Correspondence: I understand they are threatened and a return may help. But unlike the Black Bear, the Grizzly is inherently a danger to human beings. It is a problem in Yellowstone, Glacier, Alaska and other areas but they have decades to deal with it and still people are harmed and killed.

DO NOT put them back in the area too small for them and risk urban/wildland encounters that will result in preventable danger to both people ad the grizzlies.

I will hike in Black bear country,. but not grizzly...too much of a risk.

Correspondence: Opportunities for in-person public comment are inadequate for this EIS. NEPA requires an EIS for actions that significantly impact the quality of the human environment. The agency has identified that an EIS is required for this action, however has scheduled a minimum of in-person meetings at locations remote from the majority of users of the area of action. For example, Newhalem, WA is as remote as one can get in Western Washington from the majority of users of the area of action, primarily recreational users of the North Cascades. This recreational user community vastly outnumbers the population of the selected location for the one public meeting on the west side of the Cascade mountain range, Newhalem (local area population estimated at less than 200).This limited public access opportunity conflicts with the requirement and intent of NEPA to provide opportunity for public comment for the impacted human community.

Correspondence: My wife and I hike a lot throughout the PNW. We enjoy the North Cascades trails as well as other areas like the I90 corridor, Mount Rainier and the Olympics. Having the chance to encounter a grizzly on the trail will likely prevent us from going out in those area. When considering whether to move forward and introduce grizzly bears back into the PNW, please consider hikers like us who would not be able to enjoy those areas anymore. Not everybody is comfortable hiking in grizzly country. Please reconsider this plan. Good on paper, not good in practice IMO.

Correspondence: I feel fortunate enough to have spent time deep in the North Cascades, first as a teenager doing campsite building and maintenance through the North Cascades Institute and now as an adult camping and recreating in the park. I've gotten to experience the beauty and the richness of this place. Anyone who has spent time in this area knows it would be a perfect place for grizzlies to thrive, and considering it was their historic range and settlers decimated their populations it's really now our responsibility to restore their numbers here. The folks who are worried about reintroducing a large apex predator likely don't realize how avoidant grizzlies are of people, and how vast the North Cascades wilderness is. With bear safe practices and precautions already in place for those recreating here, proper bear safety is not anything new. Large carnivores are constantly demonized for existing where they've always existed, we've already made the decision to rid them from the North Cascades and we know that was wrong, we need to bring them back.

Correspondence: Currently, there is a closure in Terror Basin because black bears have found access to people's food. I don't think North Cascades National Park has the resources to protect bears and people effectively. There needs to be more infrastructure to allow car campers to lock food in bear lockers and more enforcement of neophyte hikers' use of bear cans.

Until the park has the backcountry ranger support and secure food storage, I don't support the re-introduction of grizzly bears. I see sad conflict on the horizon where the bears don't have a chance, people get hurt, and bears get shot. We need more funding for parks, not more issues to manage.

Correspondence: Restoring natural predators to the ecosystem is not only the right thing to do, especially with regards to wilderness designated areas, but have been a proven success story in other public lands, most notably Yellowstone with regards to wolves. Grizzly encounters with humans are extremely rare and backcountry programs in bear territory are easily copied from other parks. Adopting this experimental designation is a great first step.

Correspondence: My view is that grizzlies should be allowed to repopulate the North Cascades ecosystem naturally without any additional effort to accelerate the process such as importing bears from other areas. I'm an avid hiker and am in the North Cascades hiking and backpacking several times every summer and fear my visits would be less safe in the presence of a population of grizzlies. Human/bear interactions are inevitable especially if bears who don't know the area are brought in from other places, they won't know which areas to stay away from if they wish to avoid human contact. If bears filter in organically from Canada they will have a better chance to learn their way around naturally and find their place in the ecosystem. Please don't force the issue by importing bears from elsewhere.

Correspondence: As a 66-year-old with a lifelong love affair for the North Cascades, I am terribly torn on this but must side against reintroducing the bears.

The more people enjoy the North Cascades, the more protection the area will get. And, frankly, grizzlies keep people away. I fear that this will reduce the number of visitors who protect the place. It also doesn't help that many ranchers and other residents who will live with these bears have already voiced opposition to them. This would potentially drive yet another wedge between environmentalists and locals, much as wolf reintroductions have--and I would argue that wolves are an even more important keystone species.

Grizzlies exist in significant numbers to the north and east of the North Cascades. This, I think, is enough.

Correspondence: Our natural world is collapsing across many channels gravely endangering the survival of many species. We as a people have a moral and ethical obligation to restore and protect native animals such as the Grizzly Bear. For hundreds of years, Grizzlies roamed the vast wilderness of the North Cascades. Through man's intervention, the species was hunted to near extinction. Please reintroduce this iconic animal to its former habitat. Wherever Grizzly bears thrive, the natural order in nature is restored and ecosystems are replenished.

Correspondence: Thank you for the opportunity to comment. I grew up in California. I hunted deer and quail on family land in the Sierra foothills in the Mother Lode country. I remember thinking the grizzly bear on the state's flag was still alive as a species in the state and wondered if I'd ever see one from the car. Later, I learned that California's last grizzly was seen in the 1920s. I felt cheated. Decades later, long after I received my degree in Biology, I was deer hunting near Saranac Lake NY. I had inherited a collectable deer rifle from an uncle and had it with me that day, and because black bears were 4X as common as deer in that part of the country, I also carried a 9mm pistol in a shoulder holster in case I was attacked by one of those bears and needed more than just one shot to hit the attacker after missing the first shot from the rifle. The rifle was carried in a shoulder sling as I was walking.

The sun was going down, and it was time to get back to my vehicle, parked on the dirt road a ways off from where I had been hunting. I was walking on a broad clearing under the major power lines that carried electricity from Quebec into New York. There was a thin line of densely needled conifers to the left of me. One couldn't see through the foliage. I emerged from the trees near the edge of the road where the vehicle was parked. Then I noticed that a wolf had emerged from the other side of the trees at the same time I did. We stared at each other. I never unslung the rifle from my shoulder, and I never reached for the pistol. I just stared in awe and amazement. The wolf stared at me too, but showed absolutely no sign of fear or aggression. We just stared at each other. After what seemed to be many, many minutes, we simultaneously turned our backs to each other and walked in opposite directions alongside the road. I turned around once to look at the wolf again, and the wolf looked at me, and that was the last of that encounter. I never reported it.

When I started snorkeling and scuba diving in the ocean, I was warned about how dangerous sharks were too, and there were supposedly many of them in Monterey Bay, where I used to dive. Later, I learned we had to worry only about great whites and blues. I never saw either of them. Later, when I was diving in Hawaii, I saw many sharks, individually, and in large groups, and I reveled in the opportunity. I grew up.

A few weeks after I encountered the wolf, I saw an article in the New York Times that said for the first time in many decades, a grey wolf had been sighted in New York state--near Albany, about 150 miles south of Saranac Lake. That changed my life and my appreciation for sharing our planet with other living things--even ones we might have been taught to fear when we were young. The grizzly bears are like that. Let them come back. The chances of getting attacked by a grizzly in the woods is less than the chance of being killed by a car or truck getting to where you see the bear.

Correspondence: I am strongly in support of reintroducing grizzly bears to the North Cascades. In addition to the support of the tribes, and many people who view the North Cascades as valuable wilderness, there should also be significant benefits to the ecosystem. As revealed in the wolf reintroduction in Yellowstone, the trophic cascades resulting from the presence of top predators in an ecosystem can be truly transformative in ways that are difficult to predict. Thus, this could be a wonderful experiment in rewilding, or rather further-wilding, since the North Cascades is already a very wild area. At any rate, it is part of the bears' historic range, and they should be restored to it.

Correspondence: I sympathize with the goal of introducing a species back into its historical range (they were here first, right?) but I'm concerned about the aggressive nature of grizzly bears and the potential for conflict with hikers and other outdoor recreational users in the north cascades. It is a wilderness area but one that gets a fair amount of use by people. I can say that if grizzly bears are introduced into the north cascades I will no longer go hiking in that area for fear of getting attacked. Based on the number of people that are attacked in Montana and Wyoming every year it is not an unsubstantiated concern.

Correspondence: No...do not introduce Grizzly bears into Washington State. Unless the intention is to keep people from enjoying the wilderness. Being from Alaska, and spending lots of time in the woods, I had way too many encounters with Brown Bears. It is a very scary experience. Even being heavily armed. A good friend of mine, a hunting guide was mauled by a Grizzly. He hesitated for a second, with his gun pointed at the bear, thinking it would walk away. That is all it took for him to almost die. Folks in Alaska learn to read wildlife...black bear, moose, brown bear...and can usually avoid harm...but it only takes a second! Folks, generally in the lower 48 do not know how to read wildlife, it actually takes on the job practice. Folk will suffer. I strongly encourage you to flush this idea.

Correspondence: As an apex predator, grizzlies need to be reintroduced to the North Cascades. Human interaction is unlikely, and competition for other game species with hunters is likely to be minimal. Grizzlies are a vital natural resource to our area, and with their reintroduction we are one step closer to balancing and restoring what settlers damaged.

Correspondence: No, thank you!

Grizzlies are amazing creatures, but increasing the likelihood of their contact with humans will put both humans and the grizzlies at risk. It also risks destabilizing an ecosystem that has adapted to their absence. The unintended consequences could be disastrous.

Very specifically and most personally: when it comes to hiking, backpacking, and other backcountry adventures, black bears are one thing. Grizzlies are something else entirely.

And even if they once dwelt in peaceful cohabitation with local tribes, the land and its inhabitants have changed since they once walked among us.

Correspondence: My family and I enjoy back-country hiking and camping in the North Cascades. For the restoration of this beautiful ecosystem we support the reintroduction of this (and other) native keystone species. We consider the communities of the Methow Valley our own, and understand the real-world implications of living in proximity to large predators. As part of the reintroduction effort, resources should be dedicated to educating locals on bear safety, to warning systems, and to relocate animals which frequent populated areas. In addition a fund should be established that reimburses locals for damages done to their persons and/or property by wildlife.

Correspondence: As former proved by reintroducing old animals to an area, is that it leads the area to a positive change.

Even as a foreigner, do I love going to the US and its national parks, to support and preserve the nature the land got. I hope for Grizzlies to return so the area may once more, find another thriving path. Bears help uproot plants which may suffocate other important plants, while also clearing the path for plants which may have been losing.

Turning of soil can also help plants spread to get nutrition as their roots may be too short once the nutrition in the local ground area has run dry.

Correspondence: Please do not institute any federal grizzly bear recovery actions in the North Cascades. This huge wilderness area is adjacent to bears across the border in British Columbia. As noted in the reports, the North Cascades is prime grizzly bear habitat. As such, it may take time, but we should let nature take its course as to when grizzly bears establish themselves south the border. This may not be the timeline that some recovery proponents would like, but there really is no reason for rushing recovery plans and there quite frankly may be many reasons not to add another layer of federal policies, goals and laws that could end up in conflict with bigger issues.

