I oppose the use of a 10(j) rule for the grizzlies in the restoration work. This would mean grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana would be taken from their homes, dropped into the North Cascades, and lose their previous protection.

Montana doesn't have any "extra" grizzlies to lose to the North Cascades. Montana grizzlies are not yet recovered under the ESA, and any dispersing grizzlies from Glacier or Yellowstone are needed to naturally recover areas like the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest.

A natural recovery alternative must be fully developed and analyzed, even if recovery would take longer than active repopulation. The new information presented by Superintendent Striker regarding the likelihood of naturally migrating bears from Canada suggests active repopulation urgency may be more about protecting agency discretion than protecting Wilderness and creating the best environment for grizzly bears to migrate, live, and thrive.

For the long-term success of grizzly restoration, natural recovery measures must also be included in both action alternatives thus reducing the need for wilderness degrading activities that are also ultimately bad for bears. This requires work with partners in British Columbia to ensure that grizzlies have corridors to move back and forth across the international border and to prevent a small North Cascades grizzly population from shrinking over time and becoming inbred.

Thank you for the opportunity to comment.

Correspondence: Both of the action alternatives as they now stand would violate the Wilderness Act. The action alternatives should be modified to avoid helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and steer clear of heavy-handed management of bears. There are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites without the use of helicopters inside Wilderness. Please find an alternative to this. Thank you.

Correspondence: I'm writing today to strongly encourage you to reconsider your approach to grizzly recovery in the North Cascades. Neither of the current action alternatives, involving translocating bears from other regions, is compatible with Wilderness and the Wilderness Act.

While I strongly support the restoration of grizzlies to the North Cascades, the restoration must be done in ways that don't violate the Wilderness Act and harm the area's wilderness character.

Unfortunately, both of the action alternatives, as they now stand, would violate the Wilderness Act. They should be modified to avoid helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and steer clear of heavy-handed management of bears. There are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites without the use of helicopters inside Wilderness.

I STRONGLY oppose the use of a 10(j) rule for the grizzlies in the restoration work. This would mean grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana would be taken from their homes, dropped into the North Cascades, and lose their previous protection.

Montana doesn't have any "extra" grizzlies to lose to the North Cascades. Montana grizzlies are not yet recovered under the ESA, and any dispersing grizzlies from Glacier or Yellowstone are needed to naturally recover areas like the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest.

A natural recovery alternative MUST be fully developed and analyzed, even if recovery would take longer than active repopulation. The new information presented by Superintendent Striker regarding the likelihood of naturally migrating bears

from Canada suggests active repopulation urgency may be more about protecting agency discretion than protecting Wilderness and creating the best environment for grizzly bears to migrate, live, and thrive.

For the long-term success of grizzly restoration, natural recovery measures must also be included in both action alternatives thus reducing the need for wilderness degrading activities that are also ultimately bad for bears. This requires work with partners in British Columbia to ensure that grizzlies have corridors to move back and forth across the international border and to prevent a small North Cascades grizzly population from shrinking over time and becoming inbred.

An alternative that combines natural recovery with population augmentation under full ESA protections should also be analyzed.

The no-action alternative has many good Bear Smart components on how people and communities can coexist with grizzly bears and these coexistence measures should also be included in both of the action alternatives. All possible measures must be taken to prepare residents and visitors for bears, particularly given the dramatic growth of the human population in the region and rapidly increasing recreation pressures in the park.

Correspondence: Grizzlies historically roamed what today is North Cascade National Park and the surrounding Wilderness and wildlands of north-central Washington--and we should help grizzlies return to this landscape.

To that end, the National Park Service and U.S. Fish & Wildlife Service are seeking public input through November 13 on a draft Environmental Impact Statement (EIS) that evaluates options for returning grizzly bears to the North Cascades Ecosystem in Washington, where the animals once roamed.

Wilderness Watch fully supports recovering a healthy grizzly bear population in the North Cascades, but the effort must be done in a way that protects and enhances the area's wilderness character and that also minimizes the human handling and harassment of grizzlies.

The grizzly bear recovery area includes North Cascades National Park, 638,173 acres of which is designated the Stephen Mather Wilderness. Two other Wilderness areas bordering North Cascades National Park--the 531,325-acre Pasayten Wilderness and the 119,966-acre Mount Baker Wilderness--are also part of recovery area for grizzlies. Wilderness protection requires seeking ways to recover the area's grizzly population that avoids the use of helicopters, motor vehicles and equipment, electronic installations, and trammeling or manipulating the landscape or its wildlife.

Unfortunately, the current action alternatives would involve about 50 to 400 helicopter landings and twice that many helicopter flights. All, or almost all, landings would apparently be in Wilderness, either in North Cascades National Park or in surrounding national forests. The extensive use of helicopters would continue indefinitely for monitoring and managing bear movement and numbers. This heavy-handed management would be detrimental to Wilderness and bears alike. Grizzly bears would be collared, drugged, samples taken, released in Wilderness, re-collared and re-sampled, if determined

necessary, for many years. Any young grizzlies born in the Wildernesses may also be subjected to this invasive management.

There are no alternatives that look at less invasive or non-invasive means of grizzly reintroduction or recovery, and no natural recovery alternative. Neither of the current action alternatives, involving translocating bears from other regions, is compatible with Wilderness.

The federal agencies also propose under their preferred alternative (Alternative C) that the grizzlies moved to the North Cascades would be designated as a nonessential experimental population under section 10(j) of the Endangered Species Act (ESA). This means that a grizzly that is fully protected under the ESA in Montana could be taken from her Montana home range, dropped into the North Cascades, lose full protections under the ESA, and essentially be killed and harassed with fewer restrictions. This is unethical and must not be allowed to happen.

Wilderness Watch has serious concerns that the urgency for the current proposal, combined with a 10j experimental listing under the ESA, is more about safeguarding agency discretion than it is about protecting Wilderness and creating the best environment for grizzly bears to migrate, live, and thrive.

This year, North Cascades National Park Superintendent Striker told newspapers that changing conditions in Canada could mean naturally migrating grizzlies "may be down here before you know it." If bears migrate on their own, they have full protection under the ESA. Striker advocated for faster human-facilitated reintroduction stating, this way, "you can decide on different rules on how you are going to manage those endangered species ... [you can] define how we should treat bears, where do we want them, where don't we want them." Whereas, with migrating bears with full ESA protection, Striker worried, "We are going to be stuck with normal fish and wildlife rules that say you pretty much can't do anything" to the bears.

Please submit your comments to NPS and USFWS by November 13 and encourage the agencies to reconsider their approach to grizzly recovery in the North Cascades. Some points to emphasize:

I support the restoration of grizzlies to the North Cascades, and that the restoration must be done in ways that don't violate the Wilderness Act and harm the area's wilderness character. This is good for bears and Wilderness.

Both of the action alternatives as they now stand would violate the Wilderness Act. The action alternatives should be modified to avoid helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and steer clear of heavy-handed management of bears. There are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites without the use of helicopters inside Wilderness.

I oppose the use of a 10(j) rule for the grizzlies in the restoration work. This would mean grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana would be taken from their homes, dropped into the North Cascades, and lose their previous protection.

Montana doesn't have any "extra" grizzlies to lose to the North Cascades. Montana grizzlies are not yet recovered under the ESA, and any dispersing grizzlies from Glacier or Yellowstone are needed to naturally recover areas like the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest.

A natural recovery alternative must be fully developed and analyzed, even if recovery would take longer than active repopulation. The new information presented by Superintendent Striker regarding the likelihood of naturally migrating bears from Canada suggests active repopulation urgency may be more about protecting agency discretion than protecting Wilderness and creating the best environment for grizzly bears to migrate, live, and thrive.

For the long-term success of grizzly restoration, natural recovery measures must also be included in both action alternatives thus reducing the need for wilderness degrading activities that are also ultimately bad for bears. This requires work with partners in British Columbia to ensure that grizzlies have corridors to move back and forth across the international border and to prevent a small North Cascades grizzly population from shrinking over time and becoming inbred.

An alternative that combines natural recovery with population augmentation under full ESA protections should also be analyzed.

The no action alternative has many good Bear Smart components on how people and communities can coexist with grizzly bears and these coexistence measures should also be included in both of the action alternatives. All possible measures must be taken to prepare residents and visitors for bears, particularly given the dramatic growth of the human population in the region and rapidly increasing recreation pressures in the Park.

Correspondence: Hi,

I fully support grizzlies in the Cascades.

I trust this will be done in coordination so that bear have natural migration corridors to assure proper gene flow.

I also trust you will also find ways to do the reintroductions in compliance with all laws such as the wilderness act and clean water act and roadless rules.

As someone who lives with grizzly in the GYE, I understand that there are manageable challenges to coexistence that are better dealt with early.

Thank you for taking on these important challenges. All is possible with persistence, patients, imagination and knowledge.

Correspondence: I support the restoration of grizzlies to the North Cascades, and that the restoration must be done in ways that don't violate the Wilderness Act and harm the area's wilderness character. This is good for bears and Wilderness. Both of the action alternatives as they now stand would violate the Wilderness Act. The action alternatives should be modified to avoid helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and steer clear of heavy-handed management of bears. There are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites without the use of helicopters inside Wilderness.

I oppose the use of a 10(j) rule for the grizzlies in the restoration work. This would mean grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana would be taken from their homes, dropped into the North Cascades, and lose their previous protection.

Montana doesn't have any "extra" grizzlies to lose to the North Cascades. Montana grizzlies are not yet recovered under the ESA, and any dispersing grizzlies from Glacier or Yellowstone are needed to naturally recover areas like the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest.

A natural recovery alternative must be fully developed and analyzed, even if recovery would take longer than active repopulation. The new information presented by Superintendent Striker regarding the likelihood of naturally migrating bears from Canada suggests active repopulation urgency may be more about protecting agency discretion than protecting Wilderness and creating the best environment for grizzly bears to migrate, live, and thrive.

There are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites without the use of helicopters inside Wilderness.

For the long-term success of grizzly restoration, natural recovery measures must also be included in both action alternatives thus reducing the need for wilderness degrading activities that are also ultimately bad for bears. This requires work with partners in British Columbia to ensure that grizzlies have corridors to move back and forth across the international border and to prevent a small North Cascades grizzly population from shrinking over time and becoming inbred.

An alternative that combines natural recovery with population augmentation under full ESA protections should also be analyzed.

The no action alternative has many good Bear Smart components on how people and communities can coexist with grizzly bears and these coexistence measures should also be included in both of the action alternatives. All possible measures must be taken to prepare residents and visitors for bears, particularly given the dramatic growth of the human population in the region and rapidly increasing recreation pressures in the Park.

Correspondence: To Whom It May Concern,
My "comments" here are more in the form of questions. First off, since this park lies on the border of Canada, what exactly lies north of this park, in Canada? Is it designated wilderness or parks or are there towns and cities with a human population? And would "harvesting" of mature bears from other stocks exclusively be from Yellowstone National Park or Glacier? Why not harvest/relocate some bears from Alaska, or are those a different subspecies of what is in the lower 48 states? And why not have total protection over these bears as the bears have in Yellowstone N.P.?? And why would such heavy future monitoring of relocated bears be necessary? Why not relocate bears with GPS collars that would eventually fall off, then leave the bears alone in their new home? Why would constant helicopter flights and monitoring be needed? Reason says that some of these bears will establish home ranges where they are so why not relocate, with limited monitoring, then leave alone? These are answers that should be addressed before the program is begun. Thank you very much.

Correspondence: The Grizzly Bear is the quintessential symbol of Wilderness and wildness in America and Canada. Grizzlies historically roamed what today is North Cascade National Park and the surrounding Wilderness and wildlands of north-central Washington--and we should help grizzlies return to this landscape. I support the restoration of grizzlies to the North Cascades, and that the restoration must be done in ways that don't violate the Wilderness Act and harm the area's wilderness character. This is good for bears and Wilderness. Both of the action alternatives as they now stand would violate the Wilderness Act. The action alternatives should be modified to avoid helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and steer clear of heavy-handed management of bears. There are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites without the use of helicopters inside Wilderness. I oppose the use of a 10(j) rule for the grizzlies in the restoration work. This would mean grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana would be taken from their homes, dropped into the North Cascades, and lose their previous protection. Correspondence: We must act within the letter and the spirit of the law when dealing with Wilderness areas. Wilderness should, as much as possible, be left in the hands of nature. Humans have done a lot of damage to many places in this country in many ways. In recognition of all this, Congress has set aside Wilderness areas that are meant to be free from human interference. We must undo the damage we have done as gently as possible and allow for nature to heal itself without our heavy handed interference.

I support the restoration of grizzlies to the North Cascades, and that the restoration must be done in ways that don't violate the Wilderness Act and harm the area's wilderness character. This is good for bears and Wilderness.

Both of the action alternatives as they now stand would violate the Wilderness Act. The action alternatives should be modified to avoid helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and steer clear of heavy-handed management of bears. There are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites without the use of helicopters inside Wilderness.

I oppose the use of a 10(j) rule for the grizzlies in the restoration work. This would mean grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana would be taken from their homes, dropped into the North Cascades, and lose their previous protection.

Montana doesn't have any "extra" grizzlies to lose to the North Cascades. Montana grizzlies are not yet recovered under the ESA, and any dispersing grizzlies from Glacier or Yellowstone are needed to naturally recover areas like the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest.

A natural recovery alternative must be fully developed and analyzed, even if recovery would take longer than active repopulation. The new information presented by Superintendent Striker regarding the likelihood of naturally migrating bears from Canada suggests active repopulation urgency may be more about protecting agency discretion than protecting Wilderness and creating the best environment for grizzly bears to migrate, live, and thrive.

For the long-term success of grizzly restoration, natural recovery measures must also be included in both action alternatives thus reducing the need for wilderness degrading activities that are also ultimately bad for bears. This requires work with partners in British Columbia to ensure that grizzlies have corridors to move back and forth across the international border and to prevent a small North Cascades grizzly population from shrinking over time and becoming inbred.

An alternative that combines natural recovery with population augmentation under full ESA protections should also be analyzed.

The no action alternative has many good Bear Smart components on how people and communities can coexist with grizzly bears and these coexistence measures should also be included in both of the action alternatives. All possible measures must be taken to prepare residents and visitors for bears, particularly given the dramatic growth of the human population in the region and rapidly increasing recreation pressures in the Park.

Thank you for your consideration.

Correspondence: I do NOT support the re-establishment of Grizzly Bears into the North Cascades Ecosystem. There are already too many people living and hiking through the area. The black bear population is sufficient enough and also causes enough problems with human interactions. I cannot think of anything worse than coming face to face with a grizzly while on a hike or fishing trip. This re-introduction plan is a foolish idealistic idea. You might as well want to re-introduce T-Rexs too

and we know how well that idea worked in the Crichton(?) novels. This idea should be STOPPED immediately and finally now!

Correspondence: I support the restoration of grizzlies to the North Cascades, and that the restoration must be done in ways that don't violate the Wilderness Act and harm the area's wilderness character. This is good for bears and Wilderness.

I believe placing radio collars on wildlife, and effects that the electromagnetic frequencies have on them. Even if most wildlife mgmt personnel see this tool as very necessary to "manage" these animals, these devices may be doing great harm, including effecting their natural ability to navigate, effect heart & nervous systems, and, possibly making them more obvious, (less stealth), to prey & predator.

Both of the action alternatives as they now stand would violate the Wilderness Act. Correspondence: Dear National Park Service and U.S. Fish & Wildlife Service:

I support the restoration of grizzlies to North Cascade National Park and the surrounding Wilderness and wildlands of north-central Washington, where they formerly roamed. But the restoration must be done thoughtfully, in ways that don't violate

the Wilderness Act and harm the area's wilderness character, AND in ways that minimize human handling and harassment of grizzlies. Wilderness protection requires using ways to recover the area's grizzly population that avoid the use of helicopters, motor vehicles and equipment, electronic installations, and trammeling or manipulating the landscape or its wildlife. This would be good for bears and for Wilderness.

However, as they now stand, both of the action alternatives you propose would violate the Wilderness Act. They call for 50 to 400 helicopter landings and twice that many helicopter flights, all, or almost all, in Wilderness areas, lasting indefinitely for monitoring and managing bear movement and numbers. The action alternatives should therefore be modified to avoid helicopter landings and flights in Wilderness, to avoid the placement and use of telemetry installations, and to eliminate the heavy-handed management of bears. There are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites without the use of helicopters inside Wilderness.

I oppose the use of a 10(j) rule for grizzlies in the restoration work. This would mean that grizzlies fully protected under the Endangered Species Act (ESA) in places like Montana would be taken from their homes, dropped into the North Cascades, and lose their previous protection. Montana doesn't have any "extra" grizzlies to lose to the North Cascades. People cannot continue to think that the Earth's resources are here entirely for his/her benefit. We have got to protect America's wildlife before it disappears. Grizzlies are a vital link in the ecosystem and they must be given the space and protection needed to thrive. People must be educated about the grizzlies' lives, habits, and needs and learn to respect these magnificent beings.

Thank you.

Correspondence: I support restoring grizzlies to the North Cascades; the restoration must be done in ways that don't violate the Wilderness Act and harm the area's wilderness character. This is good for bears and Wilderness.

But both of the action alternatives as they now stand would violate the Wilderness Act by allowing helicopter landings and

flights in Wilderness, the placement and use of telemetry installations, and heavy-handed management of bears. There is no need for these: there are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites without the use of helicopters inside Wilderness. Also, please note that Montana doesn't have any "extra" grizzlies to lose to the North Cascades. Montana grizzlies are not yet recovered under the ESA, and any dispersing grizzlies from Glacier or Yellowstone are needed to naturally recover areas like the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest.

I urge that you strongly consider a natural recovery alternative, even if recovery would take longer than active repopulation. The new information presented by Superintendent Striker regarding the likelihood of naturally migrating bears from Canada suggests active repopulation urgency may be more about protecting agency discretion than protecting Wilderness and creating the best environment for grizzly bears to migrate, live, and thrive.

Natural recovery alternatives greatly reduce the need for activities that are hard on both the bears and the wilderness. Ideally, you would work with British Columbia to ensure that grizzlies have corridors to move back and forth across the international border and to prevent a small North Cascades grizzly population from dwindling over time and becoming inbred.

A natural recovery alternative that includes population augmentation under full ESA protections should also be considered.

The no-action alternative has many good Bear Smart components on how people and communities can coexist with grizzly bears and these coexistence measures should also be included in both of the action alternatives. All possible measures must be taken to prepare residents and visitors for bears, particularly given the dramatic growth of the human population in the region and rapidly increasing recreation pressures in the Park.

Correspondence: Bears, especially the Grizzly Bear, is an iconic symbol of freedom. There is much to admire about them when seeing them in the wild. They play an integral part in the ecosystem. By being omnivorous, they are opportunistic feeders and cull weak and inferior prey. I hope they will remain protected in the wild now and for many years in the future.

Correspondence: This is written to support the recovery of the grizzly population in the North Cascades, but it should be done in a way that does not violate the Wilderness Act: natural processes for recovery should be prioritized over the import of bears from Ofer areas which would require the use of helicopters for transport and monitoring which goes against any idea

of "wilderness". Furthermore, the population should not be declared as experimental as that could undermine the protection of the bears.

While these restrictions may seem cumbersome I encourage you to look at them as an important practice in a necessary attitude change: we have been thinking in a model of domination of nature and others for so long that it has become second nature to us, but in order to live sustainably we have to change our mindset and become vastly more economical with our interventions, sort of like an ecological martial arts. The lack of technology has not prevented indigenous people from managing their environments effectively and sustainably, better than we have done.

Thank you for the opportunity to give feedback!

Correspondence: To Whom It May Concern:

I am writing to address the Draft Grizzly Bear Restoration Plan / Environmental Impact Statement, North Cascades Ecosystem. I urge the NPS and USFWS to choose Alternative B: reintroduction and management under the Endangered Species Act (ESA).

Grizzly bears are an important part of a thriving ecosystem in the North Cascades and their reintroduction would help balance this wild area. However, a reintroduction as suggested in Alternative C would not facilitate the full potential of this work. Grizzlies are listed as a threatened in the ESA and therefore need to be managed as such--allowing a broader interpretation of how they can be managed would hurt the stated goal of the program of "restoring the grizzly bear to the North Cascades Ecosystem (NCE) grizzly bear recovery zone, a portion of its historical range."

Thank you for your time.

Correspondence: I am concerned about efforts to regulate grizzly bears in the Cascade Mountains. I support the restoration of grizzlies to the North Cascades, but that the restoration must be done in ways that don't violate the Wilderness Act and harm the area's wilderness character.

Both of the action alternatives as they now stand would violate the Wilderness Act because they involve the use of helicopters, technology, and equipment which is not in keeping with Wilderness principles.

I oppose the use of a 10(j) rule for the grizzlies in the restoration work. This would mean grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana would be taken from their homes, dropped into the North Cascades, and lose their previous protection.

Montana doesn't have any "extra" grizzlies to lose to the North Cascades. Montana grizzlies are not yet recovered under the ESA, and any dispersing grizzlies from Glacier or Yellowstone are needed to naturally recover areas like the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest.

Therefore a natural recovery alternative must be fully developed and analyzed, even if recovery would take longer than active repopulation. The primary criteria should be to protect Wilderness while creating the best environment for grizzly bears to migrate, live, and thrive.

For the long-term success of grizzly restoration, natural recovery measures must also be included in both action alternatives thus reducing the need for wilderness degrading activities that are also ultimately bad for bears. This requires work with partners in British Columbia to ensure that grizzlies have corridors to move back and forth across the international border and to prevent a small North Cascades grizzly population from shrinking over time and becoming inbred.

Obviously the situation for bears, Wilderness protection, and communities is complicate. The no action alternative has many good Bear Smart components on how people and communities can coexist with grizzly bears and these coexistence measures should also be included in both of the action alternatives. All possible measures must be taken to prepare residents and visitors for bears, particularly given the dramatic growth of the human population in the region and rapidly increasing recreation pressures in the Park.

Correspondence: Both of the action alternatives as they now stand would violate the Wilderness Act. The action alternatives should be modified to avoid helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and steer clear of heavy-handed management of bears. There are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites without the use of helicopters inside Wilderness.

Correspondence: I am submitting the following comments because I support the restoration of grizzlies to the North Cascades, and that the restoration must be done in ways that don't violate the Wilderness Act and harm the area's wilderness character. This is good for bears and Wilderness.

Unfortunately both of the action alternatives as they now stand would violate the Wilderness Act. The action alternatives should be modified to avoid helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and steer clear of heavy-handed management of bears. There are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites without the use of helicopters inside Wilderness.

I oppose the use of a 10(j) rule for the grizzlies in the restoration work. This would mean grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana would be taken from their homes, dropped into the North Cascades, and lose their previous protection.

Please keep in mind that Montana doesn't have any "extra" grizzlies to lose to the North Cascades. Montana grizzlies are not yet recovered under the ESA, and any dispersing grizzlies from Glacier or Yellowstone are needed to naturally recover areas like the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest.

I firmly believe that a natural recovery alternative must be fully developed and analyzed, even if recovery would take longer than active repopulation. The new information presented by Superintendent Striker regarding the likelihood of naturally migrating bears from Canada suggests active repopulation urgency may be more about protecting agency discretion than protecting Wilderness and creating the best environment for grizzly bears to migrate, live, and thrive.

For the long-term success of grizzly restoration, natural recovery measures must also be included in both action alternatives thus reducing the need for wilderness degrading activities that are also ultimately bad for bears. This requires work with partners in British Columbia to ensure that grizzlies have corridors to move back and forth across the international border and to prevent a small North Cascades grizzly population from shrinking over time and becoming inbred.

Clearly an alternative that combines natural recovery with population augmentation under full ESA protections should also be analyzed.

The no action alternative has many good Bear Smart components on how people and communities can coexist with grizzly bears and these coexistence measures should also be included in both of the action alternatives. All possible measures must be taken to prepare residents and visitors for bears, particularly given the dramatic growth of the human population in the region and rapidly increasing recreation pressures in the Park.

Thank you for your consideration of my comments regarding this critically important issue. And thank you for your work on behalf of America.

Correspondence: Dear Parks Service,

As a National and Washington State Parks member, I ask that you hear my voice on plans to reintroduce Grizzly Bears into The North Cascades National Park. I used the North Cascades National Park. I believe Grizzly Bears are an essential species to this landscape and should be used as a tool for education for respecting wildlife and their habitat.

All my life with family reunions held near Mazama since I was a little girl. For the last twenty years I lived in Canada, on the East Slopes of the Rocky Mountains, near Banff-Canmore area of Alberta. My husband and I brought undergrad business students and MBAs into the wilderness with traditional elders to learn from the land and become closer to themselves. David loved Grizzly Bears and always said he wanted to always live in a world where he could be eaten by a Great One (our respectful name for these honorable species). We lived adjoining Grizzly Bear habitat and never had a problem, as we, and our community, were careful regarding our behavior with garbage and food storage. We knew how to act when we encountered a bear and we respected their space. Two years ago my husband was trail running near our home and encountered a momma grizzly on her way to the summer feeding grounds near Banff. Because he was trail running, he likely did not see or notice her warnings to stop or stay away. This is the problem with any fast focused trail activity. One must keep broad awareness in the bust, especially in the evenings, and especially in April and May when young are being guided out of the winter dens. David raised his arm up to block something touching his back and they both fell off an embankment. David hit his head on a tree on the way down, ending his life. The bear tried to pull him down to the river. She tried to make sense of what had happened, and when she could not, she left quickly. Conservation officers demonstrated she had not been a problem bear and has been peaceful since. She did exactly what she was supposed to do in that encounter. David was in the wrong by trail running in the woods in early May at dusk.

As long as we can negotiate the interface between bears and humans, such that humans do not engage in hyper focused activities like trail running, biking, or off roading, then we must have bears living where humans recreate. The bears must also be healthy bears that do not have a history of reward garbage meals or comfort around humans. As long as humans are educated and act in line with what they know, this will be a great opportunity for humans to learn about wild places and how they can enter them protected, by being prepared.

Thank you for reading this. I will not be afraid of bears, except for what allows for a healthy awareness and prepared actions for a peaceful encounter. It is the ultimate excersize in yielding space, something is humans could learn so much more about. Please reintroduce the bears. This is their land.

Sincerely,

Correspondence: I fully support recovering a healthy grizzly bear population in the North Cascades, but the effort must be done in a way that protects and enhances the area's wilderness character and that also minimizes the human handling and harassment of grizzlies. The restoration must be done in ways that don't violate the Wilderness Act and harm the area's wilderness character. This is good for bears *and* Wilderness.

It is my understanding that both of the action alternatives as they now stand would violate the Wilderness Act. The action alternatives should be modified to avoid helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and steer clear of heavy-handed management of bears. There are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites without the use of helicopters inside Wilderness.

In keeping with the rubric of least invasive restoration methods, I oppose the use of a 10(j) rule for the grizzlies in the restoration work. This would mean grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana would be taken from their homes, dropped into the North Cascades, and lose their previous protection. Montana doesn't have any "extra" grizzlies to lose to the North Cascades. Montana grizzlies are not yet recovered under the ESA, and any dispersing grizzlies from Glacier or Yellowstone are needed to naturally recover areas like the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest.

It is important that we keep an eye towards restoring ecosystems in the most balanced and organic way possible, for long-lasting results and least impacts on other aspects of the ecosystems or the wider web of life. To this end, a natural recovery alternative must be fully developed and analyzed, even if recovery would take longer than active repopulation. For the long-term success of grizzly restoration, natural recovery measures must also be included in both action alternatives thus reducing the need for wilderness degrading activities that are also ultimately bad for bears. This requires work with partners in British Columbia to ensure that grizzlies have corridors to move back and forth across the international border and to prevent a small North Cascades grizzly population from shrinking over time and becoming inbred.

An alternative that combines natural recovery with population augmentation under full ESA protections should also be analyzed. The no action alternative has many good Bear Smart components on how people and communities can coexist with grizzly bears and these coexistence measures should also be included in both of the action alternatives. All possible measures must be taken to prepare residents and visitors for bears, particularly given the dramatic growth of the human population in the region and rapidly increasing recreation pressures in the Park.

Correspondence: I am opposed to the proposed grizzly bear introduction to the North Cascades area-----am opposed now, and was opposed in 2019 when the exact same proposal was resoundingly voted down by the people of Central Washington. I believe option A is the correct choice.

I am an avid outdoorsman who has hiked and backpacked all over the Cascade mountains and have enjoyed the comfort knowing that I won't have to worry about a grizzly bear encounter. I have met many of the same who specifically come to this region to recreate grizzly free. This, I think, is a significant factor in producing recreational dollars for our area, and should be seriously considered in regard to the reintroduction plan

Listen to our Representative Dan Newhouse, who summarizes the sentiment of our region, back in 2019, and now in 2023. No grizzly bear introduction to the North cascades! Period!

Correspondence: I very much support the full restoration and protection of grizzlies to the North Cascades, and that the restoration must be done in ways that don't violate the Wilderness Act and harm the area's wilderness character. This is good for bears and Wilderness.

To be clear, the goal IS NOT to fiscal subsidize or benefit any politically connected private group or corporate use of public lands or resources! Regarding the Act as written both alternatives as they now stand would violate the Wilderness Act so I offer the following modifications be included:

- The action alternatives should be modified to avoid helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and steer clear of heavy-handed management of bears. There are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites without the use of helicopters inside Wilderness.
- I oppose the use of a 10(j) rule for the grizzlies in the restoration work. This would mean grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana would be taken from their homes, dropped into the North Cascades, and lose their previous protection.
- Montana doesn't have any "extra" grizzlies to lose to the North Cascades. Montana grizzlies are not yet recovered under the ESA, and any dispersing grizzlies from Glacier or Yellowstone are needed to naturally recover areas like the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest.
- A natural recovery alternative must be fully developed and analyzed, even if recovery would take longer than active repopulation. The new information presented by Superintendent Striker regarding the likelihood of naturally migrating bears from Canada suggests active repopulation urgency may be more about protecting agency discretion than protecting

Wilderness and creating the best environment for grizzly bears to migrate, live, and thrive.

- For the long-term success of grizzly restoration, natural recovery measures must also be included in both action alternatives thus reducing the need for wilderness degrading activities that are also ultimately bad for bears. This requires work with partners in British Columbia to ensure that grizzlies have corridors to move back and forth across the international border and to prevent a small North Cascades grizzly population from shrinking over time and becoming inbred.

- An alternative that combines natural recovery with population augmentation under full ESA protections should also be analyzed.

- The no action alternative has many good Bear Smart components on how people and communities can coexist with grizzly bears and these coexistence measures should also be included in both of the action alternatives. All possible measures must be taken to prepare residents and visitors for bears, particularly given the dramatic growth of the human population in the region and rapidly increasing recreation pressures in the Park.

Thank you for addressing this most ecologically beneficial action. I just hope you'll stop addressing it from an "ecologically beneficial perspective" rather than continuing the very delusional short-sighted humanity survival risking "political perspective".

Correspondence: I support the restoration of grizzlies to the North Cascades, and in ways that don't violate the Wilderness Act or harm the area's wilderness character. This is good for bears and Wilderness.

Both of the action alternatives as they now stand would violate the Wilderness Act. Avoid helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and steer clear of heavy-handed management of bears. Bears can be released using the many inroads into the recovery area.T

The use of a 10(j) rule for the grizzlies in the restoration work is a bad idea, allowing the relocation of fully protected bears under the ESA, to lose their protection in the new area. Please don't do it.

Montana and other nearby locales don't have any "extra" grizzlies to lose to the North Cascades; they are needed for the recovery of their own area. A natural recovery alternative must be fully developed and analyzed, even if recovery would take longer than active repopulation. The new information presented by Superintendent Striker regarding the likelihood of naturally migrating bears from Canada suggests repopulation would be a great way to achieve safe habitat for bears.

For the long-term success of grizzly restoration, natural recovery measures must also be included in both action alternatives thus reducing the need for wilderness degrading activities that are also ultimately bad for bears. This requires work with partners in British Columbia to ensure that grizzlies have corridors to move back and forth across the international border and to prevent a small North Cascades grizzly population from shrinking over time and becoming inbred.

An alternative that combines natural recovery with population augmentation under full ESA protections should also be analyzed. The no action alternative has many good Bear Smart components on how people and communities can coexist with

grizzly bears; these coexistence measures should also be included in both of the action alternatives. Correspondence: Grizzly bears play a critical role in the environments they inhabit. Whenever a keystone species is eliminated from its habitat, there are downstream impacts on the rest of the ecosystem. I think if it is within the federal government's power to reintroduce Grizzlies to this habitat they have a moral duty to do so.

As climate change threatens many species and their habitats, having as many viable populations as possible becomes critical to overcoming a potential biodiversity crisis. To say nothing of the cultural importance of the bears and the awe they inspire.

Correspondence: Sir:

Thank you for the chance to comment on the Park Services' proposal to relocate Grizzly bear to the Cascades. I request the Park Service cancel this misguided proposal entirely. There are no spare grizzly bears to relocate. They're endangered and must not be used in risky projects that may or most likely fail to achieve the desired result. Cancel the NEPA analysis. Leave the ones we have alone, please.

No disrespect intended but the Park Service must concentrate entirely on protecting the endangered grizzly bears we still have. Let them relocate on their own free from the meddling hand of mankind.

Thank you for reading and carrying out my important request.

Correspondence: Dear NPS and USFWS Officials:

My family and I welcome this opportunity to submit our comments re: the Draft EIS.

We fully support recovering a healthy Grizzly bear population in the North Cascades. We hope that the NPS and USFWS will work hard to ensure that future Grizzly bear populations are protected, and that the restoration of their populations is done in such a fashion as to enhance the wilderness character of the North Cascades. All of this must be done in a way that minimizes human handling and harassment of the Grizzlies.

It will be wonderful to see the Grizzly bears come into their own as a keystone species and predator of the North Cascades. We hope everything that can be done will be done to make this happen.

Thank you for your consideration of our comments herein.

Sincerely,

Correspondence: Whereas I support the restoration of grizzlies to the North Cascades, this restoration must be done in ways that don't violate the Wilderness Act and harm the area's wilderness character.

Both of the action alternatives as they now stand would violate the Wilderness Act. The action alternatives should be modified to COMPLETELY EXCLUDE helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and steer clear of heavy-handed management of bears. There are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites without the use of helicopters.

I oppose the use of a 10(j) rule for the grizzlies in the restoration work. This would mean grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana would be taken from their homes, dropped into the North Cascades, and lose their previous protection. MONTANA DOES NOT HAVE "EXTRA" GRIZZLY BEARS TO PICK UP AND DRAG VIA HELICOPTER TO THE NORTH CASCADES! (Whoever, not in their right mind, came up with this screwy idea should seriously reconsider!)

Montana grizzlies are not yet recovered under the ESA, and any dispersing grizzlies from Glacier or Yellowstone are needed to naturally recover areas like the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest. A sensible and natural recovery alternative must be fully developed and analyzed, even if recovery would take longer than active repopulation.

Thank you.

Correspondence: I thank the NPS for accepting public comments regarding options for returning grizzly bears to the North Cascades Ecosystem in Washington. I support the restoration of grizzlies to the North Cascades, and I respectfully urge the Service to reconsider its approach to grizzly recovery so that it is done in ways that don't violate the Wilderness Act or harm the area's wilderness character. This is a win-win for bears and the wilderness they call home.

Both of the action alternatives as they now stand would violate that Act unless they are modified to avoid helicopter landings and flights in Wilderness, carefully consider the placement and use of telemetry installations, and steer clear of a heavy-handed management of bears. There are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites without the use of helicopters inside Wilderness.

I oppose the use of a 10(j) rule for the grizzlies in the restoration work. This would mean grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana would be taken from their homes, dropped into the North Cascades, and lose their previous protection. Montana doesn't have any "extra" grizzlies to lose to the North Cascades, as they are not yet recovered under the ESA, and any dispersing grizzlies from Glacier or Yellowstone are needed to naturally recover areas like the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest.

A natural recovery alternative must be fully developed and analyzed, even if recovery would take longer than active repopulation. The new information presented by Superintendent Striker regarding the likelihood of naturally migrating bears from Canada suggests active repopulation urgency may be more about protecting agency discretion than protecting Wilderness and creating the best environment for grizzly bears to migrate, live, and thrive.

For the long-term success of grizzly restoration, natural recovery measures must also be included in both action alternatives thus reducing the need for wilderness degrading activities that are also ultimately bad for bears. This requires work with partners in British Columbia to ensure that grizzlies have corridors to move back and forth across the international border and to prevent a small North Cascades grizzly population from shrinking over time and becoming inbred. An alternative that combines natural recovery with population augmentation under full ESA protections should also be analyzed.

The no action alternative has many good Bear Smart components on how people and communities can coexist with grizzly bears and these coexistence measures should also be included in both of the action alternatives. All possible measures must be taken to prepare residents and visitors for bears, particularly given the dramatic growth of the human population in the region and rapidly increasing recreation pressures in the Park.

Once again, I thank the NPS for accepting input from the public and for all it can do to ensure our struggling biodiversity has every chance to flourish.

Correspondence: As a lifetime hiker and backpacker, I am adamantly against reintroducing Grizzly Bears into the North Cascades. I understand what it's like to hike and backpack in Grizzley Bear country, as I was raised camping, hiking and backpacking in Montana, Wyoming and Canada. Co-existing with Grizzley's is not for the masses. It requires careful consideration and planning to keep both the hiker/Camper and bear safe. We had to be extremely careful packing our food, hanging our food and self care products, and scheduling around post menstrual cycles.

The Cascade Mountains are too close to the Seattle Metro Area to deliberately populate the area with Grizzley bears. There are literally tens of thousands of hikers and campers who frequent the trailheads in National Parks and Forests ranging from south of Mt Adams to north of Mt Baker. Our trailheads are "bursting at the seams" on the weekends and busy during the weekday. It's a mixed blessing. It's great to have Washingtonians appreciating our parks and natural areas. But we it's a recipe for disaster if you've got such a large population of outdoor enthusiasts who have no experience sharing their natural areas with Grizzlies. And as an avid hiker in the Northwest, I appreciate hiking in areas without the stress of encountering a Grizzley.

For the safety of our outdoor enthusiasts, I ask that you don't introduce a population of Grizzlies to Washington State. There is economic value in our Grizzley-free parks and forests by enabling more people to enjoy our forests. The end result of safe access to our parks and forests is a more eco-friendly population who appreciate the natural world.

Sincere regards,

██████████

Correspondence: Sir,

There are multiple reasons I oppose any effort to remove in any grizzly bears from protections under the Wilderness Act. The simple fact, if you cared to understand it, is that every ecosystem depends upon a apex predator. The function of that predator is to always cull the weak and the sick. This is a critical function and without it, species weaken. The lack of an apex predator often means grazers will demolish the natural balance of trees and grasses. This plus the reasons below are why I strongly oppose any actions to remove grizzly protections. And besides why would we want to exterminate such a wonderful species?

I support the restoration of grizzlies to the North Cascades, and that the restoration must be done in ways that don't violate the Wilderness Act and harm the area's wilderness character. This is good for bears and Wilderness.

Both of the action alternatives as they now stand would violate the Wilderness Act. The action alternatives should be modified to avoid helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and steer clear of heavy-handed management of bears. There are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites without the use of helicopters inside Wilderness.

I oppose the use of a 10(j) rule for the grizzlies in the restoration work. This would mean grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana would be taken from their homes, dropped into the North Cascades, and lose their previous protection.

Montana doesn't have any "extra" grizzlies to lose to the North Cascades. Montana grizzlies are not yet recovered under the ESA, and any dispersing grizzlies from Glacier or Yellowstone are needed to naturally recover areas like the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest.

A natural recovery alternative must be fully developed and analyzed, even if recovery would take longer than active repopulation. The new information presented by Superintendent Striker regarding the likelihood of naturally migrating bears from Canada suggests active repopulation urgency may be more about protecting agency discretion than protecting Wilderness and creating the best environment for grizzly bears to migrate, live, and thrive.

For the long-term success of grizzly restoration, natural recovery measures must also be included in both action alternatives thus reducing the need for wilderness degrading activities that are also ultimately bad for bears. This requires work with partners in British Columbia to ensure that grizzlies have corridors to move back and forth across the international border and to prevent a small North Cascades grizzly population from shrinking over time and becoming inbred.

An alternative that combines natural recovery with population augmentation under full ESA protections should also be analyzed.

The no action alternative has many good Bear Smart components on how people and communities can coexist with grizzly bears and these coexistence measures should also be included in both of the action alternatives. All possible measures must be taken to prepare residents and visitors for bears, particularly given the dramatic growth of the human population in the region and rapidly increasing recreation pressures in the Park.

Correspondence: After reading the Draft Grizzly Restoration plan, I believe action of some kind must be taken. While Option B would allow for the least amount of interference in grizzly populations while they reestablish themselves, Option C is the most viable simply due to the safeguards for human and economic stability in the area. While I have some qualms with the idea that lethal take would be permitted, as that could be seen as a go-ahead for bear hunting, I believe that keeping it legal will allow communities that have historically used bears to continue their usage once populations have reached

sustainable levels. Clear laws and regulations outlining when and where bear hunting can occur are necessary. Additionally, I have some doubts about the viability of relocating bears: What is getting these new bears to stay put in the Cascades? Overall, I believe that Option C is the most viable in the long term and will provide the most sustainable co-use of the Northern Cascades between humans and grizzlies.

Correspondence: As a former resident of Washington, I support the reintroduction of Grizzly Bears to the North Cascade ecosystem. Grizzlies exist in 4 of the lower 48 states, with only a few if any remaining in Washington State. This represents a fraction of their historical range. The North Cascades is listed as a Grizzly Recovery Zone and is the largest intact Grizzly habitat outside of Yellowstone, yet the current population is not large enough to sustain itself. Grizzlies must be reintroduced to reestablish connectivity throughout the Cascade range between Washington and British Columbia before this Distinct Population Segment goes extinct.

Correspondence: Please note that i am in Absolute Favor of restoring the grizzly bear to cascades/ Pacific Northwest that is shown as plan section 10/j. There are several reason a couple of which is it would restore the ecosystem which has been diminished by the decline of the grizzly, there is more than enough room and would restore them to their historic habitat. I'm sure you're aware that there is public support for this and it is so important to me to try and leave this world as good as it can be for my grandkid's. I am heartbroken that we have eliminated them in this area due to hunting etc. please approve this restoration

Correspondence: I live in a region of northern WI where black bears roam across our forests. There is bear hunting for a little over a month from Sept. through Oct, and with all weeks allowing the aid of dogs except the final week. I mention this to state my familiarity with living in an area where bears are present (and were there before "we" were). Grizzly bears in the NW area of the US described are a keystone species. This means that they are key to biodiversity--through their eating and mating habits, but most especially their range. As bears roam across their range they play a truly central role in protecting interspecies ecologies, including population numbers and propagation (seeds in fur and scat). This sparse knowledge, gleaned from public lectures by wildlife scientists, leads me to believe strongly that over managing species and especially managing or overmanaging them in intrusive ways, does not mean that the target species are living in the wild or naturally. The notion of repeated, routing helicopter flights is neither wise nor humane; indeed, it sounds traumatic. Noise and pollution and other disruption seem like the use of maximum tools to accomplish ends that do not truly depend on their usage. Moreover, what are the ends? The particular ends, include (I paraphrase the regional supervisor) where we want the bears and where we don't want them!! Undisturbed habitat would go a long way to bears remaining within a range. If bears need to be "channeled," there are many quite unintrusive ways to "direct" them, as we have seen in national parks. All efforts must be made to leave range and hibernation places undisturbed. I urgently request that the current method being proposed be reconsidered and set aside for something that will have ecological integrity and will cost less at the same time.

Correspondence Type: Web Form

Correspondence: I am writing as a

- Chairperson of [REDACTED],

- lawyer (JD [REDACTED] 1979),

- Biologist (BS [REDACTED] 1977, Phi Beta Kappa, magna cum laude) with a [REDACTED] Secondary Teaching Certificate (1977 - 1992) ,

- member of Union of Concerned Scientists,

- member of Patriotic Millionaires, and

- member of Wilderness Watch.

I support

- restoration of grizzlies to the North Cascades, and

- that restoration being done in ways that don't violate the Wilderness Act and harm the area's wilderness character.

This is good for bears and Wilderness.

Both of the action alternatives as they now stand would violate the Wilderness Act.

The action alternatives should be modified to

- avoid helicopter landings and flights in Wilderness,

- avoid the placement and use of telemetry installations, and

- steer clear of heavy-handed management of bears.

There are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses.

Such roads could provide release sites without the use of helicopters inside Wilderness.

I oppose the use of a 10(j) rule for the grizzlies in the restoration work.

This would mean grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana

- would be taken from their homes,
- dropped into the North Cascades, and
- lose their previous protection.

Montana doesn't have any "extra" grizzlies to lose to the North Cascades.

Montana grizzlies are not yet recovered under the ESA.

Any dispersing grizzlies from Glacier or Yellowstone are needed to naturally recover areas like the

- Selway-Bitterroot Wilderness, and
- Nez Perce-Clearwater National Forest.

A natural recovery alternative must be fully developed and analyzed, even if recovery would take longer than active repopulation.

The new information presented by Superintendent Striker regarding the likelihood of naturally migrating bears from Canada suggests active repopulation urgency may be more about protecting agency discretion than protecting Wilderness.

Instead, the focus should be on creating the best environment for grizzly bears to migrate, live, and thrive.

For the long-term success of grizzly restoration, natural recovery measures must also be included in both action alternatives.

Superintendent Striker must reduce the need for wilderness degrading activities that are also ultimately bad for bears.

This requires work with partners in British Columbia to

- ensure that grizzlies have corridors to move back and forth across the international border, and
- prevent a small North Cascades grizzly population from shrinking over time and becoming inbred.

An alternative that combines natural recovery with population augmentation under full ESA protections should also be analyzed.

The no action alternative has many good Bear Smart components on how people and communities can coexist with grizzly

bears.

These coexistence measures should also be included in both of the action alternatives.

All possible measures must be taken to prepare residents and visitors for bears.

Particular attention must be given to the

- dramatic growth of the human population in the region, and

- rapidly increasing recreation pressures in the Park.

Thank you for your consideration.

Correspondence: Although I recently relocated to Hawaii, I spent 30 years in Western Washington. We had black bears, coyotes, and cougars, but never a grizzly bear. I would love to see grizzlies returned to ALL of their original habitat. Stop preventing them from claiming new territories naturally and just allow them to roam and claim their land back. People have gotten too much in the way of allowing nature to care for itself, and just like the wolf, the bears are all on their way to being forgotten. Just allow them to reintroduce themselves and stop hunting/killing them because they're "inconvenient" to have around. They do NOT naturally "hunt" humans, and are not naturally aggressive animals, Please make a way to bring them back to all areas of North America, starting with the Cascades...

Correspondence: I strongly support the National Park Services preferred Alternative C: Restoration with Endangered Species Act Section 10(j) Designation.

This plan will both effectively restore grizzly bears in North Cascades National Park and give people the tools they need to thrive in and around grizzly bear country. Grizzlies belong in the North Cascades, as they enhance the park's ecological integrity and contribute to its wildness.

Grizzly bears play a vital role in maintaining ecosystem balance, cycling nutrients, dispersing seeds, and changing the behavior of species around them. Restoring them would benefit the park and the people who use it.

A restored population of grizzlies will boost the park's appeal and attract nature enthusiasts, scientists, and tourists from around the world. This would provide economic benefits to local communities and support the park's mission to protect park resources in perpetuity.

Alternative C, with the 10(j) rule, provides managers flexibility to address community concerns while protecting the grizzly population. It ensures coexistence between humans and bears. While I am supportive of releasing bears under 10(j) rule, I do not support a provision in it: the option for agencies to give conditioned lethal take authorization to a landowner. In this situation, once other deterrence or relocation options are exhausted, I would like to see problem bears handled by local management agencies, not private landowners who may not be supportive of establishing a viable bear population.

Please consider the positive ecological and economic benefits and support Alternative C. Restoring grizzly bears will secure the park's natural heritage and conserve an iconic species for current and future generations.

Thank you for your dedication to our national parks.

Correspondence: I support the restoration of grizzlies to the North Cascades, and that the restoration must be done in ways that don't violate the Wilderness Act and harm the area's wilderness character. This is good for bears and Wilderness. Both of the action alternatives as they now stand would violate the Wilderness Act. The action alternatives should be modified to avoid helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and steer clear of heavy-handed management of bears. There are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites without the use of helicopters inside Wilderness.

I oppose the use of a 10(j) rule for the grizzlies in the restoration work. This would mean grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana would be taken from their homes, dropped into the North Cascades, and lose their previous protection.

A natural recovery alternative must be fully developed and analyzed, even if recovery would take longer than active repopulation. The new information presented by Superintendent Striker regarding the likelihood of naturally migrating bears from Canada suggests active repopulation urgency may be more about protecting agency discretion than protecting Wilderness and creating the best environment for grizzly bears to migrate, live, and thrive.

For the long-term success of grizzly restoration, natural recovery measures must also be included in both action alternatives thus reducing the need for wilderness degrading activities that are also ultimately bad for bears. This requires work with partners in British Columbia to ensure that grizzlies have corridors to move back and forth across the international border and to prevent a small North Cascades grizzly population from shrinking over time and becoming inbred.

The no action alternative has many good Bear Smart components on how people and communities can coexist with grizzly bears and these coexistence measures should also be included in both of the action alternatives. All possible measures must be taken to prepare residents and visitors for bears, particularly given the dramatic growth of the human population in the region and rapidly increasing recreation pressures in the Park.

Correspondence: I am strongly in favor of the draft grizzly restoration plan; a sad history of slaughter and indifference that has diminished the grizzly population in this state and indeed, throughout the United States. Right now, there is abundant space in the area being considered, and it could be a catalyst for restoration across the US and Canada. Please go forward with this plan.

Correspondence: • We see that both of the action alternatives as is would violate the Wilderness Act. The action alternatives should be modified to circumvent helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and stay away from heavy-handed management of bears. There are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites as opposed to the use of helicopters inside Wilderness.

• I oppose strongly, the use of a 10(j) rule for the grizzlies in the restoration work. This would mean grizzlies that are fully

protected under the Endangered Species Act (ESA) in places like Montana would be taken from their homes, dropped into the North Cascades, and lose their previous protection. This does not benefit the bear population

- Montana doesn't have any "extra" grizzlies to lose to the North Cascades. Montana grizzlies are not yet recovered under the ESA, and any dispersing grizzlies from Glacier NP or Yellowstone NP are needed to naturally recover areas like the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest.

- I support the restoration of grizzlies to the North Cascades, and that the restoration must be done in ways (as mentioned) that don't violate the Wilderness Act and harm the area's wilderness character. This is good for bears and Wilderness

- A natural recovery alternative must be fully developed & analyzed, even if recovery would take longer than active repopulation. The new information presented by Superintendent Striker regarding the likelihood of naturally migrating bears from Canada suggests active repopulation urgency may be more about protecting agency discretion than protecting Wilderness and creating the best environment for grizzly bears to migrate, live, and flourish.

- For the long-term success of grizzly restoration, natural recovery measures must also be included in both action alternatives thus reducing the need for wilderness degrading activities that are also ultimately terrible for bears. This requires work with partners in British Columbia to ensure that grizzlies have corridors to move back and forth across the international border and to prevent a small North Cascades grizzly population from shrinking over time and becoming inadvertently inbred.

- An alternative that combines natural recovery with population augmentation under full ESA protections should also be analyzed.

The no-action alternative has many good Bear Smart components on how people and communities can coexist with grizzly bears and these coexistence measures should also be included in both of the action alternatives. All possible measures must be taken to prepare residents and visitors for bears, particularly given the dramatic growth of the human population in the region and rapidly increasing recreation pressures in the Park.

Thank you for reading my comments.

All possible measures must be taken to prepare residents and visitors for bears, particularly given the dramatic growth of the human population in the region and rapidly increasing recreation pressures in the Park.

. Neither of the current action alternatives, involving translocating bears from other regions, is compatible with Wilderness. The TERRIBLE current action alternatives would involve about 50 to 400 helicopter landings and twice that many helicopter flights. All, or almost all, landings would apparently be in Wilderness, either in North Cascades National Park or in surrounding national forests. The extensive use of helicopters would continue indefinitely for monitoring and managing bear movement and numbers. This heavy-handed management would be detrimental to Wilderness and bears alike.

Correspondence: I support the restoration of grizzlies to the North Cascades, but that restoration must be undertaken in ways that truly protect both the animals and the area's wilderness.
This may mean relying at least to some degree on a natural recovery alternative, which obviously would take longer than a full-blown human-engineered removal of grizzlies from one area to another.

And it is absolutely not acceptable to remove grizzlies from Montana where they are protected under the Endangered Species Act and place them in the North Cascades under terms that remove them from ESA protection. Grizzlies are simply not sufficiently numerous for that.

Please take a step back and reconsider all proposals with a goal of restoration that preserves ESA protection for the animals and that does not violate the Wilderness Act by harming the wilderness character in the North Cascades.

Please consider and analyze an alternative that combines natural recovery with population augmentation under full ESA protections.

Correspondence: As a dual-citizen (US/Canada) and avid supporter of non-motorized recreation, I am fully supportive of options B or C. Both work for me. I think it is important to reasonably re-introduce dislocated/removed species back into their native geographies.

I actually read more of the 300+ page EIS than I planned to. My biggest concern was general public objections to B or C, due to fear of bear attacks on humans and livestock secondarily. Having spent months in wilderness areas that grizzlies are a primary species, the only time I have encounter one is from a canoe 100 or more metres away - in all cases, the bears bolted away from me, even up hill. I believe the perceived threat of attack is far greater than the real-life probability. I noted your table in addressing such interactions; thank you.

Your 100-year timeline is interesting. I hope that the spirit and implementation of this effort will meet that guidance.

Good Luck.

Thanks for bringing this option to the NCE. As a lessor visited area, it is on my target list to visit more often as I have only done an 8-day canoe trip in the Ross Lake area. Getting old, so the amount of vertical travel is a challenge, but I am game. Bring the bears back and it will be a good thing.

Thank you.

Correspondence: I support restoring grizzlies to the North Cascades. The restoration process must not violate the Wilderness Act or harm the area's wilderness character. This is good for bears and Wilderness.

Both proposed action alternatives would violate the Wilderness Act. There should be no helicopter landings and flights in Wilderness, no placement and use of telemetry installations, and no heavy-handed management of bears. There are many roads in relationship to the recovery area or next to Wildernesses that could provide release sites without using helicopters inside Wilderness.

I oppose the use of a 10(j) rule for the grizzlies in the restoration process. This would mean grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana would be taken from their homes, dropped into the North Cascades, and lose their previous protection.

Montana doesn't have "extra" grizzlies to relocate to the North Cascades. Montana grizzlies have not yet recovered under the ESA, and grizzlies from Glacier or Yellowstone are needed to naturally recover areas like the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest.

A natural recovery alternative is preferable, even if recovery would take longer than active repopulation. The new information presented by Superintendent Striker regarding the likelihood of naturally migrating bears from Canada suggests the active repopulation decision may be more about protecting agency discretion than protecting Wilderness and creating the best environment for grizzly bears to migrate, live, and thrive.

For the long-term success of grizzly restoration, natural recovery measures must be included to reduce the need for wilderness degrading activities that are also ultimately bad for bears. Work with British Columbia will ensure that grizzlies have corridors to move back and forth across the international border which will help to prevent a small North Cascades grizzly population from shrinking over time and becoming inbred.

An alternative that combines natural recovery with population augmentation under full ESA protections should also be considered.

The no action alternative has many good Bear Smart components on how people and communities can coexist with grizzly bears. All possible measures must be taken to prepare residents and visitors for bears due to the dramatic growth of the human population in the region and rapidly increasing recreation pressures in the Park.

Thank you.

Correspondence: Dear NPS:

I know you're under a lot of pressure from farmers and ranchers, and from people who want to go live on the edge of wilderness who get pissed off when they find a bear in the hot-tub of their mountain resort.

But anybody who has ever understood wild animals knows that they are nomadic. And Mother Nature has her own way of regulating fauna populations without the use of poisons, guns, or death-snares.

So I believe that we should let wild animals roam our country, and they should only be trapped and relocated when they come into our communities.

(We truly should stop killing our magnificent animals...)

Correspondence: Grizzly bears are important to the ecosystem and deserve better. They've lost habitat like many other species at the same time human populations have increased. On this one planet humans need to protect all life, all species. It works in the wild when we don't interfere.

Correspondence: I support the restoration of grizzlies to the North Cascades, and that the restoration must be done in ways that don't violate the Wilderness Act and harm the area's wilderness character. This is good for bears and Wilderness. Both of the action alternatives as they now stand would violate the Wilderness Act. The action alternatives should be modified to avoid helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and steer clear of heavy-handed management of bears. There are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites without the use of helicopters inside Wilderness.

I oppose the use of a 10(j) rule for the grizzlies in the restoration work. This would mean grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana would be taken from their homes, dropped into the North Cascades, and lose their previous protection.

Montana doesn't have any "extra" grizzlies to lose to the North Cascades. Montana grizzlies are not yet recovered under the ESA, and any dispersing grizzlies from Glacier or Yellowstone are needed to naturally recover areas like the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest.

A natural recovery alternative must be fully developed and analyzed, even if recovery would take longer than active repopulation. The new information presented by Superintendent Striker regarding the likelihood of naturally migrating bears from Canada suggests active repopulation urgency may be more about protecting agency discretion than protecting Wilderness and creating the best environment for grizzly bears to migrate, live, and thrive.

For the long-term success of grizzly restoration, natural recovery measures must also be included in both action alternatives thus reducing the need for wilderness degrading activities that are also ultimately bad for bears. This requires work with partners in British Columbia to ensure that grizzlies have corridors to move back and forth across the international border and to prevent a small North Cascades grizzly population from shrinking over time and becoming inbred.

An alternative that combines natural recovery with population augmentation under full ESA protections should also be analyzed.

The no action alternative has many good Bear Smart components on how people and communities can coexist with grizzly bears and these coexistence measures should also be included in both of the action alternatives. All possible measures must be taken to prepare residents and visitors for bears, particularly given the dramatic growth of the human population in the region and rapidly increasing recreation pressures in the Park.

As a native of Northern California, I only saw my first bear in the wild this summer in the Klamath Park area. Imagine, it took 66 years and I am a hiker. Just saying this to emphasize the importance of protecting and encouraging our bear populations.

Thank you for your fine work.

Correspondence: The National Park Service must reintroduce grizzlies to the North Cascades. However, this must be done in accordance with the Wilderness Act and without violating it or the Endangered Species Act. It is equally important that this type of project is done properly as it is that it is done at all. NPS is on the right track to reintroduce grizzlies to the Northern Cascades, just do it correctly. Thank you.

Correspondence: Personally, I am revolted that this is being rushed! Isn't it enough that 'humans' hunt these poor animals? Must we make it so that they're easier to kill for so-called 'human' sport? I'm disgusted. They are protected and should be protected to the highest degree. My guess would be that at least 90% of United States Citizens demand that grizzly bears are left in peace AND NOT HUNTED AT ALL, and that the organizations that represent us not kowtow to special interest groups! Please read the below comments which aren't my own but I agree with 100%:

I support the restoration of grizzlies to the North Cascades, and that the restoration must be done in ways that don't violate the Wilderness Act and harm the area's wilderness character. This is good for bears and Wilderness.

Both of the action alternatives as they now stand would violate the Wilderness Act. Correspondence: I've made numerous trips into backcountry settings in Montana, Wyoming, and Canada where I've shared the wilderness with grizzlies. These magnificent animals are an essential and iconic part of our North American ecosystem and they deserve a presence in the North Cascades so that their populations can have the genetic diversity and broad-based habitat/geography necessary for their survival. The Cascades are an excellent location for the bears given their remote, rugged setting and lack of conflicts with livestock and ranching operations. With proper precautions (as should be undertaken with any back country travel), conflicts with humans can be managed and minimized, a small price to pay for the survival of these wonderful animals.

Correspondence: Dear Superintendent Don Striker and Supervisor Brad Thompson,

I am writing to support the restoration of a healthy population of grizzly bears to the North Cascades, their home for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations.

I support Alternative C: Restoration with Section 10(j) Designation. The proposal would bring up to 25 non-problem grizzly bears into remote areas of the North Cascades over the next decade and manage them as an experimental population.

Alternative C is the best choice for bears and the people who live and visit the North Cascades Ecosystem. The plan is wisely modeled on what's worked in Montana where grizzlies are recovering in the Cabinet-Yaak mountains with few problems and with the acceptance and involvement of local communities. Furthermore, the 10(j) rule will give people more management tools to reduce, prevent, and sometimes respond to human-bear conflict. I believe that the 10(j) rule if properly implemented, will help increase human acceptance of grizzly bears as they return to the landscape.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in

the North Cascades. Please bring back this native species to our state through the strategy laid out in Alternative C. Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

Thank you for taking the time to keep our North Cascades wild!

Sincerely,

██████████

Correspondence: I support the restoration of grizzlies to the North Cascades, and that the restoration must be done in ways that don't violate the Wilderness Act and harm the area's wilderness character. This is good for bears and Wilderness. Both of the action alternatives as they now stand would violate the Wilderness Act. The action alternatives should be modified to avoid helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and steer clear of heavy-handed management of bears. There are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites without the use of helicopters inside Wilderness.

I oppose the use of a 10(j) rule for the grizzlies in the restoration work. This would mean grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana would be taken from their homes, dropped into the North Cascades, and lose their previous protection.

Montana doesn't have any "extra" grizzlies to lose to the North Cascades. Montana grizzlies are not yet recovered under the ESA, and any dispersing grizzlies from Glacier or Yellowstone are needed to naturally recover areas like the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest.

Correspondence: As a Washington resident and nature lover, as well someone who works within a conservation-driven organization and recognizes it's critical role, I urge you to recognize the important ecological role grizzlies play in the North Cascades.

Now is the time to reintroduce them to that ecosystem and restore them to their natural habitat. Grizzlies belong in the North Cascades. We must recognize that and take action. We can and will coexist with these wonderful creatures.

Thank you for your attention to this critical matter

Correspondence: I fully support all of the following comments. There should be no policies adopted that would put the Grizzly population in the North Western States of the USA. They belong there just like all of the other top predators native to those areas. We as human beings, have no right to choose to annihilate a heritage species, nor should we limit their numbers to a level where they are genetically so inbred that they are no longer viable. The natural evolution of living species in any given area should be protected and nurtured. We should not be a primary cause of the next world wide extinction.

I support the restoration of grizzlies to the North Cascades, and that the restoration must be done in ways that don't violate the Wilderness Act and harm the area's wilderness character. This is good for bears and Wilderness.

Both of the action alternatives as they now stand would violate the Wilderness Act. The action alternatives should be modified to avoid helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and steer clear of heavy-handed management of bears. There are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites without the use of helicopters inside Wilderness.

I oppose the use of a 10(j) rule for the grizzlies in the restoration work. This would mean grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana would be taken from their homes, dropped into the North Cascades, and lose their previous protection.

Montana grizzlies are not yet recovered under the ESA, and any dispersing grizzlies from Glacier or Yellowstone are needed to naturally recover areas like the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest.

A natural recovery alternative must be fully developed and analyzed, even if recovery would take longer than active repopulation. The new information presented by Superintendent Striker regarding the likelihood of naturally migrating bears from Canada suggests active repopulation urgency may be more about protecting agency discretion than protecting Wilderness and creating the best environment for grizzly bears to migrate, live, and thrive.

For the long-term success of grizzly restoration, natural recovery measures must also be included in both action alternatives thus reducing the need for wilderness degrading activities that are also ultimately bad for bears. This requires work with partners in British Columbia to ensure that grizzlies have corridors to move back and forth across the international border and to prevent a small North Cascades grizzly population from shrinking over time and becoming inbred.

An alternative that combines natural recovery with population augmentation under full ESA protections should also be analyzed.

The no action alternative has many good Bear Smart components on how people and communities can coexist with grizzly bears and these coexistence measures should also be included in both of the action alternatives. All possible measures must be taken to prepare residents and visitors for bears, particularly given the dramatic growth of the human population in the region and rapidly increasing recreation pressures in the Park.

Correspondence: I do not believe the North Cascades is the right place for a grizzly population to be established. There are simply millions of people within a two hour drive of the proposed bears' habitat. Large increases in numbers of recreationists are already been seen in this area and the introduction of bears will just add to unnecessary and dangerous bear-human conflict. We are already seeing this issue with black bears at the urban interface, at my home not 20 miles form Seattle. Bears have to relocated or euthanized at great cost and time of personnel. Money and resources that could be better spent on supporting other desperately needed underfunded projects and parks - Mount Rainier NP is getting trashed from the increased in visitation. Grizzlies belong in areas far away from dense populations. just like they were before Europeans arrived here.

Did the death of the Canadian couple by a grizzly bear, doing everything bear-right), not show conclusively why this reintroduction is dangerous and ill-thought for both bears and humans.

Correspondence: True, thriving Eco systems need predators. You should, therefore re-establish Grizzly bears into this area. Allow nature to do it's thing once more. Humans have become a plague, spreading across this whole planet. We need to keep

as much wilderness and natural habitat as we can, out of the hands of developers. In the natural wilderness should be a solid natural system of prey and predator. I believe these bears are an integral part of that healthy environment.

Correspondence: This comment is for the idea of introducing grizzly bears into North Cascades National Park and Area: I oppose the introduction of grizzly bears into this area for one big reason- the huge population of recreationalists now using the area. Did you know that two weeks ago there were 200-300 cars parked to hike at Rainy Pass? This is the new " along highway 20 into the North Cascades- thousands of people and dogs in the area. I have been using highway 20 to camp for the last 25 years and the increase of people is phenomenal! And we know this is true as our beloved Mount Rainier National Park starts a reservation program next year.

I do not want to read where a newly introduced grizzly bear needs to be euthanized due to confrontation from people and dogs.

I believe that if grizzly bears wanted to be in that area- they would come down from British Columbia or Montana to inhabit North Cascades.

Thank you for listening,

Sincerely,

Correspondence: I applaud the work of the National Park Service, U.S. Fish and Wildlife Service and conservation partners to develop a science-based plan to reintroduce grizzlies gradually and safely.

Our generation should jump on this extraordinary opportunity to right the wrongs of previous generations. Washington's North Cascades was once home to a thriving population of grizzly bears. But our predecessors wiped them out through hunting, trapping and poisoning.

Grizzly bears belong here. The ecosystem is incomplete and unbalanced without them. The North Cascades ecosystem comprises vast, remote, and primarily public land. It offers ample secure habitat and food sources to support a stable grizzly population. But wildlife biologists do not believe a natural recovery is possible. It is very unlikely that enough animals of the critically endangered Canadian population will wander the long distance across challenging barriers to establish a functional breeding population in Washington. The bears need our help.

Reintroducing bears on the U.S. side will complement efforts led by First Nations in Canada to restore this sacred, culturally valuable species. Importantly, the new EIS provides for flexible management by wildlife authorities to safeguard people, property, and the bears.

I enthusiastically support the efforts to return this iconic animal to our wild public lands. We may never be lucky enough to see a grizzly bear in Washington's North Cascades in our lifetimes, but we can take pride in returning this key piece of Pacific Northwest's natural and cultural heritage for future generations.

Correspondence: In the big picture, the Grizzly bear is hardly endangered. The effort to introduce the bear into the North Cascades is driven by specific ideologies held by people that do not live and work in the affected areas nor are directly impacted by these decisions. I would hope that the concerns of the people living in affected areas would carry much greater weight than those that live hundreds or even thousands of miles away and seemingly care far more about the bear than the local residents. Considering how the Federal agencies are functioning these days, I'm not holding my breath.

Correspondence: Introduction of grizzly bears in the north cascades is not something the surrounding community's want or need. The grizzly bear is a dangerous predator that can not be controlled. If you really wanna support something maybe taking with the biologist that are heading up the lynx recovery in the northern cascades a call. Not only would their research be in jeopardy but putting more predators on the landscape is not the answer. Our best harvest has already increased to 2 bears a year. They haven't done that with a declining population. These predators are really hard to managed with the controls put on us from ODFW. No more grizzly's please.

Correspondence: I cannot believe that the federal government wants to bring-in grizzly bears from somewhere else, to build into a population of grizzlies in the North Cascades. This would be extremely dangerous for people who want to relax and enjoy nature in the beautiful North Cascades. I am no expert, but while bear spray (pepper spray) or a medium power handgun both have a chance of stopping a black bear, I've read that it takes a much more significant gun (44 magnum or above) to stop a grizzly. I do not care if grizzlies lived in the North Cascades hundreds of years ago; I care a lot more about not having humans killed by these bears if they are intentionally moved to Washington State. Personally I would never go hiking / walking in the back-country in an area where grizzlies live - at least not without a 44 to 50 caliber handgun on my chest. That's a \$1500 investment that would be needed due to this insane decision and I would still consider the grizzlies a risk to my life.

Correspondence: I am opposed to reintroducing the grizzly bear in the North Cascade Mountain range of the State of Washinton. They have not occupied this area for the last two decades, if the habitat is suitable for grizzle bears, they would have migrated from Canada or northern Idaho and be living there already.
The reintroduction will have grizzly and human conflict as hikers, campers, and people fishing in the lakes use this area frequently and have deadly confrontations.
The grizzle bear can and will migrate into this area on their own if they like or feel the habitat is suitable to support their life. Put the Federal dollars to better use and save the salmon or steelhead in the Pacific and Columbia River systems and remove or allow harvest of the over population of seals that lay and sink boats and docks along the Pacific coast.

Correspondence: I choose option A, no restoration of the grizzly population in the Cascades. I don't believe the biologists have done enough studies on the food sources for these animals. I don't believe it is safe to restore an animal in an area where there will be the opportunity for animal/human conflict. The Cascades are used heavily for hiking, hunting, fishing and overall recreation. Every year there are news reports of people being killed by grizzlies in Wyoming, Montana, Idaho and B.C. I take my family regularly into the Cascades for recreation and I don't want to worry about running into a grizzly. We don't have to worry about this with black bears because they are not as aggressive. I live in a community that borders the mountains so I strongly oppose restoring grizzlies into the Cascades.

Correspondence: I love wildlife. I love living among wildlife. Twice in the past two weeks I have seen bear in the wild. I see other wildlife even more frequently, and love it. Yet reintroducing grizzly bears would bring more negatives than positives.

Our ecosystem is different than it was when these amazing creatures shared these areas. Food sources have changed, and in some cases, have significantly reduced. Other animals have increased in population. Humans live and work in more and more remote areas.

Reintroducing grizzlies would disrupt our ecosystem. Problems would be inevitable.

This program makes no sense. Please do not spend your time and our money on it.

Thanks for listening.

Correspondence: Here we go again. Another federal bureaucracy unilaterally decides that we need grizzly bears in the north cascades, against the will of the people

Fact#1. It is against the law to reintroduce grizzly bears in Washington state. Doesn't this mean anything to you?

Fact#2. This issue was resolved three years ago when the public overwhelmingly rejected reintroduction of grizzly bears to the North Cascades.

Fact#3. If you believe in the logic that this is necessary, because grizzly bears, had been there in the past, then you would also have to introduce grizzly bears to downtown Seattle.

Fact#4. Grizzly bears travel, hundreds of miles. If the North Cascades were favorable environment, they would already be there.

Fact#5. How does this proposal affect the Pacific Northwest trail, recently authorized by Congress, which passes through the heart of the proposed introduction. There's no mention in the impact statement.

The notion that introducing grizzly bears will increase utilization of the wilderness area is laughable. I am a frequent user of the Pasayten wilderness. I can state that my utilization will decrease significantly if this proposal is accepted. I certainly wouldn't bring my grandchildren to experience the wilderness if there are 200 grizzly bears in the area.

How many fatalities and life-threatening maulings are acceptable under your mitigation plan?? It is only a question of time before significant life threatening grizzly bear/human encounters occur.

I am emphatically opposed to reintroduction of Grizzly Bears into the North Cascades Ecosystem. I recommend Plan A

Correspondence: My family and I absolutely love the North Cascades. We love to camp and hike and backpack each summer and work to coexist with the current black bear population. Grizzlies, however, are another story. While recreating in Grand Teton and Glacier National Parks we have experienced closed campgrounds and trails because of grizzly bear activity. It would be one thing if there were a current population in NCNP, but, to me, introducing them would add complications and make the activities my family enjoys more dangerous and less enjoyable.

Thank you.

Correspondence: I live on the border of the Wenatchee national forest south of the north cascades national park. My house has no road between the park and my front door. Im not opposed to reintroducing bears. I felt the same for wolves. I will however protect myself and property by all means necessary when the bears get hungry. I will also seek out reimbursement from damages.

Grizzly bears are large, in Alaska they protect their houses with nails and walled windows in the winter. They still destroy homes. I hope you take into account the destruction that will sure result to surrounding communities when they start to get hungry in the fall and spring. I can site many grizzly attacks from Montana and Canada in the last 5 years during these times. Most involved a dog but that's beside the point. They can be aggressive.

Correspondence: I am against reintroducing grizzly bear into Cascade for a simple reason that there are too many people who hike and camp in the area. Even though the argument is that grizzly bear attacking people is rare but the fear will reduce or prevent people to go hiking or camping in the mountains. The impact is way outweighed the so called benefits that is not proven. The habitat is also much different from when native grizzly bears were here. The fear factor on people who recreate in the mountains is too much. The population is not very active in general for the population to stay healthy. Hiking and outdoor activities are very important to the health of the community that should be way more important for unproven approaches to recovery of the grizzly bear. There are always not enough of deers and other animals in the mountains, with grizzly bear more of them will disappear. The ecosystem is fine in Cascade mountain as is why you will want to experiment that will destroy the people's recreation opportunities and may even create more unbalanced environments. Again I and a lot of my friends and outdoor people will lose the very important local mountains to hike and keep active. Please please don't do this! Thank you!

Correspondence: Absolutely not! Please do NOT re introduce Grizzly Bears to the North Cascades. They are not a peaceful predator and will cause nothing but trouble. This is not Alaska or Montana with plenty of room for them to live and not bother people, livestock, and pets. I would rather not get mauled by a Grizzly while out hiking and enjoying our mountains. I

greatly respect nature and the ecosystem however this is going beyond what is necessary. If grizzly's showed up on their own that would be one thing but to intentionally bring them into such a heavily populated area is just fool hardy and will get people killed.

Correspondence: I strongly oppose the idea of reintroducing grizzly bears to North Cascades mountains primarily because I love hiking and camping in that area and marvel at the unmatched beauty of nature those mountains can offer. The existence of dangerous and lethal grizzly bears would pose such a threat to human lives that it would ruin all the wilderness recreation fun for me and lots of my friends who share the same passion for North Cascades great outdoors ! We're advised to bring bear spray while hiking and camping, however this has proven to be useless when grizzly bears are encountered. The latest report of two hikers killed by grizzly in Banff NP says it all! North Cascades is more populated now and has become more popular in the United States and the world. Increased bear human conflicts would result in bears being shot and killed too, which is certainly not a good idea to protect them from distinction. Plus human casualties would certainly bring law suits against the agency responsible. Your idea is just looking for trouble, very costly trouble, for yourself. Please please don't impose such a crazy idea on us! Thank you!

Correspondence: I am writing to support the restoration of grizzlies to the North Cascades, and that the restoration must be done in ways that don't violate the Wilderness Act and harm the area's wilderness character. This is good for bears and Wilderness.

Both of the action alternatives as they now stand would violate the Wilderness Act. The action alternatives should be modified to avoid helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and steer clear of heavy-handed management of bears. There are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites without the use of helicopters inside Wilderness.

I oppose the use of a 10(j) rule for the grizzlies in the restoration work. This would mean grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana would be taken from their homes, dropped into the North Cascades, and lose their previous protection.

Montana doesn't have any "extra" grizzlies to lose to the North Cascades. Montana grizzlies are not yet recovered under the ESA, and any dispersing grizzlies from Glacier or Yellowstone are needed to naturally recover areas like the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest.

A natural recovery alternative must be fully developed and analyzed, even if recovery would take longer than active repopulation. The new information presented by Superintendent Striker regarding the likelihood of naturally migrating bears from Canada suggests active repopulation urgency may be more about protecting agency discretion than protecting Wilderness and creating the best environment for grizzly

Montana grizzlies are not yet recovered under the ESA, and any dispersing grizzlies from Glacier or Yellowstone are needed to naturally recover areas like the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest.

A natural recovery alternative must be fully developed and analyzed.

For the long-term success of grizzly restoration, natural recovery measures must also be included in both action alternatives thus reducing the need for wilderness degrading activities that are also ultimately bad for bears. This requires work with partners in British Columbia to ensure that grizzlies have corridors to move back and forth across the international border and to prevent a small North Cascades grizzly population from shrinking over time and becoming inbred.

An alternative that combines natural recovery with population augmentation under full ESA protections should also be analyzed.

The no action alternative has many good Bear Smart components on how people and communities can coexist with grizzly bears and these coexistence measures should also be included in both of the action alternatives. All possible measures must be taken to prepare residents and visitors for bears, particularly given the dramatic growth of the human population in the region and rapidly increasing recreational uses.

Correspondence: Just WHAT are you trying to accomplish?

I support the restoration of grizzlies to the North Cascades, BUT - the restoration must be done in ways that don't violate the Wilderness Act and harm the area's wilderness character. Both of the action alternatives as they now stand would violate the Wilderness Act.

So, WHY DO YOU WANT TO VIOLATE THE WILDERNESS ACT? What would that accomplish?

STOP THIS CONSTANT HELICOPTER NONSENSE! The alternatives should avoid helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and NO heavy-handed management of bears. There are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites without the use of helicopters inside Wilderness.

NATURAL recovery measures must be included in both action alternatives.

Correspondence: Dear Parks Service,

As a National and Washington State Parks member, I ask that you hear my voice on plans to reintroduce Grizzly Bears into The North Cascades National Park. I used the North Cascades National Park. I believe Grizzly Bears are an essential species to this landscape and should be used as a tool for education for respecting wildlife and their habitat.

All my life with family reunions held near Mazama since I was a little girl. For the last twenty years I lived in Canada, on the East Slopes of the Rocky Mountains, near Banff-Canmore area of Alberta. My husband and I brought undergrad business students and MBAs into the wilderness with traditional elders to learn from the land and become closer to themselves. David loved Grizzly Bears and always said he wanted to always live in a world where he could be eaten by a Great One (our respectful name for these honorable species). We lived adjoining Grizzly Bear habitat and never had a problem, as we, and our community, were careful regarding our behavior with garbage and food storage. We knew how to act when we encountered a bear and we respected their space. Two years ago my husband was trail running near our home and encountered a momma grizzly on her way to the summer feeding grounds near Banff. Because he was trail running, he likely did not see or notice her warnings to stop or stay away. This is the problem with any fast focused trail activity. One must keep broad awareness in the bust, especially in the evenings, and especially in April and May when young are being guided out of the winter dens. David raised his arm up to block something touching his back and they both fell off an embankment. David hit his head on a tree on the way down, ending his life. The bear tried to pull him down to the river. She tried to make sense of what had happened, and when she could not, she left quickly. Conservation officers demonstrated she had not been a problem bear and has been peaceful since. She did exactly what she was supposed to do in that encounter. David was in the wrong by trail running in the woods in early May at dusk.

As long as we can negotiate the interface between bears and humans, such that humans do not engage in hyper focused activities like trail running, biking, or off roading, then we must have bears living where humans recreate. The bears must also be healthy bears that do not have a history of reward garbage meals or comfort around humans. As long as humans are educated and act in line with what they know, this will be a great opportunity for humans to learn about wild places and how they can enter them protected, by being prepared.

Thank you for reading this. I will not be afraid of bears, except for what allows for a healthy awareness and prepared actions for a peaceful encounter. It is the ultimate exercise in yielding space, something humans could learn so much more about. Please reintroduce the bears. This is their land.

Sincerely,

██████████

Correspondence: Grizzly bears should be living where they always have lived and thrived, as part of a system the natural world knows how to make work best. We need them to be there, and now they need us to help restore their presence where they belong.

I strongly support the National Park Services preferred Alternative C: Restoration with Endangered Species Act Section 10(j) Designation.

This plan will both effectively restore grizzly bears in North Cascades National Park and give people the tools they need to thrive in and around grizzly bear country. Grizzlies belong in the North Cascades, as they enhance the park's ecological integrity and contribute to its wildness.

Grizzly bears play a vital role in maintaining ecosystem balance, cycling nutrients, dispersing seeds, and changing the behavior of species around them. Restoring them would benefit the park and the people who use it.

A restored population of grizzlies will boost the park's appeal and attract nature enthusiasts, scientists, and tourists from around the world. This would provide economic benefits to local communities and support the park's mission to protect park resources in perpetuity.

Alternative C, with the 10(j) rule, provides managers flexibility to address community concerns while protecting the grizzly population. It ensures coexistence between humans and bears.

Please consider the positive ecological and economic benefits and support Alternative C. Restoring grizzly bears will secure the park's natural heritage and conserve an iconic species for current and future generations.

Thank you for your dedication to our national parks.

Correspondence: Dear Superintendent Don Striker and Supervisor Brad Thompson,

I am writing to support the restoration of a healthy population of grizzly bears to the North Cascades, their home for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations.

As a former park ranger in Colorado, I was able to see grizzlies in the wild in Wyoming and Montana, and it is a life changing experience to encounter a truly wild species in a glorious landscape.

I support Alternative C: Restoration with Section 10(j) Designation. The proposal would bring up to 25 non-problem grizzly bears into remote areas of the North Cascades over the next decade and manage them as an experimental population.

Alternative C is the best choice for bears and the people who live and visit the North Cascades Ecosystem. The plan is wisely modeled on what's worked in Montana where grizzlies are recovering in the Cabinet-Yaak mountains with few problems and with the acceptance and involvement of local communities. Furthermore, the 10(j) rule will give people more management tools to reduce, prevent, and sometimes respond to human-bear conflict. I believe that the 10(j) rule if properly implemented, will help increase human acceptance of grizzly bears as they return to the landscape.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in

the North Cascades. Please bring back this native species to our state through the strategy laid out in Alternative C. Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

Thank you for taking the time to keep our North Cascades wild!

Sincerely,

██████████

Correspondence: We already have black bears coming into town, getting into things but we don't report them because they will just shoot them now. It will be the same with brown bears. It's not like wolves or cougars that generally want to stay as far away from human as possible. Safety is a huge concern, especially in a place where many didn't grown up around grizzlies. The thought is nice but in reality there just isn't enough space for them. Are we going to reintroduce them and then just shoot them when they get too close? What's the point? Strongly against!

Correspondence: Natural migration and recovery of the great Grizzly beings is what your agency should endorse. My goodness, isn't it time to stop practicing target management, whether that is killing or moving wild life from one area to another with the loop hole allowing the "management" of these beings by hunting or trapping and removing?

What is your ethic? You do know the consequences of humans being everywhere because everywhere is ours because we think so and we can kill to make our presence everywhere.

Act with integrity for the creatures who are disappearing.

Correspondence: The best management is natural management. I strongly encourage you to remove the use of helicopters and motorized vehicles from any plan to repopulate the grizzly bear into former areas of habitation. It seems counter-productive to simply move animals from one un-recovered location to another. There is no net gain and the animals are subjected to stresses they don't need.

Correspondence: There is no need to reintroduce grizzlies to the north cascades because they can already, and do, come down from Canada by themselves. Comparing cohabitations of grizzlies and native Americans is a poor example to use in today's world.. Maybe the population on earth was 1 billion? compared to 8 billion now. There is a reason the majority of grizzlies were killed off- cohabitation was hazardous. There are plenty of examples of grizzly attacks in recent years - if you care to pay attention. There was a fatal attack by wolves in Alaska of a school teacher a few years back (your position is, that doesn't happen).

I have lived in Alaska for many years and cohabitating with a grizzly is no fun. You would not need to rehome the grizzly anywhere, if the human population was reduced in the extreme. By the way- an 'Apex' species means it can eat anything it wants to. A grizzly definitely would eat you if he/she wanted to, and the opportunity presented.

NO to reintroducing Grizzly to the north cascades.

Correspondence: Firstly, I applaud your stewardship of North Cascades National Park. I hope the grizzly can be restored ASAP--one never knows what support of lack thereof future administrations will offer this reintroduction. I strongly give my support to the National Park Services preferred Alternative C: Restoration with Endangered Species Act Section 10(j) Designation.

This plan will both effectively restore grizzly bears in North Cascades National Park and give people the tools they need to thrive in and around grizzly bear country. Grizzlies belong in the North Cascades, as they enhance the park's ecological integrity and contribute to its wildness. Seems like a "no-brainer" to me!

Grizzly bears play a vital role in maintaining ecosystem balance, cycling nutrients, dispersing seeds, and changing the behavior of species around them. Restoring them would benefit the park and the people who use it.

A restored population of grizzlies will boost the park's appeal and attract nature enthusiasts, scientists, and tourists from around the world. This would provide economic benefits to local communities and support the park's mission to protect park resources in perpetuity.

Alternative C, with the 10(j) rule, provides managers flexibility to address community concerns while protecting the grizzly population. It ensures coexistence between humans and bears.

Please consider the positive ecological and economic benefits and support Alternative C. Restoring grizzly bears will secure the park's natural heritage and conserve an iconic species for current and future generations.

Thank you for your dedication to our national parks. And help us all in the state of Washington to accomplish what should have been done decades ago. Given that, there's no time like the present!

Correspondence: At a recent meeting with the Skagit County Commissioners (Oct. 31, 2023), a representative from the US Fish and Wildlife spoke in favor of re-introducing grizzly bears to the North Cascades ecosystem. He claimed that the grizzly disappeared from the region due to hunting pressures, and not loss of habitat. The habitat, he said, was still there, implying that more grizzly bears could be supported in the area. What he fails to realize is that habitat and ecosystem are two different concepts. There might be a few huckleberry bushes in the North Cascades habitat, but the ecosystem in the North Cascades has been altered to the point where it cannot support more grizzlies. That area is not managed for predator-prey ratios and there are few ungulates living there anymore. There is no healthy balance of plants-animals and all that's left is an empty landscape.

Grizzlies already come and go from the region, arriving from Idaho, Montana and Canada. If you were to put in more bears, there would be nothing to support them. Yes, they might eat huckleberries, but before they hibernate for the winter, bears need a supply of protein. Since there are very few deer living in the North Cascades, these grizzlies would go elsewhere for their needs. Landowners, farmers and ranchers would likely provide easy picking for the grizzlies...chickens, calves, pets and other domestic animals being at the top of their list.

We cannot introduce more grizzlies into the North Cascades. This is a dangerous predator, and any human-grizzly interaction has potential for disaster. The ONLY OPTION IS TO DO NOTHING. Do not reintroduce the grizzly into the North Cascades.

Correspondence: Thank you for the opportunity to comment on this draft Restoration Plan/EIS. I am in support of the proposed alternative discussed in the EIS. Numerous successful reintroductions of predators to ecosystems in the west (e.g. Yellowstone Wolves) have shown great benefits to those systems following reintroduction. Grizzly bear populations were historically present in the Cascade Mountains, and are an important part of this ecosystem.

Alternative C includes additional protections and management areas which are easily understandable to the public and provide a clear framework for reintroduction and population and range expansion. As someone who is is passionate about the environment, especially in the place where I live, reintroduction of species native to this area is very important to me.

I spend a good amount of my time in the summer backpacking and climbing in the North Cascades and I think reintroduction of Grizzly bears is a key part of the mission of the NPS in protecting and preserving this environment. This ecosystem evolved with Grizzly bears as a part of it, so their reintroduction is a crucial part of preserving it for the future.

Correspondence: I would like my comments to be taken into consideration.

We are outdoor people and enjoy camping and hiking, I see this reentering of Grizzlies a disturbing problem from many different viewpoints.

Saying Grizziles have been here for so many years and coexisted with humans, etc. At that time the population was no where near the current population. We now have thousands more humans, dogs etc. using hiking trails, or just enjoying the forest areas.

A good example of monitoring/controlling bears is to look at the increase of back yard visits of the black bears - WA state is unable to control their population. The idea of eventually having 200 grizzly bears is out of the question as far as I'm concerned. How can you guarantee the grizzlies will stay where you put them? Really?

How long before they begin to drift into the lowlands,etc.

I don't understand how you came to the numbers of livestock that would be killed as an estimate. How many humans are in your depredations calculations?

As an alternative - reintroduce them into the National Parks, like Yellowstone or larger and take the wolves with you.

I hope you will think very carefully as you continue to evaluate what the people of this state want to happen. And I hope giving our opinion is not for naught and that you haven't already decided what you are going to do.

This shouldn't be a "feel good" type of request - let the people have their say, BUT this is how it's going to be as an example.

If I haven't made my point - I vote a resounding NO for reintroduction of Grizzly bears anywhere in WA state.

Correspondence: I would prefer to allow grizzlies to introduce themselves into the north cascades. I am not for human intervention in the form of actively introducing grizzlies into the north cascades.

Unfortunately, humans have shown they cannot responsibly recreate in bear country, as evidenced by the continued problems at Colonial Creek CG and Cascade Pass.

If black bears are a problem in these areas, just think what would happen if grizzlies were to start habituating these areas!

I think reintroduction is a recipe for disaster. If grizzlies come in on their own then so be it.

Sincerely,

Hiker, climber, skier

Correspondence: My family has a cabin located at the edge of the proposed release area; it is located 3 miles North of Conconully on FS road 38. We spend almost all summer at this location and spend a lot of time in the Tiffany Lake area

which is on the border of the Pasayten Wilderness. Many hours and days are spent hiking in the area. Our cabin is just 33 miles from the proposed release site around Mazama.

I would like to object to any implementation of any plan except Alternative A which is NO ACTION to reintroduce grizzly bears to the North Cascade ecosystem.

The problems with any of the other 2 plans are troubling in many aspects. Below I have listed the most concerning.

The Eastern release site and the area proposed for this release has been devastated by wildfires over the last 15 plus years. I suggest anyone proposing this area for release actually place boots on the ground and visit this area. Take FS 38 North from Conconully and travel North to National Forest Road 39 and take this back to Winthrop. This follows closely the Southern border of the Pasayten Wilderness. Take road 9140 from Mazama North to the end, most of the Eastern side of this road was also devastated by wildfires.

This area has over the years been absolutely devastated by wildfires. In many areas the fire was so hot that it burned the topsoil down to rock and barely supports the growth of anything, much less food for bears. The grass has barely begun to grow back, there are very few trees left and those that are left are just solitary burned trees that support no life.

With Grizzly bears having a range of up to 109 miles and can travel up to 40 miles a day this places that whole area surrounding our cabin within their range. None of the residences in the area are prepared for this, none of the cabins or home have been bear proofed and many cannot be. Humans use this area quite extensively for hiking, hunting, woodcutting and visiting the forest. With the proposed release site just some 33 miles away it places these cabins and home directly within the rage of these released bears. As the area North of where our cabin is located devastated by wildfires this makes our cabin one of the first stops these grizzlies will make in their effort to feed themselves. I personally do not want ourselves, our children and our pets to be placed in danger to effect reintroduction of an animal that has been proven to be harmful to the lives of all.

Thank you for your time.

