done to

the wolves of Isle Royale. Over the course of our ecology unit in biology, we discussed Isle Royale and her Wolves and mooses. We started from the beginning, beginning at 1940 when the moose swam to the island, and have ended the unit talking about how the number of wolfs are affecting the Isle Royale ecosystem. So far Isle Royale is struggling to maintain a stable ecosystem, because the number of wolves has slowly started to decrease. The number of wolves recently plummeted from about 24 in 2009 to about 3 currently or maybe less(10). There needs to be a course of action to restore the island's ecosystem to where it originally was before.

I am advocating that wolves should be introduced to the Isle Royale island within a few months after the remaining wolves die off By allowing the remaining wolves to die off, we are allowing Isle Royale to restart its progress. Additionally, we are allowing LSTV to die with the remaining wolves instead of being transmitted into the new genetically diverse wolf population. Furthermore, we need to bring genetically diverse wolves to the island, because generation after generation of inbreeding leads to LSTV (CS #3). To add, we need to increase the Isle Royale gene pool as much as we can, so that the time it will take LSTV to become a major problem will be extended.

Isle Royale has a problem with inbreeding, and if we don't fix it history will repeat itself. History will repeat itself, because through generations of inbreeding we will reach the point where we currently stand. The article Down to Three Wolves on Isle Royale states that there are currently three wolves on the island, a mating pair and their pup. However, due to inbreeding their pup was born with LSTV and has probably passed recently(10). Correspondingly, the number of wolves will decrease, while the number of moose will continue to increase until the carrying capacity of the ecosystem is met. An unstable ecosystem will then be created, and the island's moose population will fluctuate unhealthy. In turn causing parts of the island to go through physical changes.

Having an unstable ecosystem can have dangerous effects, just look at what happened to Yellowstone after seventy plus years without wolves. The YouTube video "How Wolves Change Rivers" showed how the Yellowstone ecosystem got changed with their absences, and how it is still trying to return where it was originally, but it can't. Yellowstone was the first example of an ecosystem without wolves, and I hope it will be the last (3). I can't imagine what the absence of a large predator can do to the island. For this reason wolves need to be reintroduced to the island immediately.

Wolves are the glue of the Isle Royale ecosystem. They keep the moose in check, and allow other wildlife on the island to thrive. With the introduction of wolves to the island in the 1940s, fir trees on the western side of the island began growing above the reach of mooses, and had the chance of reproduction (9). With my plan, once the remaining wolves on the island die off, there will be little to no change to ecosystem of the island. However, if there will be change, it'll be so small that the ecosystem will fix itself once the new population of wolves arrive.

I strongly believe that this is the best course of action in restoring the ecosystem on Isle Royale, because it may be a while before we see wolves walking across an ice bridge to the island. Isle Royale was also established on the nonintervention management strategy, but it hadn't held true to this day (11). Humans are the prime suspects of climate change and climate change is limiting the frequency of ice bridge formations to Isle Royale(11). On the contrary, two wolves have come to the island, but left for unknown reasons (10). Not knowing when the next wolves will naturally come to the island by crossing an ice bridge is a daunting thought, and can endanger the island's ecosystem. It also proves that there needs to be more wolves on the island, because if visiting wolves come they may have a greater chance of staying if they see the other wolves.

To conclude, if we don't introduce wolves back to Isle Royale immediately there might be some long term effects, which may be irreversible(3). Wolves are the glue in keeping a healthy and stable ecosystem. Without wolves on the island, Isle Royale would practically erode itself once the moose

have killed all the trees (3). We need to bring the wolves back immediately, so that generations and generations of people will have the pleasure of experiencing this incredible ecosystem.

P.S. I believe that there should be a new study focus of Isle Royale. After wolves will be reintroduced to Isle Royale there should be a new case study opened. These wolves will not be immune to inbreeding, but due to their diversified genes it will be a while before LSTV sets in and brings us back to where we are today. This new case study should be based on genetic diversity and titled: How do genetically different wolves introduced to Isle help expand the gene pool, and how long will the change last.

Correspondence Type: Letter

Correspondence: Thank you for your contribution to our nation's national parks. Without our national parks, we would have a lot less beautiful scenery in our country. However, many of us are concerned about the wolves in Isle Royale National Park. There are only three wolves remaining on Isle Royale, and one of these is most likely malformed due to inbreeding. At this point, it may be too late to make sure there is never an absence of wolves on the island, but it is possible for us to decrease the duration of this absence, when it occurs (6). Isle Royale is a beautiful national park that may be destroyed without the wolf population. Yellowstone National Park is a good example of what happened when wolves were wiped out of a large ecosystem (14). Isle Royale is much smaller, and therefore the absence of wolves would likely cause a larger impact.

The wolf population on Isle Royale is no longer stable. As mentioned, there are three wolves left- two mates and their daughter who seems to be malformed (6). This wolf pack may not last much longer (2). If the wolves on the island die out, the moose population will grow very high, affecting the trees. The trees on Isle Royale have just grown to the point that they are not being overeaten by the moose. If the moose population increases even more due to the lack of wolves, the trees will begin to be overeaten again, which will affect the whole ecosystem incredibly (9, 10).

The reason why the wolves of Isle Royale are no longer a stable population is because of inbreeding (8). Climate change is causing fewer ice bridges between the island and the mainland to form (4). This is a problem because without ice bridges to the mainland, wolves cannot travel to the island. This causes inbreeding on the island because the population is isolated. The inbreeding on the island causes genetic defects to be amplified in the wolf population. The main problem the wolf population of Isle Royale is having is a spinal defect that has become amplified by inbreeding. At this point, on the island nearly no pups have been able to survive to adulthood in recent years due to this genetic deformity and other conditions (8).

A good example of why wolves are crucial to the ecosystem is seen in the history of Yellowstone National Park. Yellowstone's wolves were absent for 70 years. That is an incredibly long time lacking one of the keystone species in the ecosystem. Yellowstone officials decided to hunt down the wolves, apparently because they were not appealing to see. They intentionally hunted down all of the wolves, and excluded them from the ecosystem for about 70 years. When the wolves were absent, the park began to lose much of its beautiful wildlife. There was too much competition among other animals because they were at their carrying capacity, and no predators were there to control them. After the wolves were reintroduced, trees grew taller and healthier, the birds began to appear again, and the wolves physically changed the land in Yellowstone. The ecosystem was all around more bright and full of life. If wolves are eliminated from Isle Royale, similar things may happen but in greater proportion since the ecosystem is smaller. The trees will become overeaten again. Without trees and vegetation, some populations in the ecosystem will decrease or leave the ecosystem, leaving it more barren and greatly changing the ecosystem (3, 14).

I believe the best option for rescuing Isle Royale would be to add some new wolves to the population as soon as possible. Since the problem's root is in humans unintentionally tampering with nature, I believe that it is our duty to rescue the ecosystem at Isle Royale. We affected the ecosystem in a negative way, and it should be our responsibility to fix it. The policy of nonintervention in this situation is null. We already tampered with the ecosystem, and we should do our best to restore it to how it once was.

At this point, genetic rescue is either impossible or highly unlikely (10). Since

wolves mate for life and the healthy wolves on the island have paired off, there is very little opportunity to introduce new genes into the wolf population already there. However, the ecosystem does not have to go without wolves for as long as Yellowstone. We can add wolves to Isle Royale so that as the last three die, the population never has to falter and can in fact grow back to what it once was. If we do not correct or stop climate change, this problem will continue to occur forever, and we will need to continue to fix the problem.

Those who say we should continue with the policy of nonintervention may not have considered the fact that climate change is the main cause of this inbreeding situation (4). We have already affected this ecosystem, and we should do our best to restore it to how it once was, or as close to that as possible.

I believe that the best course of action for Isle Royale National Park would be to add wolves from the mainland to the island as soon as possible. I believe this will cause the smallest possible impact on the ecosystem, and also will help control the moose population faster.

Thank you so very much for taking time to read this letter. I am only a high school freshman. However, these are our nation's parks and it's all of our responsibilities to ensure that the same parks we have enjoyed are available for our children and grandchildren to enjoy. Thank you again for your time.

Correspondence Type: Letter

Correspondence: My name is [...]. I am a freshman at Maine South High School in Park Ridge, 11. In our Accelerated Biology class, we learned about ecology, with an emphasis on Isle Royale. Although I have only known about the problem of the wolf decline on Isle Royale for a short period, I am interested by the problem and hope to visit Isle Royale NP and volunteer my time to the wolf-moose study one day.

The wolf-moose study on Isle Royale is a vital study for ecologists around the world. The ecosystem on Isle Royale is unique because there is only one major predator, the wolves, and one major prey, the moose. This makes an interesting and fairly simple ecosystem for ecologists to study. The study and the understanding of a simple ecosystem is very important for studying a larger, more complex ecosystem. As your colleague John Vucetich said "Studying simple things fills a niche you can't fill any other way, and provides a stepping stone to further studies."(7)

Now the entire study is in jeopardy. The health of the fragile ecosystem of Isle Royale is in danger. As of 2015, there are only 3 wolves left on Isle Royale, down 88% from 24 wolves in 2009. (Vucetich and Peterson) In my opinion; the best option to save the wolf population was a genetic rescue. (7) Because of the low number of wolves, that is no longer possible. (10) Since the National Park service is taking suggestions on what should be done on Isle Royale, (1) I believe the best option to save the wolves would be to add wolves as soon as possible.

If the health of the Isle Royale ecosystem is the most important issue at play here, adding wolves as soon as possible is the best option. The wolf population is currently severely inbred from decades of the same genes. These inbred wolves have a spinal deformity that makes it harder for them to hunt and fill their niche of the island ecosystem. Of the three wolves that are left on the island, two are a breeding pair and the third is a severely inbred pup that will probably die soon. Its is unlikely that any new wolves would mate with the current inhabitants of Isle Royale because the wolves are a breeding pair. These wolves have an extremely low kill rate (.53 wolves per moose per month) that only makes a very small effect on the moose population of 1250 currently. (Vucetich and Peterson)

The low kill rate of the wolves allows the moose population to increase 22% each year (10). At the current rate of 22% per year (assuming that the carrying capacity of the island was limitless), there would be 3378 moose on the island in 5 years. That would devastate the balsam fir population on the island; a population that was only recently able to reproduce and expand for the first time in a century. (9) The death of the tree population would cause more erosion on the land of Isle Royale, changing the geography of the island. Tree roots hold the shores of rivers and lakes together and the removal of roots would cause the shorelines to become unpredictable. (3) If nothing is done about the declining wolf population, wolves will eventually become extinct on Isle Royale. The moose population would continue to increase, only limited by starvation. The ecosystem health would be very poor because the wolves are a keystone species.

The other two options; do nothing and wait until the wolves have died to introduce new wolves, are not as effective as adding wolves to the island as soon as possible. If the National Park Service chooses to do nothing, wolves could migrate back to the island over ice bridges as in the past (10) and it would follow the current NPS policy of non-intervention. However, humans are already intervening in the natural environment of Isle Royale, from global warming decreasing the frequency of ice bridges. (8) Ice bridges have formed in the past two years but there is no guarantee that bridges will continue to form. (Vucetich and Peterson) The canine parvovirus brought by domestic dogs, devastated the wolf population in the 1980s and 2007. (7) The

non-intervention policy has already been broken to decimate the wolf population, it can be broken again to restore it. The NPS has also reintroduced wolves to Yellowstone NP in the 1990s (14), an action of the same nature as the action I propose.

If the National Park Service waits until all the wolves die to release new wolves on Isle Royale, many problems could arise. The moose population could increase to new levels and the balsam fir population could become extinct on the island before new wolves can be released. The process to add more wolves to Isle Royale should be started as soon as possible because there could be many delays from the decision to actually releasing the wolves. The sooner more wolves are released on Isle Royale, the less the damage on the ecosystem of the island.

I suggest that the National Park Service adds more wolves to Isle Royale National Park as soon as possible. The NPS mission statement states "The National Park Service preserves unimpaired the natural and cultural resources and values of the National Park System for the enjoyment, education, and inspiration of this and future generations..." (NPS). Isle Royale is one of the few natural places left in the United States. In order to preserve it, we must maintain a healthy ecosystem for future generations. The best way to preserve it is to add wolves to Isle Royale as soon as possible. Thank you for taking the time to read and consider my suggestion about the problem of the declining wolves in Isle Royale National Park.

Correspondence: To whom it may concern,

I believe that you shall maintain both. It is important to keep as many animals as we can. Because wolves will eat the sick and the old moose. Therefore you could put them in a habitat that is healthy. If the moose die out so will the wolves. Things like this may not affect our population right now but it can in the future.

Sincerely,

Correspondence: To whom it may concern,

I feel that they should maintain both because you don't need too much or too little of either animal in the world because honestly they both help each other out in nature. So if you have too little of one or too much of one then they won't be able to help each other out. So I feel that it should be equal between the two the more equal the better the animal culture will be and it might change nature. Option C maintain both it should be equal between the two shouldn't have to be very much competition.

Thank you for your time,

Correspondence: My name is [...] and I am a biology teacher at Maine South High School in Park Ridge, Illinois. I teach two classes of accelerated freshmen who investigate course topics ranging from DNA and genetics to ecology, evolution and energy. Last year my colleague [...] was introduced to the plight of the wolves and the moose of Isle Royale through a course he took on Computer Model Simulations through Northwestern University. The program utilizes WISE -Web-based Inquiry Science Environments- to allow students to run models of, in this case, ecological conditions to observe the effects on populations. Along with the simulations, our students delve deeply into an exploration of ecological topics and principles and take a detailed look at the history of Isle Royale to observe the interactions of organisms in an existing ecosystem. Our students utilized Rolf Peterson and John Vucetich's research as well as many current videos and articles available to the public. Included with this letter is the bibliography of resources students had access to throughout the unit.

This unit is incredibly engaging for students as it provides a macroscopic view of biology in action. Alternating between the ModelSims experiences and the real-life wolf and moose data is such a unique and uncomparable way to understand population ecology and the students are certainly "hooked" on the story of the island. As a culmination to the unit, we asked our students to respond to your call for input from the public regarding the situation on Isle Royale. They have written letters to you in which they express their understanding of the contributory factors leading to the instability of the wolf and moose populations and provide their recommendations for what intervention, if any, should take place.

I recognize how busy you must be and also recognize the reality that you face in making decisions about the ecosystem on Isle Royale but I did want to send along several of the most thoughtful and thorough letters written to you by my students as I promised them I would. They were excited about the prospect of sharing their work with you and were empowered by the opportunity to have a voice in determining the next steps for Isle Royale. Many wished they could deliver the letters in person and asked if our class could take a spring break or summer break "field trip" to the island to experience the place that they now know so much about! Maybe someday ...

I appreciate the work that you do and the care and respect you provide to this unique and beautiful place. Thank you so much for your time and I look forward to following the news about the future of the Isle Royale Ecosystem.

Correspondence: To whom it may concern,

I think that you should introduce wolves because it will lower the moose population and it will get rid of the sick moose before they get other moose sick. It will also help with wolf population.

Thank you for your time,

Correspondence: To whom it may concern:

My opinion on this is just to introduce more wolves, and leave the moose population alone. The moose develop over time, and the wolves take care of the sick ones. If they don't introduce more wolves cause if there not anymore wolves to take out the sick ones. The sick one are gone to get more of the moose sick. Then eventually they're all gone to be all sick and most likely die. Then the island will be empty cause there won't be wolves or moose. If you just introduce more wolves it could take care of the sick ones, and the island will never get to the point where there is nothing there.

Thank you for your time,

Correspondence: My name is [...], and I am a freshmen student at Maine South High School in Park Ridge, IL. In my accelerated biology class, we have spent the past few weeks studying the Isle Royale ecosystem, with a special focus on the interactions between the wolves and moose. As you already know, the recent data collected on the decreasing size of the wolf population is very concerning, and it could spell trouble for both the moose and vegetation of Isle Royale. As of April 2015, there remain only three afflicted wolves, and pretty soon, the majestic Isle Royale wolf will be no more. I think it would be a shame to let these wonderful creatures die out and would like to do my part as a responsible U.S. citizen by sharing my opinion on this problem.

I believe that the Isle Royale moose population is currently stable, but the wolf population is not. A stable population has the ability to maintain a relatively average size and can bounce back to this size after disturbances to the ecosystem. The wolf population, however, has encountered many conflicts which has placed them in what could be described as an almost free fall state. To begin, unintentional human interference and climate change has negatively impacted the entire Isle Royale ecosystem. By looking at my graph of the wolf population, I can see that the population was relatively stable until the early 1980s, where there was a gradual incline, then an abrupt, sharp drop between 1981 and 1982, where the wolf population went from fifty to a mere fourteen. The information provided in Case Study #3 points out that the significant decline was most likely due to a parvovirus transmitted to the wolves by a dog that a visitor had brought to the island. Unfortunately, this disease, caused by one irresponsible person, dramatically affected the wolves, and they were never able to fully recover. Another man made problem for all the organisms on Isle Royale is the warm climate changes caused by pollution. This specifically affects the wolf stability because winter ice bridges from the isolated island to the mainland are ceasing to form, leaving little chance for new wolves to naturally travel to Isle Royale and replenish the inbred gene pool (4). In fact, this inbred gene pool is perhaps the most alarming complication the wolves are facing. As seen in Case Study #3, the effects of gradual inbreeding, or mating among closely related organisms, really began taking a toll in the past decade. Specifically, this lack of genetic variety means the Isle Royale wolves have a greater chance of developing LSTV (lumbosacral transitional vertebrae); Isle Royale wolves have a 33% chance of developing LSTV compared to the usual 1%. his spine malformation pinches the nervous system and causes lack of mobility in the wolves' tails and hind legs, making it nearly impossible to hunt moose. As a result, moose numbers are relatively high because they are no longer being preyed on by wolves; from 2007 to 2014 the population increased from 385 to 1,050. Furthermore, they are only three, highly inbred wolves remaining on the island, and they appear to be a mating pair and their pup. Unfortunately, the mating pair does not look likely to breed again, and the pup is very unhealthy. It is unclear how long this one pup will survive, and it is extremely doubtful that this trio of afflicted wolves could stabilize the population on their own (10). Lastly, it is important to consider how the dwindling wolf population will affect the moose population. By looking at my graph and reading Case Study #2, it has become clear that the aforementioned climate change has impacted the moose as well. The winter of 1997 was particularly harsh, and it did not help that there was widespread of winter ticks that killed many moose, causing a sharp population drop. This resulted in the moose population falling from 2,398 to 900 in a matter of

months. While the uncomfortably warm climate and large existence of ticks plague the moose, I would still consider them a stable population since they were able to bounce back after that dreadful 1997 winter (11).