One of those "bigger issues" we are facing is the local, regional and national impacts of fires. Rural communities and ultimately urban communities both have a stake in how federal and state agencies manage or mismanage what happens to our public lands. Smoke does not just stay over the fire. It will take multiple decades to reverse the damage of the policy that promoted the elimination of logging on much of our federal and state lands, while simultaneously promoting "let it burn" policies. Over the last couple of years we are beginning to recognize the error of these past "protection" policies. As a result, we are returning to thinning forests around rural communities as a recognition that it is necessary to protect those communities, while also seeking to move in a direction where we try to get ahead of small fires before they become huge fires and impact the health of many more people and wildlife on a state, regional or even continental scale.

We can probably better protect grizzly bears and grizzly bear habitat by continuing to get our fire and forest policies in order. Adding a "layer" of separate grizzly bear protection actions / policies may only create another point of conflict in achieving larger and more important goals.

Thank you

Correspondence: As a person who never wants to come across a grizzly ever

In the wild. I think they still have a place in Washington, they were here in these amazing mountains and forest way before colonizers came and drove them out. I think helping the population of these amazing giants should be helped to grow to a sustainable population. With that said, I am not aware of the ecological impact their return may have on plant and other wild life. As they have been grown from the Washington regions for decades. My hope is you give these animals a chance to find out. I wish the current grizzly residing in the north cascades a happy winter and may future bear be just as lucky to see those mountains.

Correspondence: Hi

I agree with the reintroduction of grizzlies to the North Cascades. Bears have a right to be there, and in an area that large we should be able to make it work. My preference would be that they are introduced away from areas adjacent to humans (ranches, campgrounds, trails) to avoid safety issues for both bears and humans.

Sincerely

██████

Correspondence: Introducing grizzly bears to the North Cascades will mean that I, a frequent user, will now be forced to carry a firearm into the woods each time I go on a hike or climb or go camping with my family. I am not in the least bit concerned about mountain lions or black bears but grizzlies necessitate preparation.

The reality is that my wife will not even consider camping anywhere with grizzlies so this reintroduction will rob my family of one of our favorite recreational activities.

The wilderness is doing fine without these bears; don't waste time and money on this - build some more trails and parking lots, instead.

Correspondence: Thank you for your service. I respectfully support Alternative C, to reintroduce, relocate, and restore grizzly bears to the US portion of the North Cascades Ecosystem (NCE) and surrounding areas and designate the population as a nonessential experimental population (NEP) under section 10(j) of the ESA. I have significant family in and around the NCE and am a repeated visitor to the area. I believe grizzly bears are a part of the cultural heritage of the NCE and belong back in the ecosystem. Although I have sympathy for Alternative B, I believe Alternative C would be more practical and represent a fair compromise with those who may have some apprehension over grizzly bears being restored to the area. I believe that the NCE is a viable habitat and terrain for grizzly bears, and I do not believe their reintroduction would negatively impact tourism or the economy of the surrounding areas in any material manner. I support FWS having the tools to engage in adaptive management and to work with other stakeholders, including the WDFW and Tribes, to manage the new grizzly bear population and hopefully reduce conflict. I would encourage FWS to pursue non-lethal methods to haze bears and mitigate the risk of conflict and depredation if at all reasonably possible, although I understand that hard decisions may occasionally have to be made. Once again, I respectfully support Alternative C to restore grizzly bears to the NCE as a NEP under Section 10(j) of the ESA. Thank you for your team's very hard work on this project to date - I'm excited for what's to come.

Correspondence: I would like to offer my comment in opposition to the assisted reintroduction of Grizzly Bear into the north cascades ecosystem. I consider myself an environmental advocate and strongly support the protection of all endangered or threatened species. However, large and aggressive predators are unique species that create significant safety concerns for the millions of people that recreate in the North Cascades. Unlike much the rest of Grizzly habitat, the North Cascades are close to multiple large cities and the decision to reintroduce would have complex, permanent, and often negative implications for millions of people near the places they live and work. This is an remarkably poor use of our federal dollars in an era of destabilizing budgetary deficits. Please choose to prioritize other environmental protections.

Correspondence: As an avid hiker and trail runner in the North Cascades, I would prefer grizzly bear NOT be reintroduced to the North Cascades.

I have spent a good amount of time in British Columbia, Montana, and other areas of Grizzly habitat, and it always makes it more difficult for myself, as well as other animals, to enjoy freedom in the mountains. We already have multiple predators such as Cougar and Wolves, so I do not believe we need it for balance in the ecosystem.

With populations in Canada, Montana, Wyoming, and Alaska, Grizzly bears are not believed to be in danger as a species, so I do not believe they need to be on a historic range and will ultimately cause more human/bear contact. Also, being so close to a major metropolitan area with many unexperienced hikers, I believe you will see a much smaller percentage of outdoors people taking necessary precautions such as carrying bear spray and/or sidearm, making noise, and properly storing food. A large population of black bear in Washington has already not triggered these precautions in many, and with the elimination of spring bear, that population is likely to increase as well.

If you do move forward, please do it as an experimental population so if we do have the inevitable, unfortunate bear/human conflict, we are more able to readily remove trouble bears from the landscape.

Thank you, [REDACTED]

Correspondence: I would support the following reintroduction strategy

One option outlined in the plan would allow grizzly bears to be managed as a threatened species under the Endangered Species Act, and only permit some to be captured, moved or killed under specific circumstances, like the defense of life and scientific or research activities.

Correspondence: Please, NO!. Let the Grizzly bear population return naturally - we don't need human inference into a natural process. It becomes a waste of resources to track and monitor the success or lack of success, The NPS has other needs with much higher priorities, like a massive maintenance backlog. It appears you must have too many employees dreaming up something to make themselves relevant. With your logic we should reintroduce Smallpox and Polio since it was here naturally at one time.

Once again, please do not introduce a Grizzly population to the North Cascades.

I hope you're listening,

Correspondence: I am concerned to hear that the NPS is considering restoring the Grizzly bear population in the Northwest. The communities that have settled in the north cascades are not equipped to deal with the issues relating to grizzlies. I believe repopulating grizzlies into the north cascades will increase the level of fear surrounding grizzlies to a public that is not used to them and make for misunderstandings more common. I am concerned that if these misunderstanding occur enough that people in general will stop wanting to explore the trails of the north cascades as frequently causing a larger negative impact.

Correspondence: Please bring back grizzly bears to the North Cascades. Grizzly bears lived in the region for thousands of years before humans nearly hunted them to extinction. The Upper Skagit people of the North Cascades, who coexisted with the bears for thousands of years, fully support the reintroduction of grizzlies to the region. Additionally, the excitement from seeing a grizzly in the wild in national parks such as Glacier is truly amazing. Please make sure the national park is properly staffed to train hikers proper food storage and behavior to avoid endangering the bears. A fed bear is a dead bear.

Correspondence: Yes let the grizzly back on their home turf. A balanced ecosystem is a healthy ecosystem. There is ample evidence of what happens when you remove predators. Example, the effect on wildlife and rivers and land with the removal of wolves. Deer and elk proliferated. They over grazed the land causing rivers to heat up due to lack of trees, As stated by others, the indigenous peoples learned to co exist with these predators. We need to learn from them. Mother nature knows what she is doing. Stop tinkering with wild life because you "know better"; You don't

Correspondence: Grizzly bears should not be reintroduced into the north cascades. There are increasing numbers of people recreating in the national park including hikers, campers, climbers, and tourists. The risk to people will increase as the population of both people and bears increases in the future decades. The risk to life and health to people in the park is not worth the ecosystem advantages. Even if the risk is low, there is also a psychological risk to people worried about a grizzly encounter. People go into the wilderness to reduce their worries not increase them.

Correspondence: Short answer: Grizzlies belong in the Northern Cascades!

Long answer: Before people pushed grizzlies out, grizzlies thrive on the land. It was their home and because of that they were respected by the tribes living in the area. The agendas of people, ie: farmers should not be allowed to hijack the natural order of things. Doing so destroys our ecosystems and the spirit of humanity and nature, in this case, grizzly bears co-existing respectfully in an area large enough for both to thrive. We harm other beings out of our own fear and agendas and that is not something to be proud of or a message worth teaching anyone. Our children and their children deserve so much more. Trump is also to blame for much of this destruction. He is toxic to all living things. This is not a political decision. This is about advocating for the voiceless and supporting nature: animals' right/climate/ecosystem, in a way that respects and restores the natural order of things. Thank you for listening and considering the public's opinion. That's incredibly refreshing.

Sincerely,

██████

Correspondence: The thought of reintroducing grizzlies to the cascades goes against nature. Natural selection removed them for a reason. Don't drop bears into an environment they intentionally left. We have far too many hikers and outdoorsmen around here that will encounter them. The first injury or death of a person or a bear is the fault of the party who decides to approve this. Who wants that blood on their hands? Keep the bears where they have decided to be.

That's my two cents,

Thanks,
[REDACTED]

Correspondence: Dear NPS,

I do not support the reintroduction of the grizzly bear into the North Cascades. As someone who has recreated in areas with grizzlies the steps to prevent conflict are difficult to adhere to successfully in the presence of large scale human activity, similar to what we see here in Washington state, and most importantly are no guarantee of safety. Although it is unfortunate that grizzlies do not roam their natural ranges, human injury and death are guaranteed outcomes with their introduction into the Northern Cascades. As someone who recreates in this area I personally do not want to have carry bear spray/fire arms; it is also worth mentioning that the production to equip everyone who frequents these areas will have substantial ecological impact. The status quo is a stable equilibrium and I please hope you do not disturb it!

Best,

Correspondence: No reintroduction of grizzly bears in North cascades. They are highly aggressive bears that cannot coexist with humans and humans who hike especially. Extended hunting licenses can take care of an over population of deer and

other wildlife that over populate. Birds have no problem distributing seeds. To release these deadly bears on purpose, who can travel miles and into human areas is playing with fire and with human lives. I know people want to save the planet n all but super monsters like grizzlies is putting countless people at risk. I vote no. It makes me and my family feel totally unsafe.

Correspondence: Grizzly bears and other large, dangerous predators should not be re-introduced or given special protection in Washington State. There is plenty habitat for them in Canada, and in Alaska and other states foolish enough to give them free reign.

The animals are not particularly endangered by climate change, and can be a severe, even if rare, danger to humans. Their increased presence would have a chilling effect on human recreational use of forests and parks as well as present a danger to local communities and human residents.

Humans fought hard to eliminate many dangerous animals that can harm our species over millenia, please don't be naive and purposely re-introduce them.