Correspondence: I am in favor of Alternative A: No Action and NO release of grizzly bears into the North Cascades ecosystem. The radio collar technology is not adequate for the job of keeping track of these grizzlies. For one, it does not provide real-time data, as Wayne Kasworm admitted at the Skagit County Commissioners' meeting October 31, 2023. There is no way to keep track of the bears' immediate movements, no way to predict where they will go, and the collars do not last forever. In addition, not all grizzly bears are collared. So there's a 48 hour delay in keeping track of the bears that are collared...how far can grizzly bears travel in 48 hours? How quickly can the US Fish and Wildlife respond to bear movements and threats to farmers, ranchers and landowners?

It is pretty obvious that you cannot prevent bear-human interactions, as example, consider the recent grizzly bear encounters north of Colville in the last month. A grizzly ate some chickens and was moved to the Selkirk recovery zone. This is a reaction, not a proactive response. Grizzly and human interactions do not turn out well for the human or for domestic animals (cattle, sheep, goats, barnyard birds, etc.)

With all the emphasis on the 10j rule and the detailing of all its benefits in terms of management tools available, I have a feeling that this decision has already been made in favor of Alternative C - moving grizzly bears back to the N. Cascades under the 10j rule. I do hope I'm wrong, and that my comments will be considered.

If grizzly bears are moved back to the N. Cascades under the 10j rule, this will be an expensive experiment ... \$100,000 - \$400,000 per year, much of which will come from taxpayer money. This is not a good use of our money, it puts peoples' lives and livelihoods at risk for an experiment that will undoubtedly fail anyway. The N. Cascades ecosystem is not capable of

supporting more bears; they would already be there if that were the case.

Do not move grizzly bears into the N. Cascades ecosystem.

Correspondence: Reintroducing grizzly bears into the Pacific Northwest is a misguided and potentially dangerous endeavor that poses significant risks to humans, wildlife, and property. While proponents argue that it would be beneficial for the environment, there are strong reasons to oppose such a move.

Human Safety: Grizzly bears are larger and more aggressive than black bears, and their reintroduction increases the risk of bear-human conflicts. The Pacific Northwest is a densely populated region with numerous communities, and the presence of grizzlies could lead to more dangerous encounters. These bears are known to be territorial and may venture into human-populated areas in search of food, potentially putting human lives at risk.

Wildlife Threat: Grizzly bears are apex predators, and their reintroduction can disrupt the balance of local ecosystems. This can have a detrimental impact on other species of wildlife. Their presence may lead to declines in deer, elk, and other prey species, affecting the populations of these animals and potentially causing a cascading effect on the entire ecosystem.

Property Damage: Grizzly bears have been known to damage property, especially in search of food. This includes livestock, crops, and even vehicles. Reintroducing grizzlies could result in significant economic losses for local farmers and landowners, who may be forced to invest in protective measures or even face the loss of their livelihoods.

Brown Bear Attacks vs. Black Bear Attacks: Advocates for grizzly reintroduction often claim that brown bear attacks are not significantly more common than black bear attacks. However, the severity of attacks is a critical consideration. Grizzly bears are much larger and more aggressive than black bears, making attacks more likely to result in severe injuries or fatalities. Dismissing this important distinction is a disservice to public safety.

In conclusion, while environmental conservation is crucial, the reintroduction of grizzly bears into the Pacific Northwest

should be approached with caution. The potential risks to human safety, wildlife, and property should not be underestimated, and the arguments in favor of such a move must be critically examined. The Pacific Northwest can explore alternative ways to protect and preserve its unique natural ecosystems without jeopardizing the well-being of its human residents and the fragile balance of its environment.

Correspondence: Through research, we know the important roles that large mammals play in their native ecosystems. By reintroducing grizzlies to the North Cascades, we have an opportunity to support not only their recovery, but that of the entire ecosystem and all of the plants and animals it supports. I support Alternative C to ensure flexibility and adaptability to the plan based on on-the-grounds conditions as the plan proceeds. In such a large area, the total number of restored grizzlies would have minimum impact on humans who also use the landscape. There are known mitigation strategies to avoid human-wildlife conflict between outdoor recreators and bears and many in the Western U.S. are already familiar with those practices. Through proper signage, ranger support, and public education, we can ensure that people know how to safely share the landscape in ways that support ecological recovery. Thank you for your consideration of this comment.

Correspondence: Alternative A is the best course of action for the possible reintroduction of the grizzly bear to the N. Cascades ecosystem. **DO NOT MOVE GRIZZLY BEARS INTO THE N. CASCADES ECOSYSTEM, FOR THESE AND MORE REASONS:**

-too expensive to run this program

-program will likely fail due to current poor management of the N. Cascades ecosystem

-habitat may be there, but the ecosystem has been destroyed

-grizzly bears cannot be supported by the remnants of the ecosystem that remain

-there are already grizzly bears that enter the N. Cascades from elsewhere, but a large, sustained population does not exist because the ecosystem cannot support them

-any introduced bears will run out of food and seek out other sources of protein, which means likely encounters with landowners as the bears search for food

-human-grizzly interactions do not turn out well for the human or their domestic animals

-no way to predict where a grizzly will go, so all actions by the government will be re-actions, not pro-active

-the radio collar technology is inadequate, as it does not provide real time data

-all grizzlies are not collared, and even if one is collared, the collars do not last forever

-this is a dangerous idea for the private landowner in the vicinity of the North Cascades ecosystem

-the management flexibility of the 10j rule do not justify the risks associated with re-introduction of this dangerous predator

My vote is NO to more grizzly bears being introduced into the N. Cascades.

Correspondence: I'm writing in support of Alternative C for the Grizzly Restoration in North Cascades Ecosystem. The NCE represents a very large area of good habitat for grizzly bears, and they should be returned to this ecosystem. By implementing Alternative C and designating the introduced grizzly bears as a 10(j) experimental population, it allows for the maximum of management tools to both aid the survival of bears in their ideal habitat and discourage grizzly bears in the areas that are deemed poor habitat and host larger human populations. The plan via Alternative C is a science-driven and conservative approach, introducing bears a few at a time each year. With monitoring and placing bears in their ideal habitat so they don't need to roam toward population hubs, this reintroduction can be done safely for the sake of the bears and the neighboring humans. Grizzly bears deserve protection as well as a chance to return to one of their historic ranges in the NCE.

Thank you,

Wenatchee Outdoors Board Secretary

Correspondence: Here are 5 good reasons to do this:

North Cascades National Park and the surrounding ecosystem have more than enough open space to successfully recover

grizzly bears

This would be a major step in restoring the species across its historic range.

Grizzlies provide ecological benefits and will improve the ecosystem's health

We're giving grizzly back their home and people WANT that

The public process includes new tools to reduce the potential for conflict with local landowners and communities.

This would be the first step toward bringing balance back to the ecosystem and restoring a piece of the Pacific Northwest's natural and cultural heritage.

Thank you for helping our wildlife

Correspondence: I am writing in support of the no action alternative. While I understand the importance of a balanced ecosystem and the historical significance of the Grizzly population in the North Cascades, I have also witnessed significant issues, including loss of life, that accompany active, assertive, aggressive reintroduction.

I spend almost half of my time in Jackson Hole Wyoming at the foot of the Grand Teton Range. The grizzly population in that valley has increased even faster than the population has increased - both dramatically in the past 25 years. Despite the actions of the NP Service, Fish and Wildlife, DNR and others, human negative interactions with grizzlies continue to increase. Just one grizzly, "399," has mothered 18 cubs and dozens of grand-cubs. Her territory now includes much of Jackson Hole and all of Grand Teton National Park. She especially enjoys backyard ponds, garbage cans and feeders. She, her offspring, and fellow grizzlies have demonstrated decreased fear of humans and increased aggressiveness. This is especially true throughout hunting season, when local hunters have been killed by grizzlies over newly harvested elk and deer.

But the main impact that I have observed and personally experienced is increased reluctance to explore, hike, climb, bicycle and generally recreate in our local outdoors. At a time of increased stress, depression, obesity, and isolation, recreation in the outdoors provides everyone - no matter their background - an equal opportunity to experience rejuvenation, peace, and happiness. Reintroduction of grizzlies would result in fewer people getting outside and experiencing our unique precious public lands.

Correspondence: Howdy

I am against grizzly reintroduction.

I believe that you will have serious problems in your efforts. Washington state has a large human population and some estimates suggest an expected 1.4 million to 2.0 million person increase in population in next 20 to 25 years. Quite a number of these new folks are expected to see thousands of new houses built within or next to the Recovery area. I am still reading the EIS draft, but so far I do not see a reasonable plan as to how you are going to avoid serious human/bear conflicts considering the great number of humans in the area.

More comments to come as I digest your Draft.

Reply requested.

Thank you

Correspondence: I oppose any plans or proposals that strip any grizzly bears relocated to the North Cascades of their protection under the Endangered Species Act. I oppose any plan that includes helicopter landings directly into the wilderness or hovering over it disturbing wildlife. I oppose both plans that have been presented. Superintendent Striker has said that grizzly bears may migrate to the North Cascades naturally on their own and if they do, they are under the protection of the ESA. I support the natural migration if a proposal or plan that doesn't strip the grizzlies of their ESA protections and with no helicopters near the wilderness cannot be reached.

Correspondence: I support the restoration of grizzlies to the North Cascades, and that the restoration must be done in ways that don't violate the Wilderness Act and harm the area's wilderness character. This is good for bears and Wilderness. Grizzlies are very important to North Cascades and need to be protected from harm. The Grizzlies should never be harmed by people or anything that people do. They are important to the ecosystem and are needed.

Both of the action alternatives as they now stand would violate the Wilderness Act. The action alternatives should be modified to avoid helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and steer clear of heavy-handed management of bears. No helicopters or any equipment should be used. These items will harm the environment plus harm the innocent Grizzlies and other animals that live in the Wilderness. Use the many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites without the use of helicopters inside Wilderness. Helicopter noise is cruel and inhumane to the ears of all animals, including the Grizzlies, that live in the Wilderness and under no circumstances should they be allowed to even fly over the Wilderness. The helicopters must go around the Wilderness to get to any roads that will be used.

I oppose the use of a 10(j) rule for the grizzlies in the restoration work. This would mean grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana would be taken from their homes, dropped into the North Cascades, and lose their previous protection. Do not remove any Grizzlies from any other state. The ESA states that all Grizzlies must stay in their home and not be move to any other place. It's like removing a small child from the parent and never, ever allow them to meet. Grizzlies are family animals and should be left where they are in their family and own home land.

Montana doesn't have any "extra" grizzlies to lose to the North Cascades. Montana grizzlies are not yet recovered under the ESA, and any dispersing grizzlies from Glacier or Yellowstone are needed to naturally recover areas like the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest. The climate is different from Montana and other places. Moving an innocent Grizzly from Montana to another location would be detriment to the Grizzly health and wellbeing and violate the EPS.

A natural recovery alternative must be fully developed and analyzed, even if recovery would take longer than active repopulation. The new information presented by Superintendent Striker regarding the likelihood of naturally migrating bears from Canada suggests active repopulation urgency may be more about protecting agency discretion than protecting Wilderness and creating the best environment for grizzly bears to migrate, live, and thrive. Leave all Grizzlies where they are. Don't move them any place.

For the long-term success of grizzly restoration, natural recovery measures must also be included in both action alternatives thus reducing the need for wilderness degrading activities that are also ultimately bad for bears. This requires work with partners in British Columbia to ensure that grizzlies have corridors to move back and forth across the international border and to prevent a small North Cascades grizzly population from shrinking over time and becoming inbred. The Grizzlies health and wellbeing should be top propriety and not what people want the Grizzlies to do. They are smart animals. Leave all of them where they are and don't be moving them to any other place ever.

An alternative that combines natural recovery with population augmentation under full ESA protections should also be analyzed.

The no action alternative has many good Bear Smart components on how people and communities can coexist with grizzly bears and these coexistence measures should also be included in both of the action alternatives. All possible measures must be taken to prepare residents and visitors for bears, particularly given the dramatic growth of the human population in the region and rapidly increasing recreation pressures in the Park.

Correspondence: I have reviewed the Grizzly Bear Reintroduction EIS and submit the following comments.

First, I strongly support the no action alternative and do not support grizzly reintroduction in any form. However, I recognize

that this is a political process, and may be a 'done deal' so I will provide specific concerns with sections of the EIS.

One major concern that is virtually ignored by the EIS is the difference between the diet of grizzly bears in the North Cascades with the source population of bears, especially those around Yellowstone and in parts of the Northern Continental Divide area. These Rocky Mountain bears can have (according to the EIS) up to 70% of their diet consisting of meat, while the N.C.E has bears that only eat about 10% of their diet as meat. It cannot possibly be safe or smart or humane to take bears used to eating protein rich bison carcasses, elk calves, gut piles and other sources of protein and calories and dropping them off into an environment where they are supposed to become virtual vegetarians overnight. Any grizzlies that are relocated into the North Cascades should come from areas where 90% of their diet is already plant material, like they will be expected to eat in the N. Cascades. The historic grizzly population from the 1800's and earlier no doubt relied heavily on salmon in lowland rivers. It is unreasonable to expect robust numbers of bears without them accessing this source of protein. The EIS says little about the potential of grizzlies to seek out salmon streams in the valleys and the resulting potential increased conflict with people. The EIS expects bears to stay in high elevation areas without an abundant rich protein source--this is unreasonable. Yes, a very low population can survive in the high mountains, but anywhere grizzlies have a robust population (Yellowstone, Alaska) there is a source of protein and bears aren't just eating plants. Consequently, in BC and parts of Canada that are similar to the North Cascades, grizzly populations are struggling or are low, even though the habitat is protected wilderness. These areas of the NCE simply do not have enough food resources to support that large of a grizzly population. Grizzly bears have never been relocated from two such different food situations, and doing so now is a giant experiment that places bears and people in jeopardy. If the NCE was great habitat, the bears would be there already or would have migrated into the region.

Socioeconomic:

I find the EIS is grossly incomplete and outdated, especially when covering socioeconomic issues. The EIS relies on recreational use data from 1993 and 1994, well before the Pacific Crest Trail became a mecca for young hikers from all over the world. There are no statistics about the use on this trail, and the Pacific Northwest Trail. One proposed release area (West Paysayten) is directly on top of one of the busiest sections of the PCT and PNT where they meet. I have hiked through this area and it is a literal freeway of thru-hikers that have started in California and have no idea of how to operate in grizzly areas, nor do they have the ability to obtain bear spray, bear proof containers, and other safety items. This section of the EIS needs updated to cover the risks to these hikers on the PCT. Any potential release site must be far away from the Pacific Crest Trail.

The Socioeconomic section also failed to include the increased costs and dangers of working in the recovery area. My daughter is a wildland firefighter in Okanogan County. She has already has to worry about cougars, wolves, rattlesnakes and other dangers on the job. Now wildland firefighters will be operating in grizzly country. Foresters, conservation officers, geologists, timber cruisers, farmers, biologists--all those who work in the field, will need to be trained and provided with safety equipment to work in a grizzly area. Agency liability could become an issue if training and resources are not provided. Bear spray is heavy and firefighters already have a 45 pound pack. The costs of training and education for people working in the woods must be incorporated in the analysis .

The increased costs to the state of Washington and the federal land management agencies is ignored. I have hunted in Montana in grizzly country and know that the Forest Service employees there spend a great deal of time 'managing' for grizzly bears. These employees drive around and check campsites for unattended coolers or bags of horse food not raised 10 feet off the ground. How many new employees, or diverted resources, are now going to bear/human management instead of fire management or trail maintenance or cleaning bathrooms. Multiply this over each agency that manages land in every state with grizzly bears. Bear management and education will cost the tax payers at the state and federal level forever, at the expense of other priorities.

The potential costs to farmers and orchard owners is underestimated and glossed over. How much would it cost to place electric fences around every orchard in the recovery area? The EIS should look at the costs in similar communities of Montana or Idaho that must deal with grizzly bears. I just returned from Ovando, Montana where a mountain biker was killed by a grizzly bear in town. I spoke to a game warden while I was there, and he said that the grizzly activity was concentrated between a campground (at the edge of the Bob Marshall Wilderness) and the town of Ovando, in the agricultural area--NOT in the Wilderness itself. Is this a trend? Bears will go where the food is, and there are always more sources of food around people. Montana warned that grizzly numbers and 'negative interactions' are increasing as bears expand both

west and east. If the North Cascades is a great island of bear habitat, the bears will find it eventually as they expand out.

Cumulative impacts of predators on prey in the North Cascades has not been studied. Mule deer numbers are down significantly, especially since Washington state outlawed hunting of bears and cougars with dogs or bait. There are so many cougars in some parts of Washington now that one farm I know of has killed two cougars that were killing goats in the front yard in the span of a few months. Now wolves are moving in. The state of Washington, whose policies are dominated by urban Puget Sound, will never manage predator populations as Montana and Idaho do. Consequently, game populations will remain low, and not contribute to the food base for grizzlies. The state is in no position to ever 'manage' grizzlies or wolves.

In summary, do not release grizzlies into the North Cascades, and if you do it anyway, pick bears from Canada that are used to eating only plants and do not put any near the Pacific Crest Trail. The federal government should then provide funding for all the extra training and resources needed to manage bear/human conflict.

Correspondence: I pack in to the wilderness areas of Washington, Oregon, Idaho, and Montana, for 60 years. In that time I have observed many black bears. From my own observations, black bears perform all of the beneficial functions for the e, sited as reasons for introducing grizzly bears. There is NO true benefit, to local residents or visitors, to justify the risks and expenses of introducing grizzly bears to the North Cascades. Use the money to restore the trail systems in the wild forest areas.

Correspondence: I oppose to the grizzly bear restoration plan. I am an outdoor person and love to go hiking in the area. This plan will discourage people to go hiking and participate in the outdoor activities to enjoy the nature that beautiful areas offer. Safety is always the top priority for us outdoor lovers, introducing grizzly bears in the area would significantly increase the safety concerns. So I strongly oppose the plan for grizzly bear restoration

Correspondence: I support the restoration of grizzlies to the North Cascades, and that the restoration must be done in ways that don't violate the Wilderness Act and harm the area's wilderness character. This is good for bears and Wilderness.

Both of the action alternatives as they now stand would violate the Wilderness Act. The action alternatives should be modified to avoid helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and steer clear of heavy-handed management of bears. There are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites without the use of helicopters inside Wilderness.

A natural recovery alternative must be fully developed and analyzed, even if recovery would take longer than active repopulation. The new information presented by Superintendent Striker regarding the likelihood of naturally migrating bears

from Canada suggests active repopulation urgency may be more about protecting agency discretion than protecting Wilderness and creating the best environment for grizzly bears to migrate, live, and thrive.

Correspondence: Commenting as a private citizen with over 25 years experience working closely with all agencies as a stakeholder and employee of partner organizations or agencies. In my career I've worked closely with USFWS on restoring habitat for T and E species and specie reintroduction.

It's concerning that this plan is being proposed as USFWS has a great number of other T and E species that should be a higher priority for their scant resources. The track record of moving species off of the T and E list is not great. With Grizzly bears naturally moving from Idaho and BC why not put those resources to land protection, habitat restoration and grants to improve the recovery of other species?

If this plan is enacted where will be grizzly bears be relocated from? What is their history? Are these "problem bears" being relocated to WA? My expectation is that WA receives no bears with a "problem bear" history if this plan is enacted.

As a citizen who has worked closely with USFWS in the past, I just do not have faith that the agency can properly manage a reintroduction of this species to NCNP, and surrounding lands, when the agency has not met the bar for removing species from the T and E list ie Lycades melissa samuelis or Picoides borealis.

Correspondence: I fully support the restoration of grizzlies to the North Cascades and urge you to do everything possible to accomplish this. The restoration must be accomplished in ways that don't violate the Wilderness Act and harm the area's

wilderness character. This is good practice for bears and the wilderness in general.

Both alternatives as they now stand would violate the Wilderness Act and should be revised. Modifications stating that helicopter landings and flights in Wilderness will be avoided, the placement and use of telemetry installations will be avoided, and in no way involve heavy-handed management of bears. There are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites without the use of helicopters inside Wilderness. The disruption of their everyday lives should be avoided.

I oppose the use of a 10(j) rule for the grizzlies in the restoration work. It's ethically wrong; if implemented, grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana would be taken from their homes, dropped into the North Cascades, and lose their previous protections.

Montana doesn't have any "extra" grizzlies to lose to the North Cascades. Montana grizzlies are not yet recovered under the ESA, and any dispersing grizzlies from Glacier or Yellowstone are needed to naturally recover areas like the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest.

A natural recovery alternative must be fully developed and analyzed, even if recovery would take longer than active repopulation. The new information presented by Superintendent Striker regarding the likelihood of naturally migrating bears from Canada suggests active repopulation urgency may be more about protecting agency discretion than protecting Wilderness and creating the best environment for grizzly bears to migrate, live, and thrive.

For the long-term success of grizzly restoration, natural recovery measures must also be included in both action alternatives thus reducing the need for wilderness degrading activities that are also ultimately bad for bears. This requires work with partners in British Columbia to ensure that grizzlies have corridors to move back and forth across the international border and to prevent a small North Cascades grizzly population from shrinking over time and becoming inbred. Any alternative that combines natural recovery with population augmentation under full ESA protections should also be analyzed.

The no action alternative has many good Bear Smart components on how people and communities can coexist with grizzly bears and these coexistence measures should also be included in both of the action alternatives.

All possible measures must be taken to prepare residents and visitors for bears, particularly given the dramatic growth of the human population in the region and rapidly increasing recreation pressures in the Park.

Protecting these bears is paramount and all measures to do so should be taken.

Correspondence: Washington state currently does not allow for any effective management of predators. Our game departments commissioners are handpicked by a far left governor and are working and succeeding at eroding the ability for outdoorsman to participate in population control. Ungulates, along with small predators like bobcats, are declining rapidly. Meanwhile, wolves, cougars, black bears, and other predators such as the Fisher, which have been released by the game department, are exploding in population at an unchecked rate. The addition of another large predator at the hands of human intervention will further exacerbate this problem. Additionally, Washington is an extremely crowded state, and gets more so by the day. These bears well quickly find their way into orchards and farmland. They will also find their way into heavily used hiking and backpacking areas along with rural areas. It will take almost no time at all before there are serious, and life-threatening interactions with bears and humans. The people that live in this region generally share the same sentiment, if the bears find their way back here on their own we will be OK with it. Government intervention on behalf of the bears, and to the detriment of the people that live here is the last thing we want.

Correspondence: My first concern is that since we have lived without a grizzly population for so long, would citizens even know how to deal with an encounter in the wilderness. Grizzlies aren't like black bears. Many documentation has shown them to be much more aggressive. Black bear are fairly docile in comparison. Many people may carry bear spray, which hasn't always proved affective. Especially against 1200lbs grizzlies. How would we keep our hikers and those who enjoy the outdoors safe from a potentially greater threat than what most are currently accustomed to? And will the department be responsible for any injuries or deaths that may occur from reintroduction?

My second concern is community safety. We have been seeing more and more wildlife coming into human occupied territories. We have a large herd of elk that regularly roams through farms and ranches as they go back and forth between their food sources and water supplies and other habitats. As more and more game animal come into our communities looking for food and water, that has been displaced due to climate change, it is also going to coax the grizzlies to follow their own food supply into our surrounding communities. The potentially puts our livestock, pets, ourselves, and our children at greater risk of an attack. Again, will the department be responsible and financially compensate all those whom may end up harmed or damaged by this reintroduction?

This would be great if we could guarantee a separation between these animals and people. Most outdoors people would know how to take care when venturing through such territory. But many in Washington State are devoid of personal safety and being aware of your surroundings when out in the wilderness. Many take their own safety for granted, mainly because most of their life they have never had to worry about their safety. But reintroducing grizzlies back into the population changes that dynamic. And we could end up with a lot of eaten backpackers who were just unaware of what else lives in those woods and are too naive to carry the tools necessary to guarantee stop a bear from killing them should the need arise.

Again, will the department be responsible?

Correspondence: I fully support recovering a healthy grizzly bear population in the North Cascades, but the effort must be done in a way that protects and enhances the area's wilderness character and that also minimizes the human handling and harassment of grizzlies.

Neither of the current action alternatives, involving translocating bears from other regions, is compatible with Wilderness. Both of the action alternatives as they now stand would violate the Wilderness Act. The action alternatives should be modified to avoid helicopter landings and flights in Wilderness and the placement and use of telemetry installations. The plan should steer clear of heavy-handed management of bears.

For the long-term success of grizzly restoration, natural recovery measures must be included in both action alternatives thus reducing the need for wilderness degrading activities that are also ultimately bad for bears. This requires work with partners in British Columbia to ensure that grizzlies have corridors to move back and forth across the international border and to prevent a small North Cascades grizzly population from shrinking over time and becoming inbred.

An alternative that combines natural recovery with population augmentation under full ESA protections should be analyzed and adopted.

Correspondence: There is already a predator problem in Washington state, we do NOT need to introduce Grizzly Bears. Can we focus on the black bears, cougars, and coyotes before introducing more predators? The black bears, cougars, and coyotes are moving into towns and preying on pets and getting into garbage's on a regular basis. Once they have a taste for the easy food they stick around for the free meals. With cities and towns expanding into their natural territory its just a matter of time until this becomes a bigger problem. There is no reason to introduce grizzly bears in the state. If they wander in from Canada so be it but placing them into areas where people hunt, hike, and camp seems like a very poor decision.

Correspondence: I support the restoration of grizzlies to the North Cascades, a cause that, in my view, must be pursued in a manner that upholds the principles of the Wilderness Act while safeguarding the area's untrammeled character. This approach not only benefits the grizzly bears but also preserves the pristine wilderness.

Regrettably, both of the existing action alternatives, as they currently stand, would transgress the Wilderness Act. They entail activities such as helicopter landings and flights within the wilderness, the installation and use of telemetry devices, and intensive bear management strategies. Yet, there are numerous roads that traverse or approach the recovery area, which could serve as suitable release sites without the need for helicopters within the wilderness.

I strongly oppose the use of a 10(j) rule for the grizzlies in the restoration efforts. This would imply that grizzlies, which are fully protected under the Endangered Species Act (ESA) in places like Montana, would be uprooted from their native habitats and transplanted into the North Cascades, thereby forfeiting their previous protection.

Montana lacks an excess population of grizzlies to spare for relocation to the North Cascades. Montana's grizzlies are not yet fully recovered under the ESA, and any dispersing grizzlies from places like Glacier or Yellowstone are essential for the natural recovery of regions like the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest.

It is imperative that we thoroughly explore and analyze a natural recovery alternative, even if it may take longer than active re-population. Recent information from Superintendent Striker suggests that the urgency in pursuing active re-population may have more to do with preserving agency discretion than genuinely safeguarding the wilderness and creating the best possible environment for grizzly bears to migrate, thrive, and flourish.

For the long-term success of grizzly restoration, both action alternatives should incorporate measures for natural recovery, thereby reducing the necessity for activities that could harm the wilderness, ultimately proving detrimental to the bears. This also requires collaboration with partners in British Columbia to ensure that grizzlies have corridors to traverse the international border, preventing the North Cascades grizzly population from dwindling over time and becoming inbred.

Furthermore, an alternative approach that combines natural recovery with population augmentation under full ESA protections should be subject to comprehensive analysis.

The no-action alternative presents several commendable Bear Smart components that address how communities and individuals can coexist harmoniously with grizzly bears. These coexistence measures should also be integrated into both of the action alternatives. It is paramount that all conceivable measures are taken to prepare residents and visitors for potential

bear encounters, especially considering the rapid growth of the human population in the region and the escalating recreational pressures in the Park.

Correspondence: I am writing to request the suspension of efforts to reintroduce grizzly bears into the North Cascades Ecosystem. The main reason I object to this plan is because of the dangers inherent in interactions between humans and grizzlies. As stated in the Draft Grizzly Bear Restoration plan negative interactions between humans and grizzlies do occur. The Draft details the status of grizzlies in other US ecosystems. The metropolitan areas which are close to the other US ecosystems have significantly smaller human populations than the North Cascades. The population of the Seattle metropolitan area is over 4,000,000 and is the 15th largest metropolitan population in the US. In comparison, the Missoula, MT metropolitan area had a population of 118,000 in the 2020 census and the Billings, MT metropolitan area had a

population of 185,000. The North Cascades have experienced an exponential increase in the amount of human recreation in the last few decades. Currently, and for the entire 50 years in which I have been utilizing the North Cascades for recreational purposes it has been a relatively safe place for people of all skill levels. A family with young children can safely hike on trails adjacent to the three potential release sites documented in the Draft. There has been no need to carry bear spray or weapons for protection; no need to carry bear cannisters in which to store food. The Draft states that safety measures for black bears and grizzlies as being comparable. The "safety measures" may be comparable but the level of aggressive behavior and risk of injury to humans is not comparable. The US ecosystem areas which do contain grizzlies have developed infrastructure over time to address the human/grizzly interface which occurs as a result of human visitation to those wild areas. The North Cascades has, in contrast, grown to accommodate and be frequented by large numbers of human visitors without any of that infrastructure.

Thank you.

On a personal note, I am definitely afraid of Grizzlies, but they deserve the right to live in their habitat as well as I do. They help our environment in the wild and make nature what it should be. All I hear these days is the killing of animals. I am sickened by the thought. Instead of killing or not protecting lets encourage and let live so that our future generations know what an animal in the wild does and how they live. All animals are Mothers and Fathers too. These creatures were here living off the land before us. By rights it is theirs.

Correspondence: Grizzly Bears - No, No, and No.

My wife and I are backpackers, trail runners, mountain bikers, and I also flyfish and bowhunt. Love the outdoor and wilderness and spend much of my recreation time in WA forests and trails.

There has not been a credible Grizzly sighting in WA for decades. The ecosystem seems to be doing just fine without them. re-introduction of Grizzlies creates so much potential for dangerous or deadly human and bear interactions.

The WA population is growing rapidly and trail and outdoor use will certainly continue to grow rapidly in years to come. Adding Grizzlies to the mix is a toxic idea and also completely unnecessary and unwanted by almost all regular outdoor users.

There are healthy populations of Grizzlies in other areas of the US and Canada.

Please do not pursue this terrible idea.

Respectfully,

██████████

Correspondence: Grizzly bears are DANGEROUS animals. They run 8 to 12 ft tall and can weigh 800 lbs or more. Ten feet for your perspective, is the height of the basketball rim. Grizzly's can run 30 to 40 mph for short distances, up to maybe 50 feet. Can you? Grizzly bear paws can decapitate humans with one swipe of the paw. Humans, unless they are well armed, always lose every interaction with Grizzly bears, and most don't survive. If they do they're guaranteed serious medical bills not to mention serious pain and likely life long harm. If they survive. Do the men who choose to introduce Grizzly bears into Washington State live in Washington state? If not, they have NO right to an opinion. Will the men who choose to introduce Grizzly bears into the North Cascades be held personally liable for all the humans who will die from this stupid idea? They should be. Will the men who choose to introduce Grizzly bears into the North Cascades be held liable to pay for all those who will be injured by bears? They should be. How many human deaths by Grizzly does the Federal government think is acceptable? Grizzly bears have been long gone from the North Cascades in Washington. Hundreds of thousands of dollars to introduce bears into Washington where the overwhelming majority of citizens living in the affected areas are opposed is morally wrong. Grizzly bears kill and dine on humans because humans are prey, food for the top predator. The only way to be safe in the Cascades after Grizzlies are introduced is for humans to be armed with high caliber arms; and be knowledgeable in their use. The Cascades have many wonderful hiking trails enjoyed by many humans; very few carry weapons. I don't want to carry rifles or pistols just to go on a hike or backpacking trip in the mountains. Grizzly bears are completely unpredictable. And very very dangerous. Please permit common sense to prevail and please do not do something extremely stupid like introducing grizzly bears into the North Cascade mountains in Washington.

Correspondence: I am against for bringing the grizzly bears to the North Cascades. I am an avid hiker and feel this is dangerous to all outdoors people whether they hike, climb, bike, etc. This will not bring extra revenue to the North Cascades.

People, like myself, will not be able to enjoy the back country of the North Cascades with the threat of a grizzly bears. The threat of grizzly bears is going to turn people away from enjoying nature and providing income to the small towns around the North Cascades like Twisp, Methow, Mazama, and Winthrop. I often go to eating and retail establishments when I go hiking. Since I will not hike with the threat of grizzlies, I will not be visiting these small towns.

Correspondence: Do you truly believe It's in the best interests of the people of Washington State to spend \$400,000 to subject them to the danger inherent in reintroducing grizzly bears? If the State has that money burning a hole in government's pocket use it to help the homeless or those with mental health issues! It may not go far toward those problems, but it certainly can do no harm and is better than deliberately choosing to harm the citizenry and their animals!!

What benefit would be gained for the people living in the affected areas? Surely anyone with wisdom would take into consideration the jeopardy this action would bring!

I say NO GRIZZLIES, period!!

Correspondence: I support the restoration of grizzlies to the North Cascades but it must be done in a way that is compatible with wilderness values and that means no helicopters or motorized vehicles. Alternatives must be explored even if it takes longer. The NPS must also work with Canada to create corridors for bears to move freely between the 2 countries, The 2 alternatives must also have some plan for preparing local communities how to interact with bears in a safe way.

Correspondence: I vote for number 1: no change. Keep WA state a place where hu
Mans can u destined and enjoy the northwest forest land. We do not need another dangerous threat for our communities and the northwest to be threaten by! We moved to the northwest to enjoy the forest and appreciate the existing animals that reside here. Washington is one of the few states left where we can truly respect the natural environment around us.

Please do not take this away by introducing grizzles to our state! Too many famines with young children could be at risk. Grizzles are wild and you can not predict the devastating out-come that other options would introduce.

Do not let other States dictate our natural beauty and ecosystems that we live in.

One tragedy is one too many! Protect our environment by voting NO Change!

Correspondence: I support alternative A in this proposal to restore grizzly bears to the N. Cascades Ecosystem. Introducing grizzlies to this environment would be expensive, as it requires helicopter trips, radio collar technology, personnel, and who knows how many road trips, meals, conferences, in-person and phone/zoom meetings. Will new government employees be hired? New vehicles bought?

The plan to reintroduce grizzlies will fail, so the expense will all be a waste of money. Why will it fail? The ecosystem cannot support more bears. Grizzlies can already enter and leave the area from Idaho, Canada and/or Montana. If the N. Cascades environment could support a population of 25 bears, they would already be there. They aren't there. So why not? Why don't you address this in your meetings with the public?

This proposal is another expensive government program that will fizzle out. These bears are dangerous, and if they can't find what they need where they are dropped off, they will go elsewhere: back yards, farms, ranches, eating chickens, pets, calves, goats, sheep. The boundary of the N. Cascades ecosystem extends to just east of Lyman, and includes many of those farms, ranches and lots of landowners' back yards. Do any of the people proposing this re-introduction live within the boundaries of the N. Cascades ecosystem? I doubt it. Would they be so eager to re-introduce these dangerous predators if the bears were put in their back yards? Probably not.

I support NO ACTION: do not re-introduce grizzlies to the N. Cascades. Skagit County farmers are already hosting an uncontrolled government animal: the Washington Fish and Wildlife department introduced elk into east Skagit County years ago. These animals, that are not dangerous, have driven a number of farmers out of the valley. What's going to happen with another government animal, and a dangerous one at that? This is not how to increase the population to get them off the endangered species list. Why not introduce them to Olympia or Seattle or Mill Creek? Oh, that's right. That ecosystem is gone. Lawmakers and government employees don't want these dangerous animals in their own back yards. Instead, they want to put them where farmers and ranchers grow our food. Leave us alone!

Correspondence: Please do NOT reintroduce grizzlies into the Cascades. Life has changed since the bears last lived in this area.

Although we do not live on the mainland, bears can swim very well and I certainly do want to have to worry about children, pets, or livestock should the bears decide to swim to Whidbey. We have horses and, although I would not like to but would not hesitate to shoot any wildlife threatening my horses, we also live in close quarters with other rural families and farmsteads. If I should miss, I could accidently shoot someone else's livestock, buildings--or a person.

Whoever came up with this foolish and dangerous idea has obviously dismissed the high cost in money, material, and public wellbeing.

Vote NO. Do NOT reintroduce grizzlies into our mountains.

Correspondence: We advocate for grizzly bear restoration. As a keystone species for the North Cascades, grizzlies have impacted this area for hundreds or thousands of years!

The forest system benefits from their existence within it, which is beneficial for other animals, vegetation, ground disturbance, seed distribution and many unnoticed other effects.

Grizzlies contribute to the ecosystem biodiversity in a major and complete way. Those of us who love the forests encourage grizzly restoration within the vast wilderness ecosystem of nearly 10,000 sq. miles.

Because North Cascades Institute brings significant numbers of people to the ecosystem to take part in conservation education programs, we have looked into issues of safety and risk management with peer organizations that operate in grizzly country. Yellowstone Association Institute and Teton Science Schools have worked with tens of thousands of school children, families and adults for over 40 years in the Yellowstone backcountry. If grizzlies were restored to the North Cascades, the additional protocols we would put in place, in addition to standard "bear aware" practices that we already require from all participants, is a minimum group size of four, with group leaders carrying bear spray. These protocols are basic for anyone visiting wilderness areas that contain large carnivores.

Correspondence: I'm an enrolled tribal member of the Sauk-Suiattle Tribe who objects to the release of Grizzlies into the North Cascades. Personally believe they not only threaten our U and A (protected by treaty rights) but also burden our natural resources that we're already losing due to environmental conditions and mass logging in the cascades, seemingly destroying the delicate natural balance of nature. Throughout the seasons, we are hunter and gatherers to sustain ourselves, storing, canning and freezing indigenous foods, fabrics, gathering herbs, medicines that are essential to our existence and well-being. We also seek spiritual work in the mountains to heal our hearts, minds and for our community, wholistically. I urge our government leaders to cancel the release of Grizzlies into the Cascade Mountains and find a zoo or other conservation group to take the Grizzlies that we all love and adore. Personally believe more environmental impact research needs to be done, in our already diminishing resources, by science. Thank you for giving me the opportunity to express my concerns.

Correspondence: I strongly support the National Park Services preferred Alternative C: Restoration with Endangered Species Act Section 10(j) Designation.

I grew up in the shadow of the North Cascades and have been eagerly awaiting this vision of reintroducing grizzlies to the ecosystem coming to fruition.

This plan will both effectively restore grizzly bears in North Cascades National Park and give people the tools they need to thrive in and around grizzly bear country. Grizzlies belong in the North Cascades, as they enhance the park's ecological integrity and contribute to its wildness.

Grizzly bears play a vital role in maintaining ecosystem balance, cycling nutrients, dispersing seeds, and changing the behavior of species around them. Restoring them would benefit the park and the people who use it.

A restored population of grizzlies will boost the park's appeal and attract nature enthusiasts, scientists, and tourists from around the world. This would provide economic benefits to local communities and support the park's mission to protect park resources in perpetuity.

Alternative C, with the 10(j) rule, provides managers flexibility to address community concerns while protecting the grizzly population. It ensures coexistence between humans and bears.

Please consider the positive ecological and economic benefits and support Alternative C. Restoring grizzly bears will secure the park's natural heritage and conserve an iconic species for current and future generations.

Thank you for your dedication to our national parks.

Correspondence: Do not re-introduce grizzlies to the North Cascades.

US Fish and Wildlife stated that the grizzly disappeared from the N. Cascades ecosystem due to hunting pressure, and that the habitat was still there. The habitat may still be there, but the N. Cascades ecosystem has been so mismanaged, that the "ecosystem" doesn't really exist any more. Without an ecosystem, introduced bears are not likely to survive without seeking their nutrition elsewhere. And any human-grizzly interactions do not turn out well for the human or their domestic animals: the grizzly is a dangerous predator and will eat people!

Correspondence: Dear Sirs and / or others,

I am not in favor of the reintroduction of Grizzly Bears back into the Cascade ecosystem.

They have been gone for a while now. The last sighting of a female Grizzly Bear with a cub, was in 1991. In the time period between then and now, no loss of human life has occurred from Grizzly Bears in this ecosystem.

Your statistics show that in the last period of time. .4 people have had a physical encounter every year, with these animals, in the lower 48 states.

Because you deal with these bears, they become your focus, and you want to promote them, just like others professionals promote their product.

I as a member of the public don't want them back into the Cascade Ecosystem!

Thank you.

Sincerely yours,

Correspondence: Please do not introduce grizzlies to the North Cascades.

Grizzlies are an APEX predator and have no natural enemies.

My biggest concern is that the grizzlies, if introduced to the Northern Cascades, will find their way to areas that are now inhabited by elk with hoof rot disease. These elk are numerous and are absolutely NOT being managed by any government agency. These elk are not able to outrun a grizzly and will be easy prey for the bears, The bears will quickly realize where the easy source of food is, which includes farmers' fields on the west side of the Cascades.

The hoof rot disaster in our elk, that is currently being ignored by the DFW, will then be compounded by this 10(j) designation from the NPS.

This is a disaster waiting to happen. Please do not let this happen.

Correspondence: To those who will make a decision on what restoration plan to implement:

I am writing from my personal experience with grizzly bears in the NCDE and Glacier National Park in particular. My experience has been that of bear management seasonal ranger at Many Glacier RS in Glacier over a period of more than 30 years. The comments are from my observation and are NOT in any manner given, nor should they be taken, as representative of an official Glacier Park statement. I speak as a private citizen whose seasonal summer work in Glacier has afforded me some insight.

I agree that your "preferred alternative C" is the direction to go. The 10(J) option.

With this Alternative C you will have the most flexibility to meet the concerns of surrounding stakeholders, that is, people who live, work, recreate and hunt adjacent to the North Cascades National Park and within the Forest Service and other public lands which comprise the re-introduction area.

Bear management involves people management as well as trail warnings, research captures and tracking or occasional removal of "problem" bears. And the greater part of people management is constant education about how people living near bears can be more "bear aware," be alert to issues of food storage and attractants that can take grizzlies down the continuum from habituation to food conditioned and "removal." With Alternative C you would have the most options at hand to work not just through federal agencies but through Washington Department of Fish and Wildlife and tribal agencies to assist people in understanding how to be more safe in the presence of bears. Obviously, bears will roam outside the political boundaries of the recovery area. And some people in those areas are going to be worried. You need the tools to meet the needs and concerns of residents and ranchers and business owners alike....who will have concerns and sometimes, issues, with bears.

Working with surrounding communities in the Glacier setting is essential to help preserve a new presence of bears moving outside and back into the Park. We have the Blackfeet Reservation on our east and various combinations of public land and, to the point, private landholders and communities to our south and west. Montana FWP works constantly with adjacent communities, as does the Blackfeet Tribal FWP on the reservation, to educate people regarding best practices in bear country. This may include the elimination of a bear from time to time, if that bear has "crossed the line"....predation against livestock or troublesome encounters with residents.

People will more likely "buy into" a plan to reintroduce grizzlies in the area if they know that resources are in place to assist them if necessary. And part of the agency's function will be to minimize the need for active management by reason of educating large numbers of folks as to how they can co-exist with grizzlies.

I wish you well in your efforts to re-introduce grizzlies in the wild country that can support them. It seems to me that Alternative C will be your best option.

All good wishes!

Helena, MT

Correspondence: Subject: I support Alternative C: Restoration with Endangered Species Act Section 10(j) Designation.

With due respects,

Lady or and Gentleman.

I strongly support the National Park Services preferred Alternative C: Restoration with Endangered Species Act Section 10(j) Designation.

This plan will both effectively restore grizzly bears in North Cascades National Park and give people the tools they need to thrive in and around grizzly bear country. Grizzlies belong in the North Cascades, as they enhance the park's ecological integrity and contribute to its wildness.

Grizzly bears play a vital role in maintaining ecosystem balance, cycling nutrients, dispersing seeds, and changing the behavior of species around them. Restoring them would benefit the park and the people who use it.

A restored population of grizzlies will boost the park's appeal and attract nature enthusiasts, scientists, and tourists from around the world. This would provide economic benefits to local communities and support the park's mission to protect park resources in perpetuity.

Alternative C, with the 10(j) rule, provides managers flexibility to address community concerns while protecting the grizzly population. It ensures coexistence between humans and bears.

Please consider the positive ecological and economic benefits and support Alternative C. Restoring grizzly bears will secure the park's natural heritage and conserve an iconic species for current and future generations.

Thank you for your dedication to our national parks.

The beauty of the country and Nation is the forests, the wild green places , the lands , the mountains , the wilderness , the ocean,the wild animals.

Parks are very especial. It means so much to everyone even painters, children the older people.

The animals love freedom and so do I.

The beauty of Nature must be protected instead of destroying it; it should be help to create it more beautiful.

For me a Forest itsa a dream that many can not reach to see it and live the magic of the colors, river and more.

Please don't take away the animals that put more beauty and life. Don't let grizzly bears disappear during our lifetime and out new generations.

Protect them and help protect those who do not follow park rules, that can protect them both.

Thank you for your time and consideration and the work it is been done.

Sincerely,

██████████ 11-3-2023

Correspondence: I have talked to 15 -20 people, some hunters, some hikers. Not one of them are for releasing these large bears to the north cascades. The weekend amount of hikers on a nice day on highway 20, and highway 2 is quite large. People are taking their children hiking. The bears will pose a threat to these hikers. Please reconsider your decision on releasing these large bears in the cascades. Thank you Michael Barth

Correspondence: As avid hiker I strongly recommend the No Action option. Moving bears into this area will put people's lives at risk and reduce recreational options in the north Cascades. This could hurt the livelihood of the citizens that live in the area. No one wants these bears and there is a reason they were hunted and removed from the area. They are dangerous and will kill people. If you reintroduce these bears you will be directly responsible for killing people, hurting the economy of the state, and reducing recreational area. There are No positives to having grizzly bears in this area, do not reintroduce the bears.

Correspondence: As a concerned Washington resident who treasures the state's natural beauty, I implore officials to reconsider the idea of reintroducing grizzly bears. While conservation is vital, the potential risks to our safety during hikes cannot be ignored. My family and I, along with countless other outdoor enthusiasts, relish our hiking adventures. Introducing grizzlies brings the unsettling prospect of encounters with these powerful predators. Balancing conservation efforts with human safety is crucial. We must explore alternative approaches to protect our wildlife while allowing families to continue enjoying the great outdoors without the constant worry of grizzly encounters.

Correspondence: I strongly oppose reintroducing grizzlies to the North Cascades ecosystem.

These vicious bears are a hazard to human life and were long ago extirpated for this reason.

Having them return to the ecosystem would introduce a potentially fatal hazard to hikers and campers.

Please keep the grizzlies out of the North Cascades ecosystem.

Thank you.

Correspondence: Please don't reintroduce grizzlies to WA state. Human / grizzly conflict is inevitable and will increase as more people use the north cascades as population increases. Grizzly introduction will ruin the outdoors for a large segment of the population that is risk averse. I for one know my wife and kids would never camp or backpack in an area with grizzlies.

Spend your energy on useful things, like improving trails and road access to trailheads. People shouldn't need high clearance vehicles to access trailheads.

Correspondence: I think that the reintroduction of bears is a good idea. They will greatly help the entire ecosystem within the Cascades and even the surrounding area. We can see evidence of this with the similar reintroduction of wolves to Yellowstone. Grizzlies help with plant growth, not only by spreading seeds but also by aerating the soil just by moving around with their large claws. Finally, we are the reason that grizzlies can't be found in the Cascades anymore, and we should fix that.

Correspondence: The Bear Reintroduction Plan is a great idea. The positives they would pose to the environment outweigh any possible negatives their reintroduction would bring. The opposition's main point is keeping families safe but they are being reintroduced to a national park, not our front porch. I especially think it's a good idea to take it extremely slowly and introduce only 3-7 bears a year, that way if there are any issues there aren't any crazy adverse effects. But the environment would prosper under the reintroduction of grizzly bears and I think it's an incredible idea.

Correspondence: Bears are essential to the ecosystems that once had them. They are a keystone species, and have a big impact on wherever they are, spreading berry seeds in their droppings, being at the top of the food webs, being a major predator for many species, and helping contribute to the balance of each ecosystem that they are apart of.

We have seen in other studies that a slow reintroduction, and then letting nature take its course, is the best way to reintroduce a species, and this plan follows those guidelines well. With the Wolves in Yellowstone, we saw them come in and immediately have an impact on the ecosystem, as they would kill the grazing animals, and then there would be more green grass available to graze on, as well as strengthening the river banks, and overall just starting a domino effect that impacted the entire ecosystem, just by reintroducing the one species.

Correspondence: I believe that we should reintroduce Grizzly Bears back into the wilderness of the North Cascades ecosystem because they are a fundamental role in acting as a natural fertilizer for plants and a predator for the other species in the ecosystem. With small doses of this introduction I believe that these bears will thrive, though with monitoring these species we can prevent them from destruction of the cattle of farmers, whom have expressed concerns about their livestock being take. This can be prevented through caution with the animals and keeping watch of them as they adapt to their new environment.

Correspondence: The Grizzly Bear reintroduction should continue forward. The Grizzlies have many great effects on the ecosystem. First of all, they are at the top of the food chain, so they regulate other species populations. Think about when wolves were reintroduced to Yellowstone National Park, it was very beneficial and allowed for more biodiversity. Another

reason Grizzlies should be added is because they are great at digging, which may sound weird but they aerate the soil which helps with growth of many different plants. Again, increasing the biodiversity.

Correspondence: I oppose this plan and the reintroduction of Grizzly Bears in areas where they are currently absent from. This is a dangerous course of action which is likely to result in the unnecessary deaths of Washington residents and tourists who enjoy our natural resources.

Many Washingtonians and tourists take advantage of the beauty of our state through engagement in outdoor activities. Camping, hiking, hunting, trail-riding, skiing, and other activities are undertaken by many in the area proposed for reintroduction. Placing a lethal predator in these areas makes it an inevitability that there will be dangerous interactions between humans and the reintroduced populations. Grizzly are historically dangerous to humans. In fact, that is one of several reasons why the populations have been extirpated as they have.

There is no sufficiently compelling reason to warrant the reintroduction of these dangerous predators in areas near population centers, nor areas which provide the opportunity for so many to enjoy the outdoors in our state. Families, especially including ones with children, will be at greater danger if this plan is implemented.

I urge you to abandon this goal. It is simply not worth it.

Correspondence: Bears play a vital role in their ecosystems and help our national parks and other wild places grow and survive, and it would be greatly beneficial if we reintroduced them back into the Cascades. They are able to modify the environment around them, they help maintain populations of deer and other prey species through predation and are important links in food webs, as well as other things like spread plant and berry seeds as they eat them. Their reintroduction would be similar to that of the gray wolves in Yellowstone. They would greatly help the environment just by doing things like regulating the prey populations and spreading plant life. Human activity is also the main reason for the bears decrease in population, and we should not be worried about being safe or not since they would be reintroduced to the parks, and not neighborhoods.

Correspondence: In general, I support the restoration of grizzlies to the North Cascades, but want to express the importance of executing a restoration plan that does not violate the Wilderness Act, nor should it put undue stress on, or harm the area's wilderness character. Currently, both USFWS action alternatives as they now stand would violate the Wilderness Act. The action alternatives should be modified to avoid helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and steer clear of heavy-handed management of bears. Additionally, I oppose the use of a 10(j) rule for the grizzlies in the restoration work. This would mean grizzlies that are fully protected under the Endangered Species Act

(ESA) in places like Montana would be taken from their homes, dropped into the North Cascades, and lose their previous protection. A natural recovery alternative must be fully developed and analyzed, even if recovery would take longer than active repopulation. The new information presented by Superintendent Striker regarding the likelihood of naturally migrating bears from Canada suggests active repopulation urgency may be more about protecting agency discretion than protecting Wilderness and creating the best environment for grizzly bears to migrate, live, and thrive. For the long-term success of grizzly restoration, natural recovery measures must also be included in both action alternatives thus reducing the need for wilderness degrading activities that are also ultimately bad for bears. This requires work with partners in British Columbia to ensure that grizzlies have corridors to move back and forth across the international border and to prevent a small North Cascades grizzly population from shrinking over time and becoming inbred. An alternative that combines natural recovery with population augmentation under full ESA protections should also be analyzed. The no action alternative has many good Bear Smart components on how people and communities can coexist with grizzly bears and these coexistence measures should also be included in both of the action alternatives. All possible measures must be taken to prepare residents and visitors for bears, particularly given the dramatic growth of the human population in the region and rapidly increasing recreation pressures in the Park.

Correspondence: The plan to reintroduce grizzly bears into the North Cascades is a terrific idea. The plan will ensure the safety of the species, saving them from extinction, while also bringing numerous benefits to the local ecosystem. When gray wolves were reintroduced into Yellowstone National park in 1995, it lead to a complete trophic cascade which helped the environment thrive and grow. If the reintroduction of grizzly bears in the North Cascades is anything like the wolves in Yellowstone, then the plan will be a massive success.

Correspondence: Reintroducing grizzly bears into the North Cascades could have a positive impact on the environment. The reintroduction of an apex predator can significantly alter the wildlife and plant life in its habitat. The reintroduction of wolves into Yellowstone is an example of this, where they changed the number of elk and the flow of the river. By reintroducing bears into the North Cascades, they can reduce the population of other species, which could allow for other animals and plant life to thrive more. This could greatly improve the park's environment and make it more attractive to visitors. While bears pose a threat to humans, with proper care, caution, and instruction, the risk of injury from bears would be very low. Additionally, measures are being taken to address what would happen if bears go after livestock. Therefore, the harm of bears to humans would be minimal.

Correspondence: As we are confronted with the issues of climate change and various other environmental/ecosystem issues, I would like to say that I support the Grizzly Bear Restoration Plan in the North Cascades. The Grizzly Bear is an important species in the North Cascades ecosystem and I believe that reintroducing them to the region would benefit the overall ecosystem as they would help to regulate the populations of their prey and keep forests healthy by dispersing seeds

and berries. Like the wolf reintroduction in Yellowstone, I believe that the reintroduction of the grizzlies can achieve a similar effect where a chain reaction can cause the ecosystem to flourish in ways that wouldn't have been possible without the reintroduction efforts. Furthermore, the grizzly bear is a threatened species because of overhunting and habitat loss by humans. We created this issue and now we must fix it. Lastly, the restoration plan would be carefully curated as it spans a long period (60 years to a century) and because conflict with local landowners and communities is being considered with the process through the 10 (j) experimental population designation.

Correspondence: I believe that Grizzly Bears should be reintroduced because they are crucial to the environment. Just like with the reintroduction of the wolves in Yosemite, bears will also change the ecosystem for the better. The bears graze mostly on berries and fish and with those berries that they eat, they spread the seeds around causing more berry plants to grow. Consequently, the other animals also thrive off of these berry plants. I believe it would be best to gradually bring back bears in the Cascade Mountains even though farmers and ranchers might complain or oppose the idea. Farmers and ranchers' main argument against the reintroduction is that the bears will eat and kill their livestock. This is a rational reason, but it could also be said that the farmers and ranchers are also at fault because they won't section off some of their land; they know that there are animal predators that may eat their livestock but are not trying to do anything to protect their animals. You can also see this whole ordeal as hypocritical. Just as Americans are emotional over their homes, why are they (not all, but some people) trying to get rid of and displace bears from their homes? Many studies have shown, that if an animal is suddenly moved from their home they will be anxious, scared, and sometimes aggressive.

Correspondence: Please do not reintroduce the Grizzlies to the North Cascades, those of us who live in the area are already plagued by the WSDFW "non-Management" of the overpopulated Elk herds, the overabundance of Coyotes, and the increasing presence of Cougars venturing into territory where they haven't been prevalent in over 50 years.

That same territory happens to be where my neighbors and I live, farm, and try to raise families.

It is bad enough that I don't venture outside at night without a gun for caution of the wildlife already; please understand I've lived in the same house in eastern Skagit County my whole life. My parents have lived in the area for over 60 years. None of us have ever felt this was an issue until about ten years ago as increasing elk populations began to encroach on the area we live; bringing the hoof rot bacteria, property damage, as well as predators looking to make elk a meal and finding easier prey in the lowlands.

I urge you to not reintroduce a species you don't understand and have no way of knowing how it may interact with the population of people who already occupy the area it used to roam.

Correspondence: As someone who recreates in the NCE every year, typically in the wilderness areas and in the backcountry, I strongly oppose Options B and C (particularly Option B). Reintroducing grizzlies in Washington will almost certainly result in death for some number of people recreating in the area. We have seen this in every state that has stable grizzly populations. It is reasonable to hypothesize that with the large number of Washington residents recreating in the backcountry in the state, that there will be human-grizzly conflicts that will eventually result in the death of some number of outdoorspeople due to grizzly encounters.

As we have seen in Montana and Wyoming, even when grizzly numbers are recovered, there is strong resistance from outside interests in preventing the states from managing grizzly populations as they do with other species (such as black bear, deer, elk, etc). This has resulted in a robust and increasing population of grizzlies that kill some number of people every single year in those states, and injury even more. I appreciate the benefit that grizzlies bring to the ecosystem, but I think it is outweighed by the strong probability that they will eventually end up killing humans who are trying to recreate in nature.

Correspondence: I would highly recommend NOT implementing this program.

I recently attended an informational presentation that was given, concerning the program to re-introduce Grizzly bear into the North Cascade Range. This presentation, for me, left more questions than answers. There was not the opportunity for those gathered at this presentation to ask any questions. The Grizzly bear requires large territories to roam and are solitary animals, each requiring up to 500-600 square miles each. Grizzly bears are considered apex predators, needing an eco-system that would support them. The relocated bears would be collared, but the monitoring of these bears would not happen in real time, their travel is recorded and transmitted every 48 hours via satellite. This does not allow for fast trapping and removal should a bear move into a populated area, or have a conflict/interaction with people. Washington State, and especially the North Cascades, is a beautiful place. Hiking, camping, and fishing streams, are a large draw for many people throughout the year. This would greatly increase the possibility of bear/human interaction, which could be very dangerous. Within this program there are specific "zones" that would be focused on for relocation of the bears. One boundary of the main zone falls just east of the town of Lyman along Highway 20. In this area are farms with livestock, houses with families/children, an Elementary school, and other businesses. The Washington Dept. Fish and Wildlife are currently partnered with local agencies, and are responsible for managing the elk population that are in the area. The elk population are not being managed well. There is a portion of the elk that are diseased, and dying a slow death. They move among homes, have been known to chase homeowners when they are in their yards. They are also inhabiting some towns within the city limits. The hoof rot disease that a portion of the herd carries can be transmitted to deer, cows, sheep and goats. It is a very painful way to die for the animals. If this is an example of how the Grizzly bears will be managed by the same agencies, then I have no confidence in the Washington Dept. Fish and Wildlife's ability to manage this program or these apex predators.

I would highly recommend NOT implementing this program.

Correspondence: Overall, I support grizzly bear recolonization of the northern Cascades. To give time for the state, federal, and tribal entities to prepare the parks, natural areas, and private lands for grizzly bears, I believe that natural recolonization is the best way forward. If we begin introducing grizzly bears into the ecosystem before preparing the people and places within (i.e., bear safe parks, neighborhoods, camping areas, etc.), it could put undue stress on the people in the area, on the conflict staff that will have to respond to problem bears that are trying to disperse, and on the bears themselves.

Correspondence: There are many reasons not to reintroduce grizzlies into the North Cascades.
These are just a few reasons:

I don't feel that public safety of campers, hikers, bikers, hunters etc. has been address.
Live stock and pets are an easy food source.
Farmers will suffer even great hardships.
The elk alone is an example of how poorly things have been managed.
The elk have learned to "live" close to people with very little fear for an easy food source. That will bring the grizzlies even closer to populated areas.
Money is being spent to bring back the salmon runs, grizzlies eat fish causing even less salmon in the streams.
You can't manage something that is unmanageable and in the end that is what grizzlies are.
Please DO NOT allow grizzlies back into the North Cascades.

Correspondence: To Whom It May Concern,

I fully welcome and encourage the reintroduction of Grizzly Bears into the North Cascades,

Living only 14 miles away from the eastern boundary of the NCNP, I have no concerns regarding reintroducing an apex predatory into the North Cascades and understand the added benefits it's reintroduction will have on benefiting the environment.

Thank you

Correspondence: Hon Newhouse:

Introduction of the grizzlies to the cascades is going to hurt the economy for central Washington. It will drive casual tourists away as well as hurting the farming and ranching communities.

Can you work with congress to cut funding for the introduction? Also was the regulation prepared under the Technology Transfer Act of 1995? That requires consensus standards to be used as part of the regulation and office of Management & Budget to approve the regulation.

Also, maybe introduce the grizzlies to Seattle. It would show the impact of grizzlies on individual homeowners.

I lived in W. Richland and still receive your newsletter. I support many of your initiatives and believe you are doing a fine job representing the people of central Washington.

Correspondence: I was in Banff when the very experienced couple were camping. Report that they did everything right yet the Grizzly maled them in their tent. Those bears are like pitt bulls, many may avoid conflict but if they ever attack the sheer strength will kill or mame the victim. They have no business being introduced back into areas that have been populated by humans. They belong in the Rockies wilderness. We saw a black bear and it got many galkers stopping along the side of the road with their phones out taking pictures. This is the world we live in now. Grizzly may have become irritated. Not to mention if there is not enough berries and food for them. Please do not bring grizzlies back to central Washington unless you want carnage.

Correspondence: Dear Park and Fish Leaders,

I appreciate your concern for the grizzly bear population. But at a time when our national parks are deteriorating, I find it ironic that we want to direct funds to projects that endanger people from experiencing the wilderness of the North Cascades. Grizzly bears will scare more people away from the North Cascades for their spiritual experience than bring people to this area. Maybe you want to scare people into a spiritual experience.

There are better uses of the funds that won't put people's lives into danger. NO Grizzly bears in the North Cascades, please.

Concerned Hiker,

Correspondence: Regarding the reintroduction of grizzly bears to the cascade mountain region, it has become clear that the organization/agency behind this terrible idea has no basis in scientific data. There is a reason why these ferocious press were largely eliminated from Washington and surrounding regions. That reason is, of course, that they are a very real threat to human habitation in the area. Grizzly bears need hundreds of square miles to roam and find their food sources, and with the population of this state and the northwest continuing to grow, it seems both **ILLOGICAL AND IRRESPONSIBLE** to push this idea on an unwilling population of rural homeowners, farmers, ranchers, and outdoorsmen.

Correspondence: I am against releasing Grizzly bears in Washington. For years we have lost habitats due to extreme fires. With these fires loss of life to our animal populations, i.e., food chain, that would be needed to support these bears. The bear will follow the food chain which means coming onto farmlands to eat livestock and anything that appeals to them which can and has included human life. We, the citizens, have strongly stood during public comment periods and voiced our opinion which was, "No". There are plenty of fires in neighboring Canada which does have Grizzly bear. The bears will migrate into our state and probably already have. That, we can do nothing about from happening.

Correspondence: I do not see a need to introduce grizzlies. Lets listen to our farmers!! They provide the needs for HUMAN life to survive and yet here we are wanting to introduce the grizzly that WILL prey on livestock. After spending 18 yrs in Montana, I see what grizzlies do. They are not to be messed with especially before hibernating. 20 miles from a place I love in Montana, this summer, and runner and mother was killed by a grizzly. She was on a well run path and had her dogs with her. She didn't stand a chance. Don't be a fool to think grizzlies will stay where designated.

Here is a copy of what I found on WA State Standard news article:

"For example, livestock owners in certain areas, under specified circumstances, and after getting government approval, would be allowed to kill grizzlies that attack or threaten livestock.

And people would be free to "haze, disrupt, or annoy" bears that approach homes and other structures."

You can't be serious. This is the best you have for one NEEDING to protect themselves and livestock. Why don't you just tie their hands? A grizzly attacks to kill. But a farmer can only protect once a grizzly starts an attack?? Are you going to pay for that farmers cow that that grizzly just killed? The grizzly YOU brought back.!

If a Grizzly approached me or my family, you think annoying a bear is the best solution. It's a GRIZZLY.

Listen to the farmers. They provide food for you!! Yes grizzlies can be good for replanting seeds and other things but grizzlies don't put food on you your table like farmers do. Please listen to common sense.

Correspondence: My family enjoys roaming and exploring the North Cascades and want the ecosystem to thrive. However, grizzly bears are known for their relatively aggressive natures, especially during mating seasons. An experienced pair of hikers was mauled to death by a grizzly in Montana less than a year ago. I have a pre-schooler who is learning to love and protect the outdoors -- he would be maimed or killed in an inopportune encounter with a grizzly. That knowledge would chill our willingness to explore the North Cascades, and ultimately would reduce our engagement with and support for the educational programs at the park which we have always loved. For these reasons, I am opposed to the reintroduction of grizzly bears to the North Cascades.

Correspondence: I would like to see Grizzly bears reintroduced to the North Cascades under the 10(j) rule (referred to as Alternative C in the prepared Environmental Impact Statement). I hike in the North Cascades multiple times per year. If grizzly bears are reintroduced, I will have increased psychological trepidation, but would likely be at less risk than encountering a rattlesnake which is common. I spent 12 years in south west Alaska and routinely explored wilderness areas where brown bear are common. They were always more interested in blueberries than us.

I agree that allowing active management would increase community acceptance but would caution against leaving those decision in the hands of state sport/game managers and prefer such decisions made by agencies with a conservationist perspective.

I know that bears typically eat vegetation and insects, but wonder if there would be sufficient alternate sources of food such as fish. I suspect that historic populations of fish are far less than when grizzly bears were last present in the area.

I also request that the park or forest service consider installing either bear resistant food boxes or fixed elevated food hanging cables at camp sites along high use hiking trails such as pacific crest trail to reduce potential bear-human interactions. I know it is mostly in wilderness, but such things may reduce bear encounters and increase community acceptance of the reintroduction program.

Correspondence: I am strongly in favor of the reintroduction of grizzly bears to the North Cascades. I feel it is our duty to our kids, grandkids and great grandkids to assist in restoring the finer that have roamed these areas for thousands of years. I think it is very shortsighted to I have previously exterminated these wild animals, and it is our duty to bring them back to our special ecosystem.

I have spent time hiking in grizzly country in Montana, and Alaska And I think it only adds to the overall experience. I think the current national park service plan for close follow up and careful study is a safe and responsible way to proceed with rehabilitation of some of the wildest areas in our great nation.

Correspondence: I know that this is a very bad idea. There is a reason these animals are no longer in the areas that they want to reintroduce them to because they came into contact with human inhabitants which forced them out of the areas due to agricultural damage and human safety. Reintroducing them will just cause damage to the agriculture in nearby areas and their ultimate demise once again. Let's keep with the conservation of the habitat that these animals are already in than re introducing them into areas that are dangerous for our agriculture, human and the animals lives as well. In the end you're going to end up with the same outcome, the destruction of these poor animals just to make a few unfounded people's feelings justified.

Don't do this for the animals' sake.

Correspondence: I think bears should be re-introduced to the North Cascades because bears hold a very important role in nature and can provide a lot of ecological benefits, such as controlling other animals' populations and even encouraging wildflower growth with their digging. Bears should be brought back also because bringing them back is restoring their species and continuing with population growth. However, if bears start getting too comfortable and close to humans, appropriate measures should be taken.

Correspondence: Please reconsider your approach to Grizzlies in the Cascades.

I fully support the restoration of grizzlies to the North Cascades, but the restoration must be done in ways that don't violate the Wilderness Act and harm the area's wilderness character. This is good for bears and Wilderness.

Both of the action alternatives as they now stand would violate the Wilderness Act. The action alternatives should be modified to avoid helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and steer

clear of heavy-handed management of bears. There are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites without the use of helicopters inside Wilderness.

I completely oppose the use of a 10(j) rule for the grizzlies in the restoration work. This would mean grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana would be taken from their homes, dropped into the North Cascades, and lose their previous protection. Montana doesn't have any "extra" grizzlies to lose to the North Cascades. Montana grizzlies are not yet recovered under the ESA, and any dispersing grizzlies from Glacier or Yellowstone are needed to naturally recover areas like the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest. This is not an ethical or humane alternative!

Therefore, a natural recovery alternative must be fully developed and analyzed, even if recovery would take longer than active repopulation. The new information presented by Superintendent Striker regarding the likelihood of naturally migrating bears from Canada suggests active repopulation urgency may be more about protecting agency discretion than protecting Wilderness and creating the best environment for grizzly bears to migrate, live, and thrive.

For the long-term success of grizzly restoration, natural recovery measures must also be included in both action alternatives thus reducing the need for wilderness degrading activities that are also ultimately bad for bears. This requires work with partners in British Columbia to ensure that grizzlies have corridors to move back and forth across the international border and to prevent a small North Cascades grizzly population from shrinking over time and becoming inbred.

An alternative that combines natural recovery with population augmentation under full ESA protections should also be analyzed.

The no action alternative has many good Bear Smart components on how people and communities can coexist with grizzly bears and these coexistence measures should also be included in both of the action alternatives. All possible measures must be taken to prepare residents and visitors for bears, particularly given the dramatic growth of the human population in the region and rapidly increasing recreation pressures in the Park.

Thank you for your consideration of these suggestions.

Correspondence: I believe that the Grizzly should be reintroduced to the north cascades. Reintroduction would have good effects on the environment because it is delivering a top level predator that has already been apart of that ecosystem back to where it belongs. The Grizzly is a part of that stable environment and without it changes occur and maybe some are yet to come that change the dynamic of the ecosystem. I also think that the inclusion of the 10j section is very important because it will allow ranchers and people who live in that area to conduct their lives in a way barely affected by the reintroduction, people should not have to give up their lively hoods.

Correspondence: I am writing in support of the re-introduction of grizzly bears to the North Cascades. Grizzlies are an important part of the ecosystem and the North Cascades provide habitat and protection where the bears will have a chance to survive and thrive. As a keystone species, they play a very important part of this amazing natural system. As you know, grizzly bears occupied the North Cascades for thousands of years as an essential part of this ecosystem. They helped in the distribution of native plant seeds and kept other wildlife populations in balance. I support the restoration of this balance.

Thank you for your time and attention.

Correspondence: Although there may be some concerns regarding the reintroduction of the grizzly bear--such as potential problems with private property and livestock--it is of utmost importance we protect our environment and reintroducing grizzlies is a great place to start. I also believe it is fair to allow owners of private land to get the bears off said land (without killing the bears) should they become a nuisance. Bears will rejuvenate the soil as well as allow for more sparsely planted berries, overall improving the health of the ecosystem.

Correspondence: The grizzly bear being reintroduced into the north cascades would 100% have a benefit to all the surrounding ecosystems. There are many pros that come with these bears being reintroduced. For an example these bears love to dig and they do it a lot, in doing so they turn dirt which initiates plant growth among many plants. These bears will kill animals which doesn't sound the greatest however in doing so these bears are adding to our land by regulating population. However, I understand the live stock portion may not be ideal. We are facing a potential 6th mass extinction and with reintroducing these bears we can prevent another animal going on that list.

Correspondence: Grizzly bears should not be intentionally reintroduced. This is a bad idea. I spend a lot of time doing outdoor recreation in the NCE. I backpack, hike, and fish in many of these places. I am accustomed to the fact that there are already large predators in those areas, black bears and cougars specifically. Those animals are less dangerous to people than grizzly bears. Black bears are quite timid around people and will almost always flee if they smell or hear a human approaching. Cougars are indifferent to people. We are not a food source for them and they are not seeking the food we carry. Grizzly bears are different. They want to eat the same things we eat, and they are not timid of people in the same way that black bears are. There will be fatal encounters with people such as the horrible incident that recently happened in Banff. That couple did every responsible thing they could do and were still mauled to death by a dangerous animal. I am not a gun owner and I do not want to have to carry a gun to feel safe when in the woods. This will directly impact my ability to enjoy these areas for outdoor recreation. It is only a matter of when, not if, someone gets seriously injured or killed as a result of this decision.

Correspondence: I applaud the work of those who are trying to improve our outdoor spaces for future generations.

I completely disagree with the plan to reintroduce grizzlies back into the North Cascades Ecosystem. Unfortunately, when (not if!) a bear does something egregious to a human or animals belonging to humans, the bear will suffer. That is inevitable and understanding this, it's entirely unfair to place such a species in this position.

If it were possible to eliminate the possibility of such human encounters then I would fully support the move to reintroduce. But it is only a matter of time before a negative encounter occurs and the consequences will fall on the bears, not the humans.

Think it through more fully. There are more and more people venturing into the wilderness so the chance of encounters that end poorly for the bears will only increase.

Sincerely,

, PhD Biology

Correspondence: I support Alternative C, which I feel is needed and would benefit the health of grizzlies, humans and the natural environment. I feel that the release rate and release numbers appear to be more conservative than I would recommend, which unfortunately will delay and slow down grizzly occupancy rates and population sizes and the associated ecological benefits somewhat. Great plan overall with plenty of space for humans and grizzlies to coexist and support each other.

Correspondence: The premise for reintroduction of grizzly bears seems to be that they once occupied certain areas therefore they have rights to graze their native lands. That being the case, it seems to be a flawed plan with an inhumane perspective. The grizzly bears have moved on to bigger and better frontiers that more adequately support their comfort, safety, and ability to protect themselves and their families. This includes protection from humans who have weapons to protect themselves, and rightly so against such a fierce foe. Another way to consider this is that if the extinction of the Grizzly bear would be appropriate if the alternative was just one human life was to be lost. The answer is a resounding yet, a human life is more precious and valuable than all the Grizzly's in the world.

The true scenario is, however, more complicated. First, it would be difficult to irradicate all apex predators such as the Grizzly and it is unnecessary given the natural tendencies for wild animals to stay within their natural habitat. There is no fence of protection but one is not needed because the potential for crossing paths is statistically invalid.

Introducing these bears into a region that may not have them, however, leads to unknown results. For example, we have no understanding of where the animals may go, what other predators they may encounter, how they determine their "home turf" of if they naturally do not being born there. The bottom line is that this argument has been presented in the past and the answer, as long as we prioritize human life, remains constant.

The Grizzly Bear Restoration Plan & Environmental Impact Statement produced by the Nation Park Service, US Fish & Wildlife, and the US Dept of Interior, seems to be mainly interested in injecting mayhem into the otherwise normal lives of the grizzly bears and into the affected lives of many humans that would be negatively impacted by such a move.

Plainly, downtown Seattle used to be owned, cohabited, and grazed by mountain goats, mule deer, grizzly bears, and others. Using the professionals' logic confirmed in the Grizzly Bear Restoration Plan, it would make most sense to release each of these species back into their homeland of downtown Seattle.

Never mind the fact that actual humans have worked for nearly 200 years to occupy, build shelter, provide security, enable transportation, and create spaces for human recreation and enjoyment. I'm sure that the grizzly bears could attend classes to ensure that they would work and live within the structure of what humans have since created for themselves in the Seattle area.

If you think this is parody then please read the report which boldly instructs, as part of its adaptive management plan, to re-educate the human population to ensure the lives of the grizzly bears are protected.

There is no human benefit to reintroducing grizzly bears into Washington State. It is arguable is there is any measurable or known benefit at all.

If the grizzly bears wanted to live in this region then they could naturally migrate here. We here in America have wide open borders so they could simply walk across the Canadian border and they could freely occupy whatever territory they see fit to take. As an apex predator, they could probably take just about any space they wanted and could make it their own.

Introduction of grizzly bears into Washington would be harmful to the existing wildlife that has developed a habitat that does not include this fierce predator.

The North Cascades National Park has a limited budget and is already stretched even without the additional load of managing a grizzly bear population. Additionally, Don Striker, Superintendent of the North Cascades Park on one hand wants to increase the number of passes into the park to increase revenue (increase revenue through passes is the story but the real reason is to leverage the number of visitors to justify additional funding politically) while on the other hand admitting that increased visitors to the park adds stress to the management and park services. This becomes particularly pointed when dealing with major medical responses and search and rescue situations.

Reintroduction of the grizzly bear would only serve to increase the already out of control regulation on Washingtonians in regards to their movement, use, and enjoyment of public lands. The Federal Land Policy & Management Act (FLPMA), 1976, has a multi-use provision which means every American including a hiker, camper, cattle rancher or energy producer has a place on public lands. The introduction of an apex predator to public lands that are otherwise relatively safe for human flourishing is counter to the human narrative. And, the introduction would open the door for even more regulation in the future when an actual human wants to use public lands for something productive because the bureaucrats will claim they need to protect the natural habitat of the Grizzly bear.

The National Environmental Policy Act (NEPA) 1969 does not include a mandate to restore grizzly bears to the North Cascade ecosystem. At best, it provides a recommendation for such consideration to be evaluated. Assuming that this suggestion is to be implemented at great cost, risk or at the cost of human flourishing is a grand overreach of anything ever intended by the 1969 Act.

Up to 500 grizzly bears may already exist in Washington state according to individual reports and official reports from Washington Dept. of Fish & Wildlife (WDFW). Therefore, the grizzly bears are currently existing, likely thriving and at least surviving. Introducing more grizzly bears to the mix would endanger both the existing and the introduced bears due to territorial issues and it would embolden people to hunt the grizzly bears. They would not be welcome by other predators and human intervention cannot be contained through the written intentions or ideas of others.

One of the stated goals of the project is to support the recovery of the grizzly bear such that it can be removed from the Federal List of Endangered & Threatened Wildlife. The issue with the current plan is that it only confirms that the grizzly would never be removed from the list because the political & charity system in the US creates an environment where funding becomes more important than the original goal of supporting a species. Because that financial opportunity is furthered by the inclusion of the species on the endangered list, species are essentially never removed from the list. Until this problem is fixed, we cannot and should not support efforts to introduce additional grizzly bears to the PNW without a plan to also protect the consumers from capitalistic efforts of charities to further themselves or of bureaucrats using the grizzly bear situation to further their political goals.

Correspondence: To whom it may concern,

I recently read the Draft Grizzly Bear Restoration Plan/Environmental Impact Statement for the North Cascades ecosystem and have a few concerns I would like addressed. First, I appreciate that there are so many positive aspects to reintroduction that would improve indigenous peoples' relations and how the reintroduction would restore ecological interactions. However, is there any plan in place to help protect these grizzly bears from human impacts like roads? Would it be possible to implement some wildlife crossings in areas where a major road intersects wild lands? I believe that it is necessary to implement a wildlife crossing to help protect grizzlies for the long term. As the population continues to grow and expand into new territories, roads are a major threat that could lead to grizzly bear mortality. These wildlife bridges could help bears thrive in their ecosystem and not be as impacted by human activity.

Additionally, by introducing bears into the area, there seems to be a higher likelihood of humans interacting with these bears. How do you plan to manage these inevitable interactions? I do not think that everyone knows what they need to do when they are in bear country. There will need to be a different standard for trash, food, and household pets. Will there be free public education on what to do if you encounter a grizzly bear and how to manage the aforementioned things? While I understand the numerous benefits of bringing grizzly bears into this area, I believe that the safety of the bears and the safety of humans need to be addressed before any introduction can occur.

Correspondence: Although I am a huge Sierra Club supporter and wilderness advocate, I do not support reintroducing grizzlies into the North Cascades. My sons and husband hike there all the time. It makes me really nervous.

When we go to grizzly areas in Montana, we can't hike. We refuse to bring guns with us.

The recent attack deaths in Canada and some of the recent deaths of hikers in Montana, are very sad. I am not sure if all areas are great to reintroduce grizzlies.

The North Cascades are being used more and more by PCT young hikers without guns. By all the younger adults moving North into the Bellingham area. All of us love getting outside. Black bears and grizzlies are totally different, and I think we need to just keep things the way they are.

Correspondence: I am not just saying "no" to introducing grizzlies to central and north Cascades, but as an avid backpacker am expressing my concern for those who enjoy backpacking in the back woods of the state of Washington. My husband and I have backpacked all of the Pacific Crest Trail in Washington, about a third of Oregon, and sections of the PCT in the Sierra Nevada Range. We also have hiked in the Blue Mountains of Oregon. We have specifically stayed away from backpacking in Glacier National Park primarily because of grizzly bears on those backpacking trails. By introducing grizzly bears to the Cascade Range, many people who would love to hike the Pacific Crest Trail might not choose to hike the PCT if it is known that they might encounter grizzlies. Even with bear spray, grizzlies are known to still attack and kill those trying to protect themselves. If grizzlies wanted to be in our Cascade range, there is nothing preventing them from "crossing the Canadian border"; This is asinine to purposely place them in an area that many, many people weekend hike and backpack. Leave well enough alone!!!

Correspondence: To the Committee considering Restoration of Grizzly Bear in the North Cascades Ecosystem, I am fervently against the reintroduction of Grizzly Bears to the North Cascades Ecosystem.

They have been known to harm people, and people are more important than the hypothetical restoration of given species to an ecosystem. Human needs and wellbeing are more important than the needs of any given non-human species, especially one eliminated by humans because of the danger they pose to humans. Perhaps consider introducing other human-centric measures to replicate the ecosystem functions of the grizzly bears, such as bounties or contests to induce human behavior with similar ecosystem functions.

Respectfully,

██████████

Correspondence: Like Oregon, you've already totally mismanaged the predator population over the past multiple decades. Banning of hounds for both black bear & cougar hunting has caused a massive increase in both species. This has caused a very high level of damage to both the deer and elk populations. It's easy enough to see if you spend any significant amount of time in the woods. Then the wolf experiment started. And as an outdoorsman, I can tell you that the wolves have expended FAR beyond what most state 'officials' are willing to admit. As a result, their impact on the deer & elk populations has been devastating. They are indiscriminate killers and, as such, need to be controlled MUCH more actively. The plan to add grizzly bears will only make matters far worse. Not only due to their impact on the deer & elk populations, but on HUMANS. Washington state residents spend a LOT of time in the wild areas of our state and introducing grizzlies is a recipe for disaster for those of us who spend a lot of time out in the wild areas, off the beaten path. DON'T DO IT!!!

Correspondence: As a 40 year resident of Alaska with 37 years spent living on a remote homestead and employed for most of that time in the guiding business, I can speak with certainty that introduction of grizzly bears to Washington State is not in the best interest of the citizens of Washington or the bears. It will only be a matter of time before disastrous human and bear encounters occur as bears become habituated to human generated food sources.

The land area of Alaska is over 9 times that of Washington, 600,000 square miles more than Washington. Even with that difference in area and living as remotely as we did ourselves and our "neighbors" had Grizzly encounters on a regular basis, even having to shoot one in my daughters sandbox. Believe me when I say that the power of these animals is, unless witnessed, is beyond comprehension and they will defend their young and food sources in a way that has to be seen to be believed. DO NOT introduce Grizzlies to Washington.

Correspondence: Honorable Federal Official(s):

Please hear and understand my opposition to the notion of Grizzly Bear re-introduction to the Washington Cascades.

It is an established fact that these huge predators pose a threat to people directly, as well as to livestock and other beneficial activities of civilized society.

It is also well known that that these predators will have a major impact on deer and elk herds. It seems only too obvious that when you increase predators, you will wind up with fewer prey, namely deer and elk.

While many citizens, probably including yourselves, think it proper to "set the clock back" and fondly try to return ecosystems to a perceived "pre-white settlement" condition, understand that your manipulation will fail to set the clock back, because the people are not going away. And they vote.

The most classic single failure of "setting the clock back" is the Marine Mammal Protection Act of 1972. Citizens are increasingly seeing the folly of this Act of Congress, though made with good intentions, has resulted in the decimation of our salmon runs. Although under reported in the news, all you need to look at is the reverse curve of salmon vs seal populations from 1972 until today. I was fishing prior to 1972, and believe me, the seal populations have exploded since then. Do the math. How many pounds of salmon do seals eat per day- vs how many seals do we have eating them? Seal depredation is the obvious factor decimating the salmon, NOT the things of civilized society.

Please do NOT place grizzly bears into the Washington Cascades. Thank you for the opportunity to comment.

Sincerely,

██████████

Correspondence: I am aware of the Grizzly Bear Restoration Plan to the Cascades. You must become familiar with history and the predatory nature of the Grizzly bear. In past history people were taught about the bears, what to do when encountering them, had guns to protect themselves (see Lewis and Clark journals as to the nature of the Grizzly) and tried to stay away from areas they were in. There were many instances of individuals being killed by the bears (which happens once in awhile today). I want to see the population of bears be strong but they should not be introduced back into areas proposed as we are a state of hikers, the Pacific Crest Trail brings visitors to our state and we are a state of campers as well as other outdoor activities. Too many people today don't respect wild animals and encounters have occurred (let's take a cute photo of myself and the bear). It is just not safe to reintroduce them here and they will roam where they wish. In the Yakima Valley we have had numerous encounters/sightings in the last 10 years and several bears have been killed by automobiles/trucks. It is not safe for the bears and it is not safe for the population and Grizzlies will end up migrating along the Cascade Range following the food chain which also moves around the range. Rats and cockroaches were native to many areas at one time but I don't think your panel would want them reintroduced to your home area. Rethink this please.

Correspondence: We are thoroughly appalled by this current administration that completely disregards the will of Washington state residents who will endure the results of the ill advised plan to release grizzlies to bring nothing but harm to people, livestock and crops. We have to wonder if the people making these decisions live anywhere the grizzlies will be released or if they're safely hundreds of miles away. This is one more reason to rid ourselves of a totally incompetent administration.

Correspondence: The grizzly bear was honored, not worshiped by the Okanagan Indian People, so don't use us and tradition in the same sentence. The grizzly bear kills sometimes just to kill, it does not just eat vegetables like the environmentally conscious believe. It has a 500 mile home range and there is no place in this State with that much land with not people on it, anywhere. The bears can not read or write and signs do not detour them from going where they danmed well please. You should put them into King and Pierce Counties where the politicians who want grizzlies. We the people on the Sunny side of the Cascades are only 15% of the population on 85% of the land in this State. All that we say and do to protest this goes to a place called "no where". The cattlemen, farmers, sheep men, hikers, bikers, recreationalist will all thank the 85% of the population living on 15% of the land, for "Giving us the Grizzly Bear". I am Arnie Marchand, an Okanagan Indian and a Member of the Confederated Tribes of the Colville Reservation.

Correspondence: I am against the reintroduction of Grizzlies to the State of Washington. I oppose reintroduction of Grizzlies due to lack of habitat, threat to livestock, threat to humans and lack of scientific study about how the reintroduction of wolves have impacted our ungulate populations. Every year I read about negative encounters between grizzlies and livestock/humans. As a lifelong Washingtonian and a member of a rural volunteer fire department I do not want to have to respond to a medical call where a fellow Washingtonian is barely alive because of being mauled by a grizzly. Aldo, as an avid hunter I have had encounters with wolves and grizzlies in the Sinlahekin (GMU 215). I am sure that our local ranchers will suffer catastrophic losses if grizzly numbers are increased due to reintroduction/relocation. I have video and photos to share.

Correspondence: As a private citizen I am writing to comment on this Grizzly Bear Restoration issue. As a lover of all wild life and supporter of bears, mountain lions, and elk, et el; and love seeing all of them in their own habitat, it occurs to me that our eco system might not be able to support the reintroduction of these bears into our Cascades. Where I live we are already experiencing the concern of brown bears, especially a. momma and her cubs roaming our neighborhoods that are not so ' rural' and hear that euthanizing them was an option to rid us of their threat, did not make sense. In fact it infuriates me. Surely there are other ways to move these animals away from the cities. SO how does bringing in Grizzly bears help us and the threat they would bring to any and all wild life to say the least the threat we are to them once they do damage to us??? This is ludicrous, as in foolish and unreasonable, on any and all levels. So I opt for Plan A; do not reintroduce these animals to our woods.

Correspondence: We dont live very near the proposed re-introduction site(s) but we frequently do hiking and walking in the general areas where reintroductions are proposed. Sometimes it is rather scary to think about predators already in the areas. Just imagining what might happen if we encountered a grizzly bear is almost too much for us who are both part of the over 70s crowd. So not too fast on our feet. In addition, we fear for those farmers and livestock raisers that would have to invest in extra protection for their charges and on whose safety depends their livelihood. We are also imagining that many cash crops would look like an easy feast for a hungry bear. AND you must be aware

So, we say: "just say no" to re-introductions of grizzly bears in WA cascades areas. It is a foolish idea and you can be sure there will be unhappy events if the plan actually proceeds. Do you want those unhappy events on your conscience? Again, JUST SAY NO.

thx,

Correspondence: I wholeheartedly support the reintroduction of all brown bears/grizzlies into Washington state. As a lifelong Washingtonian and avid outdoors person, I have no concerns over reintroduction. Historically, humans have negatively affected the environment with removal of native species. It is now our job to try to restore the balance. The arguments against the Grizzly reintroduction are exactly those (ill-advised) arguments of the groups who have opposed the reintroduction of wolves into previously wolf-inhabited spaces. But wolf re-introduction has been a resounding success in almost every instance- the balance of nature NEEDS these predators.

The earth and nature do not exist for the sole purpose of supporting humans. Humans are just one of many species which need to live in balance in order to promote healthy ecospheres. Reintroducing grizzlies is one small step we can take toward recreating balance. Please release the bears.

Thank you,

Correspondence: I am writing in support of the restoration of grizzlies to the North Cascades. The restoration must be done in ways that don't violate the Wilderness Act and harm the area's wilderness character. This is good for bears and Wilderness. Both of the action alternatives as they now stand would violate the Wilderness Act. The action alternatives should be modified to avoid helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and steer clear of heavy-handed management of bears. There are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites without the use of helicopters inside Wilderness. I oppose the use of a 10(j) rule for the grizzlies in the restoration work. This would mean grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana would be taken from their homes, dropped into the North Cascades, and lose their previous protection.

For the long-term success of grizzly restoration, natural recovery measures must also be included in both action alternatives thus reducing the need for wilderness degrading activities that are also ultimately bad for bears. This requires work with partners in British Columbia to ensure that grizzlies have corridors to move back and forth across the international border and to prevent a small North Cascades grizzly population from shrinking over time and becoming inbred. An alternative that combines natural recovery with population augmentation under full ESA protections should also be analyzed.

Correspondence: This planned reintroduction seems inevitable. It is ill conceived and makes no sense to anyone living in non urban areas of Washington. This is another feel good plan conceived by people that live in western Washington cities where they will not be affected by this plan. There are already plenty of these bears living in areas that have them. We do not need this. I suppose that if we could bring the dinosaurs back these same feel good people would want them living in areas that does not affect them. It makes no sense to take a chance that these bears would kill people and livestock if confronted by them. Enough said.

Correspondence: My name is Steve Oien and I am writing to voice my support for Alternative C in the Draft Grizzly Bear Restoration Plan / Environmental Impact Statement, North Cascades Ecosystem NCE. However, I do have some concerns regarding the 10(j) rule. The rule recognizes the need for federal, state and tribal agencies to manage Grizzlies should conflicts arise, but I would like lethal take to be limited to local management agencies and not private citizens.

I am a fourth generation native born Washingtonian. When my ancestors first arrived in Washington, Grizzly bears existed in abundance and were part of the ecosystem. I would note too that the original native inhabitants of Washington coexisted with Grizzlies from time immemorial. I have also been an avid backpacker, day hiker, and cross-country in the NCE for over 50 years. Finally, I own a home in Mazama, Washington.

I feel it is essential to restore Grizzlies to the NCE where feasible. It is necessary to make this ecosystem whole once again. The North Cascades contains some of the best habitat for the bears in the lower 48. The ecosystem includes over 9500 square miles of mostly public land that is ideal for restoration. It is highly unlikely that Grizzlies will return to this ecosystem in suitable numbers on their own to rekindle a viable population. Proactive reintroduction is required. I would note too that all evidence indicates the NCE will continue to be excellent habitat for Grizzlies even under changes that are likely to occur in the coming years from climate change.