In my opinion, the best possible solution to the failing wolf population is genetic rescue by introducing several new outside wolves into the currently inbred Isle Royale wolf population. Genetic rescue could help preserve at least some of the Isle Royale wolf genes instead of just replacing them entirely with different wolves. This would allow researchers to still be able to study at least some sort of version of the Isle Royale wolf (7). Also, ecologists could be given the opportunity to study such an extraordinary modification to the ecosystem, and they could learn a lot by observing the effects of genetic rescue on the wolves and surrounding populations. Scientists have already observed the extinction of several species, such as the Yellowstone wolves, and the effects of such an extinction can often damage the remaining ecosystem (7). For example, letting the wolf population die out would cause an increase in the moose population, since the wolves would no longer be preying on them. It is possible that this absence of the wolves will cause the population to exponentially grow, as it did previously in the 1940s before wolves were introduced to the Isle Royale ecosystem. An overpopulated moose presence would be detrimental to their main food source, vegetation like the balsam fir trees. The Isle Royale plant community would see a distinct decrease due to the numerous, constantly grazing moose, and this decrease could make food a very dire limited resource for the moose (9). As I learned by using three Berkley WISE simulations, if a long-term disturbance possibly occurred while food was already limited, the moose population could face an irreversible drop. While introducing new wolves to the ecosystem after the Isle Royale population dies out could eliminate some of these dangers of moose overpopulation, who knows how the new wolves will react to the Isle Royale ecosystem? It is a very real possibility that imported wolves could reject or struggle to adapt to the ecosystem, and then we could be left with a wolf-less Isle Royale. Furthermore, I think that it is our duty to try to correct all the damage we've done to this planet. It is possible that the Isle Royale wolves wouldn't be in such a worrisome situation if the pollution and climate change we have caused hadn't manipulated their habitat. In fact, if that parvovirus hadn't been introduced to the wolves by some reckless owner's pet, then the population would not have dropped so staggeringly in the 80s (4). Since the human race is partially responsible for the wolves' problem, why shouldn't we also be a part of the solution? Personally, in this age of global warming and uncertainty, I strongly believe that we should do all we can to prevent yet another beautiful species from going extinct.

However, I can understand why some might be hesitant to attempt genetic rescue. By bringing outside wolves to the Isle Royale ecosystem, the island would no longer be free from intentional human interference. The lack of human impact on the ecosystem is what makes it so special in the first place, but really we have indirectly affected the land through our pollution and waste (9, 2). Additionally, genetic rescue leaves a small window of opportunity for the population to once again struggle against the faults of inbreeding, since ultimately the new wolves would be producing offspring with the LSTV wolves. It would take several generations of breeding this offspring with unafflicted wolves in order to massively reduce the possibility of LSTV (9). Finally, there is a significant chance that genetic rescue isn't even an option anymore considering that the remaining wolves are a mating pair and a very unhealthy pup. The mating pair may choose not to reproduce with any outside wolves, and their pup might not be physically able to. Realistically thinking, that pup might not survive long enough to mature (10). In my opinion, the benefits of genetic rescue largely outweigh the possible negatives, and I think it would be a real shame if we missed our only opportunity to save the Isle Royale wolves because we were too afraid to make a move.

In summary, I firmly believe that the Isle Royale wolf population, due to several issues such as inbreeding, disease, and climate change, are unable to maintain a reasonable population size compared to the past sixty years; therefore, they are no longer a stable population. We need to strongly consider how this will impact the surrounding ecosystem, such as moose, their main prey, and the vegetation that the wolves consume. If the possibility is even still available, I think immediate genetic rescue would be the best solution to help the dwindling trio of remaining wolves spawn healthier offspring through the introduction of new, unafflicted wolves. Thank you for listening to my concern and advice, and I trust that you will make an educated decision regarding the wolves. They are powerful, majestic beasts, and it would be a shame to risk their prosperity on an ill-informed decision.

Correspondence: Hello! My name is [...] and during the past couple of weeks my biology class has been learning about birth/death rates, disturbances, and most importantly, stability in populations; specifically the wolf and moose population on Isle Royale! After thinking about the state of both of these populations with my class, I have come to the conclusion that for many reasons, both the moose and wolf population are currently unstable. Also, soon we should perform genetic rescue to try and replenish the stability on the island or there will be serious consequences on the ecosystem health of Isle Royale.

Stability is the ability to return to an average population size after enduring disturbances that either increased or decreased the population. For many years people were able to witness stable populations of wolves and moose on Isle Royale, in fact according to our graph, from 1959 to about 2011, there were healthy fluctuations in the populations and predator-prey interactions between the 2 species.

Although the populations used to be stable, I would argue that neither of them are anymore. As you know, there are only 3 wolves left on the island as of today; most likely a mating pair and their offspring (6). This number is a sharp decline from the 19 wolves on the island in 2011. After 2011, the population decreased to only 9 wolves in 2012, 8 in 2013, 9 in 2014, and now only 3 in 2015 with virtually no hope for another pup to be produced (Graph). Another opportunity to gain new wolves on Isle Royale would be during the winter seasons and an ice bridge is able to lead to the island. Unfortunately due to climate changes recently, the winters are becoming warmer and it is harder for the ice bridge to form. Even if it did, there are no guarantees that wolves would even cross, or that they would stay on the island; this last winter the ice bridge was able to form and 2 wolves visited the island, but they left very soon after they arrived (10). In regards of the moose population, without any predators to hunt them, there is almost nothing limiting the population from booming. According to our graph, since 2011 the moose population has been doing nothing but increasing; 515 in 2011, 750 in 2012, 975 in 2013, 1050 in 2014, and finally 1250 after this years observations of the island (10). The moose population will continue to increase over the next years, making it unstable because there are no fluctuations, until there are no more balsam firs left for them to eat, damaging the balsam fir population at the same time. A lot of the plants that moose eat, like the balsam fir, take a long time to grow back, so when the moose have eaten virtually all of the plants on the island the population will plummet dramatically and it will be very hard to recover from it.

At this point, genetic rescue seems like the most logical answer to this problem. Introducing a few new wolves to the island could help with a lot of problems that caused the downfall of the wolf population, particularly inbreeding. In 1980 there were 50 wolves on the island, then Canine-Parvovirus was introduced to the wolves and reduced the population to only 14 wolves in just two years (Graph and Case Study Update #2). I believe that this disease began the downfall of the wolf population by lowering its numbers so greatly that they had no choice to inbreed. Because of how small in numbers the wolf population has been, the wolves have suffered from deformities caused by inbreeding, especially a spine deformity called lumbosacral transitional vertebrae or LSIV (Case Study Update #3). These spine deformities made it a lot harder for the wolves to hunt the moose and made it harder for the wolves to live in general. An introduction of new wolves to the population could introduce new genetic material and possibly help rid new generations of wolves of LSIV. In 1997 there was a natural genetic rescue when Old Grey Guy crossed the ice bridge and was able to breed with other wolves and create a little more genetic diversity in the wolf population (7). Although there are no guarantees that genetic rescue could save the wolf population on Isle Royale, it is better than not doing anything and creating an obvious problem.

I believe genetic rescue is the best solution at this point, but that doesn't mean that there are no flaws in this plan. For instance, there is no guarantee that the mated couple on the island now will want to breed with any of the new wolves that we place on the island. If the Isle Royale wolves refuse to mate with the new ones, the new wolves could still mate together and produce offspring, but they would have no Isle Royale wolf in them which wouldn't really make the mission 100% successful. There is also the fact that if the Isle Royale wolves do mate with the new ones, there is a chance that LSIV could be passed onto their offspring. This passing of LSIV could be seen as unethical and it would take multiple generations to get the malformation out of most wolves. Most people would also argue that adding new wolves to Isle Royale would be disturbing the completely natural state of the island. Isle Royale is one of the only places on earth untouched by humans directly, and scientists would like to keep it that way to continue the predator-prey study for as long as they can without human interference. This

argument isn't necessarily true though; some would argue that the temperature increases that aren't allowing the ice bridge to form is due to global warming which is a fault of the human population polluting the air (10).

Simply stated, I think that the wolf and moose population are both unstable at the minute and will only get worse while harming other species in the process, specifically the balsam fir tree. Although genetic rescue damages the pristine natural state of Isle Royale, it seems like the quickest and most logical solution to the problem.

Correspondence: To whom it may concern,

I think that wolves should be introduced to the island so everything can balance out. So that the moose population can be maintained by the wolves. The wolves will eat the sick and old making the moose population healthy. That's also bringing new genetic to the island so the wolves don't have to inbreed.

Correspondence: Hi, my name is [...] and I attend Maine South High School. My class has been studying the population growth on Isle Royale for about a month now. I was very surprised that this research project has been the longest continuous study of a predator-prey system in the world (13). According to Introduction to Our Class Case Study, at the beginning of this research project there were 20 wolves which were split into three packs and 538 moose living on the island. The wolf population experienced minor fluctuations throughout the first couple of years and what's interesting is that this population reached 50 wolves once in 1980. Then the following years, this population came across a wolf disease from 1980-1981, where about ~ of the wolf population was lost. Throughout the years of this research project, the wolf population has experienced MAJOR fluctuations. They've either had a dramatic increase above their carrying capacity of about 20, or dropped below that. On the other hand, the moose have had fluctuations, but they have fluctuated around their carrying capacity of about 800-900. The wolves face a bigger stability problem and it needs to be resolved as soon as possible. Everyone's concern about this research project is the wolf population and what should be done about it. There have been many ideas spread about what the final decision should be, but before that's made, my class and I have a few suggestions on how to solve this Isle Royale crisis.

A stable population is one that has enough limiting resources in their ecosystem and its birth and death rates are relatively constant, but there still are limiting factors to control the population from dramatically increasing or decreasing. There has been a lack of stability in the wolf population throughout the course of this research project and the moose population has stayed relatively stable because the wolves have been controlling it so that it does not overpopulate. One main reason that there is a lack of stability in the wolf populations is inbreeding. As seen in the graph, starting at 1982-1996, there was a huge increase in the moose population of 780 in 1982 to 2,398 in 1996, but not one in the wolf population. The wolves were still trying to recover from the parvovirus disease, which brought them down to a population of 14 in 1982 and should have been a short-term disturbance, but later turned into a long-term one. Due to this disturbance, there haven't been as many wolves to mate with, so the only option to reproduce was inbreeding, the mating of close relatives (Case Study #3: Inbreeding within the Isle Royale wolf population). Inbreeding within the wolf population increases the chance of the offspring developing a spinal deformity known as LSTV (lumbar transitional vertebrae). This spinal deformity occurs in 1 out of 100 wolves in normal populations, but on Isle Royale this deformity occurs in 1 out of 3 wolves (11). That means that 33% of the wolves living on Isle Royale have this spinal deformity. One reason why this spinal deformity is a problem on Isle Royale is because their spine is shaped differently and the nerves located there are being damaged because of the amount of movement that takes place there. It makes it harder for the wolf to hunt because of the rubbing of the vertebrae and the nerves. These wolves affected by this deformity have a slight chance of living and die faster than those who aren't affected. Due to the amount of deformed wolves and high death rates, the population started to plummet down with major fluctuations in 1982 until now. The wolves inbred to recover from all of the limiting factors that were affecting their survival and were trying to fluctuate around their carrying capacity, but from 2012 with only 9 until now with only 3, there wasn't a chance of that happening due to the amount of wolves affected by inbreeding and dying every year. In other words, inbreeding has left a negative result on the wolf population and maintaining their stability. Due to the lack of mates, inbreeding is their only option to reproduce and make the next generation in hope of it surviving. Another cause of this drop in the wolves stability is the climate change. Over the past years, Lake Superior has gotten warmer. This means that the ice bridges that used to form every winter back then, form once in a while. This is bad

because these ice bridges let wolves from other national parks or reserves crossover and mate with the Isle Royale wolves and produce more variety (4). These wolves would help lower the risk of the offspring developing LSTV. This climate change is not only affecting the wolf population, but also the moose population. According to Case Study Update #2, the climate change has been affecting the moose. The moose hate the heat and this climate change alters their eating schedule. This means that they don't eat as much as they need to in order to be prepared for the winter (11). Once winter comes they haven't eaten the amount they should, which is 30-40 pounds of vegetation each day, and they end up starving to death once winter arrives (Introduction to Our Class Case Study). In the last four years, there has been an enormous increase in the moose population, starting at 510 and increasing to 1,050 in 2014, and still growing because of the lack of predators. So it appears that the moose are fluctuating around the same carrying capacity, which means they are stable, but they will exponentially grow if all of the wolves die out. The moose population will become a problem due to the limited amount of vegetation on the island. Once that is all eaten up the moose will struggle for survival. If the moose will die out, then the vegetation they consume will have a chance to grow freely. According to John Vucetich, the wolves had crossed the ice bridge by themselves to get to Isle Royale and the result of them being there led to a control in the moose population from eating up all of the vegetation. Now the wolves are starting to die off and the vegetation is in trouble again (9). Not only has the climate change affected both populations, but also the harsh winters. The harsh winters throughout the past years could have been one of the main causes of the drop in the wolf population. During harsh winters, the cold weather had greatly impacted the vegetation giving them a shorter growing season on the island and due to this limited amount of vegetation, there had to be a lot of competition for survival. According to the graph, between the years of 1996-1997, there was a drop in the moose population because of that and there was also an outbreak of ticks that had affected the moose during those same years (11). These winter ticks had caused the population to drop from 2,398 to 900 in just one year! Unlike the wolves, the moose started to recover from this a year later in 1998 with 925 in their population. There was also a decrease in the moose population between the years of 1972 with 1243 moose to 1981 with 767. This shows how bad these harsh winters affected the amount of plant growth by having shorter growing seasons one winter after the next. The decrease in moose had caused some decrease in wolves. One of the biggest had to be a drop in the wolf population during that time period between the years of 1976, with 44 wolves, to 1977, with 34. While these harsh winters were going on from 1977-1980 there was a huge increase in the wolf population. The moose were still slowly decreasing, but that would be a result of the lack of vegetation available and the increase in predators because the wolves increase by 16 wolves. So with around 800 moose still left during the 9 years of harsh winters from 1972-1981, they had plenty of food to reproduce, but then humans brought their pets to the island and introduced parvovirus knocking out 36 wolves in just year and that's where all of the inbreeding and struggle to recover began. We see that the wolves are having a very hard time of reaching stability which is good for the moose because the lack of predators will let them reproduce better. The only bad part is that so much vegetation will be gone, so we need these wolves to come back and help take control over the ecosystem, but there are only three wolves left and so little time. What will we do?

There have been many ideas about what to do with the amount of wolves still left on the island. The biggest ideas were genetic rescue, let the wolves on the island die out and add a new population of wolves, or do nothing at all and maybe wolves will migrate by themselves to the island. Many people have suggested that the wolves on Isle Royale need a genetic rescue. We should add more wolves to the existing population, but with the amount of wolves left, it might be too late for that. Since there are only three wolves left, it would be hard for the population to regrow/reach stability. The wolves that are left have genes that code for a spinal deformity. In 2011, it was said that only 1-2 females remained on Isle Royale, which was found out by examining the scat left behind (13). This shows that if these females die out, there will be no chance of another generation. Now with the three wolves left on the island, there is a middle-aged male and female and their pup, which suffers from a spinal deformity that must have been carried and passed by the parents (6). By adding more wolves to the existing population, there may be a slighter chance of getting the deformity due to the increase of variety, like Old Grey Guy, but the offspring will still have it in their genes, whether this gene is a dominant or recessive trait. The wolves will become carriers and pass it on to future generations, like the parents of the pup seen this past winter. This can truly harm the newly added wolves. I feel that the best option for the wolves and Isle Royale is to let all of the wolves die out and then add a new wolf population to the island. There are a lot of positive benefits of having the existing wolf population die out and have new wolves added to the island and there are some negative implications about this idea as well. One benefit is that there will be fewer wolves with this gene mutation that causes spinal deformity. By letting the existing wolves die out, we will be able to start fresh with a population of wolves where 1 out of 100 have the spinal deformity. By starting fresh, the wolves may finally become a stable population and carry that out throughout the years in the future. As we can see on the graph, in 1959 (the start of this project) to 1972, the wolf population was stable because it had minor fluctuations around its carrying capacity of 20. There was a lower chance of getting the LSTV trait because all of the wolves seemed to be healthy and they could easily recover from it. By adding a fresh population once these three wolves die out, we can experience this same stability as before, from years 1959-1972. This benefit does have a negative to it. I'm afraid that once harsh winters strike again after the wolves have had a couple of years of being stable, they will go back to major fluctuations as in the past. The wolves could die off in the next 50 years and will have to go back to the same practice of inbreeding. Due to inbreeding, there will be an increased risk of pups being born with the spinal deformity again. History could repeat itself, but we all hope this doesn't happen again. Another positive benefit of starting fresh with new wolves is that there will be an increase in

predators so the moose will be controlled again and John Vucetich won't be worried about the vegetation or the balsam firs of becoming extinct due to the excessive eating of the moose (9). Since these trees take 50 years to fully regrow and the moose are constantly eating it, the moose will eventually run out of food. The balsam firs could die due to the lack of leaves available to photosynthesize and produce the necessary food that the tree needs to grow and survive. It's a good thing that these trees are tall because the moose will only eat the bottom portion of them, so the leaves will still be able to photosynthesize on the top portion (9). With predators around, it will be harder for the firs to die because not as many moose will be able to eat from those trees because they will get hunted by the wolves. This predator/prey relationship helps these trees have enough time to regrow before being eaten again. One negative implication of the amount of wolves in this ecosystem could be that a huge population boom with these new wolves could result in the moose population becoming unstable due to the amount of predators living on the island. There will be more wolves in need of food and there will start to become a decline in the moose as a result of the high demand of food for energy. Once the wolves start to overpopulate, they will hunt the moose down until extinction and the wolves will slowly die off, because then the moose will become one of their biggest limiting resources. There will be a lot of competition for survival. Many wolves will starve to death and their population will again reach instability to a certain point of having to inbreed for survival and reproduction. This all depends on the environment. Either a disease can wipe some out and the wolves can recover or they may not, like now. Also, if the moose population decreases because of the loss of vegetation, then the wolves will die and those who are left will have a limited amount of mates to reproduce with and the problem with inbreeding will return. Thirdly, another benefit with starting out fresh is that not only the wolves will have a lower chance of developing LSTV, but also there will be a greater amount of variation due to the amount of new genes being introduced into each pack. These genes, like speed, strength and immunity to disease can help the wolves survive longer, the wolves can increase and they can have a chance of recovering if there becomes a massive fluctuation in their population. With variation comes difference and that difference can be a key to survival. The climate change on the island is a disadvantage in the wolf population. Due to the climate change, if the packs in the future don't survive, the lack of ice bridges won't help them. Migration is something that gives the population variety and won't help them in the future since ice bridges don't form as often as they used to. Since Lake Superior is getting warmer every year, it gets harder and harder for the ice bridges to form every winter like they used to in the past. Now, they form once in a while and some wolves that migrate leave the island after a couple of days because of the amount of wolves left on Isle Royale (4). I'm afraid that if there is a drop in the wolf population in the future, like from 1980-1982 or from 2011 until now, and ice bridges are unable to form, the wolf population will be doomed again.