Correspondence: I believe Grizzly bears should be reintroduced to the North Cascades National Park Complex. Initially they should be introduced as an experimental species for an initial period (10 years?) whereupon they should be given full protection under the Endangered Species Act.

I would also suggest they be initially introduced to area of the park north of Washington State Highway 20 and east of Ross Lake and have them expand from there.

While the grizzly bear does pose more of a threat to humans than the black bear, the risk would be significantly less than what a visitor to the park would encounter on their drive to the trailhead.

I live in Stehekin, WA, which abuts the North Cascades National Park, and have hiked hundreds of miles all over the park.

Correspondence: The North Cascades and Washington have certainly changed over the last 50 years. One of greatest changes is the amount of people who are wandering around in the wilderness. I see the assertion that grizzly introduction will benefit the ecosystem. Could we hear more about the specific benefits? I think they would have to be sizable and compelling to outweigh the risk to human life and the fear of going out at dusk and dawn (as residents near Yellowstone would testify). Until then my vote is no.

Correspondence: North cascades national park service
Grizzly planning

To home it concerns:

I fully support the re-introduction of a healthy grizzly population to the North Cascades national park . I've hiked there since the 1970s and met some grizzly researchers who were studying the population in the early 1970's. At that time they thought there were 12 grizzlies roaming between Canada and the park. They were radio tagging the Bears. I recently read there are only two grizzlies between 2005 and 2015 documented in our park. The North Cascades is one of the few places in North America that could support a diversified grizzly population. This mountainous region combined with the British Columbia Manning Park should be ample room to grow the population.

It is our responsibility to ensure that wildlife exist for future generations. We just need to be smart around, grizzlies by using bear canisters, and keeping food away from our camps while hiking.

I know that ranchers have concerns about loss of livestock,, but if just like the wolves, they would employ a cowboy, and dogs encounters with bears would be few. The value of a domesticated animal like a cow can be paid for. You cannot pay for it a species that gets wiped out because of lost habitat and antiquated policies.

Sincerely,

██████████

Correspondence: I write in support of Alternative C, reintroduction of grizzly bears in the North Cascades as a nonessential experimental population. I look forward to a day when there's a self-sustaining population of grizzlies in the North Cascades. I believe the best way to get there is through the management flexibility available under ESA sec. 10(j). That flexibility will allow for greater public support and cooperation with other agencies.

I am a Washington resident, I backpack the backcountry of the North Cascades often, and I look forward to a day when I might see a grizzly bear in my state in its natural habitat. I don't think I should have to travel to Idaho or Montana to have that opportunity. I am reminded of the words of the great American conservationist Aldo Leopold, who said: "That there are grizzlies in Alaska is no excuse for letting the species disappear from New Mexico. ...Relegating grizzlies to Alaska is about like relegating happiness to heaven; one may never get there."

Correspondence: I used to hike in the Cascades a lot. I followed the rules about storing food, etc and was careful but never too worried. I was pretty relaxed. However I used to troll for salmon in southeast AK and when I went into the woods up there for berries, exploring, bird watching, I was not relaxed. I knew better. I knew to avoid the streams when fish were in them. I tried to stay in more open areas so I could sense what is happening and if I saw tracks I changed course. I was always on the lookout and listening.
I don't think hikers down here can adjust to that. If it was really remote, maybe. And only a small number bears and let that be and reassess in the future.
I also realize way too many cougars are having to be put down here because of interactions with hoppy farmers. It is not fair to the cougars and it wouldn't be fair to the grizzly bears.

Correspondence: Please do not reintroduce grizzlies to the north cascades. I recreate regularly in the area and don't want the additional concern for our safety if grizzlies are present. As a hunter, I'm aware of the potential of attracting grizzlies when harvesting game and the issues around that. I realize they are different and are not an 1 to 1 substitute, but black bears are present in the area and do fill the niche to a degree. Black bears are omnivores, uproot the soil, eat similar foods, etc, and I would think the grizzlies would supplant a portion of that population as the carrying capacity of the area can only hold so many bears. It is already quite common for black bears to make their way into cities and towns, adding grizzlies would just make that worse. If grizzlies make their way back on their own I'd accept that, but I definitely don't want them transplanted to the area.

Correspondence: I think the effort to reintroduce a native species back into an environment where it was removed at the hands of humans is the right thing to do on many levels. As already noted, it's healthy for the forest and the fauna, and likley things we are not aware of. I realize that some people may claim it makes the outdoors more dangerous, however that is the animals rightful home and not ours - when you decide to go into thier home, you have to accept you are there on natures terms and not yours.

Correspondence: We do not need to add grizzly bears in an environment where many humans spend time and enjoy nature. People will get hurt. Reintroducing grizzly bears is itself an artificial act. Bears likley were present throughout the puget sound lowlands as well, but we don't consider reintroducing there because that is where the folks promoting this topic live.

For those of us who spend time in these mountains, we don't need to add the threat of aggressive wildlife as an ever present threat. There is plenty of territory for bears to roam in Alaska and Canada where they face fewer interactions with people.

Correspondence: I am speaking as the owner of a cabin in Marblemount and a person frequently exploring the high country of the North Cascades off trail.
I do understand that grizzly bears are potentially dangerous to humans and I'm a little apprehensive about the prospect of encountering one in the wild. But they are just one of many dangers one can encounter in the backcountry.
The bears have been there for thousands of years before humans hunted them to extinction in the North Cascades. So I would support a re-introduction effort by the USFS or NPS as long as bears who have shown unprovoked aggressive behavior towards humans are removed by wildlife officials.

Correspondence: I fully support the preferred alternative as described in the draft restoration plan EIS. I have confidence that the FWS and NPS can manage the introduced animals in a way that benefits the greater ecosystem and nearby populations of humans. Ultimately, the benefits of re-introducing these creatures into the North Cascades Ecosystem far outweigh any potential negatives.

I personally am excited for the opportunity to one day observe a grizzly in some of the most beautiful areas in Washington!

Correspondence: I am commenting as a regular user of the North Cascades Park complex, including hiking, camping, backcountry camping, and visitor at lodges in Stehekin and Ross Lake.

I support the adoption of Alternate 3 (reintroduction of additional grizzly bear population with monitoring and expanded management options). I think this allows for the opportunity to restore the ecosystem to perhaps a more sustainable population of bears, bring back grizzly bears to the west coast mountains where they once roamed broadly but have been essentially eliminated. I have hiked and camped in the Northern US Rockies and Canadian Rockies and have seen firsthand that with proactive engagement tourists and local populations can co-exist with grizzly bears.

Correspondence: I'm writing in to oppose this proposal as written. Suggesting the recovery will be limited to the North Cascades (ie North of HWY 20) is misleading. The cascade mountain ecosystem is a continuous corridor running the length of the state. Grizzlies cross roads and expand their territory, and this reintroduction will lead to the population expanding throughout the Cascades. What would the public say if you messaged that bears may someday now be found at Snoqualmie Pass, Mt. Rainier, etc? I suspect you would get far more feedback - which is why you've chosen this selective scope. That is not an ethical stance for public land stewardship. You should be more transparent with their likely population growth and ranges and that this in effect reintroduces the species to the entirety of the Cascades. If you can't be that transparent, then it's the wrong choice.

Correspondence: The comment is short. Grizzlies belong in the North Cascades. The more we learn about apex predators the more we realize how important they are to the health and sustainability of ecosystems. Further, there is a psychological, emotional and spiritual benefit to humans of having wilderness be at least somewhat "wild". I am a lifelong hiker and climber and have spent many days in the North Cascades. There I've seen black bears with their cubs, moose with their young, cougars, rattlesnakes and all sorts of other animals that I feel are much more enriching to my life than any threat to it. For even a modest sustainable grizzly population in the North Cascades, they need federal protection as the a threatened species and in the event of "conflict" with humans, the balance needs to be in the grizzlies' favor, to help undo, at least a little, the centuries of the opposite balance. Thank you for your consideration.

Correspondence: As someone who routinely enjoys many of both the easily accessible and remote areas of the North Cascades, I would very much like to see these native members of the ecosystem restored.

We are losing many of of natural wilderness treasures to non-natural forces including recession of glaciers, wildfires due to climate change and decades of fire suppression and factors related to overuse in some places. Although perhaps not as recent in personal human memory, grizzlies were a part of the ecosystem of the North Cascades for vastly longer than they have been absent due to well-established human factors. Their re-introduction is a relative small piece of a larger problem of human impact that we have a near term tangible and logistically realistic way to correct in a science-based manner.

I find both options B and C reasonable, but favor option C, which strikes me as a thoughtful and balanced means of giving appropriate and reasonable additional tools to the experts involved in this effort to facilitate its smoothest possible achievement. I appreciate the soundly reasoned proposal and detailed research, planning and logic that went into the published document. It is a document written by scientific experts and gives me ample confidence to put my trust in their recommendation.

While I would consider myself and my family in a higher-than-average-risk category of impact from encounters, I also know that we are high risk from encounters to a less wild or healthy ecosystems. I certainly don't wish to be harmed by a bear, but I know the odds of such with basic risk mitigation efforts I can (and do) take when in shared territory with bears bring these risks to an exceedingly low level compared to other hazards most of us tolerate already with little thought. Americans have a roughly 1% lifetime risk of dying in a motor vehicle accident, for example. The odds of similar from backcountry encounters grizzlies in established population areas elsewhere in the United States and Canada are vastly lower than the mortality risk of simply driving to the trailheads of these locations.

In sum, I favor option C. I am an advocate for making best efforts to restore, and reduce ongoing harms, to as much of the natural world as possible. I am similarly a strong proponent of science and listening to the collective wisdom of those who have spent decades learning and working to become shepherds of this knowledge (I.e. our scientists).

Correspondence: No, we should not endanger hikers, hunters, or others that frequent the forest in the North Cascades. As we can see from Yellowstone park, there have already been problems with the reintroduction of the Grizzlies. There are many predators already in the forest keeping balance in this area for many years, and there is no need to unnecessarily increase the odds of a fatal encounter with humans by putting one of the largest predators back into close proximity with humans. As a hiker that frequents this area, it would give me great pause as to my safety with Grizzlies roaming. You just need to remember what has happened recently in Yellowstone and also similar issues in Alaska with hikers or runners to see why this is a concern

Correspondence: From Environmental Impact Statement, the grizzly hasn't been a major present in the cascades for more than a hundred years, I don't see why tax dollar should be spent on bringing them back now, there are more important things that need effort and money.

Plus, there will definitely be hikers and climbers to be killed by the grizzly. The only benefit I see is bringing them back for the sake of bringing them back, to restore the historical status. By the same logic we probably should bring small pox back in order to preserve natural and cultural heritage and raise public awareness of bio hazards in real life.

Correspondence: I'd like to say I'm a staunch supporter of this plan. I'm of the belief that since we are the ones that essentially extirpated them from the area, we ought to be the ones to help their reintroduction. It's silly to say "let nature handle it" when it wasn't nature that screwed it up in the first place.

