Florida Panther

Everglades National Park (the Park) is recognized nationally and internationally as a significant natural and cultural resource. It is the only place in the United States that is designated as an International Biosphere Reserve, a World Heritage Site, and a Wetland of International Importance. The Park was authorized by the United States Congress in 1934 and dedicated by President Harry S. Truman in 1947. Everglades National Park was explicitly set aside as a permanent wilderness for the preservation of the unique biotic communities, cultural resources spanning 5,000 years of human history and the exceptional landscape of the Everglades. Flamingo, which began as a small coastal farming settlement in the 1880s, is the largest developed area within the Park.

The initial phase of construction at Flamingo began in 1956 as part of the National Park Service's Mission 66 program of park development. Mission 66 was an initiative by Park Service director Conrad L. Wirth, with the intent of modernizing, enlarging and reinventing the park system within ten years, to coincide with the 50th anniversary of the National Park Service. Flamingo was one of eight pilot projects conceived under Mission 66, selected for planning and development since the Everglades was a relatively new National Park with little existing development. The sensitive ecological environment and no set architectural or site design, as contrasted to other National Parks, provided an ideal test candidate for the new philosophies of Mission 66.

Construction of facilities at Flamingo began in 1956; by 1958, much of the visitor facilities of Flamingo were completed, including the visitor center, lodge, marina, campgrounds, employee housing, and other supporting facilities and services. The architectural design for Flamingo (and other National Park Service Mission 66 projects) contrasted greatly with the prior periods of National Park construction that utilized rustic materials, a romantic, naturalistic character, and a high level of craftsmanship. Mission 66 design focused on inexpensive contemporary materials, a simplified design vocabulary and advanced construction techniques.

From its construction in the mid- to late 1950s, Flamingo provided services and facilities to an ever-increasing visitor population; providing both day use and overnight accommodations and visitor and interpretive facilities. The harsh climate of the Florida coast combined with the age of the facilities led to the susceptibility of damage from hurricanes and tropical storms. In 2005, hurricanes Katrina and Wilma destroyed or heavily damaged a number of the facilities at Flamingo, including the lodge, restaurant, and visitor center. This led to either decreasing or discontinuing visitor services in the near term.

Currently, Flamingo has limited visitor services due to damage sustained in 2005. With Flamingo historically having the only overnight accommodations within the Park (other than tent and RV camping), the National Park Service implemented a planning process in 2006 to determine the future of the site. The Flamingo Commercial Services Plan was developed to identify options and a desired direction for Flamingo.

This Master Plan project focuses on the most critical features of the selected plan from the Flamingo Commercial Services Plan. The Master Plan provides guidance to establish a "New Flamingo" that is an eco-friendly destination with a greater variety of lodging experiences and visitor services. The vision of the selected plan integrates principles of sustainable design for facilities, compatibility with the site and landscape, and energy conservation while seeking ways to minimize adverse impacts to natural and cultural resources. The Master Plan should guide planning, design, construction, restoration and use of Flamingo for the next 50 years.

1.0 executive summary

Everglades National Park typical vegetation

2.1 History of Everglades National Park

Early in the twentieth century, the unique natural and biological features of the Everglades attracted the attention of conservationists, who saw the significant vast resources threatened by increasing development. Prior to the 1880s, seasonal rains and spillover from Lake Okeechobee created a large natural water system in the Everglades. A campaign to drain the Everglades was introduced by Napoleon Bonaparte Broward in his bid for governor in 1904. This accelerated construction of canals between 1905 and 1910 to drain the wetlands and create agricultural lands greatly depleted the wetlands and transformed the landscape of the Everglades.

Between 1915-1922, the Ingraham Highway was constructed to connect Homestead with Flamingo. As more people came to southern Florida and development increased, additional water was diverted to canals to supply both farms and urban development, and was regulated to control flooding. The diversion of water, coupled with increased pollution, greatly altered the natural water regime that was already impacted by the earlier efforts to drain the wetlands.

As a result of the mass killings of birds in the Everglades by plume hunters, the Audubon Society hired the first game warden in the country in 1902 to protect the Everglades. The Florida Federation of Women's Clubs lobbied for the establishment of Royal Palm State Park, which was established in 1917; by the 1920s, the National Park Service also supported increasing conservation efforts in the region.

In 1928, the United States Congress passed legislation to investigate the feasibility of creating an Everglades National Park. The Park was authorized by Congress on May 30, 1934, but was not dedicated until 1947, as the authorization coincided with the arrival of the Great Depression and funding for land purchases for the Park was scarce. When the Park was established, it was explicitly stated that it was to be permanently reserved as a wilderness. The park was established to be "...a wilderness where no development...or plan for the entertainment of visitors shall be undertaken which will interfere with the preservation of the unique flora and fauna of the essential primitive natural conditions now prevailing in the area."

2.0 introduction

White Ibis

Primary interpretive themes are those ideas and concepts about Everglades National Park that are key to helping visitors gain an understanding of the Park. The themes, which are based on the Park's purpose and significance, provide the foundation for all interpretive media and programs in the Park. The themes do not include everything that may be interpreted, but rather they identify the ideas that are critical to understanding and appreciating the Park's importance.

The Purpose of the Park is as "a public park for the benefit of the people. It is set aside as a permanent wilderness preserving essential primitive conditions including the natural abundance, diversity, behavior, and ecological integrity of its flora and fauna."

"Here are no lofty peaks seeking the sky, no mighty glaciers or rushing streams wearing away the uplifted land. Here is a land, tranguil in its quiet beauty, serving not as the source of water, but as the last receiver of it. To its natural abundance we owe the spectacular plant and animal life that distinguishes this place from all others in our country." (President Harry S. Truman, December 6, 1947, at the dedication of Everglades National Park.)

In November of 1978, the Everglades Wilderness was formally designated; this designation provided legislative protection for approximately 93 percent of the Park.¹ The designation included all of the keys in Florida Bay. The legislation also created a class of wilderness called "submerged marine wilderness" (meaning the bottomlands, but not the water column, are managed as wilderness). This took into account more than 500,000 acres of the navigable waters of the Park, including Florida and Whitewater Bays, the backcountry waters, and the Ten Thousand Islands area along the Gulf Coast. Excluded from the Wilderness designation were lands at the north park boundary that were reserved for Native American use, a corridor along the road to Flamingo, and the existing developed areas, including Flamingo. The name of the wilderness area was changed from Everglades Wilderness to Marjory Stoneman Douglas Wilderness in 1997.¹

In 1989, Congress passed the Everglades National Park Protection and Expansion Act. The law added 109,600 acres to the northeast corner of the Park to increase the level of protection of the Park's outstanding natural values, and among other things, authorized the Modified Water Deliveries Project, and directed the NPS to expedite construction of the Marjory Stoneman Douglas Visitor Center in Everglades City.

Today Everglades National Park is a sanctuary for wild animals. plants, birds, and people - including the more than 6 million people who live within a 50-mile driving distance of the Park - in an increasingly urbanized regional landscape.

2.2 Significance of Everglades National Park

The purpose of Everglades National Park (the Park) is a public park for the benefit and enjoyment of the people. It is set apart as a permanent wilderness preserving essential primitive conditions, including the natural abundance, diversity, behavior, and ecological integrity of the unique flora and fauna. The Park is recognized nationally and internationally as a significant natural and cultural resource.²

- It is a unique subtropical wetland that is the hydrological connection between central Florida's freshwater ecosystem and the marine systems of Florida Bay and the Gulf of Mexico. It is the only place in the United States jointly designated an International Biosphere Reserve, a World Heritage Site, and a Wetland of International Importance.
- It comprises the largest subtropical wilderness reserve in North America. The park contains vast ecosystems, including freshwater marshes, tropical hardwood, pine rockland, extensive mangrove estuaries, and seagrasses, which support a diverse mix of tropical and temperate plants and animals.
- It serves as sanctuary for the protection of more than 20 federally listed and 70 state-listed threatened and endangered species, as well as numerous species of special concern. Many of these species face tremendous pressure from natural forces and human influences in the South Florida Ecosystem.
- It provides important foraging and breeding habitat for more than 400 species of birds (including homeland to worldrenowned wading bird populations), and functions as a primary corridor and refuge for migratory and wintering bird populations.
- It includes archeological and historical resources spanning approximately 5,000 years of human history, revealing adaptation to and exploitation of its unique environment.
- It preserves natural and cultural resources associated with the homeland of Native Americans of Florida (including the Miccosukee Tribe of Indians of Florida, the Independent Traditional Seminole Nation of Florida, the Seminole Tribe of Florida, and the Seminole Nation of Oklahoma).

• It preserves the remnants of a nationally significant hydrologic resource that sustains South Florida's human population and serves as a global experiment in restoration.

· It provides the public with the opportunity to experience Everglades' wilderness for recreation, reflection, and solitude in proximity to a major metropolitan area.

Interpretive Themes

¹ Today, 86 percent of the Park is dedicated wilderness. The percentage has decreased as additional lands were acquired for the Park.

² Significance, purpose and interpretive theme statements were taken from the Everglades National Park General Management Plan Newsletter #5, published in March 2009.

Interpretive themes for Everglades National Park are as follows:

- Everglades National Park serves as a dynamic laboratory for innovative scientific investigations that identify and monitor a vast array of fragile and unique resources. The revelations from this work inform good environmental decision making throughout the world, which protects ecosystems subject to the needs and desires of human populations.
- The water-dominated landscape of the Everglades has offered a myriad of experiences, challenges, and opportunities to humans that have inhabited this place for the last 6,000 years.
- The Everglades landscape is of great cultural importance to distinct groups of past and present Native Americans. Historically these parklands served as a home; a source of abundant natural and cultural resources; a place of refuge; and today, a reminder of past and present challenges, trials, and injustices.
- The greater Everglades ecosystem is the liquid heart of South Florida, where the seasonal ebb and flow of water over unique geography defines the environment, supports the region's web of life, and challenges humans to comprehend their relationship to nature and wilderness.
- Everglades National Park provides an opportunity for people to understand and experience the value of a diverse wilderness in proximity to vast development. The park's designation as a World Heritage Site, an International Biosphere Reserve, and a Wetland of International Significance attests to its importance as a benchmark for monitoring environmental impact and revealing change.
- Everglades National Park's diverse habitats (both temperate and tropical) and protected status demonstrate its value as a critical sanctuary for wild animals, plants, and birds in an increasingly urbanized landscape. Species from those most common to those highly endangered reveal life histories that are intimately tied to these places' natural cycles of abundance, flood, fire, hurricane, drought, life, and death.

2.3 History of Flamingo

Flamingo is the largest developed area within Everglades National Park. Flamingo was established in the 1880s as a small coastal farming settlement on the eastern end of Cape Sable. While large areas of the Everglades wetlands were drained and converted to agriculture and development, Flamingo remained isolated and accessible only by boat. The village was named in 1893 when the post office was established, and was one of several scattered settlements along Cape Sable following the Seminole Wars. Residents of the village made a living by making charcoal, raising vegetables, hunting birds for their plumage, and catching fish, all of which were sold in Key West. Being so isolated, the village was slow to develop and had a population of only 49 in 1910.

The original Flamingo settlement consisted of a complex of unpaved roads, docks and piers, and a collection of buildings including a small mill for grinding sugarcane and a small general store. The village had a small post office that was constructed in 1893, and small houses built on stilts along the bay. A two-story house on pilings, named "Robert's Hotel," was built in 1915 and served the occasional visitor, but was destroyed in a 1926 hurricane.

Another small group of buildings was thought to have been located west of the existing Flamingo. This included a clubhouse with five rooms and a screened-in dining porch, which served as a hotel for visitors and land developers.

The Ingraham Highway was built in 1921, providing a land connection from Royal Palm to Flamingo, and giving greater connection between the small community and the broader region. The majority of the settlement's residents were relocated in the 1940s when the National Park was dedicated; all residents were gone by 1951.

In 1954, the Ingraham Highway was improved and the bay dredged to create boat slips at Flamingo; construction of the concrete bulkheads and piers around the marina followed in 1955. At the same time, a proposal was developed for the site to create visitor facilities that would be managed by a concessioner. The original scope of the proposal was criticized for being too "resort-like," with conservation groups arguing that the extents of the development would compromise habitat and the natural resources.

Due to the nature of the landscape of the Everglades, facilities were developed around the perimeter of the Park and a peripheral circulation system and visitor contact system evolved, with the

"Here are no lofty peaks seeking the sky, no mighty glaciers or rushing streams wearing away the uplifted land. Here is a land, tranquil in its quiet beauty, serving not as the source of water, but as the last receiver of it. To its natural abundance we owe the spectacular plant and animal life that distinguishes this place from all others in our country."

exception of a 38-mile paved road cutting through the Park to Flamingo from the main visitor center near Homestead. Portions of the road existed prior to establishment of the Park, with most of the developed components of the Park found along it. This road provides the only connection between the coastal waterways and the peripheral highway routes.

The initial phase of construction at Flamingo began in 1956 (as part of the National Park Service's Mission 66 endeavor) with construction of the service station, the marina store, and the first employee housing unit. In 1957, construction of the visitor center was begun, along with the first five buildings of the lodge and the fish cleaning station at the marina.

In the summer of 1958, finalization of construction of Flamingo was underway with the creation of Camping Loop A; erection of the flagpole in front of the visitor center and landscaping around the visitor center, a campground, picnic grounds, and parking lots. The swimming pool at the lodge was constructed in 1959, along with the maintenance office, boat shop, and boat shelter.

By 1960, the majority of the planned Mission 66 construction projects had been completed at Flamingo. Hurricane Donna made landfall on the Florida coast on September 10, 1960, damaging many of the newly constructed facilities. Extensive repairs were undertaken in 1961-1962, and hundreds of trees and shrubs planted to replace what was uprooted by the storm. Following the repairs, the next and final phases of the original Mission 66 plan were begun with a variety of camping and overnight accommodations constructed between 1964 and 1967. By 1968, the development of the site as envisioned by the Mission 66 plan was complete.

- President Harry S. Truman, December 6, 1947, at the dedication of Everglades National Park

Through the 1970s and 1980s, various repair, maintenance and renovation projects occurred at Flamingo.

In 2005, the facilities at Flamingo were severely damaged or destroyed by six- to eight-foot storm surges from hurricanes Katrina and Wilma. Damaged facilities included the visitor center; the Flamingo Lodge, restaurant and cottages; and employee housing. Destroyed facilities included the amphitheater, picnic and campground comfort stations, the camp tender's residence, and some staff residence buildings.

The amphitheater and picnic and campground comfort stations were reconstructed in 2008. In 2008 and 2009, portions of the maintenance building, the Flamingo Lodge, and duplex cottages were demolished due to significant structural damage incurred during the 2005 hurricanes. Following several months of closure and repair, the marina, campgrounds, marina store, and a portion of the Flamingo Visitor Center were reopened.

2.4 Significance of Flamingo and Mission 66

The Flamingo Mission 66 District is a significant example of early Mission 66 development that represents the Park Service Modern architectural style and planning concepts that became standard in future Mission 66 projects. Mission 66 was a ten-year endeavor by the Park Service to develop new visitor centers, administrative buildings, and support facilities at over 100 National Parks. The program focused on cost efficient construction utilizing modern materials and a modern architectural style. The intent of Mission 66 was to revitalize the National Park System and to encourage visitation in the increasingly mobile and affluent American public following World War II. The program was envisioned to elevate the National Parks to modern standards of comfort and efficiency, while also conserving the natural and cultural resources.

Mission 66 architecture sought to redefine the image of the National Park Service and to reflect the changing values in post-World War II American society. A cost-effective approach to design and construction was essential, with emphasis placed on functional, sturdy, unobtrusive buildings and not on grand architectural design. Modern building technologies and materials were seen as ways to minimize cost, construction time, and the overall impact to the surrounding landscape and natural resources. The Mission 66 program was not defined by an overall style, but rather was influenced by changes in social, technological, and economic ideas following World War II.