In conclusion, the lack of stability in the wolf population has had a dramatic affect on the wolves. This lack of stability has caused inbreeding to become more common since climate change has made the formation of ice bridges rare throughout the winter. Harsh winters have affected the moose by shorter growing seasons and have affected the wolves due to the shortage of moose available for them to eat. One of the negative effects of inbreeding is the development of a spinal deformity when pups are born. Now, the struggle for survival has been greater than in the past with only three wolves left. As we can see, it would be impossible for a genetic rescue to fully recover this dropping population. The best option is to let the wolves die out and have a new population added to the island in hopes of maintaining stability for a longer amount of time and put an end to the inbreeding. A new population would be able to lower the chance of having the offspring developing LSTV and getting new genes that will help them survive better than others. We can save the population by starting fresh, because the wolves won't have to suffer as much as they did in the past years. They will continue to control the population of moose and by hunting them, they will be able to save the balsam firs from becoming extinct and the moose from dying out and affecting the wolves. I hope that this has given you some ideas on how to solve this major crisis on Isle Royale and thank you for taking the time to read this letter. I hope to hear what your final decision will be and hopefully my suggestion has helped you decide on what to do as well as the suggestions from my classmates.

Correspondence: Dear: To whom it may concern my opinion is that they need to find some wolves that are close and release them with the others as quick as possible to up the population a little bit at least to get it started. And they should probably keep an eye on the moose populations, maybe that would help their growth with more food. It probably would help a bunch.

It's kind of sad that there's only two wolves left so you guys really need to try and get on your game about this scenario.

Correspondence: I'm [...], and I have some ideas I'd like to share with you. From Model 2, I know that when a population is stable, it fluctuates around its carrying capacity, without showing sharp changes. I think that neither the wolf population nor the moose population of Isle Royale has been stable. One cause for the wolves' instability is the canine parvovirus. The canine parvovirus, which came to the island because of pets in 2007, took a big toll on the wolves. (7) As the Case Study #3 graph shows, the wolf population got reduced by nearly one-third in 2007, assumably due to the virus, and has not recovered since. Another reason why the wolf population is unstable is due to the negative impacts of inbreeding, which have caused the wolf population to crash, mainly by making a deadly spine malfunction, known as LSTV, common. (6) The disease is a continuous problem that prevents the wolves from hunting well, and as a result, more moose have died from diseases than getting hunted down. (6) This is supported by the Case Study #3 graph, which shows that the number of wolves has dropped from 30 in 2005 to 3 now, while the number of moose increased. In addition to inbreeding and disease, global warming has caused instability and prevented the population from functioning normally. Normally, ice bridges form every winter, connecting Isle Royale to the mainland and allowing wolves to immigrate or migrate. (4) Because of global warming, these bridges rarely form, decreasing growth. (4) The lack of new genes also makes the wolves subject to inbreeding. (8) Because the moose and wolves have always been connected in a predator-prey relationship, (5) decreases in wolves usually increased moose. This, in turn, would decrease the amount of vegetation, consumed by moose. (6) Since wolf numbers are currently unstable and at a historic low, moose numbers are high while vegetation is also unstable and low. Using the information from Model 2, I can assume that since the vegetation is unstable, the moose will soon not have enough to eat and their numbers will dramatically decrease. Because dramatic changes characterize an unstable population, it is evident that the moose population is unstable. And because all parts of an ecosystem are connected, as I've learned through class discussions, instability of moose and wolves could soon lead to instability of the entire ecosystem. Extinction of either would be even more catastrophic. Thankfully, it is not too late. The wolves can still be saved.

If new wolves are brought to the island, then the wolf population can be maintained and the ecosystem of Isle Royale can be saved. Old Grey Guy's arrival at the island during the late 90s, when LSTV was causing the wolf population to be low, had a positive impact on the population. (8) Indeed, as the Case Study #3 graph shows, the wolf population doubled between 1998, when he arrived, and 2000. This case is an example of genetic rescue, an idea similar to mine, but the disadvantage of genetic rescue was that the population suffered genetic diseases and declined later on, as I wrote in the previous paragraph. However, if we try my idea, then genetic rescue can still happen on its own, but genetic diseases will most likely be eliminated. And as mentioned, it is important for wolves to live on Isle Royale so that the entire ecosystem remains stable. Without wolves, some of the populations of other animals will decrease and might even go extinct. This is best demonstrated with the example of Yellowstone. (3) When the wolves were reintroduced to Yellowstone after decades of absence, the whole ecosystem there improved and stabilized. (3) The amount of deer, prey to wolves, decreased to healthy numbers, increasing vegetation and other animals and eventually, even the rivers became calmer and less prone to erosion! (3) Likewise, Isle Royale will be a better, more balanced place wolves are brought over. Critics may not agree, saying that this is unnatural, but it is important to remember reasons why wolves are suffering. Their population dropped to low numbers in the first place because of canine parvovirus, which was introduced by humans. (7) They stopped growing and becoming diverse when the annual ice bridge stopped forming, a result of human-caused global warming. (4) This led to inbreeding becoming more common, causing further problems. Bringing new wolves will solve these problems.

Conversely, it might be a better idea to wait before acting, especially since the population might recover on its own, and the ecosystem of Isle Royale could be better off without human interference. Rolf Peterson, a wolf researcher at Isle Royale, argues, "[National Park Service Policy and scientists are in agreement that] ... non-interference is the best approach because we find out what natural dynamics are really like .. and there aren't too many places like this." (1) Essentially, Peterson is trying to say that the study will benefit most from non-interference. He suggests that interference might prevent the rest ecosystem from working in a natural way, damaging it. Since it's better to lose the wolf population than to risk ruining the whole ecosystem, it might be better to sacrifice wolves than put the ecosystem at risk by interfering. A similar idea is reflected behind the opinion that we should wait before adding wolves. Groups that hold this opinion include the National Park Service and US Fish and Wildlife Service (6.) They want to study the idea first, and then carry it out. The strength of this approach is that if we must, we can create a new pack of wolves any time we want. (6) And if studies reveal this is a bad idea, then Isle Royale won't have to suffer from any negative effects. Basically, Isle Royale is guaranteed to receive good treatment if

we wait. Plus, more wolves may not be needed. Natural Resources Chief Paul Brown, for example, claims, "The population of wolves fluctuates over time ... it's an island ecosystem, so things are fairly dynamic." (4) Fluctuations increase and decrease, so by saying that these drops are fluctuations, Brown is asserting that the population might be able to recover on its own. Brown's assertion is possible because the remaining wolves consist of a mated pair and their offspring, (6) and since the mated pair can still have offspring, the wolves might just be able to survive. However, Michigan Tech ecologist John Vucetich confirms that this is nearly impossible, meaning that the wolves of Isle Royale are bound to go extinct. (6)

If new wolves are brought to the island, then the wolf population can be maintained and the ecosystem of Isle Royale can be saved. A similar method worked well in the 90s, when a wolf from outside of the island came and revived the whole population, so it will work now, too. Keeping a wolf population is important for the welfare and stability of the whole Isle Royale ecosystem, which is very connected, making the existence of wolves necessary. Finally, it is important to keep in mind that this idea is not any less natural than the canine parvovirus and global warming, which are the original causes of wolf suffering, and were introduced by humans. Human damage is the reason why the amount of wolves on Isle Royale declined, so human help, in the form of new wolves, should be the reason why the amount of wolves on Isle Royale stabilizes.

Correspondence: To whom it may concern,

I think we should introduce wolves to Isle Royale. I think we should just introduce wolves because the environment may not be right for wolves anymore. With the environment warming and the lake not freezing over as much, wolves may not find the Isle Royale a suitable place for living. That being said, wolves should be introduced once to give them a chance to adapt and repopulate the island. If the wolves repopulate the island, they will handle the overpopulated moose and hopefully keep the island in order. If the wolves don't make it on the island, I think we should handle the moose populations and get them under control so they don't cause damage to themselves.

Correspondence: Dear wildlife persons, I hope you listen to this letter and all the other people's opinions. I think you should put wolves on the island and reduce the moose population so that the wolves have something to eat. Wolves need to be put back on their land so it can stay the same as before. Humans messed the wolves up because of the parvo. That humans brought in with another dog. After the wolves are brought back in never repopulate or mess with the lands wildlife again.

Correspondence: To whom it may concern, in my opinion I think that you should maintain both the wolf and moose population. That way neither will be too high or low, both will stay on a good level and you're not taking any chances with the wolf population getting too low or the moose getting too high. After introducing wolves once and bringing the moose population down once you may not have to do it again, but if it starts going bad you should always keep that option open.

Correspondence: Hello! My name is [...], and I am a freshman at Maine South High School in Park Ridge, Illinois. My accelerated biology class has spent the past few weeks learning about ecosystems and populations, going into detail on how stable systems fluctuate and the different factors that may cause these fluctuations. We have used the specific example of Isle Royale's wolf and moose populations in order to deepen our understanding. I thought that you would like to know my opinion on the situation that the Isle Royale ecosystem is in.

The wolf and moose populations on Isle Royale are unstable. In class, I have learned that a population is a group of the same species living in the same place at the same time. The wolf and moose populations are separate, but they still interact with each other, especially through the predator-prey relationship with the wolves preying on the moose as a food source. A

population is a stable system when it fluctuates around an average size. Even though the population size will increase and decrease, it remains around an average point. The populations of the wolves and moose on Isle Royale have not been steadily fluctuating in recent years. According to the graph of the wolf and moose population sizes in the past 56 years, the wolf population has been declining since 2009, when there were 24 wolves. In 2013, the wolf population size increased by only one (from eight to nine wolves), but then it went back down the next year. The population size is nowhere near the point where it used to be. Considering that there are only three wolves left on the island (a mating pair and their pup), it does not look like the population will ever be able to return to what it once was. (6) Additionally, the moose population is unstable. With the wolf population decreasing and a lack of predators on the island, the moose population has soared. The graph shows that since 2011, we have only seen evidence of the moose population increasing. There were 515 moose in this year, and in 2014 there were 1,050 moose. The moose are thriving, and since the population size is only going up and not fluctuating around the average size, the moose population is unstable as well.

I believe that in order to fix the issue of the declining wolf population and to save the Isle Royale ecosystem, more wolves need to be introduced to Isle Royale immediately. We are running out of time before the wolves completely die out, and action must be taken now so that the rest of Isle Royale's biotic factors are not negatively affected. First of all, we must take into account how much the moose population has increased in recent years. It has not been long enough to claim that there has been an exponential growth, but it will get to that point with such a lack of predation and an abundance of resources. The moose will destroy the balsam fir population, which they have done in the past (before the wolves arrived around 1950) and already started to again. With no wolves to eat the moose and control the population, there will be so many moose eating the balsam fir that the balsam fir population size will crash and go down. This could then impact the moose because they would not have a food source and the moose population would then dramatically go down. Everything is connected in an ecosystem. (9) Additionally, genetic rescue is no longer an option. A few years ago, it seemed like a great idea. However, now there are only three wolves left on the island. Two of these three are a middle-aged mating pair, and there really isn't that good of a chance that they will be interested in mating with any new wolves that are introduced to the ecosystem with the intention of genetic rescue. The third wolf, the pup of this mating pair, has only a slight chance of surviving to the age where it would be able to reproduce, due to its severe spinal deformities. Years of inbreeding within the small wolf population have caused a spinal deformity to become every prevalent within the population. This condition makes it harder for wolves to run, and therefore to hunt, and consequently, to live. Even if the pup was able to mate with another wolf, it would not really be worth it, as the offspring could easily inherit the gene that is coding for this fatal deformity. (10, 6) The other resolution is to do nothing and allow the wolf population to die out. This is truly pointless, as we know enough about how organisms go extinct. It would be more valuable to researchers if we could keep the Isle Royale ecosystem balanced and continue to study population fluctuations in this kind of pure environment. Finally, by introducing a new pack of wolves to Isle Royale, in a way we could be repairing the damage the human race has done to the ecosystem. It is the fault of human beings that a parvovirus wiped out a lot of the wolf population in 1980 (One can see how negatively the population was impacted on the graph). The wolves never fully recovered from this, and that contributed to the reason their numbers are so low as of now. Also, climate change that people have contributed to causes the ice bridge between Isle Royale and the mainland to form less often. This means that fewer wolves can cross over to Isle Royale, and there is less variation in the ecosystem's gene pool. This lack of genetic variation and the inbreeding caused the spinal deformity to exist in great numbers in the wolf population, driving its size downhill. All of this was started by humans. So, we would not really be interfering with the ecosystem by introducing more wolves; we would be working to undo the damage that was done. (9)

I understand that the main drawback of this solution is the topic of nonintervention. Isle Royale is one of the few pristine places left in this country, and people do not want to mess that up by getting involved in the populations. (9) Also, some say that we should try to save what is left of the wolf population through genetic rescue. While this is optimistic, it may be impossible. With only three wolves remaining, it would be a great feat for the population to recover. (10, 6)

The introduction of a new wolf pack to Isle Royale is the solution to the dilemma of the dwindling wolf population. Both the wolf and moose populations on the island are unstable. The wolf population has been steadily decreasing and unable to recover and return to what it once was. The moose population has been continuously increasing without showing any signs of stopping. In order to control the moose population and keep the Isle Royale ecosystem in balance, despite pleas of nonintervention, more wolves must be brought to Isle Royale in the hopes that the wolf population will be restored.

Correspondence: To whom it may concern,

I believe that more wolves should be introduced to Isle Royale while the moose population is left as it is. My reason for this thought process is that when you introduce more wolves, the moose population should be taken care of as well as the fact that the wolves will repopulate themselves. I believe that this is the most natural way to keep the wolves on the island and the moose population healthy because there isn't too much interference.

Thank you for your time,

Correspondence: Dear Ms. Green,

My name is [...] and I am a freshman at Maine South High School in Park

Ridge, Illinois. In Biology class we have been learning about Isle Royale. More specifically, we have been learning about the populations of the wolves and moose. As of this year, there are only three wolves left, an all time low and a very alarming fact. This signifies that the wolf population is unstable, and that these are not just normal fluctuations. Based on what I know, there are three possible options for what we, as humans, can do. These options are as follows: Attempt genetic rescue, do nothing at the moment then introduce a new pack in the future, or do nothing all together and let nature run it's course. The decision is not an easy one, however.

It seems clear to me that the population of the wolves is unstable. Since 2005, the wolf population has declined severely, from 30 wolves to the 3 we have left now, as we see in the graph in Case Study Update #3. Never before has there been a population this low, and it affects other populations as well. For instance, the moose population has been on the rise, as of late. In Case Study Update #3, the graph shows a clear increase of moose in the past 5 years. These two statistics are related, there is no doubt about it. Also, as the moose population rises, the vegetation that they eat, balsam fir trees, decreases dramatically. In fact, the balsam fir population has fallen to a historic low in recent years (1). The decline of the wolf population is beginning to take a toll on the entire ecosystem.

With this evidence in mind, I firmly believe that we need to intervene. I believe there is no other solution that will benefit the entire ecosystem as greatly as human intervention. In order to preserve the ecosystem, we must save the wolves. After all, humans have already interfered, introducing a disease to the wolves in 1980, causing the population to drop from 50 to 14, as shown in Case Study Update #2. The wolf population will not be able to repopulate and grow to a stable point on their own. With this being said, there are two options left: genetic rescue or adding a new pack with no intention of mating them with the current wolves. Between these two options, I believe that the best, safest option would be to let the current wolves alone, whether they repopulate or die out, and add a new pack to the island. According to John Vucetich, a Michigan Tech ecologist, there is a good chance there may be no wolves by the next winter, and the wolves are "on their deathbed." (2). Vucetich goes on to say that the presence of the wolves is not as important, however their ecological function, predation, is extremely important (2).

Without wolves, the moose population will continue to rise to extreme numbers, and the balsam fir tree population might become extinct. Without wolves, the whole ecosystem of Isle Royale will change drastically. Genetic rescue may be viewed as a viable option, but I think it is too late for that. I believe this because the three wolves on the island now -- a mating pair and their pup-- may not be able to, or want to mate with other wolves. The mating pair may be too old and will not likely be interested in other possible mates (3). The pup also seems to have genetic health issues, another problem that could arise in mating.

However, many people seem to believe that there should be no human interference whatsoever. Isle Royale, after all, is a part of nature and there is a case that it should stay that way, without any human intervention. Besides the disease humans brought in in 1980, there has been no other human interference with the ecosystem, and an argument can be made that it should stay that way. If the wolves die, they die and it's just a part of nature.

With all this research in mind, and over 50 years of population data, one thing seems clear. Wolves are important to Isle Royale. They should be there, for the other populations, for the island, and for the people who care about it. And because the population of wolves is unstable right now, we must intervene. To do this, another pack of wolves must be introduced, whether it be before or after the current wolves die out. This will preserve the current ecosystem and the populations within it.

Correspondence: My name is [...] and I am a freshman at Maine South High School. For the past month, my accelerated biology class and I have been studying populations, specifically the wolves and moose of Isle Royale. The populations of both the wolves and the moose on Isle Royale are not stable. To have stability, a population must fluctuate around an average state and return to it if it experiences a minor disturbance. These populations have not maintained an average state and therefore are not stable. The wolf population of Isle Royale was first founded when wolves crossed an ice bridge from Canada in about 1949 (Case study 3). Due to climate change, it is now less likely for the ice bridge to form, which decreases the likelihood of new wolves migrating to Isle Royale. The graph in case study 2 shows that when the wolf population was at its highest with 50 wolves in 1980, the population exponentially decayed due to the wolf

disease canine parvovirus. This disease only affected the wolf population for two years. In that time the population dropped from 50 to 14 wolves, and the population never really recovered. If the population was stable it would have fluctuated, but inevitably recovered and maintained its carrying capacity. Now that the wolf population is down to three wolves, it will be harder for the wolves to hunt the moose, resulting in an increase in the moose population.