That said, while I would like for Alternative B to be the option chosen, I feel like that would be detrimental overall. Alternative C, I think and hope, would make for a more receptive population in general, and other interested parties (particularly ranchers) specifically. I think having all tools at your disposal would be nice to have in case of any event. They haven't been in that area since the mid-19th century so there's no telling what might happen. So it's best to be prepared.

I realize that this is an incredibly divisive topic, and I know this has been floated before. I'm so happy that this might become a reality, and I sincerely wish you won't back down to special interest groups and certain politicians.

Correspondence: As a frequent hiker in the North Cascades, and I know many others who are, I oppose the reintroduction of grizzly bears into the area. According to statistics, the last time grizzly bears were confirmed in the area was 1996. Leave the current ecosystem as it is. There is no need bring in wildlife that have been absent for almost 30 years. I also think it would be dangerous for recreationists who frequent the area. Recently, a runner was mauled by a grizzly near Yellowstone. I think it would impede people from visiting and enjoying the area. I know that I would think twice about hiking the North Cascades if I knew grizzlies were around.

Correspondence: I am opposed to the plan to reintroduce grizzly bears into North Cascades National Park.

1. It is illegal and against Washington State Law to bring grizzly bears into the state to release. Typical to the National Park Service, they feel they are above state law and don't recognize anything but their own authority. The so-called inclusive process the Park Service uses is disingenuous and patronizing. The majority of local people in and around the park don't want

grizzly bears, it is against state law, and the park can't answer many of the questions about bear management, but the Park Service will do whatever it wants anyway regardless of "input". The Park Service has a radical agenda and state's rights be damned.

2. Park managers will use grizzly bears as a tool to close hunting in the Ross Lake Recreation area and Lake Chelan. Park managers at North Cascades and their staff have always wanted to eliminate hunting in the Recreation Area. This will be a perfect tool for them to use to first restrict and then "need" to eliminate hunting altogether in the NRA. State hunters already have to take a grizzly bear test to hunt bears in GMU 426, but that won't be enough for park staff. Their agenda is to eliminate hunting in the NRA. They will lie and say it isn't but in the end, they will strongly lobby to stop all hunting in any areas they can.

3. Park managers will close vast areas of the Park and Recreation areas whenever a grizzly bear is seen, tracks are seen, or one of the park rangers or biologists sees bear scat. Park managers have a long record of simply closing any area they want to because a bear, wolf, or cougar has been seen or behaved badly. At this writing parts of North Cascades are closed for the season due to "bear activity". A cougar attacked a child in Olympic Park and the park managers "closed the area for several weeks" instead of removing the cat. I must repeat that park managers are poor wildlife managers. The state is trained and staffed to manage wildlife, not the Park Service. But again, the Park Service feels they are superior in every way to state laws and state wildlife managers and they simply know better than anyone else, even though they have far less (if any) experience, training, and basic knowledge about any wildlife. It appears a fancy uniform is all they need as credentials to be the experts.

4. The population, if established, will be forever fragile and always need more funding, more closed areas, more closed hunting, less backcountry use, and there will be a call to "manage" areas outside and adjacent to the park (Mt. Baker NF, Pasayten Wilderness, etc.) which translates into closed areas and limited everything from cattle and sheep grazing to fly fishing. The park service is and always has been a poor manager of bears, and carnivores in general. Park managers are people managers, not wildlife managers. The biologists they employ are often agenda driven and don't take responsibility for the obvious issues that occur when mixing carnivores and people in parks. The solution to every problem regarding wildlife and people in a national park is to close the park and greatly restrict access to vast areas of the park.

5. Finally, the plan presented and if adopted will not be followed, or it will only be followed in part. There will be no oversight or authority to follow the plan and no penalty for not following it. Any assurances in the plan will not be honored, and "adaptive management" will be the excuse used to change the plan to fit the radical agenda of park managers and their staff. In the end, ESA listed grizzly bears will be the Trojan Horse that radical Park Service managers use to get whatever they want at North Cascades and change it to fit the radical, peopleless place they want it to be where only elite park managers are allowed to visit and make decisions about its use.

Correspondence: I am a white Native American (not registered with a tribe) and I believe these grizzle bears should be reintroduced into their original native habitat. I do hike and I don't feel threaten by these animals. Of course we need to ensure this is plenty of food for them to thrive before making a final decision. Perhaps the location would be where the wolves are currently flourishing.

Correspondence: I have spend a fair amount of time hiking and climbing with in the north cascades and would love to see grizzlies restored to this amazing landscape. I travel to Montana Wyoming Alaska as well as Canadian Rockies with with my wife and 2 kids and 1 of of the many things I love about these places is that is a intact complete ecosystem not altered by humans. These Animals have great power and certainly are more aggressive than many and that has not swayed me or my family's enjoyment of such an animal. It's there power and mere presence that draws me to them. There aggression is easily solved by proper education and understanding, by teaching proper food storage, hike in groups and carry bear spray in grizzly country. Me and my family have enjoyed hundreds of shared time with the bears.

Lastly. Long ago grizzlies roamed this area and we "humans" decided they didn't belong. This is a chance for us to rectify that choice that was made long ago.

Correspondence: Absolutely, NO

That you would considering reintroducing this animal is absurd to me. We have a long history in this region of safe use of our forests free from the threat of animals attacking us. My family has hunted and fished, hiked and ridden in Washington forests for generations and never once had to do so with significant fear of animal attack.

On the other hand we have had occasion to do the same in Montana grizzly country and the difference is stark and unsettling. That we would choose that is absurd. This would literally lead to people dying. We work constantly to stop people dying on thr roads but would choose to increase them among those who recreate in our woods.

This serves no reasonable purpose, will lead to deaths and is stupid in a state where millions enter the woods, have built their homes, and learned to be outdoors without the skills needed for grizzly country.

Do not waste my money doing something so obviously a fringe idea from those living in cities.

Correspondence: Why does the government think they can control nature. Don't turn our parks into a zoo. If grizzly bears wanted to be in the cascades they would be there. They were not hunted to extinction human activity moved them north they went on their own. Why would you take a bear that clearly didn't want to be around people and make them be around people. Does the bear not have a say in this. Where are the bears rights. Why are we scooping them up and putting them somewhere they don't want to be? This is the most horrible proposal I have ever heard!!!!

Correspondence: With the proximity to nearby agricultural towns such as Mazama grizzlies would likely be proactively and senselessly killed by farmers, shot by illegal trophy hunters, or become pests as they raid nearby homes and campsites for food. Furthermore, many hikers and WA natives don't know how to deal with grizzly encounters or even how to identify one - educating the public on what to do would be expensive and time consuming.

There's no sustainable outcome to reintroducing them to the North Cascades when the people have forgotten how to live with them. Perhaps set aside a small and especially remote corner of the park that's well away from homes, ranches, and hiking trails and introduce a much smaller tagged and monitored population?

Correspondence: I am in favor of re-introducing grizzlies to the north cascades. Grizzlies are a keystone species and should not have been wiped out by hunters, but they were. Because of their status as predators, they can keep other animals under control, and should be re-introduced into their native habitat.

If humans are educated on not leaving food and their garbage open with easy access for bears and other wildlife to get, it will be an easy transition. Education needs to come first and ranchers should not take precedence over native wildlife. Let's allow nature to have its symbiotic eco system intact rather than slicing it into tiny parts; then also, there must be protected wildlife corridors along with reintroduction.

Thank you.

Correspondence: I am responding to this proposal as a resident of Whatcom county, I don't think Grizzly bears should be reintroduced. We have wolves and cougars both, have created issues for people resulting in individual animals or in the case of wolves an entire pack, in one case being exterminated due to their propensity to kill cattle. Recently a sow black bear was killed due to her roaming neighborhoods here in the county. She had cubs at the time of her death. It makes no sense to introduce another apex predator.

Correspondence: These animals pose a threat to not only us as humans but also to themselves and the ecosystem we have in here in the PNW. They will hunt and kill everything to a point where deer, black bear, elk and other small game become threatened to the point of endangerment. This reintroduction program is being provided by people whom have ZERO knowledge on nature and the rolls and impacts that each species of animal plays, in the animal kingdom. I do not want these animals extinct but I do believe that the areas in which they reside across the USA and other countries are where they thrive and where they should stay. If we reintroduce mtn grizzlies back to this area, we will regret it.

Correspondence: Execute Alternative A: Take no action. Leave the brown bears where they are and let them move naturally. Do not reintroduce them into areas in the PNW. There are active predators in the area already in the form of black bears. And black bears do not threaten human recreationalists like brown bears do. It has been a great pleasure as a life time hiker to enjoy the PNW without the threat of brown bears. Do not take this away from us. It is a peace of mind that few other places have.

Correspondence: I am very against reintroducing the Grizzly bears to the North Cascades. This area is so well known for it's hiking, and back country camping. Most of us have come across a black bear out on the trail, and most have been lucky enough to not have any run ins with a cougar. However, I feel the people of Washington state are extremely unprepared for knowing how to handle a Grizzly encounter. This is a National Park, so firearms to protect yourself are legally not allowed. I think its just an awful idea. Someone is going to get hurt. I would like to continue to enjoy Washington without constantly feeling like I have to watch my back. If I want bigger bears, I will head to Alaska, Idaho, or Montana. No thanks! I'm not gonna put my life in the hands of a can of bear spray. Lol

Correspondence: As a lifelong backpacker and one who has hiked amongst grizzlies, I am ambivalent about this proposal. My wife and I once received the bad news that a couple had been mauled in Glacier National Park on a trail we had just hiked the previous day.

In the Olympic National Forest and National Park, where we have hiked for fifty years, we directly confronted black bears close-up many, many times without incident. I'm aware that black bear and grizzly bear behavior is vastly different, but believe that if North Cascades hikers were properly informed and equipped that grizzly attacks could be minimized.

After considering the benefits and liabilities, I vote yes for the Grizzly Bear Restoration Plan.

Correspondence: It will be a sad day when grizzly bears are reintroduced into Whatcom County. I have lived my whole life in Whatcom County and have hunted and fished our state and federal lands. We DO NOT need animals that can tear apart vehicles just to get at you if they choose to. These grizzly bears should not be brought back. I have been up close to grizzlies in Alaska while commercial fishing and they are a formidable animal. Our settlers and native Americans did us all a favor in hunting them out of this state long ago. The few stragglers that have shown have come down from Canada. They will continue to come from Canada without anyone's help. Do not waste our license fees or tax dollars bringing these dangerous bears back to our county let alone the rest of our state. We do not need a apex predator like this. It's bad enough that wolves have worked their way from Montana and Idaho into Washington and are now in Western Washington. We have cougars and black bears and wolves. We sure as hell do not need grizzlies. We have enough apex predators.