I understand the concerns that some may have regarding potential conflicts between humans and Grizzlies, as well as potential conflicts with agricultural land owners. In fact, for many years I was opposed to reintroduction of Grizzlies because of my own concerns for conflict. However, after studying the issue and also doing some hiking in Glacier National Park I came to realize that conflicts are extremely rare and that there are steps that can be taken to minimize the possibility of

conflict. Put bluntly, Grizzlies have a natural aversion to human contact. By following basic guidelines that have been time tested, recreationists and agricultural interests can avoid conflicts. And in situations where conflicts become too problematic, the 10(j) rule provides adequate leeway to address Grizzlies that may become habituated and dangerous.

I am hoping proactive action will be taken very soon to reintroduce Grizzlies to the NCE.

Correspondence: As a part time resident and property owner near Mazama, Washington, I am concerned about the Draft Grizzly Bear Restoration Plan/Environmental Impact Statement. We enjoy hiking, skiing, mountaineering, and mountain biking in the release areas designated in the proposed reintroduction area. We have a deep appreciation and respect for

wildlife and the ecosystem that sustains it.

There is concern about the necessity and cost benefit of the program in general. It is documented that Grizzly bears are currently migrating into this area from British Columbia and Idaho. Though the growth rate of the Grizzly population may not be as quick as some would prefer, we do not believe the cost of the reintroduction plan a wise use of tax revenue.

In reviewing the plan for Capture, Release and Monitoring, helicopter transportation is recommended but if not available, the bears would be transported by vehicles and released on or near a road. This is contradictory to the site criteria being described as "Being more than 1 mile from any maintained designated trails or roads" on page 28. Additionally, there are very few (if any) roads in any of the three proposed release areas. Based on this limited access to the backcountry, these roads tend to be frequented by recreationalists. Any bears released near a road would likely encounter humans after the area closure is lifted.

This area is popular for backcountry recreation. Many miles of the Pacific Crest Trail run adjacent to or directly through the proposed reintroduction area. There are many campgrounds near the area that are typically full of campers from Spring - Fall. The plan states that the bears would not be released within one mile of a campground. This does not seem nearly enough of a buffer to prevent human interaction with a bear.

We don't believe the plan is needed nor can it be successfully executed.

Correspondence: Okanogan County is blessed with deed backcountry that is already the home of substantial wildlife. Natural lands have been attacked by many forest fire from which recovery is very slow. Fire damaged trees are diseased and permits to log out the damaged timber are not issued. Mother Nature is struggling to support the existing animal base.

I attended the Grizzly Meeting this week in Okanogan. That meeting was advertised to begin at 5:30 and end at 8:30. The moderator announced the meeting would not begin until 6pm, that speakers were only allowed 2 minutes and the meeting would end at 8pm. A full hour of the scheduled time was taken.

At 6pm 2 politicians and one wildlife worker were allowed to speak. The Department of Wildlife did not state their position or present information to the group with the exception of a row of pre-printed brief informational signs.

The targeted wilderness areas are bordered by the farms and ranches that feed you. I live very close to border of the northern target area. My family has watched the massive reduction to wildlife when wolves were moved in as well as the loss of livestock.

This county is yelling NO to grizzly bears. As am I. NO.

Correspondence: Thank you for the opportunity to comment on the North Cascades Ecosystem Grizzly Bear Restoration Plan/Environmental Impact Statement.

I do not support efforts to reintroduce grizzlies into the North Cascades. Wilderness experiences involve risks of harm, yes, but almost entirely of our own making, such as hypothermia and falls. These are largely controllable by thoughtful planning and good judgement, offering a terrific learning environment for adolescents, in particular. Grizzlies, on the other hand, are not controllable and all encounters are unpredictable.

Wild temperate evergreen forests were my second home as a young adult. I spent weeks at a time travelling the magnificent wild spaces of Washington, in roles including search and rescue, guiding group trips through the North Cascades, igloo-building, cross-country ski trips, and more.

These trips provided multiple opportunities to share my vicinity with black bears. All meetings, happily enough, have been mutually respectful.

My closest encounter was when I was alone on a trail near Ross Lake (in the heart of the North Cascades), and I am extremely grateful he was not a grizzly. That day, I was hiking with two younger companions circling Hozomeen Mountain, a ten-mile trip, while the rest of our group canoed the section of Ross Lake between our campsites.

I was alone when I met the bear because I had been stung by a hornet an hour before, about two miles from our destination. I was concerned that the sting might incapacitate me since, in the months just prior to this trip, I had been stung multiple times and was experiencing progressively worse reactions with each one. The most recent sting caused severe swelling of the entire limb, together with nausea and chest tightness. As a developing condition for me, I had not yet considered the possibility that I might be stung on a hike, far from medical care, until it happened. After this Ross Lake trip, I got a prescription for an anaphylaxis kit which I carry with me to this day.

The two people with me that day were not fast hikers, and certainly could not carry me, so I left them to follow as quickly as they could and hiked rapidly to close as much of the gap between me and the campsite as possible, where help could be reached if needed.

After rapidly hiking most of the way out, it was clear that I would be able to reach the trailhead under my own power, so I stopped to wait for the others in the silent forest. Some minutes later, a large black bear came walking up the trail towards me, completely unaware of my presence. When he was about thirty-five feet from me, I yelled with all the volume and assertiveness I could muster. He paused and lifted head up, sniffing the air to locate me. We both stood still, and my heartbeat grew very slow and very strong, filling my body with adrenalin as I mentally considered my next step. I knew I could not outrun him. I knew I could not outclimb him. I had nothing but a comb in my hand and no coat to make myself appear large and powerful. I could threaten him by advancing on him, but my legs mutinied, absolutely and unequivocally refusing to move closer.

I yelled again, and still he stood there. It was only when my hiking partners higher up the trail heard me and yelled back that the bear finally decided to exit stage right. I watched him bound effortlessly up and over the side of this steep ravine in a display of awesome power. After we rejoined our companions at the lake that evening, their response to our story was that "We had all the fun."

Interestingly, epinephrine shots for stings are a synthetic form of adrenaline. After the bear-provided adrenaline burst, I experienced none of the massive swelling that followed prior stings. (Hmmm. Could a first aid option - of very last resort and where no other help is available - for a person who is experiencing anaphylactic shock be to absolutely terrify them?)

If this bear or any of the others whose paths I have crossed had been a grizzly, a somewhat amusing story could very possibly have had a darker end. The fear alone of grizzly attacks could dissuade people, especially younger people, from experiencing the mental and physical well-being offered by wilderness.

The forests of Washington are crisscrossed by trails. Thousands of responsible recreators find health and joy and spiritual recreation in those spaces every year. The odds of grisly encounters between grizzlies and humans are likely. Let us learn from the attacks occurring now in other states.

There is enough pain in this world already. Why would we knowingly increase it by introducing grizzlies into Washington state? Please spend our limited public funds on other worthy wilderness activities. Thank you again for the opportunity to comment on the North Cascades Ecosystem Grizzly Bear Restoration Plan/Environmental Impact Statement.

Correspondence: I wholeheartedly agree with the proposal to reintroduce grizzly bears to the Northern Cascades in Washington State.

The bears were here LONG before colonial settlers came through and drove them out / killed them off. Just because an animal has the potential to do harm doesn't mean we have to right to eradicate them from the land. They are an invaluable member of the ecosystem just like wolves and other predators. They evolved here and have every right to live in their natural environment.

Also, many other communities to the north live with bears and other dangerous wildlife at much closer quarters, and they are all managing to coexist. There is no reason to think Washingtonians can't accomplish the same feat, especially considering how long it would take after introduction for a significant bear population to develop. Plenty of time to educate farmers and the communities close to the mountains how to properly engage with wild bears they might encounter.

Correspondence: I don't think any one has really thought this through yet. Like the wolf introduction to Washington state they are ow everywhere here in okanogan county an they are a constant threat to our community up the tunk creek area.and they do kill live stock an the deers population has been devastated. I don't think the grizzly bear will stay in the cascade range for long term,but will expand it's territory on it's own and I don't have any faith that the government will deal with the problems that it will cause,, but would only worsen the problem they have created.

Correspondence: I think it is extremely important that we restore biodiversity to Washington's wildernesses. Grizzlies are no exception. We need Grizzlies in the North Cascades to help stabilize the ecosystem and right our previous wrongs of human caused extirpation from this ecosystem. These large predators should not be disallowed due to inconvenience for hikers, rancher, hunters, farmers or anyone else; no animal should be disallowed in its natural environment due to inconvenience. Yet we see us due this to wolves, bears, elk, bison, beavers, and other native animals. As a hunter, fisher, hiker, and advocate for wild places; I want it to be clear that true sportsmen and women are in favor of wild things living in wild places without exception and don't pick and choose which ones. As a hunter I do not have a vendetta against animals, but rather reverence for their importances and what they provide. Please help restore North Cascade grizzly population through augmentation.

Correspondence: Please do not reintroduce grizzly bears to the North Cascades of Washington. I enjoy hiking, biking, and four wheeling in the North Cascades with my family. It is a beautiful and rugged area that presents many risks without adding grizzly bears to the list. I would not want to worry about the safety of hiking and biking in grizzly bear territory, especially with my kids. We love visiting Yellowstone specifically to try and see grizzly bears and I am always grateful once we leave their territory and I no longer have to worry about running into one on a trail. It is especially scary to be mountain biking at high speeds with the risk that a grizzly might be around the corner. As an avid mountain biker, this would pose a significant

risk. I see no reason to reintroduce the grizzly to our area as there is little to no benefit to the ecosystem at this moment in time. With PCT hikers, an active outdoor community that is delving into the wilderness year round, and small communities in the area it will only result in more human to bear interactions that put lives at needless risk. Please do not put grizzly bears back into this region.

Thank you,

Correspondence: I have been hiking and climbing over 30 years and was a long time member of the Mountaineers where I led scrambles and climbs. I have seen my fair share of black bears and while encountering any bear is exciting we as hikers know how to react to black bear sightings. Grizzly bears on the other hand are incredibly territorial and aggressive. Grizzly bears are to be avoided at all costs. I've done my fair share of hiking in Canada as well and I can tell you that the rangers there actively patrol the trails and when a Grizzly bear is in the area the trails are closed.

Allowing Grizzly bears in the Cascades will put hikers in danger and will also add to the cost of the National Park Rangers and the State Park responsibilities to ensure Grizzly bears are tracked and that the trails are closed when there is a Grizzly bear in the area. The cost will be high to both potential loss of life and to Rangers responsibilities and work assignment. I don't think we can afford for either eventuality and I would respectfully ask that you reconsider introducing Grizzly bears to the Cascades.

Respectfully yours,

Correspondence: I'm delighted to see that grizzly bears will be reintroduced to WA state. The Department of Fish & Wildlife cleared our state to be available for grizzly bears to be brought back. Your cries about any risks to livestock are invalid. Because ANY animal can be a predator to livestock, including dogs. And I suppose you will next introduce legislation to ban dogs from the state. It's irrational. Being a farmer or rancher comes with risks of predators. That's just part of doing business. My father was the biggest potato farmer in WA state in the 1980's. He knew the risks of crops being eaten by animals. And my parents were both very anti-hunting. Hunters were angry that he wouldn't allow hunting on our farmland and even claimed that they would be doing us a favor. But my dad stood strong and true to his morals. Rabbits, deer, etc., were often on our farmland and my dad said that was just the cost of doing business. So quit crying foul.

Correspondence: Please reconsider your desire to introduce more Grizzly's into the North Cascades. We currently have Grizzly's in the eco system, and do not need to artificially add to the population. Ungulate populations are down due to a number of reasons, but wolves and cougars are a contributing factor. Another apex predator will not help the elk and deer. Since we have Grizzly bears here now, why not let them be. If conditions exist to further their population, let it happen naturally. There is no need to bring in additional animals. We already have a wolf and cougar problem, we certainly don't need a grizzly problem. Quit screwing with Mother Nature!

Correspondence: I have watched the lack of management on our local wildlife which has been diminishing in number for years except the unmanaged wolves. The habitat also has not been managed or maintained which has a lot to do with management for "natural occurrence" such as fires that have ravaged our valley and forests. What makes you think the bears can survive when none of the living animals they eat or vegetation they eat is a stable food source? Local fish and wildlife will not be allowed to make judgements on how to manage and the bears will either move, start eating domestic livestock and people or starve to death. Only a matter of time before all three scenarios play out because of previous mismanagement of the habitat bears need to survive. You are only creating a larger division between the people and government by forcing problems up on us. At some point people will retaliate and hopefully at a bear not the people who put them here. As the former commissioner said the three SSS's will come in to play and your population will not stabilize.

Correspondence: I live and work in Loomis, WA near the eastern edge of the proposed grizzly bear reintroduction area. I manage a large cattle ranch where we raise genetics that are the basis for one of the premier brands of beef in the World. Our cattle graze on private, state, and federal land throughout the year. We make great effort to be good stewards of the land and animals that we use in our operation. As a result, wildlife in the area also benefit and thrive. However, with an increasing predator population brought about by the reintroduction of wolves, the large game population has been steadily dwindling over the past several years. As the ungulate wildlife population dwindles and concentrates in the valleys where predators are more weary of human presence, the predators turn their attention to livestock instead. With the restrictions in place because of the current listing status of the gray wolf in our area, there is very little we can do to reduce the conflict between them and our livestock. It seems the alternative that is being forced upon us is to go elsewhere to raise cattle, which would mean selling our private ground most likely into smaller parcels that would further fragment habitat and increase human population in the area. Now, another predator is being proposed that would further stress the wildlife carrying capacity. It is only obvious that this would lead to more of our livestock being used for prey. Some of the genetics in our herd we have been developing since the late 1980s, and losing some of our key animals can cause setbacks that take decades to recover from. Unfortunately, much of the area of the North Cascade is not habitat that supports grizzly bears year around. Historically, mostly before settlement, the bears could roam into the valleys when wildlife migrated out of the mountains. Now the valleys are all populated, so that natural migration is only going to lead to bear/human conflict. I find it ironic that one of the few confirmed grizzly bear sightings in the recent past resulted in the bear being trapped because it was getting into someone's chicken coop near Colville. If grizzly bears are really that rare in the area, what will happen when we artificially increase the population? Will there be enough chicken coops to feed all of them? Or will some branch out into the finer cuisine of beef tartar? Or even worse, people trying to live and work in the area?

I feel giving the area and the reintroduced animals a "status will not really help much. As evidenced from the wolves, in the end litigation is what drives the decision as to how the animals are managed. We have heard all sorts of promises as to what will happen when there are wolf/human conflicts, yet few of them ever come to fruition because of lawsuits or threats of lawsuits. Even if we believe USFW and NPS are genuine in their management intentions, they will most likely be taken out of their hands by the court system at some point. That is a reality that can not be ignored in this

situation.

Most of the people that are in favor of reintroducing grizzly bears in the North Cascades are individuals that will have the choice whether or not they want to interact with the species. They simply use the area for recreation. I do not have that choice. My livelihood depends on me being outdoors in remote areas on a daily basis and often alone. When my crew or myself are going around fence or fixing a water trough, it is not always easy to be attentive enough to realize you are in the middle of a bear's living room. I realize the probability of an attack is low, but the fact is it still exists and is not something that I want my employees to have to face.

I strongly encourage you to not artificially transplant any grizzly bears into the North Cascades. It is not the right time or place for such and endeavor and will only lead to more problems for both bears and humans.

Correspondence: I have two concerns:

First, that not all Washingtonians are fans of dangerous wildlife in our forests. I recall what happened to wolves introduced here and how certain packs were poisoned and hunted down to the last wolf cub. No one is concerned with cougars because they are so good at hiding from people, that people forget about them until one turns up in Discovery Park, or chases them during a mountain bike ride. Since it is a case of out of sight, out of mind, all predation is immediately assigned to wolf packs. If grizzlies are introduced, they will become

the new cattle killers. The first problem, then, is the people who have vested interests in not having their cattle killed or their hikes ruined, or just worrying about a picnic being interrupted by a large, dangerous animal.

The second problem is the people who feel that the forest is just an extension of their suburban backyards, that proper administration of natural areas includes exclusion of all dangerous wildlife. These are the people who bring their chihuahuas along on hikes. They don't understand the purpose of natural areas and they think that forests owned by the public will naturally be safe for the public.

Dealing with these two populations and their diverse knowledge and prejudices has to be done sensitively but firmly. Invite them to see the wildlife, but leave their AR-15s at home.

Correspondence: I oppose the proposed plan to reintroduce grizzly bears to the North Cascades. This area is a heavily trafficked area for hikers, backpackers, and campers. Introducing them will almost certainly cause dangerous situations to arise for unprepared hikers and perhaps prepared hikers too. Grizzly bears are much more dangerous and many people avoid going places where they are, leaving the North Cascades without them would ensure there aren't unnecessary lives lost-both human and animal. I understand that conservation efforts are really important however, this is not the place or the state to do this in.

Correspondence: I urge you to adopt option A.

I live on lands that directly border the reintroduction area without any civilization or barrier. I have young children. I've experienced the difference between grizzly country and non grizzly country. Let them come down from Canada if they wish but please don't spend precious resources reintroducing what is certain to result in grizzly human interaction and conflict. It's just a matter of time if you proceed.

Thank you for reading.

Correspondence: Restoring the grizzly bear population to the North Cascades ecosystem is the correct thing to do. It ensures that a totally functioning ecosystem is maintained. A fully functioning ecosystem supports all animals and plants and is the correct action to take which allows people to coexist with nature.

The grizzly bear has the right to live and thrive in areas where it traditionally roamed. As the human population expands into areas where the bear lives encounters will occur, but these do not have to be negative interactions. In fact, they can be positive encounters where bears are observed just being bears. From personal experience, I backpacked for three months in Yellowstone National Park covering many hundreds of miles of trails in the back country. I had encounters with grizzly and black bears on a regular basis but never a bad interaction. Grizzly bears typically do not want any close contact with humans. I had more problems with mosquitoes rather than bears.

Villainizing grizzly bears is a common tactic by many people including our elected officials. This stance is usually a result of being uninformed. Cherry picking data that incorrectly depicts the bear population as a human predator.

Boosting the current grizzly bear population in the North Cascades is the proper thing to do. Keeping the population numbers healthy will help the ecological system thrive to the benefit to all.

Correspondence: I strongly support the National Park Services preferred Alternative C: Restoration with Endangered Species Act Section 10(j) Designation.

This plan will both effectively restore grizzly bears in North Cascades National Park and give people the tools they need to thrive in and around grizzly bear country. Grizzlies belong in the North Cascades, as they enhance the park's ecological integrity and contribute to its wildness.

Grizzly bears play a vital role in maintaining ecosystem balance, cycling nutrients, dispersing seeds, and changing the behavior of species around them. Restoring them would benefit the park and the people who use it.

A restored population of grizzlies will boost the park's appeal and attract nature enthusiasts, scientists, and tourists from around the world. This would provide economic benefits to local communities and support the park's mission to protect park resources in perpetuity.

Alternative C, with the 10(j) rule, provides managers flexibility to address community concerns while protecting the grizzly population. It ensures coexistence between humans and bears.

Please consider the positive ecological and economic benefits and support Alternative C. Restoring grizzly bears will secure the park's natural heritage and conserve an iconic species for current and future generations. Do not murder these beings. You reintroduce them only to be murdered because their populations are thriving bullshit. Yall slaughtered wolves that were reintroduced as if humans know how to manage wildlife.

Native Americans know how to live beside them. They dont need to kill these beautiful animals.

Thank you for your dedication to our national parks.

Correspondence: Dear Superintendent Don Striker and Supervisor Brad Thompson,

I am writing to support the restoration of a healthy population of grizzly bears to the North Cascades, their home for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations.

I support Alternative C: Restoration with Section 10(j) Designation. The proposal would bring up to 25 non-problem grizzly bears into remote areas of the North Cascades over the next decade and manage them as an experimental population.

Alternative C is the best choice for bears and the people who live and visit the North Cascades Ecosystem. The plan is wisely modeled on what's worked in Montana where grizzlies are recovering in the Cabinet-Yaak mountains with few problems and with the acceptance and involvement of local communities. Furthermore, the 10(j) rule will give people more management tools to reduce, prevent, and sometimes respond to human-bear conflict. I believe that the 10(j) rule if properly implemented, will help increase human acceptance of grizzly bears as they return to the landscape.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. As a resident of Twisp and someone who spends loads of time roaming the forests and crags of the North Cascades, I welcome the return of this keystone species to our shared home. Please bring back this native species to our state through the strategy laid out in Alternative C. Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

Thank you for taking the time to keep our North Cascades wild!

Sincerely,

Correspondence: The Grizzly belongs and is a normal part of a healthy Cascades Ecosystem and I'm all for the reintroduction!

Having said that, experience here in the Northwest with sea lions has demonstrated that any plan to protect or introduce a species which can become a problem needs to include a means of dealing with problem animals. Lacking this, the public will not support the measure.

I'm one of probably less than 1,000 living people who have seen a Cascade Grizzly (Mother & Cub on the south side of Glacier Peak in 2003). The encounter ended well for both my nephew and I and the grizzly family.

Again, I want this iconic animal restored to the Cascades but with controls in place to deal with problem bears.

Correspondence: I do not support reintroducing the grizzly bear in the north Cascades. I frequently hike and backpack in the area with family from Seattle and would no longer do so if there were grizzly bears. With the large city of Seattle nearby, many people would be unprepared to deal with an aggressive bear like the grizzly. Just a simple day hike into the woods from a dense urban environment would be dangerous. There will be much uproar every time an encounter with a grizzly goes bad. I don't think it will fare well with the grizzlies or humans to have the bears reintroduced in such close proximity to a large dense urban area.

Correspondence: I support the reintroduction of grizzlies into the North Cascades. As a small farmer in Okanogan, WA I feel it is my responsibility to work with nature whenever possible, for the benefit of the plant and animal species that find a safe haven in our orchard, and for my own wellbeing. A human-centric approach to farming, focusing on gaining the most profit, is not in my best interest in the long run. I want my daughter to hear a diversity of songbirds, to see healthy deer populations resting in our orchard, and occasionally see a bear passing through on her path to the river. Similarly, a grizzly bear population would restore ecological balance in the North Cascades and allow these species to survive further into our shared future.

As a hiker who often takes backpacking trips into the Pasayten Wilderness and North Cascades NP, I also feel that the possibility of grizzly bear populations would only enhance my experiences. Being a part of nature is who we are as humans and we have to treat natural spaces with respect, to honor the gifts the land gives to us, and share.

Thank you,

Correspondence: i believe reintroduction of the grizzly bear is long overdue. as the major apex predator, the bear is most important to restoring a natural ecosystem in the north cascades.

observing how the hunters have been the most vociferous against wolf reintroduction---hiding behind their role as farmers---
- minimal livestock losses, etc---it's time that we recognize that this federal land is 'our' land, and do what's right. there was strong resistance to the redwood parks in california, too---but they are our country's gems, now.

i strongly support reintroducing the grizzly bear!

Public opinion polls have shown over and over again broad support for grizzly bear restoration in the North Cascades of Washington, including among those who live in the area. Please bring back this native species to our state through the strategy laid out in Alternative C. Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

Introduction of grizzlies is necessary in the North Cascades ecosystem. Grizzly bears lived in the Washington Cascades for thousands of years until extirpated in the last century. We still have a small relict population in the Selkirk Mountains of northeast Washington. However, currently, there are no grizzly populations in the United States or Canada that are large enough or close enough to serve as a source to naturally repopulate the North Cascades.

Thank you for doing all you can to keep our wild North Cascades a "back to the future" home to the magnificent grizzly bear!

Correspondence: As a significant property owner and resident in the Lake Wenatchee area of North Central Washington I do not want 'imported' Grizzly Bears in NCW because they arrive as angry, thus very dangerous, bears due to being trapped, sedated, and the effects of being caged and transported.

In my lifetime travels I have resided in Brown and Black Bear country and observed both species to be quite peaceable critters so long as a human being does not interfere with their activities. From other people's stories about living in Grizzly Bear country I assume naturally present Grizzly Bears to be no worse than Brown and Black Bears.

And, contrary to popular research, I have now and then observed signs of large bears, Brown or Grizzly, in the White River Valley, above Lake Wenatchee, since the early 1950s.

Correspondence: Grizzlies belong in the North Cascades. They were there before the colonizers. The Indigenous knew how to live with them. So should whites. And the restoration of the grizzlies should be done in such a way as to not violate the Wilderness Act. Helicopters? Please! And do not move grizzlies that are already protected under the ESA. There are no so-called 'extra' bears that can be moved from Montana. Leave the grizzlies alone. Let them recover themselves. It is the colonizers and the fearful that need help, not the bears.

Correspondence: I am writing to support the plan Alternative C and the proposed Section 10(j) Rule for the management of grizzly bears. I understand that some may be opposed to introducing these animals into the area. That they are fearful of the bear. However, if we look at the big picture the bear has much more to fear from us than we from them. If we have any hope to maintain any areas balanced in nature, we must have areas where large predators can exist. We have taken so much from nature, it has little left. Do we want to at least maintain some species or continue on the path of extinction? Please support alternative C and give conservation a chance to protect this species, and many more.

Correspondence: I fully support the restoration of grizzlies to the North Cascades. However, the restoration must be done in ways that do not violate the Wilderness Act. In other words, the restoration project must be as minimally intrusive as possible. Currently, both action alternatives would violate the Wilderness Act. The action alternatives need to be substantially changed as follows:

1. Helicopter landings and flights in Wilderness need to be avoided. There are roads adjacent to the Wilderness areas that can provide release sites for the bears without needed to use helicopters.
2. It is essential that the plans do not involve much hands on human management of the bears such as radio collaring, drugging the bears, etc.
3. I oppose the use of a 10(j) rule for the grizzlies in the restoration work. This would mean grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana would be taken from their homes, dropped into the North Cascades, and lose their previous protection. Montana grizzlies are not yet recovered under the ESA, and any dispersing grizzlies from Glacier or Yellowstone are needed to naturally recover areas like the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest.
4. A natural recovery alternative should be fully developed. Natural recovery solutions should be favored over active repopulation. This would decrease the need for activities that will degrade wilderness which are in the end bad for bear populations. This will require work with partners in British Columbia to ensure that grizzlies have corridors to move back and forth across the international border and to prevent a small North Cascades grizzly population from shrinking over time and becoming inbred. I would also endorse an alternative that combines natural recovery with population augmentation under full ESA protections should also be analyzed.
5. Both action alternatives should include the Bear Smart components that are in the no action alternative. All measures should be taken to ensure that humans populations and bear populations can coexist with minimal interaction and harm to both species.

Correspondence: I am writing in support of the no action alternative. I grew up hiking in the north Cascades from the early 1960's. I also have spent much time in the greater Yellowstone eco system where the grizzly population has increased during my lifetime. I understand the importance of a balanced eco system and the historical significance of the Grizzly population in the North Cascades, I have also witnessed significant issues, including friend's who have had serious encounters with Grizzlies - including loss of life. I myself have also had serious encounters so my concern does not come from theory but actual experience. Unfortunately, grizzly and human populations do not go well together so any active reintroduction efforts

should be limited to remote wilderness areas which limit protentional dangerous interactions.

I do support the natural growing of habitat areas but I do not support active reintroduction efforts which would accelerate bear-human interactions.

The main impact that I have observed and personally experienced is increased reluctance to explore, hike, climb, bicycle and generally recreate in our local outdoors. At a time of increased stress, depression, obesity, and isolation, recreation in the outdoors provides everyone - no matter their background - an equal opportunity to experience rejuvenation, peace, and happiness. Reintroduction of grizzlies would result in fewer people getting outside and experiencing our unique precious public lands.

Correspondence: I will start by saying I enjoy seeing bears from a distance. I have been to Brooks Falls and have seen the Grizzly bears up close and personal in their home environment. I am also a hiker who hikes in the North Cascades and I understand the risk to both humans and bears of introducing grizzlies to the region. The North Cascades is a beautiful region of Washington. I hike alone, and I believe it is risky to introduce brown bears to a region where hikers often travel solo. Traveling solo in bear country is risky business, and there are many places in Montana and Idaho and Wyoming I won't go solo due to the grizzly risk. I am opposed to reintroducing grizzly bears to the North Cascades, as I believe that t willow lead to unwanted conflict between humans and bears.

Correspondence: The U.S. National Park and Fish and Wildlife Services are proposing to reintroduce grizzly bears to the North Cascades National Park and ecosystem (NCE) situated in north central Washington State. The NCE is a historical habitat of the grizzly bear.

As I understand the proposal, just a handful of bears (3-7) would be relocated to the NCE each year, with a decades-long (60-100 years) goal of 200 grizzly bears in the NCE.

The area of the NCE is approximately 9,800 square miles, or 6.1 million acres, comparable in size to the state of Vermont. If the goal is achieved, that would provide about 50 square miles, or 30,000 acres, of habitat for each animal.

It has been estimated that, in 2018, British Columbia (BC), Canada had a population of 14,925 grizzly bears. Report, BC Ministry of Forests, Lands, Natural Resource Operations and Rural Development (April 2020). In an almost 40 year period (1960-97), only 41 grizzly attacks on humans have occurred in BC. Ursus, Vol. 11, A Selection of Papers from the Eleventh International Conference on Bear Research and Management, Graz, Austria, September 1997, and Gatlinburg, Tennessee, April 1998 (1999), pp. 209-218. If one estimates the area of BC to be 364,763 square miles (Google search), each BC bear has access to 50% less habitat than a NCE bear.

Grizzly-human conflict is neither foreordained nor inevitable. The small population proposed, and the expansiveness of the NCE, should make grizzly-human contact infrequent, and risk of human injury or death miniscule.

We, as a species, are destroying Planet Earth. We should make every effort to attempt to rebalance the scales for the species with which we share the planet.

I support the reintroduction of grizzly bears to the NCE.

Thank you for your consideration of my comments.

Correspondence: I support Alternative A.
I do not want grizzlies translocated because I feel this would only be setting them up for failure, mainly due to potential human/sheep/cattle conflicts where the grizzly would lose in the end. If there was a rule that would not allow a grizzly to be hunted and killed due to a conflict with a human or sheep/cattle that would be a different matter and I would support it, but in this day and age of politics and with the wolf conflicts ongoing where the wolf typically loses in the end I don't want this to happen to the grizzlies. Protect them where they currently exist!

Correspondence: I am writing to support the restoration of a healthy population of grizzly bears to the North Cascades, their home for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations.

I have a cabin at the foot of the North Cascades in Mazama, WA where I spend about three months a year. I would love to know that healthy grizzlies also call this mountain range home.

I support Alternative C: Restoration with Section 10(j) Designation. Alternative C is the best choice for bears and the people who live in and visit the North Cascades Ecosystem. The plan is wisely modeled on what's worked in Montana where grizzlies are recovering in the Cabinet-Yaak mountains with few problems and with the acceptance and involvement of local communities.

Furthermore, the 10(j) rule will give people more management tools to reduce, prevent, and respond to human-bear conflict. I believe that the 10(j) rule if properly implemented, will help increase human acceptance of grizzly bears as they return to the landscape.

Thank you for considering these comments and doing what's right for grizzlies, our ecosystem, and future generations.

Correspondence: I am opposed to introduction of Grizzly Bear into the proposed area. There are already Grizzly bears in the area and others roaming in from the North (Canada) as history and current findings have shown. We do not need to bring others into this gene pool. We further do not need to increase the predator population in this area that is being managed for increasing and sustained wildfires. This management decreases the habitat and populations of pray species that do not need another predator. Leave this area alone and let it naturally evolve!

Correspondence: "A Society grows great when old men plant trees whose shade they know they shall never sit in";

I strongly support the National Park Services preferred Alternative C: Restoration with Endangered Species Act Section 10(j) Designation.

This plan will both effectively restore grizzly bears in North Cascades National Park and give people the tools they need to thrive in and around grizzly bear country. Grizzlies belong in the North Cascades, as they enhance the park's ecological integrity and contribute to its wildness.

Grizzly bears play a vital role in maintaining ecosystem balance, cycling nutrients, dispersing seeds, and changing the behavior of species around them. Restoring them would benefit the park and the people who use it.

A restored population of grizzlies will boost the park's appeal and attract nature enthusiasts, scientists, and tourists from around the world. This would provide economic benefits to local communities and support the park's mission to protect park resources in perpetuity.

Alternative C, with the 10(j) rule, provides managers flexibility to address community concerns while protecting the grizzly population. It ensures coexistence between humans and bears.

Please consider the positive ecological and economic benefits and support Alternative C. Restoring grizzly bears will secure the park's natural heritage and conserve an iconic species for current and future generations.

Thank you for your dedication to our national parks.

"There is none which compares in importance with the great central task of leaving this land even a better land for our descendants than it is for us"

Correspondence: I've been hearing discussions about the possible return of grizzlies to the north Cascades for a few years and hope that the plan can finally move forward.

I attended part of the November 2 listening session in Darrington, WA, and heard a lot of fear, a lot of emotion. Hunters afraid that they won't be able to find game if there are grizzlies in the Cascades. Tribal members afraid the salmon runs will be destroyed. Neighbors afraid that grizzlies will come all the way down to the river valley and attack livestock and pets. People afraid that they won't be able to hike safely.

I understand those fears, but think they're overblown and come from misunderstanding and ignorance. When I'm out hiking, backpacking, or even in an established campground, I'm potentially sharing space with predators and behave accordingly. I've seen and heard signs of bear, bobcat, and wolf while out hiking. I love knowing that there's still space for native wildlife, predators included. I've seen firsthand what happens in an ecosystem that has no predators--overpopulation by prey animals, overeaten grazing areas, disease, and collapse. An ecosystem is a complex system that needs all its pieces to be healthy--including native predators. Like grizzly bears.

I've read the summary of the three plans and favor Alternative C. The long timeframe (much longer than I think most opponents are willing to recognize) and provision for addressing problem bears give people time to adapt to the presence of grizzlies in the backcountry, agencies the opportunity to address problems, and bears time to establish territories away from humans.

Thank you for your time and attention.

Correspondence: The EIS has failed to evaluate the impacts the bears will have as they move out of the North Cascades into areas populated by people, farms and ranches.

The EIS has failed to adequately evaluate the impacts the bears will have on anadromous fish populations in Washington State.

The US Department of Interior should commit to being liable for damages caused by the bears to private land, farms and ranches and to the people who live in Washington State. IF/ When a bear kills someone then people within the Department of Interior who approve this plan should be held criminally and personally liable.

The EIS assumes that bears will adapt to the North Cascades ecosystem and adapt to the food sources there. Bears typically are taught by their mother what to eat: elk, fish, moths in Wyoming etc. whatever is best for them in their home range.

Moving bears to the north cascades erroneously assumes bears will change their eating habits to adapt to a new location. This assumption is wrong. In 1996 the US fish and wildlife service joined in an effort with the Canadian wildlife organization to move a Canadian Griz. south to the US border above the Pasayten Wilderness area in the North Cascades. That was a

problem bear that was eating fish at a Canadian fish hatchery. That bear went into the Pasayten Wilderness area for about 2 days then headed North to the Canadian fish hatchery. The bear did not adapt to a new ecosystem. It returned to its native food source. You cannot train Griz. to live in a new habitat. This information is a matter of public record in the notes from a Wenatchee National Forest Leadership team meeting where the information was presented by the forest Griz. expert Bill Gaines. Griz. planted in the North Cascades will move in search of better food sources that they are accustomed to. This point is not covered in the EIS.

The EIS has failed to adequately evaluate the financial impacts of Griz. on outfitter guides in the North Cascades. The EIS did not adequately evaluate the financial impacts that will happen as tourism changes. Any increase in tourism will cause an increase in air pollution due to auto emissions. Increased tourism will also over tax existing recreation facilities. Where will the money come from to expand and modify recreation facilities? This is not covered in the EIS. People go to Yellowstone Park to see the bears. They will go to the North Cascades to view bears as well.

The EIS is faulty in many respects and will lead to negative impacts on the North Cascades ecosystem, the people, recreation facilities and economy of the area and it will have negative effects on the bears the US Fish and Wildlife service intend to relocate to a new ecosystem.

Correspondence: i am for grizzly bear re introduction. i think option C is the best option. it makes sense to restore the bear given its spiritual significance to first nations people who share its ancestral home land. i also think we owe it to future generations to proactively move to restore and support all the native fauna that call the north cascades home. with accelerating climate change this becomes more important now than ever, as these ecosystems and their inhabitants are increasingly experiencing greater stress. i have hike often in grizzly country in Montana and Wyoming, and even though i have rarely seen them in the wild, just knowing they are there, adds a kind additional sense of the sacredness to the wilderness experience.

i think for people who live in closest proximity to the bears home range deserve additional flexibility to address nuisance bears, and conflict. this ia why i strongly advocate for restoring them, while also allowing the flexibility that option C provides. thank you. [REDACTED]

Correspondence: Hi,

Thank you for this opportunity to comment on the EIS proposing reintroduction options for Grizzly Bears into the North Cascades. I'd like to provide some background information about myself before providing my comment. I was born, raised, and continue to live in the mountains of Chelan County, near Wenatchee, close to the designated North Cascades Grizzly Bear Recovery Area. Next summer, we are moving to a rural area of Okanogan County, near Twisp, that is within the recovery area. I am an avid outdoorsman, who spends many hours, days, and nights, in the wilds of the North Cascades ecosystems, covering hundreds of miles on foot every year. I enjoy trail running, hiking, backpacking, birding, hunting, and observing the ecosystem as a whole.

Having said this, I am extremely supportive of reintroducing Grizzly Bears to the North Cascades. Grizzlies are a vital component to the ecosystems they reside in, digging and aerating soils, along with spreading seeds far and wide throughout mountain ecosystems. Having an intact ecosystem to live and recreate in, is beyond special, and restoring Grizzly Bears will put another puzzle piece back into its ecological place, after it was wrongfully removed. There is something so profound and exciting about having Grizzlies on the landscape, even if you never see one. Whenever I am hiking in Montana or Wyoming, you can feel it. I hope to feel this same sense of awe and wonder here in my own backyard, and maybe one day see a wild Grizzly in the North Cascades. This likely will only be possible during my lifetime with a reintroduction program. Nearby populations across the border are already very low, and with many barriers such as highways and development separating the North Cascades from thriving Grizzly populations, it is unlikely they will disperse on their own to establish a new population.

Specifically, my preference is in support of Alternative B, where this population will be granted full ESA protection. This is important to protect such an important ecological resource as Grizzly Bears, from being lethally removed due to pressure from small interest groups and local governments. Grizzly Bear recovery should take precedence over any anthropogenic concerns such as livestock depredation etc., as it is not the public's responsibility to subsidize and cater to ranchers, who already graze livestock on public lands at minimal cost. Many people who don't support Grizzly Bear recovery are already anti-predator in general, and the 10(j) rule could provide loopholes for lethal removal of bears without adequate cause over the following decades. Alternative B will provide for a more standardized and regulated approach to the recovery and protection of Grizzly Bears in the North Cascades.

I do understand the reasoning of compromise with Alternative C, and would support Alternative C secondarily. But I must state that my preference, and in my opinion best chance at long term for recovery of Grizzly Bears in the North Cascades, is Alternative B.

Thank you again for this opportunity to comment.

Correspondence: The arguments for grizzly restoration are indicative of living in the past. Supporters say that people can coexist peacefully beside them. The basis of this arrogant argument means only a few people in Alaska and Montana will die or be injured. And these are places have far smaller populations than Washington. Do you find this acceptable collateral

damage? Is that what you call wildlife "management"?

Those who simply want to see them can travel to nearby states and British Columbia to do so. I have seen grizzly in the Pasayten Wilderness less than thirty years ago, so they already exist here. If it would benefit the bears, they would move here on their own. But with a growing human population and the popularity of outdoor activity among our residents, often with a dog, it makes no sense to reintroduce a species that presents a risk to us directly, and a cost to the farmers and land owners that live here. There is no valid logic in wanting to bring them back just because they "used to roam freely" here. Four thousand years ago, large lions roamed freely in southern Europe. Does it seem like a good idea to reintroduce lions there now? I doubt the residents there would benefit in any way. And there is no benefit to reintroducing this aggressive predatory species into our own backyard. Our ecosystems have done very well without. Thank you for listening.

Correspondence: The proposed intervention alternatives (B and C) of the Draft Environmental Impact Statement (EIS) pose unnecessary risks to other endangered species within the North Cascades Ecosystem (NCE) at this time. Table A-1 lists 8 federally threatened or endangered species with critical habitat in the NCE which are also likely to be affected by grizzly bear reintroduction.

If the purpose of the Endangered Species Act (ESA) is to "protect and recover imperiled species and the ecosystems upon which they depend" as the EIS states, then the reintroduction of one species at the cost of several others is logically counterproductive. For example, while the EIS states that fish are not expected to be a primary food source of reintroduced grizzly bears in the NCE, there is not adequate analysis in the EIS of the potential effects on State and Federal threatened/endangered/sensitive fish species that could be grizzly bear food sources. Grizzly bears have an immense capacity to feed on fish, and it is conceivable that threatened/endangered/sensitive fish species will be adversely impacted, but this EIS does not adequately demonstrate that these risks are low.

Table C-2 indicates the action alternatives (B and C) would cost approximately 7.1 million dollars in capture & release, monitoring, and staff time alone over ten years. As a resident of Washington and a taxpayer, I would rather these species recovery efforts and taxpayer dollars first be spent on stabilizing the populations of imperiled prey species, as opposed to predator species. For example, I would prefer more emphasis be placed on recovering the extirpated South Selkirk woodland

caribou herd, or imperiled fish species in Washington.

Furthermore, the most recent effort from the federal government to reintroduce grizzly bears to the NCE was stopped just three years ago, in 2020, after opposition from local stakeholders. Stakeholder concerns with action alternatives in this EIS will likely be the same or similar as concerns regarding the previous reintroduction plans: restarting the process so soon shows disregard for those local stakeholders. While I would support grizzly bear reintroduction efforts in the NCE at the right time, for the reasons listed above, I do not believe that the time is now, and cannot support either alternative B or C in this EIS.

Correspondence: NOT IN FAVOR - my six reasons below:

1. Safety Concerns: Grizzly bears are large and powerful predators that can pose a significant threat to human safety. While proponents argue that bear attacks are rare, introducing these apex predators into an area that may see increased human activity, such as hiking, camping, and recreational pursuits, could raise the risk of bear-human conflicts. This could lead to injuries or fatalities, and necessitate additional resources for bear management and public safety.
2. Local Opposition: It's crucial to consider the sentiments and concerns of local communities. Many residents may be apprehensive about living in close proximity to grizzly bears and the potential disruptions they bring to their way of life. Disregarding these concerns can strain community relations and lead to resistance against the conservation efforts.
3. Economic Implications: The North Cascades region relies heavily on tourism and outdoor recreation for its economic well-being. Visitors come to enjoy the beautiful landscapes and engage in various outdoor activities. The potential for bear-human conflicts, as well as the perception of increased danger, could deter tourists and outdoor enthusiasts. This might lead to a decline in tourism revenue, impacting local businesses and employment.
4. Resource Competition: Introducing grizzly bears could disrupt the local ecosystem and lead to competition with other native wildlife, such as black bears and cougars, for food resources and territory. This competition could adversely affect the

populations of other species and disrupt the ecological balance of the area.

5. Relocation Challenges: Translocating grizzly bears into the North Cascades from other regions can be a difficult process. It can be stressful for the bears and may lead to increased mortality rates among the introduced individuals. This raises ethical concerns about the welfare of the animals.

6. Impact on Livestock and Agriculture: Grizzly bears have a well-documented history of preying on livestock, particularly in regions where they coexist with agricultural activities. The North Cascades are home to ranches and farms, and the introduction of grizzlies may result in financial losses for farmers due to livestock depredation. This could create tension between conservation efforts and the livelihoods of local communities.

I realize, the introduction of grizzly bears into the North Cascades is a complex issue with legitimate concerns related to safety, economic impacts, and the well-being of local communities. Wildlife management decisions should carefully weigh both the benefits and drawbacks of such actions. Thank you.

Correspondence: I strongly support the National Park Service's preferred Alternative C: Restoration with Endangered Species Act Section 10(j) Designation.

This plan will effectively restore grizzly bears in the North Cascades National Park and give people the tools they need to thrive in and around grizzly bear country. Grizzlies belong in the North Cascades, as they enhance the park's ecological integrity and contribute to its wildness.

Grizzly bears play a vital role in maintaining ecosystem balance, cycling nutrients, dispersing seeds, and changing the behavior of species around them. Restoring them would benefit the park and the people who use it.

A restored population of grizzlies will boost the park's appeal and attract nature enthusiasts, scientists, and tourists worldwide. This would provide economic benefits to local communities and support the park's mission to protect park resources in perpetuity.

Alternative C, with the 10(j) rule, allows managers to address community concerns while protecting the grizzly population. It ensures coexistence between humans and bears.

Please consider the positive ecological and economic benefits and support Alternative C. Restoring grizzly bears will secure the park's natural heritage and conserve an iconic species for current and future generations.

I appreciate your dedication to our national parks.

Respectfully I remain

Correspondence: I support the restoration of grizzlies to the North Cascades, and that the restoration must be done in ways that don't violate the Wilderness Act and harm the area's wilderness character. This is good for bears and Wilderness.

Both of the action alternatives as they now stand would violate the Wilderness Act. The action alternatives should be modified to avoid helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and steer clear of heavy-handed management of bears. There are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites without the use of helicopters inside Wilderness.

I am increasingly disheartened by the NPS, FS, BLM, and FWS violations of the Wilderness Act by using helicopters, chainsaws, and other mechanized equipment in Wilderness areas. It shows an increasing disregard and disrespect of fundamental Wilderness values and the law.

Correspondence: I'm an avid hiker and I value the wildness of the North Cascades. I want grizzly bears to be a part of that wildness again. There is plenty of space for both of us. As a conservationist, I know grizzly bears provide important ecological services, like distributing seeds and aerating alpine meadows. I've read that bears are considered ecosystem engineers, they have the ability to modify their environment. I have also learned that through their foraging habits, bears spread plant and berry seeds in their droppings and spread marine-derived nitrogen into the forest surrounding salmon streams. Bears are important links in food webs and help maintain populations of deer and other prey species through predation.

Humans were responsible for removing grizzlies from the North Cascades and it's our responsibility to bring them back home. If we don't take action now, we risk losing grizzly bears from the North Cascades forever along with negative consequences to the ecosystems and our environment without these keystone species.

Correspondence: Reintroducing an apex predator to Northern Washington State will ensure that innocent men, women and children are going to end up dead.

Having lived in Fairbanks Alaska, I have tremendous respect for bears and their ability to kill when hungry, protecting their cubs, or simply feeling territorial.

Most Americans from the lower 48 seem to think bears are just cute and cuddly "Teddy Bears." They're not. If you're not prepared to defend yourself (and that means a 338 Winchester or heavier rifle, or a 12 gauge with slugs), you WILL suffer a horrible death if a bear attacks you or your family.

Re-introducing bears in the Northern Cascades means that those mountains will be effectively "off limits" to most who once enjoyed that wilderness.

This is such a bad idea. Really, just DON'T do it. People are more important than grizzly bears!

Correspondence: Dear NPS:

I respectfully request you maintain the "no action" choice regarding Grizzly Bears in the No Cascades NP system. I feel the few bears that roam that area is plenty for that wilderness area to handle, given the proximity to rural interface areas.

As an avid backpacker, I look forward to backpacking in this area without the high volume of apex predator grizzlies. We have enough other regions of the continental US that have maintained the grizzly population in its habitat. I also live in a rural area and understand how easily these wild creatures could expand to unintended regions, causing reduced access by locals, cost of protective measures by private individuals and stress for local home/landowners.

Please do not change your current policy regarding the grizzly bears in the North Cascades NP.

Sincerely,

Tillamook, OR

Correspondence: I support the restoration of a healthy population of Grizzly Bears to Washington's North Cascades through Alternative C: Restoration with Section 10(j) Designation. This plan is wisely modeled on the process that has worked successfully in Montana.

Grizzly Bears are ecologically and culturally significant; they are a missing component of the North Cascades ecosystems and their biodiversity. Human actions over the past 150 years extirpated the Grizzly Bear from the North Cascades; we now have the unique opportunity to restore them to their historic range where suitable habitats still exist.

Restoring Grizzly Bears as an "experimental, non-essential" population under a well-crafted Section 10(j) Rule of the Endangered Species Act provides managers with the flexibility to reduce, prevent and address human-bear conflicts and give greater comfort to local communities that are concerned about the impacts of wildlife recovery on economic and recreation activities.

I also urge that Grizzly Bears be restored in a way that minimizes conflicts with the Wilderness Act and does not harm the North Cascades' wilderness character. Alternative C should be modified to avoid helicopter landings in wilderness and to avoid heavy-handed bear management. Many roads bisect or penetrate the recovery area or dead-end next to wilderness

boundaries that could provide release sites rather than helicopter landings within designated wilderness.

The source of Grizzly Bears to repopulate the North Cascades also is a concern. Montana's grizzlies are not yet recovered under the Endangered Species Act. Any dispersing Grizzly Bears from Glacier, Yellowstone or Grand Teton national parks are needed to naturally recover in adjacent wilderness areas.

I urge a compromise in Alternative C that integrates natural recovery measures with population augmentation in the final management plan. Working with partner agencies in British Columbia, corridors should be designated and managed to encourage Grizzly Bears to move across the international border and naturally expand into vacant suitable habitat in the North Cascades. This seems like a quicker way to jump start recovery than solely depending on bears taken from still recovering populations in the Northern Rockies.

Correspondence: Hello,

I am against the brown bear restoration to the North Cascade where I live.

It will change how we go hiking and just being able to walk around on our property without carrying protection.

A restoration similar to this happened in Alaska and the locals tell me that after the restorations the outdoors are off limits to human and pets. It has sadly has lowered their standard of living and enjoyment of being even just outside of their houses.

Please investigate the negative effect it has on the Alaskan project and I am strongly against this restoration in the North cascade. Do not restore them here and ruin the reason we live here.

Correspondence: Please reintroduce grizzly bears under the 10j rule, keeping them nonessential and experimental.

Please fully staff the Park Service, the USFWS, the Tribes, and ensure that WDFW also has adequate staff to manage and monitor bears and respond to conflicts. These agencies should also work collaboratively to continue outreach efforts to fully prepare communities outside federal land for bear coexistence. State and federal agencies must provide seed money to assist communities to become Bear Smart communities (IGBC framework) to reduce and prevent conflicts with grizzlies.

Grizzly bears targeted for reintroduction should also come from the NCDE and specifically Glacier National Park since the habitat and plant communities are far more similar to the NCE. This will greatly improve the survival of reintroduced bears and may have an effect initially on reducing conflict behavior by reintroduced bears (Set them up for success).

Thank you!

Correspondence: I am in favor of alternative A : NO ACTION

My reason is that with the decline of the fish, deer, and Elk populations there would not be enough food in the north cascade mountains to sustain the Grizzly bear. This would force them to move down into the low lands amongst the human population. This would cause a lot of conflict between the Grizzly Bear and humans. To me that would not be fair to the Grizzly Bear or humans. If the Grizzly Bear wants to make the north cascades in Washington their home we should allow them to migrate down out of Canada on their own and not try relocating them ourselves.

Thank you for listening to the concerns of the people that live, work and that enjoy the back country of the north cascades.

Correspondence: I think it is a fantastic plan to reintroduce grizzlies to the Northern Cascades. However, I believe the extensive use of helicopters, to bring them in and monitor them is horribly invasive. These are wilderness areas and that must be respected and maintained. The thwack-thwack-thwack from helicopters is actually terrorizing to animals and should be avoided. There are roads which may be utilized to bring the bears in. I think it is in the best interests to establish an agreement with the Canadians to make protected corridors to enable ease of movement and to keep gene pools vital. This will benefit more than just grizzlies and recognizes that wildlife knows no borders or boundaries. I also believe it is important that the bears receive full protection and not be considered a nonessential experimental population. Labeling them as such basically insures half measures are just fine and dandy, rather than truly giving our best for these bears. It also belittles their position as a top predator who helps hold and maintains ecosystem health and viability.

In short, I urge you to please consider the big picture and include in your planning a more natural re-establishment of these bears. Holding up the tenets of wilderness must be maintained. It is also important in your planning to include education for the public so that all may have the best experience possible. Grizzly bears are an iconic species and a top predator that has been revered as well as feared for their strength and power. Reintroducing them is a wonderful plan. Please do it in a responsible, noninvasive way, which will give them the best opportunity to make a new home.

Correspondence: Hello, Thank you for the opportunity to comment on this issue.
This is a horrible idea or plan to reintroduce a species that has been gone for decades.
You are putting human lives in jeopardy. Citizens who enjoy hiking or hunting or spending time outdoors will be at risk to a known predator. Not just any predator, but a apex predator. One that has no predator. In recent weeks we have seen reports of grizzly attacks in Canada and the state of Idaho. People lost their lives in these.
This plan reminds me of a public vote at the end of the 1990's that outlawed the use of dogs while cougar hunting. All this did was allow a species to overpopulate and become a serious problem. There have been reports of cougar attacks since this happened. Now, no one hunts cougars anymore. It got to the point where the state just added a cougar tag to your big game license and charged you for it. A foolish move by the department of wildlife. I hunt in Washington and have come across black bears and cougars and been forced to change my hunting plan.
Hikers though are a different story. Many carry bear spray, which is to be deployed when the bear is thirty feet from you. Grizzlies can run up to thirty five miles per hour. At thirty feet you have less than two seconds to accurately shoot the spray in the right direction if you haven't already soiled yourself and we're to slow. Thus ending in being mauled to death.
The state introduced grey wolves to eastern Washington and that has been very controversial. Ranchers losing cattle. Over population because once again a animal with no predator. I hunt up in twist and have seen wolves as close as seventy five feet away.
Very uncomfortable situation. Both wolves and bear eat deer and elk which is what we hunt. This will threaten the population of these animals, which will lead to no one hunting and a huge revenue loss to the state.
So, let's use some common sense and NOT reintroduce grizzlies to Washington state, for the safety of it's citizens.
Thank you for this opportunity to voice my opinion on this subject.

Correspondence: I hope you will consider the reintroduction of grizzlies to the North Cascades region. I know there is a lot of information & details I could include in my letter, but you've heard it all before, & I'm not going over the same ground with you again. Bottom line: those bears need to be brought back. I favor Conservation Northwest's option, alternative C.
Our local senator, Dan Newhouse (R) is against it, & he is just a dumb farmer, looking out for the damn cows & ranchers. That's what happened to America. We want to civilize everything, pave it over, chop down the trees, & wipe out "bothersome" nature & its unruly animals. NO It's time to call a halt to overzealous nay-sayers & restore nature & its animals & plants to a time before we thought we knew better & wiped too much of it out. Just review what happened in Yellowstone NP when wolves were restored. There is a lovely video on how the restoration one one single species affected the entire ecosystem. The wolves reduced the ruminants' overgrazing, which allowed riparian areas to be restored, and stream health to be improved. All of life in the park benefitted from the simple reintroduction of a species man thought was dangerous & should be killed. Enough already. It's time for grizzlies to return to the North Cascades. Species conflict should be minimal, as there are not that many humans living where the bears will be roaming. It's time Man made way for nature again. We've lost so much already to urbanization. Say Yes to bears!

Correspondence: I am writing to support the restoration of a healthy population of grizzly bears to the North Cascades, their home for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations.

I support Alternative C: Restoration with Section 10(j) Designation. Alternative C is the best choice for bears and the people who live in and visit the North Cascades Ecosystem. The plan is wisely modeled on what's worked in Montana where grizzlies are recovering in the Cabinet-Yaak mountains with few problems and with the acceptance and involvement of local communities.

Furthermore, the 10(j) rule will give people more management tools to reduce, prevent, and respond to human-bear conflict. I believe that the 10(j) rule if properly implemented, will help increase human acceptance of grizzly bears as they return to the landscape.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please bring back this native species to our state through the strategy laid out in Alternative C. Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

Thank you for taking the time to keep our North Cascades wild!

Correspondence: To Whom It May Concern:

I live in New York State, but I have visited Yellowstone and the Grand Tetons National Parks where grizzlies reside. I believe that apex predators like grizzlies are an essential element in ecosystems.

I support the restoration of grizzlies to the North Cascades, and that the restoration must be done in ways that don't violate the Wilderness Act and harm the area's wilderness character. This is good for bears and Wilderness.

Both of the action alternatives as they now stand would violate the Wilderness Act. The action alternatives should be modified to avoid helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and steer clear of heavy-handed management of bears. There are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites without the use of helicopters inside Wilderness.

I oppose the use of a 10(j) rule for the grizzlies in the restoration work. This would mean grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana would be taken from their homes, dropped into the North Cascades, and lose their previous protection.

Montana doesn't have any "extra" grizzlies to lose to the North Cascades. Montana grizzlies are not yet recovered under the ESA, and any dispersing grizzlies from Glacier or Yellowstone are needed to naturally recover areas like the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest.

A natural recovery alternative must be fully developed and analyzed, even if recovery would take longer than active repopulation. The new information presented by Superintendent Striker regarding the likelihood of naturally migrating bears from Canada suggests active repopulation urgency may be more about protecting agency discretion than protecting Wilderness and creating the best environment for grizzly bears to migrate, live, and thrive.

For the long-term success of grizzly restoration, natural recovery measures must also be included in both action alternatives thus reducing the need for wilderness degrading activities that are also ultimately bad for bears. This requires work with

partners in British Columbia to ensure that grizzlies have corridors to move back and forth across the international border and to prevent a small North Cascades grizzly population from shrinking over time and becoming inbred.

An alternative that combines natural recovery with population augmentation under full ESA protections should also be analyzed.

The no action alternative has many good Bear Smart components on how people and communities can coexist with grizzly bears and these coexistence measures should also be included in both of the action alternatives. All possible measures must be taken to prepare residents and visitors for bears, particularly given the dramatic growth of the human population in the region and rapidly increasing recreation pressures in the Park.

Correspondence: I understand that people who live west of the Cascades hold a great deal of fear about the reintroduction of grizzlies. There is a lot of misinformation about grizzlies preying on livestock and attacking people. The science tells us that grizzly attacks are rare and that humans and livestock can co-exist with these apex predators in the same area. More importantly, the science has proven over and over again the importance of apex predators to our entire ecosystem. It is my hope that finally science will win out over fear and myth and that grizzlies will be successfully reintroduced to the North Cascades. It's beyond time to restore this ecosystem and to reintroduce grizzlies. They will never be there in the abundance they once were, but having them in their home territory once again goes a small step toward repairing the damage humans have done.

Correspondence: To whom it may concern,

I am a natural resources technician who routinely works in the north cascades and north east WA. I generally work alone and in very remote locations on state and private land. Right now I carry bear spray but even when I have encountered black bears I am never afraid of them because they really don't kill humans.

Grizzlies do. I don't want to run into one by myself, cruising timber, miles in the back country. If they come down naturally that's great. If you reintroduce them, you will be choosing to put people at risk of death. Please don't.

Thank you.

Correspondence: I support the reintroduction of grizzly bears to the North Cascades via Alternate C: Restoration with Section 10(j) Designation. Grizzly bears once roamed much of western North America, including the area now called the North Cascades. Apex predators such as the grizzly are essential to the efficient functioning of the ecosystems they have adapted to. While reintroduction to their entire former range is impractical, there is ample space in the North Cascades to accommodate both grizzlies and current human activities, recreational and otherwise. Section 10(j) allows wildlife managers flexibility in addressing conflicts that may arise.

Correspondence: I strongly support the National Park Services preferred Alternative C: Restoration with Endangered Species Act Section 10(j) Designation.

This plan will both effectively restore grizzly bears in North Cascades National Park and give people the tools they need to thrive in and around grizzly bear country. Grizzlies belong in the North Cascades, as they enhance the park's ecological integrity and contribute to its wildness.

Grizzly bears play a vital role in maintaining ecosystem balance, cycling nutrients, dispersing seeds, and changing the behavior of species around them. Restoring them would benefit the park and the people who use it.

A restored population of grizzlies will boost the park's appeal and attract nature enthusiasts, scientists, and tourists from around the world. This would provide economic benefits to local communities and support the park's mission to protect park resources in perpetuity.

Alternative C, with the 10(j) rule, provides managers flexibility to address community concerns while protecting the grizzly population. It ensures coexistence between humans and bears.

Please consider the positive ecological and economic benefits and support Alternative C. Restoring grizzly bears will secure the park's natural heritage and conserve an iconic species for current and future generations.

It's just possible that restoring grizzly bears to this park will bring about the same dramatic ecological changes that happened in Yellowstone National Park with their reintroduction of a wolf pack, which changed the entire ecology of the area as documented in a video you should seek out and watch if you haven't already.

Thank you for your dedication to our national parks.

Correspondence: I grew up in the foothills of the Cascades on the eastern boundary of Issaquah, and the greater ecosystem of the region holds an everlasting bond within my heart and soul. Hearing that we have an opportunity and extremely well thought out plan to re-introduce a species that were once an integral part of the North Cascades ecosystem brings me joy and hope that we can continue healing the natural world around us and co-exist with nature in a productive and resilient way.

I am writing to support the restoration of a healthy population of grizzly bears to the North Cascades, their home for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations.

I support Alternative C: Restoration with Section 10(j) Designation. Alternative C is the best choice for bears and the people who live in and visit the North Cascades Ecosystem. The plan is wisely modeled on what's worked in Montana where grizzlies are recovering in the Cabinet-Yaak mountains with few problems and with the acceptance and involvement of local communities.

Furthermore, the 10(j) rule will give people more management tools to reduce, prevent, and respond to human-bear conflict. I believe that the 10(j) rule if properly implemented, will help increase human acceptance of grizzly bears as they return to the landscape.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please bring back this native species to our state through the strategy laid out in Alternative C. Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

Thank you for taking the time to keep our North Cascades wild!

Correspondence: To Whom it May Concern:

I am writing in support of the North Cascades Grizzly Bear Restoration Plan, Alternative C: Restoration with Endangered Species Act 10(j) Designation. As an avid hiker, climber, and backpacker, I am well aware of the risks involved with the reintroduction of grizzlies into the park, but believe the benefits far outweigh those risks.

Grizzly bears once roamed the entire west coast, including the Pacific Northwest, until they were hunted & their habitat fragmented to near extinction in the region. We should do what we can to bring the bears, and their positive contributions to the ecosystem, back to the Pacific Northwest.

North Cascades is the perfect location to try this plan. Please implement Alternative C.

Thank you,

Correspondence: Grizzlies don't adhere to arbitrary borders. We have grizzlies in Washington. They come down from Canada and over from Idaho. Washington is already reducing predator management opportunities in this state while at the same time introducing more predators. It makes no sense. The ungulate populations will be decimated. Let us also note the increase of negative grizzly-human interactions in other states that are significantly less populated. I do not see this as a benefit to our state or our ecosystem.

Correspondence: Stehekin, Wa resident here using a pseudonym for reasons anyone who knows Stehekin would understand many in my community would seek to make my life here more difficult if they became aware of my support of this. As a tax paying, property owning, contributing citizen of the north cascades, I FULLY SUPPORT all efforts to reintroduce the grizzly bear to its historic range here in the north cascades. I am 100% onboard with this effort. I think it is a great idea and about time. As it stands right now, the north cascades ecosystem is in many ways degraded from nearly 200 years of resource exploitation, and a frontier/livestock herding mentality that persists to this day in many areas including here in Stehekin among some of the residents. NPS and the department of fish and wildlife must not be once again bowed by this minority of voices who only seek to enrich themselves and their own out of date ideas at the expense of a fully functioning ecosystem for the greater public at large. While I think some of the concerns of those who oppose this effort can be addressed I truly feel it is important that this effort to undertake the reintroduction of the grizzly be continued forward. Just know that in the small community of Stehekin there are many including myself who support this effort. Thank you for your time, yours truly, Anonymous

Correspondence: With climate change, will we have any expectations of more occurrences of what happened to that experienced and well prepared couple from Banff? They did everything right, sat phone, bear spray, all food up tree far away etc, and were still attacked due to the late spring frost affecting the available food supply, combined with desperation to fatten up for hibernation. I could not imagine what their family and friends must be going through with the circumstances of their death.

I would like more information on what animal behaviorists found of that situation, which i know is rare but could it become less rare? Will hiking with young children still be okay?

Correspondence: Where Grizzly bears are in their native habitat presently, the human population is small compared to western WA. Think about the number of hikers that roam the Cascades. 11.4 attacks per year will increase, I believe by at least three per year when the population reaches the 200 bear's mentioned. Spreading of seed etc is accomplished well by birds and black bears. Mr Long has given no reason for reintroduction. This is nothing but an attempt to make certain people feel good about themselves. As for indigenous people living with Grizzlies for 10,000 years, it's possibly longer than that, but there are no records to show how many bear attacks there were, is there? So no way of knowing how many humans were attacked.

This a bad idea.

Correspondence: I am writing to support the restoration of a healthy population of grizzly bears to the North Cascades, their home for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations.

I support Alternative C: Restoration with Section 10(j) Designation. Alternative C is the best choice for bears and the people who live in and visit the North Cascades Ecosystem. The plan is wisely modeled on what's worked in Montana where grizzlies are recovering in the Cabinet-Yaak mountains with few problems and with the acceptance and involvement of local communities.

Furthermore, the 10(j) rule will give people more management tools to reduce, prevent, and respond to human-bear conflict. I believe that the 10(j) rule if properly implemented, will help increase human acceptance of grizzly bears as they return to the landscape.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please bring back this native species to our state through the strategy laid out in Alternative C. Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

Thank you for taking the time to keep our North Cascades wild!

The North Cascades Grizzly Bear Recovery Zone (NCGBRZ) is the second largest of six such designated areas at nearly 10,000 square miles. Combined with contiguous protected areas in British Columbia, including Manning Park, there are 14,000 square miles of productive, wild habitats, wilderness, and roadless areas.

People and grizzly bears can coexist and thrive. They do so in British Columbia, Montana, and Wyoming where grizzly populations and back and front country recreation continue to grow hand in hand, providing a vital economic boost to those areas' gateway communities.

Grizzly bears lived in Washington for thousands of years. We still have a small population in the NE WA Selkirk Mountains. However, currently, there are no grizzly populations in the United States or Canada that are large enough or close enough to serve as a source to naturally repopulate the North Cascades.

Having wiped out the grizzly bear over the past 150 years we now have the unique opportunity and the ethical obligation to restore them to their native home, where suitable habitats still exist.

Grizzly bears are ecologically and culturally significant and are vital to the overall health of the North Cascades ecosystem

and its biodiversity. They are considered an indicator of ecosystem health.

Restoring grizzly bears as an "Experimental, non-essential" population under a well-crafted Section 10(j) rule of the Endangered Species Act makes sense. Such a designation will provide flexibility for wildlife managers to prevent and address human-bear conflict and a greater level of comfort for people who are concerned about the impacts of wildlife recovery on economic and recreation activities. Agencies have used the Section 10(j) Rule in the past to restore black-footed ferrets, California condors, wood bison, and many others.

Correspondence: I support restoring the Grizzly Bear to the North Cascades Ecosystem in Washington. Looks like more than 30 years have passed since a plan has been attempted. I hope this year doesn't end in failure. The alternative C which allows for more flexible management seems to be a workable option for easily moving bears from one area to the next should problems arise. However, I am hoping that being an endangered species in Washington will prevent them from being hunted which was the cause of their extinction in the area. I have hiked in British Columbia and seen grizzlies and cubs also moving about. We were within eyesight, but the bears did not change their directions to pursue and I expect in most cases that would be true. I think both bears and humans can enjoy life in the North Cascades. I am hoping that the new EIS will be completed without delay and action will be taken to bring Grizzly Bears back! Thank you for your consideration!

Correspondence: Job 12:7-10 GNT

[7] Even birds and animals have much they could teach you; [8] ask the creatures of earth and sea for their wisdom. [9] All of them know that the Lord's hand made them. [10] It is God who directs the lives of his creatures; everyone's life is in his power.

I strongly support the National Park Services preferred Alternative C: Restoration with Endangered Species Act Section 10(j) Designation.

This plan will both effectively restore grizzly bears in North Cascades National Park and give people the tools they need to thrive in and around grizzly bear country. Grizzlies belong in the North Cascades, as they enhance the park's ecological integrity and contribute to its wildness.

Grizzly bears play a vital role in maintaining ecosystem balance, cycling nutrients, dispersing seeds, and changing the behavior of species around them. Restoring them would benefit the park and the people who use it.

A restored population of grizzlies will boost the park's appeal and attract nature enthusiasts, scientists, and tourists from around the world. This would provide economic benefits to local communities and support the park's mission to protect park resources in perpetuity.

Alternative C, with the 10(j) rule, provides managers flexibility to address community concerns while protecting the grizzly population. It ensures coexistence between humans and bears.

Please consider the positive ecological and economic benefits and support Alternative C. Restoring grizzly bears will secure the park's natural heritage and conserve an iconic species for current and future generations.

Thank you for your dedication to our national parks.

Correspondence: I write to comment on the draft Environmental Impact Statement (EIS) that evaluates options for returning grizzly bears to the North Cascades Ecosystem in Washington. I support the restoration of grizzlies to the North Cascades, and that the restoration must be done in ways that don't violate the Wilderness Act and harm the area's wilderness character. This is good for bears and wilderness. Both of the action alternatives as they now stand would violate the Wilderness Act. The action alternatives should be modified to avoid helicopter landings and flights in wilderness, the placement and use of telemetry installations, and steer clear of heavy-handed management of bears. There are many roads that bisect or penetrate the recovery area or dead-end next to wildernesses that could provide release sites without the use of helicopters inside wilderness.

I oppose the use of a 10(j) rule for the grizzlies in the restoration work. This would mean grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana would be taken from their homes, dropped into the North Cascades, and lose their previous protection. Montana doesn't have any "extra" grizzlies to lose to the North Cascades. Montana grizzlies are not yet recovered under the ESA, and any dispersing grizzlies from Glacier or Yellowstone are needed to naturally recover areas like the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest.

A natural recovery alternative must be fully developed and analyzed, even if recovery would take longer than active repopulation. The new information presented by Superintendent Striker regarding the likelihood of naturally migrating bears from Canada suggests active repopulation urgency may be more about protecting agency discretion than protecting wilderness and creating the best environment for grizzly bears to migrate, live, and thrive. For the long-term success of grizzly restoration, natural recovery measures must also be included in both action alternatives thus reducing the need for wilderness degrading activities that are also ultimately bad for bears. This requires work with partners in British Columbia to ensure that grizzlies have corridors to move back and forth across the international border and to prevent a small North Cascades grizzly population from shrinking over time and becoming inbred.

An alternative that combines natural recovery with population augmentation under full ESA protections should also be analyzed. The no action alternative has many good Bear Smart components on how people and communities can coexist with grizzly bears and these coexistence measures should also be included in both of the action alternatives. All possible measures must be taken to prepare residents and visitors for bears, particularly given the dramatic growth of the human population in the region and rapidly increasing recreation pressures in the Park.

Thank you for your thoughtful consideration of my views.

Correspondence: 1. The American Bear Foundation of Washington has always championed the well-being of bears. However, we firmly oppose the reintroduction of grizzly bears into the North Cascades. It's evident that grizzlies are already finding their way into the region, with recent incidents like the young grizzly in Stevens County. We believe in natural migration and proper management. The existing challenges with the black bear, cougar, and wolf populations in Washington highlight the need to avoid adding more pressure on our wildlife.

2. As someone who frequently hikes, the thought of an increased grizzly bear population in the North Cascades is concerning. Observing the events in places like Montana and Idaho, it's clear that more bears can lead to more dangers. Grizzlies have every opportunity to migrate from BC or Idaho without human intervention. I urge you to let nature dictate its path.

3. The North Cascades have always been a haven for outdoor enthusiasts like me. It's come to my attention that grizzly bears already exist in this range, as noted by the Washington Department of Fish and Wildlife. Introducing more would not only threaten the fragile mule deer population but also increase the risk for those of us who love the outdoors. I'm against any plans to reintroduce grizzlies in Washington.

4. The recent incident in Stevens County, where a grizzly bear was captured, is a testament to the growing predator challenges in Washington. Our state is already grappling with managing wolves, cougars, black bears, and more. Considering the strain on our ungulate populations, I cannot support the idea of reintroducing grizzlies into the state.

5. I felt compelled to voice my concerns about the potential reintroduction of grizzly bears in Washington. It's undeniable that grizzlies are already making their way into the state from neighboring regions. The absence of physical barriers means they can migrate naturally. Given the state's challenges in managing its existing wildlife, introducing another apex predator seems counterproductive.

6. The American Bear Foundation of Washington has always been at the forefront of advocating for bear welfare. Yet, we cannot support the reintroduction of the grizzly bear. The state already hosts this formidable predator. With the challenges the Washington Department of Fish and Wildlife faces in managing the rising numbers of black bear, cougar, and wolves, introducing a larger and more aggressive predator seems like a step in the wrong direction.

7. As a regular visitor to the North Cascades, the potential increase in grizzly bear population is alarming. The incidents in states like Wyoming serve as a cautionary tale. With no barriers preventing grizzlies from migrating from places like BC, it's best to let nature take its course.

8. The beauty of the North Cascades has always drawn me in. However, the knowledge that grizzly bears are already present, as confirmed by the Washington Department of Fish and Wildlife, makes me apprehensive. Introducing more would jeopardize not only the mule deer but also the safety of countless individuals. I'm firmly against the reintroduction proposal.

9. The recent capture of a grizzly bear in Stevens County underscores the challenges Washington faces with its predator populations. With the existing issues surrounding wolves, black bears, and cougars, it seems imprudent to consider adding grizzlies to the mix. I strongly advise against this reintroduction.

10. The presence of grizzly bears migrating into Washington from places like BC and Idaho is undeniable. Without any physical barriers, they can naturally inhabit the state. Given the difficulties in managing the current wildlife populations, I believe it's in the best interest to refrain from reintroducing more apex predators.

11. The American Bear Foundation of Washington is unequivocal in its position: reintroducing the grizzly bear is not in the best interest of the state. The challenges posed by the increasing numbers of black bear, cougar, and wolves are evident.

Introducing a predator of the grizzly's stature would exacerbate these challenges, putting both humans and wildlife at risk.

12. The American Bear Foundation of Washington wishes to express its reservations about reintroducing grizzly bears to the North Cascades. Recent events, such as the grizzly incident in Stevens County, highlight the existing challenges. We advocate for natural migration and believe that the current pressures on our wildlife, especially ungulates, make this reintroduction inadvisable.

13. As a frequent visitor to the North Cascades, the idea of more grizzly bears is concerning. The experiences of states like Montana and Idaho serve as a warning. Grizzlies can naturally migrate from neighboring regions, so I believe we should let nature take its course.

14. The North Cascades offer a unique experience for outdoor lovers. However, the presence of grizzly bears, as confirmed by the Washington Department of Fish and Wildlife, poses a threat. Introducing more bears could harm the mule deer population and increase risks for visitors. I'm against this reintroduction.

15. The recent grizzly bear incident in Stevens County is a clear indication of the challenges we face with predators in Washington. Our state is already stretched thin managing various predators. Given the pressures on our ungulate populations, reintroducing grizzlies seems unwise.

16. I'm writing to express my concerns about reintroducing grizzly bears in Washington. Their natural migration from regions like BC and Idaho is evident. With the state's current wildlife management challenges, adding another apex predator seems ill-advised.

17. The American Bear Foundation of Washington believes that reintroducing the grizzly bear is not in the state's best interest. The challenges posed by the rising numbers of other predators are evident. Introducing grizzlies would only add to these challenges, endangering both humans and wildlife.

18. The North Cascades are a haven for many, but the potential reintroduction of grizzly bears raises safety concerns. The incidents in states like Wyoming are a testament to the risks. Grizzlies can naturally migrate from nearby regions, so human intervention seems unnecessary.

19. The North Cascades are a sanctuary for many outdoor activities. However, the existing grizzly bear population, as noted by the Washington Department of Fish and Wildlife, is already a concern. Adding more bears could jeopardize the mule deer and increase risks for visitors. I oppose this move.

20. The grizzly bear situation in Stevens County highlights the predator challenges in Washington. With the existing predator population and the pressures on our ungulate herds, reintroducing grizzlies seems counterproductive.

21. I wish to voice my concerns about the potential reintroduction of grizzly bears in Washington. Their presence, migrating from regions like BC and Idaho, is already noticeable. Given the state's wildlife management challenges, reintroducing more apex predators is concerning.

22. The American Bear Foundation of Washington is clear in its position: reintroducing the grizzly bear poses significant challenges. The state's current predator management issues are evident. Introducing grizzlies would exacerbate these issues, putting both humans and wildlife at risk.

23. The potential reintroduction of grizzly bears in the North Cascades is alarming for many of us who frequent the area. The experiences of states like Montana serve as a cautionary tale. Grizzlies have every opportunity to migrate naturally, so human intervention seems unwarranted.

24. The North Cascades are a favorite for many outdoor enthusiasts. However, the presence of grizzly bears, as confirmed by the Washington Department of Fish and Wildlife, is concerning. Introducing more bears could harm the mule deer population and increase risks for visitors. I'm against this proposal.

25. The recent grizzly bear capture in Stevens County underscores the challenges we face with predators in Washington. Our state is already dealing with various predators. Given the pressures on our ungulate populations, reintroducing grizzlies seems ill-advised.

26. I'm writing to express my reservations about reintroducing grizzly bears in Washington. Their natural migration from regions like BC and Idaho is evident. With the state's current wildlife management challenges, adding another apex predator seems ill-advised.

27. The American Bear Foundation of Washington believes that reintroducing the grizzly bear is not in the state's best interest. The challenges posed by the rising numbers of other predators are evident. Introducing grizzlies would only add to these challenges, endangering both humans and wildlife.

28. The North Cascades are a haven for many, but the potential reintroduction of grizzly bears raises safety concerns. The incidents in states like Wyoming are a testament to the risks. Grizzlies can naturally migrate from nearby regions, so human intervention seems unnecessary.

29. The North Cascades are a sanctuary for many outdoor activities. However, the existing grizzly bear population, as noted by the Washington Department of Fish and Wildlife, is already a concern. Adding more bears could jeopardize the mule deer and increase risks for visitors. I oppose this move.

30. The grizzly bear situation in Stevens County highlights the predator challenges in Washington. With the existing predator population and the pressures on our ungulate herds, reintroducing grizzlies seems counterproductive.

31. I wish to voice my concerns about the potential reintroduction of grizzly bears in Washington. Their presence, migrating from regions like BC and Idaho, is already noticeable. Given the state's wildlife management challenges, reintroducing more apex predators is concerning.

32. The American Bear Foundation of Washington is clear in its position: reintroducing the grizzly bear poses significant challenges. The state's current predator management issues are evident. Introducing grizzlies would exacerbate these issues, putting both humans and wildlife at risk.

33. The potential reintroduction of grizzly bears in the North Cascades is alarming for many of us who frequent the area. The experiences of states like Montana serve as a cautionary tale. Grizzlies have every opportunity to migrate naturally, so human intervention seems unwarranted.

34. The North Cascades are a favorite for many outdoor enthusiasts. However, the presence of grizzly bears, as confirmed by the Washington Department of Fish and Wildlife, is concerning. Introducing more bears could harm the mule deer population and increase risks for visitors. I'm against this proposal.

35. The recent grizzly bear capture in Stevens County underscores the challenges we face with predators in Washington. Our state is already dealing with various predators. Given the pressures on our ungulate populations, reintroducing grizzlies seems ill-advised.

Correspondence: Dear Superintendent Striker and Supervisor Thompson,

I am writing to support the restoration of a healthy population of grizzly bears in the North Cascades, their home for thousands of years. I am a frequent visitor to this area and have hiked the trails of the North Cascades for the last 40 years.

I support Alternative C: Restoration with Section 10(j) Designation. Alternative C is the best choice for bears and the people who live and visit the North Cascades Ecosystem. As you are aware, the plan is modeled on what has worked in Montana where grizzlies are recovering in the Cabinet-Yaak mountains with few problems and with the acceptance and involvement of local communities.

The 10(j) rule will provide important management tools to reduce, prevent, and sometimes respond to human-bear conflict. I believe that the 10(j) rule if properly implemented, will help increase human acceptance of grizzly bears as they return to this part of their historic range.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please bring back this native species to Washington State through the strategy laid out in Alternative C. Doing so will restore an important piece of a key western ecosystem, regional culture, and natural heritage.

Thank you for leadership on this important issue and for your consideration of my views.

Correspondence: My family and I (four tax-paying and voting residents of Washington State have previously lived for many years in the "grizzly country" of northwest Montana. We support restoration of a healthy grizzly bear population in the North Cascades. We note that grizzlies lived there for thousands of years before they were exterminated by colonizing settlers. And we know that grizzly bear country also has clean water, abundant native fish, and many other healthy wildlife populations. Bears are keystone species!

We have first-hand knowledge that people and grizzly bears can coexist and thrive. We know they do so in British Columbia, Montana, and Wyoming, where grizzly populations and back country recreation continue to grow, providing vital economic benefit to adjacent, local communities.

We are heartened to learn that public opinion polls have shown broad support for grizzly bear restoration in Washington, which includes many who live in the North Cascades.

We support Alternative C: Restoration with Section 10(j) Designation. We agree that Alternative C is the best choice for bears and people who live in and visit their North Cascades Ecosystem. This plan wisely echoes what's worked in Montana, where grizzlies are recovering in the Cabinet-Yaak Mountains. Restoration there has proceeded with few problems, and active educational programs have increased acceptance and supportive involvement of local people and communities.

We think it wise that the 10(j) rule will give more management tools to reduce, prevent, and respond to human-bear conflict. If properly implemented, the 10(j) rule should increase peoples' acceptance of grizzly bears as they return to the landscape.

Please bring back this important native species to our state through the strategy laid out in Alternative C. Doing so will restore a vital piece of this ecosystem, our regional cultures, and natural heritage.

Thank you for working to restore ecosystem balance and keeping the North Cascades wild!

Sincerely,

[REDACTED]

Correspondence: We have already ruined the bears chance to survive. Our communities and lives have moved on. We had the chance to preserve the bears and blew it. Why reintroduce an old concept to the modernized cascades? Even Harts pass has become a tourist mob... do you really expect adding bears to the overwhelming mobs a good thing? I am against this! The time and effort would be better spent managing the already overwhelming crowds and destruction to what little ruggedness remains.

Correspondence: While I understand and appreciate the desire to restore the grizzlies to their natural habitat for ecological reasons, I find the second listed objective ("Provide Pacific Northwest residents and visitors with the opportunity to again experience grizzly bears in their native habitat.") to be quite puzzling. As an avid hiker, experiencing a grizzly in their native habitat is, frankly, terrifying. I recognize that this was originally their native habitat and we have pushed them

out, but I'm truly concerned about the impact it will have on outdoor recreation in the area. Even when hiking in established bear country (such as in Banff) it's surprising how many people are ill-prepared for a potential grizzly encounter, and I fear for the potential repercussions of unknowing hikers encountering them in Washington state. There's already enough groan-inducing headlines of tourists in other national parks.. So, I'm voicing my opinion and desire that grizzlies are not reintroduced into the area.

Correspondence: DO NOT re-introduce grizzly bears to the N. Cascades. This ecosystem cannot support more grizzlies. Grizzlies can already access this area from Montana, Idaho and Canada. If "the ecosystem" could provide everything the bears need, there would already be a viable population. And there isn't. If you bring more bears into the ecosystem, they're going to go elsewhere for their needs. Farms, back yards, ranches. There's a lot of private property in the N. Cascades ecosystem. All the people making this proposal live elsewhere. You need to consider the rights and needs of the people who live there. They're already supporting the Washington Fish and Wildlife's elk. They shouldn't have to support grizzlies too. Any grizzly-human encounter is not going to go so well for the human. I SAY NO TO RE-INTRODUCING GRIZZLIES TO THE N. CASCADES ECOSYSTEM.

Correspondence: As an avid hiker and a person who usually hikes with a dog I am against the reintroduction. I understand the ecological size of things, such as how the reintroduction of wolves some places helped with population controls and

revitalized the rivers, but I haven't seen much in terms of concrete examples of how grizzlies are a keystone species in ways that back bears, mountain lions, coyotes, and wolves don't already fill. Grizzlies primary spring food source being meat is concerning. I know they live plenty of places without much negative interaction with humans. As an area with so much front and back country recreation I just don't think it is advisable.

Correspondence: Thank you for the opportunity to comment. For the record, I am OPPOSED to the introduction of grizzly bears into the North Cascades under any conditions.

There are already too many hikers and backpackers in the back country. Adding grizzly bears to the mix is just inviting conflict, injury, and death to people - and bears.

To naively believe that "berry eating bears" won't eventually discover salmon to eat is folly. Bears are omnivores and opportunistic - they will eat whatever is easily available and nutritious for them. With such a keen sense of smell it should not take them long to discover salmon!

I like fishing the high lakes. I do this for the invigorating hike and the satisfaction of catching trout on my own hand-tied flies. I don't want to have to be constantly on guard, looking over my shoulder, for a grizzly bear.

While it is easy to romanticize the arrival of grizzly bears roaming free and wild in the North Cascades by viewing NPS pictures of mama bear and cub from the comfort of one's living room, equal time should also be given to those unsuspecting folks who have been maimed or killed by a provoked grizzly. We never see those photos, yet those photos would depict the unfortunate reality of human-bear encounters.

When I hike thru wilderness areas, there is enough "wild" for me as provided by wolves, goats, black bears, cougars, elk, deer, marmots, pikas, and all the rest. I don't need grizzly bears to feel the "wild".

While I suspect that the decision to introduce grizzlies into the North Cascades has already been made, and that allowing a comment period, though a required step of the process, is likely a futile attempt to push back on that decision, again I firmly say NO to grizzly bear introduction to the North Cascades.

Correspondence: I strongly support the National Park Services preferred Alternative C: Restoration with Endangered Species Act Section 10(j) Designation. It's only because our American ancestors hunted grizzly bears almost to extinction that we even have to debate this reintroduction. Let Grizzly Bears return, and this time let's try to remember that grizzlies are an integral part of the forest ecosystem, and let's let them LIVE!!!

This plan will both effectively restore grizzly bears in North Cascades National Park and give people the tools they need to thrive in and around grizzly bear country. Grizzlies belong in the North Cascades, as they enhance the park's ecological integrity and contribute to its wildness.

Grizzly bears play a vital role in maintaining ecosystem balance, cycling nutrients, dispersing seeds, and changing the behavior of species around them. Restoring them would benefit the park and the people who use it.

A restored population of grizzlies will boost the park's appeal and attract nature enthusiasts, scientists, and tourists from around the world. This would provide economic benefits to local communities and support the park's mission to protect park resources in perpetuity.

Alternative C, with the 10(j) rule, provides managers flexibility to address community concerns while protecting the grizzly population. It ensures coexistence between humans and bears.

Please consider the positive ecological and economic benefits and support Alternative C. Restoring grizzly bears will secure the park's natural heritage and conserve an iconic species for current and future generations.

Thank you for your dedication to our national parks.

Correspondence: To Whom it May Concern,

I am writing to express my deep concern regarding the plans to reintroduce grizzly bears into the North Cascades ecosystem in Washington State. As a resident and an avid outdoor enthusiast, I understand and value the importance of biodiversity and the restoration of natural habitats. However, I am troubled by the potential risks this reintroduction poses to the safety of the public.

I acknowledge that grizzly bears are a part of our nation's wildlife heritage and that their presence can be a symbol of a healthy and balanced ecosystem. Nevertheless, they are aggressive and dangerous predators. This year alone, four Montana state residents were killed by grizzly bears and I feel that reintroducing these bears to Washington state -- a more densely populated state -- will result in human fatalities. It is imperative that we learn from these annual fatalities to ensure the utmost safety of those who visit and enjoy our wildlife areas.

The reintroduction of a top predator like the grizzly bear is a decision with significant implications. There will eventually be families who will lose their loved ones because of this action. These inevitable future victims will not remain nameless. Knowing this, how can anyone with good conscience willfully choose to reintroduce such a predator? Who will be held accountable for those unnecessary deaths? Most importantly, how should the local residents feel about the willful introduction of a mortal hazard on behalf of the Federal Government?

We are stewards of our nations wildlife on behalf of future generations but we are also obligated to establish and maintain a safe environment for those future Americans as well. Bears often eat people.

Sincerely,

██████████

Correspondence: I could not be more opposed to the reintroduction of grizzlies to the North Cascades. It is a horrible idea to have grizzly bears roaming the North Cascades again. These are not the mountains of 100 years ago when grizzlies were here. Unlike WY, MT, and ID, the people and communities inhabiting the North Cascade range are unaccustomed to grizzlies. The human residents of this habitat came here knowing that there were no grizzlies. And we neither want nor need grizzlies back in this area. Encounters between bears and humans will be inevitable. The negatives of having grizzlies back in the Cascades far outweigh the few, if any, benefits to the ecosystem.

Correspondence: I am writing to support the restoration of a healthy population of grizzly bears to the North Cascades, their home for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations.

I support Alternative C: Restoration with Section 10(j) Designation. Alternative C is the best choice for bears and the people who live in and visit the North Cascades Ecosystem. The plan is wisely modeled on what's worked in Montana where grizzlies are recovering in the Cabinet-Yaak mountains with few problems and with the acceptance and involvement of local communities.

Furthermore, the 10(j) rule will give people more management tools to reduce, prevent, and respond to human-bear conflict. I believe that the 10(j) rule if properly implemented, will help increase human acceptance of grizzly bears as they return to the landscape.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please bring back this native species to our state through the strategy laid out in Alternative C. Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

Thank you for taking the time to keep our North Cascades wild!

Correspondence: As a long-time resident of Klickitat County, I want to register my vote
.....AGAINST having Grizzly Bears being released into our County,
or anywhere within 1,000 miles of Klickitat County.

IMHO, who ever thought up this plan, is either seriously uneducated, naive, or flatly... insane.

Grizzlies are notorious for considering everything and everyone they see, as being their dinner. They're also notorious for being aggressive and they hold no fear of anything in their path. They know, that they are at the top of the predator chain.

At present, there are plenty of predators... already residing within the confines of Klickitat County. These aggressive predators are, coyotes, cougars, and Bald Eagles. Each species is quite capable of taking down... children, pets, and livestock of all sizes.

Grizzlies not only can take down... children, pets and livestock of all sizes, but they're well known for being able to tear apart buildings, out of both simple curiosity, as well as looking for food.

No one is safe, in the path of even one Grizzly, and in a group (mother & cubs), that danger escalates...exponentially!!

Correspondence: I am strongly in favor restoring grizzlies to the north Cascades. This restoration must be done by means that are compatible with the terms of the Wilderness Act and are in keeping with its wild character. Unfortunately, both of the action alternatives as presented would violate the Wilderness Act. Specifically, an alternative must be developed that avoids helicopter landings in and flights over Wilderness. Instead, bears can be released from any of the many roads that crisscross the recovery area or terminate at the edge of the Wilderness. I also oppose the placement and use of telemetry installations, and any management strategy for the bears that calls for trapping, sedating, or otherwise molesting the bears once released. Additionally, I strongly oppose the use of a 10(j) rule for the grizzlies in the restoration plan, as this would entail taking grizzlies currently fully protected under the Endangered Species Act (ESA) in places like Montana and dropping them into the north Cascades, where they would lose their previous protection. Moreover, it is not as though Montana has grizzlies to spare to relocation. Grizzlies in Montana have not yet recovered under the Endangered Species Act, and any grizzlies dispersing from Glacier or Yellowstone are needed to recover areas like the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest.