Like the wolves, the moose population is also not stable. As seen in case study 2, the moose population had shown continuous growth in the past. The population rose from 830 moose in 1983 to 2,398 moose in 1996 due to no disturbances, no environmental changes, and fewer predators. Sadly, the severe winter and outbreak of ticks in 1996 caused the population to exponentially decay, reducing the population to only 900 moose by 1997. When there were more moose on the island, the amount of vegetation on trees decreased since that was the moose's primary source of food and energy. Another factor relating to the stability of the wolf and moose population of Isle Royale is the predator prey relationship between the two species. Now that there are only 3 wolves left, there is virtually no predation on the moose which is bad for the forest and vegetation (9). On the graph you can see that the populations of the wolves and moose directly affect each other. When the wolf population was lower, the moose population was higher. And when the wolf population was higher, there were less moose on the island. This can be seen on the graph between the years 2004 to 2011 when the wolf population remained higher on the graph than the moose population. This information justifies the statement that the populations of the wolves and moose on Isle Royale are not stable.

Now that the wolf population of Isle Royale is down to three wolves, it is time to take action. I believe that the best option there is for the dying wolf population is to let the three remaining wolves die out on their own, and then introduce a brand new pack of wolves to the island. Since there are only the three wolves left, chances are they may die off relatively quickly. This would allow for a new pack to be added soon and would prevent the moose population from growing much larger than it already has. Even John Vucetich, a Michigan Tech ecologist part of the wolf survey team, says he wouldn't be surprised if there were no wolves remaining by next winter (6). A new pack of wolves would also be good for Isle Royale because of the negative effects of inbreeding that have accumulated over generations. On Isle Royale the spinal deformity lumbosacral transitional vertebrae is quite common in the wolves and it affects their hunting ability. This trait has been passed down through the generations of the current Isle Royale wolves and remains in their gene pool (Case Study 3). Adding a new pack would eliminate the high rate of spinal deformities on Isle Royale. Introducing this new pack would also be beneficial because it would add more variety and variation to the wolves of Isle Royale. This new pack would allow the population to regrow and recover and would give the population the potential to become stable.

Although I believe introducing a new pack after the original dies off is the best solution, there may be negative implications that go along with it. For example, it could be a few years before the remaining three wolves die. This would allow for the moose population to increase by another 22% each year the wolves survive (6). An increase in the moose population would then cause a decrease in the amount of vegetation available on the trees. When the new wolves would finally be introduced, there is a possibility that years of future inbreeding could bring back the spinal deformities that were present in the original pack. And finally, there is a chance that the variation and new traits in the new pack may not be beneficial to the wolves because of the environment.

I believe that the wolf and moose populations are not stable. I truly think that the best option there is for the dying wolf population is to let the three remaining wolves die out on their own, and then introduce a brand new pack of wolves to Isle Royale. This would hopefully add variety, control the moose and vegetation populations, and remove the spinal deformities that were present in the original pack. I hope you take my idea into consideration.

Correspondence Type: Letter
Correspondence: Dear Ms. Green,

Hi, my name is [. . .]. I am a freshman at Maine South High School, in Park Ridge, Illinois. After studying Isle Royale for several weeks, I have become familiar with the moose and wolves, and the overall ecosystem. As a class we have discussed the stability of the populations, which can be defined as the ability of an ecosystem to resist change and return to "normal". We also discussed what should be done about the wolves. I think that the wolf population is not stable, however, the moose population is currently stable, but it could grow out of control if there are no limiting factors. In order to solve this issue I believe that genetic rescue is the best option. This current year is the lowest the wolf population has ever been, which has resulted in a very high moose population. Imagine what would happen to the moose population if there were no wolves on the island.

To refer back to the issue of population stability within the island, I feel that the wolf population

is not stable while currently the moose population is. In the past few years, and in prior years, the wolf population has decreased dramatically. From 2011 to 2015 (currently), the wolf population has dropped from 19 wolves to just 3 wolves left on the island (case study #3). This could be due to several factors, one of which is the spine abnormality present in many of the wolves. The spine abnormality has become more and more present due to inbreeding between wolves. Since there recently have not been many packs of wolves on the island, this has become the only option for many wolves when producing offspring. Furthermore, the ice bridge has not been consistently forming, which makes it harder for any new wolves to get on the island by themselves (4). Also, shown in resource 1, the climate change on the island makes it harder for the ice bridge to form. Not only does the warmer climate affect the wolves on Isle Royale, it also has a dramatic impact on the moose. This warmer climate allows ticks to survive more easily, therefore the tick population can continue to grow, which is harmful to the moose. Despite the ticks, the moose population has continued to increase and could eventually grow out of control. As seen in past years from 2011 to 2015 (case study #3), the moose population has continually increased. This will continue to happen if there are no predators to control the moose population. Due to the stability of the different populations on Isle Royale I feel that a genetic rescue should be done.

I believe that genetic rescue is valid and the best option for the wolves on Isle Royale, which will not only benefit the wolves and moose on the island, but the entire ecosystem. Currently speaking, this is the lowest that the wolf population has ever been, which is the main cause of the very high moose population. Imagine what would happen to the moose population if there are no wolves present. If there are no predators for the moose, the population would grow at a continuous rate and could become out of control. As seen in past years, even when the wolf population has been stable, the moose population continued to grow, such as from 1982-1984. (case study 2) Without the wolves on the island the moose can cause damage to the vegetation on the island (9). If the wolves became extinct on the island, the ecosystem would change dramatically. If wolves no longer inhabited the island, the vegetation would be at risk due to the moose, and it may eventually evolve, changing the ecosystem significantly. Before wolves arrived on the island the idea of introducing them to Isle Royale was discussed (9). This statement shows how crucial the wolves are to this ecosystem. If new wolves are added before the population dies out, it would help with the spine abnormality without letting the wolves die out. Due to inbreeding, the spine abnormality has become increasingly prevalent, although, when new wolves come to the island, like Old Grey Guy, it has proven to help this issue. Although there are many benefits, to genetic rescue, however I do realize that there are negative implications to any of the options presented regarding the issues on Isle Royale. I understand that it may be too late to implicate a genetic rescue on the island, however I strongly believe that wolves are necessary for this ecosystem to function. Another negative implication that could be brought up with genetic rescue is human intervention. Since this island is wilderness, many people including myself do not think humans should impact the ecosystem unless necessary (9). Also, the disease that was brought and climate change are effects of humans, even though we haven't intentionally impacted the island, there has already been human intervention. This time the change would have a positive impact on the island, and at this point I don't see what harm attempting genetic rescue could cause. Overall, I feel that genetic rescue could provide many benefits to the entire ecosystem on Isle Royale.

My opinion of the Isle Royale ecosystem is that the stability of the moose and wolf populations are definitely at risk. This is concerning because the wolves are crucial to the functionality of the island as a whole. I feel that genetic rescue should be done, if it is not already too late. Overall, this is what I think of the island and populations after studying and learning all about the Isle Royale predator-prey study.

Correspondence: My name is [...] and I'm a freshman student at Maine South High School in Park Ridge, Illinois. Recently in my accelerated biology class, we have been studying the population of wolves and moose on Isle Royale and the effects that they have on each other. Also, we've learned that there are many abiotic factors that have affected the wolf and moose populations as well. Throughout our studying, I've learned that a stable population is one that doesn't fluctuate too dramatically. Because of this, I think the wolf

and moose populations on Isle Royale are both unstable. The lack of stability of the wolf and moose populations is due to many temporary disturbances that can eventually be recovered by bringing more wolves to the island after the remaining three die.

Stability of the wolf and moose populations on Isle Royale has been destroyed due to many disturbances such as disease and genetic mutation for the wolves, and harsh climate and ticks for the moose. These temporary disturbances can eventually lead to a lack of food and other necessities. One disturbance that destabilized the wolf population was disease. According to my graph, it shows that in 1980 the wolf population on Isle Royale was 50. Two years later, the wolf population decreased by more than half to only 14 wolves. In Case Study Update #2, it says that this dramatic population decrease was due to a horrible disease called the canine parvovirus that was brought to the island by the pets of visiting humans. This disease was responsible for many deaths that have contributed to the instability of the wolf population. Another disturbance that unstabilized the wolf population was inbreeding. In Case Study Update #3, it says that inbreeding caused a mutation to appear in about one third of the wolves on Island Royale, resulting in a deformation of the spine. Because of this spinal deformity, the wolves have trouble running so they can't hunt their prey. According to my graph, it shows that from 2009 to 2015, the wolf population has plummeted from 24 to only 3. This shows that without being able to catch their food, the problem of inbreeding has contributed to the wolves unstable population. Although Old Grey Guy, a lone wolf who came to the island over an ice bridge, has different variations of DNA than the wolves on Isle Royale, he wasn't enough to help restabilize the wolf population by mating (7). Also, the moose population on Isle Royale has suffered from disturbances which has affected their stability. According to my graph, it shows that in 1996 the moose population on Isle Royale was 2,398. One year later, the moose population decrease by more than half to 900. In Case Study Update #2 it says that this dramatic population decrease was due to a harsh winter that brought along winter ticks and an intense competition for forage. The increase of ticks and lack of forage caused sickness and starvation among the moose population which contributed to its population's instability. Another contributor to the unstabilized moose population was the dramatic increase of their population. According to my graph, it shows that in 1983 the moose population on Isle Royale was 830. Fast forward 13 years and the moose population increased by about three times its original size to 2,398. In Case Study Update #2, it says that this dramatic population increase was due to a 13 year time period where there were no disturbances present to the moose population. According to my graph, it shows that the wolf population during this 13 year period did not increase as it was expected to with the increasing moose population. As a result of the unstable wolf and moose populations on Isle Royale, something must be done in order to stabilize both populations.

I think the most effective solution to help stabilize both wolf and moose populations on Isle Royale is to let the remaining 3 wolves die and add a few more packs to the island. As a result of this decision, there would be both positive benefits and negative implications for the wolf and moose populations. One positive benefit is that allowing the remaining three wolves to die would cut off the large risk of the current genetic mutation. In Case Study Update #3, it says that 33% of wolves on Isle Royale were born with the spinal deformity known as lumbosacral transitional vertebrae (LSIV), while only 1% of wolves in normal populations are born with it. This means that if the remaining wolves on Isle Royale were left to die, then the newly added wolves on the island wouldn't have a higher chance of receiving the spinal deformity since they won't mate with the genetically mutated ones. Another positive benefit is that more wolves will help stabilize the dramatically increasing moose population. For the past 4 years, the moose population has been growing at an annual rate of 22% (10). By adding more wolves to Isle Royale, the moose will have more predators, allowing their population to decrease to a stable point. This will also help much of the island's vegetation grow back since it has been partially destroyed due to the overpopulation of moose. Although there are many positive benefits of adding more wolves to Isle Royale, there also negative implications. Adding wolves to the island would break the law of allowing humans to interfere with Island Royale's wildlife population (9). Although adding more wolves to the island may help stabilize the wolf and moose populations, it wouldn't be done naturally such as by crossing an ice bridge. As you can see, there are both positive benefits and negative implications to this solution.

Clearly, the wolf and moose populations on Isle Royale are currently unstable due to many disturbances that have occurred. Some of these disturbances include disease and genetic mutation for the wolves, and harsh climate and ticks for the moose. Because of these disturbances, both wolf and moose populations haven't recovered. In conclusion, this problem can be fixed by allowing the remaining three wolves on the island to die off and eventually add more wolves to the island. This solution will allow the wolf and moose populations to stabilize and maintain healthy interactions within their environment on Isle Royale.

Correspondence: Dear to who it concerns,

I believe that the land should leave it alone because, things happen for a reason; and so to continue maybe wolves on the land weren't its plan. To be honest the population of the land in general is mainly moose, but as I said the land works on its own and the wolves will come or not. This is better than the rest of the options because if you bring wolves it could possibly harm the wolves coming in, because they don't know the land, nor does bringing wolves guarantee the population "refill" successful. Killing the moose is something I support, nor is moving them... for the same reasons. Maintaining the populations aren't something we should do because that wasn't or isn't natural, or what nature condones, I hope you come to a decision and the best of luck. Sincerely,

Correspondence: Hi I'm [...], a freshman at Maine South High School in Park Ridge, Illinois. Lately in my biology class, we have been studying the behaviors of the wolves and moose on Isle Royale and how they affect each other. As you know, in Isle Royale at this time, the wolf population is plummeting. The population has reached an all time low, three wolves, and we are searching for a solution to the problem. In general, there are three major options: first, we could just do nothing and wait it out until a wolf crosses the ice bridge again. Second, we could do nothing now, and introduce a new pack of wolves to Isle Royale if the wolves do, in fact, go extinct. Third and finally, we could introduce new wolves to the island now, before they go extinct. But the question is, which do we choose to do? The stability of the wolves that was once present (usually around 15-30 wolves), has now gone out the window in this ecosystem. The moose population has not skyrocketed, but there has been a steady increase in their population (according to the graph), since 2010 from 510 moose, to 1,050 in 2014, due to the drop in number of wolves. Because of climate changes, disease, and inbreeding, the wolf population has dramatically decreased within the last few years. Just a decade ago, in 2005 and 2006, there were still 30 wolves on the island. Since then, the population has dropped, increased, and gone down again. Like Charles Darwin had once said, "It is not the strongest of the species that survives, nor the most intelligent, but the one most responsive to change." This is true because the wolves were, and still are, not able to adapt, and their population has plunged.

A lot of factors led up to the status of the wolves currently. During the 1980's there was a disease spread from a dog, illegally brought to the island, to wolves. This disease had dropped the population of wolves from 50 wolves in 1980 to 14 in just two years. The wolf population hasn't risen to that total since. Another factor that has contributed to the population is the climate. Because the winters are gradually getting warmer, the ice bridge that often forms from Canada to Isle Royale has not formed as often as it had most years. Without the ice bridge, wolves cannot come to Isle Royale to add to the population. You may think that the ice bridge is a minor factor that plays out on this island, but in the late 1990's, it saved the Isle Royale wolves from most likely preceding extinction. In 1997, the ice bridge had formed, allowing wolf number 93 to cross over to the island. This wolf became known as "Old Grey Guy" because "he was physically large and light in the color of his coat,"(CS Update #3). The year Old Grey Guy came to Isle Royale, the wolf population was at 14, payable to inbreeding among the wolves. When there were low numbers like this, the mating choice is limited on the island. If there aren't many options for mating, the wolves are forced to inbreed, or mate with close relatives. Inbreeding may seem harmless, but it has had many negative effects on the wolf population. This has increased the likelihood of getting "a particular kind of spinal deformity, known as a lumbosacral transitional vertebrae (LSTV)," (CS Update #3) because of no genetic variation. The deformity causes a pinched nerve and an uneven vertebrae down the wolves' spines. The uneven spine and pinched nerves can cause the wolves much pain and make it harder to hunt. In the late 1990's, just prior to Old Grey Guy, "the expected incidence was well over 80%,"(CS Update #3) as opposed to 20%, like it was in the 1950's. Old Grey Guy had come just in time to save the population. In 2000, the population doubled from 14 to 28 in just two years. So now, when the wolf population has come to its all time low, 3 wolves, what are we to do? Do we introduce new wolves to the island and do what Old Grey Guy did, or just let the remaining three eventually die and let the wolves on the island go extinct?

The growing problem has not just affected the wolves, but the whole community. Due to less predators on the island, the moose population has grown. Like I mentioned above, the moose population has been growing since 2010 from 510 moose, to 1,050 recorded in 2014. The problem that goes hand in hand with the new population of moose, is less food for everyone. Moose typically feed on water plants and balsam fir trees. "In recent years, as the wolf population has fallen to a historic low, predation on moose has fallen virtually to zero, the moose population has soared and the fir forest is in trouble,"(9). The more moose is negatively affecting the environment by eating too many firs. The moose could permanently change the population of

producers on Isle Royale if they consume too much, and we need a solution. Genetic rescue was an option a couple years ago, when the wolf population was at 9 according to the graph, but it has gotten too late. Like this article from Michigan Tech News, it clarifies that, "with only three wolves remaining, Vucetich says, 'There is now a good chance that it is too late to conduct genetic rescue.'"(10). If we do introduce new wolves, and aim for them to breed with the remaining, the bad genes for the spinal deformity will be passed down to the new wolves and negatively affect them. We do not want to interfere too much, but we also do not want to pass down the junky genes that code for the spinal deformity, and corrupt the generations to come. We also should not just let them go extinct and maybe introduce new wolves afterwards, like John Vucetich once mentioned in a Minnpost interview from May of 2013, "we won't learn anything new by documenting the precise point when Isle Royale wolves go extinct,"(7) meaning, if we just do nothing, and wait until they go extinct, what would we get out of it? So how do we keep wolves on Isle Royale consistently without a period of no wolves when the remaining go extinct, assuming that they do? The answer is to bring wolves onto the island, but not to breed with the others, just to start their own new pack. We could put them onto the island as far away from the remaining few as possible, so that they have the least amount of chance to breed with each other. This way, the bad genes are not passed on further, there is no gap in time where there are no wolves on the island, and we have interfered as least as we can. The only negative things would be if the two different packs do breed and the deformity gene gets passed on. But, even then there will be many more wolves that it may not matter and inbreeding will hopefully not have to be an option. Doing this will keep the moose population down and replenish the island so the vegetation isn't all gone.

In conclusion, I believe that the wolf and moose population are both unstable at this point, and we need to act fast. The alarmingly low amount of wolves has affected the moose positively, but the producers of the island negatively. There may be more moose, but the vegetation is now getting worse and is decreasing in quality and quantity because of them. Now is the time to act, the time to introduce more wolves to the island without breeding and extinction. We should not let the remaining wolves go extinct unless there is another pack on the island, because I believe we should keep this study going for as long as we can, without interfering further.