Please do not re-establish grizzly bears in my Whatcom County. It's the wrong thing to do. If they are suppose to be here they will wander across the Canadian border and come on their own. They sure as hell don't need any help. Let nature take its own course. If it was meant to be... they would be here already... don't make me not want to fish Baker Lake for the sockeye run or choose not to hunt our federal lands. I will never camp at Baler Lake again if grizzlies are a possibility. Grizzlies are just a stupid idea and not needed. We haven't missed them and they haven't actually been here in any numbers for hundreds of years. That's a good thing. Don't ruin exploring our federal lands for those who wish to hike and hunt those same lands.

Correspondence: I believe grizzly bears should be reintroduced and managed as a threatened species under the Endangered Species Act.

Grizzly bears disperse seeds, till the land, fertilize forests, and help to regulate prey species. They are an essential part of healthy, fully functioning ecosystems. Grizzly bears and the Upper Skagit people coexisted and thrived prior to colonization, and there is no reason we cannot follow their historical precedent and do the same.

Humans (colonizers) are the reason this keystone species was eradicated from their native range to begin with. We have a duty to correct our past mistakes; to conserve and restore grizzly bears to their native lands to the best of our abilities. To do anything less would mean we are complicit in continuing the violence of forebears.

Correspondence: I support the reintroduction of the Grizzly to the Northern Cascades. It should be as an endangered or at least threatened species, one that co-existed here with the tribes for centuries. They should not be sacrificed to grazing rights for the masses of bovines that everyone knows aren't good for us or the planet. The grizzlies are worth more than a cheap burger.

Correspondence: I was initially skeptical of the preferred option C as I was reading about this initiative, but seeing the tools it offers to allow management of bears and human coexistence makes it seem like a clearly correct choice. What a wonderful plan to bring grizzlies back to this habitat. I look forward to reading about their recovery in our mountains for decades to come. Yellowstone is a place my family loves and we have been lucky to observe grizzly bears there many times, and also see the change over the last 30 years of ecological rebalancing and population growth as bears and wolves help to center the whole ecosystem in which they participate.

Correspondence: I strongly support the reintroduction of grizzly bears to the North Cascades. Having grown up in Bellingham, I have recreated in the NCE for many years. I have also spent time in grizzly territory in BC, Idaho, and Montana. I understand the additional challenges and concerns that grizzlies can add for people living, working, and recreating in wilderness areas. I think these challenges are surmountable, and in many cases the precautions and education that come from grizzly awareness can lead to more responsible, safe, and sustainable use of our natural spaces.

Correspondence: I love bears. I spend a lot of time in black and grizzly country. The North Cascades are absolutely an ideal habitat for them, however, WA state isn't ready. We aren't able to contain or wolf and black bear populations that have seen rapid expansion. While this is amazing from an ecological point of view, we are a human growing population with less forestry than Montana or Alaska. If we're in a constant battle with black bears coming into our towns due to lack of wilderness resources, what's going to happen when we introduce grizzlies? It's not hard, more black bears, cougars and coyotes and probably grizzlies making unacceptable and inappropriate human contact. Humans can't even figure out how to act in Yellowstone, and Wa will not be an exception. Quite frankly, I don't want to see more innocent animals shot by Fish and Game because we aren't responsible with managing population. I will submit that if hunting laws change to reasonable levels than it might be acceptable to introduce another predator. I also believe more support will need to go into bear, cougar and wolf rescues. The state has plenty and they could use expansion. I shouldn't have to explain why that'd be needed. Lastly, I would also consider more focus and budget in protecting the trying to but sparse returning wolverine populations to mt. Rainier before worrying about grizzly relief.

Correspondence: Grizzlies have been here longer than humans have. They have been removed from their natural lands by unnatural predators (humans). We should respect their native homeland the way we respect our own peoples homelands. The ethical reason aside, the ecological benefit is that the grizzlies are a key part of the ecosystem. In the same way that wolves reintroduced to Yellowstone changed the behaviors of grazing animals and led to positive changes in the landscape, I believe grizzlies will have a similar impact in the cascades. Realistically, my only concern is that, given the range needed for grizzlies, I worry that human activity will cause them to retract their domains more and more, and led to more fighting for hunting grounds. Down the line, I worry they will face the same uncertain future as the tigers in India. These animals need all the help and reparation they deserve from us.

Correspondence: The obvious choice is option B due to its focus on restoration and ecosystem health.

Also, option C is untenable because it puts industry and the cattle industry ahead of ecosystems services. Due to the desperate need to restore our environment to aid in combating climate change, ecosystems services should have priority of cattle and

sheep, which are known contributors to climate change, and an unsustainable source of food for local communities.

Remove cattle, reintroduce predators, and reestablish natural grazzers.

Get cattle out of these ecosystems. They are harmful to the environment.

Correspondence: I like option A of letting the bears repopulate the area by migrating on their own. Based on what little knowledge I have, I think that people try to react to their own altering of ecosystems by altering ecosystems and that often causes more problems than it solves. The focus should be on naturally repairing forests by regulating usage more strictly, which will hopefully create an environment that bears acan live in and they will naturally come back.

Correspondence: I support active reintroduction of grizzlies into the North Cascades - restoring the population of up to 200 grizzlies as quickly as environmentally feasible. Most importantly, they should be managed as a THREATENED SPECIES under the Endangered Species Act, and should only be allowed to be captured, moved or killed under specific circumstances, such as the defense of life and scientific or research activities. Also critical: anyone seeking a bear's moving/removal/killing must demonstrate they have done everything possible to address a situation prior to capture/moving/killing of the bear. We must develop a culture that allows that creatures such as grizzlies have a right to exist, and a right to habitat.

I strongly reject the option that grizzlies should be reintroduced as a nonessential experimental population under the Endangered Species Act.

Correspondence: Grizzly Bears are special animals. The truth is that in a now human dominated continent they cannot survive and thrive everywhere and they should not be introduced just anywhere. However if there is a place where we as humans should right some of our historic wrongs and mend some more of the natural ecosystem, it has to be the North

Cascades of Washington. A rugged and beautiful landscape made even more wild by the reintroduction of grizzlies is exactly what can lift the spirits of Washingtonians and Americans and something we can look back on and say we did something right. Please go through with the reintroductions, thank you.

Correspondence: Respectfully, I am opposed to the reintroduction of grizzly bears to the North Cascades.

There are many points-of-view that will be shared; mine is from the recreation perspective... hiking, backpacking, camping, and other family activities. While there are well-prepared, adventurous people who enjoy these activities in areas where grizzly bears exist today (Montana, etc.), I believe there is a much larger proportion of the population who will avoid recreating in areas with grizzlies, myself included.

The National Parks of Washington state are incredible natural resources that can be enjoyed without concern of grizzly bears.

The Purpose & Need highlighted in the Scoping Document on this topic is 50% focused on putting grizzlies in the NCE "because they were there before" & for their "long-term survival there". These are not compelling reasons. Just because you "can do something" (re-introduction of grizzlies), does not mean that you "should do something".

The other 50% of Purpose & Need address future removal from a Federal List & enjoyment by future generations. Increasing grizzly populations where they already exist, can accomplish removal from the Federal List and having a grizzly-free National Park is much more enjoyable for future generations.

Most importantly, while it may take 100 years to re-establish grizzlies in the North Cascades, the time to make a decisive decision is prior to re-introduction.

I appreciate the opportunity to share my comments & will be interested in other's points-of-view.

Correspondence: During the summer and fall, I hike in the North Cascades and surrounding areas in the Okonogan-Wenatchee Forest nearly every weekend. I love being there and getting to experience the wild beauty of that area. Grizzlies were an important part of the region until relatively recently; their disappearance from north-central Washington was an aberration that should be rectified. Grizzlies pose little danger to humans, or at least no more than the black bears already in the national park and national forest. When missing apex predators are reintroduced to their natural habitat, the entire ecosystem improves. Moreover, the plan laid out to actually reintroduce the grizzlies is well-thought out and will take place responsibly and slowly. I support reintroducing grizzlies to the North Cascades National Park.

Correspondence: NO! NO! NO!

Are you people all freaking stupid?

What are the grizzlies, the largest predator in North America, supposed to eat when they come out of hibernation?

Our ranchers are having a hard enough time with the damn wolves you all decided we needed more of here in North Central Washington.

We had wolves, we have grizzlies, we don't need anymore.

There are thousands of people living in the North Cascades.

Every year thousands of visitors visit the North Cascades to hike, fish, hunt, snowmobile, snowshoe, and ski; With this plan, you are endangering all of these people.

Or is that the plan? Get rid of all the people. Endanger their food sources, endanger their lives to the point where they have to leave or they die.

NO! NO! NO!

Sincerely,

██████████ Citizen who lives in the North Cascades foothills.

Correspondence: Are you fucking nuts?
First off, do you not understand how stupid people are in this state.
Secondly, there is a reason we ran them out of the west coast entirely.
You motherfuckers can't even manage the horse population and end up having to drop them by the thousands.
What makes you think that you're going to manage this properly?
Didn't you just shoot a brown bear a few months ago because it was walking around a business complex and elementary school?
And then what happens when a they/them gets fucked by one of these? Are we just going to shoot them at that point.

Why don't you focus on increasing the big game population for more hunting possibilities.
Or why don't you go through the large mouth bass records in CA and remove unverified lake records. How about you start with Mike Long's records?
That should be an easy one for you. Start with that before you fuck up more shit.

Correspondence: 2 points. 1 Grizzly bears avoid repopulating naturally because it's not safe due to population density, crossing highway/interstate/roads (ever increasing traffic) and the food supply is depleted i.e. insufficient elk population. The range of an adult male bear of breeding age is about 300 miles, so when they start killing children in Issaquah, Resmond or Union Hill remember this comment as you try to explain away known hazards to grieving parents since we have cases where black bears have preyed on children in rural/urban zones

Correspondence: I feel like bringing grizzly bears into this area is going to be detrimental to our game populations that us as a public enjoy hunting. Elk and deer populations do not seem to be thriving in Washington state. Maybe the public would like to see our game populations looked at a little more in depth in how we can get these populations up. I guess i don't see the benefit of bringing grizzly bears into this area even if they used to be here. Whoever is voting for this can have the grizzlys moved into their property and they can live with them.

Correspondence: Even as an experienced, avid hiker in the Cascades, fears of negative encounters with wildlife have already kept me away from many trails. Because of my physical build, I would unfortunately be a sitting duck for a grizzly if an interaction were to go wrong, however unlikely. I understand the benefits of reintroducing grizzlies into the Cascades, but I have to speak in favor of Alternative A so myself and others like me can continue to enjoy the outdoors without fear. If there is overwhelming support for reintroducing grizzlies, alternative C would be preferable as it seems to afford greater flexibility.