It is thus imperative that a natural recovery alternative be fully developed and analyzed, even if recovery would take longer than active repopulation. Information presented by Superintendent Striker regarding likely natural migration of bears from Canada suggests that much of the current apparent urgency for repopulation may be more about protecting agency discretion than about protecting Wilderness or creating the best environment for grizzly bears to migrate, live, and thrive.

Furthermore, natural recovery measures must be included in whatever plan is implemented so as to reduce the reliance upon activities that would degrade the environment for grizzlies and other species. This needs to include a partnership with British Columbia to create corridors for bears to travel across the border in search of food and mates, to prevent genetic stagnation and inbreeding.

Finally, the no-action alternative has many good provisions covering how people and communities can coexist with grizzlies, and these measures must be included in whatever action is implemented. All possible measures must be taken to prepare residents and visitors for bears, particularly given the dramatic growth of the human population in the region and rapidly increasing recreation pressures in the Park. It is incumbent upon agencies to anticipate possible points and means of interaction, and to protect both humans and bears, and to ensure that no situation ever reach the point that lethal means be used to resolve a conflict with a bear.

Correspondence: To Whom It May Concern:

Please restore grizzlies to the North Cascades, and do so in ways that don't violate the Wilderness Act or harm the area's wild nature.

The action alternatives should be modified to avoid helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and heavy-handed management of bears.

Please ban relocating grizzlies out-of-state, as this may void their ESA protections.

A natural recovery alternative must be fully developed and analyzed. This may require work with British Columbia to ensure that grizzlies have corridors to move back and forth across the international border and to prevent a small North Cascades grizzly population from shrinking over time and becoming inbred.

All possible measures must be taken to prepare residents and visitors for bears.

Thank you for your consideration on this matter.

Correspondence: I am writing to support the restoration of a healthy population of grizzly bears to the North Cascades, their home for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations.

I support Alternative C: Restoration with Section 10(j) Designation. Alternative C is the best choice for bears and the people who live in and visit the North Cascades Ecosystem. The plan is wisely modeled on what's worked in Montana where grizzlies are recovering in the Cabinet-Yaak mountains with few problems and with the acceptance and involvement of local communities.

Furthermore, the 10(j) rule will give people more management tools to reduce, prevent, and respond to human-bear conflict. I believe that the 10(j) rule if properly implemented, will help increase human acceptance of grizzly bears as they return to the landscape.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please bring back this native species to our state through the strategy laid out in Alternative C. Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

The North Cascades Grizzly Bear Recovery Zone (NCGBRZ) is the second largest of six such designated areas at nearly 10,000 square miles. Combined with contiguous protected areas in British Columbia, including Manning Park, there are 14,000 square miles of productive, wild habitats, wilderness, and roadless areas.

People and grizzly bears can coexist and thrive. They do so in British Columbia, Montana, and Wyoming where grizzly populations and back and front country recreation continue to grow hand in hand, providing a vital economic boost to those areas' gateway communities.

Grizzly bears lived in Washington for thousands of years. We still have a small population in the NE WA Selkirk Mountains. However, currently, there are no grizzly populations in the United States or Canada that are large enough or close enough to serve as a source to naturally repopulate the North Cascades.

Having wiped out the grizzly bear over the past 150 years we now have the unique opportunity and the ethical obligation to restore them to their native home, where suitable habitats still exist.

Grizzly bears are ecologically and culturally significant and are vital to the overall health of the North Cascades ecosystem and its biodiversity. They are considered an indicator of ecosystem health.

Restoring grizzly bears as an "Experimental, non-essential" population under a well-crafted Section 10(j) rule of the Endangered Species Act makes sense. Such a designation will provide flexibility for wildlife managers to prevent and address human-bear conflict and a greater level of comfort for people who are concerned about the impacts of wildlife

recovery on economic and recreation activities. Agencies have used the Section 10(j) Rule in the past to restore black-footed ferrets, California condors, wood bison, and many others.

Correspondence: It is with joy that we at BEA can finally submit a comment regarding the long-overdue reintroduction of the grizzly Bear back into the North Cascades ecosystem. This is a premier place to have this happen because 1- it is a huge and mostly undeveloped area teeming with natural resources and 2- because it is a historical area where grizzlies thrived until hunted out.

Although we would dearly like this species to be fully protected under the ESA law, we understand the need for the Alternative denoting the population as " Experimental" is more palatable for more stakeholders. Having flexibility in a situation where a predator such as the grizzly bear is being introduced is frightening to many, and it is possible selecting this alternative would be more facultative of these long term efforts, but especially in the short run.

Research that focused in the overall impacts of restoring a keystone predator species has been clear in its conclusions:

restoration of a predator helps not only stabilize populations of prey animals, but it also has had beneficial consequences on trees, plants and grasses. Hence, our support for another introduction of an animal that might help restore and/or maintain the entire North Cascades system, crucial in light of climate change occurrences.

We thank you for your support of this project .

Correspondence: I support restoring a grizzly bear population to the area. Not only do animals have a right to live and flourish as much as humans do, but they are also a vital part of our ecosystem. Large predators such as grizzly bears create a balance to the natural ecosystem. They remove sickly animals that could spread disease, control animal populations, and help

build a more natural balance of plant life in an area. We have seen in Yellowstone with the reintroduction of wolves how powerful keystone species can be to transforming an ecosystem to be healthy for everyone. Humans and grizzly bears can live in peaceful co-existence. Yes there will be encounters but they will be rare and if you treat the animals with respect they will be no harm to us. Part of going into nature is seeing animals. We do not mind seeing deer despite the fact that they sometimes attack. All animals are defensive sometimes but we do not mind other types. Just the big predators are eliminated and that is a problem. We need our natural predators to establish the correct biodiversity in Washington state. I fully support the re-introduction of grizzly bears and any other apex predators such as wolves, coyotes, black bears, etc back into our wild areas as a vital part of correcting the damage humans have done to our natural environment. We can, will, and must learn to live in peaceful co-existence for a better future for the planet.

Correspondence: Hello,

I would like to comment on this plan. I am a US Citizen who loves the outdoors and its wildlife. However, while grizzlies are charming on a picture, they are well known to be dangerous for backpackers even if backpackers take all advertised precautions. The Washington Cascade range is very beautiful and currently one of the only mountain range in the US without grizzlies. When I think about going into the mountains, I think twice about going to a place with grizzlies, so Europe is my natural place to go but is quite further away from the US.

I feel that adding grizzlies to the Cascades would detract from going there as the cascades have sufficient amount of issues to deal with while backpacking: - with the wilderness from the Cascades, one has to reckon with water, backpack weight, navigation, etc. Adding the stress of not knowing if a Grizzly is around would add to those stressors in a significant way. I believe this would detract backpackers from going to the Cascades (think PCT backpackers who would be affected) and I wouldn't think US fish and wildlife personnel would want lower amount of backpackers in Washington. My opinion.

Sincerely and thanks for reading,

Correspondence: I respectfully submit that the people who are proposing to reintroduce grizzly bears to the Cascades are insane.

The animals are killing machines, and one of them killed my great-grandfather Benjamin Hamby in Montana in the late 19th century, destroying the family's westward expansion. I feel certain that if a legitimate poll were taken of the people who will actually have to live amongst the reintroduced bears, it would be overwhelmingly defeated. Of course, if the polled area were gerrymandered to include Seattle, the poll would favor grizzlies in everyplace except Seattle.

The flawed premise of these foolish restoration projects is an outgrowth of Rousseau's philosophizing, that mankind has fallen from nature's perfect paradise and that all efforts should be used to recover that lost innocence. But to quote Lady Bracknell from *The Importance of Being Earnest*, "that reminds one of the worse excesses of the French Revolution. And I presume you know what that unfortunate movement led to." Humankind has manipulated the "wilderness" since the beginning of time.

The news article where I read of this project mentioned that some indigenous tribes support it because it comports with their traditions and religion. So what? Why should these tribes' benighted superstitions have any more value than some of those of other religions that we have thankfully gotten past, say witch burning or executing homosexuals.

In sum, this project is based not on some scientific principal or discovery, but on a particular absurd philosophical hobbyhorse. And to refer to another French thinker, Voltaire wrote: "Certainement qui est en doit de vous rendre absurde est en doit de vous rendre injust," which is often translated as: "Anyone who can make you believe absurdities can make you commit atrocities."

Correspondence: I support bringing in more grizzlies to the North Cascades. Balancing the ecosystem we have unbalanced with our unchecked development and open grazing laws has been destructive to the natural environment. If ranchers are concerned, they should not open graze, put electric fences around their herds, problem solved. We have messed with our environment for so long, developed land that should have been left to wildlife, it's time to do the right action. Bring the grizzlies back.

Correspondence: In this vastly overpopulated world, it gives me great comfort to know that a few places remain on earth where things are still wild. Please, by all means speed the introduction of grizzlies into the North Cascades not only for me but also my children and grandchildren. The positive affects on the ecosystem will be substantial and the existence value of a pristine ecosystem in the lower 48 is priceless. Count me as completely in favor of the plan.

Sincerely,

██████████, Ph. D. Natural Resource Management

Correspondence: As an avid hiker in our national parks I have had the opportunity several times to hike and enjoy North Cascades National Park. According to the NPS website grizzlies currently live in the park so the question is why artificially increase their numbers? What exactly is the purpose and how is this beneficial? The risk to humans using the park would increase as considerably more apex predators would exist.

Correspondence: I would like to express my support for the recovery and augmentation for the grizzly bear recovery in the North Cascades Ecosystem. Grizzly bears, since the retreat of the Cordilleran Ice Sheet, have been part and parcel to the

Pacific Northwest coastal and mountain regions. They played a vital role in sculpting the various habitats by aerating soil, dispersing seeds, helping pollinate plants, and dispensing nitrogen through the forest. Grizzlies, with their wide-ranging diet, in the Greater Yellowstone Ecosystem relying on some 266 different food sources, indicate the overall health of an ecosystem, making them a very valuable umbrella species that would allow research to be carried out on a plethora of different species of flora and fauna through their direct and indirect connection to the grizzly bear. They are also culturally significant to many first nations and indigenous tribes of the Pacific Northwest, which by virtue means they should be restored and respected.

With all the reasons that the grizzly should be returned, there is also great need for caution and a robust recovery plan with set goals for recovery which, when achieved, should be strictly adhered to. This requires the challenging work of seeking the valued observations, concerns, and culturally significant points of many different stakeholders involved in the matter, including tribes and first nations people, ranchers and other agricultural producers, hunters, naturalist, scientists, and members of the rural communities who will live in bear country. In addition, the ESA cannot be used or perceived by the public as government overreach or as a tool to keep bears protected forever. This has been an ongoing problem with the rocky mountain population for nearly 15 years where both the NCDE and the GYE populations have met recovery objectives but remain on the ESA.

As important as bears may be, they are potentially dangerous, and without proper education for locals and tourist alike, can potentially cause human fatalities. A robust and rigorous approach to education to mitigate as much possible fear and poor practices will be required by federal and state agencies along with NGO partners to provide this education.

It should also be noted that the public has a right to know why the bear is being considered for recovery. In much of the literature I have read on sites such as NPS, USFWS, and Conservation Northwest, it simply states that we wish to restore it to its historic grounds and/or the bear is an apex predator (which is not entirely true). This project, which is going to costs millions in taxpayer dollars as well as increased fundraising campaigns and grant proposals by both government and non-profit agencies and organizations, should offer complete transparency about the costs, risks, and ecological role of the grizzly bear in its relation to the North Cascades Ecosystem. To vaguely state that "it was there in the past," does not due diligence to the bear or the stakeholders who will be impacted by the bear. Information on the ecological benefits, and how that roles differs from the already robust population of black bears is vital information for the public to know.

As a career environmental educator/naturalist who has taught seminars and lead multi-day bear tours and educational programs specifically about grizzlies in Denali and Yellowstone, I can say through my observations of both bears, tourists, and locals, that the key to recovery is education, and transparency of information. In a contentious political climate with wildlife being a very polarizing topic, it is important to respect everyone's concerns, and provide accurate information and develop an effective and detailed outreach/education plan for all stakeholders to receive the most accurate, up-to-date, and easily comprehensible information related to all aspects of the recovery effort. Urban environmentalists should be aware and be able to empathize with the challenges and potential dangers for rural agricultural producers living in bear country. Comparatively, ranchers and rural communities should be privy to information on the ecological benefits of the grizzly, justification for increased tax monies going to grizzly recovery, and feel supported and heard by the federal, state, and non-profit agencies involved to maintain their safety and way of life. This project will present many challenges, but with rigorous science and a detailed education/outreach plan, I feel that the recovery efforts can be successful and therefore should move forward with action alternative C of the recovery efforts. Augmenting a small number (3 -7) grizzlies per year will give both the bears and the public time to adapt and grow together toward a viable population and enhance the overall ecological health of the North Cascades Ecosystem.

Thank You

Correspondence: I am writing to support the restoration of a healthy population of grizzly bears to the North Cascades, their home for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations.

I support Alternative C: Restoration with Section 10(j) Designation. Alternative C is the best choice for bears and the people who live in and visit the North Cascades Ecosystem. The plan is wisely modeled on what's worked in Montana where grizzlies are recovering in the Cabinet-Yaak mountains with few problems and with the acceptance and involvement of local communities.

Furthermore, the 10(j) rule will give people more management tools to reduce, prevent, and respond to human-bear conflict. I believe that the 10(j) rule if properly implemented, will help increase human acceptance of grizzly bears as they return to the landscape.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please bring back this native species to our state through the strategy laid out in Alternative C. Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

Thank you for taking the time to keep our North Cascades wild!

Correspondence: Alternative C is an 'action alternative' and would designate grizzlies in the area as an experimental population under section 10(j) of the Endangered Species Act. Both Alternative B and C options would add 3 to 7 bears each year to the ecosystem over the next 5 to 10 years until a total of 25 bears is reached.

*This designation would give communities and land managers additional options for managing bears, including deterrence, relocation, or removal of animals involved in a conflict. These additional tools could offer more safety and certainty for the region, while still providing for the recovery and conservation of the species.

Correspondence: First I'd like to say why didn't the Forest service make this community a priority for meetings? And why not several or at least 2 or 3 dates so people can plan & workaroud different schedules?

As a Foothills resident and having lived in Washington about 50 years, Whatcom county since 1990, I have concerns.

#1 I am in support of grizzly's being reintroduced to the North Cascades, I'm more likely to be negatively affected but I realize the value of being a caretaker for the earth & boosting ways for ecosystems to get back to taking care of itself or as close to that as we can.

#2 Any idiot who hikes or recreates in these mountains and says they "don't want to see wildlife", or specifically bears, isn't equipped to handle a walk in the woods. They need to be educated on the value of not stinking up nature by sanitizing it for humans. There's a reason for each animal and humans have screwed up the balance that God gave us in nature so catastrophically that we have to act to bring it back in balance. Sadly, that still won't be enough.

#3. Arguments against grizzlies because of salmon need to look at the science. Brown bears in Canada and Alaska generally feed on flora, fauna & mammals not fish. The coast grizzlies feed on fish. Look it up. Kind of like transient Orcas feed on mammals but local pods feed on salmon.

#4. Grizzlies keep the ecosystem in balance. What do we have without them? Ever been to an area with too many mountain lions, over run with deer and coyotes? That is a system out of balance. Grizzlies repopulate the forest with necessary diversity of seeds in their scat.

#5. Grizzlies don't want to deal with humans and generally won't if u stay out of their territory. Frankly, they might be the only thing that saves the North Cascades from becoming loved to death by humans.

#6. In the last 10 years our trails have gone from soft earth to hard pack due to human steps. The roads are clogged with idiots who can't tell when a trailhead is TOO CROWDED ,and a one lane road with no pullouts coz some idiot parked there, can't handle people coming and going. You think a grizzly will be by that trail any time soon, dream on.

#7. Ranchers with cattle & sheep have been grazing their herds in the wilds of the North Cascades FOR FREE for decades. It's time for us to quit subsidizing their earnings and let them live with nature & that means living with grizzlies. I'm not against culling bears that humans have trained to love trash nor am I against some measure of protective killing for grazers.. with close oversight.

#8. Finally, Rangers need the resources to get out in the community both to talk about all of the above and to continuously educate folks on what those beautiful mountains mean. Including fire management & who uses the forest and their responsibilities when they are in it.

Wilderness IS NOT a beautiful place to see nature . True wilderness means humans don't get to ruin the earth in that location and we don't have that anymore. We never will even if we introduce grizzlies to this area again.

Correspondence: I support the restoration of grizzlies to the North Cascades, and that the restoration must be done in ways that don't violate the Wilderness Act and harm the area's wilderness character. This is good for bears and Wilderness. Both of the action alternatives as they now stand would violate the Wilderness Act. The action alternatives should be modified to avoid helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and steer clear of heavy-handed management of bears. There are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites without the use of helicopters inside Wilderness.

I oppose the use of a 10(j) rule for the grizzlies in the restoration work. This would mean grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana would be taken from their homes, dropped into the North Cascades, and lose their previous protection.

Montana doesn't have any "extra" grizzlies to lose to the North Cascades. Montana grizzlies are not yet recovered under the ESA, and any dispersing grizzlies from Glacier or Yellowstone are needed to naturally recover areas like the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest.

Correspondence: Attendance at Winthrop's Grizzly event overflowed the parking lot, and was mostly standing room only inside. A show of hands requested by one of the 1st hour's speakers indicated about a 50/50 split among attendees. However the anti-Grizzly bear folks with their big Hollywood style "cowboy" hats were too shy to sit in the front row with my pro-Grizzly bear friends, and none of these anti-folks claimed to represent the huge memberships such as the Sierra Club and Conservation NW. There were 4 empty seats next to Doug Anderson (another xc-skier) and I, in the front row, during the first hour. Many attendees who drew numbers to speak were too shy to do so. My Swiss wife went hiking instead. I had more trouble with Moose and tourists, than Grizzlies when I rangered in Denali, but found most hikers oblivious to their surroundings including Grizzlies. The Griz however could easily smell the tourists, and avoided them. Oh, I favor alternative C, in case you're still counting.

Correspondence: I attended a public meeting in Cashmere, WA (Chelan County) several years ago on the subject of restoring Grizzly bears to the North Cascades. The public sentiment, like the one recently held in Darrington, was overwhelmingly against the idea on reintroducing the species from outside North Cascades. Conversely, the majority comments were to let the bear population take a natural hold on their own. I have been roaming the Cascades in the past 45 years and have spotted Grizzlies from time to time but only took notes and never reported it. Same thing is true with a lot of other sportsmen/hunters or outdoor recreation enthusiasts. The proposed area of the release north of I-90 corridor is heavily populated and we will encounter conflict if the number of bears reach the target population in 40 to 50 years. By that time, the projected human settlements and activity will grow exponentially. It is a bad idea and I strongly oppose the plan. Thank you for the opportunity to comment.

Respectfully submitted,

Correspondence: I'm very much in favor of restoring grizzly bears to the N. Cascades. When apex predators are removed from an ecosystem, that ecosystem becomes fundamentally changed. I appreciate that the concerns around salmon populations has been thoughtful addressed by selecting specific, non-salmon eating bears. This opportunity to reintroduce and re-establish a self sustaining population should not be passed up because people are afraid of bears. Environments like the N. Cascades are wild in large part because of the animals that call this place home. The threat that bears pose to humans is wildly overstated and I would consider myself fortunate to see a grizzly in the wild. I'd probably find myself in need of a change of pants, as well.

Correspondence: Restoration of a complete ecosystem would benefit the ecosystem as been demonstrated in Idaho, Montana. Half interested humans may protest the action to restore ecosystem health but their objections should be identified as what they are which is selfish and deliberate ignorance and disrespect of the north Cascades ecosystem. Please continue at full speed to restore the north Cascades ecosystem by bringing back bear and wolf population to pre European settlement levels. If the European descendents object, then remove their objections by removing their access to the area. If takings are necessary by law then let's pay for their access and property and remove them to a safer less natural place.

My request is based upon well known science and traditions. In addition, I note that indigenous people have a long history of ecosystem knowledge and integration and should be included in the management of north Cascades area including all of north washington. It is after all their cultural and traditional rights also. Please include Shoshone, colville, Yakima, cour d alene, coastal, tribes in consultation and management of this important ecosystem.

Correspondence: I support the restoration of grizzlies to the North Cascades, and that the restoration must be done in ways that don't violate the Wilderness Act and harm the area's wilderness character. This is good for bears and Wilderness.

Both of the action alternatives as they now stand would violate the Wilderness Act. The action alternatives should be modified to avoid helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and steer clear of heavy-handed management of bears.

I also oppose the use of a 10(j) rule for the grizzlies in the restoration work. This would mean grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana would be taken from their homes, dropped into the North

Cascades, and lose their previous protection.

Furthermore, Montana doesn't have any "extra" grizzlies to lose to the North Cascades. Montana grizzlies are not yet recovered under the ESA, and any dispersing grizzlies from Glacier or Yellowstone are needed to naturally recover areas like the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest.

A natural recovery alternative must be fully developed and analyzed, even if recovery would take longer than active repopulation.

For the long-term success of grizzly restoration, natural recovery measures must also be included in both action alternatives thus reducing the need for wilderness degrading activities that are also ultimately bad for bears. This requires work with partners in British Columbia to ensure that grizzlies have corridors to move back and forth across the international border and to prevent a small North Cascades grizzly population from shrinking over time and becoming inbred.

An alternative that combines natural recovery with population augmentation under full ESA protections should also be analyzed.

The no action alternative has many good Bear Smart components on how people and communities can coexist with grizzly bears and these coexistence measures should also be included in both of the action alternatives. All possible measures must be taken to prepare residents and visitors for bears, particularly given the dramatic growth of the human population in the region and rapidly increasing recreation pressures in the Park.

Correspondence: Dear National Park Service,

Thank you for the hard work in drafting a "Draft Grizzly Bear Restoration Plan / Environmental Impact Statement, North Cascades Ecosystem" plan.

I fully support the "Proposed Action--Restoration as an Experimental Population Under the ESA" plan.

All of the listed needs for action such as restoring grizzly bears to their ecosystem from which they've been extirpated, restoration of biodiversity, and an understanding that grizzlies can and will eventually cross international borders are all reasons to take action and propose/use our own standards of re-introduction now.

The ultimate goal of any species work - as cited by the NPS - is to support the recovery of the grizzly bear (or a species) to

the point where it can be removed from the Federal List of Endangered and Threatened Wildlife. The proposed action's preferred alternative does this.

Additionally, the agency asserts that in "the preferred alternative, the agencies considered factors such as the likelihood of successful grizzly bear restoration, public safety, long-term management, impacts on natural and socioeconomic resources, and how well the alternatives meet the purpose and need and objectives of the plan." With the understanding that NPS and its specialists are well-positioned to come to this recommendation, I equally support the preferred alternative (Alternative C).

Please move forward with the proposed action's preferred alternative (Alternative C).

Thank you.

Correspondence: As a long time hiker and who has enjoyed hiking in the Cascades, reintroducing grizzlies seems incredibly dangerous. I'm all for wildlife, but grizzlies are so unpredictable and powerful it seems unsafe to have them where people would regularly be around. I have visited both Glacier and Yellowstone when multiple trails were closed due to unsafe bear behavior (they were bears that followed hikers because they were interested in the food in their packs) and it would be terrifying to experience that here. I also live near Mill Creek town center and there has already been black bears in the surrounding neighborhoods where kids play and people go for their daily runs, and the idea that these could be grizzlies in the future that unsuspecting people could encounter seems really dangerous as well. Thanks for your consideration.

Correspondence: I am writing to support the restoration of a healthy population of grizzly bears to the North Cascades, their home for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations.

I support Alternative C: Restoration with Section 10(j) Designation. Alternative C is the best choice for bears and the people who live in and visit the North Cascades Ecosystem. The plan is wisely modeled on what's worked in Montana where grizzlies are recovering in the Cabinet-Yaak mountains with few problems and with the acceptance and involvement of local communities.

Furthermore, the 10(j) rule will give people more management tools to reduce, prevent, and respond to human-bear conflict. I believe that the 10(j) rule if properly implemented, will help increase human acceptance of grizzly bears as they return to the landscape.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please bring back this native species to our state through the strategy laid out in Alternative C. Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

Thank you for taking the time to keep our North Cascades wild!

Stay wild,

Correspondence: I support the reintroduction of Grizzly Bears into this area.

Those at the meeting who mentioned things like they want to hike in peace or do not wish to encounter the bears (wildlife in general) are not realistic and do not understand that the bears were already here, until

Man made areas and people invaded their space.

I love the wilderness and all it has to offer. I have always been cautious and try to plan ahead should I encounter wildlife. Of course I don't want them harmed and I don't wish to be harmed. But it is us, the humans, who must take the lead by reintroducing them to the area, and setting it up, as much as is possible, our co-existence with the bears, with all wildlife.

As for our salmon population, my understanding is that these bears live on berries, and vegetation. Could they possibly evolve to include salmon into their diet, possibly, but it would most likely take a very long time for that to occur.

People need to realize that the wilderness areas of our state are the homes of our wildlife - including bears.

I'm not able to get out and hike or explore the wilderness any more, but I want my children and the generations after me, to be able to live peacefully, smartly as they experience our wilderness with all wildlife, including grizzlies.

Correspondence: I am not opposed to the natural regeneration of the NATIVE Grizzly Bear population within the State of Washington under ESA and support RCW 77.12.035 Protection of grizzly bears--Limitation on transplantation or introduction--Negotiations with federal and state agencies. "Grizzly bears shall not be transplanted or introduced into

the state... Only grizzly bears that are native to Washington state may be utilized by the department for management programs".

However I am opposed to transplanting Non-Native Grizzly Bears into Washington State.

According to the NPS most of the Grizzly bears in WA had been killed by 1860. The population of the state was certainly more outdoor aware-savvy than today and had determined that apex predators and humans (and their livestock) don't coexist very well, even at WA 1860s human population levels.

More recently Yellowstone's grizzlies have tripled their range and are now moving north out of the national park and grizzlies in the Northern Continental Divide recovery zone are heading south.

Given that the combined population of Washington is 2.54 times that of Montana and Idaho combined, the North Cascades Grizzly Recovery Zone appears to be disproportionately sized in the Federal Habitat Plan when compared to the tri-state population distribution.

According to Montana FW&P throughout the 2010s, for every reported human - bear encounter, there was an average of 23% of the humans injured or killed, and 23% of the bears KILLED. One year it was no humans injured, but 50% of the bears killed. Thankfully the actuals are small, but transplanting Non-Native Grizzly Bears into the more populated Washington State North Cascades Recovery Zone would likely have greater negative consequences.

Correspondence: Restoring and reintroducing any local species to any ecosystem improves that ecosystem, and our environment as a whole. The North Cascades are a vital habitat in need of restoration. Reintroducing Grizzly Bears (Ursus Arctos) or Brown Bears, won't only benefit them, but their habitat, ecosystem, natural resources, tourism, and help reduce our environmental impact, increasing our resiliency to climate change. Any action towards these ends should be supported, as increasing the footprint of preserved and ecologically complete natural spaces is of vital importance. It's simply the right thing to do. Any risk associated with reintroducing bears can be, and has proven to be greatly mitigated with educational programs. Restore habitat. Save one of our great North American mammals. Save our planet. Help Grizzly Bears in the North Cascades.

Correspondence: How many times are people going to have to reject this free for all plan called "Grizzly Bears";Restoration plan.

We don't what this is the State of Washington. Washington State has to many people and we will not be doing justice to these bears. They deserve to be in a less populated area somewhere far north or left along where they thrive now.

Please STOP these notions of reintroducing this animal into a situation like this....

Thank You,

Correspondence: I fully support grizzlies being encouraged to repopulate the North Cascades, but this must be carried out in a way that does not negatively impact the wilderness ecosystem, its character, and ultimately, the bear's habitat.

Both action alternatives involve helicopters, and would therefore violate the Wilderness Act. Helicopters are incredibly intrusive. They spook wildlife with their intense and constant noise, and displace or even kill animals and insects caught in their vortex. There are several roads, and a dead end in the recovery area that borders the official Wilderness. These could easily be utilized to release grizzlies into the Wilderness, as they will naturally move away into this preferable habitat once released.

The 10(j) rule should not be implemented in this case. The grizzlies should remain under the full protection of the Endangered Species Act (ESA), rather than be put at risk of 'incidental harm' under this weaker rule. Being taken from their homes in neighboring states and dropped by helicopter into the North Cascades is incredibly risky in comparison to road transportation, whilst weakening their protection status going forward.

Montana needs all the grizzlies they currently have, because they are still classed as recovering under the ESA. There are no spare grizzly bears! Their natural dispersal from Glacier or Yellowstone is required to repopulate and restore (via trophic cascade) areas such as the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest. Just 25 transplanted grizzlies and 3 naturally occurring grizzlies are believed to exist in these vast areas.

Endangered species should be encouraged to recover by dispersing naturally. This needs to be a valid action option, supported by detailed analysis and development. This would need to involve the removal of man made obstacles - both physical and mental. How we view grizzlies has a huge impact on their recovery. We should consider this slower, but likely more successful repopulation method; allowing the bears to live and thrive, without the shock and risks that the other actions entail; all with full ESA protections in place. The impact of this action on Wilderness would also be negligible, and likely positive.

It is not about how quickly we can move them, but how successful they are over time. They should be able to go at their own

pace. The other actions are a quick fix, with no guarantee of success. They must be urgently reviewed to include natural recovery measures.

The border with British Columbia must be made as permeable as possible, utilizing wildlife corridors, so that the bears can go back and forth at will, whilst we respect and restore former Wilderness; naturally protecting the tiny grizzly population in North Cascades from inbreeding and unnecessary mortality.

The 'no action' alternative has solid Bear Smart actions within it, encouraging coexistence. This should form the backbone of all the action alternatives. If we can't be tolerant of the species, how can we possibly ensure their recovery? With residents and visitors increasing the likelihood of human-bear interactions in the parks, education is key to minimizing the risks to bears and humans.

Correspondence: After hiking the PCT and spending many weeks hunting fishing prospecting in the cascades i can tell you there is no true wild left in Washington State. Due to logging and development the furthest you can get from any road is 11 miles in the entire state. Whats more concerning is where all our big populations of deer and elk are and are not. Our deer are not in the cascades our elk are not in the cascades. The big food mammals are all in populated areas look how many deer were killed in the units around the areas these bears would call home. They dont have the food or habitat to avoid human conflict. This idea will get bears killed due to their unavoidable human interactions.

Correspondence: I am opposed to the plan to relocate any grizzlies from their current habitat to the North Cascades. this places an undue hardship on the bears that will be removed from their current place of living and moved to a different location. These bears will have to adapt to a new area and suffer the stress of being tranquilized and transported. IF this is

done on an "experimental" basis, the bears will be at additional risk of being further relocated, or possibly euthanized if they then come into conflict with humans or livestock in the new areas.

While I appreciate the intention of the organizations to "restore the balance of nature", this seems to be to be once again a case of humans deciding what is "best" for wildlife and interfering with the existing ecosystem. The relocated bears will have to learn to survive in unfamiliar territory. There is considerable risk for conflict with humans, as humans in the North Cascades are not used to recreating with Grizzly bears thus presenting a distinct possibility of unpleasant or dangerous encounters both to the bears and humans.

With increasingly high density of human use on hiking trails in the North Cascades and overuse of many trails, if it becomes necessary to close trails due to bear activity, this will place additional strain on the already fragile ecosystem of overused trails.

I urge you to reject any of the proposals to relocate Grizzly bears to the North Cascades. Please leave these beautiful animals alone to live in their current habitat.

Correspondence: Grizzly bears are a cornerstone species in the ecosystem of the Pacific Northwest and Alaska. Grizzly bears are also unfortunately an endangered species. The North Cascades are one of the most wild and untouched remaining wildlife areas where these critical animals can thrive. Reintroducing them would allow a restoration of the ecosystem as it should be. This effort in its entirety must be pursued in order for the ecosystems of this region to continue to thrive for many years. The North Cascades have a wilderness area which is virtually unmatched in the lower 48. There is only one main road to travel through the park, and access to trailheads can routinely require 1-2 drives off the main road just to reach the

trailhead. When compared to, for example, Mount Rainier National Park, it's easy to see why the North Cascades offers proper wilderness areas that are immensely less trafficked than other national parks. There is always the possibility of human-animal conflict, and for that to constitute bad press for the project. This should absolutely not stop the project from moving forward. Residents of mountain towns misunderstand the project and it's goals, and they seem to think that these bears are going to be outside their homes and wandering around town like you could find in a remote Alaskan village. These bears will still likely rarely be seen by people, and the people who do see them should be well-equipped and well-educated hikers and mountaineers who are deep in the North Cascades. It is important to note that it is extremely unlikely that a Grizzly bear would be seen at a popular area and pose a threat to humans.

The value of the Grizzly bear species and the fact that it is endangered means that the North Cascades should absolutely be home to a new population of this important predator. There is no other wilderness area in the lower 48 which provides a better home for these animals to grow in population and help the recovery of the species.

Correspondence: I am from northwest Washington, and have been following various attempts to bring grizzly bears back to the North Cascades for decades.

I am glad to see this effort resurrected this year, and I hope that some accommodation can be made to bring this keystone predator back to where it belongs. I don't need to reiterate all the reasons for this, as the Park Service and F&WS both know them well. If we provide for the bear, we provide for so many other kinds of wildlife in these wildlands.

Thank you

Correspondence: 11/05/2023

Dear Sirs,

My husband and I volunteer for both the Mt. Rainier National Park and the Mt. Baker-Snoqualmie National Forest as Backcountry Rangers. We have been avid hikers in the state of Washington for many years.

We have noticed the huge increase in the number of people enjoying the forests of Washington post-Covid. Human presence is higher than it has ever been with families backpacking for the first time in wilderness. I want people to enjoy the forests and wilderness like we do. We have a few cougar here, and a few shy Black Bears. Those animals tend to keep to themselves. I have no fear of camping in the backcountry, knowing they are there. If we happen to run across the carcass of a deer in the woods, we move along but don't worry too much about being killed ourselves. The hiking trails here connect with the North Cascades, most notably the Pacific Crest Trail. Many hikers are solo. They and new families have never had to worry about the animals in Washington (except mice).

Brown Bears change all of that. In Yellowstone humans have been killed by Brown Bears protecting an animal carcass. We have so many new hikers here and especially along the Pacific Crest Trail- that human-bear encounters cannot be avoided. The National Forest is requiring bear-proof food containers since last April because of the increase. Trails originating at I-90 can have 1000+ people per day on a week-end, and each year we notice more excursions farther into the woods- up the PCT to Stevens Pass and for many more than pre-Covid, past Stevens Pass to the North Cascades and Canada. Allowing Brown Bear introduction there will be a catastrophe. Humans recreate there.

A Brown Bear male can have a range of 1615 square miles- into Mt Baker-Snoqualmie National Forest. They are aggressive and don't scamper up a tree if surprised by a quiet hiker- they stand their ground and might charge. An emaciated Brown Bear will see a human child as food. I could not imagine the horror of a parent getting between a Brown Bear. They are an Apex Predator and I believe they should be allowed to exist but not where children and solo hikers are enjoying the wilderness.

Dare I ask the question- if Brown Bears are introduced in the North Cascades- how many human deaths would it take before it was deemed a mistake? And how many Brown Bears will get euthanized because they charged a human? I vote for zero, on both counts.

Sincerely,

Correspondence: I think this is a terrible plan for several reasons:

The most important reason, to me, is one I have heard absolutely no one talk about: the animal cruelty aspect. I don't understand how you can think it is not cruel to pluck innocent bears, who are minding their own business and living their lives, out of their homes and transport them somewhere else for your own selfish reasons. Because you think that a wrong was done once upon a time and that these bears would be good for the ecosystem? Well, two wrongs don't make a right. I suppose you think that the bears will adjust and be happy happy. How the hell do you know that? Do you even care? I suppose maybe that is what the African slave traders thought about the Africans, too. Yes, I am indeed equating you with African slave traders.

#2: The remote portions of the North Cascades are no longer as free from human visitation as when the grizzlies last lived there. There would be massively more opportunities for human/grizzly encounters. You simply cannot recreate the past, however romantic it may seem to you. I do not understand why you would willingly create such a situation. It would not end well and you are in Fantasy Land if you think all will be fine. People and bears will needlessly die.

#3: This is the least important reason because it is purely selfish. If grizzlies are re-introduced I will no longer recreate in the North Cascades. I know no one but me cares about that but there it is. I am sure I cannot be the only person for whom this is true. Maybe this is an unspoken goal? You certainly wouldn't verbalize it if so.

Again, I am appalled at the casual, implied acceptance of animal cruelty in your plan. What monster would do such a thing? Only a human.

Thank you for reading my comments.

Correspondence: As a citizen of Washington state and someone who spends a substantial amount of time in the wilderness of the North Cascades I am dismayed to hear that you are still considering the reintroduction of grizzlies into that environment. The fact that these animals dispersed seeds does not outweigh the safety factor for the average person out there enjoying our wilderness.

I don't appreciate "in Washington making decisions like this when they are not spending any time in the woods and don't have to think about their own safety. All you have to do is read the news about a recent attack up in Alberta where a couple and their dog were killed by a grizzly bear.

I vote no on the subject and will continue to vote no. Please do the right thing and leave grizzlies where they are we do not need them reintroduced into our society.

Correspondence: Hello, I am an instructor at Woodland Park Zoo and I am in support of reintroducing grizzly bears to the Cascades. As soon as public commenting for this issue opened up my team put together a whole program for the reintroduction of grizzly bears in the north Cascades. I have watched numerous grizzly bear story times and puppet shows and I see how much this issue means not only to the kids but also for the washingtonian community at large. Our grizzly bears at Woodland Park Zoo are named Juniper and Fern. They are some of the most popular and beloved animals at our zoo and have been great ambassadors for developing animal empathy between people and the ecosystems they are apart of. Reintroducing these animals means that the kids we teach could actually grow up and witness a life with ecosystems intact. They could see bears like Juniper and Fern outside of glass and bars. They could have the promise of a government that prioritizes the health of the land they are caretakers of. They could have hope, that humanity will figure out how to coexist. As a former park ranger I understand the safety and economic concerns of grizzly reintroduction, but at my heart and hopefully yours, I know it's the right thing to do. It doesn't hurt to try and adapt. Thank you for reading this and I hope you thoughtfully consider what an opportunity you have and what it could mean for our community.

Correspondence: Grizzly Bears are a key stone species. If they go extinct, the entire Pacific Northwest will fall into ruin. If there is a worry of wild fish or farm farming populations, a majority of a bears diet is fruit, and will often also eat things like squirrels, not interfering greatly with fish. They are also a very important animal to indigenous peoples. If the bears are gone, a big part of their culture is as well. These beautiful creatures have been here far longer than us. They deserve to live. Protect the Grizzlies, protect the Pacific Northwest.

Correspondence: To Whom It May Concern,

I strongly support the restoration of grizzly bears to the North Cascades, one of North America's premier intact ecosystems. North Cascades National Park and the surrounding ecosystem have more than enough open space to successfully recover grizzly bears. This would be a major step in restoring the species across its historic range. Restoration in the North Cascades will contribute to the greater recovery of the species across North America. Grizzlies provide ecological benefits and will improve the ecosystem's health. Where grizzlies thrive, ecosystems thrive. These bears regulate populations of the animals they prey on and keep forests healthy by dispersing seeds and berries. Additionally, the population of bears on the Canadian side of the North Cascades ecosystem is considered critically endangered, and wildlife biologists do not believe a natural recovery is possible. Reintroducing bears on the U.S. side will complement significant efforts led by First Nations in Canada to bring back this sacred cultural species.

Grizzly bears roamed across the North Cascades for thousands of years as an essential part of the ecosystem. In the 20th century, however, people hunted, trapped and poisoned them to near extinction. According to the Park Service, the last confirmed sighting of a grizzly bear in the U.S. portion of the North Cascades Ecosystem was in 1996.

When a similar review process began in 2015, it received overwhelming public approval, with more than 159,000 public comments supporting restoration of grizzlies in the North Cascades. People from all 50 states spoke up in favor of returning grizzlies to their historic habitat. Grizzlies are one of the slowest reproducing land mammals in North America, so the sooner we begin supporting their repopulation, the better chance they have for long-term survival.

This is a first step toward bringing balance back to the ecosystem and restoring a piece of the Pacific Northwest's natural and cultural heritage. It is an opportunity to make progress for wild places -- to restore the last missing piece of the park and the broader ecosystem.

Correspondence: I strongly support the National Park Services preferred Alternative C: Restoration with Endangered Species Act Section 10(j) Designation. Former and deceased president Regan tried to eradicate wolves and bears by barbaric methods and then years later on taxpayer money wolves and bears had to be rightly reintroduced because their numbers were dangerously small. So BEAR this in mind because we need grizzly bears as well as humans. COEXIST!

This plan will both effectively restore grizzly bears in North Cascades National Park and give people the tools they need to thrive in and around grizzly bear country. Grizzlies belong in the North Cascades, as they enhance the park's ecological integrity and contribute to its wildness.

Grizzly bears play a vital role in maintaining ecosystem balance, cycling nutrients, dispersing seeds, and changing the behavior of species around them. Restoring them would benefit the park and the people who use it.

A restored population of grizzlies will boost the park's appeal and attract nature enthusiasts, scientists, and tourists from around the world. This would provide economic benefits to local communities and support the park's mission to protect park resources in perpetuity.

Alternative C, with the 10(j) rule, provides managers flexibility to address community concerns while protecting the grizzly population. It ensures coexistence between humans and bears.

Please consider the positive ecological and economic benefits and support Alternative C. Restoring grizzly bears will secure the park's natural heritage and conserve an iconic species for current and future generations.

Thank you for your dedication to our national parks.

Correspondence: I am writing to support the restoration of a healthy population of grizzly bears to the North Cascades. Grizzly bears inhabited the North Cascades for thousands of years until they were extirpated by hunting and the fur trade. As an apex predator, grizzlies are key to the ecological health of an area. They affect water quality, forest health, and fish and wildlife populations.

As such, I support Alternative C: Restoration with Section 10(j) Designation. Alternative C as the best choice for bears and the people who live in and visit the North Cascades Ecosystem. The plan is a compromise for various interests, and has been shown to be effective in Montana, where grizzlies are recovering in the Cabinet-Yaak mountains with few problems and with the acceptance and involvement of local communities.

Furthermore, the 10(j) rule will give people more management tools to reduce, prevent, and respond to human-bear conflict. I believe that the 10(j) rule if properly implemented, will help increase human acceptance of grizzly bears as they return to the landscape.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please bring back this native species to our state through the strategy laid out in Alternative C. Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

Correspondence: I felt compelled to voice my concerns about the potential reintroduction of grizzly bears in Washington. It's undeniable that grizzlies are already making their way into the state from neighboring regions. The absence of physical barriers means they can migrate naturally. Given the state's challenges in managing its existing wildlife, introducing another apex predator seems counterproductive.

Correspondence: I fully support the restoration of grizzlies to the North Cascades. The restoration must be implemented by methods and strategies that do not violate the Wilderness Act so as to avoid any harm to the area's wilderness character. Both of the action alternatives as they now stand would violate the Wilderness Act. The action alternatives should be modified to avoid helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and to steer clear of heavy-handed management of bears. There are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites without the use of helicopters inside Wilderness.

I oppose the use of a 10(j) rule for the grizzlies in the restoration project as this would jeopardize grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana as when the grizzlies are taken from their homes and dropped into the North Cascades, they would lose their previous protection.

The no action alternative has many good Bear Smart components on how people and communities can coexist with grizzly bears. These coexistence measures must be included in both of the action alternatives.

Correspondence: To whom it may concern:

I'm not going to even try to be politically correct here, after reading the comment that stated bringing Grizzlies here to the North Cascade ecosystem would be a benefit as the Grizzlies would help to keep the elk and deer populations in check? SERIOUSLY, that statement is totally out of line and quite frankly stupid and it pissed me off! Just ask the residents of the Northeast and the Blue Mountains as their Mule Deer, Elk, Whitetail Deer and now MOOSE populations are now in serious decline or heading into critical risk status a due to the out-of-control 'PREDATOR' train wreck we have right now in Washington state! Wolves in the North Cascades, Blue Mountains and Selkirks are out-of-control. Our Blue Mountains rocky Mountain Elk and Mule Deer populations are at 'critical risk' status right now due to the high Cougar, Black Bear populations and yes Wolves. The state currently listed (WDFW claims) we now have 4 Wolf packs in the Blue Mountains management game units, I challenge that number and strongly believe 5 packs are now established - 'OUT OF CONTROL in the Blues'; I challenge you, the National Parks Service, Federal Wildlife staff and Our own Washington Game Commissioners to go there and see for yourselves, ask the ranchers, the locals, a local Outfitter (Western Life Outfitters, Dave Waldron from Pomeroy 509-843-1535) to get a reality check of what happens when predator populations collide, *(that would be a novel idea wouldn't it, out in the field experience!).

Now you want to add another Apex predator to the state, GRIZZLIES, I say 'NO WAY'! It's funny you want to truck in a predator in over a 10 year period with no plan what so ever for a management objective goal and a plan to keep them in check (ie: hunting) of an alarming '200+ Grizzlies', which means if this does come to fruition you will not allow us the opportunity to hunt them and keep them in a check and balance status, but 200+ seriously? Case in point a wolf management plan example: in the Blue Mountains game units at least 2 wolf packs need to be removed or relocated ASAP, yet just the idea of that will have the 'Anti-Hunting groups' cries shoved down our throats. The citizens that live out there know the realities in the Blue Mountains. The citizens in the Winthrop, Omak, Okanagan, Twisp area to name a few already know the growing wolf packs, cougars and black bears are killing the deer, elk and moose at alarming rates. The black bears love protein, especially in the Spring, they get tired of green grass, they love to eat vulnerable deer fawns and elk calves, just ask our WDF&W big game Biologist! *(the Elk calf study of 125 Elk calves collared in the Blue Mountains in 2021 was a disaster of epic proportions) . They, the locals, know how bad it is. 'Who, or someone needs to support Our Mule Deer and Elk for Christ's sake!'; A stacked deck of WDF&W Commissioners with Anti-Hunter values are not honoring or implementing the WDFW Mission Statement anymore, far from it. If you want Grizzlies trucked into this state, then set a management objective quota of '60' Grizzly Bears and when you exceed that objective by 10 plus issue hunting permits. Funny though, we have no plan to control the robust Wolf population or a strategic plan to reduce or relocate a Wolf population that has exceeded its carrying capacity such as the Blue Mountains where the destruction of that regions 'unulates' in my lifetime will never recover! Yet we hear rumors of

WDFW wanting or intending to end Cougar hunting in our state or reducing a Cougar season?? ~NO WAY ~ Wow, how out of touch that rumor or management concept would be? Our neighbor, Oregon, has estimated they have over 6000+ Cougars and growing, their Cougar season is January 1st. thru Dec. 31st., why you may ask??? You can figure it out for yourselves! Next on the menu in the Blues is cattle, sheep and the Palouse Whitetails. You wonder why "mature Bighorn Ram" are spotted now off of HWY 12 in the Pomeroy area, you NEVER saw them in town, NEVER ! Their here now, reason being , it's "SAFER in Town" !!! Fair warning ranchers of the Blue Mountains!

So I have no faith that the National Park Service and WDFW would even conceive of a hunting management tool to control a Grizzly bear population as that isn't politically correct for your urban anti-hunter vision of our outdoors.

In 1975 the population in Washington state was 3.6+ million in 2022 it was 7.6+ million, heading towards 8 million in the very near future. It's amazing we have Cougars all over the westside, Black Bears all over the westside now, a beyond healthy Coyote population doing their part to keep the neighbors pet populations in check, funny I wonder how Grizzlies in Bellevue will be accepted in the future?

I'm very aware we currently have a few Grizzlies in our state however they came in from B.C. when they become a factor then we need to react. I'm also aware that the Wolves came into our state via B.C., Idaho and Oregon however they need to be managed now, case in point the Blue Mountains conflict. However, I have no faith any action will take place by WDFW, National Park Service or the Federal Government . I'm good with the few Grizzlies we have I'm Not good with adding an entire new experiment of Grizzlies trucked into our state. Many people rave how cool the Wolf addition has as been in Yellowstone , keep in mind the population of Wyoming in 2022 was 578, 000 people.

Again, bottom line, I have no faith that the National Park Service, Federal Government and Washington DFW would create a responsible management plan for a Grizzly Bear re-introduction. Don't even get me going on the "out of control" Sea-Lion, Seal, Cormorants and Terns issue destroying our NW Salmon and Steelhead species. Hell, there's more Seals and Sea Lions now than when Lewis and Clark came through.

As an example: The Sea Lions problem, ~ Total inaction continues, no plan to manage the problem ever, not even one solution ~ shame on you! Yet you all want our "Orcas" populations to thrive, what do our Orca populations mainly feed on? Yep, Salmon!

What makes me believe a re-introduction of another Apex predator, 'Grizzlies' would be any different! We, the people of Washington, Hunters, Fishermen, Backpackers, Trappers and all Conservationist are and must be the stewards of the land and its wildlife, utilize our game department Biologist, the Science, their Research and not unfounded emotions, *(as mentioned above; how Grizzlies in the North Cascades would be beneficial to managing the ungulates population' ~(those ungulate populations are being eaten currently at alarming rates) and manage the wonderful resources we have in Washington and it's NOW time to apply that theory!

I am opposed trucking Grizzlies into the North Cascades.

Regards:

Concerned Washington State Citizen

Correspondence: I find this plan to bring Grizzly Bears to Washington state to be against the law.
RCW 77.12.035

The action should be halted immediately.

In addition if makes no sense from a practical side of things to introduce an Apex predator to the area where people and livestock are plentiful. It is asking for problems that do not now exist.

In addition the plan to restore salmon runs is habitat driven by the restoration of positive habitat. This is going in the wrong direction. More bears, less salmon, it cannot mean anything else.

Management record- the talk has been that there will be good managers of this trial to protect people and property but that is about as far from the truth as it can be based on past history with Elk in the region that continue to damage property, take lives, cause accidents, and threaten the livestock industry with a contagious disease call hoof. The damage caused alone is more that \$1,000,000. and yet nothing has been done.

NOTHING! Is this the good management that is talked about?

Food safety has been compromised by elk dedicating on crops causing major food production to be removed from the area where elk are present to the loss of local owners and farmers all because of poor management.

Protect the Public!

Protect the incomes!

Protect the Salmon!

Protect the domestic animals and farm crops!

Stop increasing the size and scope of government adding at least \$100K to \$400 K annually to the cost of citizens.

The people in these areas where the bear will be are not for this action it is the people that do not live and work in the area that want to prosper from he action and won't have to deal with the results.

SAY NO, VOTE NO, AND WORK TO MAKE SURE IT IS NO!!!

NOT NOW, NOT TOMORROW AND NOT EVER!!!

Correspondence: As a Bellingham, WA resident and very frequent visitor to the North Cascades ecosystem in all seasons, I am writing to support the restoration of a healthy population of grizzly bears to the North Cascades, their home for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations. Where grizzlies live, our wild places are wilder and our ecosystems are in full bloom. After killing all of our grizzlies and robbing the mountains of their presence, we now have the unique opportunity and the ethical obligation to restore them to their native home, where suitable habitats still exist.

I support Alternative C: Restoration with Section 10(j) Designation. Alternative C is the best choice for bears and the people who live in and visit the North Cascades Ecosystem. The plan is wisely modeled on what's worked in Montana where grizzlies are recovering in the Cabinet-Yaak mountains with few problems and with the acceptance and involvement of local communities.

Furthermore, the 10(j) rule will give people more management tools to reduce, prevent, and respond to human-bear conflict. I believe that the 10(j) rule if properly implemented, will help increase human acceptance of grizzly bears as they return to the landscape.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Correspondence: I am whole-heartedly opposed to reintroducing grizzly bears.

1. Grizzly bears will attack without provocation, to injure and kill unprotected and unaware humans.
2. There is no such thing as "certainty, safety, and control" per the 10 (j) designation, when referring to this dangerous animal.
3. Anyone responsible for enacting such a short-sighted proposal would be responsible for the death or injury to ANY person by a grizzly bear.
4. Grizzly bears don't have a vital enough role in nature to reintroduce them into an environment where their presence outweighs the safety of those who wish to appreciate, study, and protect nature.

Raised by a father who was a professor of Wildlife Management and Forestry at the University of Idaho, I am pro-nature, animals and wildlife. This includes the pesky racoons, garbage-raiding black bears, the coyotes, bobcats, and scary cougars that live in my rural neighborhood. Grizzly bears are another matter entirely.

Please don't follow through on this proposal to add dangerous predatory animals to the environment for some cultural and vaguely romantic motive that could come back to bite....AND kill.

Correspondence: Yes! Restore the grizzly to its' historical range. Too much ecosystem damage in this Country has occurred over decades, and even centuries. It is time to fix the destruction and damage of the habitat these majestic animals have a right to exist in. Now may be the only remaining time to fix this. The way things are headed with the current political climate of this nation - and our extraordinary, but quickly disappearing natural areas and continuing human encroachment, there may not be another opportunity to restore our ecosystems for decades to come, Or, perhaps, even into the next century, if ever. Now is the time! The dream of a complete and fully restored ecosystem has been a dream to many of us - we are all stewards of the beautiful publicly owned lands that belong to all of us. Perhaps a system to help ranchers who have endured livestock predation should be on the table as well.

Sincerely,

██████████

Correspondence: No Grizzly Bear Introduction Into North Cascades, Washington !!

I consider myself environmentally minded and support wildlife, habitat restoration, and protection of endangered species.

I support the existing grizzly bear protections currently in place in locations of the northern Rocky Mountains and Alaska.

However, our family does not support the reintroduction of grizzlies into the North Cascades, Washington.

The reasons are many. Local and state representatives do not support it. Farmers, ranchers, timber workers, and recreationists do not support it. The North Cascades is close to high human population areas, city and rural alike. Farming, timber, and recreation will conflict with a highly dangerous predator. Cougars, black bear, and wolf predators do not pose the same danger as an unpredictable grizzly bear.

Especially to recreationists who frequent the North Cascades area for hunting, fishing and hiking. How many tourists and day hikers are going to carry bear spray? Not many I presume. Sleeping in a tent, which thousands of people do every year in North Cascades, provides no defense with bear spray, as cannot be effectively used. There was a recent incident this summer of 2023 in which a couple was mauled to death using 2 cans of bear spray. There are always encounters and injury every year in Alaska and Northern Rockies. I'm glad we have saved them from extinction but we don't need another area for encounters, please!

I'm sure farmers, ranchers, foresters and other local residents have their own justified reasons. With all groups, an unpredictable large human killing predictor should not be allowed to be reintroduced into the North Cascades. An area highly used by large human population areas.

Please withdraw plans or any experimental reintroduction plans to put grizzlies in the North Cascades, Washington,

Correspondence: Sick or injured bears often prey on livestock. Most depredating bears are males over the age of four. Although bears are often blamed for killing livestock, they may not always be responsible. Bears are known to scavenge or steal carcasses killed by other predators.

New houses have taken over their environment. It is crucial to protect them.

They are usually shy, and I have not heard of a bear attacking livestock, except if ill.

We have got to preserve the areas that they live in. They are essential for our ecosystem. They keep the Blackberry problem down, and they prefer fish.

I have heard they are attacking livestock. If this is accurate, something is wrong. My brother is a zoologist. They have to have their area. As I said, the grizzly is shy, and the same goes for the black bear. For any bear, the hunting has to stop. Most of the bears killed are for trophies, heads, and feet.

I ask you to consider this when making plans for this wildlife.

Respectfully,

██████████

Correspondence: It's high time to right our wrongs as humans. I don't want to live in a world where I have to explain to my children or grandchildren that there USED to be grizzlies, or southern resident orcas, or salmon, or any other iconic PNW wildlife, yet we are steamrolling our way to that point. As an avid hiker and conservationist, I support the reintroduction of grizzly bears to the North Cascades. We can, and are obligated, to coexist.

Correspondence: I am writing to support the restoration of a healthy population of grizzly bears to the North Cascades, their home for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations.

I support Alternative C: Restoration with Section 10(j) Designation. Alternative C is the best choice for bears and the people who live in and visit the North Cascades Ecosystem. The plan is wisely modeled on what's worked in Montana where grizzlies are recovering in the Cabinet-Yaak mountains with few problems and with the acceptance and involvement of local communities.

Furthermore, the 10(j) rule will give people more management tools to reduce, prevent, and respond to human-bear conflict. I believe that the 10(j) rule if properly implemented, will help increase human acceptance of grizzly bears as they return to the landscape.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please bring back this native species to our state through the strategy laid out in Alternative C. Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

Thank you for taking the time to keep our North Cascades wild!

Correspondence: I support the restoration of grizzlies to the North Cascades, and that the restoration must be done in ways that don't violate the Wilderness Act and harm the area's wilderness character. This is good for bears and Wilderness. Both of the action alternatives as they now stand would violate the Wilderness Act. The action alternatives should be modified to avoid helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and steer clear of heavy-handed management of bears. There are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites without the use of helicopters inside Wilderness. I also oppose the use of a 10(j) rule for the grizzlies in the restoration work. This would mean grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana would be taken from their homes, dropped into the North Cascades, and lose their previous protection. Montana doesn't have any "extra" grizzlies to lose to the North Cascades. Montana grizzlies are not yet recovered under the ESA, and any dispersing grizzlies from Glacier or Yellowstone are needed to naturally recover areas like the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest. A natural recovery alternative must be fully developed and analyzed, even if recovery would take longer than active repopulation. The new information presented by Superintendent Striker regarding the likelihood of naturally migrating bears from Canada suggests active repopulation urgency may be more about protecting agency discretion than protecting

Wilderness and creating the best environment for grizzly bears to migrate, live, and thrive.

For the long-term success of grizzly restoration, natural recovery measures must also be included in both action alternatives thus reducing the need for wilderness degrading activities that are also ultimately bad for bears. This requires work with partners in British Columbia to ensure that grizzlies have corridors to move back and forth across the international border and to prevent a small North Cascades grizzly population from shrinking over time and becoming inbred.

Correspondence: The 2023 draft EIS has at least three serious deficiencies:

1. It fails to present the state of brown-bear (*Ursus arcticos*) populations worldwide, the state of the North American population for the regional subspecies known as the grizzly bear (*Ursus arcticos horribilis*), and the status of grizzlies in the closest realization to what is being proposed--namely the greater Yellowstone ecosystem--where repopulation of grizzlies began in 1975.
2. Most importantly, it is not a true impact statement because it fails to identify likely impacts. The needs for and benefits from reintroduction are not explained, particularly in context of North American populations. The need for restoring the grizzly to the NCE is never developed. The EIS has no analysis or prediction of what ecosystem changes the North Cascades Ecosystem (NCE) introduction would cause. Beyond bringing back the grizzly to the NCE, no case is made for any other enhancement of diversity or increased resilience. The EIS lists species of plants and animals eaten by grizzlies but makes no effort to identify which of those resources is present, and more importantly abundant, in the north Cascades today and which are likely to be affected at the population level by the reintroduction.

The document continually repeats that only a few bears will be introduced at a time, so the impacts will be small (a camel's nose approach), without addressing who will be affected or what effects are expected when the grizzly population reaches carrying capacity--other than a tourist bonanza. A credible EIS must make explicit the likely effects, short and long term, of the proposed introductions. What does success look like and how will it be measured?

3. The EIS makes little use of the very valuable and most direct comparison possible, that with the greater Yellowstone ecosystem, where wolf and grizzly repopulation efforts are more advanced and closer to new steady states. It is unfathomable that repopulation of Yellowstone with grizzlies is so little used to project and to steer the NCE repopulation.

The 2023 EIS specifies a target repopulation of about 280 grizzlies in the north Cascades ecosystem. Grizzlies reached a low of 136 individuals in the greater Yellowstone ecosystem in 1975 after dumps were closed and trash cans were bear proofed. Their numbers were supplemented starting in 1975, reached 757 bears in 2014 and for the last two years have been near 1,000 individuals, perhaps approximating their carrying capacity. What are the reasons behind the difference between the putative north Cascades carrying capacity for grizzlies and the apparently much higher carrying capacity of the greater Yellowstone ecosystem? It is not a simple difference in acres.

Essential information to inform non-mammologists is that brown bears number about 200,000 individuals worldwide at high latitudes in the northern hemisphere, with about 60,000 of the grizzly subspecies in North America (about half in Alaska and half in BC). Their success (making them the most abundant and geographically widespread bear species in the world) is attributed to their omnivory. Brown bears in general and grizzlies in particular are in little danger of extinction.

Bear physiology is unique. During hibernation, adult female bears gestate, give birth, and give milk without themselves drinking or eating. Fat stores are the source of energy and water, and fats receive much of the attention. Carbon dioxide and water (called metabolic water) are the end products of fat metabolism. Animals, however, store fats much better than they store protein, making protein supply just after and just before hibernation an important issue along with calories. Carnivory by bears usually peaks in both of those periods. Bears spend up to 20 hours a day eating during the two months before hibernation. Most conflicts with grizzlies occur then, particularly in years when natural foods are unusually scarce and bears forage further into denser human populations.

Results at Yellowstone should inform what might happen. Yellowstone grizzlies fed on spawning runs of cutthroat trout in the streams; trout populations crashed by 2008 because of competition from and predation by lake trout introduced to Yellowstone Lake. Grizzlies subsequently increased their dependence on neonate elk after hibernation. In the late 1980s, black and grizzly bears took 12 percent of elk calves. By the mid 2000s, it was 41 percent. A widely cited paper (Middleton et al. 2013) documents the switch in a top-tier journal but is conspicuously absent from the draft EIS. Surely it can offer

insights into what might happen to the NCE upon grizzly reintroduction.

The following sentence about the NCE appears in both the 2017 and 2023 draft EIS: "Mule deer and black-tailed deer numbers have declined somewhat since the historic highs in the mid twentieth century, but populations in the ecosystem remain robust." That sentence may have been appropriate in 2017 but probably should be removed from the 2023 draft because the Washington State Department of Fish and Wildlife is closing many of its 23,306 acres across five wildlife area units in the Methow Valley to public access from January to April. The reason is low survival of mule deer fawns. The EIS needs to identify NCE foods likely to be used by bears upon emergence and just before hibernation and to project likely impacts from that use.

Middleton, A.D., Morrison, T.A., Fortin, J.K., Robbins, C.T., Proffitt, K.M., White, P.J., McWhirter, D.E., Koel, T.M., Brimeyer, D.G., Fairbanks, W.S. and Kauffman, M.J. 2013. Grizzly bear predation links the loss of native trout to the demography of migratory elk in Yellowstone. Proceedings of the Royal Society B: Biological Sciences 280: 20130870.

Correspondence: I don't have all the answers nor a final verdict on the grizzly bear reintroduction. Of course I'd love to see a more complete ecosystem. however, modern people are pretty dumb when it comes to wildlife. I've had to negotiate between neighbors and raccoons for goddsakes! Imagine if people break out in a cold sweat and go hysterical over a raccoon, imagine that same person faced with a grizzly? Humans are pretty out of touch these days and this could go sideways fast. Perhaps a 20 years long reeducation campaign on how to interact with wild animals should come first before reintroducing grizzlies. Get the local tribes involved who historically lived in areas with such animals. I just don't think most people have even the faintest clue how to navigate this, and it shows.

Correspondence: While I greatly appreciate nature being wild, and wish to be good stewards of the land, I believe this venture is misguided. Yes, all animals have their role and contribute to the well being of the ecosystem. However, the Cascades are quite heavily used and I believe you know as well as I do that a run-in with a brown bear is inevitable. We have only to look at AK for confirmation. I love these mountains and use them regularly. My husband often hikes alone. Whenever we take a trail we always come across solo hikers. I implore you to rethink this idea and put the well being of humans over the bears.

Thank you!

Correspondence: There is more than enough space in the ecosystem around the North Cascades National Park to successfully recover grizzly bears. Plus, grizzlies are good for the ecosystem.

Grizzly bears have been considered "threatened" since 1975, according to the Endangered Species Act. The recommendation to add more bears to the North Cascades originated in 1997, but there were no funds available for the Park Service to do so. On the Canadian side of the Cascades, grizzlies are "critically endangered."

We don't want to lose the grizzlies.

Correspondence: I am strongly in favor of the reintroduction of grizzlies to the Northern Cascades environment. It is essential that we restore as many functional, biodiverse ecosystems as possible. Every ecosystem requires its apex predator in order to remain in balance and to thrive. The restoration and preservation of this large and pristine environment provides immense benefits: carbon sequestration, biodiversity protection, recreation opportunities, and respecting the rights of indigenous populations.

I am in favor of including some potential control measures to reassure the local population in the case of bears that threaten humans or kill farm animals.

Returning grizzlies to their original range, from which they were removed by overhunting to extinction, is the right thing to do.

Sincerely,

██████████

Correspondence: I strongly support the National Park Services preferred Alternative C: Restoration with Endangered Species Act Section 10(j) Designation.

FROM DIANE WALLACE, FORSYTH County, North Carolina Resident- Lets protect ALL species and retain their habitats. Once the permafrost thaws past a certain point then the temperature of the Ocean will rise such that plankton will die

off leading to an oxygen poor atmosphere starting above sea level.

This plan will both effectively restore grizzly bears in North Cascades National Park and give people the tools they need to thrive in and around grizzly bear country. Grizzlies belong in the North Cascades, as they enhance the park's ecological integrity and contribute to its wildness.

Grizzly bears play a vital role in maintaining ecosystem balance, cycling nutrients, dispersing seeds, and changing the behavior of species around them. Restoring them would benefit the park and the people who use it.

A restored population of grizzlies will boost the park's appeal and attract nature enthusiasts, scientists, and tourists from around the world. This would provide economic benefits to local communities and support the park's mission to protect park resources in perpetuity.

Alternative C, with the 10(j) rule, provides managers flexibility to address community concerns while protecting the grizzly population. It ensures coexistence between humans and bears.

Please consider the positive ecological and economic benefits and support Alternative C. Restoring grizzly bears will secure the park's natural heritage and conserve an iconic species for current and future generations.

Thank you for your dedication to our national parks.

Correspondence: I hike, hunt and vacation over in the proposed release area and still will for many years. I have no desire to have grizzly bears around. The area is thriving just fine as is with out the introduction of grizzly bears. Locals will be affected by this with out a doubt. The majority of people who desire to introduce these predator bears into the area will not be affected in any way.

Correspondence: I think that it's a great idea to restore grizzly bears to the North Cascades Ecosystem in Washington State. The grizzly bears once roamed here and should be restored to their former habitat. This action would help to restore a healthy eco-system as well. We need to learn to live with all wildlife that we share the planet with.

Correspondence: We should absolutely NOT introduce more grizzlies into washington. This would have a devastating effect on the already suffering ungulate population. This would also create unnecessary risk to humans through involuntary interaction with such an animal. If they make their way into the state naturally, that is one thing, but we must not introduce grizzlies into washington. I and other outdoor enthusiasts in this state are in complete disagreement with introducing more grizzly.

Correspondence: Thank you for this opportunity to comment on this proposal.

Olympic Public Access Coalition supports Alternative A - No Action.

- 1) Grizzlies are reported to be in the North Cascades. They have been there for decades.
- 2) The North Cascades has proven to not have an adequate food source. Otherwise, there would be more grizzlies. Additional grizzlies will decimate the elk and deer in the area, then starve.
- 3) In 1995, Washington State created legislation (RCW.77.12.035), declaring, "grizzly bears shall not be transplanted or introduced into the state."
- 4) This plan is a product of the US Fish and Wildlife, but takes place within National Park Service boundaries. National Park Service policy prohibits extirpated species from being reintroduced that pose a threat to park personnel.
- 5) As the population grows and disperses across the region, human and bear conflicts that arise, and will arise, will be mitigated disproportionately against the human environment and will have a direct impact to present and potential recreational opportunities.
- 6) A comprehensive impact study of management options on recreation has not been performed in the Draft Environmental Impact Study.

Respectfully,

Olympic Public Access Coalition
Board of Governors

Correspondence: I fully support reintroducing grizzly bears back to the North Cascades. I've seen the benefits of reintroducing predators into their natural ecosystems and the positive that's done, and I think the same could happen here.

I acknowledge the concerns and fears people have around bears, especially grizzly bears, but I think we need to be more aware of how our activities destroy the local ecosystems and anything we can to bring them back to a more sustainable state is a pro to me.

Correspondence: Grizzly bears are meat eaters when they run out of berries. Very active and hungry in the spring. They are of a very aggressive nature not at all like the brown or black bear. The Grizzly is not the least afraid of humans. They will stalk a person and they are a very silent predator. To defend yourself from a Grizzly attacking, it takes a large bore weapon, which hikers and campers do not carry. The horse trails and hiking trails will be in danger. You will have to hire an armed guide for your recreation. The state revenue will fall off as people do not want to expose themselves to danger. It will cost the state millions in education for the people to be able to limit their exposure to attack. The cattlemen that have lost cows to predators have rarely been reimbursed from the state. The authorities look, rule inconclusive to a kill site which can be up to a month old for free range organic cattle, then the rancher does not get paid. This can be a huge loss of thousands of dollars and cause the ranger/farmer to go broke. You will notice the quality of the grocery store beef to decline even more as local ranchers/farmers quit. Grizzly bears follow creeks and rivers to the game. Since there is more deer sightings in cities and in the foothills, I would expect to see Grizzly bears move toward the cities very quickly. Examples would be Winthrop, Leavenworth, Snohomish, Marysville, Bellingham and all outlying small towns. No to more Grizzly.

Correspondence: The public's focus on restoring Grizzly Bears in WA state is truly not there; there is no logical reason to waste money, time, and effort on this project. There are so many more areas/challenges/problems in WA state that need to be addressed and must be prioritized.

The listing would include the homeless, the drug addition, the mental health challenges, the economy, and the list goes on and on, yet we have no solutions for all of the above, but we can find time and funding to waste on placing Grizzly bears back into the North Cascades? What ever happened to common sense? Will the state's challenges that I've listed above be cured/fixed by putting bears into the woods? Do we not have enough bears currently?

Please appeal to common sense for once...the new carbon credit tax has put a huge strain on everyday WA citizens, and the new revenues will now be used to help fund the bear challenge? What on God's earth are you folks thinking??? Move on, fix the existing problems with all of the unfair funding the state is collecting, and leave the Grizzlies in MT.....if you really feel like you want to see a grizzly bear, go to AK or MT and take your camera...let's get back to fixing the areas that are way more important.

Correspondence: I enthusiastically support the restoration of grizzlies to the North Cascades. The North Cascades are beautiful, wild and unique; I have backpacked in the area and know their special charm. The restoration, however, must be done in ways that don't violate the Wilderness Act and harm the area's wilderness character.

Both of the action alternatives as they now stand would violate the Wilderness Act. The action alternatives should be modified to avoid helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and heavy-handed management of bears. There are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites without the use of helicopters inside Wilderness.

I oppose the use of a 10(j) rule for the grizzlies in the restoration work. This would mean grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana would be taken from their homes, dropped into the North Cascades, and lose their previous protection.

Montana grizzlies are not yet recovered under the ESA, and any dispersing grizzlies from Glacier or Yellowstone are needed to naturally recover areas like the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest.

A natural recovery alternative must be fully developed and analyzed, even if recovery would take longer than active repopulation. The new information presented by Superintendent Striker regarding the likelihood of naturally migrating bears from Canada suggests active repopulation urgency may be more about protecting agency discretion than protecting Wilderness and creating the best environment for grizzly bears to migrate, live, and thrive.

For the long-term success of grizzly restoration, natural recovery measures must also be included in both action alternatives thus reducing the need for wilderness degrading activities that are also ultimately bad for bears. This requires work with partners in British Columbia to ensure that grizzlies have corridors to move back and forth across the international border and to prevent a small North Cascades grizzly population from shrinking over time and becoming inbred.

An alternative that combines natural recovery with population augmentation under full ESA protections should also be analyzed.

The no action alternative has many good Bear Smart components on how people and communities can coexist with grizzly bears and these coexistence measures should also be included in both of the action alternatives. All possible measures must be taken to prepare residents and visitors for bears, particularly given the dramatic growth of the human population in the region and rapidly increasing recreation pressures in the Park.

Correspondence: We live in the foothills of the eastern side of the Sierra Nevada mountains. I'm a hunter/Fisherman/hiking and camping enthusiast. I'm in the woods a lot. I have always gone into nature whenever and wherever I could. I'm on the right wing of most social issues, except when it comes to conservation of natural resources. That's where I stand with the left side of the door enthusiast. If we don't save the habitat, then nobody gets to appreciate the wonders of nature; left wingers or right wingers. And wherever you have a chance to complete an ecosystem with an Apex predator as God intended then by all means, bring that species back to the ecosystem. I love being in the mountains where wolves are now free. And the few times, I have been a grizzly bear country, it does add to the experience. There are not many places left where the grizzly can be re-introduced. I mean look at our state flag of California. Front and center on that flag is a grizzly bear. It has become extinct and our golden state. I'm a transplanted Hozier, but I have adopted this state as my own. I truly wish we could have the grizzly bear back and it's old domain. I would like to see the grizzly introduced to the north cascades ecosystem thank you.

Correspondence: Dear Officials:

I agree with your reasons for Section 10(j) management, and support your preferred Alternative C. Section 10(j) management is especially important to give managing agencies the flexibility they may need to avoid and/or deal with potential conflicts.

It should also offer some comfort to folks concerned about grizzly recovery.

As the author of a book on grizzly bear recovery (Grizzly Wars: The Public Fight Over the Great Bear - Easten Washington University Press 2008) I want to applaud your draft environmental impact statement. It is comprehensive and accurate. It addresses all the relevant issues. You have done an excellent job.

One of the few places where you might have said more was in your discussion about the interaction between grizzlies and black bears at pages 86-87. You might have added that in areas of less suitable habitat, black bears are likely to exclude grizzlies because the habitat will not still support both in a dietary competition. Mattson, Herrero, Merrill, Are black bears a factor in the restoration of North American grizzly bear populations? Ursus 16(1): 11-30 (2005). I doubt this would change any of your conclusions. Black bears and grizzlies coexisted in the North Cascades for centuries. Grizzly recovery may take longer in view of the robust black bear population that now exists, but grizzlies will gradually regain their former status.

Grizzlies cannot recover on their own in the North Cascades. Other populations are too far away and face too many obstacles to repopulate the North Cascades naturally. Even if it were legal (which it is not) to rely on migration of bears from the British Columbia part of the North Cascades, the BC grizzly population in the Cascades is too small to make a biologically significant difference.

The North Cascades are the only Grizzly Bear Recovery Area outside of the Northern Rockies. Before grizzlies can be delisted nationwide, viable populations must be restored in diverse locations. Having them in the North Cascades as well as the Rockies is an important hedge.

Grizzly recovery reminds us of the comment by former US Fish & Wildlife Service director, Mollie Beattie: "What a country chooses to save is what a country chooses to say about itself."

Thank you.

Correspondence: I was born and raised in the Okanogan valley. My family's ranch and orchard has been in operation since the late 1800s. We have worked alongside nature all that time, which includes wolves (recently), cougars and black bears on our property. We have experienced death loss to these predators, which is a hardship financially and emotionally, but have never killed one of these predators as they usually move on. Introducing yet another predator, which is even more aggressive towards humans is entirely irresponsible. I have personally had an encounter with a grizzly mother and her cub in Washington. It was nothing but a stroke of luck that I escaped unharmed as she definitely had the high ground.

Grizzly bear introduction will certainly have negative impacts on prey species (salmon, deer, elk), public use of public lands, detrimental agricultural economics, create a need for more money for government oversight, as well as a very real danger to residents on their own property. There is literally no benefit.

It seems as if this is attempted every few years. It is always rebuffed because it simply does not make sense.

Correspondence: I support the reintroduction of grizzly bears into their historic range. Top predators make the area inherently more interesting, and they provide important ecosystem services, as was shown in the Yellowstone region. This should be a simple decision -- let's get it done.

I strongly support the National Park Services preferred Alternative C: Restoration with Endangered Species Act Section 10(j) Designation.

This plan will both effectively restore grizzly bears in North Cascades National Park and give people the tools they need to thrive in and around grizzly bear country. Grizzlies belong in the North Cascades, as they enhance the park's ecological integrity and contribute to its wildness.

Grizzly bears play a vital role in maintaining ecosystem balance, cycling nutrients, dispersing seeds, and changing the behavior of species around them. Restoring them would benefit the park and the people who use it.

A restored population of grizzlies will boost the park's appeal and attract nature enthusiasts, scientists, and tourists from around the world. This would provide economic benefits to local communities and support the park's mission to protect park resources in perpetuity.

Alternative C, with the 10(j) rule, provides managers flexibility to address community concerns while protecting the grizzly population. It ensures coexistence between humans and bears.

Please consider the positive ecological and economic benefits and support Alternative C. Restoring grizzly bears will secure

the park's natural heritage and conserve an iconic species for current and future generations.

Thank you for your dedication to our national parks.

Correspondence Type: Web Form

Correspondence: I am writing to support the restoration of a healthy population of grizzly bears to the North Cascades, their home for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations.

I support Alternative C: Restoration with Section 10(j) Designation. Alternative C is the best choice for bears and the people who live in and visit the North Cascades Ecosystem. The plan is wisely modeled on what's worked in Montana where grizzlies are recovering in the Cabinet-Yaak mountains with few problems and with the acceptance and involvement of local communities.

Furthermore, the 10(j) rule will give people more management tools to reduce, prevent, and respond to human-bear conflict. I believe that the 10(j) rule if properly implemented, will help increase human acceptance of grizzly bears as they return to the landscape.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please bring back this native species to our state through the strategy laid out in Alternative C. Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

The North Cascades Grizzly Bear Recovery Zone (NCGBRZ) is the second largest of six such designated areas at nearly 10,000 square miles. Combined with contiguous protected areas in British Columbia, including Manning Park, there are 14,000 square miles of productive, wild habitats, wilderness, and roadless areas.

People and grizzly bears can coexist and thrive. They do so in British Columbia, Montana, and Wyoming where grizzly populations and back and front country recreation continue to grow hand in hand, providing a vital economic boost to those areas' gateway communities.

Grizzly bears lived in Washington for thousands of years. We still have a small population in the NE WA Selkirk Mountains. However, currently, there are no grizzly populations in the United States or Canada that are large enough or close enough to serve as a source to naturally repopulate the North Cascades.

Having wiped out the grizzly bear over the past 150 years we now have the unique opportunity and the ethical obligation to restore them to their native home, where suitable habitats still exist.

Grizzly bears are ecologically and culturally significant and are vital to the overall health of the North Cascades ecosystem and its biodiversity. They are considered an indicator of ecosystem health.

Restoring grizzly bears as an "Experimental, non-essential" population under a well-crafted Section 10(j) rule of the Endangered Species Act makes sense. Such a designation will provide flexibility for wildlife managers to prevent and address human-bear conflict and a greater level of comfort for people who are concerned about the impacts of wildlife

recovery on economic and recreation activities. Agencies have used the Section 10(j) Rule in the past to restore black-footed ferrets, California condors, wood bison, and many others.

Correspondence: I lived in Alaska for 50 years. I have lost track of how many moose , caribou and deer I have taken in those 50 years. I remember exactly however the number of brown bear I killed. I also remember the distance from me the bears were when I shot and killed each one. Both were about 20 feet from me when I shot. The first bear was shot through it's right eye and then the bullet went on thru and broke it's jaw. I shot it three more times to finish it. I killed the second bear on Kodiak Island when I was packing out deer meat. I could hear the sow coming as she grunted whenever her front legs swept backward. The first bullet from my 375 H and H went in just over her head this stopped her and put her back end down and scooting backward. I shot her three more times in her neck and chest at which she went down dead. Soon after this her two yearling cubs showed up. I left. I came back the next day to take the hide as required by law in Alaska. The two cubs were already feeding on their mama and so I left and later reported all this to Alaska Fish and Game.

I am now 85 years old and not running around in the mountains so much myself , but I am very concerned for others. If bears work down into the Cascades from Canada then so be it they are welcome. But I can see no valid reason to reintroduce them artificially.

That first line up there got screwed up. It should say that I lived, worked and hunted in Alaska for 50 years and am a trained biologist.

The Grizzly EIS is repetitive, and lacks support of a scientific/research-study that justifies Grizzly reintroduction into the North Cascades Ecosystem. Clearly the reintroduction is an emotional choice/reasoning (confirmed by Wayne Kasworm, Montana Biologist), and truly an Unnecessary Experimental effort. The desire of a few agency individuals does does not justify the significant impact of certain human, domestic animal, ecosystem conflicts.

Correspondence: It should be noted significant habitat changes have occurred in the Upper Skagit watershed since 1900. Prior to the 1930's salmon could access the upper watershed, (management unit #1). The dams stopped fish migration, which were in large numbers, similar to Alaska rivers. This changed the habitat. A detailed inventory (plant species) needs to look at the bears requirements. To over winter, Alaska bears rely on fish, Yellowstone bears on elk. The WSU Grizzly Bear Center has evaluated the dietary requirements of the bears and should be consulted on food supply requirements..
Take what ever time is necessary to complete research for the sake of bears and people.

Correspondence: I am against the reintroduction of Grizzly bears west of the Cascades as it puts at risk the hikers and individuals that enjoy the outdoors. Grizzly bears are substantially more dangerous and aggressive toward people. I would argue that if the NPS reintroduces these bears they should be held liable for and people that are maimed or killed and livestock that is killed.

This would not have been the case before their reintroduction, but since the NPS would be taking an active role and changing the current status quo, they should be held liable for those actions.

Please vote for Alternative A. No action.

Correspondence: The Grizzly Bear Restoration is a HORRIBLE idea. Our family also has a large ranch in MT and the bears are out of control. Feel free to pull up data on Powell County! A camper who was riding her bike through the area literally had her head ripped off. At brandings we have multiple calves w bear bit marks on them we had to treat. A ranger was killed this summer in Glacier and they had to shut down. There are too many bears and now numerous attacks on humans and animals. Let nature do it's thing, the wolf re-introduction back fired in MT too and now our family is legally hunting them with the re-introduction.

The government paid to put bear fencing around our friends home so their kids were ok in their own yard, when they go feed cattle it is dangerous. My sister just had bears in her back pasture out where we had kids playing a week prior.

We do NOT need Grizzly in WA!

Correspondence: On Oct. 31, 2023, the US Fish and Wildlife made a grizzly presentation to the Skagit County Commissioners. At that presentation, Andrew LaValle from the US Fish and Wildlife, was unable to answer the question of the Highway 20 boundary of the North Cascades ecosystem. The picture of the ecosystem from the Draft Proposal shows that the western boundary of the ecosystem, along Hwy 20, is just east of Lyman. The proposed ecosystem would include Concrete, Rockport, and Birdsvew, where farms, ranches and homeowners are already dealing with the Washington Fish and Wildlife's elk population. The elk are a burden to the farmers and homeowners of the area, but the addition of this dangerous predator is asking too much. Any interaction between humans and grizzlies will not turn out well for the human.

The National Park service webpage claims that grizzlies once thrived in the N. Cascades ecosystem. This is misleading. The N. Cascades ecosystem has been so poorly managed, that it no longer really exists. If you dropped grizzly bears into that "empty habitat," (Mr. LaValle's words), they would not thrive. Yes, they would find some huckleberry plants to munch on, but there are few sources of protein. The ungulates have all but disappeared. So where are the bears going to get their protein? You'd think that our abundant salmon would be a logical source, but the Skagit river fish runs have also been mismanaged, so there are few salmon in the river anymore. The easiest source for these opportunistic bears would be domestic pets, barnyard birds, cattle, sheep, and goats.

The N. Cascades ecosystem is already open to the entry of grizzlies from Canada, Montana and Idaho. If the ecosystem could support a thriving population of grizzlies, they would already be there. This proposal is not a viable option for increasing the grizzly population and removing them from the endangered species list.

We cannot introduce more grizzlies into the North Cascades, even under the "preferred" 10j rule. The collar technology is not adequate to the job, as it does not give real-time data on the whereabouts of the bears. And not all grizzlies will be collared, nor do the collars last forever. All actions of the government with these re-introduced grizzlies will be reactive, not proactive. What good will it be to have more tools and flexibility in dealing with the grizzlies if even one person is harmed or killed because of the delay in monitoring their whereabouts? And what about the response time for a grizzly-human interaction? How quickly will the federal government be able to respond? This draft proposal for the re-introduction of the grizzly to the N. Cascades ecosystem has the potential for disaster. The ONLY OPTION IS TO DO NOTHING. Thank you.

Correspondence: I believe that, despite everyone is entitled to give an opinion, the opinion of people who has lived in Grizzly territory, must have more weight. I know that, because when I first moved into Grizzly Bear territory in Alaska, I was coming directly from a 5 million people city in the Caribbean, and for those who don't know it, there's no grizzlies in the Caribbean, and yes, I was terrified to death to have an encounter with a Grizzly. Bears are usually shy of humans, as long as they hear you coming, they will run away. After a while of living in Alaska, and educating myself about bears, I calmed down, I never lost the fear of a bear encounter completely of course, but I wasn't stressing about it either. One of the things that caught my attention while living in Alaska, was Moose roaming streets of the city of Anchorage, where I lived. I asked the locals if they knew why was that, and they told me, "They know that Bears and Wolves" don't like to go into populated

areas where humans live, they stay away from us.

So, in conclusion with my comment, if the new comers of Darrington are stressing about the re-introduction of Grizzlies in Washington State, educate yourself a little bit and relax, even though, at the end I wanted to, p I never got to see a Grizzly once in all the years I lived in Alaska.

Correspondence: Select Alternative A

The process is severely flawed.

How to reintroduce the Grizzly, not whether to reintroduce at all - usurps public opinion.

Alternative C has been identified as the preferred alternative. Thus, indicating that the agencies have already made up their minds, and not listening to the public comment.

The process has been under the radar, thus minimizing the opportunity for public review.

There is no quantifying of public opinion, just a general sense of responses. Since the action effects all of the State of Washington (except the NE lower Selkirks) a standard 7 percent population sample size is necessary (550,000 responses). The accumulation of meeting numbers and comments is woefully inadequate.

There is no designation as to who/agency will make the final decision (re: Wayne Kasworm, Montana biologist). This hinders the publics opportunity to respond.

Agency facts and responses have been distorted biasing in favor of the agency's position. Impacting full disclosure to the Public (ie that RCW 77.12.035 is a Washington State Law that prohibits the reintroduction of the Grizzly,

Human and domestic animal conflict is woefully understated. Suggesting that visitors will increase to see grizzlies in the wild - ludicrous.

Correspondence: Hi,

My name is Elizabeth Brandt, I am originally from Whatcom County, Washington. My family has lived in Whatcom County for more than 100 years, spending most of that time farming around Lynden, Washington. My grandmother also worked for the Mt. Baker National Forest. I am in support of reintroducing Grizzly Bears to the North Cascades area.

Apex predators create balance in nature. Where I currently live, in Maryland, we totally lack this balance and struggle with deer overpopulation and tick borne diseases. Many people are concerned about the potential brutality of bears, particularly ranchers, but this has led to a different brutality- a systematic elimination of an important species in the North Cascades ecosystem.

For years I lived alongside a large Grizzly population in Sitka, Alaska. The bears taught us to be mindful of how we stored

trash, where we cleaned fish, and where we ate in campsites, but they were in no way a menace that struck fear in our hearts. I would often smell the grizzlies when I was out hiking, but I quickly learned that they avoid people nearly all the time. I am surprised by how frequently I saw bear sign and how infrequently I saw bears.

I think that choosing an option for flexible reintroduction that helps surrounding communities accept the return of Grizzlies is a good thing- largely because I don't think the plan will be enacted if people fear that bears will freely roam farms and mainstreets wreaking havoc. Fear is a real barrier here, and ranchers can at times have an outsize voice in land use decisions. Please do make the concessions needed to help people accept this program- but also please move quickly to reestablish Grizzlies in their North Cascades home.

Thanks,

Correspondence: The EIS does not contain estimated population loss and displacement impacts on humans and on other wildlife. There is a significant population of mule deer in the Methow valley area which has declined in recent years calling for a restriction on winter activities in many popular snowmobile and x-country ski areas. The population is stressed and would be stressed further by introducing any new predators into the ecosystem. The EIS fails to address the impact on mule deer and other wildlife. Refer to the Early Winters EIS 19900047 as an example were a considerable amount of effort was focused on mule deer impacts and mitigation.

Recent articles published by bear experts in the northern Rockies indicate fatalities are estimated at about 11.5% of all human-grizzly encounters. The 2022 GBRP Annual Report includes many points about recovery goals and criteria but does not report on human-bear interaction occurrences or fatalities. The EIS should include goals including maximum estimated encounter and fatality rates in order to provide an accurate and complete picture of impacts.

It is my understanding that pre- and post-hibernation activity generally involves bulking up on food sources. This would

coincide with some of the mule deer migration and would occur when the mule deer are concentrated in the valley heading to or from their winter range. Deer salvage permit information from the state of Washington, and warning signs regarding deer kill and nighttime 45 mph speed limits document the prevalence of deer in populated areas. Dead deer are likely to attract the bears down to the roadways. One specific example follows.

I personally experienced having a horse die in the middle of an outfitters camp. It collapsed and died just as darkness fell on the camp. There was nothing to be done that evening so a tarp was laid over the horse. Before the next morning, a grizzly sniffed out the horse, removed the tarp and was having a nice breakfast a few yards away from a group of people.

I would not recommend the forced reintroduction and would prefer allowing it to occur naturally. However, that is a preference and since we are not voting on this I would ask that you please consider allowing this to happen naturally. At the very least include the omitted impacts noted above so that everyone understands what the estimated cost will be in terms of other wildlife and human injuries and casualties.

Correspondence: 2. As someone who frequently hikes, the thought of an increased grizzly bear population in the North Cascades is concerning. Observing the events in places like Montana and Idaho, it's clear that more bears can lead to more dangers. Grizzlies have every opportunity to migrate from BC or Idaho without human intervention. I urge you to let nature dictate its path.

3. The North Cascades have always been a haven for outdoor enthusiasts like me. It's come to my attention that grizzly bears already exist in this range, as noted by the Washington Department of Fish and Wildlife. Introducing more would not only threaten the fragile mule deer population but also increase the risk for those of us who love the outdoors. I'm against any plans to reintroduce grizzlies in Washington.

4. The recent incident in Stevens County, where a grizzly bear was captured, is a testament to the growing predator challenges in Washington. Our state is already grappling with managing wolves, cougars, black bears, and more. Considering the strain on our ungulate populations, I cannot support the idea of reintroducing grizzlies into the state.

5. I felt compelled to voice my concerns about the potential reintroduction of grizzly bears in Washington. It's undeniable that grizzlies are already making their way into the state from neighboring regions. The absence of physical barriers means they can migrate naturally. Given the state's challenges in managing its existing wildlife, introducing another apex predator seems counterproductive.

6. The American Bear Foundation of Washington has always been at the forefront of advocating for bear welfare. Yet, we cannot support the reintroduction of the grizzly bear. The state already hosts this formidable predator. With the challenges the Washington Department of Fish and Wildlife faces in managing the rising numbers of black bear, cougar, and wolves,

introducing a larger and more aggressive predator seems like a step in the wrong direction.

7. As a regular visitor to the North Cascades, the potential increase in grizzly bear population is alarming. The incidents in states like Wyoming serve as a cautionary tale. With no barriers preventing grizzlies from migrating from places like BC, it's best to let nature take its course.