Correspondence: To whom it may concern,
The best option about the wolf problem, is maintaining both the wolf population, and the moose population. You should maintain them, so the wolf population can bounce back, and the moose population doesn't become overcrowded, and end up plummeting to extinction. Another main reason why this is the best option, because the wolves don't go extinct, and the moose population doesn't become overcrowded, and the species don't become sick. If you don't take action, it will be devastating. If you introduce wolves, and don't regulate the moose, the moose will have outnumbered the wolves. Reducing the moose population drastically, and no wolves it could result in a bad situation. Maintaining both is the best way to go.
Thank you for your time,

Correspondence: I am writing to you on behalf of the current situation on Isle Royale. Our class at Maine South High School in Park Ridge, Illinois has been studying populations and food chains in school, and we have used Isle Royale as an example. I understand that you have been asking the public to provide their opinion in terms of what action should be taken in order to possibly save the wolves who are currently residing on Isle Royale. As you know, the population is not doing well, there are only three wolves left, and they seem as if they are in danger. With generally warmer climates, no wolves have been able to come to the island, and lately, the wolves have not breed well, only having one pup recently. This fluctuation is not normal, as there were 24 wolves in 2008, the numbers have not gone up since. We have learned through a number of ecosystem modeling simulations that all populations have a carrying capacity within their ecosystem, an estimated number of how many organisms can be supported by their habitat indefinitely. On Isle Royale, the wolves are definitely below carrying capacity, and if nothing is done, they may be in danger of all dying. The wolf population is unstable. In order to save the wolves, many solutions have been provided. I however, believe there is one solution that works as a strong compromise to the two major options available. I believe the wolf population should not be intervened with, nature should determine their fate, and should they die out, new wolves should be introduced to the island.

There are many reasons why this solution is the best. My choice of what should happen combines both the pros of the two major arguments, with none of the setbacks. Before I get into my solution, I believe it is best to look at the setbacks of the others. The first solution is the option of genetic rescue. This in theory, would mean that wolves would be brought over to the island, in hopes that they mate with the native wolves and are able to bring back the wolf population to stable numbers. However, there are many of reasons that this has not happened yet and why this is a bad idea. One is the fact that the wolves currently on the island have lumbar transitional vertebrae (LSTV). We learned all about this from an Isle Royale released case study. It was said that 1 out of 100 wolves suffer from this disease, but on Isle Royale, the numbers are higher because of inbreeding. If new wolves were introduced to the island, there is a probable chance that the new pups will suffer from the disease. I personally believe that it would be a terrible thing to in a way 'force' healthy wolves into having unhealthy pups. The wolves still on the island all suffer from LSTV, so it may be best to not mate them with new wolves. In addition, Michigan Tech Professor John Vucetich recorded his thoughts in a video in March 20 13 where he deals with this issue (1). He states that letting nature run its course is often the best case of action. Professor Rolf Peterson has also stated earlier this year that now it may be too late for a genetic rescue (2). Finally, as a nail in the coffin against genetic rescue, there is no clear proof that new wolves introduced to the island will even breed with those who are native. We cannot force them to breed. Basically, a genetic rescue is out of the question, a bad choice, with too likely of a probability to fail, and an even greater chance of setbacks even if it does work. One important reason action needs to be taken though is that wolves are essential to Isle Royale. Even though moose survived on the island without the wolves for upwards of 50 years, it is predicted if there were no wolves preying on the moose, the moose could grow in size and put themselves in danger by eating all the vegetation on the island too quickly. This is explained well in an article written by Keith Matheny of the Detroit Free Press (3). If there were no wolves on the island, this would be bad news for the vegetation on the island, and eventually, the moose. Letting nature run its course seems okay at first, but it can have dangerous implications.

This is where my solution comes in. I propose that those involved with Isle Royale should allow nature to run its course, but should the wolf population die out, new wolves should be introduced. This combines the ideas of both of the first two options to make a perfect solution. The rule of thumb to let nature run its course is followed, and wolves will be able to repopulate the island if the current ones die out. These new wolves would not have LSTV problems like those before them, and they would be able to stabilize the moose population before they become a danger to themselves. It really is a win-win situation, and I honestly cannot see anything wrong with this solution. Some may argue that the moose lived on their own for fifty years, but we have no data to know how many moose there were, and how this would translate to the current population of moose on the island.

Overall, by not intervening with the wolf population unless they die out, everything seems to work out. I am a firm believer that the wolf population should not be intervened with, nature should determine their fate, and should they die out, new wolves should be introduced to the island. I would like to thank you for taking your time to consider my points, and I am sure you all will make a great decision of what to do with the unstable wolf population on Isle Royale.

Correspondence: Hi, I am [...] a student at Maine South High School and for the past few weeks we have been studying the ecosystem on Isle Royale. Isle Royale is a small island in Lake Superior off the coast of Michigan. For years, people have been observing the interactions of the wolves and moose. Recently, a problem has aroused with them. Both populations are unstable. Stability is the tendency for a system to fluctuate around an average state and to return to its original state if it experiences minor disturbances. The graph in Case Study #3 shows the moose population has increased significantly in the last three years. The wolf population has been on a significant downward spiral since 2011 when there were 19 wolves. Within that year, ten wolves died leaving only nine. As of April of 2015, we are down to three wolves; a female, male, and their pup (10). Needless to say, something needs to be done. I feel the best option for the wolf population and all of Isle Royale is to wait until the wolves on the island go extinct and add all new wolves.

There was not one specific event that caused the decline in the wolf population. I believe there are many contributing factors. The first of many is inbreeding (1). The wolves have only been able to mate within the same few wolves for years. This has caused a backbone deformity called LSTV as a result of this inbreeding. In a healthy population of wolves, only 1 in every 100 has LSTV. On Isle Royale, one third of the population is affected by LSTV. This causes the wolves to be slow and not live as long as they should. If they

make it to the point of life produce offspring, their pups will have the same problem. In 1997, a wolf from Canada came over on an ice bridge. He was a strong wolf different from the typical Isle Royale wolves. They called him #93 or "The Old Gray Guy". He became the new alpha wolf. Old Gray Guy can be looked at as a small example of genetic rescue. Once he started mating with the Isle Royale wolves, the number of wolves with LSTV became less since he had not previously been exposed. In the three wolves left on the island, LSTV is still a problem that affects their day to day lives.

Another contribution to the decline in the wolf population was the introduction to canine-parvovirus. As shown in Case Study #2, in 1980, the wolf population was at an all time high of 50 wolves. That year, humans brought over a disease known as canine-parvovirus. By 1982, 36 of the 50 wolves had died, and Isle Royale was left with just 14 wolves. Although canine-parvovirus was a short term disruption and went away after these two years, the wolf population never fully recovered (1). After that the highest the population ever reached again was only 30 wolves; 20 less than it had previously been before canine-parvovirus struck the population. This is a problem brought on by us humans, and I feel we cannot just step back and let nature take its course since we have already intervened.

In addition, the wolf population has suffered due to global warming. This is another problem caused by humans. Some may say the absence of harsh winters are a good thing for the wolves, but too warm of temperatures all year round is no good either. The wolves migrated to the island over ice bridges (4). This is the same way wolf #93, a strong wolf from Canada came over in 1997. Since the climate has changed in recent years these ice bridges are no longer forming. This allows for no wolves to migrate onto the island. At the same time, this means no wolves can get off the island unless they pass; although few wolves have been recorded that migrated off the island has ever been recorded (1). Since there are only three wolves left on the island, it would have been really helpful in recent years for wolves to be able to migrate over to up the population across ice bridges. The failure to freeze the lake to form ice bridges is just one of the many causes in the decline of the wolf population.

So what now? All I have done is list problems within the Isle Royale wolf population. I believe since two out of the three major problems with the instability of the wolf population are due to humans, it is our time to step in and take action. Genetic rescue is an option to help the wolf population (7). I feel at this point, since there are only three wolves left, that is not the best option. If there were more wolves left, it would make sense to preserve the Isle Royale wolves. I believe it is not worth the risk of the Isle Royale wolves passing on LSTV to the new wolves. Plus, there is a chance the wolves already on the island will not reproduce since two of them are middle aged and the pup is said to be sick, so there is a chance he will not live long enough to reproduce. I feel the best option to help not only the wolves, but the whole Isle Royale ecosystem including the moose, is to wait until these last three wolves pass and then add a whole new pack of about 20 wolves. This will eliminate LSTV, at least for the time being. Adding all new wolves is also the best fix to the problem because we can selectively pick the wolves we think will survive best. It may be beneficial to add wolves from a few different packs to form one new pack to be placed on Isle Royale to decrease the amount of inbreeding that takes place on the island. Adding new wolves will also stable the moose population so that they will still have a predator. Adding all new wolves once the current Isle Royale wolves die is the best option for the wolf population and the rest of the ecosystem.

Although adding all new wolves seems to be the best option for Isle Royale, there may also be some uncertainty that comes along with it. When wolves first came to the island, they were healthy and there was no LSTV. It is very possible the wolves will end up inbreeding causing LSTV or other unfavorable genetic mutations to form. I feel it is still worth the risk since it did take around 50 years for inbreeding LSTV to become a major problem within the wolves. If we add genetic variation, we are not certain problems like this will even return. I also feel something is needed to be done. We cannot just let these wolves die and have the moose live with no predator (5). From the Case Study #3 Graph, we have already seen the moose population grow from 515 moose in 2011 to 1050 moose in 2014 just due to the low number of wolves that are left hunting them. Imagine what the moose population will grow to without the wolves. There is a good chance that if the moose are left with no wolves to hunt them, the moose population would keep growing to reach its carrying capacity, or maximum population Isle Royale can support, and eventually eat all the plants on the island which would ruin the whole ecosystem (6). Others may not like the idea of adding new wolves simply because it goes against the idea of observing if we step in (9). I feel humans have already touched the ecosystem by bringing in canine-parvovirus and causing global warming. Since this is a national park, we need to do what is best to help preserve Isle Royale. Others may say we should add more wolves to mate with the three wolves left on the island in order to preserve the genetics of the wolves that have been living on the island for many years. I think this is a mistake because it will pass on LSTV. The best option for helping the wolves is to add an all new wolf population back to Isle Royale once the wolves there go extinct.

The future of the Isle Royale ecosystem is not looking too promising as of now. Both the wolf and moose populations are unstable. The moose population keeps growing and the wolf population is at an all time low. In order to preserve the beauty of the island, it is our responsibility to step in. The best option in saving the island is to add a whole new wolf pack to the island once the three living wolves die. This will not only stabilize the wolf population,

but also the moose population. It will preserve the predator-prey relationship between these two animals that we have been watching for years.

Correspondence: Hi, I'm [...] a student at Maine South High School, writing to you about the Isle Royale situation with the stability of the wolves and moose. We have been talking and researching the situation in my biology class, and in my opinion the wolves and moose have opposite states of stability. The wolves are unstable while the moose are stable. A stable population is a population that fluctuates around its carrying capacity, but eventually returns relatively close to the carrying capacity. Looking at the wolves and moose of Isle Royale, the wolf population is not stable and on the verge of extinction. Whereas the moose population fluctuated due a tick virus, normal births and deaths in the ecosystem, and harsh winters, but is currently maintaining a stable population.

The wolves have had an unstable population since 2006, as seen in-on the graph from case study three, where they had thirty-two wolves and are now down to three due to limiting factors. Upon their arrival to Isle Royale the wolves have had a stable population until inbreeding, migration and emigration, parvovirus, and climate change took a toll on them. Climate change is a major factor in the deduction of the population and the problem is resulting in the melting of ice bridges. The wolves cannot cross the risky bridges and we can see from our graph that there has been no rise in population since 2009 where the wolves had a population of twenty-four (Case Study Update #3). Phyllis Green and the ABC 10 video stressed how no wolves have migrated to or emigrated from the island due to melting ice bridges (2,4). The wolves also experienced an outbreak of canine parvovirus from visiting animals which led to a great decline to the number of wolves in 1980-1982 where they dropped from 50 to 14 wolves (Case Study Update #2). Following parvovirus, it was later found that inbreeding had resulted in the spread of a spinal deformity LSTV, lumbosacral transitional vertebrae, leading to a decline in the population. Inbreeding caused such a harmful genetic disease, LSTV, that the wolf population has yet to recover from it. In 2011 a canadian wolf Old Grey Guy joined the pack and introduced new genes that helped the population (11), but after a couple years the wolves were still unable to recover from his input of genetic rescue. Therefore due to climate change, no migration, LSTV, and inbreeding, the wolf population is unstable because it has the inability to recover to its carrying capacity.

Although the moose maintain a stable population right now, they will soon become unstable if wolves are eliminated from the island. We ran a competition simulation in class and found that having too many bugs in one area created problems (Model 1). They ran out of vegetation which resulted in bug death. Comparing this to the wolves and moose, if the moose lost a limiting factor such as the wolves, then the population would rapidly grow, increasing its carrying capacity. The moose would then not have a predator, so they would eat most of the vegetation. If they ate most of the vegetation, then there wouldn't be enough food to support the large number of moose on the island, resulting in many deaths from starvation (6). Moose predate on balsam firs, and Rolf Peterson states in a documentary that if wolves were eliminated, then the moose would destroy the balsam fir population (6). Without the wolves on the island to keep the moose population under control, the lack of vegetation would create great competition and result in little vegetation and moose death. So although the moose are somewhat stable right now, that could change if a limiting factor was removed.

The wolves cannot recover to their carrying capacity due to population decline from climate, little migration, and LSTV. Meanwhile the moose population will slowly grow past its original carrying capacity. Therefore the population of the wolves are unstable and moose are stable, for the time being, and something should be done. In my opinion we should wait at this time and, sadly, let the wolf population die off so the LSTV can no longer spread through inbreeding. After waiting for a short period, we should then reintroduce a couple of new wolves from different packs to the island to stall inbreeding. Inbreeding will eventually happen, but by introducing new wolves from different packs, we can get new genes into the gene pool to prevent inbreeding for as long as we can. This solution is more reasonable than the other possible solution of genetic rescue because genetic rescue seems improbable under the condition of the current population. Genetic rescue is improbable because there are only three wolves left, a mated middle aged pair and their pup (1 0) . Researchers found that the pup seemed to look deformed or malnourished, leading them to predict that the pup most likely will not survive for much longer (1 0). I feel that since humans are the reason they were put on Isle Royale, and humans contributed to the factors that led to the fall of the population, it is only right that humans help them attempt to regain the population.

There are positives and negatives to this solution. Obviously a clear negative is that the wolves would die either way. We either let them die and then do nothing or perhaps after they die we reintroduce new wolves. Another negative is that waiting would let the moose population grow past its carrying capacity, because the wolves wouldn't be putting predation pressures on them. In this short period, the moose could do a

lot of damage to the vegetation and possibly destroy some plant populations. Also other people believe that we should restrain from human intervention and let nature take its course because the wolves had already survived for fifty-years on their own (11). On a positive note, this suggestion has many good impacts. The reintroduction of new wolves would bring new genes into the population, eliminating the genetic LSTV condition, and preventing it from passing down through generations. Also the wolves would help save the vegetation population from being overly consumed by the rising moose population. As you can see from the case studies, from 1959 when wolves were first introduced to the island, to 2012 the wolf and moose populations fluctuated with each other. Introducing new wolves to Isle Royale will allow the wolves and moose to continue to follow these fluctuation patterns.

When it comes to life, there is no right or wrong answer. There are multiple ways to approach the wolf and moose population stability issue, but I feel that letting the wolves die and then introducing new wolves from different packs after a short period of time is the best solution. It will help regulate the moose population, it will save the balsam fir population, and will eliminate LSTV by bringing new genes to the population. It's a quick way to see how the moose population stability and vegetation do without wolves, before we intervene and introduce new wolves.

Correspondence: Isle Royale is an admirably unique setting for ecological examinations to be carried out which deepen our understanding as a species of how other species interact with each other. I, [...], am an Accelerated Biology student currently studying ecology and using Isle Royale as a case study. In this letter I plan to present my humble suggestion for a plan of action to be taken by the park service supported by evidence we have analyzed in class.

I am sure that you know the current state of Isle Royale's wolf population; it is certainly one that has seen its fair share of both natural fluctuation and dangerous disturbances, but surely not to this degree. Recently, the small sliver of canines remaining on the island has become so slim that the species will undoubtedly face local extinction in a short while - possibly even this winter [10]. I believe that the most sound plan of action, both logistically and ethically, is to attempt the proposed "genetic rescue" [7]. The island is an environment of almost definite isolation, at least as far as wolves and/or moose are concerned. One "ace in the hole" present, however, was the ice bridge; now, due to climate change, it is becoming increasingly difficult for wolves to commute outside of the island on account of the warmer temperatures [4]. For this reason, we must make the assumption that new wolves can only be introduced to the island through human intervention.

At this point, only three wolves remain on the island, a shocking fact of which you must be aware [6]. If we let this rest as it is, any offspring that the trio would somehow produce would be at extremely high risk for crippling birth defects (notably: mangled and crooked spines) due to inbreeding. Statistics show that the gradual dip in wolf numbers can be directly linked to the few wolves remaining breeding with each other, among other factors such as rising moose population [15]. Continuing this logic, any wolves created from this highly tainted and messy gene pool likely would not survive very long and even less likely be able to reproduce. Inbreeding has definitely taken its toll on the population and then some - for a span after 1982, for example, the wolf numbers were going nowhere but downwards. However, an important thing to note is that 1997's unintentional introduction of No.93 "Old Gray Guy" provided much-needed genetic diversity, with numbers beginning to climb notably around two years following his introduction (after he was given time to breed and the offspring to develop) as visible on the case study graph. I argue that "Old Gray Guy" effectively saved the wolves from what could have been extinction had the course continued without him. The most logical course of action to be taken at this juncture, from my perspective, is to mimic what No.93 did to breathe new life into the ecosystem (but on a larger scale): introduce a concentrated amount of new wolves onto Isle Royale. There may be arguable ethical issues behind consciously adulterating a healthy new wolf population by releasing them into the island with the genetically inferior wolves, but I argue that the benefits of this idea outweigh the possible negative effects.

Imagine this: a new group of wolves established onto the island, if successfully integrated with the three original animals, would most likely go on to produce a lineage that would effectively rejuvenate the wolf population to its past glory. Even if their future mating never involved the original three, it is almost definite that the new wolves would mate with each other and repair the wolf-moose balance that way. This is an important factor that makes genetic rescue differ from adding wolves once the originals die out - even if the effect is the same (new wolves never breeding with the original three), their presence overlaps. This

makes sure that Isle Royale never goes without a wolf set foot on its land, a fact that fans of the island would appreciate (hence keeping public opinion on your side) as well as keeping the moose from roaming free without a predator.