Park Service Modern architecture (as the Mission 66 buildings came to be called) was influenced by modern design philosophies of the 1950s that explored advanced construction techniques, inexpensive contemporary materials, and a simplified design vocabulary. This was in stark contrast with the prewararchitectural style that embodied rustic materials, high levels of craftsmanship, and a romantic design character. The materials that were encouraged in the new designs were concrete block, steel, stone veneer, and vinyl tile. Functionality of the building and site planning was foremost in Park Service Modern architecture with the setting, spatial requirements, and visitor experience also considerations in the design and planning. The integration of the interior architecture and exterior spaces was explored to create a relationship between the built and the natural. Typical architectural design strategies included low horizontal massing, a muted color palette, and textured materials.

Park Service Modern architecture has been described as having the following qualities:

- offices.
 - construction.

 - doors with windows.

 - through large windows.
- effect.

• The building is sited in relation to an overall plan of visitor flow within the Park; and is located either near the Park entrance, en route to a major park destination, or at a park destination.

· Building design emphasizes floor plan organization. This allowed for the segregation of public areas from administrative areas, and also emphasized and directed efficient visitor flow through the building itself. A central lobby space is often at the arrival point, with trails or other park destinations often accessed as the visitor moves through the building.

Building program centralizes numerous park services, including information, interpretation, restrooms, and administrative

• Building makes use of the formal vocabulary and materials of contemporary (1945-1972) modern architecture, including flat roofs, window walls (and other unorthodox fenestration), exposed steel supports, and concrete and concrete block

 Overlapping functional space (free plans) is sometimes evident in the floor plan. Public areas are usually on one level, or on split-levels, and segregated from administrative areas.

• Interior and exterior public spaces are integrated, often separated by windows, window walls, glass doors, or wooden

· Entrances, exits, and other doorways are wide, providing easy movement of crowds. Entrances are often sheltered by porches, ramadas, arcades, etc. Restrooms are often located nearby, with a separate outdoor entrance.

Building emphasizes visitor's experience of spatial procession. This sequence of spaces often features ramps, as well as significant views of park landscapes, either from terraces or

 Siting of visitor center is near a landscape or attraction to be interpreted. Sometimes interpretive programs are extended into the visitor center itself.

• Building's elevations create a primarily low-profile, horizontal

Building harmonizes with its setting through horizontality of massing, color, and texture of materials. Use of textured concrete, concrete block, and stone veneers in facades often gives the building a generally rough exterior texture and often features earth-toned colors.

- Building footprint is often ell-shaped or rectangular around a central courtyard, or a variation of this theme.
- Naturalistic planting is used to partially screen the building, utility areas, and parking, as well as to restore areas disturbed in construction. Large planter boxes are often used to define entrances.
- Outdoor spaces and site work, including parking lots, paths, amphitheaters, terraces, and patios are often incorporated into the visitor center complex.

Everglades National Park was undeveloped as planning began for Mission 66, and Flamingo was seen as an ideal candidate to test the ideas of Mission 66, as the Park needed support and interpretive facilities. As one of eight pilot projects (Mount Rainier, Yellowstone, Chaco Canyon National Monument, Shiloh National Military Park, Adams Mansion National Historic Site, Fort Laramie, Everglades, and Mesa Verde³) within the National Park System, plans for Flamingo were drawn up in 1956 by the National Park Service Eastern Office of Design and Construction, in collaboration with local architect Harry L. Keck of Coral Gables, Florida.

Keck was strongly influenced by Le Corbusier modernism in the design of the visitor center. The visitor center is described in the Cultural Landscape Inventory 75% Draft:

"The structure was supported on concrete columns, which created a covered pedestrian space under the building. A concrete breezeway and wide access ramp linked the concessionaire building, visitor center, and public courtyard and framed views of the surrounding natural environment and marina. The horizontal massing of the structure was accentuated by ribbon windows and a low-sloping roof. The building was constructed of concrete block, coquina stone veneer, and raised stucco panels. The east facade featured a window wall that looked on the marina. The open plan of the building accommodated restroom facilities, administrative offices, a central lobby, and a museum, and was directly connected to the restaurant wing with a two-story breezeway."

The pilot study determined that the Mission 66 program would focus on the visitor experience through the improvement to and standardization of facilities, providing interpretive resources such as a visitor center, additional staff, trails, and maps. Guest and employee lodging facilities were also considered important. Visitor centers were a new type of facility developed as part of Mission 66 for the National Parks. Preliminary design standards and guidelines established for the Mission 66 program were used in the pilot projects.

In 2006, the Florida State Historic Preservation Office (SHPO) determined that the Flamingo Visitor Center, service station, 1950s-1960s staff housing buildings, and maintenance area boat canopy were potentially eligible for listing on the National Register of Historic Places. Other Mission 66 structures were deemed ineligible due to loss of integrity. The Flamingo Mission 66 Developed Area district incorporates the visitor center, marina, campgrounds, employee housing, and public lodging facilities.

Flamingo Mission 66 Developed Area List of Resources⁴

Date	Resource			
1955-56	Boat basin, concrete bulkheads, piers			
1956-57	Service station, marina store, staff housing building numbers 416, 439 and 440, electric generating plant			
1957	Roads and parking, visitor center and lodge, fish cleaning shelter/comfort station, maintenance boat basin			
1957-58	Water supply system and pumping stations			
1958	Camping Loop 'A', flagpole; trees and shrubs planted around the visitor center, in parking areas, campgrounds and picnic grounds; incinerator			
1958-59	Concrete picnic tables, benches, drinking fountains, and charcoal grills			
1959	Swimming pool at the lodge			
1959-60	Maintenance office, boat shop, and boat shelter			
1960s	Camping Loop 'T' and concessioner dormitory housing (year is unknown)			
1960-61	House trailers installed for concessioner			
1962	New trees and shrubs planted			
1964	Twelve cottages and a service building; lodge expansion; camping loops 'B' and 'C'			
1966-67	Staff cottages			

Δ List obtained from the 75% Draft, Cultural Landscape Inventory, Flamingo Mission 66 Developed Area, Everglades National Park. The period of significance has been determined to be 1955-1966 for Flamingo; the resources listed in the table were constructed during this time, but not all are considered contributing features of the Historic District.

activities.

Located at the center of the greatest wilderness east of the Rockies, Flamingo is the jumping off point for the 99-mile Wilderness Waterway and many shorter boating/paddling adventures. The area surrounding Flamingo is a birder's paradise, home to such distinctive species as the Roseate Spoonbill, Reddish Egret, Mangrove Cuckoo, White-crowned Pigeon, and a host of other birds. The waters around Flamingo provide refuge for the threatened American Crocodile, which is much less common than the alligator; the mangrove swamps are home to manatees. The wild beaches of Cape Sable serve as a major nesting ground for sea turtles.⁵

5

In addition to the historic significance of the Mission 66 period of development, there are additional significant values of Flamingo. Located on the southern coast of Florida, Flamingo provides a variety of attractions for visitors including subtropical natural history, a unique wilderness setting, and a wide range of recreational

Unique tropical vegetation is found throughout Flamingo and surrounding areas, including sea grape, Jamaica dogwood, black ironwood, and manchineel. The area is one of the world's premiere fishing hotspots, where anglers pursue mangrove snapper, redfish, snook, tarpon, and many other game fish on Florida Bay and in the backcountry via the Buttonwood Canal.

"Welcome to Flamingo!" visitor center exhibit, National Park Service -Everglades National Park. June 2009.

^{3 &}quot;Mission 66 Visitor Centers: The History of a Building Type". Sara Allaback, Ph.D., U.S. Department of the Interior. National Park Service. Cultural Resources Stewardship and Partnerships, Park Historic Structures and Cultural Landscapes. Washington, D.C., 2000

2.5 Project Background

The 2005 hurricanes caused substantial damage to already aged Flamingo facilities. The Flamingo lodge, cottages, restaurant, and gift shop were forced to shut down, and the houseboats were destroyed. Historically, Flamingo has been the only area within the Park to provide overnight accommodations other than tent and recreational vehicle (RV) camping. The closure of the facilities and services at Flamingo led to the National Park Service implementing a planning process in October of 2006 to determine the site's future. A Commercial Services Plan and Environmental Assessment was developed to identify options and a desired direction for Flamingo.

Through the public process of developing the Commercial Services Plan, a selected alternative for the site was established. The preferred vision integrates principles of sustainable design for facilities, compatibility with the site and landscape, and energy conservation while seeking ways to minimize adverse impacts to natural and cultural resources. The plan for Flamingo should "integrate principles of sustainability in site and facility design and energy conservation; identify ways to minimize adverse impacts to natural and cultural resources; and seek to have Flamingo function in a more efficient and pedestrian friendly way."

Residents from the area surrounding Florida Bay and Everglades National Park (and visitors from beyond) view the Park and Flamingo as special places to visit and desire to see the commercial facilities of Flamingo rebuilt as soon as possible.

Interpretive and recreational activities are oriented towards natural history interpretation, environmental education, and wilderness exploration. Visitors pursue various activities within the Park and Flamingo including camping, picnicking, hiking, boating, paddling, fishing, wildlife viewing and photography, and observing the natural beauty of the landscape.

2.6 Project Purpose

The purpose of the Master Plan is to guide redevelopment and restoration at Flamingo, consistent with the overall direction established by the Commercial Services Plan approved in 2008. The design program outlines the facility improvements (architecture, infrastructure, site and landscape) and uses that have been identified as desirable and that will be incorporated into the Master Plan. Objectives of the Master Plan include the following:

- To enhance visitor appreciation and stewardship of park resources, integrate Flamingo facilities into the Park environment, and showcase the area's natural surroundings.
- Incorporate "hurricane resistant" design.
- Incorporate sustainable design practices and LEED principles.
- Incorporate South Florida vernacular architectural style.
- Incorporate "Eco-Tourism" principles.
- Consider potential climate change and incorporate design elements addressing the same in the Master Plan.
- Verify the consistency of Master Plan and design program with the Flamingo Commercial Services Plan Finding of No Significant Impact (FONSI).
- Comply with accessibility design standards.
- Consider constructability, park use (wear and tear), and maintenance and operations as design solutions are developed.
- Confirm, during development of the Master Plan, that the design program and budget are consistent with the Park's goals for the Flamingo redevelopment.
- Perform ongoing quality assurance and quality control during Master Plan development.
- Consider the unique location and environmental conditions of the area.
- Follow building code requirements for high-hazard flood zones, and recognize the intense variability of seasonal weather.
- Provide the concessioner with a reasonable opportunity to earn a profit.
- Allow for and provide a range of appropriate visitor opportunities.
- Minimize the impacts to the natural and cultural resources of the Park.

Change

This section of the Flamingo Master Plan addresses the issue of climate change - how the climate of South Florida is expected to change, what the National Park Service is doing to address the issue, and what this means for the Flamingo Master Plan.

Florida?

The earth's climate is changing. Carbon dioxide (CO2) concentrations in earth's atmosphere have risen 31 percent since 1750, and there is strong evidence that this is in part due to human causes such as deforestation and burning of fossil fuels. When gases like CO2 build up in the atmosphere, they prevent heat from escaping. Coastal air temperatures and sea surface temperatures are rising. Sea level rise is one expected effect of rising temperatures - one that may have dramatic consequences on coastal areas in general and South Florida in particular because of its low elevation and flat landscape. More intense hurricane activity is another expected effect of climate change.

SEA LEVEL RISE

The United Nations Intergovernmental Panel on Climate Change (IPCC) predicts a 7- to 23-inch rise in global sea level between now and 2100 due to the expansion of warming seawater and the contributions of melting glaciers (IPCC 2007). The National Academy of Sciences (2008) reviewed available research and projections of sea level rise for South Florida, and concluded that sea level in South Florida could possibly rise as much as 14 inches by mid-century and 36 inches by the end of the century if rising greenhouse gas emissions are not curbed.

Even the more modest projections imply a potentially large impact on the low-lying Everglades and the near-coastal built environment. Low-lying coastal regions will be particularly susceptible to inundation. Everglades National Park has an elevation lower than 3 feet in most places. Mangrove trees – which stabilize sediments - might be able to keep pace with slowly rising sea levels by accumulating soil and effectively raising ground elevation. However, if sea level rise is rapid, coastal estuarine and nearby freshwater habitats could be inundated by rising seawater.

2.7 Flamingo and Climate

How will Climate Change Affect South

WARMING OCEANS AND HURRICANES

According to IPCC, sea surface temperatures may increase 2°F to 5°F by 2100. A sea surface of 80°F or more - combined with favorable humidity and wind conditions - is enough to fuel powerful hurricanes. Some scientists expect that in the future, as ocean temperatures continue to rise, hurricanes will be more frequent and intense. Others warn that long-term trend analyses can be potentially biased because hurricanes are now more easily detected and monitored as a result of better technology. One thing is certain; when intense hurricanes do occur, storm surge flooding that often accompanies such storms will be made worse by sea level rise, placing both natural ecosystems and man-made facilities at even greater risk.

Although there is uncertainty about the pace and exact effects of climate change, there is little doubt that the natural ecosystems and built environment of South Florida are very likely to experience changing weather patterns and more extreme events than the region has historically experienced.

What is the National Park Service **Doing About Climate Change?**

NPS managers and scientists working in South Florida are planning for climate change. By protecting natural areas from pollution and over-harvesting, restoring already damaged ecosystems, and modifying and improving park facilities, the parks will endure despite the added threat of climate change.

At the national level, there is now sufficient knowledge about climate change for the National Park Service (NPS) to address the issue on an agency-wide basis. In early 2009, NPS created the Climate Change Response Steering Committee to serve as an advisory body to the Park Service director and NPS's National Leadership Council. The committee has developed a draft Climate Change Response Strategy to understand, communicate, and cope with the effects of rapid climate change. This strategy defines goals and objectives to guide NPS actions in four integrated areas or components: science, adaptation, mitigation, and communication. These components and related goals are outlined below.

SCIENCE

The NPS will learn from and apply the best available climate change science and collaborate with scientific agencies and institutions to meet the specific needs of management as it confronts the challenges of climate change.

SCIENCE GOALS

- Use the best available scientific data and knowledge to inform decision making in regard to climate change.
- Collaborate with partners to develop, test, and distribute the best results from climate change models to inform NPS activities.
- Work with others to inventory and monitor key attributes of the natural resources, cultural resources, and visitor experiences likely to be impacted by climate change. Systematically assess the vulnerability of these resources to climate change.
- Acquire, provide, and apply scientific information to reduce the National Park System's carbon footprint.

ADAPTATION

In a changing climate, adaptation means adjustments in both natural ecosystems and human behaviors. The NPS's ability to remain flexible in its response as new information is acquired, yet consistent with its policies and legal mandates, is critical for effective adaptation. The NPS will work to build its adaptation capacity.

ADAPTATION GOALS

- Incorporate climate change considerations and responses in all levels of the NPS planning framework.
- Implement adaptation strategies that promote ecosystem resilience and enhance restoration, conservation, and preservation of park natural resources.
- Develop, prioritize, and implement management strategies to preserve climate-sensitive cultural resources.
- Include climate related vulnerability assessments in project approval and funding decisions.
- Enhance the sustainable maintenance, design, and construction of park infrastructure.

MITIGATION

To do our part in mitigating the cause of climate change, we will reduce the National Park System's carbon footprint through energy efficient practices and integrating mitigation into all business practices, planning, and the NPS culture.

MITIGATION GOALS

COMMUNICATION

Through clear, directed communication, we will raise our employees' and the public's awareness of the implications of climate change for national parks and the efforts that we can make to lessen the impacts. We will train employees and managers in the four components of this strategy.

COMMUNICATION GOALS

- throughout the NPS.
- the NPS.
- example.

How is Climate Change Being Addressed at Flamingo?

One of the first questions to ask, given climate change projections, is "Should the NPS abandon Flamingo, or should facilities be rebuilt there?" To answer this guestion, the NPS considered the expected life span of the facilities in the context of sea level rise projections. The Energy Independence and Security Act of 2007 directs that decisions about federal facilities be made considering a study period of 40 years. Assuming it takes 10 years to complete rebuilding of Flamingo facilities, decisions we make today should reflect sea level conditions 50 years from now. By 2060, sea level is projected to have risen as much as 14-16 inches in South Florida. Nonetheless, the NPS believes that it makes sense to rebuild at Flamingo for the following reasons:

 Substantially reduce the National Park System's carbon footprint from 2008 levels by 2016 through aggressive commitment to greener operations.