8. The beauty of the North Cascades has always drawn me in. However, the knowledge that grizzly bears are already present, as confirmed by the Washington Department of Fish and Wildlife, makes me apprehensive. Introducing more would jeopardize not only the mule deer but also the safety of countless individuals. I'm firmly against the reintroduction proposal.

9. The recent capture of a grizzly bear in Stevens County underscores the challenges Washington faces with its predator populations. With the existing issues surrounding wolves, black bears, and cougars, it seems imprudent to consider adding grizzlies to the mix. I strongly advise against this reintroduction.

10. The presence of grizzly bears migrating into Washington from places like BC and Idaho is undeniable. Without any physical barriers, they can naturally inhabit the state. Given the difficulties in managing the current wildlife populations, I believe it's in the best interest to refrain from reintroducing more apex predators.

11. The American Bear Foundation of Washington is unequivocal in its position: reintroducing the grizzly bear is not in the best interest of the state. The challenges posed by the increasing numbers of black bear, cougar, and wolves are evident. Introducing a predator of the grizzly's stature would exacerbate these challenges, putting both humans and wildlife at risk.

12. The American Bear Foundation of Washington wishes to express its reservations about reintroducing grizzly bears to the North Cascades. Recent events, such as the grizzly incident in Stevens County, highlight the existing challenges. We advocate for natural migration and believe that the current pressures on our wildlife, especially ungulates, make this reintroduction inadvisable.

13. As a frequent visitor to the North Cascades, the idea of more grizzly bears is concerning. The experiences of states like Montana and Idaho serve as a warning. Grizzlies can naturally migrate from neighboring regions, so I believe we should let nature take its course.

14. The North Cascades offer a unique experience for outdoor lovers. However, the presence of grizzly bears, as confirmed by the Washington Department of Fish and Wildlife, poses a threat. Introducing more bears could harm the mule deer population and increase risks for visitors. I'm against this reintroduction.

15. The recent grizzly bear incident in Stevens County is a clear indication of the challenges we face with predators in Washington. Our state is already stretched thin managing various predators. Given the pressures on our ungulate populations, reintroducing grizzlies seems unwise.

16. I'm writing to express my concerns about reintroducing grizzly bears in Washington. Their natural migration from regions like BC and Idaho is evident. With the state's current wildlife management challenges, adding another apex predator seems ill-advised.

17. The American Bear Foundation of Washington believes that reintroducing the grizzly bear is not in the state's best interest. The challenges posed by the rising numbers of other predators are evident. Introducing grizzlies would only add to these challenges, endangering both humans and wildlife.

18. The North Cascades are a haven for many, but the potential reintroduction of grizzly bears raises safety concerns. The incidents in states like Wyoming are a testament to the risks. Grizzlies can naturally migrate from nearby regions, so human intervention seems unnecessary.

19. The North Cascades are a sanctuary for many outdoor activities. However, the existing grizzly bear population, as noted by the Washington Department of Fish and Wildlife, is already a concern. Adding more bears could jeopardize the mule deer and increase risks for visitors. I oppose this move.

20. The grizzly bear situation in Stevens County highlights the predator challenges in Washington. With the existing predator population and the pressures on our ungulate herds, reintroducing grizzlies seems counterproductive.

21. I wish to voice my concerns about the potential reintroduction of grizzly bears in Washington. Their presence, migrating from regions like BC and Idaho, is already noticeable. Given the state's wildlife management challenges, reintroducing more apex predators is concerning.

22. The American Bear Foundation of Washington is clear in its position: reintroducing the grizzly bear poses significant challenges. The state's current predator management issues are evident. Introducing grizzlies would exacerbate these issues, putting both humans and wildlife at risk.

23. The potential reintroduction of grizzly bears in the North Cascades is alarming for many of us who frequent the area. The experiences of states like Montana serve as a cautionary tale. Grizzlies have every opportunity to migrate naturally, so human intervention seems unwarranted.

24. The North Cascades are a favorite for many outdoor enthusiasts. However, the presence of grizzly bears, as confirmed by the Washington Department of Fish and Wildlife, is concerning. Introducing more bears could harm the mule deer population and increase risks for visitors. I'm against this proposal.

Correspondence: Please allow re-introduction of grizzly bears into the North Cascades! This was original grizzly bear habitat, they were here until humans eradicated them from this (and most parts) of the contiguous US. Grizzlies play an important part in the natural balance of ecosystems where they are allowed to live, and re-introduction will benefit the entirety of the Cascades. I also support treating all grizzlies in the US as a threatened species, including those that are re-introduced to this area..

In addition, a large majority of Washington State residents agree with me! Grizzly bears should be preserved for future generations in the North Cascades Mountains.

Thank you.

Correspondence: I feel that Alternative C is the best option for restoring grizzly bears to the North Cascades. This allows the Fish and Wildlife Service to designate the bears to the US portion of the North Cascades and be considered a nonessential experimental population in which the FWS can then determine whether they are essential or nonessential to the survival of their species. Designating the bears to the North Cascades allows for the advancement of recovery objectives by providing an opportunity to reestablish a self-sustaining grizzly bear population. Although Alternative B could be a good option, Alternative C combines the management tools presented by Alternative B and adds many other beneficial tools like authorizing deterrence, research and recovery actions, relocation of grizzly bears and many more. Alternative A also just does not seem like it would be very beneficial to the survival of grizzly bears as it would be reliant upon the natural recovery of the species. Since humans have pushed them further and further out of their natural habitat, it seems only right to reintroduce them back into the North Cascades rather than waiting on them to repopulate it themselves. Using Alternative C will have the most benefits in ensuring the grizzly bears will benefit the ecosystem and their species population.

Correspondence: When I first heard this proposal about two years ago I just assumed it was somewhere east of Diablo, bordering on Canada, deep in the Okanagan wilderness ... I thought, maybe mark off some territory for "hikers to beware" and "East of Lyman" makes me think someone at their desk doesn't realize people live & work in the east valley and reminds me of shopping in Mt. Vernon with the store owner saying, "Where's Concrete?" I'm totally against this plan for the following reasons:

- 1) Grizzlies don't want to live in my backyard & I imagine they'd be confused if not downright upset to find themselves placed here.
- 2) This is the Skagit Valley, the pride of which is our farming industry. Are you trying to force them into bankruptcy or is this the long range plan to reduce the elk population, if the Grizzlies can beat the cougars & Wolves to that food source?
- 3) too expensive with little to no chance of success for the Grizzly

I vote NO on this proposal.

Correspondence: Well you've definitely put the cart before the horse. Ive read the documents provided and introducing bears into an environment that has a depleted food source is a terrible idea. Based on the data and documentation provided.

When grizzly bears were in the North cascades, the amount of fish and game was abundant. It's not anymore. There very few deer, no caribou, few elk, few moose, no bison and few fish. How about reintroducing the elk, caribou, moose, bison etc? And then when those species become sustainable re-re-evaluate bringing grizzly bears? Seems logical, right? It's just senseless bringing bears into an area with limited food and expecting them to flourish even considered.

I've lived in the Methow for over 60 years. It's an obvious divide of those in favor of Bears and those not in favor. The large majority of this in favor of the bears have moved to the Methow within the past 5-10 years. They have little knowledge of the area or concern for the animals still here. And those who oppose the bears are most often long time residents who do have a knowledge of the are and care about the negative effects the bears will have on the other animals in this area.

Correspondence: I'm not sure I would want to take my family for a wilderness camping experience in an area that has even 2 much less 200 grizzlies. Not everyone is or can expected to be a seasoned woodsman or camper so it is likely there will be more bear attacks as a consequence of reintroducing this animal. My guess is that more bears will ultimately mean fewer back country visitors. Admittedly, it's a romantic thought to imagine an environment that existed in the 1700 and 1800, but that is not reality and never will be. Too many variables and too many people influences. I support no reintroducing grizzlies in the north cascades. Let them migrate in from Canada.

I was once a strong supporter of ESA but have since watched it morph into a muddled program shaped by self serving court cases, poor science, contradictory and ineffectual management schemes and horrendous public cost to the government and to land owners who have had to deal with it. It needs not to be repealed but reworked to address these short comings.

Thank you for allowing comment. Put me on your mailing list.

Correspondence: I agree with the following pts that Wilderness Watch presents. Any reintroduction needs to be as natural as possible and good for wilderness and bears.

*I support the restoration of grizzlies to the North Cascades, and that the restoration must be done in ways that don't violate the Wilderness Act and harm the area's wilderness character. This is good for bears and Wilderness.

*Both of the action alternatives as they now stand would violate the Wilderness Act. The action alternatives should be modified to avoid helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and steer clear of heavy-handed management of bears. There are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites without the use of helicopters inside Wilderness.

*I oppose the use of a 10(j) rule for the grizzlies in the restoration work. This would mean grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana would be taken from their homes, dropped into the North Cascades, and lose their previous protection.

*Montana doesn't have any "extra" grizzlies to lose to the North Cascades. Montana grizzlies are not yet recovered under the ESA, and any dispersing grizzlies from Glacier or Yellowstone are needed to naturally recover areas like the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest.

*A natural recovery alternative must be fully developed and analyzed, even if recovery would take longer than active repopulation. The new information presented by Superintendent Striker regarding the likelihood of naturally migrating bears from Canada suggests active repopulation urgency may be more about protecting agency discretion than protecting

Wilderness and creating the best environment for grizzly bears to migrate, live, and thrive.

*For the long-term success of grizzly restoration, natural recovery measures must also be included in both action alternatives thus reducing the need for wilderness degrading activities that are also ultimately bad for bears. This requires work with partners in British Columbia to ensure that grizzlies have corridors to move back and forth across the international border and to prevent a small North Cascades grizzly population from shrinking over time and becoming inbred.

*An alternative that combines natural recovery with population augmentation under full ESA protections should also be analyzed.

*The no action alternative has many good Bear Smart components on how people and communities can coexist with grizzly bears and these coexistence measures should also be included in both of the action alternatives. All possible measures must be taken to prepare residents and visitors for bears, particularly given the dramatic growth of the human population in the region and rapidly increasing recreation pressures in the Park.

Correspondence: I support the no action alternative in the plan. Grizzlies have been protected in NCCP for 55 years as well as surrounding wilderness areas. They have had access to repopulate this area from Canada to the north. And yet, they haven't. There must be a good reason. Perhaps thi
Could it be that this area is to small to support a population of
grizzly bears without
significant adverse interaction with hikers, back road bicyclists, farmers and
hunters. I think forcing the reintroduction of these large carnivores is a mistake
and a recipe for disaster.

Correspondence: I am opposed to the current grizzly reintroduction plan to the US portion of the NCE due to my concerns for the well-being of the bears and humans. The 10(j) designation will increase the likelihood of bears being killed since the 10(j) bears will not have the full protection of an ESA species. I'm also concerned about the potential for dangerous and potentially fatal human-bear interactions. The trails in the North Cascades are crowded as evidenced by how hard it is to find solitude on trails along highway 20 for example. Recreationalists in the NCE are generally not grizzly aware which will increase the potential for human mistakes in such things as safe food storage. While the NCE is a historical habitat for grizzlies, the bears do have significant protected habitat in many other areas of the western US, Alaska, and Canada. I believe our focus should be on protecting current grizzly habitat and bear populations and not setting up a situation with potential harm to both bears and humans.

Correspondence: Yes, although the North Cascade Ecosystem was historically grizzly habitat, I am opposed to transplanting grizzly bears into the North Cascades Ecosystem. The grizzly bear population in the North Cascades Ecosystem is in the process of a slow natural recovery. I am 70 years old. Occasional sightings of grizzlies in the North Cascades is not a new thing in my lifetime. Grizzly bears are able to move into the North Cascades Ecosystem via British Columbia and northern (north eastern) Washington.

The North Cascades Ecosystem being predominantly wilderness will allow for the eventual reestablishment of a stable grizzly bear population without intervention. Proponents for transplantation of grizzly bears into the North Cascades appear to be impatient, unwilling to wait for natural re-population. The effort should be directed to planning for this re-population and answering questions such as:

- (1) What is the best way to deal with the interaction of the bears with humans who recreate in the Ecosystem?
- (2) What is the best way to deal with bears that will travel into populated areas surrounding the Ecosystem?
- (3) What is the best way to maintain the connection of the North Cascades grizzly population with adjacent populations by optimizing the bears' ability to migrate into and out of the Ecosystem?

I have hiked, backpacked, climbed and photographed in the North Cascades since 1974. I feel that forcing a change on the grizzly population by transplanting bears from places like Montana, Idaho or Wyoming in the Northern Rockies Ecosystem is a bad idea for the following reasons:

- (1) Plans for transplantation call for many helicopter flights over Wilderness Areas, and into Wilderness Areas which violates the Wilderness Act.
- (2) A ridiculous amount of money would need to be spent. Does this only serve to appease those who want grizzlies in the Ecosystem immediately? Surely the agencies have other needs where funds are needed with a much higher priority. As a taxpayer, I am opposed to the use of tax dollars for grizzly transplantation in the North Cascades Ecosystem.
- (3) The North Cascades Ecosystem is heavily used for recreation, especially by people who live in the nearby population centers in the Puget Sound area. Although I have spent many days and nights in Wilderness Areas in the Northern Rockies, and treasure the fact that the Northern Rockies are inhabited by grizzly bears, I appreciated the wildness of the North Cascades without the risk of likely grizzly encounters.
- (4) In comparison to the northern Rockies, there is limited grizzly habitat in the North Cascades Ecosystem, and therefore the North Cascades Ecosystem cannot support a large population of grizzlies.
- (5) Natural migration allows for bears to be more naturally acclimatized to the geography and environment of the North Cascades, which are substantially different from the Rocky Mountains.
- (6) Increasing the population of grizzly bears by transplantation will create a situation where bears travel into populated areas that surround the North Cascades Ecosystem. There is not a good buffer around the North Cascades.
- (6) I believe that managers will feel that troublesome bears, bears that have become habituated to human presence and food, from the Northern Rockies can be relocated to the North Cascades.

Please allow for natural processes to occur without intervention!

Correspondence: The DEIS for the Grizzly Bear Recovery Plan provides a good overview of the outcomes following the different recovery plans. I think it does a good job of explaining the impact that the recovery plans would have on the ecosystems and people visiting the park, which is ultimately the goal of this report. I think that option C seems like the best plan offered. While it is very similar to B and has the same socioeconomic impacts due to the same number of bears being released, it has more room to manage and minimize human-grizzly conflicts with both lethal and non-lethal measures. Option C would also reduce the costs of implementation and the impacts on businesses like ranches nearby. Other than this, the impacts on public safety would also be the same under both B and C. I think that having more available measures to mitigate these conflicts is very important to people who reside in the areas or who recreate in the forests and would encourage more support for grizzly bear recovery given that there might be less impact on humans. I think the increased safety of this while also still encouraging and providing education of bear safety is extremely important following this recovery plan. In addition to these comments, my main concern or question is on the effect of the transportation on both the people involved in transport and the wildlife affected by it. The case recognized that the noise and the helicopter might be distressing to mammals in the area but did not offer any solutions or ways to mitigate this impact. I also am not sure how the bears will be trapped and transported and if this will be dangerous for those involved and whoever is flying the helicopter. I think these are important questions to be addressed when creating the plan and deciding what to choose. Ultimately, I think this is a good and very detailed outline that addresses the impacts of each alternative and I think that alternative C might be the most effective and safest option.

Correspondence: I am opposed to reintroducing grizzly bears to Washington State and urge you to avoid doing this.

Just this past weekend, a friend who lives in Alaska showed me photos of a grizzly bear that tried to get into his cabin and that he had to drop for the protection of his family.

It is undisputed that these animals and people do not co-exist well. Although Washington is part of the historical range of these animals, that was a long time ago when the human population was much lower. Reintroducing them now ignores this reality and will lead to a loss of human lives, of bear lives, and of livestock lives.

Correspondence: This is a terrible idea. Downright terrible. Has Washington state not learned anything from its failed attempts at bringing wolves back? Promising locals that there won't be any issues and then having to turn around and cull wolves on the tax payers dime for something you guys did in the first place? To the point where the derelict that window licker Jay Inslee who has no experience in wildlife biology what so ever stepped in and said you guys need to figure out how to solve the wolf problem without killing anymore.

Yes wolves and grizzlies "WERE" native to the state. But it has developed a ecosystem that has gotten used to not having those animals in them. Then when you "reintroduce" them you're throwing the balance of the ecosystem off. Reintroduction doesn't make them native....that makes them invasive. The damage that wolves have done to this state should already be evident enough that is potential for catastrophe. I'm 35 now and have been hunting in this state since I was 13. And I have seen what wolves have done to the game population over in Eastern Washington. The mule deer that used to be abundant over there have gotten scarce. And the fact that there has already been vast problems with wolves and human interaction, why would you create a situation to only create more problems? You guys have already proven incapable of controlling a plan you created once before so why do it again?

Correspondence: I support reintroduction of the bears. I know this presents some risks and challenges. I own livestock and this year lost a prize doe to a cougar. I have to take some responsibility but I did not know there was a cougar roaming locally and due to neighbors shooting illegal fireworks constantly for days I had brought my farm dog inside.

What I would like to see included in Alternative C is assistance provided to those that do raise livestock to include education as well as financial assistance (low cost loans?) for equipment to deter bears. This might include perimeter alarms, fencing, bear spray systems, etc. I train animals and I know that one way to reduce risk to all is to create a system that teaches the bears that humans, livestock, and pets are a poor choice. We live in an age where there are more alternatives for protection from a rogue or errant bear or cougar. I also believe that serious investigations and penalties should be applied for the shooting of bears since there will be the yahoo that tries to claim they were protecting themselves when in fact they are out looking to bag a bear.

Thanks

Correspondence: I totally support the plan to bring grizzly bears into the North Cascade Mountains. The grizzly bears have lived in the North Cascades for thousands of years with the Native American people. I support the alternative B method but I also support the alternative C method if it helps restore the grizzly bears to the North Cascade Mountains. Grizzly bears are an important animal that helps the North Cascade mountains ecosystem thrive and prosper. Grizzly bears interact with all the other plants and animals to bring balance and health to the natural world. The North Cascade ecosystem is all connected. There is a tremendous amount of land area that has all the animals and plants for the grizzly bears to eat and live. There is plenty of space in the North Cascades for the grizzly bears to be away from people. Grizzly bears in Glacier National Park and surrounding areas has been very successful with lots of people visiting the park to see these beautiful animals. The tourism to see the North Cascade grizzly bears would help Washington States economy. I believe the grizzly bears can be managed safely because they are managed all over the world in many countries. People need to know the grizzly bear if they live or travel in land occupied by grizzly bears. In order to be safe, people need to stay away from mother bears with cubs, stay away from dead animals, human and pet foods need to be kept away from bears as well as dogs and pets. People should never run from a bear and they should travel in a group with bear spray. A grizzly bear should not be threatened. Grizzly bears fear being hurt because they will die so they avoid people which they view as dangerous unless they have been human conditioned and have lost their fear of people. I believe people can live with the grizzly bears and people can be safe if people learn the precautions and rules to protect themselves. I thank you for doing a DEIS for recovering the grizzly bears to the North Cascade Mountains. I fully support the grizzly bears recovery to the North Cascade Mountains.

Correspondence: Thank you for this opportunity to comment on the: Draft Grizzly Bear Restoration Plan / Environmental Impact Statement for the North Cascades Ecosystem

As a member of Back Country Horsemen of Washington, I am very concerned with the ability to continue to recreate in the North Cascades should a small population of heavily protected grizzly bears be mechanically moved into the region that we recreate in. The DEIS does not sufficiently analyze the impact to recreation or present any options for how trails can be maintained open in the presence of protections implemented to reduce human-grizzly interactions.

1. The Pacific Crest National Scenic Trail runs through the core habitat and has permitted distance hikers of around 10,000. When considering the other trail users in and along the North Cascades Ecosystem (NCE) since this is one of the most populated areas around any bear ecosystem, the use likely exceeds a quarter million visits. However, the DEIS indicates that the use is insignificant. It is very significant and will likely result in many human-bear interactions.
2. The Pacific Northwest National Scenic Trail also runs through the NCE as well as other bear ecosystems to the east, including the Cabinet-Yaak (CYE). The CYE has a more established population of bears but still has resulted with challenges to the very existence of the trail due to the limited number of bears in the CYE (20-40). Opposition to the National Scenic Trail in the recovering bear population area as well as the connecting landscapes between ecosystems has also been expressed by USFWS staff, the same agency putting forth the NCE proposal through which the same trail will pass.
3. Without a more detailed analysis of how to retain the carrying capacity of the trails, trailheads, and campgrounds without resulting in long term or permanent closures, there is no way to effectively review this DEIS.
4. Furthermore, the NPS and USFWS have pointed out that the Canadian counterparts and First Nations are preparing to release grizzly bears in the northern part of the NCE. IF that was the only release point, it would move the core recovery/release area north and away from the more densely human populated areas of Washington State. It also would be in line with Washington State law as well since no bears would be translocated directly into Washington, and there also would be predictability on how many bears are being moved into the entire NCE which overlaps both countries. The BC government has noted that their Recovery Plan is being developed jointly with the USFWS even though this US EIS only addresses the Washington effort.
5. As a trail horse rider in the NCE, I ask that the No Action Alternative be selected. The areas we ride in includes the Mt Baker Snoqualmie National Forest, the Okanogan Wenatchee National Forest including the Pasayten Wilderness, and the North Cascades National Park. We have many horse camps along the boundary of the NCE. We cannot support either Action Alternative without more substantive analysis on impacts to recreation as well as knowing more on the joint planning with Canadian counterparts.

IF that was the only release point, it would move the core recovery/release area north and away from the more densely human populated areas of Washington State. It also would be in line with Washington State law as well since no bears would be translocated directly into Washington, and there also would be predictability on how many bears are being moved into the entire NCE which overlaps both countries. The BC government has noted that their Recovery Plan is being developed jointly with the USFWS even though this US EIS only addresses the Washington effort. As a trail horse rider in the NCE, I ask that the No Action Alternative be selected. The areas we ride in includes the Mt Baker Snoqualmie National Forest, the Okanogan Wenatchee National Forest including the Pasayten Wilderness, and the North

Cascades National Park. We have many horse camps along the boundary of the NCE. We cannot support either Action Alternative without more substantive analysis on impacts to recreation as well as knowing more on the joint planning with Canadian counterparts.

Correspondence: I would like to express my support for the reintroduction of grizzlies into the Cascades, as an avid hiker, biker, and backpacker in the wilderness of Washington. Having worked and played in Grand Teton National Park for many years, I know first hand the additional burden, responsibility, and fear that comes with exploring in grizzly country. From my education, I also know what a gift is to have the resiliency in an ecosystem that I enjoy visiting, a robustness that comes from the presence of a top predator and keystone species like the grizzly. For too long, managers have curated a "wilderness" for the recreation and preferences of humans. The results of that style of management has been imbalance and degradation of species richness and habitat. With compounding threats of climate change and habitat loss, it's time for bold leadership in natural resources management that prioritizes ecosystem stability and sustainability even in the face of human fear and discomfort. It's time to reintroduce grizzlies to Washington.

Correspondence: Grizzlies and black bears are different species, and each species has a unique role to play in nature. We need to maintain as much biodiversity as possible in wild places like the North Cascades in order to keep them resilient, especially given threats from climate change.

Although grizzlies are often thought to be voracious predators, most of their omnivorous diet consists of insects, sedges and leafy vegetation, plant roots, and berries, whose seeds are distributed through their droppings. A large portion of the meat that is consumed by grizzlies comprises ground squirrels and other small mammals, and carrion killed by other predators, such as wolves, or harsh winters. Grizzly bears are prolific diggers in their search for roots and burrowing small mammals, thereby aerating the soil and maintaining vibrant meadows.

Culturally and spiritually, grizzly bears are important to many of the Indigenous peoples in the Pacific Northwest, who have coexisted with grizzlies for thousands of years. We are grateful for the knowledge and deep respect these peoples hold on behalf of grizzly bears, who are often seen as teachers, guides, and symbols of strength and wisdom.

Last, we have a moral obligation to restore grizzlies as a wilderness icon and a key part of our natural heritage.

Correspondence: Hi there,

My name is [REDACTED] and I support Alternative A the no action alternative in the draft grizzly bear restoration plan. Myself, my family, and friends, horseback ride and hike in the North Cascades. I feel that Grizzly Bears are dangerous animals and the human risk involved in active restoration of the population is not worth the benefit of more Grizzly Bears in that area.

If Grizzly Bears are endangered, then that tells me that they are not overpopulating an area that they would be caught from and relocated to the North Cascades. I feel the more remote a Grizzly Bears habitat the better for the bear and for humans and pets.

Thank you for allowing me to share my opinion.

Correspondence: Thank you for this opportunity to comment on the: Draft Grizzly Bear Restoration Plan / Environmental Impact Statement for the North Cascades Ecosystem

As a member of Back Country Horsemen of Washington, I am very concerned with the ability to continue to recreate in the North Cascades should a small population of heavily protected grizzly bears be mechanically moved into the region. It has been my personal experience that grizzly bears already inhabit the North Cascades, apparently moving south out of Canada in small numbers. They are doing just fine to "re-inhabit" the area on their own and do not need government assistance. Further, the DEIS does not sufficiently analyze the impact to recreation or present any options for how trails can be maintained open in the presence of protections implemented to reduce human-grizzly interactions.

1. The Pacific Crest National Scenic Trail runs through the core habitat and has permitted distance hikers of around 10,000. When considering the other trail users in and along the North Cascades Ecosystem (NCE) since this is one of the most populated areas around any bear ecosystem, the use likely exceeds a quarter million visits. However, the DEIS indicates that the use is insignificant. It is very significant and will likely result in many human-bear interactions.
2. The Pacific Northwest National Scenic Trail also runs through the NCE as well as other bear ecosystems to the east, including the Cabinet-Yaak (CYE). The CYE has a more established population of bears but still has resulted with challenges to the very existence of the trail due to the limited number of bears in the CYE (20-40). Opposition to the National Scenic Trail in the recovering bear population area as well as the connecting landscapes between ecosystems has also been expressed by USFWS staff, the same agency putting forth the NCE proposal through which the same trail will pass.
3. Without a more detailed analysis of how to retain the carrying capacity of the trails, trailheads, and campgrounds without resulting in long term or permanent closures, there is no way to effectively review this DEIS.
4. Furthermore, the NPS and USFWS have pointed out that the Canadian counterparts and First Nations are preparing to release grizzly bears in the northern part of the NCE. IF that was the only release point, it would move the core recovery/release area north and away from the more densely human populated areas of Washington State. It also would be in line with Washington State law as well since no bears would be translocated directly into Washington, and there also would be predictability on how many bears are being moved into the entire NCE which overlaps both countries. The BC government has noted that their Recovery Plan is being developed jointly with the USFWS even though this US EIS only addresses the Washington effort.
5. I have not seen any report on how the proposed mechanical release of grizzly bears in the NCE supports the North American Wildlife Management Model. I am concerned with the increase of all apex predator populations and the negative effect it is currently having on what was a settled habitat that very successfully provided for all wild species as well as domestic grazing opportunity and relatively safe public recreation. Evidence of predator pits are apparent. Incidents of apex

predator attacks on domestic herds, pets and humans are increasing. I am concerned that an artificial increase of the grizzly population in the NCE will only exacerbate the current challenges.

6. As a trail horse rider in the NCE, I ask that the No Action Alternative be selected. The areas we ride in includes the Mt Baker Snoqualmie National Forest, the Okanogan Wenatchee National Forest including the Pasayten Wilderness, and the North Cascades National Park. We have many horse camps along the boundary of the NCE. We cannot support either Action Alternative without more substantive analysis on impacts to recreation as well as knowing more on the joint planning with Canadian counterparts.

Correspondence: Although the information below was written by BCHW, I wholeheartedly agree with it as I have plans to ride my horses and hike in the areas that could suddenly become a lot more dangerous. These areas ARE used and even one fatality is too much - which will happen.

As a member of Back Country Horsemen of Washington, I am very concerned with the ability to continue to recreate in the North Cascades should a small population of heavily protected grizzly bears be mechanically moved into the region that we recreate in. The DEIS does not sufficiently analyze the impact to recreation or present any options for how trails can be maintained open in the presence of protections implemented to reduce human-grizzly interactions.

1. The Pacific Crest National Scenic Trail runs through the core habitat and has permitted distance hikers of around 10,000. Correspondence: I am writing today to voice my opposition to moving Grizzly Bears into the North Cascades. The area is too populated by people living and recreating in the vicinity for there not to be bear/human interactions. I worry that not only human life could be endangered but the Grizzlies too. If such an interaction were to occur and a human were hurt then the bear would have to be found and shot. Your plan seems very shortsighted to me.

Correspondence: I absolutely support the Grizzly Bear Restoration Plan in the North Cascades! Hopefully this will be successful and then they will need to be protected so that human hunters aren't gunning them down in their hibernation as seems to sometimes be the case in our human dominated world! Also the public visiting the area will need to be educated so that they stay away from them and don't endanger themselves or the bears. Thank you for receiving public comments on this! I really hope that this goes ahead! Other animals have as much right to live and thrive on this planet as the human animals and most of our diverse species are rapidly on their way to extinction! We should help these bears not disappear!

Correspondence: I have been an avid hiker, climber, and backcountry skier in the North Cascades for over 45 years. I am fully in favor of reintroducing grizzly bears to that part of our state. I believe one of the best ways to promote a robust ecosystem is to have it contain all of the wildlife that historically lived there. Grizzly bears (along with wolves and wolverines) need to have a presence in the North Cascades as they did before their populations were decimated by human prejudice and shortsightedness. I have been fortunate enough to have encountered grizzlies in both Alaska and Yellowstone National Park, and know that with proper respect and caution on our part, we humans can coexist with these magnificent animals.

Correspondence: You will find the below comments, which are very thoughtful points provided by Back Country Horseman of Washington. My personal thoughts are this: I get habitat restoration and endangered species, but I really don't feel comfortable with taking any action until the impact of human-bear interaction is better addressed. Running into a black bear on a trail is one thing, but a grizzly would be terrifying.

And now the comments from the group (their awareness of hiking & riding habitat is why I joined them BTW):

1. The Pacific Crest National Scenic Trail runs through the core habitat and has permitted distance hikers of around 10,000. When considering the other trail users in and along the North Cascades Ecosystem (NCE) since this is one of the most populated areas around any bear ecosystem, the use likely exceeds a quarter million visits. However, the DEIS indicates that the use is insignificant. It is very significant and will likely result in many human-bear interactions.
2. The Pacific Northwest National Scenic Trail also runs through the NCE as well as other bear ecosystems to the east, including the Cabinet-Yaak (CYE). The CYE has a more established population of bears but still has resulted with challenges to the very existence of the trail due to the limited number of bears in the CYE (20-40). Opposition to the National Scenic Trail in the recovering bear population area as well as the connecting landscapes between ecosystems has also been expressed

by USFWS staff, the same agency putting forth the NCE proposal through which the same trail will pass.

3. Without a more detailed analysis of how to retain the carrying capacity of the trails, trailheads, and campgrounds without resulting in long term or permanent closures, there is no way to effectively review this DEIS.

4. Furthermore, the NPS and USFWS have pointed out that the Canadian counterparts and First Nations are preparing to release grizzly bears in the northern part of the NCE. IF that was the only release point, it would move the core recovery/release area north and away from the more densely human populated areas of Washington State. It also would be in line with Washington State law as well since no bears would be translocated directly into Washington, and there also would be predictability on how many bears are being moved into the entire NCE which overlaps both countries. The BC government has noted that their Recovery Plan is being developed jointly with the USFWS even though this US EIS only addresses the Washington effort.

5. As a trail horse rider in the NCE, I ask that the No Action Alternative be selected. The areas we ride in includes the Mt Baker Snoqualmie National Forest, the Okanogan Wenatchee National Forest including the Pasayten Wilderness, and the North Cascades National Park. We have many horse camps along the boundary of the NCE. We cannot support either Action Alternative without more substantive analysis on impacts to recreation as well as knowing more on the joint planning with Canadian counterparts.

Thank you for your consideration.

Sincerely,

██████████

Correspondence: Hello,

I am very concerned with the National Park plan to introduce grizzly bears into the North Cascade park. The introduction of so many bears will pose a danger to the hiking community. Grizzly attacks are not easily managed with a bear spary. In addition, this will cause closures of some trails when there is Grizzly activity. Overall it will greatly impact the hiking community and will pose danger. Human safety comes first. I don't understand what is the rational of introducing the Grizzlies now and why that many. Possibly consider a staggered approach .

Correspondence: I am strongly opposed to reintroducing grizzly bears to the North Cascades. There have been so few ("2 in 42 years") grizzlies killing people in the North Cascades due obviously to the sparse number of them!

If more grizzlies are introduced be prepared for more attacks against humans who hike in large numbers in our wilderness areas in the North Cascades. My late husband and I enjoyed many decades of backpacking and hiking without incident because there were so few grizzlies. Black bears are more timid and safer to be around!

Grizzlies are more lethal than black bears and they consume large quantities of salmon! Considering our very controversial

issue with salmon I cannot fathom why we would allow more grizzlies to consume huge quantities of salmon in our area!

I am totally for "Alternative A" and NOT introducing or transporting grizzlies to our wild and still relatively safe wilderness areas in the North Cascades.

Correspondence: Grizzlies should be reintroduced to the North Cascades because they are a textbook example of when this type of reintroduction is necessary. We are the reason this key species is not widespread in the Cascades of Washington, and this change occurred during living memory. This species is necessary for proper function of these ecosystems and failure to reintroduce them means these are not truly natural systems. To have a National Park, roadless and presenting the best of our state, with an artificially absent key species, is akin to faking it. Rather than presenting a Disneyland for tourists, we should seek to present as close to natural an environment as possible, which includes an American icon. Yes, there may be rare impacts on humans, but this is what living in the woods, in nature, is. Otherwise, you're just faking it.

Correspondence: I hike, backpack and ride horses. I will not endanger myself or my animals by taking them into an area inhabited by Grizzly bears.

I do these things in areas inhabited by Black bears, cougars and coyote but not Grizzlies. Grizzlies are too unpredictable.

I have had encounters with Black bears and they always left when they heard my "bear bell" or noticed me. I have been stalked by a

cougar which was scary, but it never attacked. There have been a number of incidents involving Grizzlies in the past few years. The

North Cascades are very rugged and many trails do not allow escape from a predator. Grizzlies inhabit enough areas already. By

introducing them into this area more human bear interactions will be inevitable. This is unnecessary to improve the habitat. Please

reconsider any decisions involving humans and Grizzlies. **DO NOT REINTRODUCE GRIZZLIES INTO THE NORTH CASCADES!**

Correspondence: I prefer that option A is chosen. That is no new grizzly bears shall be introduced into the North Cascades National Park then those that already exist or those that travel across the border from Canada.

Why:

- 1) hiking, backpacking, climbing in habitat with grizzly bears his totally different than hiking in habitat with black bears. With black bears, the hiker is told to stand tall and noisy and throw rocks to scare away the bear. With grizzlies, the hiker is told to turn sideways to the bear, not making eye contact, be submissive, Mumble quietly as he or she backs away. Obviously the hiker is at far greater risk with a grizzly bear then with the black bear.
 - 2) I have hiked and climbed in the Cascades extensively and have only seen the evidence of one black bear. Similarly, I have hiked in Yosemite and had many encounters with black bears. I have hiked extensively in Canada and Glacier National Park. I know from experience that my risk of harm is much greater with grizzly bears.
 - 3) hiking with a bear canister to minimize the chance of food reward to any kind of bear is totally impractical beyond one overnight for a small hiking party.
 - 4) grizzly bears require far more habitat per bear then do black bears. That area required per bear in the North Cascades, below glacier covered areas does not support 25 imported grizzly bears.
 - 5) realizing that grizzlies will migrate from Canada into the North Cascades National Park, to seek their own equilibrium of habitat available versus number of bears, is the best solution.
 - 6) there used to be grizzly bears on Whidbey Island decades ago. That doesn't mean we have to reintroduce bears there now. Similarly with the North Cascades.

Correspondence: The Pasayten and North Cascades are a place where we have spent allt of time thru my entire lifetime. There has not been grizzlies in that territory for so long and there is no reason to reintroduce them. The deer population is much lower already than years ago and introducing yet another predator will decimate the wildlife population that us left. We are avid outdoorsman and hunters and have seen the decrease in the deer and elk population in Eastern Washington over the last few years where the wolves have been reintroduced. You can hike the whole weekend and not see a single wikh animal. WOLF tracks are seen everywhere. Not deer. Not elk. nothing. Why reintroduce another large predator where it is not

necessary or needed? Those who love the outdoors want to see wildlife but not feel the need to fear for our lives while out in the wilderness. We strongly vote against the reintroduction of grizzlies in the North Cascades.

Correspondence: I support option A, to not re-introduce grizzly bears to the North Cascades. Even though I am an environmentalist, I disagree that grizzly's should be brought back to historic levels. I have camped and back packed in the North Cascades for decades now and realize this area is becoming more popular every year for novice campers and this will significantly increase in the future. We cannot go back to what it was before people came to the area. Grizzly's aren't as accommodating to hikers as black bears are and grizzly's will displace our black bears. Please use common sense and let the bears come on their own as some will eventually make the journey from Canada. Recognize that times have changed and we cannot go back to the past. Thank you, Jerry

Correspondence: I already do not feel very safe going into the National Parks with the current number of Grisly Bears out there. They are much more aggressive & vicious than the black bears. With Canada bringing more bears to the Cascades they will naturally populate & move south to the more temperate climate of Washington. People like to hike & camp in the wilderness with their families & this will make the bears more accustom to humans, thus bringing them down into civilization looking for food, especially during the drought months & fire season. You are greatly endangering human lives by bringing in more Grisly bears. We already see many Black & Brown bears on homeowners cameras around their homes & communities on social media. People living off the grid will have a very hard time growing food, maintaining their livestock, protecting their families & pets with Grisly Bears all around. What will you do if in 2-4 years we have a hundred or more Grisly Bears coming down from Canada? They live around 20-25 years producing more & more Grisly Bears. WE DO NOT NEED MORE GRISLY BEARS so close to civilization. because they can travel & have a range of 600 square miles. Our state is only 360 miles long & 240 miles wide. They are very intelligent & can smell food from miles away. Our state has enough problems without bringing in Grisly Bears to upset the delicate ecosystem & possibly kill people & their livestock & destroy their possessions. PLEASE reconsider & do not bring any more of these dangerous animals into our state.

Correspondence: I am writing to encourage the State of Washington to move ahead with plans to bring a grizzly bear population to the north cascades. As a life-long resident of Washington, I believe we should make these types of restorations whenever possible. While there are good arguments on both sides of this issue, the presence of these rare animals will do a small favor for the population that we decimated. Everyone should be bear savvy, and grizzlies in the north cascades should be welcomed by us. People grazing animals on public lands should be prepared for some predation, and I think that there are programs to compensate citizens for this type of loss.

Please do continue the work of restoring a grizzly population in our state. It's the least we can do.

Thank you for the opportunity to weigh in on this issue.

Correspondence: I support the restoration of grizzlies to the North Cascades, and that the restoration must be done in ways that don't violate the Wilderness Act and harm the area's wilderness character. This is good for bears and Wilderness. Both of the action alternatives as they now stand would violate the Wilderness Act. The action alternatives should be modified to avoid helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and steer clear of heavy-handed management of bears. There are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites without the use of helicopters inside Wilderness. I oppose the use of a 10(j) rule for the grizzlies in the restoration work. This would mean grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana would be taken from their homes, dropped into the North Cascades, and lose their previous protection.

Correspondence: If the grizzlies wanted to be here they would migrate them selves.. humans trying to interfere with nature has been abundantly clear ...it doesn't work..leave things alone.. if agencies put the time effort and money into real boots on the ground matters, there may be some value in that..when the city idiots started to improve the wilderness by not allowing grazing and no forest harvesting..we now have a total waste of wood products from fire.. not to mention animal habitat. These ideas need to be run by the real people in the woods that see what is going on day to day not some inflated self important egotistical moron who thinks there helping.. if you want to import a freaking grizzly start with Seattle, Portland,

San Francisco, Los Angeles, and other cities first..there's plenty of easy pickings for them. And green Spaces to habitate . Let the animals migrate where there instincts lead them.

Correspondence: My question is why would you want to add more carnivores to our ecosystem?? We already have too many wolves. Add Cougars, black bears, coyotes, and bob cats and our present population of ungulates do not have a chance. Why do all you so called environmentalist always want to protect the predators. And you never do what you say you are going to do! I recall reading several articles when the grey wolves were introduced in this state stating that they would be delisted after 15 breeding pairs were reached. Now I read in another article that we have 37 breeding pairs. Still not delisted?? The exact same thing would happen if Grizzly bears were introduced, and they are more dangerous than the Wolf. I responded to a rather long survey recently about what I thought of our Department of Fish and Wildlife, and if I thought they were doing good job and if I trusted their judgement. The answer to that is absolutely No I do not. And I don't see this changing until the Enviromental liberals are out of office.

The hunter and fishermen of this state provide a huge income to the fish and wildlife and we get nothing in return, but restrictions and more restrictions. If you didn't get my point, I say NO to the reintroduction of Grizzly bears to the North Cascade Mountains of Washington State.

Correspondence: Nov.6,2023

I am writing to give my opinion on the possible reintroduction of the grizzly bear to the North Cascades. First of all, I am against this idea. The grizzly has been gone from this area for over 25 years. Why do we as humans feel like we have to change nature? Apparently because we can. What effect will this have on other wildlife that live in this vast area? I'm sure the land owners that live in the perimeters of this area are concerned if not against this idea. Bears in general have been consistently encroaching on humans land, yards and homes. What makes you think that in years to come the grizzly's won't be brazen enough to encroach on landowners home and property? Yes, a lot of questions. And if so, then maybe not the best choice for the North Cascades. I say leave nature alone. Remember, if you reintroduce grizzly's to this area, there is no control of them after they are established except for more human control.

Respectfully,

Correspondence: As a mother and grandmother, I believe it is our duty to protect and preserve wildlife as precious natural resources held in trust for all future generations. I also feel a deep responsibility as a Steward for all of Earth's Divine Creation. That responsibility will always be more important than politics or profit.

So I strongly support the National Park Services preferred Alternative C: Restoration with Endangered Species Act Section 10(j) Designation.

This plan will both effectively restore grizzly bears in North Cascades National Park and give people the tools they need to thrive in and around grizzly bear country. Grizzlies belong in the North Cascades, as they enhance the park's ecological integrity and contribute to its wildness.

Grizzly bears play a vital role in maintaining ecosystem balance, cycling nutrients, dispersing seeds, and changing the behavior of species around them. Restoring them would benefit the park and the people who use it.

A restored population of grizzlies will boost the park's appeal and attract nature enthusiasts, scientists, and tourists from around the world. This would provide economic benefits to local communities and support the park's mission to protect park resources in perpetuity.

Alternative C, with the 10(j) rule, provides managers flexibility to address community concerns while protecting the grizzly population. It ensures coexistence between humans and bears.

Please consider the positive ecological and economic benefits and support Alternative C. Restoring grizzly bears will secure the park's natural heritage and conserve an iconic species for current and future generations.

Thank you for your dedication to our national parks.

Correspondence: The 10(j) rule, allowing for greater flexibility in the operation of the program, is a checkmark in the plus column for the plan.

I would have liked to have been able to see the criteria for selection of bears to be relocated but, again, the program being under scrutiny, would not allow for bears that would become transient and gravitate towards the easy pickings of campground dumpsters nor bears that find it easier to attack chicken coops and kill livestock. The intent is for them to establish their natural tendencies towards killing deer / elk; scavenging other predator kills (wolf kills); eating roots, berries, and grubs; and fishing when seasonal. Another checkmark in the plus column here.

So what State law has already declared grizzly relocation illegal? I would have like to see that verbiage....is this a broad definition or something stated succinctly. On the one hand, it's great that the plan is so extensive, on the other hand, that makes it a little onerous for the typical citizen--even a citizen who is a voracious reader--to work through.

Oddly enough people do not realize the extent to which the bears' vegetative diet allows for them to deposit seeds over a wide area through their scat. With wolves becoming the apex predator in the absence of bears you also create a greater tendency for ungulate herds to multiply, stripping too much bark and vegetation as well as spreading things like wasting disease that can also contaminate ranchers' / farmers' cattle. Another checkmark in the plus column.

Doing the math as laid out in the article, at least as far as the bears being introduced, you're talking about a min of 15 over 5 years and a max of 35 over 5 years. Over 10 years there is a min of 30 and a max of 70. Of course, projections of new bear introductions can be altered based upon the addition of cubs over the years with, perhaps, the need to scale back new bear introductions in the later years. Would like to see the naturalists' projections of theoretical population increase over time....again a min / max.

With regard to back country hikers, etc. Almost all bear attacks on humans are due to the humans' stupidity. When going into bear country you must carry (each individual) a bear-size can of pepper spray. It is 99.9% effective and the worst thing that you can do is try to use a small "bargain-sized" can. The pepper spray has no lasting deleterious effect on the bear. You need to make noise when hiking...if 2 or 3 of you then keep talking, break a branch every now and then. If you have a walking stick have a bell on it. Bear attacks are precipitated by startling the bear, for instance coming around the bend in a trail and stumbling on a male grizzly stripping berries off of a bush, or, worst case, surprising a sow with cubs, which will always precipitate an attack. I consider this issue to be a non-factor in the argument.

Finally, steering the general public towards fear and negative emotionality on this issue is a real loser (and will be remembered at the next election, for sure). People make choices about where their residences are. Just as one considers earthquake zones in buying a house built into a hillside, one must make a choice about living in the wilds with compatibility with wildlife. To use a cliché....the animals were here first. Our desires to live in isolated or wilderness areas are not a good reason to curtail or eliminate animals of any species.

Correspondence: I support this reasonable and carefully considered plan to reintroduce and restore the grizzly bear to the North Cascades. Most of us who enjoy this wilderness area already take appropriate precautions and will not need to change anything going forward. Where we can, we must preserve and protect true wilderness and that by necessity includes the grizzly in the North Cascades. This issue needs to be driven by sound management and science, not fear. This plan does that. The groundwork is laid, we need to move forward.

Correspondence: Please, please do not introduce more grizzlies. Grizzlies do already exist in the northern areas of Washington. You can just ask enough local people who live and work in the area. This introduction will ultimately create the same conflict we have now between the wolves and domestic livestock grazing on public AND PRIVATE lands. Grizzlies are a natural predator. How do you expect to contain them to a designated area? They will end up in areas where the food is easiest to obtain.

As a business that graze livestock in the Cascades, we fear these bears will soon be eating our sheep and lambs for breakfast.

Correspondence: Dear Sir or Madam,

I'd like to SUPPORT reintroduction of Grizzly bears in the North Cascades ecosystem. I believe humans have a responsibility to restore the ecosystem to what it was before human intervention. I support Alternative C and the implementation of the 10(j) rule. This would slowly reintroduce grizzly bears to the North Cascades and provide park and forest service management with tools to minimize actions harmful to both the bears and humans.

I live in the Methow Valley and frequently hike in the North Cascades Park and surrounding forest. Bear and human interaction is a delicate balance. We have black bears that regularly visit and walk through our property during the spring-fall. We have adapted to their presence by securing our garbage, compost and bird feeders. I believe humans can adapt to an encounter with this species as well although education would need to occur

I realize my congressional representative is actively campaigning against the reintroduction of grizzly bears to the North Cascades ecosystem. Dan Newhouse does not represent my views. He rarely makes an appearance in this part of his congressional district.

Please consider my comments when making a decision on reintroducing this species to its historical roots.

Warm regards,

██████████

Correspondence: My vote is either Option B or C - whichever is more liberal to promote the return of grizzlies.

I strongly support reintroduction of grizzly bears into the North Cascades ecosystem. They belong here, this has been their home for millennia, and they play an important role in balancing the wildlife ecosystem.

I have regularly hiked and backpacked in the North Cascades National Park for 40 years. Hikers are familiar with black bears and use of bear boxes, bear cannisters, and keeping a clean campsite or rest break area. However, additional training and information would be needed once a grizzly population is established in the NCE, as the impact of an interaction with a grizzly can be much greater than a black bear.

It is heartening to read that these bears are 90% vegetarian, and the impact on ranches and stock is estimated to be minimal.

Unfortunately, the draft EIS is not entirely clear as to whether Option C is more liberal, or more restrictive in regards to promoting grizzly restoration. I support options that allow for creative conflict resolution in relation to grizzly management: "10(j) NEP would provide authorized agencies with greater management flexibility should conflict situations arise." That is good, and I support it.

However, Option C 10(j) NEP designation also lists grizzlies as "nonessential experimental population" - which appears to make it easier to kill them off for any number of conflict reasons - including the construction of logging roads (!) or if a landowner feels threatened; simply for the goal of "promot[ing] social tolerance." That is too permissive and seems counterproductive to the ultimate goal of grizzly restoration.

Thus, if Option C actually makes it easier and gives more freedom to "take" grizzlies - just to keep the ranchers and loggers happy, I do not support it, and would elect Option B. However, if Option C primarily provides for more options for "deterrence ... preemptive relocation to prevent a conflict that appears imminent or in an attempt to habituated behavior of bears...", without excessive "take" of grizzlies, then I support Option C.

Whatever is decided from this Public Comment process, my understanding is that reintroduction efforts across the border in Canada will result in grizzlies crossing into Washington - so sooner or later, they will be here someday!

Correspondence: Grizzly bears are nomadic creatures. They will not just stay in the place that they are transplanted to. This is well documented in other Grizzly projects in the West. There are many people who love ideas when they do not impact

them or their families. I guarantee that most people supporting this cause don't ever plan to be within proximity of these apex predators. I would also bet that they don't recreate within the cascades or have experienced a bear charging them.

see absolutely no reason to place these animals in the Cascade Mountain range. If they do, the only thing guaranteed is a significant impact on other animal populations and human-bear encounters resulting in life-altering injuries or death.

The thought of managing these animals happening at any time is also a huge joke. Regardless of their impact, this will never happen. You can look at wolf reintroduction plans across the West and thresholds set within agreements to manage populations through state fish and wildlife departments. Time and time again reintroduced predator populations meet those thresholds and then the lawsuits start to delay and stop management from taking place. It is almost laughable to spend time discussing due to the track record on the topic.

I absolutely fear the idea of grizzly bears being introduced into the Cascades for a plethora of reasons. The biggest fear is for my family's lives while we are recreating in our state. There is no other predator in the West that has a higher documented rate of killing humans. As a resident of this great state, please do not move forward with any form of transplanting grizzly bears into the Cascades.

Correspondence: I am not familiar with grizzly reintroductions or impacts on people (I.E hikers, hunters, etc.) or on ungulates (deer, elk, bighorn sheep, mountain goats, etc). But I can tell you what really happened here with the wolf introduction, and I can't help but think Washington would run into the same problems with Grizzlies.

In the early 90's, the Idaho Fish and Game in conjunction with federal wildlife agencies did an environmental impact study on how many wolves our state as a whole could support with the current (at that time) ungulate population, primarily deer and elk. When they did the study, we had a healthy deer and elk population. At that time, they decided the entire state could support 100 wolves without having a detrimental impact on their prey species.

Then the winter of '93 happened, and we lost (in our area) at least 60% of our deer and elk population. They did not take that into account when they introduced the wolves. They introduced the same amount that they had planned on. Truthfully the whole plan should have been scratched once they knew how bad that winter was.

Fast forward to 1995 when they introduced the first Canadian Grey wolves into Idaho, not more than 15 air miles from where we live. There's a specific quote from a woman who was present at the introduction that is very relevant. I cannot remember if she was a federal employee or a member of a special interest group, maybe the Sierra Club. She said...and I quote "This is the beginning of the end of hunting in the state of Idaho."

That should have forecasted what was to come. We then went through 10 years of the wolves multiplying by leaps and bounds and having a devastating impact on our game populations.

Once the introduction had reached all the milestones that were originally set forth, Idaho Fish and Game tried to delist the wolves and take over management of them as a big game species. As soon as that happened, the environmental groups started suing the state. Claiming that they had not met all the criteria for delisting and management, and even made up some new shit. All they needed was to find the right federal judge who was sympathetic to their claim, and he would file an injunction to stop all state management or hunting.

So here is what I have learned from all this. DO NOT trust the environmental groups that are behind any introduction. They have an agenda, and it is not about the animal in question. They will use that animal as a pawn to complete whatever they want.

If you are concerned with human-grizzly interaction, just do a search in eastern Idaho on how many issues there are. Every year someone gets mauled over there. If you are concerned about what it will do for hunting, the Idaho wolf introduction that I have spelled out should open your eyes.

IT'S NOT ABOUT THE BEARS OR THE WOLVES!!!! It's a lie. It's about their agenda!!!

Correspondence: Re the Draft Grizzly Bear Restoration Plan: We fully support reintroducing Grizzlies into the North Cascades. We have hiked, & kayaked in the park for many years, and believe it is one of the most special places certainly in the US, if not the world. As BCHW members, we are probably in the minority when it comes to supporting their

reintroduction. The simplest reason - Grizzlies were part of the ecosystem long before we as horseman had access to trails built by humans.

We have ridden many times on the Pacific Crest Trail between the North Cascades Highway & Stehekin.

We believe that it is our responsibility to the best of our ability to avoid encounters with bear, take all known precautions when camping etc. It is also our responsibility to accept the risk of an encounter, when placing ourselves in their territory.

We also believe that wolf population should be supported by whatever means for the same reason that they have been part of that ecosystem, before being decimated by humans.

Thanks for your consideration of our opinion.

Correspondence: As a hiker, the thought of sharing the trails with grizzly bears sends a shiver down my spine. These massive, powerful creatures are the undisputed rulers of the wild, and their presence can transform a peaceful hike into a nerve-wracking ordeal. While I appreciate the beauty and importance of these apex predators, I cannot deny the negative impacts they have on humans, particularly those who venture into their territory.

The most immediate concern is the potential for physical harm. Grizzly bears are known to be protective of their young and their food sources, and they can become aggressive if they feel threatened. Hikers are at particular risk, as they may unknowingly stumble upon a bear or its cubs, triggering a defensive attack. The consequences of such an encounter can be devastating, with injuries ranging from scratches and bites to maulings and even death.

Beyond the physical danger, grizzly bears also pose a psychological threat. The mere knowledge that these formidable creatures are lurking in the shadows can heighten anxiety and make it difficult to relax and enjoy the natural surroundings. The constant fear of a sudden encounter can ruin the tranquility of a hike, transforming it into a test of endurance and vigilance.

For those living or working in grizzly bear country, the threat is even more pervasive. Farmers and ranchers often face the daunting task of protecting their livestock from bear attacks, which can cause significant financial losses and emotional distress. The fear of bears can also restrict outdoor activities, limiting children's playtime and disrupting the normal routines of daily life.

The presence of grizzly bears can also have a negative impact on local communities. Tourism, a vital source of income for many rural areas, can be hampered by the perceived danger of bears. This can lead to economic hardship and a decline in the quality of life for residents.

While I understand the importance of preserving grizzly bears and their habitat, I cannot ignore the negative impacts they have on humans. As a hiker, I would feel apprehensive about venturing into an area with a high grizzly bear population. The constant fear of an encounter would overshadow the beauty of the surroundings and turn a recreational activity into a nerve-wracking ordeal.

The plight of farmers and ranchers is equally concerning. They must constantly be on guard to protect their livestock and property from bears, a task that is both dangerous and emotionally draining. The fear of bears can also restrict outdoor activities, disrupting the normal routines of daily life.

Please do not move forward with any project to place grizzly bears into the Cascades or any other part of Washington State.

Correspondence: The campaign against grizzly bear reintroduction to the Cascades plays on fear and flies in the face of statistical, fact-based analysis. The vast majority of Washingtonians will never encounter a grizzly in the wild while the historical record says grizzly attacks are overwhelmingly because humans get between a mother and her cubs. Bring grizzly bears back to their native habitat and spend the energy on educating people how to co-exist with nature instead of scaring them.

Correspondence: Introducing grizzlies will endanger people, hikers, hunters, families enjoy any outdoor activity.. They will also push black bear into residential areas as well as effect the elk and deer population. Not to mention what it would do to farmers livestock. We have enough predatory animals in the north cascades and adding grizzlies would serve no purpose. I feel that it would make people more fearful to enjoy the great outdoors that we all love here in Washington. They have no benefit on the ecosystem.. they will kill off Salmon, chase the black bear out and will not help with the cougar population.. Adding grizzlies into the North Cascades is a horrible idea and will poss more threat than it will serve purpose.

Thanks
Concerned Washingtonian

Correspondence: I oppose transporting grizzlies into the state. It is counterproductive to risk even one human life by introducing an apex predator into a national park. An area preserved for the enjoyment of the people, not proven killers of the people. Part of the national park service's function is to provide safe places for the people to enjoy the wilderness. I suppose in a time long long ago, grizzlies roamed the areas around Washington DC. I propose we put a few on the White House lawn.
Sincerely

Correspondence: This is a bad and dangerous idea. I love nature and all animals, including grizzly bears. However, the introduction of grizzlies to the North Cascades would pose a serious and persistent threat to human life. It will result in a spike of firearms being taken on trails by hikers and campers. I myself would never hike that region again without being armed. I am already doing research on the type of caliber, ammunition, and holster I will need to procure if this passes.

I was fortunate enough to be able to hike these areas without fearing that I would be mauled to death or eaten, and I think my 2-year-old daughter should be able to have that privilege as well. I strongly urge the National Park Service not to bring grizzly bears to the North Cascades.

Correspondence: I am against the new Grizzly Cascades Release Plan. I think in sparsely populated areas such as Montana and Alaska where they thrive and are able to have less human interactions is great for people and great for the bears. The fact is that Washington is not in a place where it was many years ago when there were still grizzlies. It is one of the fastest growing states and people have grown up not knowing how to coexist with grizzlies here. Additionally, NPS/NFS/DNR do not have the proper amount of resources or personnel to ensure the success of this program and be responsible stewards to the citizens of WA State. Too often we have seen programs "fire-and-forget" and locals are left to pick up the pieces (ex: catastrophe that was the wolf program management). I hope to see our taxes invested in sustainable programs such as salmon recovery.

Correspondence: To be clear, I am vehemently opposed to this so called "plan" by conservationists that are completely out of touch with the people that will be effected by it.

Here are a number of points to support my opinion:

1. **Impact on Human Safety:** Reintroducing grizzlies in the North Cascades poses a significant risk to human safety. These dangerous and powerful apex predators are dangerous if they come into close proximity with humans. Encounters between grizzlies and people lead to injuries or even fatalities, especially for those who live, work, or recreate in the area. It is your responsibility to prioritize human safety above all else.
2. **Economic Ramifications:** The reintroduction of grizzlies will have severe economic consequences for local communities. Tourism and outdoor recreation are major industries in the North Cascades, attracting visitors from around the world. The presence of grizzlies will deter tourists and outdoor enthusiasts, resulting in a decline in revenue for businesses and a loss of jobs. It is essential that you consider the economic impact of such a decision and not just think about your conservationist ideals.
3. **Threat to Livestock and Agriculture:** Grizzlies are known to prey on livestock, such as cattle and sheep. Reintroducing them in the North Cascades will lead to increased attacks on domestic animals and cause significant losses for ranchers and farmers. This will disrupt the local agricultural industry, leading to higher prices for consumers and potential financial hardships for those involved in farming.
4. **Impact on Wildlife Management:** The reintroduction of grizzlies will disrupt the delicate balance of wildlife management in the region. It will result in increased predation on other native species, leading to a decline in populations of animals already struggling to survive. We should prioritize the conservation of existing species rather than introducing a new predator that will exacerbate the challenges they face.
5. **Limited Suitable Habitat:** The North Cascades does not have sufficient suitable habitat to support a viable grizzly population. The area is already fragmented and faces various environmental challenges. Insufficient food sources, habitat loss, and climate change will further hinder the grizzlies' ability to thrive in the region. It is crucial to focus your conservation efforts on areas where grizzlies have a higher chance of survival.

In conclusion, while the idea of reintroducing grizzlies in the North Cascades may seem appealing for conservationists like you but there are valid concerns from real people that cannot be ignored. Human safety, economic impacts, livestock predation, wildlife management, and habitat suitability make this plan deplorable and also raise significant doubts about the people that created this plan.

Remember, you work for the tax payers and the people that will be negatively impacted by your short sided conservationist ideals.

Correspondence: Reintroducing Grizzlies to the North Cascades of Washington State is one of the most absurd & reckless considerations imaginable. This state and especially that region of this state has a massive population of outdoor enthusiasts, from the through hikers of the PCT to back country campers which are fantastically ill equipped mentally to respect that animal and it's potential for harm. Beyond the threat to humans, is the incredibly irresponsible and grave harm grizzlies would impose on populations deer, elk, even salmon as well as the massive threat to livestock in and around the area. The presence of Grizzlies also create a hardship for the already staggering over populated black bear which now have to move closer into residential areas in search of food. This consideration is massively irresponsible concerning the environment, safety of Washington residents and population of prey animals. As a recreational hiker and lover of our outdoors and democrat voter I should add, I staunchly oppose this horrible consideration. This is absurd to say the least.

Correspondence: Reintroducing grizzly bears to Washington State should be avoided. The reintroduction of the grizzly(especially with protected status) bear will bring an added threat to outdoor enthusiasts as well as the game populations in the state. There are enough predators in the state of Washington without artificially adding a climax predator to the mix. From what I have read about this issue there are grizzly's already migrating into this area. If the reintroduction is to happen let it happen in a natural and manageable way such as this.

Correspondence: I am opposed to reintroduction of brown bears ("grizzlies") to the Washington North Cascades by the U.S. and strongly in favor of Proposal A.

I don't feel, "there's already black bears here" hold much water, as they ignore the fact that brown bears are well known to be a far more aggressive species. Others such as, "well they used to be here" simply aren't sufficient to mitigate the danger that they could pose to people today. The risks are quite clear, as any region where encountering grizzlies is a possibility always recommends carrying bear spray.

Grizzlies are considered at G4 levels globally, which hardly puts them into a threatened category outside of solely the U.S. I do not feel that reintroduction just for the sake of reintroduction is a good enough reason to put people at additional risk. This is especially true given the wide range of outdoor wilderness activities which a much larger volume of people participate in today than in the past.

There's also the concerns raised over danger to the already strained salmon populations. Claiming that the bears are coming from regions where they forage on berries and somehow wouldn't pose a risk isn't sufficient. Bears learn and adapt. It's not exactly a stretch of imagination that they could learn to fish salmon. Not to mention the impacts to other wildlife, including black bears, which have adapted to the lack of grizzlies.

What is the actual ecological evidence-based reason why introduction is absolutely needed? So far I haven't seen a good reason beyond "just because." Even in the "North Cascades Ecosystem Grizzly Bear Restoration Plan" draft, everything seems to center around "restore for history's sake" motif rather than outlining true ecological benefits. In fact, all supposed benefits and impacts in the draft appear speculative at best, often hinging on "it could go this way, or that way, but we're unsure."

As for people experiencing grizzlies in their natural habitat, I'm willing to bet there's a far greater number of people who would rather not have such encounters than those who would.

Correspondence: As part of a family who have hiked and camped in the North Cascades and many areas in WA, we strongly object to intentionally returning grizzly bears to the North Cascades or anywhere in the Northwest. It is insane and unnecessary to put outdoors folks in danger of being mauled or killed while hiking or camping.

The Forest Service people have not given one good reason for repopulating bears. Why is it even being considered ? Do they think it's cool to have huge bears out there. It is NOT. We keep reading statistics that over many years only a small number of people have been attacked and even less killed. Well ANY number is too many people to be harmed. Would those Forest Service people like to be attacked or have their families attacked ? Doubt it. Wake up government and leave Nature alone.

Correspondence: Please do not introduce grizzly bears. This will reduce tourism money coming in with the increased risk to humans. With the increased mountain lion population, there is no need for additional predators. There are other measures to take to maintain the environment and this is another attempt at human intervention that will cost taxpayers tons of money while scaring people from these beautiful places -- which in turn reduces the human connection to these places and reduces human willingness to protect them. No grizzlies please! I'm saying this from experience encountering grizzlies while camping in Montana.

Correspondence: This is a terrible idea - it's so great being able to hike and explore without ever having to worry about Grizzly's. It would completely change the dynamic of people utilizing the Cascades.

There are already plenty of predators in the region that aren't grizzly bears and I don't understand why there is some desire to restore this natural predator. If people were really concerned about restoring the natural environment they should probably start worrying a bit more about all the invasive species of animals and plants before caring about adding an insanely dangerous natural predator back into this region.

Correspondence: As a lifetime resident of the Okanogan County, it seems ridiculous that this is still an issue that for some reason remains unresolved. The local residents have repeatedly let everyone know that the transplanted Bears are not wanted in the area and now is not the time for their reintroduction the reintroduction of the wolves has once again proven that we as a society do not seem to be capable of doing a good job of monitoring their progress and controlling. them when they get out of control. Is it fair to the animals to trust them into an area and then punish them when they venture out of the area, we have designated for them. Do you think this "experiment" will turn out any different you are kidding yourself. Putting a creature with a ranging area of up to 800 square miles in an area of limited food sources and a relatively close proximity to humanity is just asking for conflicts which is not fair to the animals or the people that reside there. This is often compared to Yellowstone Park but there are several significant differences 1st the park area is smaller, 2nd the Bears in Yellowstone are completely acclimated to their surroundings not transplanted to the location, 3rd Yellowstone is not surrounded by 20,000 acres of soft fruit orchards (a bear's favorite snack). As the bear chases its food sources out of the area it will follow them closer and closer to the valley floors. I guess the ultimate question we should be asking is how many crops need to be destroyed, livestock killed, pets killed, bears and humans injured or killed before this is considered a bad idea because it would be a matter of time before all of these things would happen. I also find it quite ironic that the majority of the people that live in the area are against this plan, but the support grows the farther away you get. It is easy to support an idea that you don't have to live with, which is exactly what it seems all of the Federal Agencies are doing, proposing something with no real plan on how to deal with the results. The 10j rule will not be effective when all of the animal rights groups sue to stop you from doing what should be done. The bottom line is PLEASE do not transplant Grizzly Bears they already live in the area in small numbers which is all the area can realistically support.

Correspondence: Save America from the endangered species act. Refuse any more funding for the encroachment of "endangered species" introduction, or maintenance of so called species. The application of that law is nothing but guess work, no matter how bright or enthusiastic people are who propose the reintroduction of bears, wolves, or the "Inland Empire Giant Angle worm." The Endangered Species Act needs a major overhaul in wording and application, to include future possible harmful consequences of any plan. I sound rough. I read the Endangered Species Act shortly after it was written. It was not good reading. Predators do not recognize boundaries, bears or wolves, or badgers. There are no salmon in the rivers. They will munch on elk calves as they are dropped. They will eat fawns as they are birthed. They will splash in the rivers , and find no fish So they will invade human environments and live out of garbage bins. Bears are happy where they now live. Why mess with them to upset their lives, by planting them in an area strange, and warmer than home. Also they will anon disease, tape worms, after subsisting on mice, rats, and ground squirrels. If they are happy where they are, leave them be. [REDACTED]. Starbuck WA.

Correspondence: It is our duty as humans to bring back the grizzly population that we are responsible for decimating without proper conservation practices. It is also our duty to respect the culture of our tribal communities. I'd also like to comment that grizzly bears already migrate into the north cascades from Canada - it is already fact and I have seen evidence.

The fact people fear them is not a valid reason to decline reintroduction - it was their choice to live in the wilderness of Washington that is home to wildlife and makes the state such a beautiful place to live and recreate. These people need to learn how to coexist and better protect themselves and their livestock. It's not difficult to build physical barriers that would prevent a grizzly from entering a grazing area for livestock, and it is the landowner's responsibility to protect and care for them.

Correspondence: Hello,

I am concerned about grizzlies being reintroduced to the North Cascades. I am an avid hiker and the north cascades area is one of my favorites. My concerns is for the safety of people and the safety of the bears. And I have many questions. Why did we exterminate them from the area before? Because we can? We wanted to hunt and kill for the sake of hunting and killing? If it was out of safety, has that safety issue been resolved? Will we just kill them again because we didn't learn from our mistakes?

Please consider the welfare of the animal when human interaction will go wrong. We've proven ourselves time and time again. We make stupid choices and we can't be trusted.

I

Correspondence: I oppose reintroduction of grizzly bears to the North Cascades.

As a beekeeper, I provide honey bees for pollination in North Central Washington. I am currently dealing with one to three incidents per year of bee hive destruction by bears in this area. In spite of efforts to place bee hives for crop pollination in areas of low bear traffic, bears continue to destroy several hives per year. The bears which currently destroy my hives are usually dissuaded by electric fences and bee stings, but not always. When this happens, I lose bee hives and the grower loses the pollination service which was supposed to be provided by the destroyed hives.

My father used to operate bee hives in Northern Alberta, Canada. Unlike bears which destroy a few of my hives annually, grizzly bears in that area are not dissuaded by electric fences or by bee stings. They can destroy entire apiaries in spite of these defensive measures. When a grizzly makes repeated visits to the same apiary, officials from Alberta Fish and Wildlife Enforcement would issue my father a permit to shoot them when they appeared at the apiary. I would rather not have my apiaries destroyed or be forced to shoot bears.

Therefore I oppose reintroduction of these bears to Washington state.

Correspondence: Grizzly bears do not need re-introduction within the state of Washington. These bears have already been re-colonizing part of their original territories for years. Residents have already been dealing with increasing bear conflicts, and without a better management plan for preventing further conflicts, a re-introduction of more grizzly bears into the mix is a recipe for disaster. It's bad for the people and the bears of Washington state. I do not support this proposed re-introduction.

Correspondence: I initially was skeptical to the idea of introducing grizzly bears to the North Cascades. Most of what we hear are about severe and often fatal interactions between bear and human. However, having looked at what they can do for the environment and the low risk that an encounter would be, partly based on the geography where the introduction would

happen, and partly on the fact that bears prefer to avoid us if possible, my mind has been changed. I am now in favor of having limited numbers of grizzly bears reintroduced into the North Cascades.

Correspondence: I would very much like Grizzly bears to be returned to the North Cascades wilderness. I think it's very important for us as humans to share the land better with our non-human neighbors. It sounds like they are an important part

of the ecosystems in our area and they have just as a much right to live here as we humans do. It also seems like ranchers in other areas of the country (like Montana) get along ok with grizzlies so hopefully there is opportunity to protect the livelihood of ranchers as well as provide a safe home for such majestic animals as the grizzly. I fully support bringing grizzly bears home to the north cascades.

Correspondence: I support the restoration of grizzlies to the North Cascades, but only if this restoration is conducted in ways that don't violate the Wilderness Act and harm the area's wilderness character. Both action alternatives as they now stand would violate the Wilderness Act. The action alternatives should be modified to avoid helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and steer clear of heavy-handed management of bears. There are presently many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites without the use of helicopters inside Wilderness.

I oppose the use of a 10(j) rule for the grizzlies in the restoration work. This would mean grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana would be taken from their homes, dropped into the North Cascades, and lose their previous protection. Montana doesn't have any "extra" grizzlies to lose to the North Cascades. Montana grizzlies are not yet recovered under the ESA, and any dispersing grizzlies from Glacier or Yellowstone are needed to naturally recover areas like the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest. An alternative that combines natural recovery with population augmentation under full ESA protections should also be analyzed.

For any long-term grizzly restoration programs to succeed, natural recovery measures must also be included in both action alternatives. The need for wilderness degrading activities, are also ultimately bad for bears. Partnership with British Columbia should be included in any plan to ensure that grizzlies have corridors to move back and forth across the international border. This would help to prevent a small North Cascades grizzly population from shrinking over time and becoming inbred.

Thank you.

Correspondence: I would only support grizzlies in the North Cascades if they migrate on their own with no human help much. Like wolves are doing.

I have in the area and the packers say there isnt enough food for more than a very few grizzlys. There are already black bears there and there would be competition for limited game and food sources. That would push them on the ranchers similar to wolves and cause more problems.

We never saw elk sigh and some trips few deer.

So unless we planned to help feed them no grizzlies.

Correspondence: To whom it may concern,

My family are ardent supporters of America's National Parks. In the past two years we have visited more than 15 National Park managed sites in the Western United States. Many of those parks are home to grizzly bears. While it can be scary to camp in an area with young children knowing there could be grizzlies around it is inspiring as well. We are focused and attentive to our surroundings in a way we aren't in other settings. We are connected as a family as we take in the awe and wonder of nature.

I believe reintroducing Grizzlies into North Cascades National Park should move forward for several reasons. First, North Cascades is uniquely situated with significant open space in the park and surrounding area to support and successfully recover grizzly bears. North Cascades is some of the most prime wild space in Washington state that has been saved from development and thus has space to support the reintroduction of grizzlies.

Second, Grizzlies provide significant positive ecological benefits to the ecosystems they are found in. Grizzlies provide

critical support to the plants and forests they live in - they aerate the soil with their large paws and claws, making space for plants, trees and flowers to grow.

Lastly, over the many years of this project public comment has resoundingly supported this effort. A small but vocal minority has been speaking out with non-scientific claims that they are afraid of the grizzlies and the harm they may have on surrounding communities and ranchers. There are provisions in place to support more effective coordination with local communities now than has been in place in the past. The concerns of this minority have been heard and incorporated.

Grizzlies deserve an opportunity to be reintroduced into North Cascades National Park. We humans deserve an opportunity to see these majestic creatures in nature. Please move forward with the effort to reintroduce grizzlies into North Cascades National Park.

Correspondence: Thank you for this opportunity to comment on the: Draft Grizzly Bear Restoration Plan / Environmental Impact Statement for the North Cascades Ecosystem

As a member of Back Country Horsemen of Washington, I am very concerned with the ability to continue to recreate in the North Cascades should a small population of heavily protected grizzly bears be mechanically moved into the region that we recreate in. The DEIS does not sufficiently analyze the impact to recreation or present any options for how trails can be maintained open in the presence of protections implemented to reduce human-grizzly interactions.

1. The Pacific Crest National Scenic Trail runs through the core habitat and has permitted distance hikers of around 10,000. When considering the other trail users in and along the North Cascades Ecosystem (NCE) since this is one of the most populated areas around any bear ecosystem, the use likely exceeds a quarter million visits. However, the DEIS indicates that

the use is insignificant. It is very significant and will likely result in many human-bear interactions.

2. The Pacific Northwest National Scenic Trail also runs through the NCE as well as other bear ecosystems to the east, including the Cabinet-Yaak (CYE). The CYE has a more established population of bears but still has resulted with challenges to the very existence of the trail due to the limited number of bears in the CYE (20-40). Opposition to the National Scenic Trail in the recovering bear population area as well as the connecting landscapes between ecosystems has also been expressed by USFWS staff, the same agency putting forth the NCE proposal through which the same trail will pass.

3. Without a more detailed analysis of how to retain the carrying capacity of the trails, trailheads, and campgrounds without resulting in long term or permanent closures, there is no way to effectively review this DEIS.

4. Furthermore, the NPS and USFWS have pointed out that the Canadian counterparts and First Nations are preparing to release grizzly bears in the northern part of the NCE. IF that was the only release point, it would move the core recovery/release area north and away from the more densely human populated areas of Washington State. It also would be in line with Washington State law as well since no bears would be translocated directly into Washington, and there also would be predictability on how many bears are being moved into the entire NCE which overlaps both countries. The BC government has noted that their Recovery Plan is being developed jointly with the USFWS even though this US EIS only addresses the Washington effort.

5. As a trail horse rider in the NCE, I ask that the No Action Alternative be selected. The areas we ride in includes the Mt Baker Snoqualmie National Forest, the Okanogan Wenatchee National Forest including the Pasayten Wilderness, and the North Cascades National Park. We have many horse camps along the boundary of the NCE. We cannot support either Action Alternative without more substantive analysis on impacts to recreation as well as knowing more on the joint planning with Canadian counterparts.

Correspondence: I support Alternative B.

Although I live in Missouri, I regularly hike in the North Cascades (for example, I did a weeklong trip in the Glacier Peak Wilderness this past summer). I have also backpacked in Yellowstone NP, and seen grizzly bears in the backcountry.

I am concerned that Alternative C would allow opponents of the reintroduction of grizzly bears to concoct an excuse to shoot them.

As Yellowstone NP learned from wolf re-introduction, the health of the North Cascades ecosystem will be enhanced by re-introducing a keystone species like the grizzly bear.

Correspondence: I am in favor of returning grizzly bears to the State of Washington. I would strongly prefer these bears to be released within the Pasayten Wilderness area.

It would be desirable to have the Grizzly Bears remain east of the Cascade elevation divide.

It would be desirable to have the bears fitted with radio tracking devices if possible.

Troublesome grizzly bears would first be removed to a remote area. However, in certain cases, troublesome grizzly bears could be confined to a zoo or be killed.

If the troublesome grizzly bear were to be killed, this action should be handled by the National Park Service, the National Forest Service, the Washington State Department of Fish and Wildlife, or by contracted individuals who have been granted this authorization by a state or federal agency.

I prefer the public should be forbidden to kill a Grizzly Bear except in a clear case of self defence.

Correspondence: As a resident of Bellingham and close to the North Cascade National Park and Mt. Baker National Forest, it is time to reintroduce this apex predator. Over and over research has shown that to maintain a healthy natural balance of animals, predators are crucial. One just has to see the positive response to the overall health of Yellowstone National Park after the reintroduction of wolves. Not only a natural balance of animals restored but a positive impact to vegetation and less bank erosion and flooding. I am a hiker and Mt. Baker National Forest is my playground while knowing that grizzlies will be meandering from British Columbia and the North Cascades National Park. It means I will have to be more careful when hiking if I wish not to encounter a bear. This philosophy should apply to mountain bikers or any outdoor enthusiast as well. Ranchers will yell the loudest but grizzlies are loners and not rabid livestock killers. It is time and I have been writing letters and attending meetings since 2017. Just do it!

Correspondence: What do human gain by reintroducing these killing machines? With all the interaction that has happened with human in the past year in Montana, Wyoming and Idaho that has ended badly for the humans should ask why put the possibility of an encounter between humans and bears is worth it. Then there is the issue of the deer populations that will suffer. I have been hunting elk in the panhandle of Idaho for the past 15 years and have seen what the wolf introducing has done to the elk population there. What has humans gained by that reintroduction of wolves there? Same thing will happen with the bears in Washington. What will humans gain, I ask.

Correspondence: I am against reintroducing grizzly bears to Washington State for several reasons. Their populations are currently exploding in the areas they already habituate and now those areas are in disagreement with how to handle the issues brought on due to the ever increasing population and the conflicts brought on by it - human conflict, livestock conflict, financial burdens, etc. I don't think they should ever repopulate our area but at an absolute bare minimum it should at least wait until the current areas have an established AND long standing proven effective plan on how to manage the current issues, not just haphazardly add to the problem. The ecosystem of our state is flourishing as is without grizzly bears, there is no need to change what is already working. If nature intends for them to repopulate our area let it happen naturally. It would also definitely end many families spending time outdoors enjoying nature for fear of an encounter which is something we don't need added to an already struggling generation of kids who need to be out enjoying nature more. I would no longer feel secure letting my child go camping with a friend, ride his mountain bike, dirt bike riding and many other outdoor activities. We lived in Idaho for a while and this was a constant fear in the back our minds so we spent zero time in the woods. Prepared or not a grizzly bear attack happens in a split second most often without time to even react. Please don't take our woods away from us. Let nature run it's course on it's own.

Correspondence: As a resident of northwest Washington State, I feel that the grizzly bear should be re-introduced to the Pacific Northwest. The grizzly was an integral component of the environment in the past. It needs to be reintroduced to complete the natural chain of the species. Without the grizzly, the other predators don't have an enemy to fear and will over populate the area. We need to remember that the grizzly bears were here long before we, people, were here.

Correspondence: Grizzly bears and other large mammals are essential to ecosystems. They not only add to biodiversity themselves, but their activity alters ecosystems, creating support and opportunities for other plant and animal species.

We are all part of an interconnected web, and every species is essential to its balance. Humans' fear of a particular animal due to our encroachment on their habitat should not prevent supporting those species and protecting, restoring and maintaining their habitats and communities.

Thank you,

Correspondence: I greatly support restoration of grizzlies to the North Cascades; but I do not agree with either of the alternatives as they would both violate the Wilderness Act.
The use of helicopters and heavy machinery should be avoided at all costs. The use of 10j is not acceptable as it means that grizzlies protected under the Endangered Species Act (ESA) in Montana would be taken from their home and safety and dropped into the North Cascades thereby losing their protection. The Endangered Species Act and the Wilderness Act MUST be strictly followed for the protection of our Wildlife and Wilderness Areas. Montana grizzlies have not yet naturally

recovered to a healthy eco-system under the ESA.

A natural recovery system alternative must be fully developed and analyzed in spite of the length of time to repopulate.

Natural recovery is ALWAYS the answer to bring a species back to a normal, healthy level.

The natural recovery system MUST be incorporated into both of the proposed alternatives. Recovery could also be examined by natural recovery with augmentation under FULL protection.

The no action alternative has some benefits with the scientifically known practice of coexistence measures that prepare and teach residents and visitors how to handle conflict humanely and efficiently. This can be done.

Humans are moving more and more into bear regions and they have to respect the wildlife in full.

The Wilderness Act and the ESA are the stalwarts of Wildlife and Wilderness areas. They CANNOT be violated.

Correspondence: I do not support the proposal to reintroduce grizzly bears to the North Cascades Ecosystem for the following reasons:

1. There is little local support for the proposal from those who will have to live with the consequences first-hand. While there may be majority support for the proposal nation- or region-wide, I suspect it is primarily from those who don't live in the area, so there will be no direct impacts on their lifestyles. The local populace will face the brunt of adverse impacts from having an apex predator in their backyards. Unlike gray wolves, grizzly bears do attack and kill people. This will lead to more hostility towards grizzly bears, the Endangered Species Act, and federal agencies charged with administering and enforcing the ESA.
2. Grizzly bears will be persecuted by those opposed to the reintroduction proposal. There is no way to stop illegal killings of reintroduced bears. No amount of federal enforcement or rewards will impact this. I have great admiration and respect for these animals, and I surely want to see them recovered, but this proposal is going to unleash more hostility towards bears and ESA and more unfortunate killing of this grand species.
3. Moving this proposal forward will further harden the views of those skeptical of ESA species recovery efforts and will undoubtedly raise the ire of elected officials looking for further evidence of a hostile federal government not listening to local concerns.
4. It doesn't matter whether the federal government lists these bears as an experimental population. They are grizzly bears-an apex predator. They will undoubtedly have adverse run ins with people, pets, and livestock. Someone will get mauled or killed and the federal government will be blamed for not listening to the concerns of its citizens. It is inevitable. There is no way to sugarcoat this or sweeten the deal for locals through a designation. Grizzlies will do what grizzlies do. The bears will either be killed by locals or removed and killed by state or federal agents.
5. You are proposing to reintroduce bears into an ecosystem that hasn't had bears in decades. During their absence, the ecosystem has developed a visitation expectation as a safe place to hunt, fish, and recreate. As an avid outdoors person, I can tell you quite honestly, while I love the idea of grizzly bears, I hesitate to recreate in areas inhabited by them, for good reason. Where they are present, we are no longer at the top of the pyramid. We are vulnerable. It doesn't matter the low odds of having an adverse interaction. You are potentially opening up a Pandora's Box. For the sake of the bears, I urge you to reconsider.

Correspondence: Hello, I would like to voice my opposition to reintroducing grizzly bears in the North Cascades.

Here a a few reasons why I do not think grizzly bears should be reintroduced to the North Cascades:

- 1) They could pose a threat to human safety, with encounters potentially leading to conflicts and danger.

2) The reintroduction could lead to hunting restrictions or reduced opportunities, affecting the economic interests of hunters and related businesses.

3) With grizzlies roaming the North Cascades, recreational activities like hiking, camping, and fishing could face restrictions or deter tourists. Areas like the Methow Valley depend on tourism for everyone's economic well being and I don't want to jeopardize the tourism that feeds areas surrounding the North Cascades for the sake of a few bears.

I ask that you do not reintroduce grizzly bears into the North Cascades.

Thank you for considering my opinion.

Outside Organization: CCHW and Cowboy Campsite Business(Official Rep.)
Received: Nov,07 2023 12:34:56
Correspondence Type: Web Form
Correspondence: In addition to the concerns listed below by the BCHW group leadership, as a member and board member of Cowboy Campsite, I only see problems associated with this initiative. Our 90-acre campground is located in the North Cascades portion of the proposed area. We have 125 memberships who own campsites and over 200 members that potentially ride the nearby trails all year long in the Harry Osbourne State Forest including my family. Please pursue the "No Action" alternative indefinitely.

As a member of Back Country Horsemen of Washington, I am very concerned with the ability to continue to recreate in the North Cascades should a small population of heavily protected grizzly bears be mechanically moved into the region that we recreate in. The DEIS does not sufficiently analyze the impact to recreation or present any options for how trails can be maintained open in the presence of protections implemented to reduce human-grizzly interactions.

1. The Pacific Crest National Scenic Trail runs through the core habitat and has permitted distance hikers of around 10,000. When considering the other trail users in and along the North Cascades Ecosystem (NCE) since this is one of the most populated areas around any bear ecosystem, the use likely exceeds a quarter million visits. However, the DEIS indicates that the use is insignificant. It is very significant and will likely result in many human-bear interactions.

2. The Pacific Northwest National Scenic Trail also runs through the NCE as well as other bear ecosystems to the east, including the Cabinet-Yaak (CYE). The CYE has a more established population of bears but still has resulted with challenges to the very existence of the trail due to the limited number of bears in the CYE (20-40). Opposition to the National Scenic Trail in the recovering bear population area as well as the connecting landscapes between ecosystems has also been expressed by USFWS staff, the same agency putting forth the NCE proposal through which the same trail will pass.

3. Without a more detailed analysis of how to retain the carrying capacity of the trails, trailheads, and campgrounds without resulting in long term or permanent closures, there is no way to effectively review this DEIS.

4. Furthermore, the NPS and USFWS have pointed out that the Canadian counterparts and First Nations are preparing to release grizzly bears in the northern part of the NCE. IF that was the only release point, it would move the core recovery/release area north and away from the more densely human populated areas of Washington State. It also would be in line with Washington State law as well since no bears would be translocated directly into Washington, and there also would be predictability on how many bears are being moved into the entire NCE which overlaps both countries. The BC government has noted that their Recovery Plan is being developed jointly with the USFWS even though this US EIS only addresses the Washington effort.

5. As a trail horse rider in the NCE, I ask that the No Action Alternative be selected. The areas we ride in includes the Mt Baker Snoqualmie National Forest, the Okanogan Wenatchee National Forest including the Pasayten Wilderness, and the North Cascades National Park. We have many horse camps along the boundary of the NCE. We cannot support either Action Alternative without more substantive analysis on impacts to recreation as well as knowing more on the joint planning with Canadian counterparts.

Correspondence: I am opposed to USFS bringing any more grizzlies into Okanogan County, Washington. They are here and have been over the past years. During the years 1979 and 1980,I was employed by Okanogan Co. Sheriffs Office as a Deputy Sheriff to patrol the Tonasket Ranger District of the Us Forest. During that time, I investigated two Hereford Cow kills. One north of Crawfish Lake, buried under a pile of brush. her estimate weight around two thousand pounds. The second one was with a yearling calf. Both were dead with the cows neck was broke and her left side was raked with large claw marks. The calf died with two large puncture wounds at the base of its neck. Neither had been eaten. They were located East of Crawfish Lake. Later I was contacted by a Rancher who lives on Coco Mtn. Road, north of Anenas valley road. He told me that He spotted A Sow Grizzley with twin cubs at gooseberry meadows north of his ranch in the last week. Mr. Brazile reported that he was cutting hay on his property next to Roy Nealey's Ranch east of Havilah when he spotted a lone Grizzley next to a small lake. Other Ranchers from the area have seen them over the years.

About 12 years ago, during the 4th of July , while riding our atv's on the West side of Arlington Ridge south of Conconully at the old townsite of Loop-Loop my wife and I and others in our party spotted a lone Grizzley about 200 yards crossing a meadow away from us.

In closing, I do not support The bears being brought in from Montana or elsewhere.

Correspondence: I do not believe reintroducing grizzly bears is a good idea for two big reasons.

Reason one:

The bears that will be introduced are not native to the North Cascades. Yes, grizzly bears did once roam the North Cascades. However, the bears that would be introduced to the North Cascades are perfectly adapted to the environment they are being taken from, not here. Everything from their behavior, their diet and their temperament is dependent on their habitat. Animals do not adapt to change's overnight, it sometimes takes hundreds of years. Not to mention the native animals living in the North Cascades. There is no telling exactly how this will affect the deer, elk and mountain goat population. They are not adapted to a habitat that is shared with grizzly bears. There's no telling what this will do to the native wildlife population, but if we look at history, it most likely will impact native wildlife in a negative way.

Reason Two:

Interactions/encounters between grizzly bears and humans is something that no one wants to think about when they are enjoying the outdoors. Introducing grizzly bears to the region will increase human and bear interaction, which is bad for the human and the bear. The introduction of grizzlies will compromise the safety and assurance of both people and bear, especially in a region that is popular for hiking and camping. Sure, this will not be a problem at first, but give it time and it will eventually become a problem.

Thank you

Correspondence: My great grandfather and grandmother moved to a remote location on Lake Chelan in 1907. My family and I still have a large portion of the ranch. They were sheep ranchers and tended orchards. While family history and birth records indicate he was native, his ancestry was not of any local tribes but from east.

My Aunt and Uncle currently live there three seasons and I will as well in the future. The property is surrounded by Okanogan Wenatchee National Forest on all borders. The property is boat access only and off grid. There are by far more wild animals than people there, which is part what makes it so special there. We regularly have bear interactions although generally just property destruction only.

While I understand the desire to correct or repair human destruction of species and habitats, I do not want to add Grizzlies to the list of animals we already encounter and share space with. This area of reintroduction is literally our back door.

Thank you for the opportunity to voice my concern.

Correspondence: It is my opinion that adding grizzly bears to the North Cascades environment is an extremely bad idea. Many of us like to venture into the forests. We are absolutely respectful of these wild places and would never do anything to jeopardize its natural existence. My BCH group goes to great care for maintaining the available trail. For example, I will pick up debris on the trails so that others do not have to have their pathway obstructed. I would like to be mindful of existing wild animals such as cougars or brown/black bears so that myself or others do not harm them or ourselves. I have been hiking and skiing in the Cascades for nearly 60 years. I consider it a precious national treasure and am thankful for those who have gone before us to preserve and protect these lands. PLEASE!!!!!!! DO NOT ALLOW THE INTRODUCTION OF THESE GRIZZLY BEARS!!!! I want my children and grandchildren to enjoy these spaces.

Correspondence: Reintroducing grizzlies to the North Cascades will be a terrible mistake. The outcome will be inevitable: livestock killings, pet killings, human casualties. Make no mistake: grizzlies are predators. Humans are predators. There will be conflict between both before the apex predator is determined.

Do you feel comfortable with being directly responsible for a child being one of the casualties of this conflict? With an elderly person living near the forest being attacked? With a hiker on being pursued, killed, and eaten? How about with a Scout troop being assaulted as they sleep in their tents? You will bear the load of responsibility for every incident if you reintroduce grizzlies to the North Cascades.

I am from Canada. One of my very good friends suffered just such a fate. You can say it will never happen here. Or if it does, it's the fault of the humans.

You are wrong. Dead wrong.