If we let the wolves die out before we add more in, the moose population would reach levels that could be potentially detrimental to the ecosystem, and the trophic flow of energy would be severely disrupted [Evidence Log]. Effects such as dangerously low levels of vegetation available due to the increased moose numbers would also likely result [CS Jigsaw]. Depending on the sheer volume of moose that are produced in that period, it may be difficult for the new wolves to take the level of moose back down to a level safely congruent with the carrying capacities of surrounding populations.

In conclusion, I argue that while adding a new wolf pack to Isle Royale may be somewhat messy ethically and/or logistically, it cannot be denied that the benefits outweigh potential negatives. With a plan of action like this, the long-treasured wolf-moose relationship, unique and valuable in nature, could be rejuvenated and continued to be studied for the betterment of ecological research worldwide.

Correspondence: What other alternatives, alternative elements, or management tools should be considered?

A breeding stock of wolves should be introduced to the park as soon as possible to restore balance of predator-prey.

What issues should be considered when evaluating future management of moose, wolves, and vegetation at Isle Royale?
Restoring a healthy population of wolves will help to maintain healthy vegetation and moose population.

What type and intensity of management should the NPS consider given that approximately 99% of the land area of Isle Royale National Park is designated wilderness?

Monitor closely the introduction of wolves and reintroduce based on data.

What type and intensity of management should the NPS consider in the face of a changing climate?
Cannot depend upon the ice bridges for natural wolf introduction. Will have to be man made.

What do you like and dislike about the preliminary alternatives?
Wolf population is low. Must act now!

Correspondence: What other alternatives, alternative elements, or management tools should be considered?

Bring wolf on to island from U.P. (Illegible) Just do it.

What issues should be considered when evaluating future management of moose, wolves, and vegetation at Isle Royale?
Same thing as (1).

What type and intensity of management should the NPS consider given that approximately 99% of the land area of Isle Royale National Park is designated wilderness?

To much of management is not a good thing. Let life take care of self (ask how it was in 1940 and 1950)

What type and intensity of management should the NPS consider in the face of a changing climate?
To much management back at it in the (1940-1950) camp there (illegible)

What do you like and dislike about the preliminary alternatives?
To much meetings and tech study year. Put on island from U.P.

Correspondence: What other alternatives, alternative elements, or management tools should be considered?

Wolf augmentation is necessary to retain any moose hunting genes resident in island wolves.

What issues should be considered when evaluating future management of moose, wolves, and vegetation at Isle Royale?
The timing of any changes should be studied. We wouldnt want to introduce wolves at the wrong time of year.

What type and intensity of management should the NPS consider given that approximately 99% of the land area of Isle Royale National Park is designated wilderness?

Wolf augmentation should begin right away. No access roads should be cut.

What type and intensity of management should the NPS consider in the face of a changing climate?

I dont think that the NPS can impact climate change. They should record the effects.

What do you like and dislike about the preliminary alternatives?

No hunting of moose or wolves should ever be considered on Isle Royale.

Correspondence: What type and intensity of management should the NPS consider given that approximately 99% of the land area of Isle Royale National Park is designated wilderness?

Let me start by saying that I am 16 years old and I have visited Isle Royale and several other National Parks and really enjoyed it. I think that National Parks are a great thing. I cant say that either of the main alternatives (letting the wolves run their own course or intervening to keep them alive) is definitely the right course of action. Both have pros and cons and both make sense for the national park. I can only say that it would make me happier to know that there are still wolves on Isle Royale.

Affiliation:

Received:

Aug,10,2015 00:00:00

Correspondence Type:

Park Form

Correspondence: What other alternatives, alternative elements, or management tools should be considered?

More research in to all systems on IR and their inter-relatedness. How does ^ moose pop. Affect water ways/fishing? Involve more volunteers to come and help collect data on systems/changes. Increase public knowledge of Isle Royale and how unique and special that is.

What issues should be considered when evaluating future management of moose, wolves, and vegetation at Isle Royale?

-Impact of visitation: will people/campers not come if loss of major species?

-Why did this become so political? Should these decisions come from a greater pool of knowledgeable scientists, rather than a few park admin. Who do not study the systems involved?

What type and intensity of management should the NPS consider given that approximately 99% of the land area of Isle Royale National Park is designated wilderness?

Introduce wolves once (second choice) or maintain both species (first choice)

What type and intensity of management should the NPS consider in the face of a changing climate?

Recognize and mitigate human impact. For example, if the wolve pop. Was decimated by parvovirus from a humans dog, then seek to correct that. If inc. temps change ability of ice bridge to form, then add wolves periodically to mimic wolf migration.

What do you like and dislike about the preliminary alternatives?

Way too much politics involved, not enough science and public opinion. The NPS handling of this situation is poor based on the published science and public opinion.

Correspondence: Dear Mr. and Mrs. Isle Royale National Park People

The population of moose and wolves is a big problem. There's way too many moose in that park. They are over populating the wolves. The wolves are almost extinct! So to fix this issue I think the best option would be to maintain both types of animals. Why this option and know others? Well, it's simply because I feel that both types should be maintained because maintaining them would mean you see the changes slowly within the park, which is better than no changes at all. For example, there are two wolves on the park now which is pretty much the extinction limit, so maybe maintaining both by reintroducing a few wolves would be good. So now the wolves are introduced. You see how they are adapting. If great then after that worry about the moose. If after the introduction the population is still at the same increase or even more than reducing the population will probably be best. And after reducing, see how the other moose and wolves adapt, and act accordingly. So, in my opinion, maintaining both would be the best option.

From,

Correspondence: What other alternatives, alternative elements, or management tools should be considered? Significant weight should be given to the research of Rolf Peterson and his team, the amount of data and validity of the studies have demonstrated the effectiveness of a balanced environment. By including wolves on Isle Royale, nature will achieve balance.

What issues should be considered when evaluating future management of moose, wolves, and vegetation at Isle Royale?

There are normal ebbs and flows in nature but controlling the current do nothing approach will only do further damage. There is even impact on the loon population because of the high moose population taking vegetation that impact loon habitat.

What type and intensity of management should the NPS consider given that approximately 99% of the land area of Isle Royale National Park is designated wilderness?

General balance. There shouldn't be a population control where NPS removes animals or culls the herd of moose but by re-introducing wolves, balance can be achieved.

What type and intensity of management should the NPS consider in the face of a changing climate?

Wolves may need to be introduced from the mainland from time to time in order to maintain appropriate genetic diversity.

What do you like and dislike about the preliminary alternatives?

The process is creating such specific alternatives and delaying all action.

Correspondence: To whom it may concern,

I'm writing in regard for the wolf/ moose situation on Isle Royale. Personally I think you should try and maintain the moose population, not let it get too high, or too low. The reason being, is that letting them overpopulate is gonna rapidly decrease their food supply, causing the population to instead of just leveling out. It will just drop which would hurt the moose in a number of ways. As far as wolves go, they are a scavenger/ hunter based species they will go anywhere there is food, be it Isle Royale, or somewhere else. It's in their nature, just introducing wolves to the island isn't going to help anyone. Honestly I don't want more wolves introduced depending on their age and size, the transport from one place to another could traumatize them or make them more violent. In the end I'm trying to say, regulate the moose population, and let the wolves come and go as the please.

Thank you for your time -

Correspondence: To whom it may concern,

My plan would be to maintain both the wolves and moose because if you don't there will be all moose and no wolves. You need wolves to kill off some of the moose generation. So if there were all moose they would overpopulate and die during the winter because there is not enough vegetation for all of them. So that's why I think it would be best for them to maintain both.

Correspondence: To whom it may concern,
I think that they should maintain both wolf and moose population. The reason for that is because it will be unequal amount and, from where the wolves eat the moose it will help maintain how many moose there is. Just hopefully that the wolves won't overpopulate like it did once before, but if the wolves do get low again, that's why it's good to have a little more wolves than moose. The reason for that is because it seems even though there was more wolves than moose, the moose still came out on top. Now that there are only two wolves left you should put more wolves on the island. The reason why is so that the wolves will not die out so fast, and maybe out populate the moose. But I think that they should try to maintain both moose and wolves population.

Correspondence: What other alternatives, alternative elements, or management tools should be considered?

I think you should consider the alternative of reestablishing the caribou population on the island. They were present into the 1920s. Some believe they were extirpated due to hunting but this interaction with the newly arrived moose may also have had an effect on them. Introducing caribou would allow for an intensive research study (long-term) to determine how moose and caribou interact in a closed system. And augment the wolf population.

What issues should be considered when evaluating future management of moose, wolves, and vegetation at Isle Royale?

The wolf-moose study is iconic and identifies Isle Royale. It is what you are primarily known for. If it your BRAND. I think it is incumbent upon you to at least try to augment the wolf population with a one-time reintroduction of 10 or 15 wild wolves. If this fails, you will be able to say you tried to maintain a sustainable population to control the moose. If you decide to just let the wolves disappear and then deal with the consequences, you will be open for lots of criticism. Use adaptive management is dealing with the current situation.

What type and intensity of management should the NPS consider given that approximately 99% of the land area of Isle Royale National Park is designated wilderness?

I would like you to be much more explicit regarding how you might manage or reduce the moose population if wolves are extirpated. Does the NPS have a team of hunters or shooters to cull the moose? Would shooting them from helicopters be allowed in a wilderness area? This sort of activity would be very negative for the park managers to deal with. I think you want to avoid having to cull the moose herd.

What type and intensity of management should the NPS consider in the face of a changing climate?

If global warming continues, the problem of moose overpopulation the island may become a moot point. Warmer climate may eliminate a good share of them. Otherwise, I am unable to offer any suggestions to this scenario.

What do you like and dislike about the preliminary alternatives?

I dont mind the various alternatives you propose (see 1 above). However, I would certainly like to see some reference to adaptive management. i.e. if A doesnt work, lets move to plan B, etc, etc. Be a little more flexible. Having to choose among 1 of 6 plans feels like being placed in a straight jacket.

Correspondence: What other alternatives, alternative elements, or management tools should be considered?

Bring enough wolves to take care of the genetic problem for reproduction. Just introducing a few now will not do it. If the ice bridge allows wolves we bring in to leave that should be fine. Or mainland wolves may come across the bridge which would be great.

What issues should be considered when evaluating future management of moose, wolves, and vegetation at Isle Royale?

Keep the wolves producing in a healthy way; get enough here to keep the moose in balance so other animals and vegetation will be in a healthy spot also.

What type and intensity of management should the NPS consider given that approximately 99% of the land area of Isle Royale National Park is designated wilderness?

Collar 10 wolves to keep track of where they go and where they die. Keep the wilderness idea going with water in 2 spots and signs to a minimum. Keep the interactive presentations coming with ranger talks and updated video/multimedia presentations.

What type and intensity of management should the NPS consider in the face of a changing climate?

Since the bridge does not freeze as it used to, bringing the wolves in is a must!

What do you like and dislike about the preliminary alternatives?

Too few wolves on the first round of introducing wolves.

Correspondence: What other alternatives, alternative elements, or management tools should be considered?
I think the management should consider introducing more wolves into the island. This would help stabilize the wolf and moose population.

What issues should be considered when evaluating future management of moose, wolves, and vegetation at Isle Royale?
The falling population of the wolves and the rising population of the moose should be considered.

What type and intensity of management should the NPS consider given that approximately 99% of the land area of Isle Royale National Park is designated wilderness?
I think that the majority of the management should focus on the up keep of the campsites themselves and only occasionally manage the animals and plants.

What type and intensity of management should the NPS consider in the face of a changing climate?
Moderate management in making sure that the animals are adjusting to the changing climate of the island. And, report any damage done by climate change.

Correspondence: To whom it may concern:
I have recently read the article about the wolf and moose population. This problem is very concerning. I think what needs to be done is wolves need to be introduced one time or as many as needed, and the moose population needs to be reduced. If you introduce more wolves, they won't die off and become extinct to the island. As well as reducing moose population, because we don't want too many moose on the island. If they are steadily maintained they will not die off and keep a good population. Consider this as an option to save Isle Royale! Something needs to take action.

Correspondence: What other alternatives, alternative elements, or management tools should be considered?
The cost of these plans, both in terms of money and environmental impact should be considered.

What issues should be considered when evaluating future management of moose, wolves, and vegetation at Isle Royale?
Most certainly, the moose population and its impact on the environment of the island is something that should be central to any plan.

What type and intensity of management should the NPS consider given that approximately 99% of the land area of Isle Royale National Park is designated wilderness?
I think the best course of action is for the NPS to introduce new wolves to the island to restore the balance between the populations of moose and wolves.

What type and intensity of management should the NPS consider in the face of a changing climate?
I am not sure, but the NPS should continue to study the impacts of a changing climate, and evaluate a plan of action from that point forward.

What do you like and dislike about the preliminary alternatives?
I like that some strive to restore a balance on the island. I do not like that some could consider the culling of animals. Culling should absolutely be the last option, if it is on the table at all.

Another wolfpack needs to be brought in.

What issues should be considered when evaluating future management of moose, wolves, and vegetation at Isle Royale?
As little management as compatible with maintaining balance-all 3 should be able to keep in balance as long as one does not become dominant.

What type and intensity of management should the NPS consider given that approximately 99% of the land area of Isle Royale National Park is designated wilderness?
See #2

What type and intensity of management should the NPS consider in the face of a changing climate?
Wish we all knew.

Correspondence: To whom it may concern: I've read a lot about the moose and wolf population on the island. In my opinion I think you should maintain both wolf and moose population. If the moose population becomes too high or too low it can be fixed. You could do the same with the wolves. I believe the animals should be able to live a normal life as much as possible.
Thank you for reading,

Correspondence: To whom it may concern:
I really think you should release wolves onto the island. It's one of the least human interacion options. That way the wolves can manage the moose population like in the woods. You'll also get back the wolf-moose relationship that you had once years ago. The moose population will fall and that will give time for vegetation to grow back. I think this is the best choice for Isle Royale.
Thanks for your time!

Correspondence: To whom it may concern,

Personally, I feel that alternative concept B, introducing the wolves once, sounds like the best management plan. It seems that this option may involve the least amount of human intervention, other than taking no action, and as the park is a wilderness zone I think that the least involvement it takes to keep the island healthy and regulated, the better. Management Plan B seems like it will help the most.

Introducing wolves to the island one time will solve the low wolf population while at the same time naturally managing the high moose population. The wolves will most likely put the moose population back down to a normal level thus keeping the island vegetation from dwindling. If this plan is implemented, the wolf population will go up, the moose population will go down, and the island will balance back out.

Thank you for your time,

Correspondence: What other alternatives, alternative elements, or management tools should be considered?
Isle Royale is a uniquely isolated ecosystem with significant scientific value that extends beyond standard NPS management expectations. A

knowledgeable advisory board may be a useful management tool to consider.

What issues should be considered when evaluating future management of moose, wolves, and vegetation at Isle Royale?

Decades of research have focused attention on the intricate relationships between a balanced predator/prey ecosystem on Isle Royale. The critical issue IRNP needs to decide is whether its more important to maintain this ecosystem for continuing research or wait for random events to reshape the ecosystem.

What type and intensity of management should the NPS consider given that approximately 99% of the land area of Isle Royale National Park is designated wilderness?

Taking action or not taking action to maintain the predator/prey ecosystem both have equal weight in the potential impact IRNP will have on Isle Royales ecosystem. IRNP should manage the Islands natural resources with the best scientific and wilderness recreational experience in mind.

What type and intensity of management should the NPS consider in the face of a changing climate?

I personally hope that IRNP elects to maintain the existing predator/prey ecosystem with the reintroduction of wolves. This would provide the purest opportunity for scientists monitoring and assessing Isle Royales uniquely isolated ecosystem to identify direct impacts of climate change.

Correspondence: To whom it may concern,

The issue of Isle Royale's wolf and moose population intrigues me greatly. Ever since my zoology teacher brought up the situation to our class, it has fascinated me. I believe out of the six solutions, alternative concept B seems like the best step of action. Since Isle Royale is a wilderness reserve, little action will result in the best resolution. I believe that the reserve should be left as natural as possible, but yet wolves are needed on the island, without them, the moose will overpopulate and become a much larger problem.

Thank you for your time,

Correspondence: To whom it may concern, I personally don't think you should try to decrease anything wolves nor moose because you can help keep the populations steady and constant. But there's no reason to try to decrease either population. Absolutely no reason for it. It's cruel to kill animals just so you can decrease the population. You should have taken action earlier due to the fact we wouldn't be in this situation to begin with. People want to take action when things go bad but why not take action when everything is perfectly fine instead of letting it get ran down. But that's you guys choices there's really no point in writing this because yall aren't going to take our advice yall make the money so yall are going to do whatever yall want to do for the most money you guys can make.

Thanks for your time.

Correspondence: What other alternatives, alternative elements, or management tools should be considered?

Can birth control on a limited basis be used with the moose-tagging to see who is and is not able to reproduce? Introduce wolves on a schedule of X number of years? Ex. 5 one year, 6- 2 years later

What issues should be considered when evaluating future management of moose, wolves, and vegetation at Isle Royale?

What parts of the world would have faced similar issues- not maybe with the moose and wolves- but serious population changes. What human intervention worked, didnt- why.

What type and intensity of management should the NPS consider given that approximately 99% of the land area of Isle Royale National Park is designated wilderness?

Need active and equal input from science, invironmentalists and government

What type and intensity of management should the NPS consider in the face of a changing climate?

I get the feeling decisions have been made. Asking input is a politically correct exercise.

Correspondence: My zoology class went over your moose-wolf plan and I've decided to go with one of the options we had in class and I went with 'Introducing wolves once.' The reason I go with this is because the wolves is what really keeps everything going, running smooth like. If you introduce one female wolf to the single male wolf then it should re-populate for the wolves just by that one female wolf. The moose population decrease a little and there should be enough food to survive for winter of 2015.

Thank you for your time!

Concept B, bring in new wolves to manage the moose population. The wolf population can keep the mooses from populating cause wolves prey on moose. If you leave the mooses alone and let the wolves control it. Their would be moose on the island but just less moose and they wouldn't die from sickness or some disease and spread it to other animals.

Correspondence: To whom it may concern,
Due to climate change caused by humans I feel as if we should intervene in the Isle Royal wolf-moose-vegetation problem. We should maintain all population in this national park. The only way to keep wolves alive is to have more moose, but because people have caused global climate change these isn't enough plants to feed the moose. With the global temperatures rising it's a lot harder for moose to even survive the winter because they didn't eat much in the summer heat. The wolves on Isle Royal are extremely imbred therefore there needs to be more wolves introduced to the Island. If we don't intervene all wild life on Isle Royale will be greatly impacted, resulting in a completely abandoned island.