 Integrate climate change mitigation into NPS business practices and culture.

 Incorporate biological carbon sequestration as a mitigation option where it is consistent with the NPS mission.

Coordinate and distribute climate change information

Increase climate change knowledge and understanding within

· Provide external communications about the implications of climate change and the NPS response.

• Model and communicate sustainable practices that lead by

• Provided the facilities at Flamingo are planned and designed with climate change in mind, the facilities proposed in this plan should be capable, during their useful life, of coping with the projected effects of climate change. This includes potential sea level rise and greater storm surge associated with more frequent and intense hurricanes.

- There is no suitable alternate location within Everglades National Park for replacing Flamingo facilities. Most of Everglades National Park is designated wilderness, where developed facilities are inappropriate and not permitted. Just as importantly, Flamingo's real attraction is its coastal location, with views of Florida Bay and access to the Park's more than 600.000 acres of marine and estuarine waters.
- As a historically disturbed (filled and elevated) area that has accommodated visitor and operational facilities for the past 50 or so years, it make sense to use Flamingo in this way for the next 50 years, albeit in a more sustainable, climate-change aware way. Fifty years from now, the question of whether facilities should remain at Flamingo will need to be reconsidered in the context of updated climate change projections and observed climate change effects like sea level rise, increased storm surge, and increased hurricane intensity.
- In future years, climate change impacts on the Park in general, and Flamingo in particular, will be better understood and future projections may become more accurate than they are today. This critical information, gained through direct observation, monitoring, and updated modeling, would allow the NPS and the Flamingo concessioner to potentially re-assess the identified project phasing strategy described in this plan. This knowledge would allow for adjustments in implementation to better manage park resources, provide for quality visitor experiences, and ensure wise use of funds.
- This Master Plan for Flamingo is an opportunity for the NPS to play a leadership role in (1) adapting to climate change, (2) rebuilding Flamingo in a way that protects taxpayers' investments while reducing the area's contributions to climate change, and (3) engaging the public in conversations about changing climate and sustainability. The ways that the NPS intends to accomplish this are outlined below, organized according to the four components of the NPS Climate Change Response Strategy. More specifics on planning, design, and technology are provided in Section 4 of this document.

SCIENCE

- Use the best available scientific data and knowledge about climate change to inform decision making at Flamingo.
- Work collaboratively to inventory and monitor resources and visitor experiences likely to be affected by climate change, and manage Flamingo facilities and activities adaptively to minimize such impacts.
- Acquire, provide, and apply scientific information to reduce the "carbon footprint" at Flamingo.

ADAPTATION

Consolidate and minimize the developed footprint by building only what is truly needed and economically feasible, and by using spaces under elevated structures for other purposes (parking, shaded gathering areas, etc.) that would not be adversely impacted by flooding.

- Keep infrastructure simple to reduce long-term maintenance needs and vulnerability to strong winds, storm surges, and saltwater corrosion.
- Restore previously disturbed areas that are no longer needed for facilities.
- Consider how development can best be sited, oriented, and designed to take maximum advantage of natural conditions such as breezes, natural light, energy from the sun, shade, etc.
- Elevate and armor structures especially overnight lodging and housing - to withstand storm surges and sea level rise impacts.
- Build facilities to withstand Category 4 or greater hurricaneforce winds.
- Adaptively reuse existing infrastructure where possible.
- Use low-cost, mobile buildings that can be moved or removed when conditions warrant (e.g., eco-tents that are disassembled and stored during summer/fall, when visitor use is lower and hurricanes are likely).
- Use native and/or local landscape plants and materials that ameliorate harsh environmental conditions, fit into the landscape, and require little special care.

- response at Flamingo.

 Design and construct facilities that use the least amount of energy and water practicable. Use sustainable technologies such as solar power, graywater recycling, natural ventilation, ground-coupled cooling systems, and low-flow water fixtures to reduce energy and water consumption.

 Use sustainable and conservation materials and practices during construction, operations, and maintenance.

Rebuild and restore in a way that encourages visitors and staff to walk, ride bicycles, or use shuttles instead of driving within

Through training, make NPS staff and concessions employees based at Flamingo aware of climate change issues and

Teach visitors and staff about natural systems, ecosystem restoration, and "ecosystem services."

 Incorporate the latest information about climate change into interpretive programs so that visitors understand the causes and effects of climate change, and how they can reduce their contributions to climate change.

Showcase sustainable features and technologies as an integral part of the interpretive programs and visitor experience at

Communicate with park neighbors, partners, and the general public about the implications of climate change and the Park's

Everglades National Park is located on the southernmost mainland area of Florida, encompassing approximately 1.5 million acres and is the largest subtropical wilderness in North America. The Park is a designated World Heritage Site, an International Biosphere Reserve, and a Wetland of International Significance. The Park was officially dedicated as Everglades National Park in December 1947. At its southernmost area is the Flamingo Developed Area, the largest developed area in the Park. Flamingo is at the terminus of the 38-mile long main park road that extends southwest from the main park visitor and administration center near Homestead, Florida. While the primary mission of Everglades National Park is the conservation of natural and cultural resources, Flamingo has been developed to provide a destination for interpretive, educational, and recreational programs for the Park's visitors. Flamingo was conceptualized by the National Park Service in the early 1950s to meet the goals of the federally sponsored Mission 66 program, a development program with the primary goal to improve deteriorated and dangerous conditions in the National Parks - the result of a massive visitor boom after World War II. Since its development, visitors to both the Park and Flamingo have grown, with park visitation in 2009 of 900,882 visitors.

Visitors come to the Park for an experience that cannot be found anywhere else in the world. A wide variety of activities await and include fishing, boating, kayaking, canoeing, birding, hiking, camping, biking, and wildlife viewing. The Park's diversity attracts visitors of all types from all over the world, with interests as varied as they are.

Everglades National Park, Source: NPS

3.0 flamingo today

The extensive variety of activities is influenced by the varying climatic conditions and seasons of use. Peak visiting times typically range from December to April during the winter dry season. During the dry season, visitors have greater access to Park Service led tours and programs as well as more available facilities. Relief from nuisance insects - including mosquitoes and biting flies - during the winter season allows for a more pleasant outdoor experience. Wildlife tend to congregate in greater numbers at water holes that have lower water levels during the dry period, making wildlife viewing during this season more accessible. A large number of bird species winter in warm South Florida and their presence provide a haven for bird enthusiasts.

During the wet summer months between May and November, there are limited facility hours, more facility closures, and fewer recreational opportunities than during the dry season. As water levels rise, animals disperse, making wildlife viewing sporadic and more difficult. The increased water levels also bring elevated numbers of nuisance insects, compromising the outdoor experience. Heat, humidity, and the possibility of tropical storms and hurricanes may also impact visitor comfort and trip coordination.¹

In 2005, Flamingo was severely damaged by storm surges of up to nine feet during hurricanes Katrina and Wilma. Prior to the hurricanes, Flamingo offered a wide range of visitor services including a visitor center, marinas, stores, campgrounds for individuals and groups, a range of overnight accommodations in the Flamingo Lodge and in cottages, a service station, staff housing, and administrative and maintenance facilities. Prior to the hurricanes, these facilities and some services had been in decline due to their age and the harsh Flamingo environment. Much of this infrastructure was damaged or destroyed in the hurricanes, leaving a number of the facilities damaged beyond repair. Since 2005, the heavily damaged or destroyed facilities have been demolished and removed. Today Flamingo offers minimal visitor services at the marina with the only overnight accommodations offered at the campgrounds.

In 2006, the National Park Service approved funding to study how best to rebuild the Flamingo Developed Area with the goal of restoring a full range of visitor services including overnight accommodations. The plan that resulted is the Flamingo Commercial Services Plan and Environmental Assessment, which was approved in July 2008. Since the approval of the Flamingo Commercial Services Plan, several elements of the selected plan received emergency hurricane

Flamingo Visitor Center Area Enlarged Map, Source: NPS

Flamingo Master Plan and Design Program - Everglades National Park

¹ NPS 2008 Flamingo Commercial Services Plan

funding, largely as replacement-in-kind projects; these projects have been completed. The work included rebuilding the outdoor amphitheater, constructing elevated park housing structures, constructing several park maintenance buildings, and constructing two backcountry camping platforms ("chickees") in Florida Bay.

Everglades National Park has been administratively listed on the National Register of Historic Places, although official National Register documentation had not been generated as of 2009. The Flamingo Developed Area was not specifically identified in the National Register listing, but elements of Flamingo have been identified by the Florida SHPO as eligible for listing.

The Flamingo Mission 66 Developed Area is classified as a historic district under the National Register of Historic Places under Criterion A for its association with the Mission 66 initiative within the National Park Service. It is also classified under Criterion C for embodying distinctive characteristics of Park Service Modern design. The district boundaries were established to include all of the significant cultural landscape features within the developed area. The historic district boundary for Flamingo follows the eastern, western and northern boundaries of tracts acquired by the federal government for the establishment of Flamingo. The southern boundaries of the tracts have changed over time due to filling the bay for construction of the visitor center and marina, as well as wind and water erosion. Thus, the southern boundary is considered to be the shoreline of the Park.

The Flamingo Mission 66 Developed Area district contains a number of features that are considered contributing to the historic district, which are identified on Map 3.1.3, Historic District Boundary and Contributing Features.

3.1 Existing Conditions and Resources

Site visits were conducted with the design team and client group over four days in September 2009 and were followed a month later with a four-day workshop at Everglades National Park in October 2009. A general review and analysis of the site and architecture was conducted at that time.

Information regarding the site was collected from a number of available sources and is incorporated in this section. In conjunction with site visits and in coordination with park staff, the design team developed and analyzed the existing conditions to prepare for Master Plan development. The following existing conditions and resources are summarized from information presented in the Flamingo Commercial Services Plan and from on-site visits.

Topography and Geology

The development area consists of low, flat topography with elevations no greater than seven feet above sea level. Topographic variation at Flamingo is no more than three feet throughout. While flat, the Flamingo Developed Area has had a great amount of topographic modifications through the introduction of fill material. Areas constructed on fill include the visitor center and marina complex, maintenance and housing areas, the main park road roadbed, and camping loops. The fill material consisted of oolite lime rock and gravel overburden.

The parent material is limestone bedrock that is soft and erosion prone. Exposed limestone, called caprock, hardens when exposed to atmosphere and lies typically 10-40 inches below soil surface.

Soils

There are four common soils found in the development area: marl, peat, sand, and rock outcroppings.

Compaction, disturbance, and erosion are the three major causes of soil degradation. Degradation of non-fill soils has primarily occurred in areas where visitors have moved outside designated areas. Shoreline erosion is occurring due to increased frequency of waves hitting the shore from recreational and commercial boats. This erosion results in loss of habitat including loss of useable land, increased sedimentation, decreased water quality, and release of nutrients.

The development area is built on structural fill because the natural soils are not stable enough for construction. The flat topography allows for minor disturbance when leveling, grading and excavating for the proposed development. Soil disturbance and compaction are of concern with the use of heavy machinery. Exposed soil can more easily be eroded by wind and water. To minimize impacts, construction should be limited to the dry season when there is less rainfall and runoff. Mitigation precautions and soil rehabilitation should be taken during construction as outlined in the Flamingo Commercial Services Plan and Environmental Assessment.

Air Quality

Everglades is a Class I designated area - the highest requirement of air quality protection. The Park participates in a number of air quality monitoring programs that are listed in the Commercial Services Plan. Due to the remoteness of Flamingo, there is little air pollution. Existing pollution occurs in the form of local emissions from vehicles and motorboats and occasional reduced visibility due to high humidity and salt mist.² There are no present plans for prescribed burning of vegetation. There are currently no exceedances of the Class I criteria within the Park.

Master Plan improvements will likely bring increased numbers of visitors and subsequently, increased emissions. Measures taken by the Park to reduce on-site vehicular travel within Flamingo, such as houseboats, the shuttle, and the bike sharing system, will help keep emissions to a minimum.

Soundscapes

The remoteness of Flamingo provides visitors with an escape from the noise of suburban and urban areas. The Park is active in preserving an often-overlooked natural resource: the absence of human induced sound. The acoustic environment of Flamingo and the surrounding wilderness and backcountry areas is important to the quality of visitor experience and preservation of wildlife habit. As man-made noise levels increase, so do the impacts on wildlife. Many species of wildlife depend on a degree of silence for communication and survival. The Park works with the NPS Natural Sound Program on soundscape issues and monitoring. Desired conditions for soundscapes in the Park will be identified in its general management plan.

2 NPS 2008.

Water

The two major watersheds of Everglades are the Shark River Slough and the Taylor Slough, which outlet near Flamingo at the southern coast of Florida. The Flamingo development is not subject to overland flow from these watersheds because of the fill on which the development is built. Surface water in the area includes Florida Bay, Buttonwood Canal, and Eco-Pond. The Eco-Pond is a ten acre artificial pond, which was built to treat wastewater but is now in the process of returning to a natural state. Groundwater exists in an unconfined aquifer that flows from the north.

All of the water bodies in Everglades National Park are designated Outstanding Florida Waters and are monitored and protected carefully. The high water quality makes these water bodies more susceptible to degradation.

WATER QUALITY

The development area is affected by external and internal pollution sources. Everglades as a whole is impacted by runoff of excess nutrients and contaminants such as fertilizers and pesticides from developments to the north. The development is impacted by onsite non-point source pollution including runoff from boat ramps, fueling facilities, housing/landscaped areas, and parking lots.³

Currently there are no stormwater management facilities or best management practices in place to keep runoff from entering the Park's water bodies. Dredging is an activity that occurs on occasion to allow for boat tours. Oil and gas spills are also a threat to water quality, though spill control kits are provided to lessen the impact in the event of an accident.

WETLANDS

Flamingo is surrounded by wetland habitats that support wildlife. The development area itself does not support wetlands but there are roughly six types of wetlands found near the development area: Estuarine intertidal wetlands, broad-leaved evergreen scrubshrub wetlands, emergent coastal prairie and salt marsh, broad-leaved evergreen forested wetland, excavated permanently flooded palustrine wetland – unconsolidated bottom, and estuarine subtidal wetland. These wetland types are described in further detail in the Commercial Services Plan.

FLOODPLAINS

The entire development area is within the 100-year floodplain and is also considered a high hazard zone. A sub-zone of the 100-year floodplain is the Federal Emergency Management Agency (FEMA) VE zone (Storm Wave Hazard)⁴ and is the area closest to shore that is subject to storm wave action. While hurricanes are a threat and affect the VE zone, the area can also be impacted by periodic storm surges not associated with hurricanes.

Normal protocol for floodplains within the National Park Service standards is not to develop the area. Due to the entire Flamingo Commercial Services already being built within floodplain, the facilities must comply with the Monroe County floodplain management standards as well as the State of Florida building codes.

Considerable damage occurred in 2005 because of hurricanes Wilma and Katrina. The damages resulted in the lost use of structures and the deposit of flood debris and material from Florida Bay that covered much of the developed area.

Wilderness

The Flamingo developed area is not within the Park's designated wilderness boundary. However, human activity within the area and travel to and from the area can impact the surrounding wilderness, including the vast submerged marine resources of Florida Bay and the Park's backcountry. Flamingo plays a significant role in broadening people's understanding and exploration of the Park's wilderness. At the same time, motorboat use originating from Flamingo and elsewhere perpetuates damage to the extremely shallow, Florida Bay submerged marine wilderness. Everglades National Park is the largest remaining subtropical wilderness in the United States and is designated as an International Biosphere Reserve, highlighting the importance of the area for species preservation.

The Park manages the wilderness according to the Wilderness Act of 1964. Management strategies include limiting development to areas of existing services and necessary utilities and infrastructure, instituting a leave-no-trace philosophy, and enforcing wilderness regulations and the Director's Order #41 (direction within the National Park Service on meeting requirements of Wilderness Act).

Wildlife and Wildlife Habitat

It is surprising for many first time visitors to the Everglades to learn of the diversity of ecosystems and vegetation due to seemingly miniscule variances in site characteristics such as elevation. However, these variations create rich habitats that support multiple and diverse communities of plants and wildlife. Again, while the main project area is developed, it is surrounded by these fascinating systems.