Correspondence: I really do not think the state needs another top of the food chain predator introduced. People in the city vote these things through with absolutely no idea the danger and devastation predators have. If you're not out in bear country then you have no idea what an unmanaged population can do to an ecosystem. It would be one thing if they were managed but just like black bear cougars and wolves they won't be properly managed because people in the city don't want to come to grips with the fact that proper biodiversity of a ecosystem involves managing of predators. On top of that grizzlies are hyper aggressive. people always wanna say your chances of being attacked by a grizzly are the same as being struck by lightning... Yeah it is for the people on downtown Seattle, come out in the back country and your in counters with predators becomes 10x more likely. Our states ecosystems are already under attack by people who don't understand that if you ban predator hunting it's just going to cause a slow suffer and decay of deer and elk then the predators them self will starve out and die a slow death. State biologists should be listened to not these people with some utopian view that was learned from watching Disney movies. Overall I think releasing grizzly's would greatly effect deer and elk populations and but a lot of hikers and hunters in very dangerous positions. I really hope we do not add more of a predator problem to a already over saturated ecosystem.

Correspondence: Yes, its time to reintroduce them to the North Cascades to provide them more habitat to maintain their existence as a species. There will be conflicts with people and domestic animals, so any reintroduction must allow for measures to control, limit and compensate for those situations. I would recommend the option that would designate the bears as a nonessential experimental population and give agencies "greater management flexibility should conflict situations arise."

Correspondence: Hello,

While I recognize that there are many potential unfavorable interactions that grizzlies might have with humans in the north cascades, I think it's only fair to give nature a shot at what we have taken away from them. If this is their natural habitat it is our job as smart humans to be smart and be prepared in the north cascades. Please continue with the plan to reintroduce grizzlies in the north cascades and understand that there will be interactions between them and humans. As long as we're prepared to deal with the potential side effects of reintroduction, it'll be a benefit in the long run.

Thanks,

Correspondence: Please reintroduce grizzlies!
If it is indeed illegal to reintroduce grizzlies, as stated by a State representative, that law should be changed. Grizzlies belong in their ancestral range and original habitats. Risks to humans are low and can be mitigated with good human behaviors to prevent conflict. Risks to livestock are lower than many people assume, though perhaps it would be fair to make sure any livestock losses are compensated somehow.
Thank you for opening this matter for public comment.

Correspondence: I am very staunchly opposed to the reintroduction of Grizzly Bears in Washington state period. As a former resident of Alaska, I know first hand the horrendous problems these animals present with regard to public safety both in the wilderness as well as to adjacent populated lands. This is public endangerment on a grand scale to restore an animal

that serves no beneficial purpose to the Washington environment that our more docile and rational Black Bears already provide as apex predators.

Please abandon this insanity at once and leave Washington mostly Grizzly free!

Correspondence: Hello. It's good to hear some action is being taken to bring back native animals to habitat they once roamed. Currently the area that is being studied is very remote, so remote only experienced outdoorsmen dare go into. Unfortunately some not so seasoned adventurers may wander into these areas too. This often leads to destruction of sensitive ecosystems and may even result in injury due to the inexperience of the hiker or adventurer. They often leave trash or destroy plant life by unknowingly destroying it in their journey. They may also introduce foreign insects into these deep forests from wherever they're from on their person. My concern is that there may be too many people barging into lands that are meant to be pristine and protected wild lands. The introduction of this apex predator will likely deter people from entering these protected places and perhaps slow the effects of human-made destruction along trails and trailheads. Having a reintroduction of grizzly bears may also boost the global population of this species. The land is there, the food is there, everything that once supported them is there. It's time for them to move back home.

Correspondence: The North Cascades is one of North America's premier intact ecosystems, but it is incomplete without grizzly bears.

This is the second attempt by the agencies to restore grizzlies to the NCE after a 2015 process was halted by the Trump administration in 2020. At the time, more than 159,000 members of the public wrote comments supporting the reintroduction of grizzlies.

"The time has come for the grizzly bear to return to its habitat to take its place in the indigenous ecosystem," said Scott Schuyler, policy representative for the Upper Skagit Tribe, whose territory lies within the recovery zone. "The Upper Skagit successfully coexisted with grizzly bears for thousands of years, and we should once more."

The NCE is one of two federal grizzly recovery areas without an established population of bears, and natural bear migration is unlikely to repopulate it. Instead, based on decades of thorough research, wildlife biologists suggest safely relocating existing bears into the North Cascades. I fully agree

Correspondence: I don't know why you ask for public comments when you know you will not only ignore the requests of the public to keep these bears out of the North Cascades (which is my fervent request), but you also override the Washington State Constitution, which forbids grizzly bears in the state.

Grizzly bears are NOT an endangered species. There are tens of thousands of them in Canada and tens of thousands of them in Alaska. They thrive in the wilderness where there is peace and quiet and plenty of food for them. The North Cascades is teaming with people. Hikers and climbers walk over every part of these mountains and valleys. Conflict with bears is inevitable. If a bear mauls a human, the bear will suffer no consequences. Instead, the injury area will be shut to humans. The whole area is filled with black bears, which co exist with humans magnificently. Putting grizzlies where they don't want to be (they could easily walk down from Canada - they DON'T) and where they are not wanted excepting by some bear enthusiasts, is contrary to common sense, and is most certainly contrary to what the majority of citizens in Washington want.

But even though you open this to comment, you don't plan to listen to a whit of it. I am venting this complete common sense, but I know you will completely ignore it. This is just an exercise you do because the law forces you to. I wish fervently that the law would also force you to do what we ask.

Correspondence: During the 70s and 80s my mountaineering partners and I spend quite a bit of time in remote areas of the North Cascades. We never encountered a grizzly or any sign and really never thought about it. This despite being in areas where it felt like no human had ever been (pretty special). I'm older now but still enjoy the solitude of remote places immensely. In 2017 I got a small getaway place in Lewistown, Montana for the purpose of finding additional solitude. Being 110 miles from an Interstate highway in any direction, day trips are very feasible. During this very short period of time, just a couple of years ago grizzlies have begun to naturally repopulate the plains areas where they were formerly native. No matter how accomplished or experienced one feels they are in the wilds, going afield carrying bear spray is #1 an exercise in humility. It is not possible to treat a wild grizzly with disdain the way we commonly treat some of our fellow humans with disdain. Being aware that you just might have an encounter with a grizzly tempers everything that you do in the outdoors: the ways we treat human waste, food litter, campsites, and any outdoor activity be it hiking, fishing, hunting, bird-watching, photography, etc. Every outing becomes more special and we return to civilization with a renewed sense of wonder and, yes, that H-word again--humility. Let's bring this potential back to the North Cascades.

Correspondence: I have hiked 90 miles of the Pacific Crest Trail from Rainy Pass to Stevens Pass. The freedom afforded to hikers in that exquisitely beautiful terrain, without the worry of an attack from grizzlies, was undeniably important to me. I wouldn't even consider a similar trek in Glacier National Park for that reason. Family friends who live in Smithers, B.C. were forced to build a high fenced berm around their house just so their children could safely play outside while the mom washed dishes at the kitchen sink, watching them from the window. They go nowhere in the nearby wilderness without being armed because the threat of grizzlies is so high.

With all the violence American citizens face in our cities, please let us keep some beautiful sanctuaries where the threat is low and it isn't necessary to pull out some type of protection. Hikers may not have time to get the toggle turned on that bear spray can during a grizzly attack, and who wants to carry a gun in such a beautiful place? Not me.

Correspondence: Although currently a resident of SLC, UT, we are looking to move to Bellingham, WA in the next 2 years - and are, therefore, an interested party.

We oppose the move to introduce grizzly bears into North Cascades. We like grizzlies and have seen them not only from the safety of our vehicles but also encountered them multiple times on the trails. While our encounters have been peaceful thus far, they have not been without risk. So, we know that the risk in human-grizzly encounters is essentially uncontrolled and sooner or later there are adverse consequences for the humans. Frankly, there is too much stress and risk associated with the encounters that we have slowly stopped visiting the areas with grizzly bear population.

We, therefore, think that keeping the grizzlies in their current habitat is preferable to adding them to North Cascades following such a program. As such, our preference would be to not proceed with this initiative.

Correspondence: I am commenting as Chair of Whatcom County Democrats, in representation our over 900 dues-paying members. Our Platform, unanimously adopted, states, "State Legislature, Federal Government: Protect keystone and other species - such as orca, salmon, wolf, beaver, puma, and grizzly bear - and restore them to suitable parts of their former ranges to maintain a healthy ecosystem."

That explicitly includes restoring the grizzly bear to the North Cascades, much of which lies within Whatcom County.

In this time of severe climate change and threatened extinctions, it is essential to do all we can to restore and protect our native fauna. The grizzly bear is also emblematic of truly wild habitat that is everywhere under siege. It is also a draw for ecotourism.

Correspondence: Please do not bring back grizzly bears to the North Cascades or anywhere else. As a back country hiker I have seen the ecosystem work just fine without them, and they would pose a significant danger to people who are in the wilderness. We do not need to restore any animals that are dangerous to people. The forest will not die; cities will not be over-run with deer; and it will be much safer for people to enjoy the wilderness areas without the threat of being killed by a grizzly bear. Life has been just fine without them. And wolves are not necessary either.

Stop listening to all the tree-huggers and animal worshippers that think all animals are necessary and good. Those people are in the minority. The majority of wilderness users want to be safe when they venture into the woods, but also understand that there are certain natural risks when doing so. We don't need to increase the danger risk by restoring grizzly bears. Black bears and cougars can handle all of the necessary ecosystem duties that grizzly bears would.

Thanks for your time.

Correspondence: First off this is a very bad idea. Leave them in Alaska or Canada there's too many people in the forest down here that are irresponsible and not able to take care of themselves let alone worry about a 1000 pound bear that will eat them. I say this from experience being Hey avid camper myself. I have had 4 Bear encounters with big brown bears 3 in California and one in Montana I am still lucky to be alive.. I don't mind the blackbears there a little more timid. If you bring grizzly bear's back there's gonna be too many people bear encounters and as people do not win against a bear. You bring grizzly bear's back and they start killing people 1 or 2 a year it's on you

Correspondence: Don't do it. Grizzlies aren't endangered but hikers will be. The North Cascades is so close to millions of people. The bears are fine living in Canada or wherever. They don't need to be this close to people. It's not the 1700s anymore.

Or consider the lawsuits that will be filed by mauled hikers and dead hikers' families. And for what? So there can be a few more grizzlies in the world? It's not like the bears know or care.

Don't do it.

Correspondence: I do not support any grizzly "restoration" in the cascade range. If introduced they would be an invasive species. Much like the timber wolves brought down from up north wich never inhabited these lands. They decimated the deer,elk and moose populations everywhere they spread. We do not need another invasive predator species putting a strain on the ungulate populations. Grizzly bears are not endangered so why propagate the species? Restore the deer and elk populations and remove the wolves. Spend your time on projects the public supports. Not special interest projects that a handful of radicals support.