Definitely concept C is the best possible option. You could bring in more wolves. Bring in more moose because of the decrease in moose and wolf population. Put together a committee service team. Students, people of the committee, or people that have been put in jail or prison. They could get together with supervision by park service. They could plant the new vegetation if you need it. The park service could visit places to get best candidates to help out. Concept C will help everybody. It is the right way to go about this situation.

Correspondence: Dear Phyllis;
Tried to get my 2 cents in for the managing of Isle Royale. But- as it so happens on a regular basis, the computer and me don't work well together. After I filled out the lengthy format, I was told to correct one of my mandatory fields but before I could try, the page disappeared. So, in a nut shell, here if my opinion: Proposal A. Keep the management and intensity of it on a low level. Since it's a wilderness, let things just happen. Isle Royale will still be a great destination even without the wolves. If the moose numbers get out of control, culling or a hunt season like they do with the elk is what I favor. That pretty much sums up what I said on the computer. You guys are doing well there. God bless you.

Correspondence: To whoever it might concern,

The Isle Royale National Park is in desperat need of moose and wolf management. I think you need to maintain a steady population. I would reintroduce the moose population first and let them bounce back. Because there needs to be more moose than wolves. After the moose population increases I would then reintroduce about 10-15 wolves and let them repopulate up to about 45 - 50. Then the wolves and moose would be balanced. The wolves would keep the moose under control so the moose wouldn't eat too much vegetation and stunt their own growth.

Correspondence: Isle Royale Park, you people should maintain the populations. Which means bringing in new wolves and hunting some of the moose. There should be a limited amount of moose, just as well as the same with wolves. That is my opinion about the wolves and moose.

Correspondence ID: 2739

Correspondence: You need to maintain populations, which could include reintroduction. You need to hunt the moose, and bring in new wolves and go from there. If there are only a few wolves, the moose are taking over the island, eating all the plants, the wolves can't do anything about it. There just aren't enough wolves to run the island. After you get the wolf thing in order, then everything will be fine.

Correspondence: Dear Isle Royale National Park,
I believe you should reestablish and bring new wolves in. Especially female and also have male and see how that goes. Probably will develop and have no moose management, or maybe some. If you would let male and female wolves together it could probably develop more wolves. I'm not saying have no moose management but not have a lot.
Sincerely,

Correspondence ID: 2741

Correspondence: Dear Isle Royale National Park
I love animals so much. Therefore my opinion is quite strong. I think you all should just leave these animals alone unless they get sick. When they get sick, they need help. But after the wolves and moose die you should go save some and put them in the park. I just believe all animals deserve respect and love.

Correspondence: What other alternatives, alternative elements, or management tools should be considered?
I favor alternative B or C where both populations of wolf and moose are maintained.

What issues should be considered when evaluating future management of moose, wolves, and vegetation at Isle Royale?
Ecological balance between wolf and moose.

What type and intensity of management should the NPS consider given that approximately 99% of the land area of Isle Royale National Park is designated wilderness?

Some management of the wolf/moose population needed to restore a balance to the system.

What type and intensity of management should the NPS consider in the face of a changing climate?
Management should be based upon research and scientific data.

What do you like and dislike about the preliminary alternatives?
I am in favor of introducing a breeding pair of wolves to the island.

Correspondence: What other alternatives, alternative elements, or management tools should be considered?
I support introducing additional wolves to allow the population to increase over time.

What issues should be considered when evaluating future management of moose, wolves, and vegetation at Isle Royale?
Maintaining a balance similar to the historical balance that sustained the environment for so long makes sense to me.

What type and intensity of management should the NPS consider given that approximately 99% of the land area of Isle Royale National Park is designated wilderness?

If it is to remain the type of wilderness that it has been, I believe it needs intervention by man before it is too late.

What type and intensity of management should the NPS consider in the face of a changing climate?
Assessment and adaptation over time seems best. Its difficult to know the future with certainty.

What do you like and dislike about the preliminary alternatives?
I wonder whether they are based on the advice of local experts.

Correspondence: What issues should be considered when evaluating future management of moose, wolves, and vegetation at Isle Royale?
Wolves and moose. Maintain both moose/wolf populations. Deploy alternative B and C immediately.

What type and intensity of management should the NPS consider given that approximately 99% of the land area of Isle Royale National Park is designated wilderness?

Management should be based on scientific knowledge and recommendations

What type and intensity of management should the NPS consider in the face of a changing climate?
NPS should factor in predictions by scientists as well as the experience of those who have witnessed climate change impact.

What do you like and dislike about the preliminary alternatives?
The issues which should be considered are the loss of a historically important wolf presence on Isle Royale and the recommendation of scientists especially Rolf Peterson to reintroduce wolves to help carefully manage the moose population.

Correspondence Type: Park Form
Correspondence: What other alternatives, alternative elements, or management tools should be considered?
Develop a moose/wolf management team. This team would have representatives from all areas (policy, wildlife management, botanical life). Their team would design a place for scientific monitoring and maintain populations.

What issues should be considered when evaluating future management of moose, wolves, and vegetation at Isle Royale?
Economic issues appear to biggest concern. This is the least visited National Park and people are wanting to experience being in a place where both moose/wolves reside. Wolves complete the picture and serve to keep the island in balance.

What type and intensity of management should the NPS consider given that approximately 99% of the land area of Isle Royale National Park is designated wilderness?

The wolf population needs to be viable. Reintroduction of fresh genetics appears to be a simple solution and could take care of moose and vegetation concerns.

What type and intensity of management should the NPS consider in the face of a changing climate?
Climate change is unpredictable and would pose reactive management plans. Not really sure if it is sustainable to manage for climate changes. That would be a waste of \$\$?

What do you like and dislike about the preliminary alternatives?
I appreciate the wilderness designation and can appreciate hands off approach, however this is an island and dependent on wolves and moose as part of its legacy. Keeping the wolf population viable is the best alternative. One time reintroduction seems worth a shot and may be a necessity in this case. The other alternatives create more expense to the pack in the long run. More managers, less visitors, more staff \$\$\$.

Correspondence: What other alternatives, alternative elements, or management tools should be considered?
Being that this area is such a closed system and perfect for study I believe the wolf population should be reintroduced and monitored. The wolves know what moose need to be taken.

What issues should be considered when evaluating future management of moose, wolves, and vegetation at Isle Royale?
Wolves reintroduced, continued support for the research that is currently being done and any future research.

What type and intensity of management should the NPS consider given that approximately 99% of the land area of Isle Royale National Park is designated wilderness?

You let people and boats in- and they are more detrimental to the area. This is such a unique place and the animal population needs help NOW!

What type and intensity of management should the NPS consider in the face of a changing climate?
There will be no more moose or wolves crossing over- so, in order to protect the moose from over population and possible starvation-wolves need to come back!

What do you like and dislike about the preliminary alternatives?
Too slow!

Correspondence ID: 2748

Received: OfficialRep
Correspondence Type: Park Form
Correspondence: What other alternatives, alternative elements, or management tools should be considered?
Not sure!

What issues should be considered when evaluating future management of moose, wolves, and vegetation at Isle Royale?
In that the current wolf/moose population does not seem to be human-caused the option of not actively managing moose, wolves, and vegetation should be chosen in a National Park where nature by law should be allowed to take its natural course as has been the case with Isle Royale since it was founded.

What type and intensity of management should the NPS consider given that approximately 99% of the land area of Isle Royale National Park is designated wilderness?

Leave it alone unless humans create problems. If the wolf/moose problem were human-caused, favor option 3, manage wolf by supplementing the current wolf population or introducing wolves following extirpation. There are plenty of wolves around to supply new genetics and wolves with the least cost \$\$!

What type and intensity of management should the NPS consider in the face of a changing climate?
Some management will be needed because much of the current climate change appears to be human-caused. Changes certainly should be monitored to document ecological changes as part of science.

What do you like and dislike about the preliminary alternatives?
I dont think options 2 and 4 are doable, reasonable, or financially possible.

I just got back from IR Aug. 30, 2015 so just had to respond.

Correspondence: What other alternatives, alternative elements, or management tools should be considered?

I believe the importance of genetic infusion to the wolf population a couple of years ago would have been helpful. Since that time has past introducing new wolves is essential to the balance of the moose- wolf- management plan.

What issues should be considered when evaluating future management of moose, wolves, and vegetation at Isle Royale?

I believe paying attention to the collection of data collected via the Petersons long study is essential to a healthy, balanced system.

What type and intensity of management should the NPS consider given that approximately 99% of the land area of Isle Royale National Park is designated wilderness?

I realize that Isle Royale is 99% wild, but surrounding areas are not abundant in supplying wolves and Lake Superior shoreline becomes more inhabited. Environmental changes impair ice travel as well.

What type and intensity of management should the NPS consider in the face of a changing climate?

I think genetic diversity should be introduced to the wolf population pronto! Balance had lasted for several generations- further study will contribute to intensity (illegible).

What do you like and dislike about the preliminary alternatives?

Doing nothing has almost killed the wolves. Eventually that change will eliminate the moose as vegetation is ruined. Will the park be as attractive with vegetation removed?

Correspondence: What other alternatives, alternative elements, or management tools should be considered?

We visited Isle Royale this last summer. These topics were discussed with my 9 and 12 yr. old grandkids. There are their solutions.

Combination of Concepts C & D. Reintroduce wolves in a systematic manner. Reduce moose density by moving healthy moose to the mainland where the moose population is declining.

What issues should be considered when evaluating future management of moose, wolves, and vegetation at Isle Royale?

Balance natural changes with decimation of eco system.

What type and intensity of management should the NPS consider given that approximately 99% of the land area of Isle Royale National Park is designated wilderness?

Management should be minimum to prevent erosion of vegetation and maintain healthy moose and wolves, etc.

What type and intensity of management should the NPS consider in the face of a changing climate?

Same as above.

Correspondence: What other alternatives, alternative elements, or management tools should be considered?

None

What issues should be considered when evaluating future management of moose, wolves, and vegetation at Isle Royale?

One thought is that the Island could lose its attraction of tourist to see moose or wolf, but again I think the attraction of the Island should be for its pure wilderness. You dont always see a moose and rarely a wolf.

What type and intensity of management should the NPS consider given that approximately 99% of the land area of Isle Royale National Park is designated wilderness?

Maintain as what was done in the past; dont choose alternative ways.

What type and intensity of management should the NPS consider in the face of a changing climate?

None. I think if man tries to intervene you upset the balance of nature.

What do you like and dislike about the preliminary alternatives?

I believe alternative concept A is the only choice. I believe nature has its own way of making things right and when man interferes it offsets the balance of things.

Received: Aug,29,2015 00:00:00
Correspondence Type: Park Form
Correspondence: What other alternatives, alternative elements, or management tools should be considered?
I like the options that involve wolf augmentation and introduction to mimic a migration event. It seems silly to bound yourselves in by limiting it to only a one-time event right out of the gate. Better monitor and see how it goes&

What issues should be considered when evaluating future management of moose, wolves, and vegetation at Isle Royale?
Scientific value. (which strategies offer scientists the best conditions in which to answer important questions?)
Political value (do certain approaches help to build a larger public constituent supportive of conservation and the environment?)

What type and intensity of management should the NPS consider given that approximately 99% of the land area of Isle Royale National Park is designated wilderness?
Probably the ones that do not involve shooting moose.

What type and intensity of management should the NPS consider in the face of a changing climate?
Whichever strategies the NPS and other experts deem will maximize the scientific and political value of the park. (see above for definitions of scientific and political value)

What do you like and dislike about the preliminary alternatives?
I like the idea of wolves and moose on the island. I do not like the idea of using semi-automatic weapons in the wilderness. Can the park teach us important things about climate change that might help solve/mitigate climate change?

Correspondence ID: 2757
Moose-Wolf-Vegetation Management Plan/EIS

Correspondence Type: Park Form
Correspondence: What issues should be considered when evaluating future management of moose, wolves, and vegetation at Isle Royale?
The island (and both moose population and vegetation_ need a predator for balance.

What type and intensity of management should the NPS consider given that approximately 99% of the land area of Isle Royale National Park is designated wilderness?
Keep it wild. Maintain a health predator/prey balance.

What type and intensity of management should the NPS consider in the face of a changing climate?
Monitor and adjust as needed, but as hands-off as is possible.

What do you like and dislike about the preliminary alternatives?
Like: Alternative C: We need active reintroduction of wolves, and need to do it before the existing wolves are gone. The wolves know how to hunt moose.
Do not like: A: It is not working anymore
B: Not is it means waiting until they are gone
D: No hunting on Isle Royale
E: Lets the wolves die out and a predator is needed
F: Same as above. Just do like the vegetation restoration.

IRNP Moose-Wolf Vegetation Plan

The no action alternative, a continuation of current management practice is not a desired choice as it will likely result in the extirpation of the wolf and increase of the moose population, resulting in depletion and damage to the existing vegetation as has been observed in the earlier moose population crashes prior to the appearance of wolves on the island.

A one time introduction of wolves is a short term solution. The results of this have been demonstrated in the past as inbreeding and resulting genetic abnormalities manifest in future generations weakening the population and leading ultimately to extirpation of the wolf.

The alternative that maintains both species that includes introducing new wolves but with the periodic infusion of new wolf genetics every 10-15 years is closest to finding a long term solution to the challenge of maintaining a sustainable balance. I would highly recommend that Alternative C read close to; "maintain populations of moose and wolves on the island, which shall include wolf reintroduction and periodic genetic refreshment through new wolf introduction."

The three remaining alternatives D, E, and F are like alternative concept A and so are not favored because of the end results that will lead to habitat depletion and damage to the existing vegetation. Managing the moose population through "culling" and relocation efforts would be costly, time consuming, and undesirable. If moose are culled through "hunting" or by federal or contracted animal control sharp-shooters the idea of "wilderness" on the island is compromised even more so than it already is with the presence of the National Park and associated recreational uses. The results of the moose harvest would likely be used off island when a moose carcass is removed from the island that concentration of resources is no longer available for use by island species and is no longer present in that system.

The current resource manager and staff (or lack of staff) does not have the funding or knowledge to maintain the resource by inventorying exactly what exists, monitoring current species status, and determine how to best manage and remove invasive plant species. They have to depend on volunteer help for this. It is doubtful that the National Park Service, Fish and Wildlife Services, and other governmental agencies required to manage will have sustainable funding sources to continue a long term culling program. Resource management staff will become nothing more than moose ranchers.

As alternative to "hunting" moose as a management tool might be to consider a biological control by introducing a method of birth control, additional parasites that would reduce numbers through stress elevation or outright killing the individual using a bacterial or viral infection method that would be of a contagious nature to the moose population.

But why are we not thinking about climate change and the impact it is having on moose and other species. Isle Royale may end up serving as a last refuge for moose in the lower latitudes of North America and will be needed as the source for reintroduction efforts in the future. All the more reason to be good stewards of the island and it's residents. The wolf is the best manager for this ecosystem requiring only a healthy habitat, plenty of food and occasional genetic refreshment. Wolves prey on a number of species: moose, beaver, and snowshoe hare. Three herbivores that left unchecked, will have a devastating affect on island plant communities. With the increase in these larger herbivores the carrying capacity for a number of species dependant on this island habitat will collapse. Accounting for these three species, moose are the least selective in their food choices; although balsam fir, a preferred species, risks extirpation if moose numbers increase. Exclusion structures demonstrate the impact these three herbivores have on the plant communities. Deep snow keeps some protected from snowshoe hare because these animals only eat what is exposed. They do not dig under the snow for food. Aquatic exclusion devise data and photographic evidence demonstrates that beaver are selective in the plant materials they eat. Moose are not as discerning and eat everything they can reach.

This major habitat destruction has severe impacts on other aquatic lifeform requirements like fish and macroinvertebrates food and cover needs. Reduction in these species have cascading effects along the entire food web that include fish, waterfowl, osprey, kingfishers, and young loonlings along with many other species.

A kill made by a wolf provides food for a number of animal species and nutrient dispersal for plant life. Portions of the carcass not immediately consumed by the wolf are available to the raven, red fox, grey jays, woodpeckers, and others. Numerous invertebrates count on the available nutrients. The bones and antlers scattered about provide sources of minerals for red squirrel, snowshoe hare, and others. What nutrients that remain scattered by the wolf fertilize the plant communities at and around the "kill site". The local fungi and microbes benefit as well, recycling the nutrients back through the island system.

The wolf serves as a moose protectorate in another capacity. As climate change warms the area the white-tailed deer population continues to move farther north displacing moose and transporting with it a parasitic brain worm, lethal to the moose. As Lake Superior waters warm white-tailed deer reaching Isle Royale with the potential of carrying this parasite of CWD (chronic wasting disease) is a real threat. The wolf would serve at the moose's first line of defense against this threat.

A sustainable wolf presence on Isle Royale is the key to maintaining a healthy and biodiverse island habitat.

It took a number of years for Aldo Leopold to realize the importance of a sustainable predator-prey association with regard to maintaining a healthy diverse plant community that so many other species depend on. Isle Royale needs the wolf. That animal was doing the right thing long before homo sapiens set foot on this continent.

Thank you.

Correspondence: Dear Concerned Parties:

I am writing to you as a citizen of the United States and a long-time supporter of the US national parks. My husband and I have visited many national parks in the past decade, and I was very fortunate to join the Road Scholar program on a week-long visit to Isle Royale last fall. It was a beautiful trip to a very remote area. I was able to learn about the flora and fauna of the islands eco-system, and, in particular, I felt privileged to meet Dr. Rolf Petersen of Michigan Technological University and his wife Candy and to learn about the wolf and moose who live on Isle Royale. This experience compels me to write to you and to express my opinion on the policies that will affect the status of the wolf population on Isle Royale National Park.

It is my understanding that the wolf population on Isle Royale is approximately three (3) wolves, possibly two (2) as some reports have indicated that one

(1) of the remaining wolves recently killed another of the wolves, a pitiful situation for a long, proud, and enduring wolf population on Isle Royale. I believe that the National Park Service (NPS) has been concerned about the diminishing wolf population on Isle Royale for many years, and it has long been exploring possible options to address the issues created by the diminishing wolf population.