The Flamingo developed area consists mainly of artificially maintained vegetation or mowed lawn. The Commercial Services Plan describes the vegetative communities in detail, but following is a list for reference of the plant/aquatic communities: coastal prairie, salt marshes, mangrove swamps, coastal strand, tropical hardwood hammocks, freshwater (Eco-Pond), and marine/estuarine.

The vegetative communities provide valuable habitat for the unique wildlife found near the development area. For a complete species list, refer to the Flamingo Commercial Services Plan.

Night Sky

Currently lighting at night is minimal. Due to closed overnight accommodations, there is a decreased effect on night skies, migratory birds, and nocturnal wetland species. Potential effects of night skies may include visitors with RVs and lights associated with camping including headlights, flashlights, and campfires.

With the addition of rebuilt facilities and new facilities, including the eco-tents, there may be increased effects on nocturnal wildlife. As the Master Plan is developed, additional roadway, parking, and pedestrian area lighting is a recommended addition for safety and security of the visitor and staff. New lighting should meet the requirements of the International Dark-Sky Association (IDA), and existing historic site and building light fixtures should be renovated to help reduce light pollution.

Views

The majority of the site offers expansive views of the Florida Bay as well as the interior areas of the Park. On-site, elevated buildings such as the visitor center provide views from indoors as well as under/through the structure to the Bay and to the Everglades. Views to the interior areas of the Park offer opportunity for watching wildlife, particularly birding.

⁴ NPS 2008. The VE Zone is the 100-year floodplain with 150 mph winds and storm wave hazard.

3.2 Building Analysis

Building Name, Description, Condition	Opportunities	Constraints
Mission 66 Service Station		
 Historic Mission 66 Building - Contributing. Originally served as fuel service station at Flamingo. Slab on grade construction. Structurally sound but deteriorated building at Flamingo district entry. Abandoned and unutilized. Deteriorated and worn finishes and building assemblies. 	 Historic and cultural resource available for restoration, rehabilitation, re-use and interpretation. Representative example of Flamingo Mission 66 aesthetic. Existing building area available for programmed uses; accessible by existing park roads and served by existing utilities and services. Provides an opportunity to populate and improve the Park entry and exit visitor experience. Example of passive sustainable strategies (daylighting, shading). Additional sustainable features may include energy efficiency, solar power generation, water collection and conservation. 	 Balance must be achieved to program needs, code require Deteriorated finishes and bu Insect and vulture population Isolated building location limits required to ensure minimation Space is limited to existing to
Mission 66 Visitor Center		
 Historic Mission 66 Building - Contributing. Originally built as the visitor center and Concessioner Restaurant. Survived the 2005 hurricanes. Elevated slab construction. Structurally sound but deteriorated building within Flamingo district. Interior of structure was impacted by 2005 hurricanes. Current area is underutilized. Park rangers occupy north wing. South wing (former restaurant and gift shop) is unutilized with significantly deteriorated finishes. 	 Historic and cultural resource available for restoration, rehabilitation, re-use and interpretation. Representative example of Flamingo Mission 66 aesthetic. Highly visible and iconic building showcases park history and allows for superior interpretation opportunities and unparalleled views of Florida Bay. Showcase location for restoration efforts in the Flamingo District. Existing building area available for programmed uses; accessible by existing park roads and parking and served by existing utilities and services. Existing exterior space is shaded, open to breezes and accessible. Centralized location is primary wayfinding landmark. Example of passive sustainable strategies (daylighting and views, shading, orientation, durability). Additional sustainable features may include solar power generation, water efficiency, energy efficiency and indoor air quality. 	 Balance must be achieved to program needs, code requir Building shell requires strue envelope improvements and Code compliance and access Overgrown historic vegetatisafety and public use at exvegetation. Space is limited to existing the second structure of the second struc
Mission 66 Marina Building		
 Historic Mission 66 Building - Non-Contributing due to modifications. Originally built as the marina store. Survived the 2005 hurricanes. Slab on grade construction Continues to function as the marina store and is the only district location for retail, minimal food service (prepared and packaged foods), supplies and public restrooms/ showers. All marina operations are based from this building (gas service, boat rental and service, boat tour ticketing). 	 Functionally relevant building in good condition. Existing building area available for programmed uses; accessible by existing park roads and parking and served by existing utilities and services. Example of passive sustainable strategies (daylighting, shading, durability). 	 Site constraints create con traffic. Best management practices construction near the water Space is limited by existing limiting programming opport
Mission 66 Fish Cleaning and Restroom Building		
 Historic Mission 66 Structure - Contributing. Originally built for and in continuous use for intended purpose. Slab on grade construction. Accessibility and sanitary modifications have been implemented. 	 Functionally relevant historic structure in good condition. Representative example of Flamingo Mission 66 aesthetic. Passive sustainable strategies in place (daylight, passive ventilation and durability). Additional sustainable features may include solar power generation, water efficiency. 	Balance must be achieved to program needs, code requir
Mission 66 Lodge and Cottages Site (buildings demolished 2008-2009		-
 Former historic Mission 66 Development including multi-building lodge, pool and cottages. Slab on grade construction. Buildings were catastrophically damaged by 2005 hurricanes Katrina and Wilma and were subsequently demolished. 	 Previously developed area which is cleared and available to accommodate re- development to programmed functions. Opportunity to reduce overall development footprint by streamlining and consolidating future development programs. Centralized and visible location for implementation and highlighting of sustainable building process and strategies. 	 Adjacency to the iconic Mi design and screening to ens Building location, orientatie environmental conditions, standards for sustainable be Best management practice water's edge.
Campground Fee Station		
 Recently constructed building for fee collection. Functions seasonally. Slab on raised earthen berm construction. 	 Existing structure in good condition for continued use. Employs materials consistent with the Park goals of new architectural treatment of buildings (concrete block and metal roofing). 	 Location is centralized to see Additional camping areas (e to better manage the campione)

Building Name, Description, Condition	Opportunities	Constraints
Comfort Stations		
 Existing buildings throughout campgrounds with toilets, showers and dishwashing facilities. Cold water only (solar water heat is under current contract). Slab on grade construction. 	 Functionally relevant existing buildings in good condition for continued use. Some of the buildings employ materials consistent with the Park goals for architectural treatment of buildings. Remaining buildings are easily adapted with maintenance level upgrades (roofs, doors, fixtures). Passive sustainable strategies in place (daylight, ventilation, opportunity to incorporate and highlight sustainable features including solar power generation, water collection and water efficiency). 	Facilities are adequate for a will require additional faciliti
Mission 66 Boat Shelter		
Historic Mission 66 Shade Structure - Contributing. Adjacent (non-historic) boat hoist is present but abandoned.	 Functionally relevant historic and cultural resource available for rehabilitation, re-use and interpretation. Representative example of Flamingo Mission 66 aesthetic. Passive sustainability in place (shading, durability). 	Balance must be achieved to operational needs, code req
Mission 66 Boat Shop		
 Historic Mission 66 Building - Contributing. Originally built as repair and maintenance facility. Currently functions as emergency vehicle storage. Slab on grade construction. Structurally sound deteriorated building. Under current contract for demolition. 	 Existing building area could be available for programmed uses; accessible by existing park roads and served by existing utilities and services. Scheduled demolition creates the area for efficient redevelopment on previously developed land with existing utilities and services. New developments allow for implementation and highlighting of sustainable building process and strategies. Additional sustainable opportunities include stormwater management, energy efficiency, passive ventilation, daylighting, water collection and efficiency and solar power generation. 	Best management practic construction near the water
NPS New Office and Emergency Vehicle Storage Facilities		
Two new warehouse and office buildings under current contract.Slab on raised earthen berm construction.	New durable structures to accommodate NPS functions.	Planned to meet current nee
NPS Maintenance Warehouses		
 Two existing warehouses (recently upgraded and renovated for NPS use). Slab on grade construction. 	 Recently renovated warehouses in good condition for re-use. Passive sustainable strategies in place (ventilation, durable). Opportunity to incorporate additional sustainable features including solar power generation and water collection and efficiency, sustainable site strategies, durable materials. 	 Space is limited to existing f Best management practic construction near the water
Miscellaneous Maintenance Buildings		
Miscellaneous maintenance buildings within Maintenance Yard.Slab on grade construction.	Existing buildings can maintain temporary functions.	Locations and sizes limit the
NPS Mission 66 Duplex Buildings 416, 439 and 440		
 Historic Mission 66 Quad-plex Housing Units - Contributing. Continuously operating as staff housing. Survived 2005 Hurricanes. Elevated slab construction. 	 Functionally relevant historic structures in good condition. Representative example of Flamingo Mission 66 aesthetic. Example of passive sustainable strategies (daylighting, shading, durability). Maintenance replacements can implement additional energy and water efficiency measures as well as envelope improvements. 	 Balance must be achieved to code requirements and sust

current camping occupancy rates. Additional development ties.

e program that can be accommodated.

to preserve the historic character of the building with modern stainability initiatives.

Building Name, Description, Condition	Opportunities	Constraints
Miscellaneous Housing		
 Existing housing units. NPS and concessioner staff housing. Elevated slab construction. Several structures were catastrophically damaged by hurricanes Wilma and Katrina in 2005. Buildings were subsequently demolished. 	 Functionally relevant structures in good condition. Previously developed area is cleared and able to accommodate re-development. Passive sustainable strategies are in place (orientation, durable materials, impervious surfaces, reflective roofing). Additional sustainable strategies can be integrated through maintenance activities (water conservation, reflected surfaces, envelope improvement, and energy efficient equipment). Additional sustainable strategies can be integrated in new and redeveloped housing units including water conservation, reflective surfaces, envelope efficiency, energy efficiency, durable materials. 	Existing developed footprint m Best management practices an construction near the water'
NPS New Housing		
 Two new duplex units elevated concrete structures (completed in 2009). Elevated slab construction. 	 Example of contemporary housing and construction techniques are a good reference for future construction in the Flamingo area. Example of sustainable strategies which can be employed as part of design and construction at new and redeveloped housing. Structures designed to respond to modern codes by elevating above minimum flood level and designed to withstand Zone VE (150 mph) hurricane winds. 	
NPS Common Structure ("Chickee")		
 Screened building for staff leisure use. Recently renovated and in good condition for re-use. Slab on grade construction. 	Functionally relevant and in good condition for continued use.	
Concessioner Dormitory Buildings		
 Existing private and semi-private rooms for concessioner staff. Cyclical maintenance ongoing. Elevated slab construction. 	 Functionally relevant and in good condition for continued use. Existing building area available for programmed uses; accessible by existing park roads and served by existing utilities and services. Passive sustainable strategies are in place (existing buildings, durable materials, shared living quarters, ventilation). Additional sustainable strategies can be incorporated through maintenance activities or building renovation (reflective roof surfaces, improved building envelope, energy efficient equipment, water conservation). 	 Existing footprint limits prog Current configuration with s current industry standards f Best management practices construction near the water

nust not expand. and sustainable strategies must be employed in all proposed r's edge.

gram which can be accommodated. shared baths requires renovation to private baths to meet for employee dorms.

and sustainable strategies must be employed in all proposed 's edge.

Mangrove Beach

The Development Program outlines the vision for a "New Flamingo", where nature and park amenities coalesce to deliver a visitor experience that molds one's view of the Everglades.

4.0 flamingo master plan and design program

In the years following the 2005 hurricanes, which demonstrably changed the features and the services present within the Flamingo district, the National Park Service teamed with Everglades friends and stakeholders to embrace a unique opportunity to preserve, restore and improve the beloved Flamingo gateway to the Florida Bay and Wilderness Waterway. The result of this initial effort was a Commercial Services Plan, which determined "necessary and appropriate commercial services for the Flamingo area in accordance with all applicable laws and policies, while providing a viable long term business opportunity for the concessioner(s)" who will ultimately operate the facilities. (Flamingo Commercial Service Plan, November 2007, Introduction).

In developing the Master Plan, the design team reviewed existing documents, visited the project site as a part of several master plan workshops, and organized and led design workshops collecting site information from the on-site NPS staff. Various existing documents produced by others were reviewed to understand and analyze the site, and include the following:

- "Everglades National Park, Flamingo Commercial Services Plan/Environmental Assessment (CSP/EA Draft), November 2007." This Environmental Assessment described in detail the purpose of the project, regulatory requirements, park and area history, information and analysis of existing development, current park management and operations, visitor experience objectives, interpretation objectives, environmental impacts and mitigation. The Environmental Assessment set forth a series of site planning alternatives for consideration. The Environmental Assessment alternatives were described in detail and encompassed a full range of potential development scenarios: Alternative A – No Action; Alternative B – Flamingo Rebuilt; and Alternative C – Flamingo Redesigned.
- "Flamingo Commercial Services Plan, Finding of No Significant Impact, July 2008." Resulting from the mandated Commercial Services Plan/Environmental Assessment process, a Finding of No Significant Impact (FONSI) was developed and approved. The FONSI set forth the selected development Alternative D – The Selected alternative. This selected alternative along with the requirements of the Commercial Services Plan/Environmental Assessment and the FONSI was the foundation for the development of this Master Plan.
- "Technical Assistance Panel for Everglades National Park, Flamingo Commercial Services Plan, Urban Land Institute, August 2008." A technical assistance panel was convened on August 4-5, 2008 to consider implementation options for the approved Commercial Services Plan. That document set forth general planning and design guidelines that were considered as a part of this Master Plan.
- "National Park Service Cultural Landscape Inventory, Flamingo Mission 66 Developed Area, Everglades National Park, 75% Draft, September 2009." This draft report documents the development chronology and physical history of the Flamingo Developed Area, a significant Mission 66 developed area.

The following Master Plan and Design Program reflects the critical features of the selected alternative (Alternative D), including the overall vision for the redevelopment of the Flamingo Developed Area. The selected alternative is described in the Finding of No Significant Impact (FONSI) and is illustrated within the FONSI as a land use bubble diagram shown on the following pages. The FONSI provides National Environmental Policy Act compliance for the project, and is the ultimate guiding authority for development of the Master Plan.

Preliminary campsite concept

Campsites with a view of Florida Bay are a highly desired amenity within the Flamingo District. High canopy shade trees, native grasses, and selective mowing provide an improved visitor experience at Flamingo. The master planning process consolidates, organizes, and analyzes research, historic circumstances, environmental studies, site visits, interviews, and regulations. Additionally, the process illustrates the implementation of the stated project goals and resolves normal conflict between site conditions and desired features.

The Design Program outlines and quantifies proposed features and the Master Plan illustrates the implementation of these features. This "New Flamingo" is an eco-friendly destination with a variety of lodging experiences and visitor services. Paramount to the FONSI selected alternative is the consolidation of related uses, reduction of the development footprint, incorporation of well-integrated pedestrian, bicycle, and shuttle pathways, and the restoration of 50 acres to natural conditions. The Master Plan exemplifies the sustainable vision of the National Park Service and is intended to guide planning, design, construction, restoration, and use of Flamingo for the next 50 years.

The Master Plan and Design Program illustrate an intensive redevelopment of the Flamingo district. The implementation of proposed features and amenities may be developed in a series of phases to allow the park to sequentially fund and absorb new development, proposed services, and increased visitation. Section 5.0 - Cost Estimate (p. 113) includes illustrations and cost breakouts for six proposed phases.

4.5.3 Maintenance and Staff Housing Area Plan Enlargement Key

4.0 3.0 5.0 45

4.6 Area Master Plans 4.6.1 Marina and Entry Area

- Entry monument and signage, vehicular service station and landscaping are to be located at the main park road entry to Flamingo.
- The historic Mission 66 Service Station is to be rehabilitated and used as the hub for vehicular fueling. Landscape screening is to block the view of this area from historic Flamingo.
- Separate parking lots are required for boat trailers and individual vehicles to limit conflicts. Parking is separated from the main road by a large grassy, multi-use space.
- Queuing areas are adjacent to, yet separated from, vehicular lanes to maintain efficient vehicular flow. Both inbound and outbound queuing areas are provided.
- Retain existing Whitewater Bay/Backcountry and Florida Bay boat ramps.
- Parking for boat trailers is available in parking lots adjacent to both the Whitewater Bay/Backcountry and Florida Bay boat ramps. Boat trailer parking includes pull-through and head-in parking spaces.
- The historic Mission 66 Service Station site is reorganized: historic rehabilitated structures are utilized; circulation is improved; and new fueling pumps are installed.
- Safe, accessible pedestrian circulation includes continuous sidewalks and crosswalks connecting the main road and parking areas with the marina, fish cleaning station, and dayuse pavilions.
- Rededicate one vehicular lane of the outbound main park road as a multi-use bicycle/pedestrian trail.
- Additional plantings screen new construction, provide shade, and replace missing trees in the historic pattern at historic parking lots.
- Existing boat docks are retained in both the Whitewater Bay/ Backcountry and Florida Bay marinas.
- Existing historic Mission 66 fish cleaning and restroom building to remain.