Correspondence: I live in Whatcom county and regularly hunt, fish, and hike in the North Cascades. I am against the reintroduction of grizzly bears into the North Cascades and am concerned about the ungulate population if they were

reintroduced. Blacktail deer on the western half of the reintroduction area cannot be surveyed and the Okanogan mule deer heard on the Pasayten side of the reintroduction area is already struggling. The addition of grizzly bears will not help either of these populations, and the impacts to these populations has not been studied enough to move forward with the plan. If the North Cascades was good habitat for grizzlies, why have they not naturally populated the area for Canada? This state already has a predator management issue, that the WDFW commission is actively trying to make worse through bad policy decisions. There is very little benefit in reintroducing grizzlies to the North Cascades, if they wanted to be there, they would have already come down and established a population from Canada.

Correspondence: As a avid outdoorsman i completely disagree with this. Grizzlies are known to be very aggressive, much more than our beloved black bears. Introducing these bear into areas where their will be hikers and campers will result in people being attacked. Is Introducing more predators in the ecosystem more important than the safety of people trying to enjoy the outdoors? Wolves have already been introduced into the state and the population is getting out of control. Livestock is being attacked. Elk and deer populations are decimated. They have migrated to the west side of the mountains, where they were never ment to be. Do you really think the Grizzlies will stay in the east cascades? What happens when they start popping up in populated areas? I sincerely hope you think twice before you do this.

Correspondence: Absolutely NOT! Washington is already suffering the consequences of an over abundance of Apex predators! The wildlife is in decline due to the high number of wolves, cougar , bear , Bobcat, and coyotes . The last thing we need is MORE 600 lb grizzly bears . WDFW has already hurt this state by eliminating hound hunting , eliminating spring bear season , eliminated baiting bears . These were the 3 most successful ways to control the populations , it also was the best way to size up animals and assure they were older mature animals before harvesting them . Somehow WA state politicians have forgot that us humans are in fact part of the food chain , we should be at the top of the chain , but bad policy's have removed us , destroyed our resources and put us lower on the food chain . Stop the insanity !

Correspondence: Dear Superintendent,

I am writing to express my vehement opposition to the proposed Grizzly Bear Restoration Plan for the North Cascades Ecosystem. While I understand the importance of preserving wildlife and maintaining ecological balance, reintroducing grizzly bears to this region is a misguided and perilous endeavor.

The potential risks and threats posed by an increased grizzly bear population cannot be understated. These animals, once reintroduced, will undoubtedly encroach upon human habitats, leading to an inevitable surge in human-wildlife conflicts. The safety of local communities should be of paramount concern, and it is irresponsible to jeopardize the well-being of residents for the sake of an ill-conceived environmental experiment.

Furthermore, the draft Environmental Impact Statement lacks a comprehensive assessment of the economic repercussions that may arise from this proposal. Local industries such as agriculture, tourism, and outdoor recreation are bound to suffer as the presence of grizzly bears raises legitimate concerns among residents and visitors alike. The potential decline in these sectors will have far-reaching consequences on the livelihoods of countless individuals.

It is disheartening to witness government agencies prioritize the interests of wildlife over the safety and prosperity of their own citizens. I urge you to reconsider this misguided proposal and focus on initiatives that prioritize the well-being of the

human population and the sustainable growth of local economies.

Sincerely,

Correspondence: Thank you for this opportunity to comment. I currently feel OPPOSED to any proposal to reintroduce Grizzly Bears into the Northern Cascades of Washington State. While I usually support all natural ecosystems & related reintroduction efforts (especially in my home state of Washington), I make a unique exception only for Grizzly Bears, for the following reasons:

- I backpack in the backcountry of the North Cascades, and it's a tremendous relief not having to worry about Grizzlies. (Black bears are significantly easier to deal with.)
- After Grizzlies' absence of more than a century, the ecosystem has already evolved accordingly - as have the expectations & lifestyles of surrounding communities and visitors (e.g., campers/hikers) to the area.
- The North Cascades already have apex predators (Black Bears and Cougars), which seem to provide balance?
- Unless there's a severe & compelling problem to be solved here (e.g., an egregious ecosystem imbalance), then I struggle to understand the rationale for pursuing the reintroduction of Grizzlies.

Thank you again for considering my input.

Correspondence: We need more wildlife diversity and native animals to be brought back to where they belong. As a biologist with a master's degree in environmental science, I am begging the NPS to sponsor and fund as many projects like this as possible. We need NPS and BLM lands to remove invasive plants and animals as much as possible as well. Allow grizzlies and bison to start in national parks and then spread to as much of their native ranges as possible.

Natural herbivores and carnivores will help with natural processes for plant life in the areas as well.

Correspondence: No one looks forward to encountering a bear in the back country, but everyone I know in the PNW who spends time in the Backcountry knows how to stay safe from bears (i.e. using bear canisters, keeping smell ables away). When we eliminate critical pieces of ecosystems that have been thriving for centuries or millenia, we start to destroy the very thing all nature enthusiasts wake up early to get out and experience.

The whole concept of national parks is to preserve the environment so that future generations can experience some of the magesty that we get to experience today. Restoring an environment to the way it was two generations ago feels like a great way to keep to that goal.

That said, I think we need more education for the casual day hiker on how to interact with bears. The North Cascades are on every trending TikTok for the most beautiful hikes in Washington, and people who have never gone in the woods before will be in this area. Let's set everyone up for success.

Correspondence: I wholeheartedly support the idea of reintroducing grizzly bears to the North Cascades National Park and managing them as a threatened species under the Endangered Species Act, while allowing for limited capture, relocation, or euthanization under specific, carefully monitored circumstances. This approach strikes a balance between conservation and the safety of both bears and humans.

Grizzly bears are not just charismatic megafauna; they are keystone species that play an essential role in shaping their ecosystems. Their return to the North Cascades would help restore ecological balance, benefiting a wide array of flora and fauna.

Moreover, this initiative offers invaluable opportunities for scientific research and education, fostering a deeper understanding of these magnificent creatures and their impact on the environment. It can also promote responsible tourism, bringing economic benefits to local communities while ensuring the preservation of our natural heritage.

However, it's crucial that we prioritize human safety and community engagement throughout this process. Strict protocols for bear management, based on the best available science, must be in place to minimize conflicts and protect people's lives.

In conclusion, managing grizzly bears in the North Cascades as a threatened species under the ESA, with carefully considered guidelines for capture or euthanization when necessary, represents a responsible and ethical approach to conservation. It not only aids in species recovery but also enriches our understanding of the natural world, benefiting both the environment and local communities.

Correspondence: I am an avid outdoorsperson and I usually spend 2+ weeks per year in the backcountry in the North Cascades. One of the huge reasons that the North Cascades National Park is so special is its unique remote and wild character.

While I have enjoyed the luxury of playing carefree and not needing to think about grizzly bears, it's much more important that they return to their place in this intricate ecosystem. Conservation of truly wild places is very important to me and humans don't belong at the top of the food chain in the North Cascades.

I fully support the Grizzly Bear Restoration Plan Alternative C -- Restoration with Endangered Species Act Section 10(j) Designation -- for North Cascades National Park.

Thank you,

Correspondence: I am a hiker, and get up to the North Cascades area a few times a year. High on my list of hiking enjoyment ingredients is not having to worry about my safety - yes, taking due diligence for my safety is important, but your proposal to increase my risk of encountering bears is just plain unnecessary. I already have native risk from black bears and cougars - both of which behave differently than grizzlies. If I want to see a grizzly in the wild, I can go to Yellowstone or some other park (I like seeing them there - but I also don't hike there).

The idea of reintroducing them is just unnecessary. Equilibrium, after the grizzlies were removed from the area, has already long since been established, so they are not, and have not been for decades, part of the ecosystem. Yes, they were once a part

of it - but they are not now, and a new equilibrium exists. Leave it alone! Grizzlies do not sufficiently benefit the ecosystem so as to endanger hikers. I'm not saying there is no benefit at all - it's just not enough benefit to warrant the risk.

There are also better uses for Park Service funds than this, but that's not the point. The point is that reintroducing grizzlies is just not necessary and any benefits are not worth the impact to the recreational community.

Correspondence: We do not want Grizzly bears in Whatcom County or the State of Washington. As someone who has spent a lot of time in the mountains I do not want to see a dangerous bear introduced. Black bears will usually run away from you but grizzly bears will hunt you down . They will also kill deer and elk which are already being preyed upon by cougars and wolves. which the government has been promoting. I think it is a really bad idea. There is a reason why we got rid of the grizzly bears in other areas. They are a great threat to humans and other animals. Recently we had reports of a Mama black bear and her two cubs that were seen roaming all around whatcom county from South Pass road to Blaine. The game department finally had to trap them and euthenize them because they were getting into peoples garbage and they knew the bears would keep coming back. luckily no one got hurt, If this had been a grizzly bear people and livestock would have been in danger. Please do not reintroduce grizzly bears back into anywhere in Washington State.

Correspondence: Restoring the grizzly to the Washington State Cascade Mountains is a dangerous waste of resources. With the very large populations and number of people recreating in the Cascades - many people WILL be hurt/killed if these predators are restored.

No clear imbalance is present in the ecosystem currently. These predators have been absent for a century. The case for recovery seems to be more about "they used to be here, so let's bring them back", Recovery of the grizzly here will not heal an ecosystem - it will only bring danger to residents.

No to recovery in Washington State. Just no.

Correspondence: For the love of god please scrap this idea altogether. Sure, grizzlies once lived here. Emphasis on the past tense. Displacing a bunch of grizzlies into a new region as the alpha predator to create a domino effect to disrupt the entire food chain. What could go wrong? Oh, yeah. The same thing that happens every time us humans meddle with things like this. How many times do we collectively have to not learn our lesson here?

But sure you have some fanciful idea of what the state once was. Will you bring back the woolly mammoth too? How about you put your resources towards keeping our dwindling salmon population alive? That way everyone from environmentalists, to fishermen, to the already stressed animals and plants are happy. Last i checked the salmon are nearly wiped out in the north cascades, and you seriously want to add a predator notorious for hunting salmon? Great. Lose the animal every loves and replace it with one everyone is terrified of. What a trade.

Look, im not oblivious to bears. Im an avid outdoors adventurer. Ive seen over 50 bears in the wild. I'm more confident around these animals than 99% of the hikers and backpackers out there. When the only bear you need to concern yourself with is a black bear, its not a big deal. You follow good bear practices, have some bear mace, and use good judgment. When you have grizzlies, you bring guns. Big guns. Ask anyone in Alaska.