It appears that the options have settled around the following three (3): (a) do nothing, even if wolves go extinct; (b) allow wolves to go extinct (if that is what they do), and then introduce a new wolf population; or (c) conserve Isle Royale wolves with an action known as genetic rescue by bringing some wolves to the island to mitigate wolf in-breeding.

I strongly support Option C to introduce a genetic rescue for the Isle Royale wolf population, even with only 2-3 wolves left remaining on Isle Royale. It seems that official inaction has forced in-breeding issues and problems that are or were part of the wolf pack(s) on the island and has almost forced the adoption of Options A or B by default, but perhaps there is still a window of time-sensitive opportunity to put Option C - the genetic rescue - into effect. If the remaining 2-3 wolves die, then I would support Option B as a secondary measure. I do not believe that Option A - wolf extinction on the island - is a viable and/or responsible measure for the ecosystem on the island. I also believe that it flies in the face of so many recent successful efforts to actually reintroduce wolves into wildlife habitats where they had been extinct.

I strongly support Option C because the study of the wolf and moose population through the Wolf-Moose Isle Royale Study is the longest-running research effort on the predator-prey relationship IN THE WORLD. It is rare that we are able to obtain, record, and analyze data from a 50 year evolutionary biological study of this kind. The Wolf-Moose Isle Royale Study should be maintained for this reason alone.

Even with the 2-3 wolves left on the island (and even with the issues that have evolved from in-breeding), there remains a genetic pool that should be saved. To allow the extinction of the current wolves on the island, and permitting the introduction of a brand new wolf population, is starting ALL OVER AGAIN with entirely new subjects and may (probably will) significantly reduce the relevance of 50 years worth of carefully and respectfully obtained data from a biologically-related set of wolves that have lived and died on the island. Wolves with no connection to the Isle Royale family will have to be introduced to produce a viable pack (or pack[s]) on the island, so new genetics will be introduced into the data, but there will be existing data with which to compare it.

I believe that Option A is not an option for Isle Royale for the simple reason that, now that there are (and will be) few or no predators (wolves) on the island, there are an overwhelming number of prey (moose), and the eco-system on the island will be significantly damaged. It is my understanding that the moose population on Isle Royale has doubled, and the flora upon which the moose feed (including the balsam fir trees and the vegetation that grows in bogs and ponds) is greatly threatened, which in turn threatens the ecological life of the bogs, ponds, and forests. Dr. Peterson estimates that it is possible for a catastrophic die-off of the moose of Isle Royale because so many of them will destroy their own environment on the island (Detroit Free Press, January 11, 2015). This is not an acceptable outcome under any circumstance.

Preserving and maintaining a strong Wolf-Moose of Isle Royale Study and saving the ecological health of the 260-square miles of a remote, pristine, and beautiful island in Lake Superior are the two (2) most important reasons that I believe that the NPS should begin a genetic rescue of the wolf population on Isle Royale. Further delay and study and consideration only reduces the chances of success with the genetic rescue.

I believe it is important to point out that I feel the wolf is a greatly misunderstood and misaligned creature. The wolf has actually never been a threat to anything except the livestock of human beings who have overtaken and destroyed the wolves natural habitat. I think it is worthwhile to save one (1) small healthy population in one (1) small healthy habitat for this majestic animal.

Thanks very much for your consideration. Please do not delay; take action on the genetic rescue as soon as possible. It only takes one wolf.

It appears that the options have settled around the following three (3): (a) do nothing, even if wolves go extinct; (b) allow wolves to go extinct (if that is what they do), and then introduce a new wolf population; or (c) conserve Isle Royale wolves with an action known as genetic rescue by bringing some wolves to the island to mitigate wolf in-breeding.

I strongly support Option C to introduce a genetic rescue for the Isle Royale wolf population, even with only 2-3 wolves left remaining on Isle Royale. It seems that official inaction has forced in-breeding issues and problems that are or were part of the wolf pack(s) on the island and has almost forced the adoption of Options A or B by default, but perhaps there is still a window of time-sensitive opportunity to put Option C - the genetic rescue - into effect. If the remaining 2-3 wolves die, then I would support Option B as a secondary measure. I do not believe that Option A - wolf extinction on the island - is a viable and/or responsible measure for the ecosystem on the island. I also believe that it flies in the face of so many recent successful efforts to actually reintroduce wolves into wildlife habitats where they had been extinct.

I strongly support Option C because the study of the wolf and moose population through the Wolf-Moose Isle Royale Study is the longest-running research

effort on the predator-prey relationship IN THE WORLD. It is rare that we are able to obtain, record, and analyze data from a 50 year evolutionary biological study of this kind. The Wolf-Moose Isle Royale Study should be maintained for this reason alone.

Even with the 2-3 wolves left on the island (and even with the issues that have evolved from in-breeding), there remains a genetic pool that should be saved. To allow the extinction of the current wolves on the island, and permitting the introduction of a brand new wolf population, is starting ALL OVER AGAIN with entirely new subjects and may (probably will) significantly reduce the relevance of 50 years worth of carefully and respectfully obtained data from a biologically-related set of wolves that have lived and died on the island. Wolves with no connection to the Isle Royale family will have to be introduced to produce a viable pack (or pack[s]) on the island, so new genetics will be introduced into the data, but there will be existing data with which to compare it.

I believe that Option A is not an option for Isle Royale for the simple reason that, now that there are (and will be) few or no predators (wolves) on the island, there are an overwhelming number of prey (moose), and the eco-system on the island will be significantly damaged. It is my understanding that the moose population on Isle Royale has doubled, and the flora upon which the moose feed (including the balsam fir trees and the vegetation that grows in bogs and ponds) is greatly threatened, which in turn threatens the ecological life of the bogs, ponds, and forests. Dr. Peterson estimates that it is possible for a catastrophic die-off of the moose of Isle Royale because so many of them will destroy their own environment on the island (Detroit Free Press, January 11, 2015). This is not an acceptable outcome under any circumstance.

Preserving and maintaining a strong Wolf-Moose of Isle Royale Study and saving the ecological health of the 260-square miles of a remote, pristine, and beautiful island in Lake Superior are the two (2) most important reasons that I believe that the NPS should begin a genetic rescue of the wolf population on Isle Royale. Further delay and study and consideration only reduces the chances of success with the genetic rescue.

I believe it is important to point out that I feel the wolf is a greatly misunderstood and misaligned creature. The wolf has actually never been a threat to anything except the livestock of human beings who have overtaken and destroyed the wolves natural habitat. I think it is worthwhile to save one (1) small healthy population in one (1) small healthy habitat for this majestic animal.

Thanks very much for your consideration. Please do not delay; take action on the genetic rescue as soon as possible. It only takes one wolf.

Correspondence: By late 2013, we knew what needed to be done, short-term. We have lost two years, and we cant afford to waste two more. It was not altogether a good thing that we got channeled into the vegetation/climate/wilderness longer-range components. It has prevented us from a timely attempt to deal with the wolf aspect. Please see the 5 space below, for additional.

What issues should be considered when evaluating future management of moose, wolves, and vegetation at Isle Royale?
The plan must allow for continuous adjustment. It must be a living plan, not one which locks actions for 10, 5, or even 2 years. It should consist of introducing a few (4-6?) wolves as soon as possible, then observe, for maybe 2 years, what happens to moose, wolf, vegetation, et al., then in timely fashion, make adjustment.

What type and intensity of management should the NPS consider given that approximately 99% of the land area of Isle Royale National Park is designated wilderness?
Respectfully, I think we bit off too much at once. Give this question some time, do our best with the wolf question, and see how things go.

What type and intensity of management should the NPS consider in the face of a changing climate?
Mother Nature, as always, will fail our best attempts to artificially shape or control the climates effect. Dont try to do too many things as once. We know the effect the moose-wolf balance has on vegetation. Handle that one, to the best of our ability, now.

What do you like and dislike about the preliminary alternatives?
The Humane Soc. Representative who recently visited the area suggested using problem wolves for re-supply, an interesting idea. I disagree with his idea of introducing just one family unit though- I think we need as much diversity of genes as possible in that first attempt.

Correspondence: What issues should be considered when evaluating future management of moose, wolves, and vegetation at Isle Royale?
Balance and pre-development state.

What type and intensity of management should the NPS consider given that approximately 99% of the land area of Isle Royale National Park is designated wilderness?

NPS should be proactive in returning Isle Royale to its natural state (before mining, lumbering, and vacationing). Additional wolf packs should be introduced to various parts of Isle Royale NP.

What type and intensity of management should the NPS consider in the face of a changing climate?

Advocate for slowing down climate change.

What do you like and dislike about the preliminary alternatives?

Alternatives that do not reintroduce additional wolf packs to Isle Royale will ensure the extinction of wolves on Isle Royale and uninhibited growth in moose population.

Correspondence: What other alternatives, alternative elements, or management tools should be considered?

Maintain the introduction of wolves over time. If a one time introduction doesnt create a viable population then further introductions may be advisable.

What type and intensity of management should the NPS consider given that approximately 99% of the land area of Isle Royale National Park is designated wilderness?

Air plane surveys with a grid map are probably the most accurate and leave invasive methods of counting.

What type and intensity of management should the NPS consider in the face of a changing climate?

None- Theres nothing that can be done. The animals will adapt or leave, or die.

What do you like and dislike about the preliminary alternatives?

I like the introduction of wolves to expand the gene pool. The moose culling must be done without taking the big dominant bulls. There are the best breeders and by reducing the gene pool is weakened.

Correspondence: What other alternatives, alternative elements, or management tools should be considered?

Introduction of new wolf packs to IR

What issues should be considered when evaluating future management of moose, wolves, and vegetation at Isle Royale?

There are to few places where wolves can run free. I think IR should continue to be one of those places.

What type and intensity of management should the NPS consider given that approximately 99% of the land area of Isle Royale National Park is designated wilderness?

Wilderness designation should not equate to a total hands-off approach given the wife way in which human activity is changing the environment. Measures should be taken to maintain IRs unique wilderness.

What type and intensity of management should the NPS consider in the face of a changing climate?

Measures to maintain current levels of species should be used.

Correspondence: What other alternatives, alternative elements, or management tools should be considered?

n/a

What issues should be considered when evaluating future management of moose, wolves, and vegetation at Isle Royale?

Same answer as Question 6

What type and intensity of management should the NPS consider given that approximately 99% of the land area of Isle Royale National Park is designated wilderness?

Its remote, respected, and unique

What type and intensity of management should the NPS consider in the face of a changing climate?

Dont presume climate change prediction-outcome, yet prepare for worst case scenarios

What do you like and dislike about the preliminary alternatives?
Dislike letting wolves die out. Approve boosting wolf population with mgt.

IRs wolf-moose relationship and ability to observe has informed all ecosystem mgt. decisions world wide and should be maintained.

Correspondence: What other alternatives, alternative elements, or management tools should be considered?

The addition of a minimum of 3-5 males and 3-5 female wolves all from different packs to ensure diversity for mating. The wolves would reproduce and in turn take the population of moose down to a level that sustains both animals and vegetation. I suggest a combination of option B and C.

What issues should be considered when evaluating future management of moose, wolves, and vegetation at Isle Royale?

Think about natural selection. All of the option for introducing wolves said one time. Since wolves take down the old & weak thereby ensuring the health of the moose population.

What type and intensity of management should the NPS consider given that approximately 99% of the land area of Isle Royale National Park is designated wilderness?

After reintroduction of wolves, let time be the guide. All decisions cannot be made at this time with out the possibility of grave errors.

What do you like and dislike about the preliminary alternatives?

The options of wolves being added are only a one time proposal. The addition of additional wolves may be necessary to ensure diversity of the packs.

It is obvious what direction I would like you to take, that of wolf reintroduction. Listen to the researchers and scientists as they have the data and science to support wolf reintroduction.

Correspondence: What other alternatives, alternative elements, or management tools should be considered?

Tracking, counting

What issues should be considered when evaluating future management of moose, wolves, and vegetation at Isle Royale?
equilibrium

What type and intensity of management should the NPS consider given that approximately 99% of the land area of Isle Royale National Park is designated wilderness?

Since human intervention, wilderness has been compromised. Intensity of management needs to be commensurate with intensity of negative human intervention.

What type and intensity of management should the NPS consider in the face of a changing climate?

Wild species manage climate change naturally

What do you like and dislike about the preliminary alternatives?

Dislike one-at-a-time plan for bringing in wolves. They are PACK animals.

Mitigate the intervention of mankind, which has resulted in the virtual extinction of wolves on the island- hunting, parvos, and other domestic diseases, clear-cut logging, population centers.

Mitigation would be best accomplished by adding a dozen, genetically diverse, wolves from the region in Canada where migration via ice-bridge might have naturally occurred in the past.

Correspondence:

What issues should be considered when evaluating future management of moose, wolves, and vegetation at Isle Royale?

1. Overpopulation of moose
2. Aquatic grasses have mostly been eliminated which will cause starvation of moose eventually
3. Wolves would provide balance in the environment

What type and intensity of management should the NPS consider given that approximately 99% of the land area of Isle Royale National Park is designated wilderness?

Monitoring the health and well being of moose and wolves

What type and intensity of management should the NPS consider in the face of a changing climate?

Perhaps cut dead trees- follow fire prevention strategies

What do you like and dislike about the preliminary alternatives?

I would not want hunting to be allowed.

Correspondence Type: Park Form

Correspondence: What other alternatives, alternative elements, or management tools should be considered?

Management is needed. Prefer alt C, B, or D. Wolves are needed to balance moose. Consider augment moose with intro of new genetics.

What issues should be considered when evaluating future management of moose, wolves, and vegetation at Isle Royale?

Dont let the pendulum swing too far either way. Dont let moose population destroy habitat.

What type and intensity of management should the NPS consider given that approximately 99% of the land area of Isle Royale National Park is designated wilderness?

Trails are good- but dont over-improve. Current balance is good. Fire pits or rings are welcome- but not too many.

What do you like and dislike about the preliminary alternatives?

No action-dislike- moose will degrade habitat.

Dislike E and F- wolves best to control moose.

Correspondence Type: Letter
Correspondence: I'm writing to comment on the Moose-Wolf-Vegetation Management Plan/EIS and the moose/wolf relationship on Isle Royale. The sinking wolf population on Isle Royale has become genetically isolated and is in danger of dying off. Introducing wolves on Isle Royale will be beneficial and not impact people who feel threatened by the presence of these animals.

Three options in the EIS include introducing new wolves on Isle Royale to boost the sinking population of these animals. I'm in favor of the option that would augment wolf populations as necessary. Increasing wolf numbers on Isle Royale will slow the population of moose that are overgrazing the vegetation there. This augmentation will also enhance the genetic pool of the wolves living on Isle Royale and give these endangered/threatened animals a chance to establish a permanent, healthy population in a place where people don't live and would not feel threatened by their presence.

Many say we should let nature run its course and allow the wolf population on Isle Royale to die off. However, many of the problems faced by wolves in North America are because of irresponsible human actions. Claiming we should just let nature run its course now is hypocritical. Augmenting the wolf population on Isle Royale will benefit wolves, moose, and environment on that island as well. Thank you for reading my comments.

Correspondence: Moose hunting is a lot of work!!
In Alaska, the Yukon Territory, British Columbia, Alberta, Montana, Ontario, Quebec, and other various locations it is a well-established fact that moose hunting expeditions are a ton of fun and work. In Alaska we divide the adventure into the following:

- A. Planning and organizing the hunt and gear
- B. Travelling to the hunting area
- C. Establishing camp and scouting the area
- D. Hunting and killing the moose
- E. Butchering the animal and caring for the meat
- F. Breaking camp and travelling from the hunting area back to highway and home
- G. Processing the meat, caring for the equipment

This all takes money, experience, equipment, and hunting partners and outfitters/Air Taxi operators, etc that are compatible and comfortable with each other.

In Alaska the Department of Fish and Game will hold controlled entry hunts. This is for a specified areas and species, and each hunter is assigned a Fish and Game employee to individually monitor his or her activities. The employee accompanies the hunter in the field.

The National Park Service needs money and could be charging to allow hunters to pay for the privilege of taking a moose on Isle Royale. The hunters can pay \$4K-\$6K per hunt, plus a trophy fee is a bigger bull trophy is taken. The NPS would have to set up the guidelines for these hunts, and some guide and outfitters might need to be consulted or hired.

People regularly book hunts in Canada and I think there could be a qualified pool of hunters to draw from in the Midwest. A significant obstacle to overcome could be the anti-hunting sentiment that exists. The alternative to having hunting parties involved is to turn the moose harvesting over to

government sharpshooters/hunters and lose the fees and income that would be paid.

Moose Hunting Trip to Koyukuk River Controlled Use Area

Truck, Boat, Motor, Trailer and all gear
Travel 335 miles to Fairbanks, stay overnight
Travel Fairbanks to Dalton Highway/ Haul Road to the Yukon River Bridge
Launch the boat, pack gear and load boat
Travel downriver- camp out overnight
Tanana to Ruby- 125 miles
Ruby downriver 55 miles to Galena
Camp out overnight
Galena- downriver 35 miles to Koyukuk River, turn upstream on Koyukuk
Go upstream to Koyukuk River 150-175 miles into the Controlled Use Area (CUA) and set up camp.
End of hunt- go back to the Yukon River Bridge.

Several years ago the moose population on IRNP reached 2,900-3,000 animals. The next winter was a massacre, and in the spring there were about 1,000 living moose left. The carcasses were everywhere, and very odiferous. I hardly think the NPS and wildlife managers and responsible hunters want to see that happen again.

Correspondence: What other alternatives, alternative elements, or management tools should be considered?

This is a good set of alternatives. Obviously there are additional hybrids of the listed ones.

What issues should be considered when evaluating future management of moose, wolves, and vegetation at Isle Royale?

- scientific value of the species and their interactions
- cost to taxpayer and alternative uses of NPS funds
- average usage of the park
- long term expectations of the above

What type and intensity of management should the NPS consider given that approximately 99% of the land area of Isle Royale National Park is designated wilderness?

Management approaches minimizing impact on the wilderness(wolf augmentation, reintroduction, no action)

What type and intensity of management should the NPS consider in the face of a changing climate?

Long term expectations of species distribution, range, and habitat should be considered in the choice of management approach.

What do you like and dislike about the preliminary alternatives?

Options including very expensive approaches like translocation should be avoided. I would have to see more data but it would see that the wolf aug/reint offer the greatest benefit to the parks climate and ecosystem as a whole as lowest cost. Active management should be chose if and only if long term ecosystem is maximized relative to cost.