4.6.3 Marina Building

- The new elevated marina building provides a large deck with view of the multi-use landscaped plaza, Florida and Whitewater bays, and day-use areas.
- A large plaza in front of the marina building allows for efficient • pedestrian circulation and a space for families to gather.
- Two new day-use pavilions utilize historic stone walls from the demolished former marina store and provide shaded sitting areas.
- Wide pedestrian sidewalks connect the parking areas to amenities within the marina, and allow service vehicle access to the new building.
- Bench seating around the perimeter of the marina basins provides excellent views of wildlife and water activities.
- Porous paving around the perimeter of marina basins reduces runoff water quantity and improves runoff quality.
- A queuing area is located along the drive in front of the new marina building.
- Service access for the marina store is located next to the store • and utilizes the boat ramp paved area for large vehicle access.

4.6.4 Lodge, Cottages and Visitor Center

- The rehabilitated Mission 66 Visitor Center is the first stop and main hub for visitor information, orientation, limited interpretation, and check-in for overnight accommodations.
- Existing historic Mission 66 Visitor Center and visitor center parking lot are retained, and one parking bay is rehabilitated to accommodate large vehicle parking. The underutilized staff parking lot at the visitor center is retained and used by park staff.
- Pedestrian sidewalks connect the main park road and parking lots to the marina, visitor center, lodge, restaurant, pool and cottages. Paved trails connect to the bayside pedestrian/bike trail.
- Service access is provided to the visitor center on south side of the building and is screened from adjacent uses by a screen wall and dense planting.
- New elevated lodge, restaurant and pool are located at the south edge of the historic parking lot.
- A large plaza located in front of the lodge accommodates passenger and luggage drop-off area and provides a large gathering space for groups.
- The lodge buildings are connected by broad decks that allow for circulation and views to the bay.
- The restaurant service area is northeast of the restaurant and pool and is screened from adjacent uses by planting. The service area is accessed via a new curbcut from the historic parking lot west of the visitor center.
- Twelve new elevated cottages are located west of the new lodge buildings. The duplex cottages have parking beneath them. One-half of the units have adjacent boat trailer parking spots.
- Vehicle access to the cottages is from the main park road.
- Paved trails connect the cottages with the lodge buildings, visitor center, and bayside pedestrian/bike trail.
- Additional planting screens new construction, provides shade, and replaces missing trees in the parking lots.
- Shade trees and palms provide shade and separation between the cottages.

- 4.6.5 Eco-Pond
- Parking is separate from the main park road to provide safe visitor access to the eco-pond.
- Detached, meandering pedestrian/bike paths allow for safe access to the eco-pond and connect to the campgrounds.
- Near the parking lot is an elevated (raised with fill 2-3 feet), small interpretive overlook with educational information and benches facing the pond.
- An informal mowed turf trail encircles the pond and connects to the interpretive overlook.

4.6.6 Campground Fee Station

- An elevated (raised with fill 2-3 feet) fee station is relocated southwest of the eco-pond to serve all camping areas.
- The fee station has a staffed building and a self-pay station.
- An information kiosk located next to the self-pay station provides general Park and campground information.

4.6.7 Eco-Tents

- The eco-tent area is located adjacent to the walk-in campground, south of the campground fee station and east of Campground Loop 'A'.
- East eco-tent parking area accommodates boat-trailers, while the west eco-tent parking area is for vehicles only.
- Two new elevated (raised with fill 2-3 feet) comfort stations are constructed adjacent to each parking lot and provide restrooms and hot showers for campers.
- Paved trails permit access by small service carts and connections between eco-tents and comfort stations.
- Shade trees, palm trees, mowed and native grasses and shrubs are planted within the eco-tent areas to provide shade and privacy between tent sites.
- Based on project phasing strategy described in this plan, there
 may be a need to consider a paddle launch site along the ecotent area shoreline to provide a quality launch area in proximity
 to this new use proposed for phase 1 and 2 implementation.
 This feature may be similar to item #14 on page 63, including
 the need for a separate NEPA document to implement.

4.8 Design Character Guidelines **Design Character Guidelines -**Architectural

CHARACTER INFLUENCE: MISSION 66

The significance of the Mission 66 history permeates site and building aesthetics. Any work that is undertaken in this district must be critically sensitive to the historic character of the site and buildings.

The character of Flamingo is consistent with mid-century modern architecture of the 1950s and 1960s featuring sturdy, unobtrusive buildings that featured advanced construction techniques, inexpensive contemporary materials and simplified design vocabulary. "Most buildings are concrete and cinder block, built for function and to withstand environmental conditions. However, the buildings, lawns, and palm trees, set against the backdrop of the lush and exotic Everglades environment convey a special sense of place to the visitor" (Commercial Services Plan, 3-95, Section 106 summary).

New buildings must be compatible with the Flamingo Mission 66 vocabulary with complementary features that evoke without replicating existing character. Designs for new buildings should consider the following characteristics:

- Expression of long, horizontal planes
- Low horizontal massing
- Exterior freestanding vertical circulation elements
- Single sloped, low-pitched roof planes
- Flat roofs
- Concrete and/or stucco exterior finishes
- Concrete block
- Stone veneer •
- Aluminum accents and railings
- Exposed structural systems
- Textured accent materials
- Exterior windows walls and unorthodox fenestration
- Interior window walls and light sharing
- Exterior/interior spatial integration

CHARACTER INFLUENCE: CONTEXTUAL HISTORY

Predating the Flamingo's Mission 66 development was a nearby historic fishing village from which indigenous concepts and details are relevant. Additionally, Flamingo's locale and climate invite the incorporation of design character that is reflective of a south Florida vernacular. Relevant features include:

- Passive solar orientation: Siting buildings for maximum control of sun exposure
- Passive wind ventilation: Organizing windows, porches and openings to capture and capitalize on prevailing winds
- Elevated first floor level: Raising floors for comprehensive shade and ventilation of interior and exterior spaces
- Integration of interior and exterior primary living spaces
- Protection of openings:
 - Protect openings from solar heat gain with shading devices
 - Protect openings from storm winds and storm surges with shutters
 - Protect openings from insects with screening, vestibules or passive breezes
- Simplicity in finish and detail
- Expression of structure and functional detail

Protected exterior living space

Contemporary expression of modern features

Existing and appropriate materials

Focus on interior/exterior interaction and views

4.0

81

CHARACTER INFLUENCE: ENVIRONMENTAL CONTEXT

Flamingo is located in a harsh and precarious environment. Future design character is guided by Flamingo's unique environmental influences:

- Elevated first floor level: Raising floors for protection from floods and/or storm surges
- Materials: Substantial, water-resistant and durable non-water sensitive materials
- Materials: Reinforced concrete and aluminum structural systems (anti-corrosive)
- Protection of openings: Protect openings from storm winds and surges with operable shutters
- Simplicity in finish and detail for reduced maintenance

CHARACTER INFLUENCE: SUSTAINABILITY

The National Park Service is committed to incorporating sustainability into current and future designs for park buildings. Character-defining sustainable strategies that are to be implemented where practical throughout Flamingo's buildings include:

- Passively managing solar resources by orienting buildings to maximize northern daylight, minimize western façade exposure and maximize solar power generation on south façade exposures.
- Passively managing wind resources by aligning openings to channel coastal breezes.
- Integrating storm protection by utilizing high strength noncorrosive structural systems (i.e. concrete), incorporating protective shutters at openings, and protecting ground level spaces with flood doors and water resistant finishes.
- Integrating overhangs, shading devices, shutters and reflective surfaces to control effects of the intense summer sun.
- Incorporating versatility and flexibility into building spaces.
- Capitalize on passive ventilation by connecting and incorporating exterior spaces as primary living/working spaces.
- Share uses to minimize footprint requirements.
- Using durable, local and responsibly manufactured building materials including, durable structures and finishes that can withstand coastal storms and saltwater corrosion (i.e., concrete, stucco, aluminum, coral rock and recycled plastic timber).

- Expressing sustainable technologies for interpretation and education:
- Exposed solar collection systems incorporating advanced photo-voltaic technologies.

Exposed water catchment tanks and conveying systems to illustrate the conservation and reuse of rainwater.

Design Character Guidelines - Signs, Site Furnishings, and Materials SIGNS

Sign design for Flamingo should follow the National Park Service UniGuide Standards: Volume I, Park and Facility Identity Signs, and Volume II, Roadway Signs; Visitor Information Sign System, VIS and Wayside Hardware Specification Manual; and the Director's Order #52C: Park Signs.

NPS sign program management should result in signs that:

- Offer clear, concise, and consistent communications to park visitors while not detracting from natural and historic settings.
- Maximize the public's convenience and safety and reduce the National Park Service's liability exposure by ensuring compliance with pertinent federal regulations and principles of sound engineering and communication.
- Build upon, but not be bound by, NPS design traditions.
- Strengthen the public identity and perception of the NPS as

standards.

- circumstances change.
- priced.
- design.
- guidance listed below:

• Are easy to acquire, maintain, and replace, and are reasonably

Comply with NPS's commitment to rely more on standardized

Signage for the Flamingo Developed Area should follow the

Sign base and column materials should use native limestone to match the pattern, texture and overall appearance of the limestone used on site historically, such as on the service station, to fit with the Mission 66 character.

Other sign materials are to follow the UniGuide

Wayfinding signage design is to follow the UniGuide

Monument signage, which is located at entry, will follow UniGuide Standards. It is suggested to use native limestone for the sign base and vertical elements.

Area identification signs are to follow UniGuide Standards. It is suggested to use native limestone for the sign base and

Roadway signs are to follow the UniGuide Standards.

Bulletin Board

It is estimated that approximately 75 percent of all Park signs will fall into the Visitor Information (VIS) category. VIS signs are designed to present information in a consistent, attractive, convenient, and flexible format. Such information may involve pedestrian or bicycle and (low-speed) motorist guidance, regulations, resource protection, instructions and general information, fee information, safety warnings, maps, and interpretation. VIS signs may also be used to identify Park areas, features, or facilities when more monumental identification signs are not required.1

SITE FURNISHINGS AND MATERIALS

- Site furnishings are to be durable to heavy use. •
- Site furnishing materials are concrete or aluminum to withstand salt exposure.
- Site furnishings will be of a standard design to make replacement or additional pieces more easily facilitated.
- Furnishings should not detract from the historic Mission 66 character of Flamingo.
- Paving and walls are to be constructed of durable and native materials. •
- The design of walls should fit in with Mission 66 character and have a contemporary feel.

4.9 Technologies and Standards Appropriate to the Flamingo Area

Site Technologies and Standards

FEDERAL MANDATES AND GUIDELINES FOR WATER. ENERGY & CARBON REDUCTION Energy

Energy Policy Act of 2005

• The Energy Policy Act of 2005 set energy reduction goals for existing federal facilities by 20 percent, which was to be accomplished by the Fiscal Year 2015. This policy was superseded by Energy Independence and Security Act (EISA) of 2007.

Executive Order 13423

- Executive Order 13423 requires the reduction of energy use by 3 percent per year between Fiscal Years 2008 and 2015), and a 30 percent total reduction by 2015 from 2003 energy use levels.
- Secure 50 percent of renewable energy from new sources. This is required for buildings built in 1999 or later.

Energy Independence and Security Act of 2007

The purpose of the EISA is "to move the United State toward greater energy independence and security, to increase the production of clean renewable fuels, to protect consumers, to increase the efficiency of products, buildings, and vehicles, to promote research on and deploy greenhouse gas capture and storage options, and to improve the energy performance of the Federal Government, and for other purposes."2

- Section 431: Reduction of energy use (relative to the 2005 level) by 3% per year between Fiscal Years 2008 and 2015, with a total reduction of 30% from 2003 energy use levels by 2015.
- Section 432: Directs that federal energy managers perform comprehensive water and energy evaluations at each facility at least every four years, and implement measures within two years.
- Section 433: New and renovated federal buildings must reduce fossil fuel use by 55% (from 2003 levels) in 2010, by 80% by
- 2 Pelosi, Nancy (2007-01-12). "House Speaker's Description of Legislation." Speaker of the House. United States House of Representatives.

2020, and be carbon-neutral by the year 2030.

- Section 434: Utilize the most efficient energy design, systems, and equipment for major replacements, such as heating and cooling systems
- Section 523: New and renovated buildings must meet 30% of hot water demand through solar hot water systems by the year 2015.

Water

Energy Policy Acts of 1992 & 2005

These acts set national efficiency standards and specifications for residential and commercial water utilizing fixtures and appliances. The implementation of low-flow fixtures and appliances will assist with reducing the Flamingo energy demand and carbon footprint by reducing the overall water demand.

Executive Order 13514 (2009)

This order requires that all existing federal facilities reduce their potable water consumption intensity, from a baseline of Fiscal Year 2007, by 2 percent per year by 2020, for an overall reduction of 26 percent. This order also requires a reduction in industrial, agricultural and irrigation water consumption of 2% per year between 2010 and 2020, for a 20% total reduction. To ensure these reductions are achieved, prior to the design phase of redevelopment, a detailed analysis of the historical water consumption and intensity at Flamingo will need to be conducted in order to determine the necessary actions.

Carbon

Executive Order 13514

- Specific goals for the reduction of greenhouse gases must be established for 2020 using baseline data from 2008.
- Federal agencies must increase the use of renewable energy sources and implement renewable energy generation on site.
- Achieve a reduction in fossil fuel use by:
 - Utilizing low carbon emitting vehicles
 - Optimizing the use and number of fleet vehicles
 - Reducing the use of petroleum products (from a 2005 baseline) by 2 percent annually through 2020.

OTHER FEDERAL MANDATES AND GUIDELINES Executive Order 11988

This executive order is intended to protect wetlands. The existing and proposed developments within Flamingo are contained within areas that were historically filled; no additional use of fill or other adverse impacts to wetlands are proposed. The restoration and creation of wetlands and other native habitats will be included as part of the redevelopment plan.

Executive Order 11990

Clean Water Act

The objective of this national standard is "to restore and maintain the chemical, physical, and biological integrity of the nation's waters." The act supports the establishment and enforcement of water quality standards. (Draft Commercial Services Plan 2007) Water-sensitive urban design, the implementation of low impact development strategies that utilize best management practices, maintaining pre-development runoff rates and limiting the pollutant discharge will contribute significantly to maintain water quality.

LEED

The construction of new buildings within federal facilities are required to meet the United States Green Building Council's (USGBC) Leadership In Energy and Environmental Design (LEED) Silver rating for New Construction.

FLORIDA

Outstanding Florida Waters In accordance with the Clean Water Act, Florida has designated all waters of the Everglades National Park as Outstanding Florida Waters (OFW). This was conveyed via Section 403.061(27) of the Florida Statutes, which grants the Florida Department of Environmental Protection (FDEP) the power to establish these waters as OFWs and as worthy of protection.

This executive order oversees floodplain management, with the intent of reducing or eliminating development within floodplain areas. However, the development at Flamingo is unique and since the entire area is within the floodplain, meeting this requirement is not possible. To reduce the impact on the floodplain and the surrounding natural environment, no additional filling of the floodplain or impacts to native areas are proposed.

REGULATIONS AND OTHER **OVERARCHING STANDARDS**

National Park Service – Director's Orders (DO) (Sustainability Related)

- DO #12: Conservation Planning per National Environmental Protection Act and National Park Service Organic Act
- DO #77-1: Natural Resource Protection implementation of Executive Order 11990
- DO #77-2: Natural Resource Protection implementation of Executive Order 11988

Site Sustainability Strategies

Some overlap with building systems may exist since the site and building systems are integrated and each affects the other.