Correspondence: As an historically native apex predator to the region, it's critical that the reintroduction of Grizzlies to their historical ranges be welcomed. Thriving numbers of apex predators are a sure indication of a healthy ecosystem. As demonstrated by ecosystems where they do thrive, there's also the additional economic benefits brought in by citizens who seek to view them in nature. We've done so much damage to our natural ecosystems. It's not too late to address the damages done and attempt to reestablish natural balances, more so for future generations to enjoy and cherish.

Correspondence: I oppose introducing more grizzlies to the North Cascades Ecosystem!! Dangerous people-grizzly bear encounters will increase. This year alone there have been at least nine grizzly attacks on people up and down the Rocky Mountain Corridor of Idaho-Montana. A man lost his jaw to a grizzly in Montana. A couple in Banff Park were killed. I completely disagree with reintroduction of a native species if that native species is a threat to human life and prosperity. Speculative estimates are made as to how many attacks will be made on livestock. Why doesn't the EIS estimate grizzly related attacks? Obvious! Those should be no less accurate than livestock interactions. I have more concern for the safety of people using the area proposed and the families that live in the surrounding area. Ecosystem scientists and people that will never recreate in the area care more about the the grizzly bear and the infinitesimal impact of reintroduction on the ecosystem over human safety.

Ecosystems have not been static through time, they are constantly adapting including through pre-historic time. Ecosystem scientists should stop trying to manage species back to some arbitrary point in history. What a waste of time and resources unless it is for human health and safety.

Correspondence: Restoration of Grizzly Bears to the North cascades is long overdue. Apex predators are groups of mammals that require more attention since there is the constant struggle with us. We have done a great job in restoring the ungulates; let's make sure that we do the same with animals that bite! Incidentally, get the livestock grazers resituated to the mid-west, closer to their food supply!

Correspondence: North Cascades is a great summer hiking, camping, recreational area for the Pacific Northwest residents. Grizzly bears are easily the most dangerous wild animals in United States. Grizzly habitat means, right away, carry bear spray on even shortest hikes, no tent camping, constant focus on the surroundings instead of enjoying the great outdoors. Unlike black bears, grizzlies do not necessarily avoid humans - they may confront and attack humans. Think about Yellowstone, rangers recommendations about bear safety, cases of deaths of wounds inflicted by grizzly bears in the surrounding areas almost every year. Grizzlies are not endangered animals, there are parts of the country where they are thriving. Of all things, grizzlies is the last thing we need in the Pacific Northwest.

Sincerely yours,

██████████

Correspondence: I am admittedly apposed to relocating Grizzly Bears into WA State. The complications this will cause with hikers, horseback riders, and other user groups is huge. And the impact to other wildlife will also be affected. I am a member of Back Country Horsemen of WA, as well as the local chapter. Our public lands are being cut by not having a budget for the Forest Service to maintain trails that currently exist and now we will have to deal with a population of bear that has a whole new set of concerns for safety. I ask this. Would you relocate them to the Olympic Peninsula? I didn't think so.

Correspondence: I fear that there will be too many human-bear interactions that result in great or substantial bodily injury. I also fear that over time these bears will become food-habituated and actively seek out human food from hikers, backpackers, and climbers.

I can also see local communities will face the burden of living alongside these bears. I understand that there is a small population already. I also understand these bears need big territories to wander and live. However I believe a bigger population will lead to conflict. Poaching may become a problem. I'm not sure that these grizzlies will be able to live in peace and prosper as intended.

Sedro Woolley, WA 98284

RE: The PCTA's Response to the 2023 North Cascades Ecosystem Grizzly Bear Restoration Plan Draft Environmental Impact Statement

Dear Superintendent,

I am writing on behalf of the 14,700-member Pacific Crest Trail Association (PCTA). The PCTA is the primary private partner, with the federal, state and local land management agencies, in the management and maintenance of the Pacific Crest National Scenic Trail (PCT). The foundation for this private-public partnership in the operation of National Scenic Trails is rooted in the 1968 National Trails System Act. Section 11 of the Act, titled "Volunteer Trails Assistance" states, "... the head of any Federal agency administering Federal lands, are authorized to encourage volunteers and volunteer organizations to plan, develop, maintain, and manage, where appropriate, trails throughout the Nation." Sec. 11(b) continues, "Each Secretary or the head of any Federal land managing agency, may assist volunteers and volunteer organizations in planning, developing, maintaining, and managing trails."

The involvement of volunteer and private organizations in the operation of National Scenic Trails is re-emphasized in Executive Order 13195, "Trails for America in the 21st Century." The Order states, "Section 1. Federal Agency Duties. Federal agencies will, to the extent permitted by law and where practicable--and in cooperation with Tribes, States, local governments, and interested citizen groups--protect, connect, promote, and assist trails of all types throughout the United States. This will be accomplished by: (g) Fostering volunteer programs and opportunities to engage volunteers in all aspects of trail planning, development, maintenance, management, and education as outlined in 16 U.S.C. 1250." Based on this direction, and captured in our memorandum of understanding, it is the PCTA's role to work with the land management agencies to ensure the best possible management of the PCT and the year-round experiences it affords trail users.

The PCTA supports the purposes and needs presented in the Draft Environmental Impact Statement (DEIS) documents and the reintroduction of grizzly bears to the North Cascades Ecosystem (NCE). Grizzly bears are a historically natural part of the NCE, and we support efforts to recover the species and promote an environment that maintains its natural conditions, processes, and species composition. Grizzly reintroduction is consistent with direction in the PCT's designating statute, the 1968 National Trails System Act, to conserve the natural qualities of the areas through which national scenic trails may pass. The Act states:

"National scenic trails... will be extended trails so located as to provide for maximum outdoor recreation potential and for the conservation and enjoyment of the nationally significant scenic, historic, natural, or cultural qualities of the areas through which such trails may pass [emphasis added]."

As planning for grizzly bear reintroduction proceeds, we ask that management of the PCT and requirements from the National Trails System Act are adequately considered and incorporated throughout the planning process. Restoration of a self-sustaining grizzly bear population in the NCE is consistent with the "nature and purposes" for which the PCT was designated as a national scenic trail. The PCT's nature and purposes statement, along with the trail's significance and fundamental resources and values can be found in the PCT Foundation Document.

While PCTA supports the intent behind the reintroduction of grizzly bears into the NCE, we ask that area and trail closures only be utilized when absolutely necessary. That said, we appreciate the agency speaking to the issue on page 122 of the DEIS as stated below.

"Initially, closure of park or forest facilities and main roads is not expected to occur nor would access to visitors be limited because of grizzly bear restoration. For example, the agencies do not anticipate the need to institute trail closures along the Pacific Crest Trail or other high use trails."

Throughout the grizzly bear reintroduction planning process, it will be important to recognize that the PCT is a highly valued recreational resource that sees use from thru-hikers (people attempting to hike the entire trail in one season), other backpackers and horseback riders, and day-hikers. Additionally, there are countless other backcountry travelers who use the PCT as part of a broader backcountry or wilderness trip. Altogether, the PCT sees thousands of people per year. The PCTA would like to avoid a situation where access to the PCT is unduly restricted due to concern of bear and human conflicts.

The PCTA is incredibly supportive of additional backcountry bear-resistant food containers (i.e., bear canisters) requirements for overnight users to reduce the potential for human and bear conflicts. Additionally, we support opportunities to increase public education around how PCT hikers, horseback riders, and other backcountry travelers can recreate more responsibly. We believe that proper food storage requirements and effective public education should negate the need to unduly restrict backcountry and wilderness recreation opportunities.

As the exact effects that reintroduced grizzly bears will have on outdoor recreationists in the NCE is unknown, as well as the impact non-motorized recreationists will have on bear populations, we support the initial reintroduced population being designated as a 10(j) population within the meaning of the Endangered Species Act (ESA) as described in Alternative C of the DEIS.

We appreciate your time and consideration of the PCTA's comments regarding management of the Pacific Crest National Scenic Trail in relation to the 2023 North Cascades Ecosystem Grizzly Bear Restoration Plan Draft Environmental Impact Statement. As the primary private partner in the management and maintenance of the PCT, we are eager to work with the federal agencies to ensure the purpose and need of reintroducing grizzly bears to the NCE is successful, while still providing for the PCT's nature and purposes. Please do not hesitate to contact the PCTA with any questions or to discuss our comments.

Sincerely,

██████████

Correspondence: The reintroduction of the grizzly bear to the NCE bear recovery zone is a necessary step in restoring historical biodiversity to the area and providing ecosystem resilience and strength to the NCE. The DEIS covers many important points but should be careful to include several other points.

While Alternative A is necessary when drafting and EIS, implementing Alternative A would only provide negative effects to the NCE. While it is the most cost effective and easily implementable strategy, there is no interest in re-introducing grizzlies in this plan. There is no indication that grizzlies will establish themselves naturally in the NCE anytime in the next 50 years as the NCE is fairly isolated from other grizzly habitats. As climate change continues to encroach, every year that grizzlies are not re-introduced is a detriment to the NCE, as the keystone species is not providing the various benefits and ecological resilience attributed to them.

When introducing grizzlies in both action plans, initiative should be taken to provide as much genetic diversity as possible. While it would be reasonable to translocate grizzlies from the same grizzly recovery region, efforts should be made to select grizzlies with high levels of genetic diversity both on an individual and population scale. This will provide the grizzly

population with the most resilience against disturbances and would only improve the population as generations progressed.

While Alternatives B and C are both acceptable options for the reintroduction, alternative B does not provide the flexibility to handle the innate complications that come with bear and human interactions. While Alt. B does allow for defense of life, the interactions between humans and bears are vastly more complicated. Alternative C allows the flexibility necessary to promote a safe and successful co-existence between humans and bears.

Correspondence: I am writing in SUPPORT of the proposal to reintroduce grizzly bears to the North Cascade Ecosystem in northwest and northcentral Washington.

I am an avid hiker and have safely hiked and camped in grizzly bear territories - including a safe, distant encounter with a grizzly bear while hiking in Alaska.

I respect the concerns of local citizens with regards to this reintroduction and ask that consideration be made to address their concerns - while continuing to move forward with this historic opportunity.

I am excited for a future of living and hiking in a Washington where grizzly bears have been thoughtfully re-established in their historic range.

Correspondence: I am an avid backpacker and have been my whole life. I support efforts to protect and restore the environment on many fronts including in my own community living in the foothills of the Cascades. However, I find it rather odd that Grizzly reintroduction has become a priority and that the various agencies are spending millions of dollars pursuing

this agenda. I live around Black Bears and also often see them while hiking. They bring me great joy and I have never felt like they had any inclination to be aggressive. Grizzly Bears on the other hand are known to be much more aggressive. It is my understanding that Grizzly Bears also compete with Black Bears for food and territory. I would rather see a healthy population of Black Bears and let the Grizzly Bears return naturally if that were to happen. I would rather see the Federal agencies spend the energy protecting Mountain Lions and Wolves from ranchers who think it is their right to graze cows on Federal land at subsidized prices. If we really want to build up the large predator population then I would rather see an end to the killing of wolves, coyotes and Lions for the sake of raising cows for profit. I vote for the option to do nothing and not spend more energy reintroducing Grizzly Bears. Michael Savatgy

Correspondence: Humans seem to be extremely ignorant and quite capable of displacing and eventually wiping out other species. There seems no regard for understanding what role other species play in our environment. Overall, humans no longer need to hunt for survival. In fact, they no longer need to hunt for any reason beyond the human thrill of stalking and killing.

The return of the Grizzly Bear is a great start in helping to bring back this magnificent animal from the brink of extinction. As a lifelong resident of Washington state, I am thrilled with the prospect of returning the Grizzly Bear to their natural habitat. Thanks so much for taking the time to seriously consider this issue. It's so important and I sincerely hope you will follow through.

Correspondence: I write to support alternative C in the draft EIS. Both my father and I have worked in the Greater Yellowstone Ecosystem (GYE) over the course of the last 30 years, and we have both seen the positive impacts to the natural world and to the visitor experience to the park that having apex predators like grizzly bears bring to the area. We have also seen how beneficial it is to have a multi-agency apparatus in place for making difficult management decisions, and I believe that option C of the draft EIS best provides for the sort of nuanced, granular rulemaking that is vital to the success of reintroduction projects. As we have learned from the experiences of the wolf reintroduction in the GYE, there will be conflicts with other sorts of land use whenever an apex predator is reintroduced into an area. I believe that those tradeoffs are worth it for the sake of ecosystem integrity and restoration, but whatever you believe it is important to have a framework in place for responding agilely to stakeholder concerns, changing conditions in the field, and other unforeseen circumstances. Alternative C provides that framework, and should be adopted.

Correspondence: I would love to see grizzly bears living in the Cascade Mountains again. I would only like to see this, however, if the reintroduced bears receive protection at the federal level... Forever. It has been heart breaking to see wolves reintroduced into states that turn around and kill them on-mass. It is irresponsible and unethical for any animal, whether it is endangered or not, to be brought into areas where they will be at risk from state legislation granting the right to unrestricted

killing. Bring grizzly bears back, but make sure they have the protections they need to ensure their continued survival and quality of life into perpetuity. Anything less is a cruel and irresponsible joke.

Correspondence: I support reintroducing Grizzly Bears into the North Cascades, but have concerns about the target of 200 bears. The lowland habitat has far less access to salmon which is a key food source all coastal and near coastal Grizzly populations. Hoping that NPS has evaluated the current available biodiversity and food sources in the targeted habitat and that it is sufficient to support the population they're attempting to achieve. Otherwise it will be the same continual issues of Bear/Human conflicts. There are a few Grizzlies in the North Cascades right now - a friend showed me a picture of one that was clearly a Grizzly appx 10-15 miles south of the Pacific Coast Trailhead south of Marblemount. Yet there have been no reports of conflict with humans or livestock.

Correspondence: It is a terrible idea to reintroduce grizzlies to the North Cascades. Especially under the excuse that "they once thrived there". The entire ecosystem has changed since those days, and human interaction in the area

has increased greatly. Our government needs to stop letting animal lovers make decisions that impact other species and man in negative ways.

Correspondence: Hello,

I moved from Montana to Seattle a couple years ago and have been surprised to learn about the extinction of grizzlies in the North Cascades. Grizzlies are intimidating animals, but they are part of what makes wilderness wild. People in Montana have coexisted with Grizzlies forever. I would love to see Grizzlies back on the landscape in the North Cascades. I also hope the voices of Indigenous people are being centered in this discussion. I support reintroducing grizzlies to the North Cascades.

Correspondence: To All who control this,
It has come to my attention that despite severe disapproval there has been proceeding on this grizzly bear project with no

regard or concern for human beings and businesses and families disrupted by this threat. In addition public employees funded by the very souls that are being ignored have made it their livelihood to to negatively impact or threaten to impact the futures of families and businesses who contribute as tax paying citizens. Most recently we face a document that is so large that unpaid citizens trying to read and comprehend this could take months if not years to evaluate and we have been given only 3 short months to consider it for comment. This is an unrealistic and irresponsible operation and borders on criminal in how it has the ability to disrupt so many people and their lives. At the very least I request an extension in time for proper evaluation of this document. Thank you for your consideration,

Correspondence: NO!!! Please do NOT reintroduce grizzlies into WA state parks! The people in this community do not want them here. Introducing grizzlies into the environment WILL lead to the deaths of people. It will also bring fear into a region that is so beautiful and peaceful now. When I visit grizzly country, I have to really be on guard, carrying bear spray and traveling in small groups. It impacts the way I experience an area. I always appreciate our parks here in WA state because I can enjoy them without that fear.

You keep saying that grizzlies are mostly peaceful. They aren't. They are huge carnivores that will aggressively defend their young or even on occasion prey on humans for food. I don't want them in my area. If you feel like you need to introduce an apex predator, try wolves!

You need to spend a little time caring about the HUMANS who live here instead of worrying so much about grizzly bears. Not everything has to go back to the way it was in the past. There are enough grizzlies in Alaska, Wyoming, and Montana. We DO NOT WANT THEM HERE. If you care at all about what the people in these communities actually feel, you will stop pushing this agenda on us. Haven't we already been through this? Didn't we make our feelings known in 2018?

I will vote ANYONE who supports this OUT. And while I would never wish harm on any animal, IF grizzlies were reintroduced here, I would applaud any poacher who tried to eliminate them himself. What you are doing is wrong - sick and wrong. STOP.

Correspondence: Grizzly bears 🐻 should be protected because they play a natural role in the North Cascades National Park by digging up the soil with their big paws and claws to look for insects they help loosen and turn the soil so new plants can grow. And when grizzly bears catch a salmon from the streams and rivers and waterfalls they eat it and when a grizzly bear is done eating the dead salmon, the nutrients from the dead salmon it fertilizes the earth bringing nutrients to plants and trees to help them grow healthy.

Correspondence: I strongly oppose introduction of grizzly bears into my home state of Washington.

Despite the unanimous continuous rejection by the people who live in Washington state The subject of introduction of grizzly bears into the cascades has been continuously brought up by unelected bureaucrats in Washington, D.C.

Why do these unelected bureaucrats refuse to see the issue of predators in the West--grizzly bears and wolves--from the perspective of the people who have lived there for generations. These bureaucrats seem to have some delusional utopic vision. They just want to know grizzly bears are romping happily through the woods smelling the flowers and eating berries like in a Disney movie. This "utopic" vision puts the onus of tolerance on communities that are forced live in the midst of bears or wolves.

How much is it going to cost the taxpayers to "manage" a grizzly population? Lets look at wolves. The introduction of the unwanted wolves may have been a success numbers wise but it has been a nightmare for some sparsely populated counties in the state south of me. Nearly every week I read of wolves killing livestock in those areas. So many wolf depredations in fact, that game management have been allowed to permanently remove some members of the pack through designated elimination. There is a rigorous time consuming and costly process to determine a wolf kill. All this effort and money could have been better spent to better manage other wildlife. Our deer and elk are threatened by such diseases and

black tongue and chronic wasting disease. Moose are being decimated by ticks. The unwanted introduction of grizzly bear will divert even more desperately needed resources and money away from wildlife that truly need it.

The introduction of these apex predator grizzly bear to Washington state is a threat to the safety of our communities. I repeat, grizzly bears are apex predators. They are apex predators that are federal under protection and have no fear of humans, making them over 20 times more dangerous than their cousin black bears. Residents will be forced to be always vigilant of their surroundings. Be forced to live in fear. In nearby states with grizzly populations people are forced to put electric barriers around their gardens and livestock to keep the grizzly bears out. Residents will forced to live in a sort of federally induced prison.

Introducing grizzly's will have a profoundly negative impact on the communities and wildlife in Washington state.

Again, I strongly oppose introduction of grizzly bears into my home state of Washington.

Correspondence: To whom it may concern,

I've been hiking and climbing in the North Cascades my entire life. I've run into Cougar, Black Bear, and Wolverine in the backcountry. It is my opinion that those animals are enough for outdoor enthusiasts to watch out for while recreating. Reintroducing a massive animal such as a Grizzly bear to an area where many people recreate is not a wise idea. Most of the people recreating are from the city and have enough problems with things as simple as backcountry navigation- let alone being comfortable and confident when coming face to face with a Grizzly Bear. Reintroduction of these animals is inviting serious trouble to an already tearcherous and rugged swath of land.

Thank you for your time,

Climber, flyfisherman, outdoor enthusiast

Correspondence: "As a resident of Washington State, I am excited at the prospect of grizzly bears returning to the North Cascades ecosystem. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife. That's why I support restoring grizzly bears to the North Cascades via Alternative C: Restoration with Endangered Species Act Section 10(j) Designation - provided that the accompanying 10(J) rule promotes the recovery of the population, ensures management is humane, prioritizes non-lethal management tools and enables humans and grizzly bears to coexist. Properly developed and implemented, the 10(J) rule will help increase human acceptance of grizzly bears as they return to the landscape."

I have spent time hiking in Montana and in the Yellowstone Park area and have never had any encounters or issues with the Grizzlies that were seen. By being Bear Aware and carrying bear spray, myself and family members have enjoyed our outings.

Correspondence: This is probably a bit odd because I financially support Conservation Northwest, BUT.....I'm not a real fan right now of re-introduction of grizzlies into the North Cascades for one very simple reason: I'd like to be able to backpack without having to worry about the unpredictability (at times) of grizzlies. I specifically do NOT backpack in Glacier NP, Yellowstone NP, or some of the other grizzly habitat areas in the Rockies simply because I really don't care to have an encounter with a grizzly. I do everything that most authorities would want me to do: bring a bear resistant food canister, pack bear spray, keep a clean camp, make a little conversational noise along my route to alert bears to my presence, etc. But I just don't relish the idea of an encounter with a grizzly. While attacks have been rare, they have happened, and sometimes with fatal results.

Correspondence: We already have grizzly bears in WA. If the our current ecosystem could handle more they would re-introduce themselves and repopulate these areas. Like the wolves, they are transient until there are enough food & land present to keep them here. They will expand when it is time. Unnatural reintroducing grizzly will put a strain on the ecosystem. It will lead to conflicts with people. The pronghorn that were reintroduced on the Yakama Res. wandered off Yakama lands. The same may happen when the bears run out of food and space in the North Cascades. The wolves wandered in from Canada and from the Yellowstone Wyoming transplants. And the McKenenzies brought into Yellowstone were not the right subspecies of wolf. Now the WDFW culls a pack or two everyonce in a while due to them running out of natural food which forces them to prey on livestock. Please do not introduce another species/ subspecies into our state to feel better. Help the ones that are here by keeping your hands off the species.

Correspondence: To planners and organizers of the Grizzly Bear Restoration Plan.

Be advised that I am against the reintroduction of Grizzly into the North Cascades. As a hunter/fisherman on both the Western and Eastern side of the state, I have seen a reduction of big game animals and a loss of livestock, due to the reintroduction of wolves. Adding another apex hunter to the eco system would only deplete the game even more. Plus the landscape from a century ago has changed dramatically as Western and Eastern Washington's population explodes. Overpopulation will inevitably lead to more human-bear conflicts which will result in deaths of humans and Grizzlies. I am sure that nature has already brought some grizzlies down from Canada. So government agencies should not be introducing more to the eco-system.

Correspondence: Docket No. FWS-R1-ES-2023-0074).

NO TO GRIZZLY RELEASE IN THE NCE

SPEND MONNEY ON REMOVING THE PINE BEETLE.

I have lived in Washington State my whole life. I'm 53 and have spent much of my life in the outdoors with my father (now 84) enjoying the nature that this state had to offer. I was taught at a young age to respect nature and to be a good steward of the land. I can't believe that the introduction of grizzly bears into the north cascade ecosystem (NCE) is a good idea. As with the wolf I would think we would figure out that animals do not stay where you put them. If the grizzly wanted to move in to an area, they would have moved. If the end goal is to keep people from using our public lands then just shut them all down. Introduction of big animals that have the potential to kill the current population of native animals (that I have seen in decline over my time in nature) I do not think is a good plan. To me it sounds like dropping a fox in to a hen house and tell it not to kill all of the hens. I have seen over my time in nature that between the state run lands and the federal lands that there is less and less access. There appears to be more and more fences that block off access to places to camp and use the lands. This forces people to use only state or federal run camp grounds (good for the budget but bad for us that don't want to stay in a place that is piled up with people like cord wood). In the draft grizzly bear restoration plan/ environmental impact statement. The grizzly bears have gradually expanded their occupied habitat by more than 100% (NPS 2023a). Grizzly bears have tripled the extent of their occupied range in the GYE since the early 1980s. The implementation of grizzly bear restoration activities could contribute to the spread of invasive species such as diffuse knapweed (*Centaurea diffusa*) or reed canary grass (*Phalaris arundinacea*) within the NCE. Restoration population goal of 200 bear's. Based on the report this would mean that we would have a new population of grizzly from Canada to Oregon. The bears are not concerned with roads, rivers or borders. Grizzly are very aggressive and can sprint 35mph to 40 mph, and will eat anything that it perceives as food.

In conclusion:

Promote Selkirk Mountains in Washington for grizzly bear encounters.

No new programs to release grizzly.

No more closing down public lands.

Spend more time on removing the pine beetle.

Correspondence: I do not think grizzly bears should be brought back to the N Cascades. Time has marched on and so has the human population from when the bears were in the N Cascades. WA has had a big increase in population and more and more people are moving further into the forest for one reason or another. The N Cascades are also a visitors, campers, hunters, etc. destination. This is the present situation and what it will be like in a few more years will be worse, let alone in the 60 years you are talking about. I don't think you can predict how many people will be exposed to the bears in the future. Black bears are already becoming an expected sight in neighborhoods. My vote is no.

Correspondence: As a resident of Washington State, I support restoring grizzly bears to the North Cascades via Alternative C: Restoration with Endangered Species Act Section 10(j) Designation - provided that the accompanying 10(J) rule promotes the recovery of the population, ensures management is humane, prioritizes non-lethal management tools and enables humans and grizzly bears to coexist. Properly developed and implemented, the 10(J) rule will help increase human acceptance of grizzly bears as they return to the landscape.

Correspondence: I am writing to support the restoration of a healthy population of grizzly bears to the North Cascades, their home for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations.

I support Alternative C: Restoration with Section 10(j) Designation. Alternative C is the best choice for bears and the people who live in and visit the North Cascades Ecosystem. The plan is wisely modeled on what's worked in Montana where grizzlies are recovering in the Cabinet-Yaak mountains with few problems and with the acceptance and involvement of local communities.

Furthermore, the 10(j) rule will give people more management tools to reduce, prevent, and respond to human-bear conflict. I believe that the 10(j) rule if properly implemented, will help increase human acceptance of grizzly bears as they return to the landscape.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please bring back this native species to our state through the strategy laid out in Alternative C. Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

The North Cascades Grizzly Bear Recovery Zone (NCGBRZ) is the second largest of six such designated areas at nearly 10,000 square miles. Combined with contiguous protected areas in British Columbia, including Manning Park, there are 14,000 square miles of productive, wild habitats, wilderness, and roadless areas.

People and grizzly bears can coexist and thrive. They do so in British Columbia, Montana, and Wyoming where grizzly populations and back and front country recreation continue to grow hand in hand, providing a vital economic boost to those areas' gateway communities.

Grizzly bears lived in Washington for thousands of years. We still have a small population in the NE WA Selkirk Mountains. However, currently, there are no grizzly populations in the United States or Canada that are large enough or close enough to serve as a source to naturally repopulate the North Cascades.

Having wiped out the grizzly bear over the past 150 years we now have the unique opportunity and the ethical obligation to restore them to their native home, where suitable habitats still exist.

Grizzly bears are ecologically and culturally significant and are vital to the overall health of the North Cascades ecosystem and its biodiversity. They are considered an indicator of ecosystem health.

Thank you for taking the time to keep our North Cascades wild!

Correspondence: It's past time that humans do the right and just thing for these bears. With proper education and prevention, bears and humans should be able to survive in the North Cascades. They did so for decades before humans

decided to pass judgement on these animals. Instead of setting limitations on bears, why not set limitations on humans who are supposed to have enough intelligence to obey and follow the law. The human race is systematically eradicating all animals and that is a sin!

Correspondence: Strongly against reintroducing grizzly bears. Where do we draw the line with manipulating nature? Mongoose was introduced to Hawaii to control rats, with disastrous consequences. Would we introduce more white sharks to Hawaii to restore white shark populations? How would the local populations feel about this? Have the local populations in the northern Cascades agreed to this idea? This is not a native plant or other innocuous species, this is a dangerous animal that has attacked and killed humans, even those armed with bear spray. This will negatively impact campers, anglers, farmers, and other Washingtonians. I will not take my family, including my small children, on hikes, camping, or fishing, in areas that have grizzly bears - we will travel to Oregon or other states that do not have grizzlies. This will result in camping and gaming fee revenue loss. I have not seen any reports of ecosystem issues due to a lack of grizzlies. Are deer and elk populations out-of-control? Is the claimed reduced seed spreading by grizzlies causing vegetation issues? These are things that grizzlies CAN do, but no scientific evidence that missing grizzly bears is causing a negative impact. There are 60,000 grizzly bears in North America. We are not in danger of losing grizzly bears as a species. Do not reintroduce grizzly bears to the Northern Cascades.

Correspondence: I am NOT in favor of restoring Grizzly bears in the North Cascade. Though I am a big fan of nature and bears, and have seen Grizzlies before in other parks, I am AGAINST the introduction of them into the North Cascades. My reason are the following:

Safety Concerns: I have seen the literature that says people + Grizzlies have co-existed (examples in Alaska, Montana etc) and in the majority of cases it is peaceful. But there are still cases of danger and close calls, and many more additional measures need to take place, for people visiting the park as well as surrounding communities that require a higher level of preparation and diligence, which still does not alleviate safety concerns to zero. I enjoy how the parks are today, and though there is a level of diligence and precautions taken today for the current habitat, adding Grizzlies into the park adds an additional safety concern for, in my opinion, not much upside.

Unintended Consequences: There have been previous human re-introductions of species that had unintended ecological effects. I am worried we are taking an unnecessary risk that may lead to unforeseen outcomes (whether it be for the animals, plants, local communities, etc)

Cost Benefit/Reward: The park and its ecosystem have existed well so far without Grizzly Bears. There are many other areas of investment (e.g. wildfire mitigations, greater access, etc) that would seem to benefit the National Park. From all the literature I have read, I do not see what the huge upside is, in the habitat, for introducing Grizzlies, with all the other animals and species we have today. This will definitely change the ecosystem, but at what benefit and cost.

Correspondence: I am not in support of the plan to reintroduce the bears in the northern cascades.

The department is clearly ignoring the wishes of land owners, citizens, and the current legislature of the states there included.

The department is failing to take into adequate consideration the public danger of reintroducing predator animals into human proximity habitats from which they were purposefully extirpated.

The department is also guising the reintroduction as helpful to ecosystems for seed dispersal and population control, which could as easily be achieved via other means such as hunting and private organizations. With out the reintroduction of a large predator .

One only needs to read the journals of early explorers and naturalist like Bartram , to grasp the danger of predator animals to the public especially young children and the agricultural industry, which is already overburdened - including wolves and bears.

I'm firmly against this measure .

Correspondence: Thank you for this opportunity to comment on the: Draft Grizzly Bear Restoration Plan / Environmental Impact Statement for the North Cascades Ecosystem

As a member of Back Country Horsemen of Washington, I am very concerned with the ability to continue to recreate in the North Cascades should a small population of heavily protected grizzly bears be mechanically moved into the region that we recreate in. The DEIS does not sufficiently analyze the impact to recreation or present any options for how trails can be maintained open in the presence of protections implemented to reduce human-grizzly interactions.

1. The Pacific Crest National Scenic Trail runs through the core habitat and has permitted distance hikers of around 10,000. When considering the other trail users in and along the North Cascades Ecosystem (NCE) since this is one of the most populated areas around any bear ecosystem, the use likely exceeds a quarter million visits. However, the DEIS indicates that the use is insignificant. It is very significant and will likely result in many human-bear interactions.
2. The Pacific Northwest National Scenic Trail also runs through the NCE as well as other bear ecosystems to the east, including the Cabinet-Yaak (CYE). The CYE has a more established population of bears but still has resulted with challenges to the very existence of the trail due to the limited number of bears in the CYE (20-40). Opposition to the National Scenic Trail in the recovering bear population area as well as the connecting landscapes between ecosystems has also been expressed by USFWS staff, the same agency putting forth the NCE proposal through which the same trail will pass.
3. Without a more detailed analysis of how to retain the carrying capacity of the trails, trailheads, and campgrounds without resulting in long term or permanent closures, there is no way to effectively review this DEIS.
4. Furthermore, the NPS and USFWS have pointed out that the Canadian counterparts and First Nations are preparing to release grizzly bears in the northern part of the NCE. IF that was the only release point, it would move the core recovery/release area north and away from the more densely human populated areas of Washington State. It also would be in line with Washington State law as well since no bears would be translocated directly into Washington, and there also would be predictability on how many bears are being moved into the entire NCE which overlaps both countries. The BC government has noted that their Recovery Plan is being developed jointly with the USFWS even though this US EIS only addresses the Washington effort.
5. As a trail horse rider in the NCE, I ask that the No Action Alternative be selected. The areas we ride in includes the Mt Baker Snoqualmie National Forest, the Okanogan Wenatchee National Forest including the Pasayten Wilderness, and the North Cascades National Park. We have many horse camps along the boundary of the NCE. We cannot support either Action

Alternative without more substantive analysis on impacts to recreation as well as knowing more on the joint planning with Canadian counterparts.

Correspondence: Despite the unanimous continuous rejection by the people who live in Washington state The subject of introduction of grizzly bears into the cascades has been continuously brought up by unelected bureaucrats in Washington, D.C.

Why do these unelected bureaucrats refuse to see the issue of predators in the West--grizzly bears and wolves--from the perspective of the people who have lived there for generations. These bureaucrats seem to have some delusional utopic vision. They just want to know grizzly bears are romping happily through the woods smelling the flowers and eating berries like in a Disney movie. This "utopic" vision puts the onus of tolerance on communities that are forced live in the midst of bears or wolves.

How much is it going to cost the taxpayers to "manage" a grizzly population? Le's look at wolves. The introduction of the unwanted wolves may have been a success numbers wise, but it has been a nightmare for some sparsely populated counties to the state south of me. Nearly every week I read of wolves killing livestock in those areas. So many wolf depredations in fact, that game management have been allowed to permanently remove some members of the pack through designated elimination. There is a rigorous time consuming and costly process to determine a wolf kill. All this effort and money could have been better spent to manage other wildlife. Our deer, elk, pronghorn, and mountain sheep are threatened by such illnesses as hemorrhagic disease and chronic wasting disease. Moose are being decimated by ticks. The unwanted introduction of grizzly bear will divert even more desperately needed resources and money away from wildlife that truly need and deserve it.

The introduction of these apex predator grizzly bear to Washington state is a threat to the safety of our communities. I repeat, grizzly bears are apex predators. They are apex predators that are under federal protection and have no fear of humans. Grizzly bears are exponentially more dangerous than their cousin black bears. Residents will be forced to be always vigilant of their surroundings. Residents will be forced to live in fear. In nearby states with grizzly populations people are forced to put electric barriers around their gardens and livestock to keep the grizzly bears out. Residents will be forced to live in a sort of prison induced by the federal government.

Introducing grizzlies will have a profoundly negative impact on the communities and wildlife in Washington state.

I strongly oppose introduction of grizzly bears into my home state of Washington.

Correspondence: To whom this may concern,

After reading the Grizzly Bear Restoration Plan Environmental Impact Statement, I have some input and concerns that should be considered.

I am in support of the preferred alternative C. An important part of getting support for this management is the social context of grizzly bears. Alternative C would have the most flexibility to reduce conflict between humans and grizzly bears, increasing the social tolerance of the bears. Unlike alternative B where grizzly bear management options are limited since grizzlies would be managed as threatened species under the Endangered Species Act, alternative C allows for preemptive relocation and authorized lethal action if necessary. The aspect of preventative mortality will make users feel safer when restoring grizzly bears.

The main downside I found of alternative C (which is also found in alternative B) was that recreation by users would be impacted. Just as helicopters can disturb wildlife dens and nests when used to release bears in the North Cascades, they can also interrupt users' contemplative recreation. Just as there are limits to helicopter use in consideration of wildlife, has user recreation been considered in deciding the limiting of time of year and frequency of helicopter use?

Looking at the map of the North Cascades ecosystem in the impact statement, I noticed the North Cascade Highway SR 20 goes through the North Cascades National Park Service Complex. Grizzly bears crossing the highway could complicate restoration of the bears if they get hit by a car or if the crossing creates human and bear conflict. Is there information available on how often wildlife in the North Cascades die due to vehicles on this highway? In alternatives B and C, is there a plan for road mitigation for the introduced grizzly bears? Would use of a wildlife crossing be considered?

Thank you for considering my comments.

Correspondence: First, I would like to express my appreciation for the NPS's efforts to restore grizzlies to the North Cascades. Returning species to their native habitat and consequentially improving the wilderness character is incredibly important to the long-term well-being of the ecosystem. Though it may cause some distress to humans, I think that if it is deemed practical, likely to be successful, and accepted by the majority of the population, that this is an incredibly important initiative to continue to push forward.

One area of interest that I think would be valuable to further research is the potential for increased species resilience and genetic diversity that could result from the establishment of a new population of grizzlies. As grizzly bears continue to be heavily threatened, it is important for their long-term survival that there is sufficient diversity within populations and within

the species as a whole. Though the NCE population would be made up of individuals from existing populations, its likely isolation from other populations would allow the bears to adapt relatively independently over time. If there was ever a major genetic threat to an existing grizzly population, I would hypothesize that having a distinct population in the NCE could increase the chances for resilience and ultimately, species survival. I think this is something that is important to include when weighing the potential pros and cons of reintroducing grizzlies. Beyond just restoring the bears to their native habitat, I think it could also provide more long-term security and increase chances of species survival.

However, I think it is important to more fully assess the impact that a fully restored grizzly population may have on recreational activities in the NCE. You note on page (vii) that "as grizzly bear populations are restored and numbers increase, the likelihood for an encounter with a grizzly bear would also increase." This is certainly true, and I think it has the potential to significantly decrease comfortability with recreating in the NCE, especially for families with young children. Thus, I am curious how the NPS intends to manage potential grizzly bear interactions. I see in alternative C that lethal take would be permitted in some scenarios, but does that mean that the typical recreationist would be expected to carry a firearm in case of a grizzly encounter? This hardly seems like the best option for both the bears and the humans. Further, suggesting lethal take as the solution to human-bear interactions could cause unnecessary fear surrounding bears, discouraging people from using the wilderness. I think that the reintroduction of grizzlies in the NCE is incredibly important, but it must come with a thorough plan for public education about the bears, the dispersal of management-related information and guidance, and alternative plans for ensuring that human-bear interactions are as safe for both parties as possible. This is done generally well in Glacier National Park, and I would like to see the North Cascades investing more thorough solutions to recreational concerns.

Correspondence: I'm just a citizen, camper, hiker here. This is the usual MO for the DC clan who just do what they want based on poor information, and don't listen to the citizens; making sure they sneak it through before most people notice or have a chance to respond. Why the sneaky manipulation? Because they know the people who live here probably would not want grizzlies living nearby. When are we all going to be sick of this administration circumventing the legal process and doing as they please? Why would anyone think it is a great idea to move a predator into this area? Is this an environmentalist's fantasy? Why WA not CO? This is not 1820. We have small towns, rural homes, resorts and ranches with hundreds of trails and dozens of campgrounds in this region. The bears don't know where the boundaries are, so this is a fatality waiting to happen. There was a near tragedy in 2018 (i believe near Okanogan) when a researcher was treed by a pack of federally protected wolves. The feds would not tell anyone where the wolves were located. The dispatcher's call for help was like a "who's on first?" routine. Every agency pointed to another to respond while she was hanging on for life. She was rescued by helicopter. This summer, a young woman was fatally attacked by a grizzly on a trail near West Yellowstone, a popular tourist town.

I hope enough people will respond in protest to this ill-conceived idea and it will be stopped.

Correspondence: No! Grizzlies should NOT be reintroduced into the North Cascades. If they come on their own, fine, but artificially bringing them here is a death sentence for them, humans, and domestic animals. Black bears are already coming into towns and housing areas in the foothills and causing problems. Then these black bears have to be "put down." Other animals that have been "introduced" have also caused problems for farms, ranches, family pets, and rural housing areas (even sometimes in towns and cities) and then these "introduced" animals are killed.

The argument that grizzlies lived here 1000's of years ago is irrelevant since the human populate now is considerably larger than even a hundred years ago. Washington's human population is growing and more animals and people will be encroaching on grizzly habitat. Grizzlies and human/domestic animals WILL NOT coexist peacefully! Grizzlies will kill and then humans will have to kill the grizzlies.

There have been several news reports of grizzlies killing people/animals just in the last few years. Even ONE human death is too many unnecessary deaths caused by an "introduced" grizzly. Are those in favor of introducing grizzlies willing to be held responsible for the human deaths (even one human death) caused by introducing a large predator into an area where it did not naturally migrate?

Correspondence: First, I am in support of grizzly bear reintroduction. Second, as a former heavy user of offtrail areas of the North Cascades I believe you must have data of stray bear already having been there or being there now. I saw a cub prior to 2010 but post 2004. The cub was golden and in a sloped area north of Hwy 20 in Mazama where I had chosen to pick berries

from a copious location.

Reintroduction poses concern for climbers especially perhaps as we are most likely to be traveling before sunup or returning late, but our recreation is not a reason to deny the survival or thriving of a species. Having encountered a curious juvenile black bear as a solo female hiker on the PCT and a small group of cubs together with a group of climbers on our way to Luna Peak, I appreciate that grizzly encounters, if population is increased, will occur. And yet, we can adapt, we should adapt to them because we can.

It concerns me that this is even a question, though I understand some of the circumstances that necessitate its existence.

I will say that the presence of grizzlies probably creates recreational interest in Washington State in as much as it may deter others. Please bring them back and let's co-exist. Let's think about the opportunities not yet known to benefit from their reintroduction.

Correspondence: The more diverse an ecosystem, the healthier it is. The bears would help diversify plants and animals and restore the natural balance in the North Cascades. The remoteness of the area will keep humans and grizzlies from interacting and help maintain their natural range in areas that are away from big civilization. I would love to see grizzlies reintroduced to keep our state's ecosystem healthy and thriving! Please consider!

Correspondence: Noooooo!! Please don't reintroduce grizzlies to Washington State!! Leave them over in Montana! There's plenty of them over there! We don't need them here. I'm sure there must be some in Idaho too. I used to get so nervous when I was huckleberry picking in Montana for fear of running into a grizzly. We have black bears and cougars here, that's plenty of excitement.

Correspondence: Hello,

My name is [REDACTED], I am an avid hiker and biologist who had recently moved to Seattle from Canada. Early in my career I was fortunate enough to be a part of multiple studies related to grizzly bears in the Canadian Rockies. I spent months hiking in bear country with bear bait, with only one other person and had zero incidents. Most recently, I have been hiking throughout the cascades in Washington state where I would love to see the bears re introduced into their historic home range.

It possible for hikers and the bears to peacefully co-exist in their native habitat. It is our responsibility as hikers to be cautious and educate ourselves on how to conduct ourselves in bear country. People need to Cary bear spray and make their presence know while hiking. These bears are part of the ecosystem and we should not restrict their presence based on the worries of people who have no lived with these bears in the past. I have and I know it is possible.

Thank you,
[REDACTED]

Correspondence: Hello:

While I hear two sides to the reintroducing Grizzlies back to the Cascades, I feel the fact they were there as was the wolf BEFORE the Cattleman who use OUR land to graze their cattle. Isn't it time to put Wildlife back where it belongs and as what is done with anything else a foreign object is removed in this case the cattle! I buy beef and pay for the ability to do so. However, I do not want Cattle to roam all over the Forest, get killed and the Wolf blamed so you shoot them. even when the picture shown then was of a Mt Lion killing, that picture lead Washington State to kill a whole pack of Wolves. Sorry went off topic a bit. My point is you do not or are afraid to let the Natural Original Wildlife back so Cattleman can allow a non-native animal to roam. Please stop this practice.

Correspondence: I'm writing in strong support of restoring grizzly bears to their historic range in the North Cascades. The mountains and lowlands offer plenty of space for the bears, who no longer exist in 95 percent of their historic habitat. It's been three decades since the US Fish and Wildlife Service declared almost 10,000 square miles of the North Cascades an "official recovery zone" for the bears, creating a tantalizing path for possible restoration. Grizzlies on the land will improve ecosystem health, a particularly critical benefit in the anthropocene era of global warming. Their presence is a tangible symbol of their cultural and historic importance to indigenous peoples in the region. As a historian, hiker, and the author of a book about the history of North Cascades National Park, I view the grizzly as a vital missing piece in the environment and culture of the region.

Since the earliest days of Euro-American settlement in North America, grizzlies have had a public relations problem. The bears' reputation for fearsomeness was recorded in writing as early as the mid-1600s, but the journals of Lewis and Clark introduced the great bear to a wider audience and in doing so, established its image as a bloodthirsty predator. In May 1805, William Clark and an expedition member shot a 600-pound male grizzly 10 times, then watched it swim away before it finally died on a sandbar. Clark wrote the bear was a "verry large and a turrible looking animal, which we found verry hard to kill." Weeks later, after a wounded grizzly chased one man for more than a half-mile, Lewis decided "these bear being so hard to die reather intimatedes us all; I must confess that I do not like the gentlemen." Lewis and Clark's depiction has been compounded and amplified by decades of misguided belief that the extermination of predators like grizzlies would benefit game populations and, therefore, hunters. Grizzlies have been viewed as something to eliminate and, in the tamed forms of tanned robes or stuffed and mounted specimens (inevitably in a menacing upright position), as evidence of American exceptionalism and dominant masculinity.

When in 1967 local guide Rocky Wilson shot the last grizzly known to be killed in the North Cascades in Fisher Creek basin, he knew it was unusual even then to see grizzlies. But I doubt he foresaw the historical significance of his act. The area closed to hunting the next year with the creation of North Cascades National Park, Ross Lake National Recreation Area, Lake Chelan National Recreation Area, and the Pasayten Wilderness. Four years later, the completion of the North Cascades Highway created a literal barrier for the bears, who don't like to cross roads and were now trapped between the new highway and the Fraser River Highway in British Columbia, but opened an easy-to-traverse route for human recreation. The new park complex and highway marked the end of a way of life in the North Cascades.

Just as the park complex's existence depends on humans, so does the grizzly's. Author David Knibb wrote that the bear's "ultimate value and purpose may be to test our willingness to share part of Earth with a wild and fearsome creature that remains as intolerant of us as we have been of it." The North Cascades ecosystem is a big area, certainly, but, based on the very few confirmed sightings in the last half-century, not big enough to support a healthy population of grizzlies without

human intervention. It's time for that to change. Many, myself included, feel grizzly restoration would be the finishing touch on the crown jewel wilderness of the North Cascades. Without the grizzly, the North Cascades are wild. But as one journalist pointed out, they are not humbling. I believe a little more humility in our relationship with nature would be a good thing. And I suspect Rocky Wilson would agree. Bring back the grizzly. They deserve the chance to thrive again in the Pacific Northwest.

Correspondence: I write in support of the proposed plan to re-release grizzly bears into the North Cascades Ecosystem. This plan will have the following benefits:

- 1) return the bears to a habitat in which they were previously established, thus mitigating some of the damage caused by their loss;
- 2) expand the territory for the bears, potentially allowing the species to be further protected and increase numbers
- 3) provide support for a more complete ecosystem with the bears returning to their original habitat.

The EIS makes clear, I believe, that the concern for human-bear interaction is unwarranted, at least in the very near future as the number of bears to be released is low in number and over an extended period of time. The other concern I've heard expressed in media is an impact on salmon fisheries but again, the EIS makes clear this would not occur and again, the numbers of bears to be released are small.

I hope the NPS proceeds with this project and that grizzlies will once again be part of the Washington state ecosystem.

Correspondence: I am a hiker who enjoys being out in our beautiful PNW wildlands. I am also involved in the community science program to monitor urban carnivores. As such I have learned a lot about the role carnivores play in ecosystems and how to safely coexist with them.

Grizzly bears play a significant role in the high mountain meadow ecosystem. As omnivores, they disperse seeds and aerate the soil through their digging. They also hold an important cultural significance for the local tribes and are one of the animals most associated with wilderness for all people.

Restoring the grizzly bear to the North Cascades represents a major step in repairing the damage humans have done to the PNW ecosystems. As demonstrated by the excitement of visitors seeing the brown bear cubs at the Woodland Park Zoo to all the people voting in the annual fat bear contest, the Grizzly inspires wonder, a state that improves the emotional health of

people who live in an increasingly fraught world.

For these reasons and others, I am in favor of restoring the Grizzly bear to their ancestral range in the North Cascades.

Sincerely,

██████████

Correspondence: Alternative A remains the only rational course of action under the circumstances described in the new EIS.

Alternative C, with its 10(j) designation, does nothing to mitigate the opposition that I have expressed in the past to any attempt to artificially create a new population of grizzly bears in the NCE.

I have lived my entire life in close proximity to the NCE. I have roamed the North Cascades my entire life and intend to continue to do so as long as I am physically able. I am not a member of any advocacy organization with a merely abstract or academic interest in this issue. It is deeply personal for me. The proposed importation of grizzly bears has a direct impact on the quality of my life and my need for remote wilderness recreation in solitude, free from any measurable possibility of violent or fatal animal encounters (the black bears common to the Cascades being an entirely different animal from grizzly bears, and far less dangerous), which is the whole reason why I live here and have contributed to the local economy for so many years. I could never obtain the benefit from the NCE that I do by traveling in groups, wearing bells or banging pots and pans (which would destroy my chances of any benign wildlife encounters), or having to be constantly looking over my shoulder or listening for any rustling in the brush for fear that a surprise grizzly encounter would be next. I relish my close emotional connection with the NCE as it presently exists. I would never choose to live near Glacier or Yellowstone or any other grizzly bear territory or to go solo hiking there, nor would I choose to relocate to the area of the NCE if grizzly bears were to be imported.

Alternative C's representations about "flexibility" to take this or that management action under this or that scenario if it turns out more negatively than hoped are hardly reassuring. There is no guarantee of sufficient long-term funding or availability of staff resources to implement and enforce the measures that Alternative C claims will serve and protect the public. Furthermore, the assurances vest too much judgment solely in the responsible agencies, do not provide for any objective criteria requiring them to take specific remedial action under specific circumstances, and do not provide any avenue for efficient citizen rights of redress against the agencies for failure to protect human life and personal property that may be impacted by the presence of grizzly bears.

Another highly disturbing element of the EIS is its failure to articulate an exit strategy if the grizzly importation program turns out to have adverse consequences that cannot be anticipated based on best presently available science. It is simply

assumed that the program will be successful to some degree because grizzly bears roamed freely in the NCE in the bygone days of the "Wild West," when humans were few and hunting restrictions were nonexistent, and that any adverse consequences will have to be dealt with in some manner. But there is no analysis of what would need to be done if the entire program were to turn out to be a disaster due to changed conditions from the "Wild West" days that are undetected and/or not properly addressed in the EIS.

Nothing in the present iteration of the EIS has changed my views that attempted restoration of an NCE grizzly bear population is an ill-advised boondoggle that threatens to upset the appropriate balance between humans and wildlife in the NCE which has existed for decades and has worked so well, enabling so many people to enjoy a relatively intact environment in such a relatively carefree manner in comparison with the precautions that have to be taken in grizzly country. Insertion of new elements such as a restored grizzly bear population that has the potential to create management headaches and threaten public safety is playing with fire. This is particularly so in view of the agencies' admitted inability to predict or control whether and where imported grizzly bears, or their offspring, might migrate outside the zone of initial introduction.

I saw no evidence cited in the EIS that importation of grizzly bears into the NCE is essential for survival of the species. Conversely, I also saw no cited evidence that the relatively intact environmental quality of the NCE is suffering from lack of grizzly bears. Publications over the last several decades that are too numerous to cite have addressed the controversies surrounding the impacts of road building, timber harvesting, mineral extraction, commercialization, highway construction, dams, proposed tramways and the like. But I have never seen any analysis establishing that seed dispersal in the NCE is inadequate due to the absence of grizzly bears, that prey is overabundant and in need of control by grizzly bears, or that any other element of the ecosystem is not functioning due to lack of grizzly bears.

The degree of urbanization adjacent to the NCE - which is vastly greater than in any of the other U.S. areas I know of presently containing documented populations of grizzly bears - and the human demands on public lands associated with that urbanization, have only increased. And it is well known that the demand for the area's outdoor recreation opportunities has increased many times faster than the state's human population as a whole. Not only is this regularly reported in the news media, but it is plainly obvious from the ballooning number of REI and other outdoor equipment stores and trip reports on the Washington Trails Association website, and the overflowing parking lots at trailheads at peak times.

Emblematic of the EIS's failure to appropriately assess the impact of this increasing public pressure on the advisability of importing grizzly bears is the following statement on page 147: "Given the amount of recreation that occurs in other grizzly bear ecosystems associated with Glacier National Park and Yellowstone National Park, the presence of grizzly bears is not expected to limit overall visitor use and experience of the NCE." I saw no scientific support cited in the EIS for this statement. Furthermore, the comparison is inapposite. Unlike North Cascades, Glacier and Yellowstone are not urban proximate parks. They are completely different scenarios, Glacier and Yellowstone being nowhere near major metropolitan areas with heavy local demand for wilderness recreation on the part of a largely and increasingly urban-suburban clientele. North Cascades is not a far-flung, out-of-the-way hinterland where few people would be impacted by sweeping wildlife management actions involving apex predators.

The vast majority of visitors to Glacier and Yellowstone are not from the local areas, they deliberately travel to these parks knowing in advance that they are grizzly territory, and they have the option of diverting their activities to other areas if they wish to be in an environment where they can be assured that they will not encounter grizzly bears. Residents of western and central Washington who are tied to their jobs and depend on the NCE to meet their demand for regular wilderness recreation as an essential element of the local quality of life but do not want to run the risk of a grizzly encounter will not have this option if grizzly bears are imported. They will be forced to divert their activities outside their cherished North Cascades. If Washington residents wish to experience grizzly country and have the time, they have many options where they can do so, including British Columbia, Alberta, northeastern Washington, Idaho, Montana and Wyoming. It is not necessary to import grizzly bears into the NCE to create this opportunity.

While it is undoubtedly true that many visitors to Glacier and Yellowstone actively desire to observe grizzly bears in their natural habitat, I know of no evidence that the many people who have chosen to live in Washington on account of its multitude of outdoor recreational opportunities have done so because of the possibility that they may at some point in the future observe grizzly bears.

I saw no analysis in the EIS of how people perceive that their visitor use patterns may change if grizzly bears were to be reintroduced. Due to the lack of a significant grizzly population in the Cascades since large scale outdoor recreation became established as a tradition in the area in the 20th century, the vast majority of local residents, including wilderness recreationists, have never had to take grizzly preparedness into account, have never had a close call with one of these animals, and have never been forced to deploy defensive measures against one. The claims of people who have not actively recreated in grizzly country that the presence of grizzlies would not deter them would be based to a large degree on speculation. What might sound like a nice idea on paper can be terrifying when one has to confront the actual on-the-ground reality of it. The agencies cannot possibly hope to gauge eventual public acceptance of grizzly bear importation by tallying present statements of support from people who have never had such an experience - or think it would never happen to them. I, for one, am not willing to accept this risk, and I doubt very much that I am alone.

Quite contrary to the statement on page 147 of the EIS, the importation of grizzly bears into the NCE has the potential for huge disruption of visitor use patterns. Are the agencies not aware of the monumental nightmares being faced by administrators of the Alpine Lakes Wilderness and Mt. Rainier National Park - areas outside the proposed initial reintroduction zone - because these areas are already bursting at the seams with visitor use, as evidenced by recent public comment processes on management plan updates? Can they not envision how these problems could be exacerbated by yet additional use on the part of local people who desire a quality wilderness recreation experience but are unwilling to accept the risk of a grizzly encounter in the NCE - or have recently had one somewhere else (or experienced the imminent threat of one) and do not want another one? This issue has not been adequately addressed.

Despite multiple EIS iterations over the past several years and the new preferred alternative of a 10(j) experimental grizzly population in the NCE, the agencies have not adequately analyzed the potential impacts, risks and consequences of such a plan and are not ready to implement it. I saw no discussion in the EIS of any previous program to import grizzly bears into an urban proximate ecosystem and whatever lessons may have been learned therefrom. Proposed importation of grizzly bears into the NCE is simply too far into "brave new world" territory under the current state of analysis.

Correspondence: I am concerned that the introduction of Brown (Grizzly) Bears into north Washington will bring about negative consequences for both humans and bears. Humans of the region have grown accustomed to not having the potential threat of Brown Bears in the local environment. This area borders a very densely populated region that contains a great number of outdoor enthusiasts. Many are not prepared to deal with the potential risks of large bears. People in the northwest generally don't carry bear spray, bear bells or many other deterrents. To add a species that has been substantially absent from a region for a generation is going to result in a conflict which will cost human and bears lives. Much of the ecological niche that brown bears occupy are now covered by the slightly less dangerous black bear. I am against the reintroduction of Brown Bears into the Northwest.

Correspondence: I am writing in support of the reintroduction of the grizzly in the North Cascades wilderness and National Park. These iconic bears are essential for the complete and balanced ecosystem that this beautiful and rugged area needs to be able to continue on for generations to come. This is the perfect habitat for these great bears and much can be done to mitigate any human or livestock interaction so that little harm would come from their reintroduction. It is long past time that these bears are finally allowed to live again in their historic range, and the North Cascades is the perfect place for this to take place.

Thank you very much for your consideration and actions on this important ecological issue.
Sincerely,

██████████

Correspondence: I support the restoration of grizzlies to the North Cascades, and that the restoration must be done in ways that don't violate the Wilderness Act and harm the area's wilderness character. This is good for bears and the wilderness environment.

Both of the action alternatives as they now stand would violate the Wilderness Act. The action alternatives should be modified to avoid helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and steer clear of heavy-handed management of bears. There are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites without the use of helicopters inside Wilderness. Montana doesn't have any "extra" Grizzlies to lose to the North Cascades.

A natural recovery option must be fully developed and analyzed, even if it takes longer. Prioritize the bears and the wilderness.

Correspondence: I am writing you to express my opposition to the reintroduction of Grizzly bears in Washington's North Cascades range. The north Cascades now are not what they were a century or two ago. There are now many of us who use the area for backpacking and camping. By simply reintroducing these apex predators into the area you will not be able to turn back the clock to the population density of the surrounding area and the recreational use of the Range by the surrounding populations that existed a century or two ago. There are now parents with families who would not and should not expose themselves to the elevated risk level that Grizzly bears would pose on a typical backpacking or camping trip. The arguments in favor of introduction such as "controlling deer and elk populations, spreading seeds and other nutrients", etc., do not justify tampering with the reality on the ground in the Washington Cascades at the present time. Similarly, attempting to justify this project as an effort to support "Tribal cultural and spiritual values related to the grizzly bear" would ignore the fact that in civilized society there are never-ending public safety decisions that must prioritize the safety of vulnerable segments of the population over personal views of sub-groups. The need to protect families is a spiritual value shared by a very large segment of the population, Tribal and otherwise. It's easy to say that attacks by Grizzlies are rare but the fact remains that backpacking or camping in an area with grizzlies poses a distinctly elevated recognized safety risk.

Thank you for all the great work you do in making this area accessible to us.

Regards,

Correspondence: Please do not add grizzly bears to the mix in the north cascades. That has to be the most hiked area in the state. Not to mention hunters and other wildlife. Grizzlies are killers and will kill anything they come across it doesn't matter if it's a deer or person. If they come across the boarder from Canada we can't do anything about that but it will take alot longer for Grizzlies to show up here and cause problems. If your going to release them in the cascades you might as well release them in down town Seattle so people can know what they're dealing with when they go hiking. This makes no sense we pushed them out for a reason.

Correspondence: I think Alternative C for the Grizzly Bear Recovery Plan in the North Cascades Ecosystem is better than Alternative B because the bears would be seen as an experimental population, rather than being protected as a threatened species. This would determine whether or not the recovery of the species in NCE is vital to the survival of the species as a whole is an important part of this situation. But with that being said, I think one part of this plan that could be better is looking into whether or not the recovery of grizzly bears in the NCE is vital to the survival of the species before the recovery effort actually starts. With more grizzlies in the NCE, this is going to change the overall structure of the ecosystem, whether for better or worse, but I think that if the recovery of the bears in NCE isn't essential to the survival of the species as a whole, it's probably not worth the effort behind the recovery process. Although there are benefits to recovering the species in NCE, there are also negative aspects of it as well, such as the effects this will have on recreational usage along with economic costs

of the plan. First off, the NCE is pretty separated from the other grizzly bear populations in the US, mainly being Yellowstone and the Northern Continental Divide areas. Because the NCE is so far away from these other populations, the recovery of grizzlies in the NCE probably isn't essential to the survival of the species as a whole because this would just create separate populations, instead of a metapopulation. I think that the USFWS could predict these outcomes instead of using many more resources on actually engaging in a recovery plan to determine whether the population in NCE is essential or not. Given this, the recovery plan could negatively affect recreational usage in NCE because of the threat of grizzlies to humans. This could lead to a decline in recreational usage within the NCE because of this recovery process, which may not even be essential. Along with this, there is also the obvious economic costs to following through with the plan, ranging from transportation costs of the bears to tranquilizer costs that would be used on the bears. Overall, I think that there could be more research done before this plan gets put into place to determine whether or not grizzlies are essential to the NCE, without going through the process then determining, which could have various negative impacts on recreational usage and the ecosystem in general.

Correspondence: I think it would be a great idea to re-introduce Grizzly Bears to the North Cascades area. I am a hiker and backpacker and I think that as much as we can we should right the wrongs of how humans have impacted our natural and wild areas. These bears used to be there and I think they would be a beneficial part of the ecosystem again. The north cascades in particular are so rugged, remote and wild the seem like the perfect spot for growing a Grizzly population as there would be a minimum of the kinds of human interactions that have come up as grizzly populations grow again in other areas of the US.

Correspondence: No reintroduced grizzlies in WA or OR please. There are plenty of ways to improve the ecosystem in WA that don't involve purposefully introducing people eaters.

Grizzlies are incompatible with outdoor recreation. Solo activities (i.e. hiking, trail running races, etc.) in areas of ID, WY, and MT are already not advised due to grizzlies, and WA is one of the few areas in the US with a somewhat intact wilderness where one can enjoy a hike without worrying too much about being eaten, and perhaps one of the only grizzly-free mountainous areas in the US with an oceanic climate. Like the bears, people need natural habitats and refuge too and in WA they find it.

Introducing grizzlies will put the public at risk and there are no effective mitigations. Spray is no panacea, as the tragic mauling of the backpackers and their dog in Banff National Park illustrates. Recent maulings by grizzly bears in Montana have left members of the public with grievous injuries, even when spray was properly deployed.

Grizzlies are at little risk of extinction. Existing populations of grizzlies in the US and Canada are sufficient to protect the species.

The ecosystem of the North Cascades is fundamentally intact already. There are already apex predators in WA and OR, such as wolves, black bears, wolverines, and mountain lions, to keep prey species in check.

Introducing grizzlies to WA, while cruel to outdoor recreationalists, is also cruel to the potential bears, which will inevitably be tempted to venture into semirural areas along Puget Sound to snack on fruit, etc. These bears will continually be

ethanized.

There are over 300 million people in the US--the frontier has been lost and it's not coming back by adding a couple hundred grizzlies in WA. Please drop the effort.

Correspondence: After reading the North Cascades Ecosystem Grizzly Bear Restoration Plan / Environmental Impact Statement, I had a few questions arise. Looking specifically at Alternative B: Restoration with Existing Endangered Species Act Protections, one area I had a few concerns around was managing the bear populations. Like with all wild animals, you can't ensure that they're going to stay in the protected area their entire lives. They're bound to leave the protected areas at some point, which may subject them to human interference or mortality due to humans (i.e. getting hit by a car). Alternative B discusses bear mortalities, specifically human-caused mortalities and recreation activities, but believes that only 2% of the grizzly population would be lost due to this. How does the plan account for the bear mortalities? Where did this number come from? If this 2% is generated by looking at previous data regarding the number of bears killed per year due to human caused activities, has it taken into account that there is now going to be an increase in bear populations which may cause more frequent bear and human interactions. Also with the increase in bear populations, there is a subsequent increase in human populations, which may mean more cars on the road. Since only 7 grizzly bears are being released yearly, how will the restoration plan account for the bear mortalities if mortality exceeds the projected 2%? Will more bears be released the next year or will they release more bears in the current calendar year? These situations are likely to arise with the restoration of bears into the North Cascades. If the mortality rate exceeds the projected amount, how will it affect the population goal? Will it push it past the projected 60 to 100 years? As bear populations restore, it becomes more likely that humans will encounter bears, which may result in an increased mortality rate. If bear populations are being restored near roads, we may also see an increase in bear and car collisions.

Correspondence: Please do not reintroduce grizzly bears to the North Cascades. As an enthusiast of the outdoors I've spent great amounts of time in the North cascades and enjoy taking my family throughout the Cascades multiple times per year. It is not as remote as it once was, there are more people, which is why there are no longer grizzly bears. It would only introduce

the opportunity for endangering the safety of both bears and people if the bears were to be reintroduced. They are dangerous predators and human engagement would be negative. Please vote NO on this proposal!

Correspondence: Washington state has a ban on hunting cougars and black bears with dogs so their populations have skyrocketed. Now they're intruding on public areas and there have been numerous attacks on people hikers and livestock. Now you want to introduce the Apex predator back into the Cascades. Deer populations have plummeted due to the increase in blackbear and cougar populations then there's another predator. The wolf which is also feeding on deer and other animals as well as presentation on livestock. With the decrease in deer and elk populations, and also the government trying to increase the salmon populations, now is not the time to introduce an Apex predator like the grizzly to the north Cascades. You were just asking for problems when the grizzlies don't have enough fish to feed on or enough other animals to feed on they'll come looking for it and livestock.

Correspondence: This plan seems well thought out, structured, and reasonable. We all want these bears back in their natural habitat, and the ecological benefits that will follow. I strongly support this resolution!

- North Cascades National Park and the surrounding ecosystem have more than enough open space to successfully recover grizzly bears.
- This would be a major step in restoring the species across its historic range.
- Grizzlies provide ecological benefits and will improve the ecosystem's health.
- We're giving grizzlies back their home -- and people want that.
- The public process includes new tools to reduce the potential for conflict with local landowners and communities.

Correspondence: As a Washington resident I strongly support the National Park Services preferred Alternative C: Restoration with Endangered Species Act Section 10(j) Designation.

I understand it is a challenge to restore large carnivores, however, this plan will give people the tools they need to thrive in and around grizzly bear country. Grizzlies belong in the North Cascades, as they enhance the park's ecological integrity and contribute to its wildness.

Please consider the positive ecological and economic benefits and support Alternative C.

We have lost and continue to lose so many species. We have an opportunity to benefit the ecology of the northern Cascades Range, provide economic benefits and restore grizzly bears for our future generations.

Thank you for your dedication to our national parks.

Correspondence: Grizzly bears are an essential component of North American woodland ecosystems. As the perpetrators of decimation, people should restore Grizzlies to Washington's North Cascades and Olympic mountains. Millions of acres of intact, well connected habitat has been vacant of these creatures since the 1860's and it's honestly quite sad. I work in habitat restoration and I often find myself planting trees that will inevitably be mowed down by herbivores within a year or less. Large predator species like Grizzlies have been shown to help plant ecosystem recovery rates by 89%. The work I do is funded by taxpayer's money. If we want to use that money more effectively, Grizzly bears and other predator reintroduction plans are a viable option to achieve that.

Correspondence: Federal law defines the grizzly bear as threatened, (2017) with the exception of within the Greater Yellowstone Ecosystem (2018). Grizzly bears don't stay where you put them and the Federal Government though they possess authority over the National Parks land they do not possess authority over surrounding state land and communities.

Canada is moving forward with their relocation program (very irresponsible) when their deep northern territory is a much better fit for relocation, vice the other side of the boarder. Bears will migrate south, with this being said the below should still be addressed while standing down this initiative in the PNW region.

Safety/ Surrounding Populated Areas:

The number one reason for any EIS to stop dead in its tracks!
The region where this relocation program is planned on average is 50-100 people per square mile, though the major populous blossoms to 700-1100 people per square mile. This is terribly close to metropolitan communities with unlimited opportunity of future and very dangerous interactions/impacts. This in itself is a bell ringer for any EIS for 'environmental impacts to public safety'! Chelan, Okanogan, Skagit and Whatcom counties have a combined approximate population of a three quarter million+ people the neighboring communities west burst with a combined populous of millions of community members. This is as unsafe as it gets, mindset that bears will stay where bears are put in 'remote areas' is unscientific and against the laws of nature.

Washington State law conflicts with the proclaimed federal self-defense policy publicly narrative:

Federal policy wants to reintroduce an apex predator to the 'national forest' areas under their management. (Canada is doing the same.) With the disclosure that under threat of serious harm, self-defense is legal. Per RCW 77.08 and WAC 220-440-060 killing wildlife causing private property damage states federally listed threatened or endangered species will require federal permits or federal authority, in addition to a state permit. Nowhere in the RCW or WAC does the law state self-defense is legal or defensible in preventing public harm or injury. This requires correction for public safety.

Damage Burdens (livestock and property):

Agriculture 'limited Animal Mortality coverage' is a secondary insurance that the agriculture community would at their own

expense be required to obtain as a result of this federal program. This high probability adds additional financial burdens to an already stressed community. Additionally private residence structures are not designed to withstand the level of destruction grizzly bears can impose.

The federal government under this program nationally should implement a federal program to fully indemnify - reimbursement for associated damages of stock animal mortality and structure damage at 100%. This damage if it occurs would be a direct result of a federal program and the negative outcomes/ effects of implementation nationally. The program should include manned hotlines for federal claims, across fiscal year for resolve and quick disbursement - no red tape. However funny and impossible this sounds the sovereign federal agency must make those it negatively impacts whole however big or small. (Exponential damage and loss has been witnessed from the Gray Wolf experiment - bad program too).

To complement the above damage burdens and self-defense laws a policy should be implemented for salvage permits as grizzly bears are on the threatened list and not the endangered. Waste not want not, when they are taken in defense. This should be a standing federal allowance in or out of federal lands with introduction new predators to the local landscape. Save tax payer dollars the associated disposal cost and including this language in an existing act or measure on the docket.

In summary -

I along with many in our region do not see the value in reintroducing an apex predator into to a thriving and growing community where children, families and communities flourish.... For the sake of "Aspiring future generations of bears for legacy purposes" makes minimal no sense - what does this really mean? Legacy purposes... what purpose do grizzly bears provide? This is smoke and mirror big words with no meaning. Our eco systems are balanced by land management practices and where this fails the tribes have first dibs on anything above the norm which is what they were promised in the first place. Bringing back the grizzly population at the proposed math rate of repopulation will forever change the landscape of the PNW. Stop the madness!

Correspondence: I am not at all in favor of this plan. The year is 2023, not 1850, and the state is now populated by humans who enjoy recreating in the north cascades wilderness. Grizzly bears are an apex predator, and one of the few wild animals that see humans as a potential food source. There are many, many records of grizzly bear attacks on humans in areas that are populated by them. In most cases, the person is either mauled or killed. Take for example the poor soldier who was recently killed on a wilderness training mission in Alaska. Or the hunter from Lewis County, WA. who was mauled several years back while hunting in Montana and barely escaped with his life. These animals are an absolute threat to human beings.

I do not believe grizzlies are necessary for a balanced ecosystem. This is an excuse that proponents use repeatedly and without sound merit. Humans have replaced the grizzly in terms of managing deer and elk populations, as well as other animals, and the Washington state department of fish and wildlife does a good job of overseeing this recreation to maintain balanced and healthy animal populations. And, if grizzlies are reintroduced the hunters will see far fewer opportunities to hunt because of the impact of grizzlies on wild game, and hikers and fishermen will see a decline out of fear of these predators.

If grizzlies are reintroduced they absolutely will find their way into populated areas, especially in times of scarce food and/or hard winters. One of the foremost fact-based arguments, historically speaking, for expanding Yellowstone national park is that game do not recognize human boundaries and, likewise, boundaries do not respect the natural migratory patterns of wild game. John Muir himself was one of many who promoted this fact.

If you reintroduce grizzlies, someone will eventually be mauled or killed and eaten by one of these animals, or their offspring. At some point, reintroduction will absolutely come at the price of human life, and it will be on those who just thought they new best for everyone and had to have their way.

Once again, it is not 1850 and the ecosystem, supported by sound human management, has done just fine without the grizzly bear. I implore you to not move forward with this proposal.

Correspondence: To Whom It May Concern,

I am writing to express my opposition to the idea of planting grizzly bears in the North Cascades National Park (NCNP.) I am opposed to the idea of purposely planting grizzlies for the safety and financial reasons as described below.

The introduction of grizzly bears into the NCNP is a massive safety concern for tourists and residents alike. The NCNP and Lake Chelan National Recreation Area (LCNRA) are uniquely isolated areas that will be difficult for rangers in applicable agencies to patrol and manage due to the lack of roads, isolated trails and rugged terrain and I wonder how the public safety and the safety of the bears can be adequately managed. I have personally seen grizzly bears in Yellowstone and Glacier National Parks and with each experience armed NPS rangers were already present or arrived within minutes to monitor the involvement of humans and grizzlies both on the road and on the trail. I cannot see how this type of management will be possible in the NCNP and LCNRA for the reasons described above and I do not see how grizzlies and humans can stay safe without it.

Additionally, applicable agencies will need to spend more money to increase head count to provide the appropriate safety monitoring for both bears and people as previously mentioned. I am concerned that hikers and tourists will stop visiting out of fear of a negative bear encounter and the lack of agency personnel to provide adequate protection. This fear will lead to lack of tourism dollars entering the area which is often providing the livelihood of area residents. As a result, I predict that there will be a very negative financial impact from extra spending and lack of income. Visitors looking for the thrill of a

grizzly sighting are going to head to Montana where they can view bears safely from their cars in large parks with roads and abundant staffing.

I am aware that a grizzly bear entering the park is not outside the realm of possibility but the idea of purposely planting them seems dangerous and expensive to me and I hope that you decide not to proceed forward with the grizzly bear introduction plan for these reasons.

Thank you for your time.

Correspondence: After reviewing the Draft Grizzly Bear Restoration Plan / Environmental Impact Statement for the North Cascades Ecosystem, I would like to express my support for the planning of restoration efforts taking place for grizzlies in Washington. I do however have some questions and comments regarding a few aspects of the draft text.

The first point which I had some concerns about is regarding the 10-J designation option for the grizzlies in the North Cascades ecosystem and the implications of this designation. I'm curious what the protocol would be for any bears who wander out of the natural ecosystems in which they are released and into local towns bordering the North Cascades such as Twisp, Mazama, or other more rural areas. Lethal removal of these bears in such a case under the 10-J designation could undermine the restoration mission at hand by removing individuals from an already vulnerable and threatened population. Are there any alternative approaches to the lethal removal of these bears in an instance like this? What sort of public education efforts are in place for locals in these towns regarding grizzly safety both for themselves and the bears?

Secondly, the ecological interactions mentioned in the report emphasize the role grizzlies play in shaping habitat, stating that "restoring grizzly bears in the NCE would contribute to restoring missing ecological interactions that help to shape fish and wildlife habitat through seed dispersal, increasing nutrient availability, and controlling prey populations." To what extent is the recovery of these interactions needed within the ecosystem today, especially in comparison to when grizzlies last inhabited the area? Are the prey populations currently at levels where they need to be controlled by grizzlies? A more in-

depth assessment of the existing habitat structure and prey population status could help insure that grizzly reintroduction is rooted in ecological science.

Lastly, I have some questions regarding the impact on the wilderness areas designated for grizzly bear release. What are the direct impacts on these primitive areas that grizzlies will be released into? What are the exact "impacts on the qualities of wilderness character" that will occur during releases in order to restore these grizzlies to their natural habitats? Though I can see the ecological value of adding grizzlies to these wilderness areas, I think it is important that the NPS, USFS, and USFWS attempt to preserve the wilderness character and values established within the Wilderness Act.

Correspondence: Grizzly Bears were an apex predator in the North Cascades before settlers came. They kept balance in their ecosystem along with wolves and cougars. When you take an apex predator out of an ecosystem, it is no longer a healthy ecosystem. Grizzlies need to be reintroduce in order to bring back balance. Deer and elk populations will be in better check which will make our forests healthier. They will eat salmon, but not enough to put a dent in our salmon stocks. Grizzlies are an icon of our country and the deserve to be reintroduced into their native range.

Correspondence: There were grizzly bears in the North Cascades a century ago when one took my grandparents collie in Diablo around 1920. They owned the town site and had established a hotel there. Today there are still remnant bears around awe almost hit one that plunged I front of my car near Cascade pass 3 Yeats ago. It was not fully grown, but was a cinnamon coat , leggy and with a bug hump on its back. . It raced across the road and into the headwaters of the cascade river. It was no black bear! Entirely wrong shape. I had known others who have had grizzly encounters , all of whom always said do not let any hunters know, they will just kill them

Correspondence: The DEIS for the Grizzly Bear Recovery Plan proposes three potential plans. The first option, Alternative A is no action. This means that nothing will be done differently than it currently is for grizzly bear recovery. The second option, Alternative B, is managing grizzlies as a threatened species under the Endangered Species Act. This would provide the grizzly bears extensive protections and severely limit how humans interact with bears. The third option, Option C, is managing grizzly bears under Section 10j of the Endangered Species Act. Under this option, the grizzly population being introduced in the North Cascades would be a non-essential, experimental population. While listing grizzlies on the Endangered Species List would provide the most protection and opportunity for population recovery and would help restore native ecosystems, it does have some very crucial limitations. For one, when species are listed on the Endangered Species List, populations can only be restored in native ecosystems in their historical range of variance. This means that even if areas in their historical range of variance are no longer suitable for grizzlies, they have to be restored there regardless of whether that location would be the most beneficial. Additionally, due to the restrictions and regulations outlined in the Endangered Species Act, there are significantly fewer allowed management practices. This can be problematic if there is conflict between a bear and a human or if a bear moves out of the park and is eating livestock as the bear cannot be killed and tranquilizing and transporting a bear is not always an option. Given these notable limitations, Alternative C (management of introduced bears as non-essential, experimental populations) is the best option. While listing grizzlies as a 10j population does not provide quite the same level of protection a full threatened species listing does, the numerous benefits of this option outweigh the potential consequences of less protections. Primarily, an experimental population can be introduced in non-native areas. This means that the grizzlies can be introduced to whichever ecosystem is most conducive to population recovery as opposed to just in locations where they historically existed. Additionally, as humans are the largest cause of grizzly bear mortality, a 10j listing allows for more management strategies that can help reduce human caused bear mortality. The other major benefit of a 10j listing is that the increase in management options can result in humans being more comfortable with the reintroduction of an experimental population, likely more comfortable than they would be with an essential population. This was very successful with wolf reintroduction in Yellowstone and provides hope for the success of grizzly restoration. In deciding which alternative the grizzly restoration will pursue, it is essential that all impacts of each alternative are considered, not just prioritizing the management strategy that provides the bears the most protection.

Correspondence: As a resident of Washington State, I am excited at the prospect of grizzly bears returning to the North Cascades ecosystem. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife. That's why I support restoring grizzly bears to the bears North Cascades via Alternative C: Restoration with Endangered Species Act Section 10(j) Designation - provided that the accompanying 10(J) rule promotes the recovery of the population, ensures management is humane, prioritizes non-lethal management tools and enables humans and grizzly bears to coexist. Properly developed and implemented, the 10(J) rule will help increase human acceptance of grizzly bears as they return to the landscape.

What fun it would be for me to be hiking and camping in the North Cascades and see wildlife like nature intended with grizzly bears and wolves balancing the ecosystem. Once the grizzly bears have returned, perhaps there can be some pamphlets at the Ranger Stations about grizzly bears so people understand them better and enjoy them from a distance and not intrude upon their privacy or habitat.

Correspondence: Unintended consequences always follow when we try and manipulate outcomes for one species. This will be true of the grizzly bear in Washington state. When a forest fire ravages an area we leave it mostly to mother nature to take it's own course for recovery. Some species flourish that didn't before and some that were doing well struggle. Over time a balance is reached.

We should take a 'natural' approach to the grizzly bear in Washington and let them migrate into new areas of the state on their own terms and speed. A gradual approach determined by the grizzlies themselves will optimize their ability to choose territory and thrive. A gradual approach will also help them be accepted by a concerned population.

Please do not mess with mother nature by trying to have man play mother nature.

Correspondence: Grizzlies are beautiful animals that we should protect here in the Cascades, and throughout the state of Washington. While they are predators, that's one of the reasons they are so important to our ecosystems. We should do what we can to protect them and make sure that they continue to fill that role, as well as the many other roles they serve as a keystone member of our local ecosystems. Humans and grizzlies can exist together peacefully and it is our duty to make sure

that we protect and strengthen populations here in Washington. We should do what we can to bring them back to ensure the health of our local ecosystems so that they can be enjoyed for generations to come.

Correspondence: I strongly support the National Park Services preferred Alternative C: Restoration with Endangered Species Act Section 10(j) Designation.

This plan will both effectively restore grizzly bears in North Cascades National Park and give people the tools they need to thrive in and around grizzly bear country. Grizzlies belong in the North Cascades, as they enhance the park's ecological integrity and contribute to its wildness.

I personally spend my tourism dollars to see wildlife. While I loved the North Cascades during an extended camping trip this summer, I was disappointed to not see many animals a pika was ther highlight! Whereas, my visits to Alaska and Yellowstone have yielded many sightings, including grizzlies. Bring back grizzlies to their historic range ASAP.

Alternative C, with the 10(j) rule, provides managers flexibility to address community concerns while protecting the grizzly population. It ensures coexistence between humans and bears.

Please consider the positive ecological and economic benefits and support Alternative C. Restoring grizzly bears will secure the park's natural heritage and conserve an iconic species for current and future generations.

Thank you for your dedication to our national parks.

Correspondence: Thank you for creating this report and for requesting public comment.

As someone who lives near, and frequently recreates in the NCE, I feel opposed to the addition of grizzly bears. The first reason is human/bear interactions. In the last two years in western Washington, we have had at least two black bears become habituated to humans, resulting in the death of one bear. The North Cascades National Park, being in proximity to highly populated western Washington, receives thousands of visitors a year, a portion of which have limited experience in the wilderness. I would be concerned that visitors to these areas, unlike residents of rugged places where the other four zones of rehabilitation are located (Wyoming, Montana, and Idaho), would be unprepared to avoid a bear encounter, leading to increased risk for bears and humans alike.

Second, though the report states historically in the 19th century there were 50,000 grizzly bears, I wasn't clear on what the goal of rehabilitation was for today. Of course, I understand the goal of introducing 200 bears over the course of 60-100 years, but my question is, though I read that the NCE is prime territory for grizzly bears, is it actually necessary to re-introduce them to the area? It seems that the four (of six) zones are successful in maintaining their grizzly populations.

Finally, as I mentioned before that I recreated frequently in the area, the addition of grizzly bears would certainly give me pause when planning camping trips, backpacking trips, and hikes. I practice proper food storage with a bear canister and always carry bear spray, but the knowledge that grizzly bears are in the area would make me nervous.

Thank you again for you time.

Correspondence: As said in the DEIS "Comments included requests for further analysis and review of existing information related to human safety, coexistence with livestock," This is one of the most important points to consider surround the reintroduction of grizzlies in the North Cascades. If there is a non-experimental reintroduction of Grizzlies how will USFW deal with human grizzly conflict, and livestock grizzly conflict? Will the resources needed to manage bears be solidly in place and how will problem beats be handled if they have greater protection than an experimental population. I know this is being considered but its importance is much greater than any previous large predator reintroduction due to its

proximity to a huge metropolitan area. Multiple highways cut straight through the grizzly recovery zone and very few of them have adequate wildlife crossings. Due to bear reproduction being so slow and every member of the population it should be pertinent that everything possible is done to prevent grizzly vehicle collisions. In their current state it does not seem that any of the highways intersecting the recovery zone, what is being done to mitigate this? There is finite number of bears to reintroduce to the north cascades and the loss of a single bear could slow recovery very much. Is the department of transportation working on any projects currently to deal with this? Additionally have any studies been done to look at how highways may affect the spread of grizzlies and how it may fragment their habitat? My final comment is how will grizzly related livestock mortalities be dealt with? It seems there is nothing that can sour a reintroduction quicker than farmers who feel ignored or when their livestock gets killed by a wolf or grizzly. They are the ones who bare a lot of the downsides of reintroductions and there should be a huge focus on ensuring they are happy and effective ways of balancing the needs of farmers and bears are met. What resources does WDFW and USFW have in place to make sure this happens, have effective strategies been employed in places in Idaho and Montana and could they be applicable to the North Cascades?

Correspondence: The re introduction of Grizzly bears to washington state is definitely not a good idea. It would be extremely unsafe with The amount of people that go into the wilderness here. Places like Alaska and Montana. People are prepared for grizzlys. People there know how to deal with them and have grown up around them. And alot of the people that go hiking here are from the city that have probably never seen a bear much less a Grizzly. The trails in the summer are so crowded everywhere here in Washington. Throw some grizzlys and you have a bad situation.

And then there's the salmon. Wich will become a food source for the bears. They are in such critical rebound right now. They are having a hard time and don't need any other obstacles. The southern residents need these fish to survive. Let's focus on the species that are here currently.

I get where people are coming for the reintroduction of Grizzlys, but there is to many cons
There's way better things that we could be putting resources into. We'll that's my two cents.

Correspondence: It is not a good idea to introduce more Grizzly bears to the Cascades in WA. I grew up in Gardiner, MT (North entrance to Yellowstone). We had Grizzly Bears. When I was a child hearing of bear attacks was rare. It happened but was rare. As an adult things have changed. There are now Grizzly bear attacks every year, especially during the hunting season. I have family friends that have been mauled while out hiking. Montana is a large state at 147,040 square miles with 1.1 million people living in it. Washington on the other hand is 71,300 square miles with 7.7 million people living in it. Introducing Grizzly bears to WA makes no sense. You will have encounters between Grizzlies and livestock, pets, and people. Once they are introduced there's no going back. The Grizzlies are already in WA and they will make their way to the Cascades in larger numbers in due time. Let it happen naturally if it's going to happen. You aren't talking about introducing an herbivore to our area, this is a huge, dangerous carnivore. I love Grizzly bears. I loved getting to see them while growing up in MT but introducing them to the Cascades in WA is a foolish idea and clearly the long term effects of such a decision

haven't been thought through. Will it be worth it when a child is mauled and a human life is lost? Because it will only be a matter of time before it happens.

Correspondence: After looking over the restoration plan and EIS to reintroduce Grizzlies to the North Cascades, I believe that the clear best course of action is to undertake Alternative C and make the reintroduced individuals a 10(j) experimental population. To start, these kinds of populations have proven success when it comes to reintroducing megafauna to national parks. The most popular example is with the Yellowstone wolves, who upon reintroduction, were managed as a 10(j) designated population. That population is now extremely stable and successful and a good example of the success that the special designation can bring. It simply allows the management agencies to be flexible in their practices and do what is best for the population. Additionally, it keeps the balance of power in the hands of humans. A significant number of people live in or very close to the recovery zone and they have a right to be wary of grizzly bears. They can be disruptive species, especially if they get comfortable around humans and other more urban elements. Under the 10(j) designation, more can be done to prevent these types of interactions. If they do still occur though, a person can do what needs to be done to protect themselves without the repercussions if the grizzly was classified as a regular endangered species. Although this may not change the minds of some people that oppose reintroduction, this at least ensures some security and flexibility for those people should the reintroduced plan be implemented. Lastly, this is a very unique situation, so if some management practice isn't effective, the 10(j) designation allows for agencies to try other methods. This flexibility is ultimately what will make the plan successful. With all this being said though, Alternative B is still a good option, should Alternative C not work out. Grizzlies lived in the area historically and have major significance to both the ecosystem and the indigenous people of the area. Some grizzlies are better than no grizzlies.

Correspondence: Does the experimental nonessential (10J) option for recovery come with estimates or projections as to how many grizzlies will be lost through nonprotected human contact? If so is there concern that commitment to a

reintroduction effort will result in too many lost bears from the total population, or is the population the bears are moved from large enough for the loss to not matter? While obviously the point of an experimental population is its flexibility, if bear deaths do grow too high, is there any threshold of bear deaths at which the reintroduction would be aborted or the population might be re-designated as essential?

If public comfort level rises to sufficient levels over the course of a 10J recovery, is there a plan to shift the population to being protected under the endangered species act, or is that not considered until the 25 bear population goal of the restoration plan has been completed?

Correspondence: This plan sounds like a lot of trammeling on not only the wilderness but the bears themselves. Who wants to live with a GPS collar around their neck? Does that really count as a wild bear? Do they really behave as they would without a collar? What about the trauma of relocation? We know that sort of trauma is lifelong for humans. Due to the small population, I don't think mortalities from this sort of experiment are worth it. It sounds like a desire to experiment with the environment for curiosities sake, with the benefits being near impossible to achieve considering what is required to artificially move the bears and then monitor them. Perhaps they have not moved further into the NCE for reasons we cannot measure. Perhaps they do not want to be found. This sort of tampering with ecosystems seems equal to that which caused the current state of affairs. There are always unintended consequences.

They were extirpated for reasons. Those reasons will be even more pronounced I imagine due to the higher density of the human population, and the expected increase in population.

It seems irresponsible to move individuals from their home to a place whose future habitability due to climate change is unknown.

Ultimately, as an inholder habiting a permanent residence surrounded by USFS on all sides with two small children relatively close to a proposed relocation zone, I favor action plan A.

Thank you for your stewardship of our national treasures, and for your diligent work on this EIS process.

Correspondence: For the section titled "Consultation and Coordination," this plan discusses some very important factors that went into its design and ongoing plans for Grizzly Bear populations in the PNW. This section talks about its efforts to involve members of the community in voicing their values in what's done with grizzlies. This is very important since where grizzlies will live, especially if it's anywhere near human habitats, should involve the consent and knowledge of the community. In the Environmental Impact Statement, it mostly discusses having an open forum for people to come in, to which it appears that ~200 people showed up. I didn't see mention of any other work to report what's going on to the broader public, so if there's not much being done there then I would encourage some more notification so that it's not only people who are deeply invested in grizzlies to know what's going on.

This section also discusses the consultation of many nearby Tribes, which is also incredibly important. However, it mostly just talks about how some Tribes were contacted and few have responded, but not what any of the results of such consultation were.

Both for the work being done with the Tribes and the community members who left comments at the forums, I think making

more evident what their contributions were would be helpful for people to know, primarily so people can know why participating in such forums can be helpful and what kind of a difference they can make.

Correspondence: I do not support the National Park Services preferred Alternative C: Restoration with Endangered Species Act Section 10(j) Designation.

Wolves were reintroduced in Yellowstone and now they are being slaughtered again. There is a reason that wolves and grizzlies were eliminated from the parks. These reasons still exist so Unfortunately reintroducing them will only result in their death.

Alternative C, with the 10(j) rule, provides managers flexibility to address community concerns while protecting the grizzly population. It ensures coexistence between humans. This is a fallacy - as both the human and bear populations increase, there will be a definite conflict and the bears will be the losers!

Thank you for your dedication to our national parks.

Correspondence: I am not in favor of reintroducing the grizzly bear to N Cascades NP.
My experience living and working in Great Falls, MT leads me to believe it will endanger livestock and people.
With over 2,000 grizzly bears already in North West USA, why is there a need to expand their habitat territory?
From what I've read, local govt. entities and local citizens most impacted by this decision are not in favor of reintroduction. They should be listened to.
Outside NGO's who won't have to deal with the repercussions of reintroduction should not have influence on the decision. If for political reasons, the will of the local people is ignored and the grizzly is reintroduced to the area, money needs to be budgeted for educating locals and tourists to minimize the chance of encounters resulting in harmful outcomes (to people).

Correspondence: As a Washington State resident and longtime visitor to the North Cascades National Park I am fully in favor of the National Park Services preferred Alternative C: Restoration with Endangered Species Act Section 10(j) Designation.