ENERGY REDUCTION

The use of renewable energy can greatly reduce the overall carbon footprint of Flamingo, in addition to lowering operation and maintenance costs, and in some cases, capital costs. There can also be an improved lifecycle cost and an increase in savings through extending the life of costly mechanical systems.

Some strategies to reduce energy and meet the federal mandates include:

- Use of solar arrays
- Use of wind generation turbines
- Use of site lighting fixture-mounted solar photovoltaic panels and/or micro wind turbines
- Use of high efficiency water and wastewater treatment systems
- Use of solar water heating
- Appropriate use of interior and exterior site lighting to prevent overlighting and light spillage
- Use of light sensors or timers
- Use of water treatment system work exchangers to lower pumping demand
- Continued training of key personnel to operate and maintain systems utilizing new technologies
- Implementation of green procurement policy
- Continued auditing of system to verify efficiencies and reduce waste

WATER REDUCTION

The use of water conservation techniques and devices not only conserves water, but also the energy used to treat and pump the water, which can contribute to a reduction in the overall carbon footprint of Flamingo. In addition, the conservation of water can lower capital costs, operation and maintenance costs, and improve the lifecycle cost and savings by extending the life of costly mechanical systems.

Some strategies to reduce water consumption and meet the federal mandates include:

- Use of low flow water fixtures (as described in the sustainable building section below)
- Use of native, low water plant materials (Xeriscaping)
- No permanent irrigation
- Harvesting and reuse of rooftop rainwater for toilet flushing
- · Harvesting and reuse of air conditioning condensate for toilet flushing
- Harvesting and reuse of greywater for toilet flushing or irrigation
- Maintaining adequate water distribution system chlorination and pressure (reduces system flushing)
- Sub-metering for all facilities to track water use and detect leaks
- Use of efficient HVAC systems that require little or no water use
- Continued training of key personnel to operate and maintain systems utilizing new technologies
- Implementation of green procurement policy
- Continued auditing of system to verify efficiencies and reduce waste

WATER OUALITY

Water Sensitive Urban Design / Low Impact Development: The use of Water Sensitive Urban Design (WSUD) strategies, Low Impact Development (LID) devices, and Stormwater Best Management Practices (BMPs) can reduce the Total Maximum Daily Pollutant Loading (TDMLs) and increase the quality of stormwater flowing into adjacent surface waters and infiltrating into the groundwater.

Relevant stormwater BMPs and LID devices are:

• Porous Pavement: the use of porous pavement can assist with reducing the stormwater runoff and the transportation of pollutants into the marina basins and Florida Bay. The applicability and feasibility of this device will require a detailed analysis of the soils and specific performance requirements,

- larger events.
- reduce the runoff volume.
- Other BMP devices that may be applied to the site as part of the WSUD/LID development:
 - Detention Basin
 - Dry Swales

 - Green Roof
 - Dry Well
- percolation ponds.

CARBON REDUCTION

- Reducing vehicle miles traveled (VMTs) by fleet vehicles
- walking and bicycling

- rates

whether to reduce pollutants or to meet LEED.

 Bio-Retention Ponds: the use of created wetlands and small ponds close to pollutant sources to capture and treat stormwater runoff from small storm events and first flush of

 Infiltration trenches and pits: these devices direct stormwater runoff from specific sources into sub-surface infiltration chambers which provide a level of pre-treatment and can

- Filter Strips/ Bioswales
- Sedimentation Basin
- Oil & Grit Separator

• Land Application of Treated Sewage Effluent (TSE): since the sanitary waste is treated to a very high level, the disposal of this effluent water can be done through various means, including site-wide land application or irrigation. Although the need for irrigation may be minimal or even non-existent, the use of the TSE for irrigation is an accepted and sustainable way to dispose of this water. This may become more relevant and important as the redevelopment of Flamingo is completed and the volume of sanitary wastewater increases, especially if this volume exceeds the capacity of the current effluent evaporation and

Relevant strategies to reduce carbon footprint are:

- Reducing or eliminating use of fossil fuels in fleet vehicles
- Use of alternative means of transportation for visitors, including
- Use of mass transit for employees to reduce VMTs
- Reducing potable water demand
- Reducing energy demand
- Increased use of renewable energy sources
- Increased use of water reuse
- Increased use of plant materials with high carbon sequestration

Architectural Technologies and Standards

BUILDING CODES AND REQUIRED CONSTRUCTION STANDARDS

- Design to the Florida Building Code 2007 Edition, adopted March 2009, Hurricane Zone VE, 150 mph wind loads (or currently enforced Florida Building Code).
- Design to flood insurance floor elevations of minimum 15 feet above Mean Sea Level (or currently enforced mandates).
- Track current climatic change projections for Mean Sea Level rise over 50 years and increased storm intensity levels (in 2008 the median projection was for a 14 to 16 inch rise in sea level in South Florida). Revise design requirements to accommodate projected climatic conditions.
- Apply the Secretary of the Interior's Standards for the Treatment of Historic Structures for planned work in and around historic structures.
- Incorporate the requirements of the National Park Service Sustainability Checklist in all design and documentation.
- Employ applicable accessibility guidelines, including American's with Disabilities Act. Section 504. UFAS and ADAAG.

RECOMMENDED CONSTRUCTION STANDARDS **Raised Building Elevations**

- Raise building floor elevations to protect people, systems and water sensitive construction from storm impacts
- · Elevate all building systems and typically occupied floor elevations above flood level or protect with dry flood-proofing enclosures below flood level (minimum 15 feet above sea level).
- Elevate utilitarian structures, support facilities, maintenance buildings and other miscellaneous structures on filled pads above storm surge level (estimated 10 feet above sea level)
- Incorporate non-water sensitive materials for areas below flood level

Structural Systems

- Utilize structural slab-on-raised-structural-fill or slab-on-piling foundations for maintenance structures located at or above general Flamingo fill elevation
- Utilize surge protection buffers at slab type foundations and at on-grade facilities
- At foundation systems without structural pilings, provide structural fill to oolite strata and extend fill 5 feet horizontally around perimeter of slab
- Where structural slab foundation systems are not practical, utilize precast concrete foundation pilings to elevate building

structures above flood elevations to meet state of Florida and Monroe County building codes.

- Extend pilings approximately 5 feet into limestone strata. Total piling length to be determined by geotechnical analysis at project site
- Evaluate reclaimed fill material (from proposed restoration areas) for reuse as structural or backfill
- At slab foundations, utilize concrete masonry unit wall structure with aluminum pre-manufactured truss framed roof systems
- At raised slab buildings, utilize structural modular concrete and pre-cast building systems to minimize on-site construction requirements
- Utilize aluminum components for exposed structural framing to avoid corrosion
- Utilize structural steel only when fully encased and protected from corrosion
- Avoid wood framing
- Avoid exposed steel framing

Materials and Finishes

- Complement historic finishes and materials consistent with the Secretary of the Interior's Standards for the Treatment of Historic Structures
- Standard exterior materials include sealed or painted concrete and masonry finishes or 3-coat stucco system over concrete or masonry construction
- Exterior accent materials include aluminum or cementitious panels and locally relevant materials (i.e. cochina stone)
- Utilize mill finish aluminum at exterior exposed metal (structural or decorative)
- Utilize aluminum framed windows with high performance glazing
- Utilize aluminum screening for windows and exterior enclosures
- Incorporate manual hurricane shutters at all window and screened openings
- · Incorporate motorized hurricane shutters where manual operation is impractical
- Utilize perforated recycled boardwalk decking for occupied exterior spaces and walkways
- Utilize light colored prefinished aluminum metal roofing at sloped roofs, incorporate applied photovoltaic systems where practical
- Utilize light colored membrane roofing at flat roofs. Incorporate embedded photovoltaic systems where practical

Conveyance Systems

• Provide accessible entry and egress at all buildings and

structures

- Where possible, utilize ramping and transitional graded areas to achieve vertical circulation (in lieu of lifts or elevators) to minimize maintenance
- above flood level.

Mechanical Systems

- · Locate all equipment above flood level (condensers, air handlers, motors, pumps, etc.)
- individual building
- Incorporate geo-thermal and geo-exchange sources for cooling and heating where possible. Consider site impact of loop wells on historic context
- Where possible, eliminate all exterior equipment. Protect necessary exterior equipment from water surges and from damage by windborne debris
- penetrations

Plumbing Systems

- possible
- Utilize ultra low flow fixtures and faucets
- Utilize waterless urinals
- Provide rainwater and greywater collection and reuse systems at all new buildings that have an applicable water load
- load of the building
- Locate all pumps and equipment above flood level

Electrical Systems

- Flamingo
 - to the overall grid

 - demand

- Where necessary, utilize and protect lifts and/or elevators
- · Utilize traction type elevators to ensure that equipment is
- Fully enclose and protect elevator doors and shafts
- Utilize ramps or grade transitions to ensure elevator entry is elevated a minimum of 5 feet above Mean Sea Level
- Utilize wheel chair lifts at interior applications only

· Specify premium efficiency mechanical systems at each

· Where possible, protect and damper all exterior wall

- · Reduce demand, reclaim and reuse potable water wherever
- Size collection systems should be sized to meet the applicable
- Utilize solar water heat at all Flamingo buildings
- Incorporate photovoltaic power generation throughout
 - Engineer photovoltaic systems to return generated power
 - Locate all electrical equipment above flood level
 - Utilize high efficiency lighting and controls to reduce energy

Architectural Sustainability Strategies

The Master Plan exemplifies the sustainable vision of the National Park Service and is intended to guide planning, design, construction, restoration, and use of Flamingo for the next 50 years. All buildings designed within the district must employ a unique set of sustainable principles suited to Flamingo's specific environment. Flamingo's climate is seasonally harsh, which dictates a sustainable building approach reliant on practical, fundamental and integrated design approaches and durable, low maintenance technologies.

Flamingo's historic developments provide living examples of fundamental design approaches appropriate to this climate. Existing buildings illustrate passive orientation for wind and sun as well as use of local and durable materials. Designs for Flamingo's redevelopment must balance contemporary innovations and technologies with the demonstrated successes of these sound design principals.

The influences of Flamingo's harsh climate, historic context, remote location, and National Park status determine the strategies and technologies on which to focus future designs.

GENERAL REQUIREMENTS

- Utilize the National Park Service Sustainability Checklist to identify and test appropriateness of sustainable opportunities for each project proposed in Flamingo.
- Utilize the US Green Building Council standards for guiding Design projects to achieve LEED Silver sustainability. Certification.
- Establish maintenance and management protocols to ensure implementation of high performance building characteristics.
- Showcase sustainable features as an integral part of the visitor experience.

FUNDAMENTAL CONSIDERATIONS

- · Limit proposed development boundaries to currently or previously developed areas.
- Consolidate uses to reduce Flamingo's overall development footprint.
- Implement practical passive systems for the region.
- Implement residential-scale strategies and systems to minimize costs, simplify maintenance, accommodate phased development, and facilitate meaningful interpretation.
- Implement environmentally conscientious maintenance and operation of facilities.
- Ensure that employees are well-trained to operate and maintain the new systems.

SPECIFIC CONSIDERATION: CONSERVE AND CREATE POTABLE WATER

Flamingo's remote location requires on-site water treatment. Producing potable water is energy intensive and results in significant operating and maintenance costs. Conserving water and providing alternate sources for non-potable uses offsets system requirements, saves water, and reduces operating costs.

- Consider auto on/off and auto flush fixtures to control overuse. Utilize hot water sensing showerheads to avoid initial water waste during heat up.
- Offset potable water demands and water treatment quantities by collecting greywater to flush toilets.

- Selectively implement condensate, rainwater, and greywater collection respectively, and only until building needs are met. Install tanks and enclosures sized to handle building requirements.

Flamingo Lodge

Utilize ultra low flow and waterless plumbing fixtures.

- Offset potable water demands by collecting rain water to flush toilets or water plants when required.
- · Collect condensate from air conditioning systems to supplement building water requirements in the summer.

Technology and Standards, Character Qualities

- Horizontal planes punctuated by vertical masses
- Elevated building and exposed structure
- Pre-fabricated modular building components
- Exposed exterior vertical circulation
- Low sloped roofs
- Punched openings
- Deep overhangs and shading protection with shutters for sun control and hurricane protection
- Precast concrete, aluminum, coral rock and regional/local materials

SPECIFIC CONSIDERATION: CONSERVE AND CREATE ELECTRICITY

The redevelopment and continued operation of Flamingo as a lively visitor destination will maintain and likely increase energy demands. While Flamingo is served by Florida Power & Light utility, Flamingo is the beneficiary of abundant solar resources for the production of local, renewable and clean energy.

Based on current conditions, electricity that is generated at Flamingo is most beneficial if it is returned to the electrical grid, providing a clean, supplemental source to utility company production.

- Proposed development is to occur in phases, yet photo-voltaic arrays can be sized based on the building area (roof or wall) or site area available to them. By feeding the grid rather than batteries, excess power production can benefit the overall park rather than feed and discharge from a localized battery. This takes advantage of an existing shared system without creating an independent power plant.
- Flamingo's use is seasonal and Flamingo's summers are intensely hot, resulting in inconsistent electrical demands. Sizing systems to meet demands becomes problematic, making shared resources more appealing.
- Flamingo's coastal eco-system can foster a corrosive environment for battery based storage and transfer systems. Maintenance and replacement costs for these systems may exceed their overall value in this climate.
- Typical arrangements with utility companies benefit consumers who provide clean power to the grid (currently the rate paid for clean power units is double the rate charged for power units). The net gain to Flamingo is substantial without the maintenance of expensive equipment.

Power requirements at Flamingo are substantial, including powering potable water and wastewater treatment plants, site lighting, building power (lighting, air conditioning, refrigeration, user power), campsites, and housing locations. These power requirements will likely increase with the proposed redevelopment of Flamingo, but can be substantially offset by practical, sustainable strategies. There are great opportunities to reduce Flamingo's operating expenses and dependence on remote utilities by reducing electrical demand and generating power on site.

- Utilize passive design strategies to reduce building cooling loads:
 - Orient linear buildings with long axis east to west to reduce exposure to hot afternoon sun and to capture northern daylight and coastal breezes.

- Locate operable openings on opposing north and south faces to ensure cross ventilation from coastal breezes.
- Utilize overhangs and shading devices to protect southern facing openings from Flamingo's intense direct sun and associated solar heat gain.
- Incorporate constructed or natural shading devices to protect east, west and south building faces from direct sunlight.
- Maximize north facing openings for daylighting interior spaces.

• Enhance building envelope performance to reduce building cooling loads:

- Maximize insulation about the entire building envelope and seal all penetrations to contain conditioned air inside building.
- Use highly reflective wall and roofing materials to reflect intense direct sunlight.
- Incorporate high performance glazing and engineered overhangs to limit solar heat gain inside buildings.
- Locate equipment in conditioned spaces for optimized performance.
- Incorporate vestibules or air locks to minimize heat transfer and to control insects.
- Employ energy efficient systems
 - Consider ground source, geo-exchange systems with water source heat pumps to reduce electrical demands associated with extreme air temperatures in the summer.
 - Appropriately size mechanical equipment for high performing building envelopes.
 - Consider energy recovery systems at air-conditioned spaces to capture and reuse energy from already conditioned air. This energy recovery reduces electrical demands associated with extreme air temperatures in the summer.
 - Incorporate zoned spaces, advanced controls, and variable speed motors for customized mechanical system efficiencies.
 - Utilize EnergyStar and/or FEMP rated appliances and equipment.
 - Design lighting to complement planned daylighting.
 - Consider high efficiency lighting technologies such as high output fluorescent and LED combined with dimming controls.
 - Incorporate daylight harvesting systems.
 - Incorporate advanced lighting controls and dimming for multi-use spaces.
 - Utilize solar water heating.

"Sustainable design balances human needs (rather than human wants) with the carrying capacity of the natural and cultural environments. It minimizes environmental impacts, it minimizes importation of goods and energy as well as the generation of waste. The ideal situation would be that if development was necessary, it would be constructed from natural sustainable materials collected on-site, generate its own energy from renewable sources such as solar or wind, and manage its own waste."

Climate Responsive Design

Passive Design Diagram

U.S. National Park Service: Guiding Principles of Sustainability

Local Materials: Coral Rock

Integrated Solar Collectors

Overhangs and Shading Devices ideal for Southern Exposures

Greywater Collection and Treatment System

"The Federal Government is committed to designing, locating, constructing, maintaining, and operating its facilities in an energy efficient and sustainable manner that strives to achieve a balance that will realize high standards of living, wider sharing of life's amenities, maximum attainable reuse and recycling of depletable resources, in an economically viable manner, consistent with Department and agency missions." Federal Leadership in High Performance and Sustainable

Buildings' Memorandum of Understanding

- Consider building management programs to ensure continued building performance.
- Research and employ current advanced technologies. Consider technologies which create symbiotic combinations (i.e. capture geo-exchange heat output to heat water), consider remote control building management systems for consistent performance; carefully select equipment based on seasonal use criterion.
- Generate solar power.
 - Generate clean electricity from the abundant renewable solar resource in Flamingo to supplement utility company provided power.
 - Incorporate photovoltaic systems at all new building roofs. Wherever possible, utilize systems that are integral to roofing materials and are resistant to corrosion.
 - Orient building roofs for optimum solar power generation. Primary roof surface should face generally southward (30) degree tolerance) and should follow a slope between 25-40 degrees.
 - Design roofs to structurally support selected photovoltaic array systems.
 - Incorporate photovoltaic technologies that are integral to building materials.
 - Carefully consider local climate concerns (saltwater, hurricane force winds/debris, extended periods of rain) at each proposed application to confirm appropriate selection.
 - Ensure that adequate building area is provided to accommodate required inverters and metering equipment.
 - Employ solar water heat for all buildings requiring hot water.
 - Research and employ current advanced technologies. Consider technologies such as compact solar power generator/storage modules for use at eco-tents to limit utility infrastructure, photovoltaic films within wall or roof materials for protection from hurricane winds and debris, solar collector panels within road beds to improve sustainability of current asphalt surfacing.

UTILIZE MATERIALS

- Reduce, Reuse, Recycle wherever possible.
- Implement a recycling program for visitor use.
- •
- interior spaces.
- Recycle existing fill from restoration areas, where appropriate, for use in new fill areas.
- - Prioritize products based on durability and ease of maintenance. Preferentially procure materials that are manufactured or harvested locally.
 - content.
 - material content.
 - Preferentially procure materials that have low emissions of volatile organic compounds.
 - Preferentially procure materials that bear labels of industry approval for sustainable production or content (i.e., Green Guard furniture, Green Seal cleaning products or Green Label Plus Carpets).

- Retain and reuse existing buildings.
- Reduce new building footprints by consolidating uses and accommodating shared uses.
- Incorporate shaded, breezy exterior spaces in lieu of enclosed
- Require construction waste management practices. Reduce construction waste and recycle all reusable debris.
 - Preferentially procure materials with significant recycled
 - Preferentially procure materials with rapidly renewable

4.10 Architectural Plans and Schematic Design General Note: All architectural plans in this Master Plan are schematic concepts.

More detailed plans will be developed in the future.

Postcard Image - Historic Flamingo Visitor Center

Visitor Center today

The visitor center at Flamingo was built in 1957 and remains iconic in its expression of the character of Flamingo's Mission 66 history. This Master Plan preserves and rehabilitates the visitor center area, re-establishing its prominence and historic integrity.

The visitor center is to be the first stop and main hub for visitor information, orientation, limited interpretation, and check-in for overnight accommodations. The renovated visitor center building will accommodate Flamingo district's interpretive center, including offices and support space for Flamingo district interpreters. Sharing the building are law enforcement and resource protection staff.

Plans for the visitor center must preserve historic materials and the quality of historic public spaces, ensuring the integrity of Flamingo's Mission 66 history. Restoration of the building's exterior components and attributes will significantly beautify and revitalize this unique landmark.

Originally designed to take advantage of daylight, views and breezes, the visitor center illustrates sound sustainable planning. Utilizing high efficiency equipment and fixtures, improving insulation levels and studying the efficiency of window glass will result in reductions of energy and water consumption in the renovated building. Solar power collectors may be possible on the visitor center roof, but designs must respect the historic character of the building.

Concept drawings will be developed in more detail in future phases of work. Storage and equipment areas are to be sized adequately for sustainable equipment specific to each project.

Flamingo Visitor Center

Rehabilitated interior spaces will capitalize on the quantity and quality of the natural light and openness of the spaces. The revitalized visitor center area will elicit memorable visitor experiences of this historic gem. Exterior spaces at the visitor center offer opportunities for visitors to enjoy the restored natural environment and to participate in orientation or interpretive activities. Lower level public restrooms complete the program.

LODGE - TYPICAL UPPER LEVEL CONCEPT

С	Admin and Meeting Area	1	500
D	Housekeeping + Storage + Mech	2	2,000
	Misc. Circulation & Bldg Services		3,500
FLAMINGO LODGE BUILDING Total SF 20,00			20,000

Concept drawings will be developed in more detail in future phases of work. Storage and equipment areas are to be sized adequately for sustainable equipment specific to each project.

Lodge/Restaurant Area

Lodge Entry

The proposed Flamingo Lodge provides a hotel-like atmosphere near the Florida Bay waterfront within walking distance of Flamingo's main activity centers (visitor center, marina, restaurant and pool). Guest parking and drop-off plaza provide convenience and access to ramp or stair entry to building. Connected walkway to restaurant and pool allow easy access to shared amenities and elevator access. The lodge is to have 30 guest rooms with 1-2 beds per room, balconies and bay views. Additional visitor amenity spaces include meeting rooms and sitting rooms.

After hours administrative assistance for lodge guests is to be provided in the restaurant building. Maintenance and housekeeping space and limited administrative space complete the program. The lodge design concept includes two separate buildings to allow for seasonal closure of a portion of the rooms.

The lodge is designed to complement the more prominent Mission 66 visitor center. Vegetative screening will be used to reduce visibility of the lodge from the visitor center and beyond. The proposed raised first floor, pre-manufactured concrete construction, and public exterior spaces evoke the character of the visitor center, provide enjoyable visitor experiences, and protect building systems and finishes from threat of flooding.

The lodge buildings are oriented for passive ventilation, controlled solar exposure and bay views. Shade features and exterior shaded spaces provide comfort and extend opportunities for passive ventilation. The lodge roof can readily host solar power collectors and solar water heat. Rainwater and/or greywater collection and reuse will require ground level protected tanks. High performance envelope and high efficiency equipment and fixtures will reduce the energy and water demands of the building.

Cottage Complex

Unique among Flamingo's amenities, the former cottages operated year-round, occupied by tourists, boaters, fishermen and researchers. The original Flamingo Cottages suffered catastrophic hurricane damage in 2005 and have since been demolished.

Flamingo's Master Plan proposes replacement cottages adjacent to the new lodge complex. Proposed duplex cottages offer visitors a semi-private, air-conditioned overnight accommodation option. The cottages are small scale structures placed within the landscape. Cottage visitors experience a uniquely intimate experience of Everglades ecosystems.

Proposed are 24 units in 12 duplex buildings. Both one bedroom and two bedroom units are planned. All units are accessible by car, bicycle, and foot. Accessible entry to one or more cottages is achieved by connecting raised walkways to the lodge. Boat trailer parking is available to a portion of the units to fully support yearround use. Bay views and more isolated locations allow a portion of the units to accommodate visitor desires for privacy and/or more remote natural settings.

Cottages provide an ideal opportunity to demonstrate sustainable strategies at a residential scale. Each cottage incorporates a sustainability module at its core, which can house the equipment and storage associated with solar power, solar water heat, and water harvesting systems. Ideally, visitors leave informed and inspired about sustainable strategies that are accessible in their own homes and lives.

Marina Area

Marina Building Concept

The marina peninsula is the hub for Flamingo's waterborne activities. The marina is rich with interpretive material and prized by visitors for excellent views of diverse ecosystems. Crocodile and manatee are frequent visitors to marina basins. From here, visitors embark on boating, fishing, touring, and sight-seeing activities.

Flamingo area.

Section 4.0 - Flamingo Master Plan and Design Program

Flamingo Marina Building

The current marina experience is compromised by the congestion of servicing multiple activities from a very small area. This Master Plan proposes redeveloping the peninsula, enlarging pedestrian areas, and redistributing parking and fuel service elsewhere in the

The proposed new marina building is located inland on the peninsula, preserving views and water access for Flamingo's visitors. The building is one raised story and houses food service, retail, and tourist/boat reservations services. Wrapped by an elevated deck, the building offers excellent views and convenient queuing opportunities. Under the raised building are shaded seating areas, public restrooms, fee showers, and boat rental operation areas.

This raised building is oriented to capture views and breezes and provide significant shaded areas for interpretation, seating and visitor use. The marina building roof can accommodate solar power collectors and solar water heat systems. Rainwater and/or greywater collection and reuse will require ground level protected tanks. High performance envelope, high efficiency equipment, and fixtures will reduce the energy and water demands of the building.

Flamingo Restaurant & Pool

Enhancing the public amenities at Flamingo is the proposed restaurant building & swimming pool adjacent to the lodge complex. All Flamingo visitors can take advantage of the 80 patron capacity full-service restaurant and lounge. Adjacent interior and exterior dining areas allow for year round use and offer varied dining experiences. A small retail area also serves as after hours check in for lodge guests.

The restaurant/pool building is accessible by bicycle or foot along the visitor center parking lot and along the Guy Bradley Trail. Connecting walkways to the lodge and cottages make the building convenient to overnight guests for dining, swimming and after hours check-in/check-out. Elevator and ramp access is available from the plaza area.

The swimming pool, within a screened enclosure, allows for yearround use and enjoyment. Alternative water treatments are to be considered upon specific design. Saltwater and ultra violet light systems may be considered in lieu of chlorine chemicals.

The restaurant building roof can accommodate solar power generation, solar water heat and rainwater collection. Public areas must be oriented for breezes and views.

Eco Tent Common Structure Concept

Eco Tent Area

Eco Tent Site Concept

Eco-tents are a proposed addition to the options for overnight accommodations previously provided at Flamingo. Eco-tents cater to campers who desire a natural experience that doesn't require bringing all of their own gear. Eco-tents are a simple overnight accommodation that exemplifies sustainability.

The eco-tent area is arranged around two separate parking areas and common buildings for flexibility in occupancy. Common buildings provide restrooms, hot showers, dishwashing, cooking and gathering areas for eco-tent guests.

Each tent location is intended to have a minimal permanent footprint and minimal infrastructure. No utilities will be present at individual campsites. Tent sites have a concrete pad foundation on raised earthen berms. Seasonally demountable storage units and canvas tents will be installed and furnished. The furnished tent provides a genuine outdoor camping option for visitors of all camping experience levels.

Common buildings provide all water and power resources for the area and are to incorporate solar water heat, photovoltaic systems, water reclamation and passive ventilation. Compact solar power units may run minimal lighting, fans or plug loads.

Eco-Tents and Common Buildings

4.0

103

4.11 Utility Infrastructure Analysis and Master Plan

Potable Water System

Existing Conditions

The domestic water used on site is supplied from local deep wells and treated at an on-site Reverse Osmosis (RO) plant for potable use. The water treatment plant was built approximately 11 years ago and was upgraded to an RO plant approximately 4 years ago. There were some issues with contaminants in the previous water source that have been addressed with the new deep wells and RO plant. Currently the RO plant is not operating at full capacity, with only 6 of the 8 membrane cylinders functioning. The designed output of the system at full capacity was 160k gallons/day; however, the actual output is closer to 68k gallons per day. It is expected that when all cylinders are operational, the output will be around 80k gallons per day. The brine discharge from the RO process is currently pumped to a rapid infiltration bed.

The domestic, potable and fire suppression water systems are all combined in a single distribution system. Many of the facilities on site are metered, and numerous valves appear to allow much of the system to be segregated. Some portions of the water system have been shut down due to leaks. The repair of these leaks is currently underway. In addition, many of the existing water fixtures at the comfort stations and visitor center are in the process of being replaced with low or no water use fixtures.

Recommendations for Future Use

The existing RO water treatment plant supply at full capacity is expected to be adequate to serve the proposed development as identified within the Master Plan. As the system ages and requires additional maintenance or replacement, it is recommended that the feasibility of alternative treatment systems be evaluated. An example of one such system is the Electo-Dialysis Reversal (EDR) system, which is substantially more efficient than RO and is growing in popularity. This system produces much less wastewater (brine) than the standard RO system. Other alternatives that may improve the efficiency of the water treatment system include the use of work exchangers, larger diameter filter elements, and additional pre-treatment. These measures can increase the efficiency, lower the operating cost, and increase the life span of the system, while reducing the overall carbon footprint.

The existing water supply system will be used whenever possible with minimal modifications and impacts to accommodate the proposed development. Some existing water lines will need to be relocated to accommodate new facilities, especially in the lodge and cottage area. There will also be a need for additional valves,

Reverse Osmosis plant with chlorination and other chemical treatment

backflow preventers, and meters to provide optimal management and control of the system in addition to serving the proposed uses. It is also important, considering the frequency of flooding, to maintain pressure in the system and have back flow preventers for all service taps (including irrigation) to prevent contamination in the event of a line break. The water lines within the area of the former lodge and the camping Loops B & C will need to be removed, including any services, in order for those areas to be restored to a natural state.

Some options for considerations for water reuse and sustainability are rooftop rainwater capture and grey water capture for reuse as toilet flushing and irrigation. The use of underground holding tanks or cisterns can collect the water from rooftops to be used on demand. Greywater (water from sinks, showers and clothes washing) can be collected separately in each facility as appropriate, pre-treated, and used for toilet flushing or irrigation, reducing the demand for potable water as much as 25 percent.

Fire Suppression System Existing Conditions

The fire suppression system contains a large storage tank (approximately 500,000 gallons) and booster pumps located at the water treatment plant. Fire hydrants are located around the site, including the housing area, maintenance area, marina area and around the visitor center. Some of the water mains feeding these hydrants have been shut down due to leaks. The repair of these leaks is currently underway.

In addition to the proposed water demand estimate included in this report, the actual system sizing will require capacity to provide fire flow for all facilities in addition to any additional contingency and safety factors the NPS may require. If these additional flows and factors require an upgrade to the water treatment plant capacity, this upgrade should include sustainability and efficiency improvements as mentioned in the water treatment section above.

Recommendations for Future Use

Existing Conditions

Recommendations for Future Use

Even though an irrigation system is not currently planned as part of the master planning process, the use of an irrigation system for new plantings is highly recommended, even if on a temporary basis. These plantings could be irrigated via drip line and other high efficiency irrigation components. Should permanent irrigation be installed, a site-wide central control system or other weather-based control system would also be recommended, along with a strict management plan to ensure the highest efficiency for all irrigation water use. These control systems along with efficient irrigation management methods are likely to save more than 30 percent of irrigation water.

Irrigation water can be provided by sources other than potable water. The capture of storm water from roofs and grey water reuse may also be a viable for some common buildings where enough storm and grey water is captured or generated and the reuse of this water is justified. Some examples are the lodge building and visitor center.

104

All new permanent buildings will have internal sprinklers per the National Building Code. Some portions of the existing water system will require relocation within the area of the proposed lodge and cottages to serve the new facilities. Improvements to the system (as indicated in the water system recommendations above) will be required and will affect the combined water and fire system. Additional cross connection of the water loop may be required to maintain a high volume of flow to the new facilities and reduce sedimentation and maintenance of the system. A new maintenance program will also be required for the overall water system.

Irrigation Water System

Some irrigation heads were observed around the Mission 66 visitor center; however, no irrigation is currently in use nor currently planned within the Flamingo area. Water for the previous irrigation system was supplied from the potable water system. The efficiency and management of the system when it was operational is unknown.