Fifty to one hundred thousand grizzly bears ranged throughout the America's West in the early 19th century. I believe it is time to finally have a plan such as Alternative C to restore grizzly bears this small, but wild area of the North Cascades National Park in Washington State The plan also prepares people to coexist with these bears. Grizzlies were a thriving and important part of the western ecosystem for thousands of years coexisting with indigineous peoples. With the proper tools and education contemporary populations of people can also do the same. It will benefit the economy while bringing back a missing piece of the historical wildlife in the region.

I hope you consider the positive impact of Alternative C for people, nature, the region's economy and the magnificent grizzlies who belong in a wilderness like the North Cascades National Park!

Thank you!

Correspondence: Please do not let the fearmongering stop the reintroduction of a native animal to our mountains. For a healthy ecosystem, it is always best to have all the animals - including the apex predators. Please continue to work toward allowing the reintroduction of the grizzly bear to the North Cascades. Keep the Cascades wild! Thank you.

Correspondence: Hello,

I am writing to support the restoration of a healthy population of grizzly bears to the North Cascades, their home for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations.

I support Alternative C: Restoration with Section 10(j) Designation. Alternative C is the best choice for bears and the people who live in and visit the North Cascades Ecosystem. The plan is wisely modeled on what's worked in Montana where grizzlies are recovering in the Cabinet-Yaak mountains with few problems and with the acceptance and involvement of local communities.

Furthermore, the 10(j) rule will give people more management tools to reduce, prevent, and respond to human-bear conflict. I believe that the 10(j) rule if properly implemented, will help increase human acceptance of grizzly bears as they return to the landscape.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please bring back this native species to our state through the strategy laid out in Alternative C. Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

The North Cascades Grizzly Bear Recovery Zone (NCGBRZ) is the second largest of six such designated areas at nearly 10,000 square miles. Combined with contiguous protected areas in British Columbia, including Manning Park, there are

14,000 square miles of productive, wild habitats, wilderness, and roadless areas.

People and grizzly bears can coexist and thrive. They do so in British Columbia, Montana, and Wyoming where grizzly populations and back and front country recreation continue to grow hand in hand, providing a vital economic boost to those areas' gateway communities. Grizzly bears lived in Washington for thousands of years. We still have a small population in the NE WA Selkirk Mountains. However, currently, there are no grizzly populations in the United States or Canada that are large enough or close enough to serve as a source to naturally repopulate the North Cascades. Having wiped out the grizzly bear over the past 150 years we now have the unique opportunity and the ethical obligation to restore them to their native home, where suitable habitats still exist.

Grizzly bears are ecologically and culturally significant and are vital to the overall health of the North Cascades ecosystem and its biodiversity. They are considered an indicator of ecosystem health.

Restoring grizzly bears as an "Experimental, non-essential" population under a well-crafted Section 10(j) rule of the Endangered Species Act makes sense. Such a designation will provide flexibility for wildlife managers to prevent and address human-bear conflict and a greater level of comfort for people who are concerned about the impacts of wildlife recovery on economic and recreation activities. Agencies have used the Section 10(j) Rule in the past to restore black-footed ferrets, California condors, wood bison, and many others.

Thank you and I hope to see Washington reintroduce more wildlife that has historically always been here and should still be thriving here. Washington is supposed to be wild, and let's keep it wild.

Correspondence: I do not believe grizzly bears should be reintroduced to the North Cascades. It will reduce outdoor recreation opportunities for people who are afraid to be in the wilderness with these large animals. These mountains are one of the few truly wild glaciated areas in the region without grizzlies. It is important to remain inclusive and provide an area for hikers, climbers, and mountaineers to roam without having to worry about these animals. Implementing this proposal will likely reduce the diversity of people that are willing to go to these mountains.

Correspondence: I am highly involved with recreation in the north cascades, including mountaineering and horse packing. Although it would have a negative impact on my recreation, I think that restoring grizzly bears to the ecosystem is a great idea, especially since climate change is reducing habitat, and we need to do as much as possible to let species and ecosystems have a chance at surviving the anthropogenic era. The north cascades is one of the best spots in the entire US and we shouldn't be thinking selfishly just about ourselves, individualistically, but also the biosphere and each ecosystem as a whole. Without grizzly bears here, it is like the body trying to function without one of its organs.

Correspondence: While I value a diverse ecosystem, I do not support the reintroduction of another improperly or unmanaged large carnivore to the state of Washington. I realize that bears are technically omnivores, but I am not concerned

with the effects of bears eating plants. I am, however, very concerned that these efficient new predators eating meat will result in a further erosion to the prey base we all share. The leadership, planning and management of wolves is a pretty good indicator of how bears will be handled. This is unacceptable at all levels. The end result will be a declining prey base with more demand. Members of the WA Wildlife Commission are reportedly considering further reductions or the total elimination of predator hunting. This move will allow predator levels to rise to the point the natural prey base is decimated forcing predators to seek new food sources. This results in a huge swing of predators/prey populations, in a push of predators into new sources of prey and likely the future ban on all hunting in WA. If Grizzly Bears repatriate naturally, the ecosystem will adapt. Forced introduction will have the same results the introduction of wolves has had in many areas.

Correspondence: I live in Whatcom County and have hiked the North Cascades nearly everyday for the last 6 years. With my particular use case, I don't feel much danger from eventually running into a Grizzly Bear. I hike slowly. I have a dog who will alert me of potential predators. I have a can of bear spray that I take care of; I store it inside when not in use, so the propellant can't escape with extreme temperature and I replace it every year. I think about these encounters, so I know what to do in case they happen. My wife follows a Whatcom County Wildlife Photos group that reminds me how many Cougars are in our forest, which helps keep my guard up. I think I would be fine.

In my hikes these past 6 years, I have passed thousands of other hikers. My guess to the number of them who seemed prepared like me, I could count on two hands. The VAST majority of hikers don't think about these things. They are mothers with their kids who go there to enjoy nature. They are teenagers on their mountain bikes. They are joggers with earbuds in. Unless somebody has bear spray where I can see it, it would not do much good for them; and I have not seen nearly anyone with bear spray. The reality is that the people who use the North Cascades aren't thinking about these things. And whether or not you think they should, they don't.

I watched the movie The Revenant where Leonardo DiCaprio's character suffered a Grizzly Bear attack and I researched to determine whether that was an accurate characterization. My impression is it was. Unlike other predators who kill their prey

quickly, the Grizzly Bear does not. They hold you down with their massive weight and strength. They don't worry about putting you out of your misery, since there is no possible escape and they don't care about your suffering. So they just calmly snack on you while you are suffering immense agony. Do you think a family member wouldn't research this reality if one of their loved ones were killed by a Grizzly Bear?

Grizzly Bears eat meat. You don't know how well the North Cascades will support them. You say that in the past Grizzly Bears thrived here, but things have changed. With climate change, the mountains will likely be drier, forcing the bears closer to people. Salmon runs aren't what they used to be. Deforestation I imagine would have an affect on their food supply.

I am against reintroducing Grizzly Bears into the North Cascades.

Correspondence: Reintroducing grizzlies back into the North Cascades is the best thing I've heard out of modern conservation efforts to date. There are countless studies and surveys that prove the positive ecological impact of having this species in its natural habitat, and anyone who hikes in the area should be practicing bear and animal safety ALREADY! Bringing back the grizzlies does not pose a substantial threat to the population, and should only improve the conditions we already enjoy up north.

Correspondence: Alternative C, as written, appears to be the strongest option as it gives you additional tools to manage the population but doesn't place any additional mandates or restrictions.

My primary question is: While this plan is good for the species (Grizzly Bears), is it good for the rest of North Cascades ecosystem? If it's been 30 years since the last confirmed Grizzly bear, have we started to see problems (such as deer abundance which is one of the reasons for wolf introduction). From the Affected Environment; Mammals section, it reads like you're expecting this reintroduction will put stress on already struggling populations.

Correspondence: As someone who is very active in the outdoors, along with my family, I believe the reintroduction of grizzlies into the North Cascades is a bad idea. It unnecessarily increases risk for hikers, backpackers, campers, cyclists, horseback riders, and hunters alike who frequently recreate in the North Cascades. Whether it is warranted or not, it significantly increases worry for many who get out into the wilderness of the park, and may lead to many people largely avoiding the park. Decreased numbers of tourists and recreationalists will decrease income in the local economies, which rely on these people coming to visit and use the North Cascades.

In addition to the impact on human visitors, I believe that the environmental impact on the North Cascades ecosystem will be negative as well. The wildlife population in the North Cascades already has to deal with predators such as wolves and cougars, along with the dangers created by forest fires every summer, and does not need one more challenge to survival.

I strongly encourage you to pause and reconsider next steps with this plan and the negative impacts it may have, which I believe outweigh the potential benefits to the grizzly population.

Correspondence: I support returning grizzly bears to the North Cascades. I think the bears should be protected over the interests of any industrial purpose (including ranching, livestock, etc). This part of Washington is not a major producer of beef. (in fact Washington ranks very low in overall US beef production, 31st out of 50). Settlers and homesteaders have had

to protect their interests against natural threats since they started using the land, the introduction of grizzly bears would be no different. There should be a ban on hunting the bears until they have established a healthy population. I'm not allowed to shoot hawks or eagles that fly over my property, It should be the same with bears - unless a human life is at risk.

Correspondence: Hello,

I am writing in support of the plan to reintroduce grizzlies to the North Cascades under Alternative C.

Grizzly bears have historically been a part of this ecosystem, linked with the area's other species through millennia of co-evolution. The North Cascades are a big and diverse region, with enough space to support grizzlies and black bears, elk and deer, and human visitors as well.

With decades of experience and lessons learned from management of the Yellowstone ecosystem's grizzly population, wildlife management professionals should have the tools and expertise to successfully manage a grizzly population back to healthy levels in the North Cascades.

I trust the scientists at US Fish & Wildlife, the National Park Service, and the Washington Department of Fish and Wildlife to find the right balance between wildlife, agriculture and human safety in the North Cascades. This ecosystem will be healthier as a whole with all of its historic residents in place, including grizzly bears.

Thank you.

Correspondence: I have lived in the Methow Valley for 20 years, worked as a teacher and a farmer and am raising my family in the Methow Valley, adjacent to some of the wilderness where bears should be reintroduced. I wish to express my willingness to coexist with native wildlife, and that includes grizzly bears. I fully support Alternative C of the draft EIS, to reintroduce grizzly bears with a 10(j) rule.

Grizzly bears have been in this ecosystem for over 20,000 years, and their current dwindling numbers mean they need our help. While there are documented grizzlies to the north in BC, there are currently significant gaps in wildlife corridors that make it difficult for grizzlies to freely move north and south. Because of this geographic isolation, natural recovery is not possible, and unless we supplement the local population, we risk losing these bears in the North Cascades Ecosystem forever.

Science shows that the North Cascades are excellent habitat for grizzly bears: 75-85% of their diets are vegetation-based, and of the 124 plant species that grizzlies have been shown to consume, the North Cascades are home to 100. Spanning nearly 10,000 square miles, the North Cascades Ecosystem is one of the only wild places left in the lower 48 where grizzly bear reintroduction could be viable.

Concerns around how humans can live with grizzlies are valid and important to consider, and states like Montana and Alaska have proven that with straightforward 'Bear Aware' precautions, recreationalists, hunters, and ranchers can coexist with grizzlies, just as we do with other native wildlife. Option C of the DEIS strikes the right balance between the needs of grizzly bears and the needs and values of local communities.

Throughout the 6 year period of public comment, nearly 80% of the comments received have been supportive of grizzly recovery, and these have included many individuals from both sides of the Cascades, those living in communities closest to the proposed area of reintroduction like myself. I wish to make room for bears.

Sincerely,
██████████

Correspondence: Dear NPS and USFWS staff,

So many issues are close to my heart - the state of an imminent water emergency we'll be facing certainly in the western United States, the loss of most of our Old Growth forests, the loss of much biodiversity and habitat and lack of 'greenways' for those plants and animals that have managed to 'hang on' and somehow manage to find a way to exist (certainly not thrive); the horrific travesty befalling our wild mustangs at the hands of the BLM; the current struggle of wolves trying to reestablish some of their historical territory - as evidenced in the recent gratuitous slaughter of over 200 in Wisconsin; the ever present danger to the cougars and coyotes being killed for sport; the wolverine's loss of needed snow range unpopulated, wild habitat to reproduce and survive being threatened by outdoor enthusiasts as well as climate change; and the Grizzly Bears (to name a few!).

I am not an 'expert' in any of these issues, but am a concerned citizen who both loves the outdoors, and has chosen to live in the Methow Valley where the beauty of the outdoors and nature are abundant and accessible. But even here we face constant pressures from industry expanding land sales and building, extractive practices, increased use by hunters, logging, heliskiing, snowmobiling and the like.

I would love you to help in any/all of the areas you and your team can so that we may start to turn things around and support Mother Nature in doing what only she can do.

I would especially love you to help us to reintroduce the Grizzly back into its historical territory here in the Northwest and that is why I support Alternative C of the draft EIS. As I believe (much like what we witnessed when wolves were reintroduced back into the Yellowstone ecosystem) our ecosystems will more easily be able to find 'balance' when grizzlies are here.

I thank you for your service and your dedication.

Correspondence: Please consider the following comments:

North Cascade grizzlies must have the same protection under the Endangered Species Act that all populations have. It is unacceptable for the U.S. Fish & Wildlife Service to issue a special rule for "a nonessential experimental population."

The final Restoration Plan should account for the positive effects grizzly bear reintroduction will have on wildlife in the North Cascades, maximizing their beneficial role in improving the ecological diversity necessary for a thriving ecosystem.

The National Park Service should craft the final Restoration Plan to account for the role humans play in minimizing human-grizzly bear interactions. While people are encouraged to enjoy recreational activities in and around the vast, sparsely populated North Cascades, the final Restoration Plan should prohibit hunting and encourage people to use non-lethal means to respond to and to deescalate any human-bear interactions.

The National Park Service should prioritize protections for grizzly bears over livestock grazing. Provisions to accommodate "management" of grizzly bears for the benefit of the livestock industry are not necessary.

Thank you for considering these comments.

Correspondence: Dear NPS and USFWS staff,

I am writing to express my full support for the reintroduction of grizzly bears to the North Cascade mountains of Washington State and Alternative C of the draft EIS. This wild area of our state historically supported a healthy population of grizzly bears, whose population was decimated by human activity, including over-harvesting and "predator removal" actions.

I have lived in the Methow Valley, in the foothills of the North Cascades, for almost 50 years. I have enjoyed hiking, backpacking, snowshoeing and skiing in these mountains throughout those years, with my family and now with friends or solo. I have also spent a good deal of time hiking and hunting in Alaska and Montana in grizzly habitats.

We who choose to reside on the edge of our country's remote areas, must accept that we are in the home of a myriad of wildlife species, including other predators such as cougar, lynx and wolf. We learn to be bear and cat observant and to easily modify our styles and activities to accommodate these native species. We accept the modicum of danger their presence may impart, as we do the danger of snowstorms and (unfortunately) wildfires, in return for the many benefits.

Others will and have expressed the scientific and biological importance of grizzlies to our wild areas, and I concur in those sentiments. I want to emphasize that as a long time resident and frequent outdoor recreationalist, I support the reintroduction of grizzlies to my "front yard" in the North Cascades.

Thank you!
Sincerely,

Correspondence: Please help our grizzlies from extinction---they need our help! Grizzly bears roaming the wildest parts of the North Cascades in Washington State could once again create a thriving, balanced ecosystem. As a keystone species, they spread seeds, aerate the soil, recycle nutrients and keep other wildlife populations in balance.

Correspondence: I fully support the reintroduction of Grizzly Bears back to their native habitat the North Cascades. They should receive FULL Endangered Species Protection and not treated like an experiment. They should be reintroduced and left alone as much as possible, and protected from ignorant livestock owners and humans who would harm or kill them. They are a Keystone Species and a missing link to a balanced ecosystem. Please return them to their native home The North Cascades.
Thank you

Correspondence: Thank you for soliciting public feedback in the Grizzly reintroduction effort.

I would like to express my support for Alternative A - No Action.

I am an avid hunter, backpacker, and [REDACTED] Tribal member. I enjoy all that nature has to offer. I do enjoy knowing that there are cougars, black bears and wolves in many of the areas that I frequent. The grizzly is a very different animal from a human conflict perspective. I think it was best described to me by an old Alaskan friend who said "1/20 Grizzly want to kill you, for reasons we'll never completely understand". I'm not afraid of cougars, wolves or black bears and the data we see supports that they are virtually zero risk to humans. Grizzly are different. We currently have incidents EVERY SINGLE YEAR with humans and grizzly bears. Usually with maulings that require significant reconstructive surgery in the least or death in the worst. This is with bear spray, handguns and bells. So commonly, in other political venues, we say "if only one life is saved it will have been worth it". I can tell you that by choosing to reintroduce the Grizzly to Western WA, AT LEAST one life will be impacted in a negative way. Is that worth it to your panel? I suspect that a great deal more than at least one will be impacted over time.

The population of Western WA has grown significantly. I have a strong suspicion that the majority of supporters have never spent a night in North Cascades National Park. I have a stronger suspicion that many have not considered the changes that may eventually be required in their backpacking setup to ensure a safe night sleep when visiting the park. Additionally, the bears do not know where the park boundaries are, they will travel down to the suburban areas that have spread rapidly in the last 20 years and are ill equipped to handle Grizzly interactions. There will be livestock depredations, human interactions, and changes to common north cascade visitation norms that I believe will surprise (and not delight) the visiting population.

My last support for Alternative A is to suggest that nothing prevents Grizzlies from migrating naturally across the border from BC today. If the environment was suitable and fertile, they'd already be there. Their lack of natural migration suggests that this is no longer preferred habitat. Maybe we should take a hint from nature, rather than ramming down the throats of a place that has lived without them for so long.

Thanks,
[REDACTED]

Correspondence: Dear Mr. Striker:

I am writing in favor of grizzly bear restoration in the North Cascades. As a hiker, hunter and angler I want to share the wilderness with bears, and enjoy a more intact ecosystem.

These magnificent bears were native to the area and were extirpated by hunters. The data show that natural migration of bears from Canada is unlikely to result in sustainable populations. Reintroduction is the only way to recover the species in the North Cascades.

I also believe that humans who use the backcountry need to adapt to the animals, not the reverse. This includes cattlemen who use public land for grazing.

Thank you.

Correspondence: Greetings Superintendent Striker,
I live at the end of the road above the Methow Valley in Okanogan County, in a small homestead I began some 22 years ago. I made my home here, founded a small production studio in Twisp and I have traveled widely. Yet, ultimately I'm aware that I came here and have stayed here because of the Bears.

Thus I write so you'll know that I, and many of my friends and neighbors, would prefer to see grizzly bears reintroduced to the North Cascades ecosystem - which is their rightful home.

Indeed this is more than a preference. At least for myself I consider this an expectation if we have any hope of developing a meaningful reconciliation between ourselves and this landscape - which modern people have harmed so thoroughly. The systematic harm done to this landscape is rarely seen more clearly than in our historic and ongoing persecution of grizzly bears.

Back in my 20's my life was transformed from a frail urban youth to an adventurer and outdoor educator who traveled widely throughout the intermountain West in search of bears.

My studies in anthropology and human ecology at the Evergreen State College helped me recognize that ancestral humans world-wide had a long standing relationship and appreciation of bears; being omnivores like ourselves and important animal teachers in the landscape. And yet, in the modern era we have invaded their homes and

challenged their very existence in limiting the vastness of their historic range. Traveling through, visiting with, and even living in landscapes with large wild animals requires people to pay more attention - to themselves, their surroundings, the very nature of living. People must cultivate an awareness that something "bigger" is out there and this informs our humility and humanity. Without such teachers on the land, we are left to our own hubris,

rumination and inflation.

There are many people who are going to write and tell you that grizzlies should be reintroduced to the North Cascades because it is their home; because it is economically savvy for tourism; because it is scientifically sound ecologically; because it is the right thing to do emotionally. I agree with them.

But, I write so you'll hear this too: reintroducing grizzlies to the North Cascades is a critical step as humans must acknowledge what we've done on the landscape as colonists, settlers, and ultimately, invaders. We must take this opportunity to show that we can learn and make reparations, and so that our young and old people alike will have someplace to walk where they're not the most powerful creature out there.

In so many ways we're at a crossroads. We can either continue to harm wildlife and wilderness, or we can change our trajectory and try to put some things right... both ecologically for other species and for ourselves.

I don't envy the agencies as you negotiate these types of challenges with the "stakeholders" or people with such varied interests, expectations and heartfelt opinions. Still, I do encourage you to think of future generations who can either have the opportunity to be humbled and inspired by their experience of large and formidable animals out on the landscape, or, never have such experiences at all.

We wouldn't be the complex capable creatures that we are if our ancestors had not lived with and learned from bears. We deserve the right for these enriching encounters as well, as do our children's children. Without them, it's everywhere just a walk through a pretty field with little to make us more than ourselves.

Thank you for your time and attention and best wishes with your challenging decisions ahead.

Correspondence: I strongly support the re introduction of Grizzly bears to the state of Washington. This is an excellent use of tax payer dollars. Bears improve the environment.

I would caution that views that oppose bear introduction are uninformed or have a special financial interest.

The best thing for Washington State and it's residents is bringing back the grizzly bears.

I would add that I strongly believe bringing back the bears will be good for Washington State and US as a whole.

This is the government working for the people.

Correspondence: I am writing to address several concerns the Back Country Horsemen of Washington (BCHW) have with the proposal to relocate Grizzly Bears to the N.C.E.

The mission of BCHW is specifically concerned with keeping trails and trailhead roads open and accessible. This includes trail maintenance work on Washington State trails.

Proposed alternatives B and C do not provide any protection for recreation. A meaningful impact study of those management options on recreation has not been included in the DEIS. Without better alternatives BCHW will accept only Alternative A: No Action. We would like to see more reasonable options and better planning for the protection of recreational activity in the planned Recovery Area.

An additional concern is the mention of the concept of Wilderness Permits in the backcountry and Pasayten Wilderness to control the number of people in an area for recreational activities. This includes stock users and packers. The DEIS planners also need to realize that both the Pacific Northwest Trail, a National Scenic Trail, and the north end of the Pacific Crest Trail cut across the NCE area.

It seems likely that, if the 10(j) rule is implemented, additional prohibitions and regulations may be established to enable agencies to deal with bears that travel into areas outside of core habitat and cause conflict. BCHW is concerned that the 10(j) rule could be used to restrict, regulate, and/or close access over a longer term if agencies perceive a threat to recovery of Grizzly Bears.

Washington State law RCW.77.12.35 specifically states: "Grizzly Bears shall not be transplanted or introduced into the State". This law has not been changed. This law also affects federal agencies, contrary to their opinion.

In addition, the following comments are my own opinion as a resident of the Methow Valley.

Proponents, in their rush to relocate Grizzly Bears in the NCE, neglect the seriousness of human/bear conflicts. Washington State's population is greater than the combined populations of Idaho, Wyoming and Montana, the states where grizzly bears are currently located in continental U.S. This larger population will lead to a greater likelihood of conflict: destruction of property, maulings and deaths of our citizens. There is a real safety risk to recreational activity and to residents in surrounding areas. It is a frequently repeated fallacy that resident bears exist now in the Pasayten Wilderness and are the most endangered population there.

The theory that habitat will increase in the NCE over the next 50 years due to climate change will be offset by increases in large fires. Fire and destruction of habitat will cause bears to wander to the edges of the NCE increasing the likelihood of human/bear conflict.

Correspondence: The plan to transplant these apex predators into the Northern Cascades is unwise and contrary to the North American Wildlife Conservation Model. Grizzlies haven't been hunted in several decades and there are grizzly bears to the north in BC. Why haven't they repopulated on their own with no hunting pressure? Because the habitat will no longer support them. Your proposal not only endangers the animals you seek to "protect", but prioritizes these predators over other wildlife AND human beings in the area. If there were a void, nature would fill it. Stop playing God and return to practicing sound scientific wildlife management. Do not transplant grizzlies into the Northern Cascades.

Correspondence: Dear National Park Service Staff,

I am alarmed to hear of this plan to reintroduce grizzly bears into Washington. I understand some people have a desire to see grizzlies restored to an area that was once their habitat and that these people insist they will be able to manage these bears. It is unrealistic to think that anyone can completely control these bears and prevent tragedies from occurring. Grizzlies are wild animals and even with tracking devices, it is impossible to fully prevent every possible outcome from occurring between bears and people or livestock. My husband and I recently visited Montana and Wyoming where grizzlies are prevalent. The people there live with a high level of caution and always have to be aware of a potential bear encounter. Everyone carries bear spray or guns. They have to keep their trash cans and food in bear proof containers. The list of items I read to keep locked up was mind blowing to me because the average person would not think bears would be attracted to these things. A few items listed are: sunscreen, toothpaste and baby diapers. The pamphlets warned that these items will attract bears just as food will. Most people would be shocked to know this. This poses major problems for people who have never lived in "bear country." The entire public who lives in or near the Northern Cascades would have to be educated in these safety protocols. This could dramatically impact the way they live their everyday lives and put them on constant high alert, causing extreme amounts of stress and fear for some. Washington is also a state where so many people love to hike... there will be grizzly to human encounters and some of them will be fatal. It is impossible to control these bears... they have a mind of their own and can be unpredictable. Just this year, a woman who was on a hiking path in Yellowstone was mauled to death by a grizzly. In Canada, a couple and their dog were all mauled to death by a grizzly even though they had deployed an entire can of bear spray. If you reintroduce grizzlies into Washington, we will soon hear of these stories happening here... but perhaps happening to your neighbor, friend or family member. It's important to take care of animals, but not at the expense of human life. Please reconsider your decision to reintroduce grizzlies. If people want a bear encounter, they know which states to visit. The potential benefits are not worth the risks when you're dealing with people's lives. Thank you for reading and considering my comment and concerns. Sincerely, Brittney Jackson

Correspondence: In regard to the reintroduction of Grizzly bears alternative A is in my opinion the only option. No where in the EIS is there a discussion on how bear reintroduction will affect recreation. I spend at a minimum of three weeks in the mountains where the proposed reintroduction will occur. While I am not worried about a bear encounter I want to make sure that I can still ride my horse in the Cascades. At this point there is no way to know if I will be able to access the area.

Correspondence: No-action alternative A

It is critically important that the public understands that the two action plans of this EIS will result in a contract that federal agencies in WA D.C. will be required to enforce on public lands - whether federal, state, or county, but also on your private properties. Make no mistake in understanding the extent of the Agency's reach. The Park Service, the U.S. Fish & Wildlife Service as well as WDFW are all promoting for the occupation of grizzly bears not just onto federal lands, but onto state public lands and into our communities.

Page 60 of the EIS, cites a report from Northern Continental Divide Ecosystem that states "Approximately 90% of the recovery zone is in federal, Tribal, or state ownership, with only 10% on private lands." The report goes on to say, "However, the majority of human-grizzly bear conflicts and bear mortality occur on private lands, especially as grizzly bears expand their ranges" Again, it is documented, "the majority of human-grizzly bear conflicts and bear mortality occur on private lands". So read the contract.

So, what kind of "human-grizzly bear conflicts" are the agencies not willing to disclose either in the EIS, or in your public meetings? I'll read just a small sampling of these conflicts, but first here is the National Park Service Management Policy language concerning their conduct and decision making -

National Park Service written policy states, "The safety and health of employees, contractors, volunteers, and the public are core Service values. In making decisions on matters concerning employee safety and health, NPS managers must exercise good judgment and discretion and, above all, keep in mind that the safeguarding of human life must not be compromised." Their policy goes on to say "The species does not, based on an effective management plan, pose a serious threat to the safety of people in parks, park resources, or persons or property within or outside park boundaries."

So here is a small sampling on conflicts, most of which have occurred in a 4-month period this year 2023 -

- WOMAN was camping IN CITY LIMITS, ripped from her tent, killed by a grizzly bear.
- Grizzly bear and cub euthanized after months of breaking into homes.
- Navy veteran had jaw torn off in horrifying grizzly attack (he was ambushed).
- Grizzly killed hiker, then it broke into a home.
- Grizzly charges fishermen in Montana before being killed.
- Grizzly bear mauls Montana hunter.
- Woman found dead in Montana following grizzly bear encounter.
- Grizzly attack on 2 boys
- 14 grizzlies euthanized, double the 10-year average, (that was in a single year, 2019)

And if you believe that bear spray will save you, know this - empty bear spray canisters have been found next to the dead bodies of those killed by grizzlies. Grizzly proponents will say the remedy is public education. Yet attacks resulting in death or injury also occur against individuals expertly trained in how to protect themselves against grizzlies.

So what are the consequences of these deaths & injuries, cleverly referred to by the government as simply "conflicts"? According to either of the "Action Plans" when human/grizzly conflicts occur in the Park or in our communities, history has shown that very little occurs other than renewed efforts by the Agencies to "educate the public" on the dangers of grizzlies. There is no "pause button" or intervention in either Action Plan. When a grizzly is found to have "substantially injured a human" or killed a hiker, a biker, a camper, or, become food conditioned, killed cattle, or starved to death, both action plans call for Immediate replacement of the offending grizzlies, on a one-for-one basis. But that loss of a human or livestock has to happen first, then a replacement grizzly is inserted right back into the recovery zone. In feet, County Commissioners from both Chelan and Okanogan asked the same question that I just posed - What happens when the Agency's system is shown to be broken and public safety is taking a back seat to continued grizzly attacks? The federal government declined to answer the

question from either of the Commissioners, because there is no Exit Plan. In fact, there are no caps or limits in either duration or the number of incidences of attacks or conflicts that would occur, either in our communities or in the Park. There is no offramp, no threshold point in this contract that would dictate a pause, an intervention, or reconsideration of continued insertions of grizzlies into the foothills bordering our communities. Once this starts, it does not end regardless of the threat to public safety. So read the contract.

If you think there is due process for affected states to request relief through an appeal that would delist the grizzly, and that process is honored by the federal agencies, you are mistaken. Three recent cases make this point - Montana, Wyoming, and Idaho have all filed formal petitions over the last 2 years for delisting the grizzly. And despite viable populations of grizzlies in all three of these states, U.S. Fish and Wildlife Service has ignored these requests, and they remain ignored today.

Even the previous Director of U.S. Fish and Wildlife Services stated before Congress that the grizzly is biologically recovered. He said this based on the thousands of grizzlies in Montana, Wyoming, Idaho, and Canada. In fact there are so many grizzlies inside and outside recovery zones that the government is killing them due to the government's overreaching management policies.

Finally let me say "Intentional omission of relevant information in any Environmental Impact Statement is the same as lying to the public. As a result of their failed grizzly management programs the leadership within the federal government and state agencies understands full well the tragic human sacrifices are ongoing in communities located near other recovery zones. If these agencies prevail with these reckless grizzly management plans inside WA state, they would have done so by lying to the public and cheating the system.

Correspondence: I have had an opportunity to read both documents. I find the opportunity to re-introduce a major/top predator to eth ecosystem to be valuable to both the plants + animals of the ecosystem. The NCE has adequate space and food resources for the introduced bears now and apparently, in the future despite climate change. Recreationalists, and people using public lands for grazing livestock will need to exercise additional precautions which will enhance the experience.

People in Montana, Wyoming, and Alaska have all learned to exercise the additional awareness which comes with living with large carnivores. The 10(j) rule may be useful and I support its inclusion if wildlife biologists recommend it.

I comprehend the risks of large carnivores in the ecosystem and I judge the benefits to the ecosystem outweigh the risk to possible prey, be they human on livestock. We have wolves on the landscape presently and have learned albeit with difficulty, to exercise caution and awareness when in shared territory.

I spend much time in the NCE observing the natural world and I am willing to exercise necessary precautions to co-exist.

Correspondence: The following comments are my own but also represents the opinion of the 285 members of the Richland Rodd and Gun Club.

If the North Cascades were a good grizzly bear habitat, the bears would already be there from Canada, Idaho, or western Montana. There is a serious overpopulation of grizzly bears in north central Montana, so a potential solution for the USDFW is to move a portion of that overpopulation to the state of Washington. That way they can claim they responded to two groups and solved two problems with no loss of total grizzly bear numbers. However, they fail to take into account that they are creating a new problem in Washington and really doing nothing to solve the problem with too many bears in north central Montana.

The North Cascades is slowly being populated with wolves as they move from north eastern Washington. They have destroyed the deer and elk populations in north eastern Washington, northern Idaho and parts of Montana and Wyoming. The addition of grizzly bears as another predator spells disaster for the wildlife and ranchers in the area as well as all residents who have domestic animals.

It appears to me that there are too many urban people who think wild animals are no different than domesticated animals and its okay to have them everywhere so they can go see and admire them. I use the problems with people in Yellowstone Park who have gotten to close to wild animals and have suffered serious injuries. They are not cognizant of the perils of interacting with wild animals.

Please be responsible and stop introducing grizzly bears into the North Cascades before it becomes a disaster.

Correspondence: Hello,

I support the Grizzly Bear Restoration plan. I believe the bears are a natural part of the health of the ecosystem of the North Cascades and should be reintroduced for the long term good of everyone. People who want to live and recreate in and near mountain and forestland will be able to exist with bears side by side. If we keep the forest healthy the bears will have plenty of habitat to sustain them. It is natural that both bears and people have a good fear of one another to head off any encounters. It is not ethical or reasonable to exterminate all of the creatures people "fear" or find a nuisance just to satisfy a hiker or livestock owner. We all must coexist to survive on this planet over the long term. The goal should be to live in agreement with nature, not dominate it foolishly and to our own detriment.

Thank you,

██████████

Correspondence: I am writing in support of the restoration of a health population of grizzly bears to the North Cascades Ecosystem. As stated in the scoping newsletter, the low population size combined with low reproductive rate of NCE grizzly bears suggest that this population will be unlikely to recover without active restoration. I feel we have an imperative to ensure that this iconic species remains a part of the biodiversity of the North Cascades Ecosystem. As a large member of the carnivore family, grizzly bears play a key role in the functioning of these montane ecosystems. Personally, when I recreate in mountain ecosystems that grizzly bears still inhabit, I feel more aware of my surroundings and thus more connected with nature.

I support Alternative C: Restoration with Section 10(j) Designation. I feel that Alternative C is the best choice for bears and for people who live in and visit the North Cascades Ecosystem. The plan is modeled on what's worked in Montana where grizzlies are recovering with few problems and with the involvement of local communities. My sense is that the process as a whole might have better chance of being accepted by all stakeholders if the population were considered an experimental population. In addition, with possible grizzly bear recovery actions in the Canadian portion of the NCE coming soon, now is the time for the US to provide ourselves this flexibility in management as we recover this important species.

I have been involved in various efforts to foster coexistence between people and wildlife and have observed public values shifting towards a mutualist perspective on sharing our landscapes with wildlife. I believe (and hope) that with appropriate, proactive community outreach and education about the recovery effort and coexistence, there would be minimal chance for either recreationists or property/business owners/managers to find themselves in direct conflict with NCE grizzly bears. I know that I'm not alone in support this effort to restore an important piece of our ecosystem, regional culture and natural heritage. There is broad support for grizzly bear restoration in Washington, including among residents of the North Cascades area.

Thank you for taking the time for this meaningful process!

Don Striker
Superintendent
North Cascades National Park Service Complex
810 State Route 20
Sedro Woolley, WA 98284

Subject: Draft Grizzly Bear Restoration Bison Management Plan

Dear Superintendent Striker:

I write on behalf of more than 2,500 members of the Coalition to Protect America's National Parks (Coalition), who collectively represent some 45,000 years of national park management experience. The Coalition studies, educates, speaks, and acts for the preservation of America's National Park System. Among our members are former NPS directors, regional directors, superintendents, resource specialists, park rangers, maintenance and administrative staff, and a full array of other

former employees, volunteers, and supporters.

Our members and supporters appreciate the long history of grizzly bears in the Pacific Northwest and controversies over whether and how to return that species, listed as threatened under the Endangered Species Act (ESA), after its being functionally extirpated for decades. Many of our members have had previous experience in North Cascades, as well other parks where grizzly bears remain, such as Glacier, Grand Teton and, like you, Yellowstone National Parks. We are familiar with the considerable challenges associated with living in bear country and with the perpetual commitment that is needed to manage the animals and humans for the safety of both.

Yet we respect that National Park Service Management Policies outline the affirmative responsibility "to strive to recover all species native to national park system units that are listed under the Endangered Species Act...and both proactively conserve listed species and prevent detrimental effects on these species." The North Cascades Ecosystem grizzly bear recovery area, as noted in the draft plan, has sufficient habitat to support a viable reproducing population, although it has lacked verified sightings of the species for thirty years or more.

We support the plan's preferred alternative C, which would reintroduce a small number of grizzly bears over five to ten years under Section 10(j) of the ESA, which permits flexibility for managing a 'non-essential, experimental population' to address conflicts such as may occur over livestock grazing, timber harvest, and mining operations. The inclusion of maps showing where those activities occur near the proposed restoration area are especially helpful. Alternatives B and C both take care to address concerns for wilderness values, nesting birds, and other species that could be affected by aircraft noise or other disturbance needed to accomplish restoration and associated monitoring. The ongoing commitment to no net loss of grizzly bear habitat and steps already taken to enhance campers' safety, such as the placement of bear-resistant food storage boxes, will help ensure low levels of human-bear conflicts. Importantly, alternative C would permit proactive relocations of bears to prevent conflicts or habituation of the animals to human presence and activities and to address livestock depredations. Experience in other grizzly bear-occupied ecosystems demonstrates that this option can be vital in securing tolerance, if not support, for bear recovery in balance with maintaining other public and private values. We also appreciate that, after certain conditions are met, the plan calls for adaptive management, and that robust discussions with cooperators, park neighbors, the State of Washington, and Tribes have occurred and will continue.

We offer a few comments for you to consider in a final plan. Future success of the program may require consistent food storage orders across North Cascades National Park and the adjacent national forests; we encourage adaptive determination of dates for which such orders apply, even though a June 1-November 15 time period may be sufficient under current conditions. Based on experience on other parks, some of our members, suggest that the cost estimates for implementation listed in Table C-1 are conservative, especially with regard to annual costs for sanitation. The cost of bear-resistant food storage boxes, trash cans, and dumpsters have risen considerably in recent years, and it is unclear whether costs for shipping and installation are included. Also, even though costs are anticipated to be 'project-based,' such equipment requires cyclic maintenance and repair, which should be included, as should funds needed to ensure that concession and administrative facilities are bear-resistant through such means as fencing off trash or recycling areas and sewage lagoons, if they exist.

In several places, the plan references the 1986 Interagency Grizzly Bear Guidelines, which have provided a tested framework for managers in other grizzly bear-occupied ecosystems to determine management actions for nuisance bears and bear-human conflicts. We support the use of the Guidelines, but we suggest that managers and the public would benefit from clarity on how your proposed 'Management Zones 1-3,' defined on page 36, would relate to their application. The proposed Management Zones are clearly of larger scale, although there is some similarity in the definition of Management Zone 1 and the IGBC Guidelines' Management Situation 1, as both refer to areas where bear recovery is of primary concern. Since management options outlined in the Guidelines often depend on where a conflict or nuisance bear occurs in 'Management Situations 1-5,' we infer that areas within each Management Zone would be further divided into Management Situations (such as park developed areas, which would likely fall into Situation 3). If the proponents have had or anticipate discussions with the U.S. Fish and Wildlife Service as to specifically how the Guidelines would apply to different locations within the North Cascades Recovery Area, we believe sharing this in the plan would reduce confusion over potential control actions that could occur within North Cascades National Park and surrounding lands.

The cited information on grizzly bear diets (page 73 of the plan) may minimize the potential influence recovered bears could have on non-vegetative food sources; while the animals are indeed omnivores, the higher energy content gained from bears

eating ungulates and fish is noted in more current publications such as Gunther, et al.'s Dietary Breadth of Grizzly Bears in the Greater Yellowstone Ecosystem (Ursus 25(1),2014,pp 61-73) and Fortin, et al.'s Dietary adjustability of grizzly bears and American black bears in Yellowstone NP. (Journal of Wildlife Management 77(2), 2013. pp170-181). We question whether it is your and the U.S. Fish and Wildlife Service's intent to abide by item number 5 on page D-5 of the Appendix, taken from the 1986 Interagency Grizzly Bear Guidelines, specifying that, in the case of a grizzly bear death, mortality reports and all bear carcasses would be sent to the Montana Department of Fish, Wildlife and Parks lab in Bozeman, Montana, for examination and subsequent disposition, as opposed an appropriate facility in Washington.

Overall, we compliment you and your partners for completing a thoughtful analysis of a contentious issue. We know that grizzly bear restoration, should it occur, will continue to require considerable time and attention by the park as well as Tribes, individuals, and other state and federal agencies. Nevertheless, it is exciting to consider the potential for the return of this long-missing species to the park and surrounding ecosystem. With continued attention to public awareness, we believe that your preferred alternative action can contribute to the recovery of a threatened mammal, add to integrity of the North Cascades' natural and cultural resources, and provide enhanced visitor appreciation with minimal added risk to human safety and other values and interests of people in the area.

We appreciate the opportunity to provide comments on this plan.

Sincerely,

Correspondence: My name is [REDACTED] and I live in Twisp. I live on a farm bordering public land where we raise livestock, I'm an avid hiker and backpacker, and I support alternative C, active grizzly bear reintroduction alongside a 10(j) designation.

Grizzly bears were an integral part of our ecosystem here for thousands of years until we humans hunted and trapped them to local extinction. The North Cascades is ideal grizzly bear habitat. We are fortunate to live so close to these amazing wilderness areas that comprise nearly 10,000 square miles of public lands, we have the space for bears.

While grizzlies are incredibly powerful animals, there has also been so much misinformation spread about this keystone species. Reintroduction is something to take seriously, but it is also totally doable. I have family in Western MT and have seen firsthand how rural communities there very similar to ours socially, economically and culturally are already living, recreating and thriving alongside grizzly bears, and we can too. Preventative coexistence tools like electric fencing, carcass composting programs, and bear-proof garbage containers have been proven to work.

This time around, we also have an incredible tool in the 10(j) designation. This will allow our local communities to have more management flexibility should any conflicts with bears arise, giving us more agency in the process.

Here in WA and around the globe we are facing a biodiversity crisis of immense proportion. Grizzly bears are an endangered

species that deserve to be here in the North Cascades, and we as a community have a chance to bring them back, making our ecosystem more resilient for future generations by doing so.

Correspondence: I am writing to support the restoration of a healthy population of grizzly bears to the North Cascades, their home for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations.

I support Alternative C: Restoration with Section 10(j) Designation. Alternative C is the best choice for bears and the people who live in and visit the North Cascades Ecosystem. The plan is wisely modeled on what's worked in Montana where grizzlies are recovering in the Cabinet-Yaak mountains with few problems and with the acceptance and involvement of local communities.

Furthermore, the 10(j) rule will give people more management tools to reduce, prevent, and respond to human-bear conflict. I believe that the 10(j) rule if properly implemented, will help increase human acceptance of grizzly bears as they return to the landscape.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please bring back this native species to our state through the strategy laid out in Alternative C. Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

Thank you for taking the time to keep our North Cascades wild!

Correspondence: I am adamantly opposed to reintroducing grizzly bears into the St. of Wash. (N. Cascades et al). My reasons; (1) people will die (2) people will be maimed.

Safety is always first. It is inevitable that interactions between people + bears will result in death + injuries.

That said, if you superintendent, and the employees pushing this matter are willing to step up + hold yourself personally liable, both criminally + civilly, I would be willing to entertain a revision of my opinion.

What I'm succinctly saying is that above all else government has a duty to not willfully put its citizens in danger. It is very foreseeable that establishing a grizzly bear population will lead to deaths + injuries. It is only a matter of when, and how many, not if.

Correspondence: Resolution in favor of the "No Action" option for Grizzly Bear Restoration in the North Cascades Ecosystem (NCE)

WHEREAS the National Park Service and U.S. Fish & Wildlife Service have requested public input on a draft Environmental Impact Statement (EIS) evaluating options for restoring grizzly bears to the NCE;

WHEREAS the EIS had been terminated by the previous administration's Secretary of the Interior David Bernhart and no justification was provided to reinstate the EIS process;

WHEREAS the EIS fails to document mitigation costs for citizens within and adjacent to the NCE (loss of range, expensive fencing, depredation of domestic animals and livestock, etc.);

WHEREAS the EIS fails to establish liability or set reparations for damages caused by the grizzly bears to individuals or businesses;

WHEREAS the EIS has exceeded its scope, which is confined to the NCE, but now includes two new areas, Zone 2 and Zone 3, which impact more stakeholders than those associated with the NCE;

WHEREAS the law requires public lands to be managed for multiple use and the 10(j) rule as proposed seems to rely heavily on closures of roads and access;

WHEREAS the Washington Department of Fish & Wildlife is already prohibited from introducing grizzly bears from out of the area; and

WHEREAS the restoration project is a misuse of the Endangered Species Act because the grizzly bear (*Ursus arctos*) is not endangered or threatened as a species, due to existing healthy populations in significant parts of its traditional range; therefore be it

RESOLVED that the Okanogan County Republican Party endorses and recommends the "no action" alternative in the EIS; and be it further

RESOLVED that this resolution be transmitted as a comment to the EIS, presented at the public input meeting to be held in Okanogan, sent to Representative Newhouse and Senators Murray and Cantwell, and submitted to the local newspapers.

Correspondence: To members of the public comments committee:

ABSTRACT

Existing populations of grizzlies in British Columbia, Idaho and Montana will eventually fill an existing void in the north cascades ecosystem without human intervention.

An EIS could be in order to consider use of beavers to help reduce the impact of global warming as the long term outlook for Homo sapiens begins to place it in line as a threatened species..

INTRODUCTION/DISCUSSION

Theodore Roosevelt witnessed the demise of the passenger pigeon. Insightful people like TR saw the imminent demise of animals like wolves and buffalo. Later on Rachel Carson raised the alarm about rampant use of DDT. John Craighead began serious studies of grizzly bears.. We have people like them to thank for stable, manageable, populations of those and other species as well as an awareness of their importance to the environment. Grizzly bears were once a part of the north cascades ecosystem. They should return and fill that void through natural integration from expansion of nearby populations instead of by capture and release. The north cascades ecosystem/environment has changed dramatically since the last grizzly in Washington State was shot in the nineteen sixties. Roads are everywhere, numbers of hikers/campers has increased exponentially. Most of all, Homo sapiens has a terrible reputation when it comes to injuries as a result of interacting with wild animals. Interaction never ends well for grizzlies. Without help from governmental agencies the return of grizzlies would incur no liability, hence no grounds for litigation arising from attacks whether provoked or not.

Meanwhile north cascades, glaciers that stored and slowly furnished a steady supply of water are disappearing rapidly as a result of global warming. There does not appear to be a "quick fix" to that dilemma. Fostering increased numbers of beavers would contribute to slowing runoff from spring rain and summer snow melt. Beaver dams and the resulting ponds behind them create biodiversity that would ultimately contribute to enhanced grizzly habitat. Presently researchers have expressed divergent views with respect to beavers effect on salmon habitat due to stream siltation. Interestingly recent articles supporting grizzly relocation contain reference to Hudsons Bay Company records of grizzly hides taken in the north cascades.. Those same records also contain accounts of brigades sent out to trap as many beavers as possible. In addition to the financial incentives a less well known, but stated, goal was to turn the northwest into a "beaver desert".. Conventional wisdom of the day was the belief that total absence of beavers would make American immigration to the northwest unattractive. One thing is certain, in the early history of the northwest, beavers and salmon and grizzlies coexisted as abundant members of the exosystem.

Sincerely,

Correspondence: Grizzly bears are not wanted in the northern Cascade Mountains. For the sake of all recreational users of our public lands do not move to reintroduce them.

The state wildlife agencies already struggle to manage the other predators (wolves, mountain lions) due to not having effective management tools available to them, adding another apex predator would only further the challenges.

Due to loss of habitat, climate changes and diseases the wildlife herds in Washington state are already suffering, adding another challenge to the mix isn't a good idea.

Other western states have sustainable grizzly population with significantly less people than what Washington state currently has and history has proven that it has been a challenge to keep the residents of those states safe when they recreate on public lands. The loss of even one person's life is not worth any potential benefits to reintroducing grizzly bears back into the ecosystem.

Although certain ideological thinking residents of Washington state, in areas of the state that will not be impacted by a decision to reintroduce grizzlies back into the state favor doing so, the majority of local residents who will live with the impacts of this decision every day oppose it. The personal safety of those local residents should be a top priority. The ability of those local residents to earn a living that is resource-based should be a top priority. How those local residents choose to enjoy the recreational activities in the impacted areas on their public lands should be a top priority. Strongly against reintroduction of grizzly bears into Washington state.

Correspondence: Grizzly bears are aggressive to humans
In oct 2022 two wrestlers were mauled by a grizzly near Cody, WY (I lived in Cody)
In June 2023 a man was killed in his campsite
As well just today in Montana a woman filmed a grizzly tearing down her shed. Then fell asleep right next to it. His weight was estimated at 800 lbs.
Aggressive - YES it will be very aggressive to defend its personal space, cubs and food source. If you scream or make sudden movement it may trigger an attack, never make bear sounds or high pitch squeal a grizzly may think it's the sound of prey and attack. If a grizzly sees you as a threat it will attack and will not stop until the threat is gone. A human will not be on the winning side. If you think you can outrun or swim a grizzly can run 38 miles an hour + that's at a sprint, unless you are in a car. You will not win. Don't try to outswim a grizzly he can swim 6 miles an hour. The fastest human swims 3 miles an hour even with this facts 6% of americans believe they can beat a grizzly Facts: a grizzly can stand tall @ 8ft. weigh up to 1700

lbs powerful bite to 1000 PSI and has larger claws 5' or more than a polar bear. A grizzly can split your body in half in seconds. They go after the neck and back of head. Then eat you from the chest down
In north America there are 60,000 wild grizzly 30,000 in Alaska 29,000 live in Canada. That leave 1,000 for the rest of the US - grizzly are not in Washington state. We need to keep it that way. We pride ourselves as Evergreen for hikers + campers. Grizzly do not belong here. NO to grizzlys.

Correspondence: Our primary home is in Tacoma, Washington. We also have a residence in Mazama, Washington and recently attended a public comment meeting in Winthrop on November 3, 2023. First, I would like to recognize the Draft Grizzly Bear Restoration Plan/Environmental Impact Statement Document. It's very comprehensive and appears to be very well researched. Likewise, the Winthrop public meeting was extremely well organized and conducted with respect for all participants and opinions. My one area of concern relates to the existing black bear population. There is some mention of the potential impact and resource competition between the two species, but it did not appear to me that there is any concentrated focus on monitoring the black bear population as the grizzly bear is reintroduced. For many reasons, this seems to me an important monitoring element. Finally, great work! I look forward to hearing updates as the reintroduction begins!

Correspondence: Dear Staff- I think it is un-necessary ecologically to introduce grizzly bears into the North Cascades ecosystem- there is a clear migration corridor from Canada for grizzly bears to migrate into the North Cascades from southern BC in Canada. This has been documented to be already occurring, My suspicion is that bears would migrate to suitable habitat in their range if habitat is available. Black bears currently provide virtually the same ecological services as Grizzlies, This project is not necessary ecologically. I am opposed to this plan. Thanks for letting me comment.

Correspondence: I'm not for the bears in any way, We went through this a few years ago. you need to listen to the people that live close to where you want to dump them and the hunters that hunt for deer and elk. Its bad enough that you brought in the wolves that are eating what we are hunting for. In the Methow valley the deer population has declined to far already. Also the habitat that is lost from wild fires is already keeping the black bears down low in the valley, So I expect the grizzly's well do the same. The game department use to be for the hunters not any more!!!! Maybe all of us hunters should get on social media and get every hunter to stop buying a license? why hunt if all the game is going to the Bears and Wolves. So I'm just saying I'm for getting my friends to stop buying a license and get the word out. MAYBE DROP THEM OFF IN DOWN TOWN SEATTLE TO THE FOLKS THAT WANT THEM

Correspondence: Dear Staff- I am opposed to the plan to reintroduce grizzlies into the North Cascades, As a result of introduction of Grizzlies in this area there will be a substantial increase in recreational visitor encounters with Grizzlies as a result of this introduction plan. This would lead to maulings and possible fatalities from bear encounters. The North Cascades are a highly used recreational area. I think a thorough study needs to take place that accurately documents the risk of encounters with bears after say 10 or 15 years under the release plan as bears are established. The risk needs to be clearly and transparently studied and the results need to show whether encounters would be significant based on current and anticipated visitor usage. Significance needs to be clearly tied to bear /human encounters and expressed as a risk. Any encounter with a grizzly has a significant risk of attack, and a risk of serious harm. This plan has a fundamental flaw in analysis without this information. Thank you for considering this.

Correspondence: I am in full support of this. I think the grizzlies should be given back more of their natural habitat.

I think people will complain and raise concerns due to fear of running into a bear while hiking or how they could interact with livestock. I dont think hikers who visit the area 1-2x per year should really be listened to. Similarly, other places in the US and Canada have grizzlies nearby and don't have major issues - people will have to learn to adapt.

People hate change, but change is good.

Correspondence: I am an avid hiker and a backpacker.

I believe that the introduction of the grizzly into an environment where the overwhelming majority of hikers/backpackers are not familiar with proper grizzly bear safety practices is irresponsible. It will likely lead to people getting injured or killed. Either instance will also result in the death of the bear.

Please do not make this mistake. Decisions have to be made based currently available information and circumstances. And the drive to fix what happened long ago is not always wise.

Please listen to the majority of the people that would be required to share the environment with an apex predator - and not activists that have never stepped foot in the back country.

Thank you.

Correspondence: I oppose the re-introduction of Grizzly bears to the North Cascades. A lot of people enjoy hunting/fishing/hiking/backpacking this area and do so currently without the concern of having a bear attack. Adding grizzly bears to this area changes the risk factor and tranquility of being in the outdoors greatly. Is this "experimental"

plan worth someone being mauled or possibly killed? Are the benefits greater than the risks? I think not. Bringing things back just because they were once here does not always make sense. This is a case where it does not make sense. The people making these decisions are not the same people that spend time recreationally in the area. Please listen to the people that will be most affected by this decision.

Thank you,

Correspondence: The plan to transplant these apex predators into the Northern Cascades is unwise and contrary to the North American Wildlife Conservation Model. Grizzlies haven't been hunted in several decades and there are grizzly bears to the north in BC. Why haven't they repopulated on their own with no hunting pressure? Because the habitat will no longer support them. Your proposal not only endangers the animals you seek to "protect", but prioritizes these predators over other wildlife AND human beings in the area. If there were a void, nature would fill it. Stop playing God and return to practicing sound scientific wildlife management. Do not transplant grizzlies into the Northern Cascades.

Correspondence: North Cascade grizzlies must have the same protection under the Endangered Species Act that all populations have. It is unacceptable for the U.S. Fish & Wildlife Service to issue a special rule for "a nonessential experimental population."

The final Restoration Plan should account for the positive effects grizzly bear reintroduction will have on wildlife in the North Cascades, maximizing their beneficial role in improving the ecological diversity necessary for a thriving ecosystem.

The National Park Service should craft the final Restoration Plan to account for the role humans play in minimizing human-grizzly bear interactions. While people are encouraged to enjoy recreational activities in and around the vast, sparsely populated North Cascades, the final Restoration Plan should prohibit hunting and encourage people to use non-lethal means to respond to and to deescalate any human-bear interactions.

The National Park Service should prioritize protections for grizzly bears over livestock grazing. Provisions to accommodate "management" of grizzly bears for the benefit of the livestock industry are not necessary.

Thank you.

Correspondence: I am against reintroduction of the grizzly. We have to many people living in the area. If it was less populated maybe.

Yellowstone has shown us someone will try to take a selfie with a grizzly, then the grizzly will have to be killed. The salmon runs are not strong enough to support more wild life. They will not have enough to eat, then they will find food closer to humans.

Some people might think the north cascades have no people, but humans are to overpopulated to have large predators in Washington state.

Correspondence: I do not support the introduction of anymore predatory animals in Washington state especially grizzly bear! If they wanted to be here they would be! No matter how far back in the hills they're put they WILL wind up in our back yards. We like to fish,hunt,hike,camp and just wonder in the hills and definitely do not need the threat of an apex predator such as a grizzly that was put in place by humans troubling us just because someone got a warm fuzzy feeling that it would be a good idea. They're happy where they're currently why would anyone want to snatch them up and put them somewhere new, somewhere they don't know and somewhere with habitat that doesn't support their species.

Correspondence: We have abundant evidence that reintroduction of keystone species and large apex predators to the environment they have been removed from improves the population of all animals in the ecosystem. In fact improves the ecosystem down to erosion and plant life. This applies to land and sea, such as wolves in Yellowstone to the fish populations that increase in shark sanctuaries.

Our scientific evidence alone supports reintroduction of grizzlies into the North Cascades. We are in a desperate fight to save our most iconic apex predator of the area, our resident orca population, with few options. We have an option to correct damage we've done to another apex predator and we should. The environment improves when we work with it and the apex predators rather than conquer it.

Correspondence: If we are trying to save the bear population and increase biodiversity in the NCE I personally think option B is the best solution in this scenario. I think it is important that we take this issue very seriously, but I don't think we need to manage the bears as much as considering them an "endangered species." I think with some human guidance we can restore/ introduce grizzly bears to the NCE, and create more biodiversity to the ecosystem at the same time which is the main overall goal.

Correspondence: I support the reintroduction of grizzly bears to the North Cascades. We have had the privilege and great good fortune to have hiked and skied the North Cascades for 35 years. The wildness of the place is an irresistible draw. Grizzly bears roamed these wild places long before humans decided unilaterally to sanitize the land of any perceived threats to humans and trap, kill, or remove native species for our economic gain.

Native Americans learned how to co-exist with grizzly bears. People who venture into the woods need to respect grizzlies and understand the root cause of potentially bad interactions. These are often the result of poorly handled refuse, inappropriately stored food, getting between cubs and a mother bear, ignorance of bear signs, ignorance of safe hiking behaviors in bear country, and diminishing habitats that shrink the space between them and us. This is a matter of public education and taking responsibility as individuals to behave in compliance with basic backcountry standards.

As stated in their website, the National Park Service "preserves unimpaired the natural and cultural resources and values of the National Park System for the enjoyment, education, and inspiration of this and future generations. The National Park

Service cooperates with partners to extend the benefits of natural and cultural resource conservation and outdoor recreation throughout this country and the world." It doesn't say "eliminate all potential hazards to humans in the wilderness". There is no way to achieve that even without the presence of grizzlies. The grizzly bear is an integral part of the ecosystem of the wilderness and a magnificent apex predator that deserves our respect and reverence.

While we fear grizzlies, an apex predator, we would exponentially save more human lives and reduce human suffering through enhanced auto safety and actual regulation of industrial chemicals than we would by removing all grizzlies from the landscape.

Our attempts to eliminate any and all threats to human life have often resulted in unintended consequences, creating imbalances in the ecology of the land. Such action damages, sometimes irreparably, the natural world, precluding incredible experiences of nature for future generations. Reintroducing grizzlies to the North Cascades is one step to repair our past actions in reverence for that animal's magnificence and to respect our obligation to future generations who wish to roam the mountains as we have had the privilege to do.

Correspondence: I am apposed of the inserting Grizzly Bears to the Northwest. My husband and I are avid hikers and campers here in the beautiful northwest. The danger of grizzly bears in the area will limit us and others in the northwest to enjoy exploring the national parks that we as taxpayers pay for.

Grizzly bears are omnivorous although their digestive system is that of a carnivore. They consume a wide range of food items constituting both plants and animals. They prey on mammals such as bison, bighorn sheep, mule deer, white-tailed deer, caribou, elk, and sometimes black bears. The northwest also cattle farm business in the area that the bears would feed off of. Introducing them here will endanger the ecosystem that is already in place.

Correspondence: Grizzly bears have been a part of the Western landscape, including Washington State, since before the arrival of European civilization. It was European Americans who largely extirpated them from this region through hunting and game shooting because they falsely believed that bears are dangerous predators which are incompatible with civilization (aka colonization). Indigenous peoples had coexisted with these bears since time immemorial, and many people all over the world coexist with brown bears just fine. It's only right to bring them back to the North Cascades to allow them to re-engineer the landscape and bring back a more balanced natural environment. I am strongly in favor of Grizzly bear reintroduction in Washington State.

Correspondence: As an individual that has grown up in the cascade forests, i have witnessed the changes brought about by the introduction and protection of aggressive predators. Since cougar hunting with dogs was banned, and wolf packs are being introduced, the black tail deer numbers in my area are declining. We have seen both cougar and a wolf on our property.east of North Bend on the south fork of the Snoqualmie river. The thought of seeing grizzly bears is not something I welcome. I feel there was a reason these bears have disappeared from our forests due to their aggressive nature toward both humans and livestock. I feel that if the bears migrate into our forests on their own the numbers can be controlled. I cannot favor these predators being reintroduced by man.

Thank you.

Correspondence: I strongly support grizzly recovery in the North Cascades Ecosystem (NCE). From the current DEIS, I support Alternative C, which will recover grizzly bears as a 10j Non-Essential Population under the Endangered Species Act.

I have two concerns with the proposed 10j rule, however:

- Why are State-owned lands that would appear to have suitable grizzly bear habitat within the NCE designated as Management Zone 3 rather than Management Zone 2? There is only vague reference in the proposed rule about lands within MZ 3 being more vulnerable to conflicts and resultant bear mortality - which makes sense for private lands, but is much less clear about the excluded State lands. My recommendation is to make state-owned lands as Mgmt Zone 2 within the NCE if they have suitable grizzly bear habitat.
- I have serious concerns about allowing private citizens to lethally remove a grizzly bear under Management Zone 3. The proposed rule enables an authorized private land owner to “kill a bear presenting an ongoing threat to human safety, livestock, or other property (e.g. compost, chickens, beehives) if there is a demonstrable and ongoing threat and when it is not reasonably possible to eliminate the threat through nonlethal means.” My questions/comments are these:
 - o Whereas human safety is a legitimate concern that might warrant an authorized member of the public to kill a grizzly (as enabled in MZ 2), how do property like compost and chickens rise to that level? Keep in mind it was people with guns, traps, and poisons that led to the extirpation of grizzlies in the NCE. We are not that far removed from those times nor those attitudes, and to willingly enable a private citizen to legally kill a grizzly for those resources is troubling. Certainly, agency staff should be involved in trying to manage those conflicts, and the various tools available (electric fencing, for example) should be used. If a bear persists in causing conflict after agency personnel have attempted other means, and after non-lethal means of conflict resolution are attempted and presumably failed, then it should fall back on the agency staff to manage that bear - either trap and move, or as a last resort, euthanize the bear. But do NOT enable private citizens with that task.

I have read that the federal agencies are working to memorialize the “no-net-loss of core” approach for management of core lands within the NCE - this is an important, critical step to complete. Please proceed with that effort!

Similarly, as discussed in the proposed 10j regulation, make the exception to the incidental take rule on USFS lands be contingent - as proposed - on the USFS continuing to abide by the no-net-loss of core approach.

Within the body of the DEIS, I would suggest reviewing the following publications to update and inform the discussion on Wilderness Character for the North Cascades NPS Complex. Both are peer-reviewed, published by the NPS:

Riegel, B., and J. Oelfke. 2020. The Stephen Mather Wilderness: Wilderness character baseline assessment. Natural Resource Report NPS/NOCA/NRR - 2020/2164. National Park Service, Fort Collins, Colorado

Oelfke, J. 2022. Stephen Mather Wilderness: An update of the 2015 wilderness character baseline and completion of the 2020 wilderness character monitoring reporting summary. Natural Resource Report NPS/NOCA/NRR - 2022/2452. National Park Service, Fort Collins, Colorado. <https://doi.org/10.36967/2294337>

Thank you for the opportunity to comment

Correspondence: Return grizzly bears to the North Cascades. Grizzlies are important for a healthy ecosystem. Humans have been poaching them and destroying their habitat since the 1800's, resulting in a decline down to only two confirmed bears. I support your ecologists' recommendations.

<https://www.nps.gov/noca/learn/nature/grizzly-bears.htm#:~:text=There have always been grizzly,during the heyday of mining.>

Correspondence: I live in unincorporated Snohomish county and have seen black bear, bob cats, deer and other wildlife on my land. I enjoy the area and we spend plenty of time with our young children hiking, looking after our livestock etc.

Part of the appeal of this area is the fact that there are no grizzlies. I would worry for the safety of my children and my animals. It would make hiking and camping/ back packing much less enjoyable and stressful knowing the grizzly bears are out there. No thank you!

Correspondence: I'm writing to support the restoration of a healthy population of grizzly bears to the North Cascades, their home for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations.

I support Alternative C: Restoration with Section 10(j) Designation. Alternative C is the best choice for bears and the people who live in and visit the North Cascades Ecosystem. The plan is wisely modeled on what's worked in Montana where grizzlies are recovering in the Cabinet-Yaak mountains with few problems and with the acceptance and involvement of local communities.

Furthermore, the 10(j) rule will give people more management tools to reduce, prevent, and respond to human-bear conflict. I believe that the 10(j) rule if properly implemented, will help increase human acceptance of grizzly bears as they return to the landscape.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please bring back this native species to our state through the strategy laid out in Alternative C. Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

Thank you for taking the time to keep our North Cascades wild!

Correspondence: Re: the EIS regarding restoring and placing grizzlies in the North Cascade Park System

We live in a rural area west of the Town of Twisp along the Twisp River. There are 50 miles of forest behind our property that reaches into the Stehekin area and north into the Pasayten Wilderness. We have dogs and many friends with dogs and enjoy recreating with our dogs in the North Cascade system. We also live in a riparian area and have had close encounters with black bear and cougar since moving here in 2006.

We feel that this move to reestablish grizzly bears in the North Cascades Ecosystem is not well-informed or for the benefit of citizens that want to recreate in this beautiful unique part of our country. My husband drives a local public transit bus part time and meets many hikers that are coming from all over the country, as well as all over the world to hike in this wilderness. They are often headed for the Pacific Crest Trailheads in the North Cascades. These people are not ones who would carry weapons and, if they have bear spray, they are not anticipating meeting grizzlies. Black bear attacks are fairly rare, but they will follow dogs back to people. Generally they are pretty quickly dissuaded by bear spray or loud noise. These are different animals than grizzlies.

As early as the 70's, hiking in Montana, trailhead signs told us to not take dogs on the trail because of the risk of them attracting grizzlies. It was hot in the summer there so there weren't ways to leave the dog safely in a car. I see that being a huge obstacle for people wanting to hike in the North Cascades as people here often hike with their dogs.

A little over a month ago there was a horrible incident involving a couple and their dog who were camping in the Banff Provincial Park. They were experienced with bears. They stowed their food away from camp in a tree. They had bear spray with them. They were attacked inside their tent and were killed along with their dog. They had GPS connected and sent out messages and there was no help that could have saved them. Grizzlies have always been there as a part of the environment and people carry spray, electrical devices, but cannot carry guns. I don't think we can rely on carrying guns, or should rely on that, to be safe recreating in this great ecosystem.

There are other populations we've been trying to bring back in this area. We've seen huge swings in the number of mule deer in this area in the past 10 years. Black bears will eat fawns and there are diseases like blue tongue and mite infestations that the deer population has been trying to recover from. Adding another effective predator will likely upset the balance of the game here. Many people we know hunt to support their families and the resource brings a lot of tourist dollars to the local economy as well.

We have had nuisance black bears threatening our safety, our dogs' safety and our garden crops. We had a boar black bear last year that was brave enough to stand on his hind legs to threaten the dogs on the other side of a 6 ft fence and he did not back down when we went out to scare him off. When we called the local fish and wildlife agents about the bear problem they told us that they don't relocate bears or come shoot them. They recommended we get rid of anything that attracted them (like our cherry trees). If that didn't work they told us that we could shoot them with some rock salt or something to scare them away. Or, as a last alternative, kill them or have a hunter come take the bear so the meat wasn't wasted. They told us that if we called them to come get the bear they would drop the carcass in the forest somewhere.

So, maybe that helps you to understand our concern with this Grizzly Plan going forward. If we don't have the resources to manage black bears close to residential areas, hiking trails and other heavy recreation areas, we do not believe that this plan can be successful. There is a growing population on the east and south side of the North Cascades Park and more people recreating here all the time. We have the largest county in acreage in Washington State and we account for a large part of the border of the North Cascades area. But, we have a County with so much public land that isn't taxed that we rely on a skeleton Sheriff Department for emergencies. In the past 3 years a completely volunteer Search and Rescue has been reorganized with volunteer supervision in Okanogan County. I worked in local government and in this largest County in the State, often sheriff's department staffing on the weekends was a minimum of 3 deputies. No one is going to get to a site of a bear attack in time to have a better outcome.

Please do not launch this experiment in the North Cascades with the growing population and recreation level and lack of resources to manage the reintroduction. If local wildlife officials cannot deal with black bear incidents, how in the world can we anticipate that there won't be disasters like what happened in Banff happen here in our backyards. The federal government should not inflict this disaster-in-the-making on the State of Washington and local resources hoping that everyone will be on board when the first bear disaster happens. Stop, think, back this up!

Correspondence: I'm delighted that our state has been chosen to reintroduce grizzlies. This is important due to the endangered species recovery. The arguments I'm hearing that are against the grizzlies are idiotic. A couple who had a grizzly come into their yard and kill a chicken said that they moved to that area knowing perfectly well that there were bears in the area. But then they said that doesn't mean that they have to tolerate the bears. OH YES IT ABSOLUTELY DOES!! If you move into their habitat, then you have to share that habitat. It's that same old argument of "not in my backyard". The species recovery should take precedent. I also hear arguments from farmers and ranchers about crop or livestock loss. That is just the price of doing business. My father was the biggest potato farmer in WA in the 1980's. He was very much anti-hunting. He prohibited any and all hunting on our land, which was 9,000 acres. This angered hunters who claimed they would be doing us a favor and getting rid of pest animals. But my father said that any crop loss was just the price of farming. He held true to his values, and we did just fine. The recorded number of livestock killed by bears is miniscule compared the number of total bears in those areas. We need to bring grizzlies back to WA state!!

Correspondence: I support Alternative A.

From the Proposed Rule Threats section;

"The complex relationship between changes in climate, natural processes, and natural and anthropogenic features will ultimately determine the future quality of grizzly bear habitat across the ecosystem (Ransom et al. 2018, entire)."

The effects of climate change does not appear to be fully analyzed. The proposed rule which seems to cite one author in the threat section, Ransom 2018 and 2023, indicates fire will cause a disruption in the grizzly's territory which will result in bears seeking new areas for a period of time followed by an increase available food. With the increased occurrence of mega fires in the North Cascade Complex the interaction between grizzly and communities will increase similar to that as we have seen with the black bear. Washington State Fish and Wildlife are currently closing lands in the Methow Valley to the public due to

decreased Mule deer populations. It seems adding an additional keystone predator into the area will further reduce the numbers of this important species in our ecosystem. Has the two agencies communicated or are the taxpayers and community members going to endure the hardship of unfunded mandates and poor planning. The addition of grizzly bears in areas which currently are demonstrating changes in vegetative community and structure is a flawed plan. Please review the nps study on the changes to the park as a result of climate change

<https://www.nps.gov/noca/learn/nature/climate-change-resource-brief.htm>

This study by the park service provides the data that the habitat slated for these bears to reside is decreasing at alarming rates.

Alternative B and C are both extremely irresponsible.

Correspondence: Hello,

I am writing in complete opposition for the reintroduction of grizzly bear to the North Cascades Ecosystem (NCE).

As someone who recreates throughout the NCE on an almost weekly basis, grizzly bears are not an animal I want to see on the landscape. Documented annually, there are human - grizzly bear conflicts throughout other grizzly bear recovery zones. In some cases those conflicts result in death or serious harm to the humans, and they often result in the lethal take of the bear. The NCE is facing an increased predator populations from mountain lions, black bears, and wolves. I do not advocate for another predator, an apex predator, to be introduced to the landscape.

Animals do not know boundaries, and will not stay within remote confines of the National Park complex or within wilderness areas. As documented in other grizzly bear recovery zones, there is conflict between ranchers and grizzly bears every year. Resulting in tens of thousands of tax payer dollars going to compensate the rancher, and/ or funding wildlife professionals to investigate and potentially lethally take the problem bear.

Additionally, ungulate species across the eastern slopes of the cascades are in a decline. The decline is a complicated issue surrounding climate change, wildfire, human encroachment into habitat and loss of winter range habitat. Introducing an apex

predator will only further the decline.

For these reasons listed, I am firmly against the reintroduction of grizzly bear to the NCE and ask the NPS, USFWS, WDFW, and other federal, state, tribal, and local agencies to select the "no action" reintroduction option.

Regards,

Correspondence: Alternative C, or the Incremental Restoration option, is the best choice. The grizzly bears were here before us and they deserve to be returned to land that they once freely roamed. Because they are a keystone species, they are much more valuable, and this positive quality by far outweighs the threat that they may pose to humans. They will help return the ecosystem to a more balanced and thriving state, which also is more important than livestock that could potentially be damaged. This earth is the only one we have - we have to focus on taking care of Mother Earth and give her the respect and love she deserves.

Correspondence: The species *Ursus arctos horribilis* is magnificent. But your proposals to reintroduce Grizzly bears are ill advised and prohibitively expensive if looked at as both a cost per bear both at the start of your B or C alternatives and with ongoing expenses of dealing with further reintroduction and with "problem" bears either by relocation or execution when an encounter goes wrong with a "touron" (think Yellowstone and Bison) or a rancher loses livestock, both of which will happen eventually if bears are there. With continued global warming and increased wildfire danger, beetle kill in Cascade forests, increased use of the backcountry by humans, and logging, your vast proposed habitat may not be quite as vast as you assume to support your proposed numbers of bears. Then, if you do succeed in reestablishing a large (relatively speaking), long term and healthy bear population even beyond your wildest dreams, you may simply be subsidizing trophy hunting and poaching. Political winds can and do shift and the hunting lobby is strong (think Wyoming, Idaho and Montana). A reminder to you of the proposed road to a mine through Gates of the Arctic National Park and prime Grizzly habitat should give you pause. I am in my 71st revolution around the sun and am not clairvoyant. I have though spent many, many days and weeks in the areas that are included in the NCE approaching then climbing many of the mountains there and I am glad Grizzly bear encounters were not included in the many dangers inherent in my chosen pursuit at the time. If you look at what happened to wolf reintroduction in Northeastern Washington where wildlife biologists went to great extremes and expense to reintroduce *Canis lupis*, then when those wolves found easy prey in sheep and cattle apparently surprising everyone, the State hired guns to eliminate the problem. In closing, I would remind you of the law of unintended sequences. No matter how detailed you plans, you don't have any idea of how things will actually work out. People and Grizzly bears do not mix well and it will be the bears that pay the price with their lives while the taxpayers pay with, well, their taxes.

Correspondence: As a family that camps and hikes all throughout Washington state and the North Cascades, I am very concerned about the possible re-introduction of grizzlies into the area. The presence of grizzlies would give me pause in considering outdoor activities with my family. Safety is a top priority when considering where our family enjoys the outdoors. Children make it very hard to ensure bear safety, as they do not pay attention to cleanliness and food scents. This area also has been without grizzlies for a very long time and it would impact the current ecosystem and recreation activities.

Correspondence: The grizzly bear is a cultural cornerstone of the former Wild West, America's last frontier. The American West is the ancestral home (historic range) of grizzly bears. Before our nation's westward expansion, bears travelled freely, unencumbered by human involvement and conflict. The Environmental Impact Statement for the North Cascades Ecosystem Restoration Plan offers three solutions- do nothing, the proposed recovery plan, or a modified recovery plan under section 10 (j) under the Endangered Species Act.

A potential area for concern under Alternatives B and C is the impact of helicopters upon visitors recreating in designated wilderness areas. Personally, when I hear a helicopter while I am recreating outside, curiosity and concern are the primary emotions that I experience. I imagine a potential search and rescue operation taking place nearby and recognize the importance of these efforts. The interruption caused by helicopters is typically brief, especially when compared to the amount of time that a typical visitor spends in the wilderness. Other individuals may be frustrated or upset by the noise pollution. A maximum of 144 flights, totaling 65 hours, would take place over wilderness areas in the North Cascades Ecosystem (pp. 40). Although these flights will primarily take place during times of high recreational value, the limited quantity and duration of flights means that the impact on visitors will be as minimal as possible. Posting disruption notices online and at trailheads would reduce curiosity and concern among visitors, which would work to mitigate the impact of helicopter flights on recreation. These notices should include bear awareness tips and information surrounding the exciting species restoration program. Even when considering intermittent area closures on a short-term basis (pp. 45), the recreational value of returning grizzly bears to the North Cascades Ecosystem outweighs the negative effects of the restoration program. The recreational impact of release efforts is described in the Environmental Impact Statement as follows:

"Area closures during operations at the staging areas would temporarily limit opportunities for solitude and unconfined recreation; however, closures are expected to last only a few hours. Closures are not expected to be needed at release sites because remote areas without people would be preferred. However, the duration of any necessary closure would be temporary and last until the bear has moved away from the release site."
(pp. 106)

Remote areas without humans are specifically targeted as ideal release locations in order to limit interactions between humans and bears. As an avid user of public lands, being asked to avoid an area due to an imminent grizzly bear reintroduction would not impact me negatively. The ecological and cultural value of reintroducing grizzly bears to the North Cascades Ecosystem far outweighs the temporary inconveniences of helicopter noise and area closures.

Overall, Alternative B or Alternative C should be initiated to return grizzly bears to the North Cascades Ecosystem, part of their historical range. Despite the limited potential interference with humans recreating in secluded wilderness areas, the positive impact of grizzly bears in the areas overshadows concerns about disruptions. This reintroduction plan is an

opportunity for the North Cascades Ecosystem to be a model public lands unit for further grizzly bear and ursus reintroduction programs in the future.

Correspondence: Grizzly bears were a vital component of the ecosystem of the North Cascades for thousands of years until humans hunted them out of existence in the area. Now that we have the opportunity to responsibly re-introduce this important species into the area and bring balance back to this wilderness, it's important to not let naysayers use scare tactics to stall or end this effort by claiming a few dozen grizzlies being re-introduced to an area the size of New Jersey over decades is going to cause loss of human life and doom local farms. These animals have as much of a right as humans to exist in these areas, and the proposed settlement sites would not pose any direct threat to humans or their livestock. The areas are very remote, far from any towns, and would only benefit from the presence of grizzly bears. I urge the NPS to push forward with the re-introduction plan and allow these animals the opportunity to live in the wild of the beautiful North Cascades. Humans shouldn't be able to dictate what native animal species are allowed to exist in what areas. Co-existence is the goal.

Correspondence: I have lived in "bear" country for many years. Including MT, WY, and now Alaska. It's beyond my ability to comprehend why anyone in their right mind would want to bring these beasts back after they were eradicated. They make an area with many hazards far more hazardous. They don't play and they do not improve anything, rather they kill valuable livestock and much wildlife that could be used as subsistence by people. Why would you even consider this? I am strongly opposed to this plan and I speak from personal experience. Nothing is more terrifying than making contact with one of these brutes and no one who has would want them around. Have you ever been hunted? I have and I don't like it. You won't either. This is a terrible idea. You are putting many people and valuable assets in jeopardy. If your wife, children or other livestock were attacked or killed you would never be in favor of this insane notion of reintroduction. You bet I feel strongly. Thank you.

Correspondence: We need the grizzly bears back in the North cascades. They would be able to live there and it would bring in people who are excited to see them. It would not affect livestock negatively - not more than how snakes do.

Correspondence: Plan A doesn't help achieve any of the goals laid out because it doesn't take any action. The grizzly bear population cannot come back on its own and if there is something we can do to help support their recovery, then we should take action instead of sitting back and ignoring the problem.

While both alternatives B and C offer similar reintroduction plans, alternative C is a better alternative because of the constraints for management options with alternative B. If your objective is to restore the grizzly bear population and allow visitors the opportunity to see bears in their native habitat then a plan that takes preventative action is better for the well-being of both bears and people. Under alternative B it states that bears can be removed for the defense of life, but we are visitors in their habitat they should not be removed from their habitat for defense due to human interference. alternative C addresses this concern by proposing deterrence as well as relocation, therefore, trying to create a space where humans and bears can coexist. This will help restore the bear population because of fewer disturbances and will help prevent human mortality.

Both alternatives B and C use helicopters to transport bears into the habitat. I like that these plans address concerns about the disturbance of helicopters on other wildlife populations such as northern spotted owls. It is good that they will be staggered throughout many years, but I would like to see a monitoring of the impact this many helicopter flights make. If it is impacting nesting birds, what would alternatives to transporting bears into the environment look like?

Overall, alternatives B and C seem very well thought out and both would have positive impacts for the grizzly bear population. I think that alternative C is better for management, prevention, and the coexistence of humans and bears.

Correspondence: I am in strong favor of returning the Grizzlies to the North Cascades. I live in an area that borders the national park and recreate there year round. We need to return the Grizzly bear to it's rightful home. Furthermore, I am in favor of Alternative C and the proposed Section 10(j) Rule which is our best choice that meets both ecological and social needs in the area. The Grizzly has been successfully reintroduced in other areas and WE CAN meet the needs of all parties. I know that many of those of us in favor are also in favor of developing means and contributing to funds that will support farmers/ranchers among other parties. Please, let's right a long-term wrong!

Correspondence: I strongly support the National Park Services preferred Alternative C: Restoration with Endangered Species Act Section 10(j) Designation.

I am sure you are already familiar with the many reasons we should bring grizzlies back. I wanted to share a personal view point.

Ive lived in Seattle for 11 years and love visiting the North Cascades.

However, I know we live on stolen land. And I know the National Parks would not be necessary if indigenous people still lived there, because the space would be properly cared for and honored.

Bringing grizzlies back helps restore the balance in the ecosystem and takes away the focus of National Parks on human recreation. We are just visitors on this land.

Correspondence: As a hiker and equestrian I feel that no action be taken. I do not want Grizzly Bears as a threat to me or my horse. However I do believe that they will gradually move down from Canada and will eventually repopulate the area. The fact that they were in the North Cascades in the past does not mean they need to be there now. There are several other predator animals there to keep things in balance. JoAnn Yost

Correspondence: If we're going to restore extirpated predators to our wild lands, why not reintroduce lions to Washington? No, not cougars, but pantherine lions, similar to their extant African cousins except 25% larger. They lived here for hundreds of thousands of years before Native Americans wiped them out. Let's release a few prides that have been observed to be cold-tolerant and see what happens.

How would you feel about hearing stories where a family hiking up to Cascade Pass found themselves surrounded by a pride of aggressive lions, and only their bones and shredded packs were found by S&R?

There is no need to do this with bears either. Grizzly bears have connected habitat from the Rocky Mountains through Canada to the Coast Range, which then leads south to the North Cascades. There's minimal civilization and minimal highway crossings. Let them find their way here again naturally if they are inclined to do so. If they don't, leave them be.

The NPS and USFWS seem determined to create a human safety problem where none now exists. This is a stupid idea that should not be enacted.

Correspondence: Dear Director Williams and Director Sams,

Below are 989 of 8,415 comments submitted by advocates and supporters of the National Wildlife Federation Action Fund in regards to the Draft Grizzly Bear Restoration Plan/Environmental Impact Statement, North Cascades.

Thank you for releasing an environmental impact statement and draft plan that outlines a path forward to recover and restore grizzly bears in the North Cascades Ecosystem (NCE).

Grizzly bears belong in the North Cascades. They roamed the region for thousands of years and their eventual decline was a loss to biodiversity and to the cultural traditions of First Nations and Indigenous communities throughout the Pacific Northwest and British Columbia. Restoring and managing grizzlies in the North Cascades is an important step in bringing the full ecosystem back together and it's a critical step to larger grizzly bear recovery efforts in the lower 48.

I'm grateful for your leadership on this issue and encourage you to continue the recovery process in coordination with Tribal governments, local partners, and other stakeholders. Doing so will ensure that grizzly bears maintain a path towards full recovery for the benefit of future generations.

Sincerely,

Correspondence: We are completely against relocating Grissley Bears to North Cascades, this is iour back yard withing 50 miles, these bears will kill our livestock, amd at \$4500.00 per living cattle price it will help put us out of business. These bears are also a extreme danager to the public that hike and enjoy camping in North Cascades. I suggest relocating them to Down town Washington DC, OR Southern Border to help stop iillegal aliens coing into our country, WITHOUT tracking or vetting or Monitoring there location. DHD is gambling with future terrossim attack in our homeland. Stop the idea on relocating these bears. ANYWHERE.Except as noted or there current location.

Correspondence: Please don't add Grizzlies where they are not currently. Grizzlies and people have a poor interaction history. You are asking for problems. If people try and get close to an elk to take a picture with it imagine what happens when they do the same with a grizzly. They the bear will have to be destroyed. This is a bad idea. Please don't do this, for the people and the bears sake.

Correspondence: I support this initiative for the following reasons.

Some main points are;

They have been part of the ecosystem for 20,000 years and we don't have a complete eco system in the north cascades without them.

That it has been carefully researched and it will have minimal impact on people.

That grizzlies help to balance an eco system through spreading seeds in poop, fertilize soil, and keep other prey species in check.

Correspondence: Many years ago, grizzly bears roamed the North Cascades region of Washington. They carried a vital role in the ecosystem as a keystone species.

Tragically, these bears and many more predators were driven to the brink of extinction by humans. Today grizzlies are still functionally extinct in the North Cascades. It's time to bring them back!

The return of grizzly bears to their historic range is long overdue. We need to restore the North Cascades ecosystem, and to enable this iconic species to benefit the region and continue inspiring future generations.

As a resident of Washington State, I am excited at the prospect of grizzly bears returning to the North Cascades ecosystem. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

I support restoring grizzly bears to the North Cascades via Alternative C: Restoration with Endangered Species Act Section 10(j) Designation - provided that the accompanying 10(J) rule promotes the recovery of the population, ensures management is humane, prioritizes non-lethal management tools and enables humans and grizzly bears to coexist. Properly developed and implemented, the 10(J) rule will help increase human acceptance of grizzly bears as they return to the landscape.

As a keystone species, grizzlies will have a vital role in the North Cascades ecosystem. It is crucial that we step forward NOW and protect these wild species and restore the natural ecosystems!

Correspondence: Please do not bring grizzly bears back to the North Cascades. The prospect of reintroducing grizzlies to the North Cascades saddens me because my family will visit less and have less interest in the park. I've spent many days with my sons in the park, without fear of dangerous human predators, and that will all change with the presence of grizzlies. These impressive animals have roamed the area for roughly 200,000 years, and are a natural part of the environment but as they were pushed out, people moved in to enjoy the natural beauty of the environment. If grizzlies move back in, many, including me, will stay away. The project also creates new conflict that is not currently an issues. Ranchers, farmers, and other area residents don't need new problems to deal with. I don't think creating problems is the intent of the National Park Service but it will be the result for many, including our family. Please do not bring grizzly bears back to the North Cascades.

Correspondence Type: Web Form

Correspondence: Dear Director Williams and Director Sams,

Below are 997 of 8,415 comments submitted by advocates and supporters of the National Wildlife Federation Action Fund in regards to the Draft Grizzly Bear Restoration Plan/Environmental Impact Statement, North Cascades.

Thank you for releasing an environmental impact statement and draft plan that outlines a path forward to recover and restore grizzly bears in the North Cascades Ecosystem (NCE).

Grizzly bears belong in the North Cascades. They roamed the region for thousands of years and their eventual decline was a loss to biodiversity and to the cultural traditions of First Nations and Indigenous communities throughout the Pacific Northwest and British Columbia. Restoring and managing grizzlies in the North Cascades is an important step in bringing the full ecosystem back together and it's a critical step to larger grizzly bear recovery efforts in the lower 48.

I'm grateful for your leadership on this issue and encourage you to continue the recovery process in coordination with Tribal governments, local partners, and other stakeholders. Doing so will ensure that grizzly bears maintain a path towards full recovery for the benefit of future generations.

Sincerely,

Outside Organization: National Wildlife Federation Action Fund Non-Governmental
Received: Nov,09 2023 10:29:47
Correspondence Type: Web Form
Correspondence: Dear Director Williams and Director Sams,

Below are 1,001 of 8,415 comments submitted by advocates and supporters of the National Wildlife Federation Action Fund in regards to the Draft Grizzly Bear Restoration Plan/Environmental Impact Statement, North Cascades.

Thank you for releasing an environmental impact statement and draft plan that outlines a path forward to recover and restore grizzly bears in the North Cascades Ecosystem (NCE).

Grizzly bears belong in the North Cascades. They roamed the region for thousands of years and their eventual decline was a loss to biodiversity and to the cultural traditions of First Nations and Indigenous communities throughout the Pacific Northwest and British Columbia. Restoring and managing grizzlies in the North Cascades is an important step in bringing the full ecosystem back together and it's a critical step to larger grizzly bear recovery efforts in the lower 48.

I'm grateful for your leadership on this issue and encourage you to continue the recovery process in coordination with Tribal governments, local partners, and other stakeholders. Doing so will ensure that grizzly bears maintain a path towards full recovery for the benefit of future generations.

Sincerely,

Correspondence: Good morning,

I am writing you in regards to the U.S. Fish & Wildlife Service and National Park Service's desire to bring grizzly bears back into Washington, specifically the Cascade Mountain Range. Grizzlies are an amazing beast and should be respected for their fierce and unwillingness to back down. They are truly an aggressive predatory animal that is at the top of the food chain. This makes them unafraid of humans and able to attack hunters, hikers and livestock. As a lifelong resident of Washington state, I love the great outdoors and have always been thankful that growing up I did not have to fear coming across grizzlies or wolves as a kid in the woods. As a father to six I do not look forward to an increase in predatory animals, especially wolves and grizzlies. It is my responsibility to protect my wife and kids, and purposely bringing grizzlies into Washington is viewed as an attack against my family. We love hiking and camping, and never worry about black bears because they are generally afraid of people when encountered in the wild. Grizzlies on the other hand are known to attack people in the wild. Take a minute or two and research grizzly bear attacks in Montana and elsewhere, it won't take long to find innumerable stories. With all of this said, I am pleading with you to do everything within your power to stop this re-introduction of Grizzlies into our state.

VR

Correspondence Type: Web Form
Correspondence: Dear Director Williams and Director Sams,

Below are 999 of 8,415 comments submitted by advocates and supporters of the National Wildlife Federation Action Fund in regards to the Draft Grizzly Bear Restoration Plan/Environmental Impact Statement, North Cascades.

Thank you for releasing an environmental impact statement and draft plan that outlines a path forward to recover and restore grizzly bears in the North Cascades Ecosystem (NCE).

Grizzly bears belong in the North Cascades. They roamed the region for thousands of years and their eventual decline was a loss to biodiversity and to the cultural traditions of First Nations and Indigenous communities throughout the Pacific Northwest and British Columbia. Restoring and managing grizzlies in the North Cascades is an important step in bringing the full ecosystem back together and it's a critical step to larger grizzly bear recovery efforts in the lower 48.

I'm grateful for your leadership on this issue and encourage you to continue the recovery process in coordination with Tribal governments, local partners, and other stakeholders. Doing so will ensure that grizzly bears maintain a path towards full recovery for the benefit of future generations.

Sincerely,

Correspondence: I oppose putting grizzly bears in Washington state because they are the most aggressive bears. They are a threat to wildlife and humans and can kill. There are more people moving into Cities near the Cascades away from the big cities and moving into such cities as Easton. Cle Elum, Rosylyn etc and other cities near the Cascades and It will put them at risk to these types of bears. I'm living in Kent and I hear about an occasional citing of a bear even in Renton and other closely populated Cities more and more. Do we need to worry about possibly seeing a grizzly bear getting into some of these populated cities by putting them In the Cascades. There could be a chance they may wander and endanger humans, wildlife etc. The population has grown in Washington state since they have been here. Why would you jeopardize human life and others doing this? California got rid of the massive grizzly which was seen as a threat to livestock or as a commodity or both back in the 1700's gold rush. Doing research on this on Google the bears were chased off lands newly occupied by sheep and cattle, often killed For a bounty, their pelts or meat. Because there are more hunters than Ever before this is bound to happen to the bears again. In Oregon state the grizzly has Been extinct since the 1930's, a victim of habitat destruction and over-hunting, Our human population has grown over the past decades and we don't need a threat to human life and wildlife since they are one of the most aggressive bears there are and can attack and kill. I was Born in Montana and my mother was chased by a bear in the 1950's In Kalispell Mt so do we need to put them in Washington a growing

populated state? My daughter lives on 8 acres in Cle Elum near Upper Peoh point do I have to worry about a Grizzly possibly wandering over there? That is the question we need to answer and Is it a possibility that this could happen.in these growing cities threat to Human life and Livestock animals?

Correspondence: Dear Director Williams and Director Sams,

Below are 2,610 of 8,415 comments submitted by advocates and supporters of the National Wildlife Federation Action Fund in regards to the Draft Grizzly Bear Restoration Plan/Environmental Impact Statement, North Cascades.

Thank you for releasing an environmental impact statement and draft plan that outlines a path forward to recover and restore grizzly bears in the North Cascades Ecosystem (NCE).

Grizzly bears belong in the North Cascades. They roamed the region for thousands of years and their eventual decline was a loss to biodiversity and to the cultural traditions of First Nations and Indigenous communities throughout the Pacific Northwest and British Columbia. Restoring and managing grizzlies in the North Cascades is an important step in bringing the full ecosystem back together and it's a critical step to larger grizzly bear recovery efforts in the lower 48.

I'm grateful for your leadership on this issue and encourage you to continue the recovery process in coordination with Tribal governments, local partners, and other stakeholders. Doing so will ensure that grizzly bears maintain a path towards full recovery for the benefit of future generations.

Sincerely,

Correspondence: There are 3 reasons that Grizzlies should not be reintroduced to the N. Cascades:

- 1) their ecological niches have been taken over and occupied by other species
- 2) climate change has added a lot of uncertainty as to the suitability and potential threats of and to the habitat for bears
- 3) and most importantly, bears are smart, lazy, and efficient foragers always moving toward the highest quality prey which in this region would be endangered wild salmon and hatcheries. So just as the outdated Marine Mammal Protection Act directly conflicts with recovery of endangered Chinook and resident Orcas, reintroduction of Grizzlies will add another challenge to the recovery and maintenance of salmon runs. Please don't do it!

Correspondence: I advocate implementing Alternative C as described in the Draft Plan and EIS. I am a lifelong admirer and visitor of Washington's varied and beautiful landscapes, including the areas proposed under this plan. I hold a strong conviction that the wilderness areas are some of the greatest gifts afforded to us all and we all have a responsibility to maintain them and if possible, improve them for future generations. Reintroducing the grizzly, in my opinion, is long overdue and if given a chance, it may play an important role in maintaining and improving the wilderness areas. I appreciate and understand the concerns of others regarding reintroducing the grizzly, but the grizzly is an important piece of the ecosystem that was forcibly removed and has long been missing from these critically few remaining areas where one can experience firsthand or at least take pride that we've chosen to keep these areas wild. Thank you for considering my comment.

Correspondence: Hello,

I personally think that if grizzly bears are planted in the cascade's that we are setting them up for failure. There are too many people that have moved closer to their habitat. Also, if you have driven North Cross at all this summer you would have seen the hundreds of cars parked at all of the trailheads. This year, in my opinion, at least double the amount of people than a typical year.

We are being reassured that they will not harm humans and if the current news stories that you read on a weekly basis recently there have been several bear attacks in other states. Yes, I realize that not all were grizzly but many of them were. I will never be convinced that they will not harm humans.

Also, as a sportsman they will have a big impact on large game animals that have already declined tremendously in the past 10 years already.

I really hope that you truly do take into consideration the comments of those that DO NOT want them planted. If a few roam down from Canada then so be it, as we have no control over that. But, again I really feel that they will be set up to fail.

Sincerely,

Ken Miller
11834 Family Forest Ln SW
Olympia, WA 98512

To whom it may concern:

I have farm and forestland where part of my stewardship plan to help a variety of critters survive and thrive, mainly by just avoiding the increasing pressure to convert.

I'm sure there are some biological reasons to what to introduce Grizzlies back into lands they may have existed before, particular to those folks who will never get off their couch but see something "cool" about this effort to help mother nature.

However, and especially when considering such an introduction into highly populated or high recreation areas for humans you must weigh the risks to humans against the benefits of reintroductions, particularly grizzlies.

Regardless of the cause, it's a certainty that such an introduction will lead to human deaths as some point in the future that would not have occurred without such an introduction. From a human moral standpoint you must assign a cost to that human life and weigh it against the benefits of introduction. If you decide the benefits are in fact worth more than one or more human lives then shame on you - and this would seem to open our government for some level of culpability for loss of human lives.

Maybe they will arrive naturally where you will have responsibilities to manage all possible for protection of human lives. . . . some culpability, but far more liability if you are responsible for introducing the grizzlies that ultimately/surely will kill some humans at some point of time (regardless of who's fault). It's one thing for humans to consciously go into grizzlie territory. . . . it's an entirely different decision for our government to intentionally put grizzlies into areas frequented by humans - where a human(s) are certainly going to be killed by bears at some point in time.

Beautiful, but dangerous animals have a place in our environments but that place is not where the risks of animal/human conflicts are high, and where at least some human deaths would have been avoided without such an introduction. Some decisions simply don't make sense regardless of what the laws/agencies seem to want/require - - this is one of those decisions where you can't go forward unless you are conscientiously asserting that introducing grizzlies is definitely more benefit to society than one or more human lives!!

Correspondence: Grizzlies are a keystone species that was driven to functional extinction by humans. Reintroducing should help bring back an important element to the ecosystem to help keep it in balance. While that isn't guaranteed, it is worth trying to validate the idea. While I understand hesitation others may have due to the dangers or inconvenience bears could pose to humans in the area, I think tools, strategies, and knowledge exists to allow us to coexist. While human safety and livelihoods should be respected and correctly planned for, we are not the only beings with a right to the land we live on and the land surrounding it. We don't fully understand our impact on the natural world around us or its impact on us. Every opportunity we can take to learn how to better coexist with it, as it was before we started making our impacts should be taken. This is the case because while we don't fully understand it, as the most powerful destructive force due to our infrastructure, tools, and intelligence, it is our responsibility to be stewards of the land. To me that means not assuming we know what is best, but doing what we can to mitigate our impact on it or doing what we can do restore it to what it was before. If it is not enough to believe it is our responsibility, I also believe the system is so sophisticated and complex, it is hubris for humans to think we know better. By restoring it, we are likely paving a road for the world to also be better for us. We have knowingly, but also importantly unknowingly done astonishing damage to the natural world we rely on to survive. I think the unknowing element is important, because even if we don't know or fully understand the benefit of working to restore what we destroyed, we can now equal work to unknowingly restore something that one day we may discover is hugely beneficial to our own survival and existence. I don't think restoring grizzly bears is the answer to the problem I am describing, but it is one of a multitude of solutions that are all necessary and important to embrace. We know we have done wrong before. We cannot let fear, lack of proof, or inconvenience stop us from doing what is right now.

Correspondence: I'm opposed to any actions that create further strain on the ungulate populations in Washington state. Recent actions by the WDFW Commission have increased predation pressure by wolves, cougars, and black bears throughout the state. Deer, elk, and moose populations are in decline as a result. Introducing yet another predator to the landscape further threatens herd health. It's a hard no from me on grizzly reintroduction.

The goal appears to be to spread grizzlies throughout the entire Cascade range and not limit them to the North Cascades National Park. I'm concerned that the implications of this are not being adequately communicated nor addressed with the public. The impacts of grizzlies are being minimized in NPS plan. And I see no discussion of cooperation among other agencies that will be affected, especially the WDFW Commission.

How will the grizzly population be managed if ungulate populations are foundering? Or if the grizzly population exceeds the goals laid out here? Will they be hunted or relocated to manage population numbers?

With how poorly wolf reintroductions have gone from an ungulate management perspective, I am firmly opposed to grizzly bear release in the North Cascades. I grew up in Washington and have spent countless days exploring and enjoying the North Cascades. I know that land intimately. Grizzly reintroduction is a hard no from me.

U.S. Fish and Wildlife Service (via electronic submission)

Re: 2022 North Cascades Ecosystem Grizzly Bear Restoration Plan/Environmental Impact Statement

The Vital Ground Foundation strongly supports the agencies' alternatives B and C to actively restore a population of grizzly bears to their historical range in the North Cascades Ecosystem under the Endangered Species Act. Vital Ground supports designating this populational as a 10(j) experimental population and alternatively supports restoring the NCE grizzly population without an experimental population designation and varying the number and frequency of proposed grizzly bear releases into the NCE to achieve the restoration goal in a shorter time period. Vital Ground does not support the agencies' no action alternative A.

The Vital Ground Foundation is America's only nationally accredited land trust dedicated to protecting and restoring North America's grizzly bear populations for future generations by conserving wildlife habitat and by supporting programs that prevent conflicts between bears and humans. Vital Ground accomplishes this by partnering with landowners through voluntary, incentive-based conservation projects to protect habitat, and by supporting community programs to prevent bear-related conflicts.

The NCE is one of two intact ecosystems within historical grizzly bear range that does not currently host a functional population of grizzly bears. Spanning more than 6 million acres, the NCE offers a singular and irreplaceable opportunity to return the grizzly as a vital link in the nation's wildlife heritage. Restoration of the species to the NCE will make significant strides in restoring the biodiversity of the ecosystem, and also contribute to overall grizzly bear recovery and enhance the probability of its long-term survival in the lower 48 states - where the NCE is the only ecosystem capable of supporting the species that is situated outside of the Northern Rockies.

Ecosystems where grizzlies are recovering show that people and bears can coexist. Millions of people live and recreate in grizzly bear country annually, and numerous highly effective educational outreach programs ensure that this could occur in

the NCE. Embracing grizzly recovery in the NCE will focus additional energy and resources from around the nation on ensuring a future for both bears and the people who treasure the abundant natural values of the ecosystem. Recovery of the species will also stimulate positive economic impacts far beyond the reach of those partners immediately collaborating on the effort. Tourism industries anchored on the lower 48 State's two model ecosystems where grizzlies have recovered – the Yellowstone and the Northern Continental Divide Ecosystems – are a testament to the benefits that large, charismatic megafauna like grizzlies bring to communities, and moreover, to current and future generations of outdoors enthusiasts.

Sincerely,

Correspondence: I am against moving any grizzlies to the North Cascades. We have black bears here already and they are generally less aggressive. Considering that many hikers are using the area, introducing grizzlies puts both people and the grizzlies at risk. There are many individuals who are not concerned about keeping the wilderness pristine, and my fear is that those who leave food and garbage around would give the grizzlies a taste for human food and potentially cause danger to those who act responsibly. This would not only lead to potential injury and death for innocent humans but also lead to the destruction of the grizzlies responsible.

Don Striker

Superintendent

North Cascades National Park Service Complex

810 State Route 20

Sedro Woolley, WA 98284

Re: Draft Grizzly Bear Restoration Plan / Environmental Impact Statement, North Cascades Ecosystem

Dear Superintendent Striker:

I write this letter as Representative of Washington's Fourth Congressional District to express my staunch opposition to the proposed Draft Grizzly Bear Restoration Plan Environmental Impact Statement (EIS) for the North Cascades Ecosystem. It is clear that the National Park Service (NPS) and the U.S. Fish and Wildlife Service (FWS) (collectively, the agencies) are moving forward with plans for the introduction of grizzly bears to the NCE, without listening to the concerns of the local communities that will be most impacted by the introduction of these bears. The concurrent release of this draft EIS and 10(j) rule indicates that the agencies have already made their decision and are ignoring the concern of my constituents who are against the idea of an apex predator being released near their backyard.

In both the EIS and 10(j) proposals, the agencies have detailed what they would consider substantive comments, saying "messages that simply say 'do' or 'don't' (i.e. just 'votes') are not considered substantive." Only considering comments that identify additional issues or concerns, other alternatives, or management actions from residents who might not have any knowledge of grizzly management is a good way to ignore the will of the public by putting guardrails on an "open" process. Limiting the scope of a comment during this process amounts to hindering an individual's First Amendment right to petition and speech and I urge you to reconsider this decision.

Furthermore, it is clear that environmental groups' views on the introduction of grizzlies is being prioritized over my constituents' perspectives. If proper order was followed, citizens would have had adequate time to review the EIS and offer input as to what alternative would be best for them and their communities. However, the concurrent release of the preferred alternative "C" as a proposed 10(j) rule has blatantly skipped a critical portion of input from the public. This was why I, along with five of my Congressional colleagues, requested an extension to the public comment period and additional in-person meetings for constituents to be able to have time to process the proposals being put forward. However, the agencies ignored our extension request, and crammed more public meetings into the already short time frame between publication of the EIS and close of the comment period.

For the last eight years, every time an effort has been made to introduce grizzlies into the NCE, hundreds - if not thousands - of my constituents have vocally opposed the effort. From farmers and ranchers, to outfitters and sportsmen, and those who came forward as members of the community- the message has been clear that grizzlies are not welcome in our backyard. Concerns about safety for livestock, crops, and family members are abundant. As seen with the introduction of the wolves, we know that these apex predators know no boundaries and will eventually end up in our communities.

The agencies thus far have refused to assuage citizens of these fears, including - what is the plan for dealing with crop loss and livestock depredation that is inevitable from the introduction of these predators, the timeline for issuing lethal permits, and how much will citizens have to lose before they can defend themselves from this predator in their backyard. My constituents and I urge you to select 'Alternative A' of the EIS and not release grizzly bears into the NCE.

Thank you for your prompt attention to this matter and please contact my congressional office with any questions and/or response.

Sincerely,

██████████

Correspondence: I am a 17 year resident of the Pacific Northwest, specifically the North Cascade foothills. I enjoy recreation time in the wilderness like so many in our area. I greatly support the reintroduction of grizzly bears into their native habitat in Washington State.

Aside from the benefits of returning an apex predator to the natural environment I would like to comment on the concern many have on living in the proximity of these magnificent creatures. Prior to moving to Washington I lived in Alaska. In the Anchorage Bowl, the urban setting blends with the wilderness. There people live among bears and other animals on a regular basis with very little negative interaction. The key is understanding the environment in which you live and preparing properly. Simple adjustments such as protective trash covers and an appreciation of animal behavior makes for a wonderful life in our modern world.

Please return the grizzly bear to our part of the world.

Correspondence: Do not re-introduce grizzlies into the North Cascades Ecosystem. This is a dangerous predator, and any human-grizzly interaction has potential for disaster. The ONLY OPTION IS ALTERNATIVE A: DO NOTHING.

You should also give more weight to comments from people affected by this draft proposal. It sounds great from apartments and buildings in Seattle - people there won't have to deal with any consequences of re-introducing this bear.

No one is stopping these bears from entering the N. Cascades Ecosystem from elsewhere. If this ecosystem could support a thriving population of grizzlies, they would already be there, but they're not. The fact is, the grizzly will not find enough food in the N. Cascades Ecosystem. Deer are scarce, so what will the bears eat for their protein source?

At a recent presentation in Mt. Vernon, WA, [REDACTED] spoke to the fact that grizzlies are opportunistic in their food sources. They will eat whatever is easiest to catch. So if there are no deer, what is the easiest to catch? Domestic animals, like cats and dogs, farm animals, like pigs, sheep, goats, cattle, chickens, ducks. And where are these animals? Peoples' yards and porches, farms, and ranches.

And let's not forget humans. These grizzlies will kill humans. No amount of education is going to prevent a grizzly from eating someone!

Why don't you re-introduce grizzlies in Seattle? Or Everett? It's just as likely the grizzly will stay in these cities as it is they will stay in the N. Cascades Ecosystem. And it's also just as likely the grizzly will eat someone in the city as they would in the N. Cascades Ecosystem.

This proposal is not sustainable. It's expensive to manage and it has potential for disaster for all involved. This same proposal has been tried and stopped multiple times in the past. Unfortunately, we need to stop the proposal again. WE NEED TO SAY NO TO RE-INTRODUCING THE GRIZZLY TO THE NORTH CASCADES ECOSYSTEM.

Correspondence: In reference to management unit 1.

The EIS states the decline of the grizzly bear was because of hunting. This is most likely NOT the case, for the area in the early 1900's was vary remote and not easily accessible by humans. Most likely it was because a change of habitat, which occurred with the construction of dams in the 1930's stopping all fish passage. The remoteness in 1900 would have made it almost impossible to kill all the bear, please remember the North Cascades Highway was not constructed until the 1970's. Very few humans ventured into the North Cascades in the early 1900's, except a few prospectors.. There are a number of other flaws in the EIS, that need to be researched further.

Correspondence: To whom it may concern,

I don't understand this effort. You state that people want to give them their habitat back: I don't, No. Just no.

I know that anything I say will have no impact, the environmental bureaucratic inertia behind this is already decided, but I will still state my opinion even if it is into the wind.

NO.

There is no reason to do this. None. It is a shiny object in the eyes of environmental bureaucrats. It is all downside.

Someone is going to die from this. What will definitely happen is more people will travel the north cascades trails ARMED. After you do this (for I know it is a fait accompli), after you do this, I would only travel if I was heavily armed. Do you want more people out on the trails with a gun?

No, just no.

Hopelessly commenting,

Correspondence: I write from my residence in the Methow Valley to comment on the efficacy of reintroduction of grizzly bears to the North Cascades area of Washington. I think it is entirely feasible, based on the documentation prepared by various agencies, and I urge you to finalize the EIS and issue an ROD in favor of Alternative C.

My conclusion derives from my research on the ecology of bears over 40+ years in Montana, BC, Alaska and Kamchatka that considered the role of bears in expansive river and mountain landscapes like the Cascades. The research shows that grizzlies play a key role in mountain ecosystems in a variety of important ways. They churn meadow soils while digging for rodents and nutritious plant tubers, a natural disturbance that promotes plant biodiversity and productivity. Put simply, grizzly bears were functionally important to the ecology of landscapes like the North Cascades and should be restored.

The main concerns against reintroduction are 1) that bears will kill livestock, 2) that there is not enough food in the mountains to keep the bears away from adjacent ranches and population centers, and 3) that they are dangerous to people. All of this is true, but over-blown and entirely manageable. Grizzlies and people live mostly in harmony in mountain landscapes of Canada and Alaska. In Kamchatka, Russia, I worked among the highest density of the big bears in the world for over 10 years without incident. The reintroduction of grizzlies in the Cabinet Mountains of Montana and substantial enhancement of populations in Glacier and Yellowstone have been notably successful and millions of local people and tourists annually enjoy the presence of the big bears in these iconic landscapes.

Why not the North Cascades? Yes, big salmon runs that once were important to grizzlies in the Cascades are largely gone (in spite of massive salmon recovery efforts that have failed miserably owing to lack of attention to science... but that is another matter you need to look into). But the bears do fine in mountain ecosystems without salmon, using alternative food sources that are naturally abundant in the Cascades.

Superintendent Striker, the bears and bear advocates need your support. It's time for grizzlies back in the Cascades. The reintroduction plan is sound and should be adopted.

Correspondence: I fully support restoring grizzly bears to the North Cascades ecosystem. I prefer alternative C - restoring bears with the 10-J rule. Grizzlies had been a part of the North Cascades wilderness for centuries. Humans are the reason they were extirpated. Humans also have the power and responsibility to restore grizzlies so the wilderness of the North Cascades region is whole again. I respect the opinions of those who don't want grizzlies restored. However, I don't agree with their reasons, particularly that grizzlies will attack humans frequently and/or that grizzlies will cause massive damage for farmers and ranchers. Large populations of people and grizzlies have been co-existing safely in other regions of the lower 48 states in the USA, without a 10-J plan for over 30 years. With a 10-J plan in effect, the recovery plan in the North Cascades carries even less risk than other recovery zones and provides wildlife officials and citizens with effective policies to minimize grizzly/human conflicts. The North Cascades will be another region in the grizzly bear recovery plan where people and bears will co-exist safely. I look forward to the grizzly bear recovery plan being approved, and grizzly bears to be released, in the North Cascades ecosystem as soon as possible.

Correspondence: While it may be historically and ecologically accurate to have this predator in the North Cascades it is idealistic to believe that Grizzlies can exist without negative impact to the human population.

The concept of Grizzlies in the North Cascades is an ecological novelty. It does not benefit the general population of Washington and costs taxpayers. Taxpayers are struggling with basic cost of living and a Grizzly program should not be added to this. Costs of a Grizzly program will increase as the population grows. It will require more compensation to farmers due to livestock lost or stressed, property damage as Grizzlies destroy outbuildings, more calls for Park staff to help with nuisance calls or relocation of bears that get too close to human populations, and the loss of revenue as fewer hunting tags are offered for those species that the bears need as prey (elk and deer).

The hunting opportunities of the Pacific Northwest has reduced year after year with little regard for the culture of its residents who value the tradition and rely on healthy elk and deer populations.

I do not support the introduction of Grizzly Bear into the North Cascades.

Correspondence: I am in favor of the reintroduction plan. It is well researched, including consideration of genetic diversity, habitat suitability, potential negative human interactions, and plans for monitoring translocated bears and future population numbers. I thought I had heard there were three proposed actions that we could comment on, but I'm not finding that information now. I'm in favor of adaptive management of the reintroduction process as the years ensue, modifying as required to eventually result in a viable population of genetically diverse bears, while minimizing the potential for bear-human conflicts. I have lived and worked in an area of high density of brown bears in Alaska. We can live compatibly: bears can thrive and people can continue to enjoy wilderness areas.,

Correspondence: Alternative A is the best option for reintroducing the grizzly bear population.

I am incredibly grateful that you are allowing the public to comment on this plan, and further humbled that you are taking the time to read my humble opinion. For that, I don't want to spend your time reading my thoughts on the impacts on recreation and human conflict because we don't really know the true impacts. Instead, I'd like to talk about the aspects of what I have the right to have an opinion on, where my money goes.

Using the amount of resources needed for introducing grizzly bears is excessive, with no real reason. We already have black bears in this area that fill the niche that a grizzly would in this ecosystem (though I understand its not exactly the same). I certainly feel bad that humans drove this bear from the habitat but resources should be used to drive up the numbers of animals we already have here. I am an avid outdoor person, spending an average of three days a week in the wilderness a year. I am often surprised at the lack of wildlife I see here compared to the states that border Washington with similar ecosystems. I appreciated that the plan attempts to outline potential income from tourism but there is not a good way to truly analyze the financial impact on tourism in the NCE. Especially because we would need to make enough on tourism to pay for ranchers for their dead livestock.

Again, thank you for taking the time.

Correspondence: I have been an avid outdoorsman for years spending many days afield hunting fishing and recreating. I have camped on Kodiak island and mainland Alaska with generally decent levels of safety in bear county. i know the risks and preventive and reactionary measures to insure my safety and have never had to DLP (defense of life and property) a bear to date. Having said that I would not bat an eye to do so and most likely would have the support of the State of Alaska if justified. This is where I have an issue with the reintroduction of Ursa Horribilis to the N Cascades. The way politics influences big game management in this state is absurd and lacks any real genuine scientific input with bear management. Look at the recent change of Spring Black Bear management in the state or lack thereof. The recent loss of the season due to politics and nothing more is absurd and nonsensical. Based 100% on emotions, feelings and yes politics. Couple with what all outdoorsman have witnessed with wolf reintroduction 15 years ago and the continued moving of the goal posts regarding what is considered healthy populations I am very suspect that the same will occur with Grizz reintroduction to the N Cascades. It will happen mark my word. The progressive environmentalists will get their way and the 25 bear will turn into 50 then 100 and so on. Just look at YNP for how this has occurred. Bears are now finding their way into the crop lands to the East, the small towns and cities in Wyoming and of course the human- bear interactions have quadrupled in the past 3 years. ALL due to lack of management. Bears have become charismatic megafauna and city people have zero idea of what this means. If the Feds are so anxious start by dumping 12 breeding pairs in the South Bay Area to Point Ana Nuevo where the greatest concentration of Grizz existed in the 19 century and let's watch that little experiment unfold. Only then will you understand that micromanaging bears is fraught with peril.

Correspondence: I do not support the reintroduction of grizzly bears as outlined in this draft plan, for the following reasons.

1. I do not believe that North Cascades National Park (NOCA) is prepared to manage a grizzly population or its interactions with the public. While the draft claims that NOCA provides bear-resistant trash cans at its trailheads and campgrounds, in fact, NOCA removed many trash receptacles in 2023 and gave itself the label of "trash-free park." This policy resulted, predictably, in the improper disposal of trash (e.g. on the ground or in vault toilets) by the public, culminating in one

instance in which a vault toilet (at the Cascade Pass trailhead) was too full of trash to be pumped and was flooded with feces in the attempt. Given that NOCA implemented such a ludicrous and irresponsible policy for the disposal of trash, an obvious bear attractant, this very year, I do not trust park management to prepare visitors for grizzly interactions in the future.

2. I do not believe that this project is an appropriate use of money. If I added up the numbers in the table on page C-2 correctly, either of the proposed action alternatives will cost at least \$823,000 per year. This seems a lavish expense for a park that has consistently failed to hire new career scientists (to, say, monitor wildlife) as the older generation has retired. Most park divisions - trail crew, buildings and utility maintenance, native plant restoration, resources, and wilderness rangers - are understaffed at the ground level, where the day-to-day burdens of managing public interaction with grizzly bears will fall. In short, the park can barely staff itself and manage year-to-year operations, so I believe it would be inappropriate to spend this sum on an unnecessary project that it has not demonstrated the ability to manage. The money would, in my opinion, be better spent hiring permanent staff in the resources, maintenance, and wilderness divisions in support of the year-to-year operation of the park.

Correspondence: Reintroducing grizzly bears to the North Cascades is a very bad idea. We have a lot of hikers including our family. We often like to find locations in the North Cascades that are not as well traveled to escape the crowds. We do not want to fear running into a grizzly bear on one of our hikes. You say encounters with humans would be seldom but the truth is it would be likely at some point that a grizzly would kill a hiker. It is inevitable. And when it happens the blood of that hiker will be on your hands. The argument that "we're giving the grizzlies back their home" and "they balance the ecology" are garbage arguments. We spend a ton of time in the North Cascade wilderness and it is perfect the way it is. You are inventing a problem that does not exist. And wasting millions of tax dollars in the process.

Correspondence: OK,

/This is the second EIS I have read in my time. There first was the proposal to close the Summit ridge road on the west side of Hells Canyon during hunting seasons.

Like that EIS I find this one also lacking a bit. It seems to minimize the dangers of Grizzlies to humans.

If you put Grizzlies in that area you WILL have people Attacked. Think about it.

Grizzlies clearly are not in danger of extinction in the lower 48. If they were struggling at all you wouldn't be able to remove up to 70 of them from other areas. You wouldn't remove any.

While some people may want to experience Grizzlies, some may not. The problem with this is that those that want to experience grizzlies already have places to go for that experience. Those that don't want the experience will LOSE Wilderness experience. This is NOT a balanced equation.

I couldn't find much about costs other than adding personnel. Our country is some 30 Trillion dollars in debt. We cannot afford to continue spending money on projects that are not REQUIRED. Helicopters, education programs, etc....

When the wolves were reintroduced the other thing that was introduced is conflict.

The same will happen with the Grizzlies. It's just going to cause problems because the Grizzlies can't recognize boundaries.

Please, just stop this project, you've already wasted too much time and money. That money would have been better spent on trail maintenance.

Correspondence: We are unalterably opposed to reintroducing grizzly bears into any public lands, anywhere. After living in Montana for 30 years and always worrying about grizzlies on our backpacking trips, we finally moved to OR and then WA. In OR and WA we have not had to worry about damn grizzlies and we don't want that to change. These bears are stalkers. We have been stalked by one in MT, who followed our foot tracks in the snow 5 miles, from our parked truck into our cabin. It then circled our cabin many times during the night. Thank goodness our cabin had window barricades up for the winter and double, solid wood doors. There are enough grizzlies in MT WY and AK. Let them roam free there, but keep them out of the rest of the USA. We haven't had to carry a 44 mag for years now. We are so sick and tired of bear loving biologists, wanting to expose everyone outdoorsman to grizzlies, to say nothing of ranchers. We don't need dinosaurs and we don't need grizzlies. This is 21st century America and grizzlies don't belong here, not for people and not for other wild animals. Read the book Grizzly, and the encounters therein. What we need is some biologists to be mauled and eaten by grizzlies, not the rest of us outdoor users.
[REDACTED] lifetime hikers, backpackers and grizzly haters.

Correspondence: I have camped, hiked and hunted all over the state of Washington, including wilderness areas for more than 50 years.

The reintroduction of grizzly bears into Washington state will guarantee increased dangerous encounters between humans

and these bears.

That will result in two outcomes.

Injured, mauled and dead humans.

And dead grizzlies.

This is an incredibly stupid idea and plan.

Correspondence: I am dismayed that reintroduction of grizzly bears would be under serious consideration.

What is the objective? To run people out of bear territory? We already have plenty of black bears. Why do we need grizzly bears?

Here are some of the things people who live in rural areas are expected to do:

"Residents of rural communities throughout Idaho, Montana, Wyoming and Washington state, are being cautioned to remove bear "attractants" from their property. Fruit trees and berry bushes should be eliminated and electric fences installed

around bee hives, chicken coops, and children's play areas. Bird feeders are a big no-no, as well as compost heaps and unfenced garden."

So normal human activities will be subject to ever increasing restrictions in order to avoid conflicts with grizzlies. Or maybe we should just be confined to smart cities and never have any access to natural areas such as the Cascades.

Is that the objective of government reintroduction of grizzlies?

GRIZZLY BEARS are not endangered. But soon rural residents may be if our mountains overflow with these monster bruins.

Correspondence: Bring back the grizzly bears!

North Cascade grizzlies must have the same protection under the Endangered Species Act that all populations have. It is unacceptable for the U.S. Fish & Wildlife Service to issue a special rule for "a nonessential experimental population." The final Restoration Plan should account for the positive effects grizzly bear reintroduction will have on wildlife in the North Cascades, maximizing their beneficial role in improving the ecological diversity necessary for a thriving ecosystem. The National Park Service should craft the final Restoration Plan to account for the role humans play in minimizing human-grizzly bear interactions. While people are encouraged to enjoy recreational activities in and around the vast, sparsely populated North Cascades, the final Restoration Plan should prohibit hunting and encourage people to use non-lethal means to respond to and to deescalate any human-bear interactions.

The National Park Service should prioritize protections for grizzly bears over livestock grazing. Provisions to accommodate "management" of grizzly bears for the benefit of the livestock industry are not necessary.

"It is paramount that non-lethal methods are required to handle any conflicts between grizzly bears and property or livestock," says Rob Huss, senior attorney for FoA's Wildlife Law Program. "FoA urges the National Park Service to select the path forward that promotes the positive impacts and effects of grizzly bear reintroduction without short-sighted, lethal methods of 'management.'"

Correspondence: Thank you for the opportunity to comment on the reintroduction of grizzlies into the North Cascades. I am a retired FWS biologist who spent 25 years of my career in Alaska. I also commercial setnet for salmon with my husband in the Kodiak district. I have lived among grizzly and brown bears and had several interactions with them -- none hostile on either side. I spend part of each year in Winthrop, WA so have a keen interest in the reintroduction into an area I spend time in.

I have read the EIS and I think that its major flaw is a scientific calculation of carrying capacity. The historical records seem spotty at best with poor location data. I was not able to access the study that determined that the north Cascades could support 200-400 bears but I am skeptical of the number. There are no longer large numbers of mammals in the high country, when the relocated bears come out of hibernation there will be little for them to eat and I agree with the concerned ranchers and farmers that the bears may move to areas where there are livestock and other sources of food in the valley. Bears can range far and wide and have a strong sense for finding where the food is. I believe if the north Cascades habitat is bear country that some bears would have found their way there from populations further north.

One of my chief concerns that I did not hear voiced at the public meeting in Winthrop concerns expense. I understand the drive to implement recovery plans but I think this is misplaced planning and misplaced funds. 100 bears were killed in one month by Alaska Department of Fish and Game in an attempt to benefit declining caribou herds, the roadless area controversy in the Tongass National Forest threatens brown bear habitat in SE Alaska. Last fall 5 bears were killed in the Yellowstone area when they moved out of protected areas. None of the reports on bears populations already in the lower 48 sound positive. Before a lot of money is spent on reintroducing grizzly bears, we need to take better care of the bears that already exist. FWS has a backlog of refuge problems, threatened species, and other issues where money can be better spent.

I thought that the attention paid to the impact to recreationists, especially hikes on the Pacific Crest trail, was minimally addressed. Climate change and fire probabilities were also not adequately addressed

In conclusion, I support Alternative 1, the no action alternative.

Respectfully submitted,

RE: Draft Grizzly Bear Restoration Plan/Environmental Impact Statement

Thank you in advance for consideration of my thoughts regarding the proposal to re-introduce grizzly bears into the North Cascades ecosystem here in Washington state.

I am FIRMLY OPPOSED TO THE REINTRODUCTION of grizzly bears, as I believe the negatives far outweigh any positives.

1. The National Park Service and Forest Service are, sadly, chronically underfunded. The artificial re-introduction of grizzlies will be a costly affair, not only on the front end, but continuously as issues with the bears will need to be addressed. The money spent on the artificial introduction of grizzly bears, and the inevitable issues that will result, would be much better used to maintain trails, upkeep infrastructure and improve pay for park and forest service staff.
2. I question whether it would actually be a positive for our ecosystem to have grizzly bears present. Is the science truly settled? I think not. I will add that I do have an undergraduate degree in Zoology and studied ecosystems back in my university days, though admittedly not as a career.
3. The Cascade mountain range, as the crow flies, is not very wide and, with the amount of settled areas in the foothills on both sides of the range, human-bear conflicts will inevitably occur, both to the detriment of the bears and to the detriment of humans.
4. Areas with grizzly bears will need to be periodically closed to recreation due to various bear issues. This happens in areas such as Yellowstone. This will limit the public's use of potentially large tracts of wilderness. Why would we wish to do this when our outdoor areas are more and more crowded?
5. The Pacific Crest trail is one of America's premier hiking routes, enjoyed not only by our citizens but by outdoor adventurers from around the globe. Through-hikers travel as light as possible. The presence of grizzlies would necessitate bear proof containers and other cumbersome changes, such as the need to carry bear spray.
6. Solo hiking in areas with grizzly bears is sometimes forbidden, depending on the jurisdiction, and, even in the best circumstances, often unwise. As an experienced backpacker and mountaineer, I have greatly enjoyed the occasional solo trip into the mountains. This would no longer be possible.
7. Grizzly bears ARE dangerous. As a surgeon, I have personally provided follow-up care to survivors of bear attacks. The risk can be cited as "low" but the risk IS very real. When in the mountains, I most certainly do not wish to be continually nervous and looking over my shoulder worried about attacks either on myself, my friends, my children or my grandchildren,

whom I am now introducing to the outdoors.

8. Grizzly bears are common in Canada, yet they have not repopulated here on their own. The areas north and south of our borders is remote territory and I do not think civilized barriers are enough to prevent natural in-migration. I suggest the best approach is a "no action" approach to see if grizzlies will naturally relocate to the Cascades on their own.

9. Aside from the direct cost of bringing in grizzly bears and the ongoing cost of dealing with all the problems which will subsequently follow, the artificial re-introduction of grizzly bears will result in damage to the local economies. The Cascade mountains are NOT Yellowstone where tourists drive the many roads and are thrilled at the chance to see a grizzly . . . from the safety of their car. Access to the Cascades is limited and difficult. It is not an area that can be readily enjoyed from roads or even by short hikes. Thus, having grizzly bears will not induce additional tourism. I believe the opposite would occur. Most users of the Cascades are hikers, trail runners, backpackers and/or climbers, and the presence of grizzly bears will be a deterrent to visit. Also, as stated above, the inevitable need to periodically close off areas to humans will further diminish visitation. Less visitors will cause damages to local economies which depend on those who now adventure in the area.

I am not anti-predator. I fervently wish for the grizzly bears, in locations where they currently live, to thrive and be protected. BUT speaking as someone who has roamed mountain areas all over western US and Canada, in areas both with and without grizzly bears, I am firmly opposed to the artificial re-introduction of grizzlies and thus I vote for NO ACTION - ALTERNATIVE A.

Sincerely,

Correspondence: Hello,

PLEASE do not bring the grizzly bears to our area. I am very sad that they were eradicated many years ago - that should have never have happened. But bringing them in artificially like this is not the correct solution. It is not humane to the bears nor the people (like myself) who live and recreate here.

The deer population is already suffering from pressure from wildfires that are now common here, plus the pressure from hunting. There is not sufficient food sourcing for the grizzlies here - they will end up eating the struggling deer population as well as the cattle that are ranged here. There is not enough fish in the area for them to survive, either.

I am a lover of nature and the wild things. I love seeing the owls, moose, ducks, deer, skunks, black bears and all sorts of critters. But they all live here on their own.

Years ago, the National Park Service decided to import mountain goats into Olympic National Park. Now that the goats have overpopulated and started destroying the landscape there, the NPS is now killing the goats and exporting some of them to other areas where they are native to, like the Lake Chelan area. Why were the goats imported in the first place? Why was it

thought to be a good idea then and how was that any different than thinking it a good idea to import grizzlies into an area that is no longer their native territory?

I vote in many cases in ways that support the natural environment, including protection of endangered species. But if the NPS and USFWS decide to push this agenda in spite of public pressure, my ways of voting may lean in different directions to vote for people who will actually listen to the public instead of forcing their way against the wishes of the public. The Federal government is a wonderful thing, designed to serve the public and I am grateful for this, but if it chooses to ignore the public then the government needs to be changed by the way of the voters.

Please reconsider moving forward with this plan.

Thank you,

Correspondence: NO to Grizzlies

- During low salmon run years the black bears are skinny and are more prone to raid closer to residential areas for food. The Grizzlies would do the same with far more destruction.

- The relocated mountain goats did not stay in areas they were expected to. I would anticipate the Grizzlies doing the same or returning to thier original location.

- Would there be compensation for killed livestock or damaged farm facilities? Past programs did not adequately meet the requirements needed by farmers (elk with fences and damaged crops).

Correspondence: I am writing to support alternative A in the proposal to re-introduce grizzly bears to the North Cascades. I strongly oppose options B and C. It is indeed sad that human development and actions have displaced the grizzly bear population from so much of the United States, disrupting the natural balance of wildlife in our ecosystem. But today, tens of thousands of people visit the North Cascades National Park every year, and many more than that recreate in the North Cascades and Pasayten Wilderness areas, hiking, backpacking, hunting and fishing.

The risk of a hiker being attacked by a grizzly bear one day is exceptionally small. However, just knowing that risk exists affects every single day I am in the backcountry. I will no longer be comfortable hiking alone in the quiet with my dog. Now I should hike in a group, carry bear spray or a gun, make plenty of noise, and probably leave my dog at home.

We should absolutely keep and enforce grizzly bear protection laws. Let their numbers grow and they will move our way as they seek new territory. But before we try to unwind time and force their repopulation in our region, please consider how this affects everyone who walks into our mountains to find some solitude and quiet. I go to the wilderness to escape stress, not invite it.

Correspondence: This Is a horrible idea. Looks good on paper until you read anything at all about these apex predators an how many people survive attacks an what they do to wildlife , livestock , pets, habitat for wildlife , salmon whom are just barely making a comeback . Not to mention how many people living here can afford to buy all the expensive things required to grizzly proof trash , food , an property, land an homes from these huge normally aggressive creatures especially if a sow has cubs. If that happens whomever or whatever is as good as dead . How many children may stumble on them an surprise each other what do you think. Will happen to any children that encounter them ? An I doubt a child would think to carry bear spray at all times . Which by the way does not always work . Many times there have been people attacked an killed that deployed a whole can an still were killed . These arnt cute cuddly teddy bears these are ferocious normally grumpy when disturbed very vetu hungry apex predators whom have a super sense of smell they use to find as much food as possible cuz they need alot of food especially before winter an will kill an break anything to get it . It's very hard to scare them away . Their paws are bigger than a humans head an that's not counting their enormous claws that will Rip open a person's flesh like butter an huge teeth that will crunch an crush thro a person skull like it was an apple . There are enough predators here without purposely putting the top apex predator here an letting it loose. An no they won't stay in designated little spots they are told to . Kinda like the people crossing illegally here they have no clue where they are until murders start happening . No not all but quite a few do . An other crimes . Anyway sorry I couldn't resist that but this is a horrible an irresponsible an dangerous idea for our wildlife for our livestock for our pets an for us an for the habitat . I can't even believe somebody thought this was a good idea much less enough to push this thro an try to make it happen I can't for real see anybody that lives here being for this Assinine horribly scary dangerous plan to make this state a anxiety ridden nightmare where you have to spend alot of money to just try to survive a coukd happen anytime bear encounter an to attempt to protect your family from . No no no pls im begging you do not do this .

Correspondence: I am an avid outdoor person and hiked.vicam frequently in the North Cascades area. Any ecosystem is extremely complicated. We really don't know exactly how species interacted when grizzlies were last in the North Cascades. introducing an apex predator may have consequences that will be totally unexpected and undesirable. Not to mention that the human population and the number of hikers and other outdoor enthusiasts have dramatically increased over the years. Finally there is no fence between Canada and the US. If the grizzly population is under stress from overpopulation in the North, the will eventually migrate south anyway, on their own good time. I am 100% opposed to the reintroduction of grizzlies to the North Cascades.

NOT IN FAVOR Of the Re-Introduction Of Grizzlies Bears into the North Cascades
• Latin name of [URSUS ARCTOS HORRIBILIS commonly believed to be derived from "GRISLY"
MEANING "HORRIBLE"; which is resultant from the common meaning of "DREADFUL NORTHERN BEAR"

when it was classified in 1815. They have been around awhile and there known reputation. If you go to Google and type in horrible bear it pops up.

- Westerly reach of the North Cascades proposed area is too close to private landowners and allows for no buffet or small of a buffer to the easterly reach of the Skagit Valley which is in inhabited to an uncontrolled numbers of elk said to number 1800-2200 depending on the study. The Grizzly is an opportunist the elk will be the last thing they choose to act on the easy target. This open population of elk will act like bate and bring the "DREADFUL NORTHERN BEAR" , into our community only to prey upon domestic livestock and rummaging.
- It most cases when the Grizzly encounters with humans, that I have heard of, the Governing regulatory enforcement always blame the fisherman, the hiker, the producer first and not the bad actor, "DREADFUL NORTHERN BEAR" in the chance meeting.
- Radio collar technology did not work as expected when the wolf was introduces and bears are individuals and known NOT to travel in packs or numbers. Just to profess the effect of collar impact is not arguable as all "DREADFUL NORTHERN BEAR". No successful tagging project has been provided for conformation of governing claims.
- The Methow Valley on the Cascade Loop Scenic Byway was the last know area to have "Homestead the Act" which was known to have the "DREADFUL NORTHERN BEAR" in the area. A hay hauler shared with me that the last marauding grizzly bear known in the area was basically eliminated by an all-out effort by the locals amend with pitchfork and weapons that were acting when government efforts promised had failed.

Correspondence: I favor the 10j option for re-establishment of brown bears in the NCE.

Living on conservation lands adjacent to WA DFW lands outside Winthrop, I adjust my human activities and awareness to live alongside cougar and bear (and the more dangerous human hunters) who appear with seasonal regularity.

Having already spent two decades guiding hikers, skiers and climbers in the extended NCE back country, I am less concerned about the potential impact of limited Grizzly re introduction program than I am far more concerned about the impacts of catastrophic wildfire and the environmental impacts of human activity.

I do want to echo and emphasize that those who have expressed concern for the health of bear food supplies might also best be managed with a (modified by a tongue in cheek) 10j management plan that encourages adjusting bipedal hunting, grazing, watershed and fire-management practices to the benefit of all species who call the NCE home.

Correspondence: North Cascade grizzlies must have the same protection under the Endangered Species Act that all populations have. It is unacceptable for the U.S. Fish & Wildlife Service to issue a special rule for "a nonessential experimental population."

The final Restoration Plan should account for the positive effects grizzly bear reintroduction will have on wildlife in the North Cascades, maximizing their beneficial role in improving the ecological diversity necessary for a thriving ecosystem. The National Park Service should craft the final Restoration Plan to account for the role humans play in minimizing human-grizzly bear interactions. While people are encouraged to enjoy recreational activities in and around the vast, sparsely populated North Cascades, the final Restoration Plan should prohibit hunting and encourage people to use non-lethal means to respond to and to deescalate any human-bear interactions.

The National Park Service should prioritize protections for grizzly bears over livestock grazing. Provisions to accommodate "management" of grizzly bears for the benefit of the livestock industry are not necessary.

Non-lethal methods must be employed to handle any conflicts between grizzly bears and property or livestock. Please select the path forward that promotes the positive impacts and effects of grizzly bear reintroduction without short-sighted, lethal methods of 'management.'"

Correspondence: I am in favor of some grizzly reintroduction by means of both relocation as well as natural ingress.

However, I am not in favor of closing large areas of hiking trails and other low-impact recreation in areas of bear sightings.

Please do not go overboard with closing areas with overuse of caution but do enforce good human-bear cohabitation practices; no food, trash, close approaches, etc. You know this stuff better than I, smile.

I can't speak too much regarding livestock and human resource use and development near wilderness areas, other than I don't feel public wilderness lands should be governed too strictly by a minority of people in and near those areas.

Thank you for letting me get a few cents in on this!

Correspondence: Dear Superintendent Don Striker and Supervisor Brad Thompson,

I am in full support of restoring a healthy grizzly bear population to the North Cascades through reintroduction.

I own property within the Mt Baker National Forest and spend a lot of time recreating in the North Cascades. I have also lived for many years in western Montana where grizzlies are a much respected and often celebrated presence in the wilderness. In the minds of many, grizzlies are what make the wild areas of Montana and Alaska "Wild".

Wilderness that has lost its grizzlies feels less wild because it is incomplete.

I support Alternative C: Restoration with Section 10(j) Designation - relocating up to 25 non-problem grizzly bears into remote areas of the North Cascades over the next decade and manage them as an experimental population.

Alternative C is the best choice for bears and the people who live and visit the North Cascades Ecosystem. The plan is wisely modeled on what's worked in Montana where grizzlies are recovering in the Cabinet-Yaak mountains with few problems and with the acceptance and involvement of local communities. Furthermore, the 10(j) rule will give people more management tools to reduce, prevent, and sometimes respond to human-bear conflict. I agree that the 10(j) rule, if properly implemented, will help increase human acceptance of grizzly bears as they return to the landscape. It has proved very successful in Montana and, I believe, it can be equally successful here.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please bring back this native species to our state through the strategy laid out in Alternative C. Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations, and these are things all Washingtonians - like Montanans - can cherish and take pride in.

Thank you for your dedication to keep our North Cascades wild!

Sincerely,

Correspondence: Take no action on the North Cascade grizzly bear reintroduction plan. Present Skagit County human population is 74.5 residents per square mile. Way to high to minimize human and bear disasters. The North Cascade ecosystem grizzly bear restoration plan boundary lines go way beyond federal designated areas and include private property, farms and towns in Skagit County. RCW 77.12.035 which in part says "grizzly bears shall not be transplanted or introduced into the state". Allowing grizzly bears into private lands would violated RCW77.12.035. The elk are a burden to farmers and landowners and adding a dangerous predator for Washington State Fish & Wildlife to manage will lead to disastrous results. As all residents in Skagit County know the Washington State Fish & Wildlife Dept.can not even manage elk allowing the elk to damage private property at will and allowing 40% of the elk to become infected with the deadly elk hoof rot disease a death sentence for elk. Fish & Wildlife admits collaring grizzly bears is non-effective because it is not possible to know exact location at any given time. Fish & Wildlife admit there is no way to keep bears collared all the time. If our area was suitable habitat the grizzlies would be here. Putting bears in Skagit County will only disrupt and destroy our county ecosystem. The only option is do nothing.

Thank you

Correspondence: Comment period for Grizzly Bear EIS.

NCNP Superintendent and other involved with the EIS review.

I am against any projects to do with introducing grizzlies into the North Cascades.

Why? I have worked around them. My first job was with the Forest Service in Alaska. I was hired to do road surveys, mapping and timber cursing. But one of the other skills I listed on my job app was that I was also on a rifle team and we had gotten third place in the nationals. That skill helped me land my first job along with a degree in forestry. So I was the crew's rifleman. I know full well how it feels to have a grizzly look at you like your a Hostess Twinkie. Being looked at like that isn't forgettable(the term Hostess Twinkie was used during the Yellowstone fires to describe firefighters that may become bear food when they slept in the yellow GSA sleeping bags of that time period). Walking a trail or road with bear scat every 15 to 20 feet doesn't help that feeling. The rifle I carried was a 375 HH carbine with a short barrel. Short so that you could swing it quickly in heavy brush when you come up on a grizzly 10 feet or so in front of you. A heavy caliber so hopefully one shot could kill it. Besides the rifle I carried on the crew, everyone also carried either 357 or 44 magnum pistols, one individual carried a Model 1911 45. All heavy calibers also.

I am not opposed to any of the other apex predictors we have in our area, wolves included. But not grizzlies. Later in my career in fire management I went back to Alaska on an Fire Incident Management Team. Part of the firefighting up there involved ordering shooters to keep the crews safe day and night.

I also worked with an individual who had half his face ripped up by a grizzly. Not a pretty sight. I can only imagine the PTSD that poor guy has. I also have friends who live in Montana who live in grizzly country. Their backyard and garden space has a fence that would rival and penitentiary. Just to keep out the grizzlies. So no. I don't want to live on the outskirts of Federal land, living under these conditions. I don't need my home invaded by this apex predator. The black bears are quite enough. Damages done by Grizzlies can be pretty extensive also. A lot more so then that done by black bears. A series of cabins along a nearby river at the district I worked at in Alaska were pretty much destroyed by a grizzly that had an abscised tooth.

This area may have been used by grizzly at one time, but culturally times have change. We now have communities and towns in those areas, my home included. Where do you think the bears are going to go if they run short of forage in the high country. It'll be in the areas that people live now. People's farmlands, gardens, compost bins, river and streams where the salmon run. If people get invaded and threatened you know full well the guns are coming out whether their are restrictions on killing grizzlies or not. It already happens with the regular black bears.

Frankly I am tired of the National Park along with some of the other federal agencies trying to push approval to introduce more into our local area. Year after year it keeps coming up. At least since about 1988 when I first started to get some exposer to it. Pushed by those who have some romantic notion that it would be cool, politically appropriate, or historical. It stops being cool as soon as you become impacted by this apex predator.

Correspondence: I am in favor of option A (no action), thus allowing the grizzly bear population to naturally, and gradually, reestablish itself in the North Cascades of Washington State. I believe the active reintroduction of grizzlies into a region bordered by such a large human population, many of whom regularly recreate in the NCE, would greatly increase the risk of potentially fatal (for human and/or grizzly) encounters, whereas a natural repopulation would allow more time for humans and bears to adapt to each other's presence.

Correspondence: I support the grizzly reintroduction plan.

I believe the farmers and rancher's concerns are adequately compensated by the state. There is always some loss in farming and ranching from various factors.

My main concern is although the north Cascades has a lot of rugged wilderness, in the summer even the most rugged and remote areas gets hikers and climbers. Washington state has a large population of outdoor enthusiasts, more so than Montana, Idaho, or Wyoming. There will be hiker and grizzly encounters.

Your lessening the number of reintroductions and the radio collaring seems prudent, and allows more time for assessment of impacts.

I'm an outdoor person myself, and ok with sharing the land with mountain lions, wolves and grizzly bears.

Correspondence: November 10, 23

Dear Superintendents,

I support working toward a sustainable population of grizzly bears in the North Cascades Ecosystem. As a long time resident of the Okanogan, I have spent portions of many summers hiking in the Pasayten Wilderness, the North Cascades National Park, and other areas of the North Cascades. Admittedly, there is a sense of security knowing that I'm not apt to run into a grizzly in these meanderings. Yet, I am 100% in favor of bringing the bears back. These large, roaming omnivores are an integral part of our American ecosystems and heritage. In any tinkering, we would be wise to listen to Aldo Leopold's legacy of words and "keep every cog and wheel". In this case, our tinkering means bringing back a moth eating, berry picking, deer culling animal to roam what rugged country we have in northern Washington.

I am in favor of ALTERNATIVE C- RESTORATION WITH ENDANGERED SPECIES ACT SECTION 10(j) DESIGNATION, as outlined in the Draft EIS from September. 2023. I am no bear biologist, but it seems that this strategy will lead to a positive outcome for the bear population, and is socially responsive as well. And, with luck, the Alternative may give me a chance to see a grizzly in the North Cascades, preferably from the next ridge over and through binoculars.

Thank you for the opportunity to comment.

Sincerely,

██████████

Correspondence: I am glad that the process has gotten to this point, and I hope that it has the support to truly bring this apex species back in a meaningful way to the North Cascades Ecosystem. What we have seen with the reintroduction of wolves in the Greater Yellowstone Ecosystem is evidence that the positive impacts are far reaching in the natural world.

It is clear that the experts have weighed in and the evidence is substantial for the need and positive impact to come from bear restoration to sustainable numbers in the Cascades.

Correspondence: This is a fine detailed and constructive document addressing a big ecosystem gap. It is a noble effort. Having spent some time in grizzly country in Alaska, I appreciate the changes this implementation will bring. It is very humbling to realize one is not the apex predator in a wild environment. I like the NEP initiation. A shakedown cruise.

My thoughts, in no particular order:

The helicopter use is underestimated. Is there really such a thing as a 4 minute helicopter flight? There will be more and more flights, adding to the approximately 225 hours of flights annually. My impression is that grizzlies do not like helicopter noise and sudden appearance over a ridge any more than a wilderness backpacker does. Anything that alters a bear's foraging, feeding, resting, and hunting behavior, even briefly, seems like a bad thing.

And the NAVY jets! Little attention is paid to the horrendous noise and disturbance of these roaring monsters rumbling across ridges and valleys as they wish. The Growler is capable of speeds in excess of 1,000 mph. I have experienced these invasive machines flying low over Cascade Pass, and it is offensive to the max. Good luck trying to talk the NAVY into controlling their flight paths in this "Untrammeled Wilderness".

The low success rate of capture and translocation events referred to on p.66 are not encouraging. In my experience, if things can go bad, they often do. 77 fails out of 110 is not a good ratio. Just animal abuse and frustration, and very bad optics in the watching world.

Page 67. More bears, more take? Hmm. As for the 10(j) designation management authority ultimately improving the social tolerance of bears, this seems somewhat fanciful. If there are injury-related conflicts in the 10-year NEP, the social tolerance for bears will drop like a rock.

P.79. Ongoing and planned administrative Trends and Actions read like a dagger in the heart of wild creatures like grizzlies. Hydro project work. Habitat loss from logging and development. Vehicles of all types, everywhere. Ski Area expansion. Road relocation and construction. Trail maintenance. Firefighting. Cattle and sheep grazing. CERCLA mine cleanup. And, of course, the NAVY keeps flying wherever they want, whenever they want. Grizzlies are known to be adaptable. This will certainly test that belief.

P.87 Helicopters again. I see no mention of "Guide to Effects Analysis of Helicopter Use in Grizzly Bear Habitat" (Montana/Northern Idaho Level 1 Terrestrial Biologists Team FINAL-Version September 17, 2009). This is a useful document in the consideration of effects on grizzlies, and would be worth including in the analysis of this project. At Lituya Bay in the 1970's, there was research being conducted along the coast, using helicopters. A sow and two cubs attempted to swim across the entrance of the Bay, resulting in the drowning death of the two cubs. I found the dead cubs. It was my belief that the bears attempted to swim across the Bay entrance to escape the din of the helicopter. Thus my bias toward aircraft noise in grizzly country.

P.88. What elevation are the grassy meadow release sites? And will Karelian bear dogs be in attendance at release sites, for the protection of the release staff?

P.96. Any short-term adverse effects of blasting, on trail projects?

P.100. The NAVY, again. The quest for personal solitude is shelved when the jets are flying.

p108. Closures for public safety? Why? Wilderness is about taking your chances. Being humbled and awed by nature. The Fear will set you Free.

P.138. Why is the Farm Date from 2015 and 2017? Anything more recent? Things change in 6 years in farming....

I wish there had been more regional public meetings, say, in Seattle at REI, or in Bellingham, or Everett. There are a lot of NCE users in these areas, as opposed to Newhalem, where you might get 25 people to show up. It looks like you are trying to avoid the public.

Thanks for opportunity to toss in my thoughts. See you on the trail!

Correspondence: I would love to see grizzlies in Washington, my state. I use to live in Alaska and had the great pleasure to see grizzlies frequently in Denali N. P. These visions of sows with cubs and a huge male running along a river are amongst my life's most treasured memories. Moreover, our North Cascades will benefit from having grizzlies restored to their natural habitat, as Yellowstone has. It is understandable for people to have fear about grizzlies, but those fears are misplaced. People should fear the overpopulation of deer, as their population results in more human death, mostly by car accidents, than any other animal in our state. Bears could help with this overpopulation.

I strongly support action alternative C, but I have issues with some of the 10(j) rule that I will comment on in the appropriate place.

Thank you,

Correspondence: I do a lot of remote hiking & climbing in Mt. Baker-Snoqualmie National Forest and occasionally points north. 75% of the time I am traveling off trail on infrequently used "climbers" trails. Myself and others that engage in this type of activity are the most likely type to encounter a Grizzly bear so this is rather concerning for me. While I'd like to see more wildlife (this region is almost completely devoid of any except for Mountain Goats and Owls), I'm not sure Grizzly bears are the answer. While I feel safe being around black bears carrying only bear spray, with this large of a predator I would have to start carrying a firearm. I'm against doing so for various reasons (Mainly having to give money to the gun industry & carrying 3 lbs of additional weight all the time). I get that deadly encounters are rare, however you won't have much of an excuse when this does eventually happen. "We never saw this coming" wouldn't work so the best you could say is "We hoped this wouldn't happen." How about bringing in some less deadly animals instead? If people want to see Grizzly's they can go to Alaska. Its not that far away. Thank you for soliciting and reading public comments on this issue.

Correspondence: I support the restoration of grizzlies to the North Cascades, and that the restoration must be done in ways that don't violate the Wilderness Act and harm the area's wilderness character. This is good for bears and Wilderness. Both of the action alternatives as they now stand would violate the Wilderness Act. The action alternatives should be modified to avoid helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and steer clear of heavy-handed management of bears. There are many roads that bisect or penetrate the recovery area or dead-end next

to Wildernesses that could provide release sites without the use of helicopters inside Wilderness.

I oppose the use of a 10(j) rule for the grizzlies in the restoration work. This would mean grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana would be taken from their homes, dropped into the North Cascades, and lose their previous protection.

Correspondence: Dear Superintendent Striker,

As a property owner in Stehekin and recreationist in the North Cascades, I am opposed to the introduction of grizzlies in the North Cascades Complex. I don't believe this was a historical range or that there was ever a population in the Stehekin/Glacier Peak/ Methow areas. My family came to the Stehekin valley in the 1890's as prospectors and there has never been any history of grizzlies in the area. There was no one before that time to eliminate a viable population.

I have backpacked over most of the trails in the area over the past 60 years. I will definitely have misgivings about family or friends encountering a grizzly on a trail. This introduction would certainly have negative impact on the Stehekin residents and visitors. The chance of an encounter with a grizzly is not going to increase visitation. This is not Yellowstone where you can sit in your car and observe the wildlife. We are out on the trails, in the backcountry, recreating.

I feel the National Park Service and US Fish and Wildlife keep pushing for this despite the number of times we have said we don't want it. If it is such great habitat for grizzlies, let it happen with natural recovery.

Thank you for your time and consideration of this comment.

Correspondence: Thank you for the opportunity to comment on the draft environmental impact statement (EIS) for grizzly bear restoration to the North Cascades Ecosystem (NCE). I applaud the development of alternatives in the draft EIS and the careful use of the best available science to identify how best to recover bears.

I strongly support reintroducing grizzly bears to the NCE. It seems clear that without moving bears, chances for achieving a viable population of bears in the recovery area are extremely low. Moving expeditiously to restore a top predator to prime habitat in the NCE is important in achieving the goals of the Endangered Species Act (ESA), which include conserving "the ecosystems upon which endangered species and threatened species depend," as well as conserving individual species.

I have reviewed the draft EIS and generally support Alternative C, which proposes to move 3-7 bears a year for 5 to 10 years to achieve an initial population of 25 individuals. Use of the 10(j) will provide management flexibility to address any issues or conflicts with bears. I do have some concerns using that rule if First Nations in British Columbia reintroduces bears in the portion of the NCE north of the border and how those bears might be responded to if they move across the border.

Again, thank you for pursuing recovery of grizzly bears in the NCE and for the opportunity to comment on the alternatives.

Correspondence: I am an environmental historian, wildlife ecologist, professor, and founder and facilitator of the California Grizzly Research Network.

Since we will likely be going through a similar process for grizzly bears here in California in the not-too-distant future, and because I have longstanding connections to the North Cascades, having worked there as a NPS ranger as a young man decades ago, I read this EIS (as I did the previous NCE EIS) with great interest. The thing that strikes me about this document is how long it took to accomplish so little. Few of insights contained in it were unknown two decades ago. We've gotten to a point where studying these issues indefinitely is an end unto itself, with little benefit- -and this comes from someone who is dedicating his life to studying these issues!

So what on earth are we waiting for? There is nothing more we need to know. It's time to act. I support recovering bears in the North Cascades. I also support helping in nearby communities adapt by fostering a culture of coexistence that will enable them to live with their old neighbors once again.

I strongly support alternative B, and I call for implementing it yesterday.

Correspondence: North Cascade grizzlies must have the same protection under the Endangered Species Act that all populations have. It is unacceptable for the U.S. Fish & Wildlife Service to issue a special rule for "a nonessential experimental population." The final Restoration Plan should account for the positive effects grizzly bear reintroduction will have on wildlife in the North Cascades, maximizing their beneficial role in improving the ecological diversity necessary for a thriving ecosystem.

The National Park Service should craft the final Restoration Plan to account for the role humans play in minimizing human-grizzly bear interactions. While people are encouraged to enjoy recreational activities in and around the vast, sparsely populated North Cascades, the final Restoration Plan should prohibit hunting and encourage people to use non-lethal means to respond to and to deescalate any human-bear interactions.

The National Park Service should prioritize protections for grizzly bears over livestock grazing. Provisions to accommodate "management" of grizzly bears for the benefit of the livestock industry are not necessary.

Thank you.

"The human appetite for animal flesh is a driving force behind virtually every major category of environmental damage

now threatening the human future - deforestation, erosion, fresh water scarcity, air and water pollution, climate change, biodiversity loss, social injustice, the destabilization of communities and the spread of disease." - The World Watch Institute

Correspondence: I favor Alternative A, the no-action alternative. The need for grizzly bear recovery in the NEP was not established. We do not need more grizzlies in Washington State. Grizzlies will survive in Wyoming, Montana, Idaho and even northeast Washington without introducing them to the NEP. There is plenty of biodiversity in the NEP without grizzlies. If you want to make wilderness areas more "natural" then you need to reintroduce indigenous hunting in the wilderness areas and national parks along with the grizzlies. But this was not included in your action alternatives.

Introducing grizzlies in the NEP makes no common sense. The NEP is not in rural Montana or Wyoming. Millions of people live just to the west of the NEP. There is too much potential interaction between people and grizzlies once the bears reach a population of 200 or even 280 per your most recent estimate. Even if people follow all the grizzly precautions, people will still die. In Banff National Park this year two people who took all the bear precautions and used bear spray, were killed by a grizzly. Grizzly enthusiasts can travel to Montana or Wyoming to see the bears.

I think natural recovery was too quickly dismissed. With Canada about to reintroduce grizzlies to their part of the NEP, that will gradually cause recovery in the U.S. There was no proof provided showing that grizzlies won't cross the border and stay in the U.S.

Puget Sound suburbs are experiencing more and more problems with black bears. The EIS states that black bear and grizzly bear ranges overlap, but there was no definite analysis showing that grizzlies won't eventually displace black bears more into the suburbs once the grizzly bears reach the 200 to 280 level.

While the WCA strives to be collaborative, we have grave concerns with the grizzly bear introduction. Bears have the potential to be destructive in ways we aren't prepared to handle, and they pose a risk- -not just to our livestock- -but to human life as well. WCA has raised these concerns with the federal government repeatedly and we urge Washington, D.C. to listen to the needs of Washington state.

Sincerely,

Correspondence: I see absolutely no valid reason to re-introduce grizzly bears into the Cascades in Skagit County, WA or anyplace in the proximate area of Skagit county.

This plan to re-introduce them is not only a danger to human life and livestock and crops but is also a costly, needless expense. The grizzly bears are currently doing fine proliferating in other less populated areas of the northwest and Canada.. Leave well enough alone and let nature do the populating at the present time.

Correspondence: I support Alternative A, the No Action Alternative. Leave the bears alone and let them repopulate Washington on their own if and when they desire. There are currently more than 2,000 grizzly bears in British Columbia and Alberta and there are minimal barriers to natural relocation to Washington, Idaho, and Montana if the bears decide to expand their territory. There is no need for federal action to reintroduce grizzly bears to Washington. Sportsmen, ranchers, and people living and recreating within proximity of the North Cascades National Park rallied strongly in 2017 against what is referred to as Alternative B in the revised EIS. NPS and USFWS have developed Alternative C for this version of the EIS to hopefully soften the repulsion people felt for the original heavy-handed version offered as Alternative B to this draft plan. The document clearly identifies Alternative C as "nonessential" and "experimental" under ESA section 10(j). Federal reintroduction of grizzly bears to Washington is a violation of state law, a waste of taxpayer money, an increased risk to citizens' safety, property, and animals, and should not be considered or allowed. USFWS and NPS constantly complain about a lack of funding to adequately maintain and operate national wildlife refuges and national parks so why are they wasting millions of dollars on this attempt to forcefully reintroduce a species to an area where it is not needed or wanted? Further, Alternative C attempts to open the door to grizzly bear reintroductions throughout the state by creating three management zones that include the Blue Mountains, southern Cascade Mountains, southwest Washington and nearly the entire state except the Selkirk Ecosystem where there are already grizzly bears. This is totally unacceptable unless the burden of dealing with the cost of any deaths, injuries, or damages caused by grizzly bears will forever be the responsibility of the NPS and USFWS (i.e. the federal government). Do not expect this burden to be borne by the WDFW and citizens of Washington. Alternative A is the only acceptable alternative.

Re: North Cascades Ecosystem Grizzly Bear Restoration Plan / Environmental Impact Statement

Submitted via National Park Service (PEPC) Planning, Environment & Public Comment website

Dear Superintendent Striker:

We are writing on behalf of Skagit Audubon Society to provide comments on the North Cascades Ecosystem Grizzly Bear Restoration Plan / Environmental Impact Statement (Plan/EIS). We are commenting separately to the U.S. Fish & Wildlife Service on the proposed establishment of a nonessential experimental population of grizzly bears in the North Cascades Ecosystem and approval of a 10j rule.

Skagit Audubon, the Skagit County-centered chapter of National Audubon, has 481 members living in or near Skagit County, Washington. We share the Audubon mission to conserve and restore natural ecosystems, focusing on birds, other wildlife, and their habitats for the benefit of humanity and the earth's biological diversity.

Consistent with the Audubon mission, we support the decision to restore grizzlies to the North Cascades that was made 32 years ago when the Interagency Grizzly Bear Committee designated the North Cascades Ecosystem (NCE) a grizzly bear recovery area. The 1975 listing of the species under the Endangered Species Act established a legal requirement that this species be restored. The large, mostly publicly owned and protected area of the North Cascades Ecosystem is an appropriate place to do that. In calling for national parks and congressionally designated wilderness areas to be maintained in their natural condition, the National Park Service Organic Act of 1916 and the Wilderness Act of 1964 also obligate the land-managing agencies to restore the grizzly bear. We want this keystone species to once again fill the ecological role it had for thousands of years.

We agree with the Purpose and Need and the objectives stated in the Plan/EIS and find the plan to be thorough and well-considered. We offer the following further comments.

1. We support Alternative C with the accompanying 10j designation and rule.

Alternative C with the designation of a nonessential experimental population and a 10j rule should alleviate the concerns expressed by some members of the public. Skagit Audubon's support for Alternative C is bolstered in part by the experience a number of our members have from years of living, working, and recreating in Yellowstone and Glacier National Parks and various parts of Alaska. We support the statement, "(The preferred alternative is the alternative that) would best accomplish the purpose and need of the proposed action while fulfilling the statutory mission and responsibilities of the agencies, giving consideration to economic, environmental, technical, and other factors."

2. Possible effects of helicopter use on Marbled Murrelets and Northern Spotted Owls have been addressed.

We appreciate that the possible adverse effects of helicopter use on Marbled Murrelets and Northern Spotted Owls mentioned in our scoping comments of December 11, 2022, have substantially been addressed. Effects on Marbled Murrelets can be avoided by not using any staging or release areas closer than 55 miles to marine waters. Please make it clear in the Plan/EIS that the potential effects from helicopters should be a consideration both when landing at and departing from both staging areas and release sites.

We appreciate the statement that, "Impacts on ground-nesting birds would be minimized through pre-release site assessments, and areas with active nesting would be avoided." Such assessments should also be done at staging and release areas close in time to the planned helicopter activity for Northern Spotted Owls and, if within 55 miles of the coast, Marbled Murrelets.

3. Please minimize use of helicopters to transport people monitoring grizzly bears.

Within the limits of safety, please minimize use of helicopters over Wilderness to transport staff doing post-release monitoring, retrieving collars, and examining grizzly mortalities. These matters are addressed in the wilderness impacts analysis, but please strengthen the wording about doing by foot what can be done without aircraft.

4. Why is the Glacier Peak Wilderness (GPW) omitted from the Wilderness impacts analysis?

The analysis of the proposed action's effects on wilderness in Plan Appendix E addresses the Stephen Mather Wilderness and the Pasayten Wilderness but not the Glacier Peak Wilderness (GPW). The map in the Plan/EIS showing the release areas depicts the southern release area as including part of the GPW. Is there a reason for the GPW being shown on the map as part of a release area but being omitted from the Wilderness impacts analysis?

We appreciate the opportunity to comment. Thank you to all the staff involved in preparing this thorough plan and E.I.S. Please address any questions about our comments to Skagit Audubon Society, P.O. Box 1101, Mount Vernon, WA 98274 or conservation@skagitaudubon.org.

Sincerely,

Correspondence: I am opposed to the grizzly restoration in areas not extremely far from my home. To say grizzlies will be "managed" is hard to understand. This is a wild animal, unpredictable, an apex predator - not something you can reason or negotiate with when confronted. There WILL be fatalities - either bear, human, livestock, or other innocent animals. Can your agencies guarantee safety for all? I am concerned for the Washington State park/natural resources employees that will have to contend with the results of your decision. Does our state even have the amount of staff hired and trained that it will need?

The Chelan and Wenatchee Valley areas are full of orchards, vineyards, wineries, agri-tourism businesses, and land owners with livestock. Can you guarantee that eventually a grizzly won't see these areas as food sources?

I have also read that if these bears are in designated protected wilderness areas, it is PROHIBITED to use helicopters and any other motorized vehicles to "manage" them. Also, the bears may be taken from Montana where they are afforded more protection, and placed in our area where the 10j rule allows for potential killing I think there are too many variables to consider to effectively reintroduce a grizzly population here.

This area has seen an increase in the cougar population - even in residential neighborhoods. We do not need another predator here.

Please do not proceed with this plan. Let grizzlies make their way into the North Cascades on their own if that's what nature intends.

Correspondence: I strongly support the reintroduction of Grizzly bears into the North Cascades. Grizzlies are a keystone species and absolutely should be restored as an integral part of a healthy and natural North Cascades ecosystem. Public fears and the opposition based on them regarding supposed risks of human-bear conflict are unfounded and I hope that the project can also serve to spread legitimate, science based knowledge about the important role Grizzlies play in our environment.

Correspondence: Dear National Park Service and Fish and Wildlife Service:

North Cascades Conservation Council offers these comments on the Draft Environmental Impact Statement (DEIS) for the reintroduction of grizzly bears to the North Cascades Ecosystem. Our enthusiastic support for the return of grizzly bears to the Ecosystem is tempered by our concerns over the process proposed to reintroduce bears, and the management of bears post-placement.

The first principle for successful reintroduction of grizzlies is to do no harm to existing bear populations or to wilderness, and to safeguard reintroduced bears. The reintroduction plans contemplated in the DEIS Alternative C appears poised to violate this principle. We cannot support any reintroduction plan that involves intensive use of helicopters in wilderness, and the haphazard killing of reintroduced bears under vague pretenses. The way to get grizzlies flourishing in the North Cascades is to protect wilderness, not desecrate it while killing bears. Therefore, we support implementation of Alternative B.

Reintroduction Targets

We are generally supportive of the target of a local population of 200 bears over the long-term. We generally agree with the process of introducing a small group of bears each year over a period of five to ten years. However, we feel that an initial population of 25 bears may be insufficient to obtain the 200 bear objective when considering the limited breeding stock, limited potential for interbreeding with outlying grizzly populations, and the proposal for lethal means of managing bears. We would favor a firm commitment to reintroduce a minimum of five bears per year over an eight-to-ten-year window.

Reintroduction Process

The EIS should include a review of all previous grizzly reintroductions anywhere in North America to determine the level of, and reasons for mortality that occurred both during the transport of bears, and due to the unsuccessful adaptation of bears within the first 3-6 months post-reintroduction. Every effort should be made to avoid repeating past mistakes, and to reduce, if possible, the shock to bears of being drugged, transported, and placed in an unfamiliar location. The EIS should identify whether and to what degree causes of mortality can be avoided, and whether on balance any given reintroduction plan's value outweighs the deaths of bears it will cause.

Sources from which to Glean Grizzlies

While we recognize that travel distance is a factor in ensuring the safe relocation of grizzlies into the North Cascades, we believe bears should only be gleaned from places where the existing population is stable and flourishing, and would be expected to remain intact even after removal of some bears. We are not presently comfortable with removing bears from anywhere in the lower 48 United States.

Furthermore, bears should not be gleaned from populations whose primary food source differs from the available food sources in the North Cascades. For example, it would seem unwise to reintroduce bears that have adapted to coastal food sources.

Public Education Program

A grizzly recovery effort should be accompanied by a more intensive public education campaign than is proposed. It should of course involve both federal and state government, focusing on communities and popular recreation sites surrounding, and within Zones 1 and 2 to minimize potentially dangerous encounters between grizzlies and humans.

An intensive information campaign would involve how to identify grizzly bears; how to avoid areas where grizzlies are likely to be present at specific times of the year; what to do if encountering a grizzly; how to bear-proof campsites and residences; a requirement to carry bear spray in the backcountry; what brands and/or intensities of bear spray to carry and how to use it; the value of noisemaking devices to scare off bears.

The State of Washington should educate hunters (bear hunters or pursuers of other game animals) on how to distinguish a grizzly from a black bear. Killing a grizzly bear for any reason other than justifiable self-defense should be met with legal consequences under the Endangered Species Act to be enforced by the respective federal and state agencies.

10(j) Designation Under the Endangered Species Act

We are including our position on the designation of the North Cascades grizzlies as an experimental population under Section 10(j) of the ESA in these comments, as this issue is directly related to the overall goal of establishing grizzlies in the North Cascades. This is not a separate issue. It isn't clear why two separate sets of comments are required when the 10(j) rule is proposed in one of the action alternatives (C) and not in the other (Alternative B).

If the objective of establishing a breeding population of grizzlies in the North Cascades, and in suitable habitat outside the Ecosystem (outside of Zone 1) is to be realized, half-measures will not suffice. Assessment of whether the existence of grizzlies is compatible with present land uses and activities has already been made with the decision to pursue reintroduction.

Such determination should consider the fact that grizzlies were extirpated from their traditional range in the Ecosystem due to perceived land use conflicts. Humans killed all grizzly bears in the North Cascades rather than adapting land uses to the ecological necessity of top-tier predators across the landscape. This reverse-logic process should not be repeated.

In consideration of the three management zones, management direction for Zone 2 should not differ from Zone 1. In Zone 3, killing of bears should be limited to cases where a person is in imminent danger of being harmed or killed by a grizzly. It should be an accepted principle that grizzly bears will self-restrict to preferred habitat in wild places where conflicts with humans other than recreation users would be unlikely.

We oppose 10(j) designation for North Cascades grizzlies and instead encourage the implementation of public education measures that reduce human/bear conflicts and preclude the perceived need for lethal means of managing bears, as described further in these comments. Alternative B satisfies most of these concerns. The purpose of reintroduction of grizzlies is to amend the mistakes of the past, so why compromise that principle? The alleged need for a 10(j) designation has been described as a "...larger tool box." When the main tool in the box is a high-powered rifle, the designation is contrary to the purposes of the project.

Human Use Issues

Management of bears that may pose threats to livestock should be more detailed. There should be a distinction between grizzlies threatening livestock on public land open range versus contained livestock on private land. Lethal force should never be used to protect open range livestock: federal land should be considered bear territory. The standard for addressing bear interactions with livestock on private land should stipulate that bears may only be disturbed if they directly threaten livestock (attacking animals) rather than merely their presence in areas where livestock are present.

The first option to address bears that directly threaten contained livestock should be relocation, not killing. The option of supplying ranchers in the wildland urban interface with rifles that discharge tranquilizer darts whereby bears would be disabled to await relocation by federal officials, is preferable to deadly force at the discretion of the livestock operator. In the relocation effort, every bear should be considered an integral part of ecosystem restoration rather than an expendable resource.

We are also concerned that logging operations are listed under direct threats to human uses. We fail to see the need to have any distinction between bears interacting with recreationists in backcountry than with personnel on logging operations. This directive implies that logging companies may arbitrarily kill bears that are in the general vicinity of a logging operation.

Helicopters in Designated Wilderness

We implore the Park Service & FWS to explore and analyze all options to the use of helicopters in designated wilderness, and in roadless areas. Based on available information and common sense, we believe the use of helicopters in designated wilderness for reintroduction of grizzlies is not a necessity but an unnecessary convenience in violation of the

Wilderness Act. No exceptions to the Wilderness Act should be pursued. There are several locations where bears could be successfully placed with wide geographic coverage using ground-based vehicles on existing, open roads, and/or using helicopters without landing in designated wilderness.

Exceptions to the Wilderness Act should be limited to emergency situations where human life is at stake, not the contradictory objective of facilitating the reintroduction of native species that depend on wilderness for survival.

We have identified several locations outside areas of human presence where reintroduction can occur on existing roads with no helicopter use: Slate Peak near Hart's Pass; roads end on the upper Twisp River Road; the end of Eightmile Creek Road south of the Pasayten Wilderness; the road along the Chiwawa River near Trinity; the end of the road at Cascade Pass, the end of Road 11 above Shannon Lake.

Helicopter reintroductions could occur outside of designated wilderness in, but not limited to, the following locations: Golden Horn in the upper Methow Watershed; Burch Mountain at the headwaters of Eightmile Creek; Foggy Pass on upper Canyon Creek; Lamont Lake at the headwaters of Cedar Creek; Easy Pass; Cub Lake at Prince Creek; Evergreen Mountain near Beckler River; Indigo Lake in the Suiattle River Watershed.

All the above locations would allow a wide distribution of grizzlies throughout Zone 1 without using helicopters in designated wilderness, or at all. However deep into backcountry bears are placed, released bears will presumably remain in backcountry, and migrate to the habitats necessary for their survival.

In addition, for management of bears post-release, access to bears in designated wilderness should be by foot or pack animals only- no continued use of helicopters for ground examination should be permitted. The EIS should state more succinctly what human intervention would be deemed necessary (not just "desirable") for bear survival after bears have been released.

Connecting Island Populations

As you know, the 10(j) rule considers a reintroduced species that is geographically isolated from other occupied habitats as experimental. This begs for a solution to creating populations that will remain isolated. Although it may seem outside the scope of the EIS analysis, we highly recommend there be disclosure in the EIS of measures that can be taken in specific areas to facilitate connectivity between grizzly bear populations in the United States and Canada in the future.

Connectivity is essential to facilitate inter-population migration to diversify the grizzly gene pool. Such analysis would include identification of areas where habitat restoration could occur on public land between the North Cascades and federal land in the Idaho panhandle and northwestern Montana, and populations in south and central British Columbia.

The EIS should disclose what measures would be needed in the respective areas for example, road closures and other means of habitat restoration. This consideration would set the stage for the overarching objective of expanding habitat to restore grizzlies to areas of historical existence outside island populations by creating seamless habitat.

This concludes our comments. It is refreshing to comment on a federal proposal that would restore the natural world. We are grateful for the time and effort the National Park Service and Fish and Wildlife Service have invested in the effort to restore native grizzlies to their former habitats.

Sincerely,

North Cascades Conservation Council

Correspondence: Hello,

I am an enthusiastic hiker residing in Issaquah, deeply appreciating the natural beauty of the Pacific Northwest mountains. I frequently embark on hikes with family and friends, prioritizing safety, particularly in bear-populated areas. I always carry 1 or 2 cans of bear spray to safeguard against potential encounters, which typically suffice for deterring black bears.

However, the recent reconsideration of the initiative to reintroduce grizzlies with a troubled history in the North Cascades raises significant concerns for me. Unlike black bears, grizzlies are more challenging to deter, rendering traditional bear sprays less effective. This anxiety stems from my firsthand experience hiking in Glacier National Park a few years ago, where I learned from members of the Blackfeet tribe about their fear of the aggressive grizzlies introduced in the area. They cautioned against venturing into certain zones, such as Medicine Lakes, due to safety concerns.

Adding to these apprehensions is a recent incident in Jasper Provincial Park, Canada, where an aggressive grizzly attacked and killed a couple and their dog despite their use of recommended bear spray and safety gear. This incident prompts contemplation on the effectiveness of these preventive measures in the face of such threats. It raises questions about the practicality of relying solely on bear spray, especially when encountering aggressive grizzlies, and emphasizes the need for nuanced considerations in policymaking, especially by those who may not personally experience the challenges of mountain environments.

Thank you for considering my input,

██████

Correspondence: The purpose and need of this plan are consistent with the mission of the National Park Service (NPS), as defined by the Organic Act of 1916, and are consistent with the mission of the Fish and Wildlife Service (FWS) to implement the Endangered Species Act of 1973, as amended.

If the agencies do not move forward this time, I fear that grizzlies will be permanently extirpated from the NCE. Therefore, we must support and encourage NPS and FWS to get this done and we must do that by generating public support for grizzly restoration that extends beyond political party preferences and extends beyond the geographical, cultural, and political boundaries in the state of Washington.

The best available scientific data indicate that the restoration of grizzly bears into the NCE is biologically feasible and would promote the conservation of the species. Numerous studies have shown that the NCE is big enough, wild enough, and contains adequate food and habitat to support a viable population of grizzly bears. Furthermore, the agencies have the expertise and experience required to implement this project. FWS has been successfully moving grizzly bears into the Cabinet Mountains in Montana for decades. They can use the same techniques to move bears into the North Cascades. Restoring grizzlies to the NCE is the right thing to do and we know how to do it, so why has this effort been delayed for 32 years and why are many people who live, work, and recreate in the NCE opposed to restoring grizzlies? The answer - FEAR.

Last week (October 30 - November 3) I attended four public meetings about grizzly bear restoration in Okanogan, Newhalem, Darrington, and Winthrop. Nearly everyone who opposed grizzly restoration did so because they were afraid of getting injured or killed by grizzlies, would lose livestock to grizzly depredation, or would suffer economic loss due to reduced tourism or other business activities.

Here is the catch - most of their fears were not based on facts. Most people did not know that interior grizzly bears get 80%

of their calories from plants and insects. Most people did not know that the risk of getting injured by a grizzly bear is very low. In our everyday lives we face greater risks than we will ever face from a grizzly bear. Ranchers claimed that grizzlies would devastate their cattle and sheep but had not read the statistics that show grizzlies pose little threat to livestock. And most people did not know that the presence of grizzly bears in Yellowstone and Glacier national parks is one of the main reasons people go there.

Chris Servheen, who led grizzly recovery efforts for FWS for 35 years, said "people are afraid of what they do not know or understand. My experience is that once people become familiar with grizzlies most of their fears go away."

So, my first recommendation for NPS and FWS is to implement a comprehensive, well-funded, outreach and education effort that aims to reduce the fear and misunderstanding that many people have about grizzlies. Some of this is currently taking place, but the effort, staffing, training, and funding must be ramped up to be effective.

My second recommendation is that NPS, FWS, and all other partners, must do everything we can to proactively reduce human-bear conflicts.

The good news is that we know how to do this. In recent years several programs have been developed to create Bear Smart Communities that address the root causes of human-bear conflicts and reduce the risk to human safety and private property.

Typically, these initiatives include local organizations, agencies, local jurisdictions, individuals, and businesses that work together to reduce and eliminate garbage and other attractants that so often lead to conflict. Unfortunately the saying, "A fed bear is a dead bear," is too often true.

We have a clean slate in the North Cascades. There are no grizzly bears here now. Before any grizzlies are brought into the North Cascades, we must have a well-organized and well-funded program in place to eliminate attractants that would get grizzly bears into trouble.

The National Park Service and the Forest Service have been putting in bear-resistant trash bins and other infrastructure to manage garbage, but more needs to be done to eliminate attractants throughout the North Cascades Grizzly Recovery area and in nearby areas managed by state agencies.

But we cannot stop there. We must proactively work with the communities around the NCE, including Carlton, Chelan, Cle Elum, Concrete, Darrington, Entiat, Gold Bar, Index, Leavenworth, Marblemount, Mazama, Methow, North Bend, Sedro-Woolley, Stehekin, Twisp, Winthrop, and others to reduce human-bear conflict.

We need to find resources to help these communities become Bear Smart. This will require a major investment in bear-resistant garbage cans, dumpsters, and a detailed plan for pickup and disposal services (including transfer stations). This will require close cooperation with waste management companies to make sure all cans and dumpsters are compatible with the garbage trucks. Scheduling pickup times is critical too, and this is complicated by the fact that there are many short-term rentals in places like Chelan, Leavenworth, and Mazama.

There are existing problems with black bears in these communities which are only going to get worse without a major effort to reduce the problem. If grizzlies are brought into the NCE the need for these communities to become Bear Smart will become a priority and critical to the success of the grizzly restoration effort. We must secure all attractants in and around the NCE from Day 1, so grizzlies never become habituated to human food and other attractants.

Funding such a comprehensive effort will be challenging, but there are already Bear Smart initiatives underway that are using a combination of funds from city resources, state resources, and from NGOs like Defenders of Wildlife. I have also heard from wealthy donors that they are willing to make major contributions to help communities become Bear Smart.

Summary of Recommendations

- NPS and FWS should implement a comprehensive, well-funded, outreach and education effort that aims to reduce the fear and misunderstanding that many people have about grizzlies.
- NPS, FWS, and all other partners, must do everything possible to proactively reduce human-bear conflicts.

- Go forward with Alternative C and get a positive Record of Decision (ROD)

Thank you,

Correspondence: I am a fourth generation cattle rancher and farmer in Asotin County, Washington. We have farmed & ranched in and around Anatone and Shumaker Grade since my great grandfather's time. We are having a real problem with the wolves that have been reintroduced in the state. We have lost cattle to them as have our neighbors. This is a hard enough way to make living, without bringing in more predators.

If you bring in grizzly bears this is only going to increase the problems we have. Not only will cattle, horses, deer and elk be killed, so will humans. Grizzly bears are a massive animal that can be extremely aggressive. Bringing in the bears will only make things worse. This is definitely something we don't need or want. Move your wolves to the West side of the state along with your bears if you want them so badly.

No to grizzlies.

Superintendent Striker,

Thank you for this opportunity to comment on the Draft Grizzly Bear Restoration Plan / Environmental Impact Statement for the North Cascades Ecosystem

Back Country Horsemen of Washington (BCHW) is a 501(c)3 organization that is committed to maintaining access to public lands for all pack and saddle stock users. Our mission is to advocate for trail users and to assist the managing agencies of our

public lands in the care and maintenance of those lands. Our members are volunteers who spend countless hours working on trails in Washington State, work that benefits many people who recreate on these lands.

BCHW shares its mission and values with Back Country Horsemen of America (BCHA) as part of the national organization consisting of 32 states.

There are vast areas of the NCE that are accessed by pack and saddle stock users. The Mt Baker Snoqualmie National Forest, the Okanogan Wenatchee National Forest including the Pasayten Wilderness, and the North Cascades National Park are all used by equestrians. BCHW has many established horse camps along the boundary of the NCE.

BCHW is genuinely concerned about how our members and other users will be able to continue to enjoy the North Cascades should a population of heavily protected grizzly bears be translocated into the region where we ride, camp and where we work with the managing agencies to maintain trails.

The DEIS presents three Alternate plans for consideration with A being No Action. Plans B and C would both implement the importation of Grizzly bears into the NCE, with the difference being use of the 10(j) rule in plan C to designate the imported animals as an experimental population, allowing more management tools to use for conflict resolution. Plan B and Plan C are deficient in their analysis of the impact on recreation and lack options for how trails can be maintained open in the presence of protections implemented to reduce human-grizzly interactions. The DEIS fails to disclose the potential impacts of the proposed action and alternatives as they might affect non-motorized recreational uses, such as hiking and horseback riding. The DEIS does speak to "tourism" and to the importance of educating the public to bear behavior and conflict avoidance. It completely lacks a management plan that supports recreation either initially, or in the future as both the human population and the Grizzly population grow. The DEIS should include consideration of how the carrying capacity of the trails, trailheads, and campgrounds will be considered without resulting in long term or permanent closures. Without that there is no way to effectively review this DEIS.

Two National Scenic Trails, The Pacific Crest National Scenic Trail (PCT), and the Pacific Northwest National Scenic Trail (PNT), traverse the identified core habitat of the North Cascades Ecosystem.

The PCT in Washington hosts multitudes of hikers and equestrians each season. These users are both distance users and day or weekend users, making the PCT one of the most populated areas around any bear ecosystem. Public use in the entire NCE likely exceeds a quarter million visits. However, the DEIS indicates that the use is insignificant. Comparing this landscape to Yellowstone National Park seems ingenuous. Back Country Horsemen of Washington has hosted several multi-day trail maintenance work events along the PCT, and regularly encounter a steady stream of users hiking or riding through daily. Use of the trail is significant and will likely result in many human-bear interactions.

The PNT, while not currently fully developed has the potential of seeing the same amount of use as the PCT over time. It also runs through the NCE as well as other bear ecosystems to the east, including the Cabinet-Yaak (CYE). The CYE has a more established population of bears but still has resulted with challenges to the very existence of the trail due to the limited number of bears in the CYE (20-40). Opposition to the National Scenic Trail in the recovering bear population area as well as the connecting landscapes between ecosystems has also been expressed by USFWS staff, the same agency putting forth the NCE proposal through which the same trail will pass.