Water storage tank

Water supply booster pumps

Sanitary Sewer System Existing Conditions

Wastewater is currently collected and treated on site and discharged to effluent percolation/evaporation ponds located immediately adjacent to and northwest of the wastewater treatment plant. The old effluent pond, or eco-pond, located approximately 500 feet northeast of the existing campgrounds, just north of the west end of the Flamingo Lodge Highway, is no longer used for this purpose and is being naturally restored to a wetland state. There is a possibility that the eco-pond may be used again for treated effluent discharge.

As part of the collection system, and because of the flat site with a high groundwater table, there are a series of 17 lift stations across the site pumping water to the wastewater treatment plant.

The existing wastewater treatment facility was designed for approximately 90,000 gallons/day; however, this demand is not currently seen, even during peak season. As a result, the plant is not operating efficiently, requiring additional maintenance. Plans are currently underway to modify the plant, which will allow the system to fluctuate between 20,000 gal/day and 70,000 gal/day as the seasonal use varies, in order to keep the system operations as efficient as possible.

Since the Everglades area has been designated as an Outstanding Florida Water, the quality of the discharge water from the plant is even higher than state requirements. This additional level of treatment removes nutrients contained within the effluent discharge that do not naturally occur in the Everglades environment.

Recommendations for Future Use

The existing sanitary collection system and lift stations will be used whenever possible with minimal modifications and impacts to accommodate the proposed master plan development. The existing sanitary facilities within the lodge and cottage area will need to be relocated to accommodate new buildings, and any sanitary facilities within the areas to be restored will need to be removed prior to restoration.

Any new full service restaurant facilities will require grease traps with access to cleanouts for maintenance. The dumpsters serving full service restaurants should also be located adjacent to storm water inlets to capture and treat any grease and food residue runoff from the dumpster pad rather than allowing this water to flow directly into the basins and Florida Bay.

Wastewater Treatment Plant

Electric Power System Existing Conditions plant systems.

Recommendations for Future Use

No major power improvements are planned; all major systems, such as water, wastewater, and other public facilities, should have backup generators to ensure minimal loss of services when power is out. Alternative sources of energy are recommended for electrical generation and for water heating, where applicable. Roof mounted photovoltaic panels can be used to supplement the electric power provided to lower the overall electric cost for the Park Service. The use of solar water heating is also a viable option for use on comfort stations, marina, lodge, cottages and many other buildings on site that will use hot water. This system provides another solution to lower overall energy demand for the Flamingo area. Another source of renewable energy is available in the way of ground source heating and cooling. This is the use of a heat exchange system and the constant groundwater temperature to provide both water heating and area space conditioning. This source is consistent and has a short simple payback period.

Florida Power & Light provides the power to Flamingo facilities. The power is brought to the site via underground lines from the Miami Dade area, where the closest sub-station is located. Provided plans show (8) buried 25kv cables serving the site. Electricity is extremely important for the water treatment plant. Since power outages are common, a 50kW backup diesel generator was installed at the water plant to power some miscellaneous equipment and lighting at the plant in addition to pumps that maintain system pressure; however, the generator is not used to run all of the water treatment

4.0 105

Communications

Existing Conditions

Phone service is provided via antenna. Buried telephone lines currently serve the maintenance facility, the concessioner and employee housing, the marina facilities, the visitor center and restaurant. Phone service will be provided to the new cottages and lodge, with wireless phone coverage provided. Cable television is provided by satellite. A large antenna is located adjacent to the water treatment facility and serves multiple users including the Coast Guard, the Park Service, and many other federal agencies. This antenna is scheduled to be upgraded or replaced in the near future.

Recommendations for Future Use

Communication services to the following facilities will need to be maintained, improved or added including landline phone, cell phone, cable TV, and high-speed internet. Wireless internet should be evaluated for feasibility in providing service to the entire site in addition to the lodge and other public gathering areas.

Natural Gas / Liquid Petroleum Gas Existing Conditions

There is no use of natural gas, historically or currently. There was an aboveground propane tank located at the Mission 66 gas station near the Flamingo area entrance to fill RV and camper propane tanks; however, the tank and appurtenances were removed and mitigated many years ago.

Petroleum fuel storage tanks at marina

There is currently a series of (4) 2,000 gallon above ground liquid petroleum fuel storage tanks located in the marina area adjacent to the marina retail store; three of which hold gasoline, and the fourth holds diesel fuel. There are (3) pumping stations, one located on a fueling slab for automobiles and the other two located on the seawall of the marina for boat fueling.

Recommendations for Future Use

Two of the fuel tanks will remain at the marina area to continue to serve the existing pumps for boat fueling. The relocation of the other two fuel tanks and fuel pumps to the old gas station area for a new vehicle fueling station is recommended. The two relocated tanks and the remaining two tanks will be screened from public view.

Storm Water Management Existing Conditions

The Flamingo area receives an average of 48.5 inches of rainfall per year. This relatively high volume of precipitation frequently causes flooding during the larger storm events.

The entire Flamingo area is located within the 100-year floodplain as indicated on the FEMA FIRM map for Monroe County as revised on Feb. 18, 2005 (map # 12087C0675K). The topography of the site is very flat with the majority of the site being between 3 and 5 feet above sea level, and the highest point at approximately 7 to 8 feet. Since all new development will be within this floodplain, an elevation of 15 feet will be required for FF elevation for all new permanent structures. The existing comfort stations and common buildings are primarily CMU walls on slab on grade and do not contain the type of finishes or furniture that would be damaged by flood waters.

There are no stormwater retention or detention facilities on site. All rainwater from impervious surfaces including roads and parking lots sheet flow into non-developed natural marsh areas or directly into the basins and to Florida Bay with a minimal level of treatment. There is minimal structured conveyance of stormwater on site with approximately four to six grated inlet structures with culverts in grassed areas adjacent to the visitor center and marina parking lots. Some of these culverts, which drain directly into the marina basins and Florida Bay, will be plugged as part of the seawall improvements currently under construction. The coastline of Florida Bay along the campground area and near the amphitheater has experienced severe erosion during past hurricanes and other large storm events. Some attempts to curb this erosion have been implemented with little noticeable improvement.

Recommendations for Future Use

As with any developed site, the two main issues regarding stormwater management is quality and quantity. The quality should be addressed with appropriate designs, including Low Impact Development (LID) strategies for the smaller storm events or the "first flush" of the larger storm events. This water should be captured and treated wherever possible to prevent pollutants from entering the natural environment and surface waters. The quantity is generally addressed on a larger scale with larger conveyance and treatment swales and ponds for the 100-year design storm event. A detailed evaluation of the required stormwater quality and flood storage and routing should be completed during the design phase of the development.

The proposed development, as shown in the Master Plan, will generate stormwater runoff from the additional impervious services. This runoff increases the potential for transportation of pollutants and nutrients into the marina basins and into Florida Bay. To address this, all paved surfaces which may contain grease, oil and fuel from vehicles, and other sediment and pollutants will be either directed into a stormwater collection system and treatment pond or allowed to sheet flow into a created wetland, grass swale or other means of providing conveyance and treatment prior to entering the natural waterways or Florida Bay. Parking areas, in particular, will need to be regraded in a manner to encourage stormwater runoff to enter a swale or created wetland for pre-treatment prior to entering the natural waterways. This can also be accomplished by installing shallow trench drains to intercept this water, which directs it via a short pipe, to a pond or swale for treatment to minimize regrading. The use of porous pedestrian pavement is also recommended at some locations to provide additional infiltration and limit the runoff and transportation of pollutants into the adjacent surface waters.

In addition to capturing and/or treating the stormwater from all paved impervious surfaces, the rainwater may be captured from rooftops for reuse as irrigation, toilet flushing and or other domestic non-potable uses. This water will be relatively clean and, depending on the anticipated use, will require only limited, if any, pre-treatment. By collecting and reusing this water, the stormwater treatment volume will be reduced by the volume captured and reused. Shoreline protection should be considered to address ongoing shoreline erosion and protection of the proposed facility improvements at Flamingo. Shoreline protection is not part of this master plan effort, however, and would require analysis of alternatives (e.g., use of geotextiles) as well as consideration of any associated ecological impacts.

A Stormwater Best Management Practices (BMPs) program is also recommended. BMPs incorporate a wide range of stormwater programs, technologies, and processes that can control or prevent damage from runoff as well as reduce potential pollution from site runoff.

Summary

The overall utility infrastructure is in good shape and will only require minimal improvements to serve the new and renovated facilities in the Flamingo area. With new federal mandates, executive orders, and other requirements to reduce overall water and energy use, many sustainable concepts and systems are being evaluated and recommended for use as part of the Master Plan upgrades to the site. As with many types of solar dependant and sustainable systems, a backup or primary system may also be required to ensure a high level of service to meet hot water needs, electricity demand, etc. For this reason, these systems are recommended as a supplemental system to lower the demand and cost of energy in Flamingo.

As the mechanical systems age and require major repair and replacement, an evaluation of new technology and more efficient or green systems is recommended, such as the use of an EDR water treatment system which has a similar water cost to that of an RO system, but is far more efficient and may reduce energy consumption.

Notes and Assumptions							

Flamingo Proposed Utility Demand Summary

1. Approximately 80% of potable water is returned as wastewater.

2. Approximately 35% of interior wastewater may be captured as greywater (Amy Vickers 2001.)

3. Existing NPS housing s.f. is estimated.

4. Rainwater capture is based on a daily average from a 48.5" per year average.

5. The energy demand est. does not include the water or wastewater treatment plants.

6. The energy demand does not include site lighting.

7. The energy demand does not include energy for any communication systems.

8. Water demand does not include fire suppression water (or safety factors), only potable water use.

Roseate Spoonbill

5.1 Basis of Cost Estimate

The following Class C Construction Cost Estimate is organized in a unit cost format for the facilities and project elements shown in the Master Plan and Design Program. The Master Plan and Design Program represents an early phase in the planning and design process; many assumptions have been made in the estimating process and are noted on the estimates. The estimates should be used for budgeting purposes only. As the project advances through future planning and design phases, more detailed Class B and A Construction Cost Estimates should be developed.

General assumptions used for this estimate include:

- All costs are given in 2009 construction dollars, with an inflation factor included as a part of the contingencies reflecting estimated inflation for Phase 1 development starting in 2010. Per the NPS, construction is planned to begin in late 2010.
- The estimated costs and quantities are order of magnitude estimates, and are based on the conceptual plans and design elements shown in the master Plan and Design Program.
- Costs given assume that all improvements will be made under contract with a qualified contractor. No adjustments have been made for volunteer labor or donated materials.
- The estimate has been developed to reflect the Master Plan development phases as shown in this document. We have assumed that the phases are planned for each year beginning in 2010 and ending in 2015. The inflation factor that is applied is 4 percent per year and is compounded yearly for each phase.
- Historical Cost Data. Costs for similar South Florida projects were evaluated for comparison to historical cost data.
- Taxes: Sales tax is included in the unit costs on materials. No sales tax is applied in the markups.
- Building Estimate Supporting Information. The building costs shown in the following Class C Construction Cost Estimate have been developed from a detailed estimate based on the Pre-Design Building Area Program, which is a separate document from this Master Plan report.
- Building: FF&E & FSE pricing is included as lump sums.¹ OS&E is included in base unit costs.² Interpretive exhibits are included in FF&E lump sum for the visitor center. All site work beyond 5-foot perimeter of building is included within sitework estimates.

5.0 cost estimate

FF&E: Furniture Fixtures and Equipment include: loose furniture, (generally Owner provided fixtures and equipment) and soft goods such as bedding, towels and miscellaneous accessories. This includes retail display and interpretive exhibits. FSE: Food Service Equipment include: kitchen and bar equipment, storage shelving and walk-in freezers and coolers.

² OS&E: Operational Systems and Equipment include Telecom, Audio Visual, Servers/Computers, Building Management Systems.

Cost Estimate mark-ups and contingencies included in this estimate:

- Location Factor. A mark-up factor for the project location, which indicates the cost of commercial construction for the project location, and the regional market economics, as compared to the national average. The published source is "2009 RS Means Building Construction Cost Data"; the location used is Miami, Florida.
- Remoteness Factor. A mark-up factor for the remote location of the project in relation to the nearest location with a "Published Location Factor." The nearest "Published Location Factor" is Homestead, Florida. It is 49 miles between Homestead and Flamingo along a two-lane road with an average speed of 45 mph. This distance and access will have an effect on the cost of material and labor above the Published Location Factor; as agreed to by the NPS, a 10 percent contingency factor is applied.
- Federal Wage Rate Factor. A mark-up factor that accounts for state and federal regulations requiring that the Contractor must pay staff appropriate county Davis-Bacon wage rates. We have assumed the Davis-Bacon wage rates will generally exceed prevailing wage rates that are reflected in the Published Location Factors. Therefore, an adjustment to these factors to reflect the government wage rate requirements has been included. The location factor pertains and impacts only the labor costs on a project and therefore should be applied to the labor portion of the estimate. We have assumed that 50 percent of total base costs are considered as labor. Based on a recommendation from the NPS, 6 percent Federal Wage Rate Factor is applied.
- Design Contingency. The master plan contingency is a percentage of the total estimated cost of construction. The estimate has been prepared utilizing the Master Plan and Design Program shown in this document, including assumptions. Since it is very early in the design process, many assumptions have been made and there are still many unknowns in a project of this magnitude. This contingency is included to cover the assumptions and design refinements as the project planning and design progresses. As agreed to by the Design Team and the NPS, a 25 percent contingency factor is applied.
- Standard General Conditions. These are the Contractor to the Government associated with the cost items defined in the Division 1 specifications for a project. The costs associated with temporary utilities, field offices, fencing, field engineering, operation and maintenance manuals, etc. are all included as standard general conditions. Also included in the General Conditions percentage should be the cost of construction

permits, bonds, and insurance. As agreed to by the Design Team and the NPS, a 10 percent contingency factor is applied.

- Government General Conditions. Not included in Standard General Conditions is the cost of doing work for the United States Government and the National Park Service. Many of these government costs are attributable to increased administrative requirements and quality requirements along with sensitivity to the NPS mission of protecting the cultural and natural resources while allowing the public access and enjoyment thereof. As agreed to by the Design Team and the NPS, a 5 percent contingency factor is applied.
- Historic Preservation Factor. Many of the structures within Flamingo are historic. It is part of the National Park Service's mission to preserve and maintain the integrity of the original architectural construction and historical fabric of these structures. This often creates additional access, control and protection processes and complications during construction. Material costs are often increased significantly because of care to select compatible materials. A Historic Cost factor of 15 percent is included in building unit costs (remodel 5 percent over conventional construction cost; preservation 15 percent over conventional construction).
- Overhead. Overhead is the cost that a contractor has for staying in business. A general contractor has expenses not directly related to the construction of a project, but vital to the contractor's business operations. These include fixed overhead (Federal and State Unemployment costs, Social Security Tax, Builder's Risk Insurance and Public Liability Costs) and variable overhead (Worker's Compensation Insurance, Main Office Overhead, etc.). As agreed to by the Design Team and the NPS, a 12 percent contingency factor is applied.
- Profit. Profit depends on the size of job and a contractor's annual billing. Contractors generally take more profit on a smaller job. Also, consideration should be given to the fact that the installing contractor(s) (sub-contractors) will also charge profit on a project. As agreed to by the Design Team and the NPS, an 8 percent contingency factor is applied.
- Contracting Method Adjustment. The National Park Service seldom awards construction contracts based on the lowest price proposal of full and open competitive bid solicitations. The contracting methods most often employed by the NPS add additional cost to construction projects as compared to a competitive price proposal solicitation, because these methods limit competition. The primary procurement method is competitive negotiation where award is based on negotiating a price with the best technically-qualified contractor. The NPS also awards many contracts through the Small Business

Administration's 8-A program. Depending on the procurement method chosen, cost can be affected as much as 15 percent. As agreed to by the Design Team and the NPS a 15 percent contingency factor is applied as construction contract may be a sole source procurement.

yearly for each phase.

Inflation Escalation. The unit prices within the estimate are priced using current 2009 costs. As agreed to by the NPS, a 4 percent escalation factor (based on one-year historical inflation) is applied, with planned Phase 1 construction starting in 2010. Additional phases are assumed to be completed yearly with the last phase being implemented in 2015. The inflation factor that is applied is 4 percent per year and is compounded