Your bear management BS will provide zero defense to the unprepared public trying to recreate. Particularly as the grizzlies are trying to figure out their food sources in a new spot. Hikers in tents may as well be bear tacos. What happens to the outclassed black bears? They'll get pushed out of their territory into the suburbs. A hungry desperate black bear is a dangerous black bear. Those are the kinds that attack people. So even if you have grizzlies deep in the wilderness, they dont just fold into the food chain. They push something else out of it.

Has it even been established that these bears can sustain themselves here? There's a reason they aren't here already. Its one thing in Montana or Alaska. But the cascade mountains let the wolverine's naturally re-establish themselves southwards. If it was viable, the bears would have already done the same on their own accord. Again. Stop meddling with nature.

What happens next summer when the wildfires wipe the habitat out again and push animals away and limit their resources? Where are the grizzlies gonna relocate to? Hint: You wont be in control of them.

This plan, boiled down to its constituent parts is simple: Insert chaos and danger using taxpayer dollars in order to make our prized parks less usable to humans for the sake of massaging someone's naive sensibilities about nature.

Correspondence: We have had encounters with grizzly bears in Montana and Alaska. They are not to be taken lightly! People are regularly attacked and killed in Glacier Park, Yellowstone Park, The Great Bear Wilderness and parts of Alaska. The terrain in both Montana and Alaska is not nearly as populated as in Washington State and the number of backpackers and horse-packers are not as numerous in the backcountry of Alaska and Montana. People will get killed by Grizzlies if they are introduced here. If the wild parts of Whatcom County were viable for grizzlies, they would have already migrated down from BC or from populations in the eastern part of the state, Idaho and Montana. This is a dreadful idea that does not value human life and safe access for people into the back country.

Correspondence: I am commenting in opposition of this draft. I believe this is not a great decision or use of US Fish and Wildlife funding. Until states can manage these animals individually, this should not be considered as another federally ran program. Washington's state fish and wildlife will ultimately end up with higher costs to deal with these animals on our landscape. If Grizzly bears wanted to be in WA, they already would be. I feel that if the Grizzly bears were reintroduced, the anti hunting groups and organizations would protect these animals at such a cost, that they would then never be managed and would pose a threat on our ungulate and livestock species. WA state will never vote for a delisting of the Grizzly bears. Please do not reintroduce them here.

Thank you,

Vice President - WA Chapter

Correspondence: Yes, they should be returned, and protected from hunters and ranchers protecting cattle or sheep. Bears are native species and should receive priority over humans moving into what was, until relatively recently, wilderness. Domestic livestock have no business there. If required change the zoning and land use regs to push back areas humans inhabit or might move into. Take "grazing land" out of circulation with a new, very large land use category "predator habitat";

Correspondence: Please accept our organizational, and our individual Board member support of the proposed initiative to return a sustainable population of grizzly bears into the North Cascade ecosystems.

The North Cascades have traditionally, healed, robust grizzly populations for centuries prior to their extirpation, in the ecosystem is fully capable of supporting grizzly bears in combination with other wildlife. We believe that the presence of grizzly bears as a vital part of a wilderness ecosystem, and we recognize that in many areas across North America, including parts of Idaho, Montana, Alaska, the Yukon, British Columbia, and Alberta, people have managed to recreate, roam, farm, and coexist in harmony with grizzly bear populations.

Grizzlies have become an icon of successful wilderness, and for many of the First Nation people who have lived here since time immemorial, the grizzly has always been a revered and important ecological species present throughout the northwest. As society continues to 'progress' ahead, the trend has been to lose many of our native species to extirpation; in order to ensure sustainable biodiversity, and the true integrity of God and his ecosystems, it is important for us to allow for, and actively support, the return of natural predators into regions where they were previously, and senselessly, eradicated. The presence of grizzlies will also do much to help provide for a healthier prey-species presence in the North Cascades.

We urge the NPS to provide the resources, build the necessary partnerships, and commit to the long-term re-introduction of a stable and balanced ecosystem in the North Cascade by pursuing a grizzly bear reintroduction program in Washington State. Thank you for your attention and consideration.

Correspondence: I'm writing to support reintroducing grizzly bears in the North Cascades

The very survival of humans and all life on earth requires that we respect and repair ecosystems. Diversity of species (e.g. black bears, grizzly bears, and others) occupying a similar ecological niche AND maintaining the presence of keystone species like top predators are essential for ecosystems to thrive. Humans have removed grizzly bears from the North Cascades in Washington. It is our responsibility to bring them back, even if it means that people have to make shifts in their own lives to accommodate them.

Please keep this effort moving forward so that grizzly bears can once again live in the north cascade mountains of Washington state.

Correspondence: I live in WA and quite often hike and backpack in North Cascades. The area is already wild and dangerous enough, and introducing grizzlies there will make it even more so, adding dramatically to the risks of being out in the nature. I believe we shouldn't make any moves and let the nature do its job, if grizzlies find it good for their life, so be it. But changing it artificially (even if we believe it's how we think it needs to be) is the wrong choice

Correspondence: Return/restore Grizzly Bears to the North Cascades Ecosystem in Washington, where the animals once roamed.

Do I have to say more?

OK.: "The Upper Skagit people are historically the people of the North Cascades, along with the grizzly bear," Scott Schuyler, policy representative for the Upper Skagit Tribe, said in a phone call. "It has always been important for us to restore and see the return of grizzly bears."

"From the tribe's standpoint, we believe the answer is pretty clear: yes, they do have a right to exist," he said. "Our history proves that coexistence is possible, our ancestors respected these animals and they thrived up until the point they were driven out."

Coexistence IS possible, if we respect Grizzly Bears!

Correspondence: I feel that introducing grizzly bears into the North Cascades would create a very dangerous situation for the hikers who visit the area. Because it's a roadless wilderness, a hiker, possibly exhausted from a steep climb up a trail, would be in real danger if they came around a bend and surprised a grizzly bear. I'm aware that there are black bears living in the area, but grizzly bears are bigger and more ferocious. The North Cascades National Park was created to preserve an exceptionally beautiful area for people to enjoy the wonder and peace of nature.....not to go hoarse calling out to warn off grizzlies and constantly looking back over your shoulder to check for them. I also think the introduction of grizzlies would inspire more hikers to this remote area to carry firearms for self-protection, even though that's not legal in the park. Better safe than sorry.

Correspondence: Greetings,

I am writing for my extreme support for the "no action" option for the grizzly bear recovery plan. My support for no action is based on public safety and the best interest of the grizzlies that would potentially be relocated. Current grizzly bear populations take advantage of many different food sources, most of which do not exist in the high cascades in enough volume to produce quality habitat for grizzly bears. In populations in BC, grizzly bears take advantage of caribou, elk, moose, white bark pine, fish, and other vegetation. In Montana and other western states where grizzly populations thrive, you can substitute fish for moths and other insects and small mammals. The crest of the Cascades holds NONE of these in sufficient volume, so you'd be taking a bear from its habituated diet and setting it up for failure; either the diet would have to adapt, which would likely directly compete with healthy and also naturally-occurring black bear populations, or the bears would relocate to find more suitable forage. This migration would take them off the crest of the cascades into the human matrix, which only spells disaster for the bears and the persons they interact with. IF the bears stay in the cascades and do not find suitable food... you will have an entirely different challenge; the Pacific Crest Trail sees some of the largest usership on the west coast, with most of the persons trying to compete it doing so in late summer and fall... the same time these bears would be desperate enough for a very poor outcome for recreational users. You are setting persons AND the bears up for a very poor outcome for little to no reward. The fact is that there is no physical barrier for grizzlies to reoccupy the Cascades should they choose to do so from the British Columbia population. Grizzlies are physical, mobile, and highly intelligent creatures that would have already repopulated the region in question if the habitat were preferable to them. Let nature decide where it should exist rather than dictating where it does.

Correspondence: I'm so disappointed in this effort - it's too late, folks. The bears got screwed here, first by being hunted almost to extinction and NOW with this effort to repopulate the region! Humans continue to encroach on their habitat - and this will continue as there's no effort to incentivize anyone to have either fewer kids or even no kids. So as the population continues to go up more land is/will be used to house these folks; the bears get less and less habitat & get screwed once again!

And you plan to reintroduce these poor bears into an ever-diminishing territory? What are you thinking? Or are you thinking?!

Wake up please -

Olympia, WA

Correspondence: Everyone in our household support the restoration of animals which have been pushed out of/hunted out of historic territory.

We support this action.

We ask that controls are put into place to prevent land owners from indiscriminately killing animals that they perceive to be a threat. I am reminded of an old South Park episode where the characters were going hunting and only had to shout "they're coming right for us" and then would unload on whatever creature was in range.

While this is an example in a comedy TV show, it is my perception that property owners only have to provide a flimsy excuse as to why entire wolf packs and other animals need to die.

Civil penalties should be mandatory with killings that are not approved or sanctioned by the appropriate government body.

Restore the Grizzly Bear to its historic habitat and protect it.

Correspondence: Please do not introduce grizzlies to Whatcom County. I feel that with the ever growing loss of territory that would be suitable for grizzlies, due to deforestation and housing development, they will inevitably end up in human populated area. I don't have faith in the department of fish and wildlife to remove and relocate these bears in a timely fashion when that inevitably happens. I have good reason to not have faith in them because of the way they've handled the family of black bears (mom and 2 cubs) that have been roaming my area for over a month now. They were spotted just a couple blocks from where I live. Fish and wildlife released a statement that they would be trapping and relocating them but that was at least a month ago and it has not happened yet, in spite of the public continually posting sightings on social media. This has caused me to fear bringing my dog out to potty when it's dark. I don't have a fenced in yard. I have a German shepherd that is naturally protective of her property and if those bears did happen to come into my property, I have no doubt that there would be bloodshed, probably my dogs blood and/or mine. Please, for goodness sake, please don't release grizzlies into Whatcom County.

Correspondence: I am opposed to the reintroduction of additional grizzly bear population to the Whatcom and Okanogan Counties in Washington State. The grizzly bears that remain are fine, but increased human population and increased recreational use of the area will only increase the opportunity for grizzly/human interaction. As we've seen in WY, MT, and ID, those interactions are rarely pleasant, for both bear and human.

As we see in Glacier, Teton and Yellowstone National Parks, a growing population of tourists are complete idiots and think wild animals are Disney characters. Taking pictures within fee of bison, elk, moose, and bears. Those outcomes are rarely pleasant and the animals are always faulted.

I write this not from fear, but from a protection for the grizzlies from the idiocy of humans. Thank you.

Correspondence: Dear Sirs,

I am totally and adamantly against the introduction of grizzly bears into the local environment. When it comes to things such as wild fires, it seems that the park managements viewpoint is to let it go, it's natural! I ask that you take the same stance on everything in the park. Just leave it alone and nature will restore balance in time.

Thank you, [REDACTED]

Correspondence: Grizzly bear re-introduction, especially to the north Cascades and Eastern whatcom county , is a absolutely horrible idea. We already have massive predator management problems, only getting more and more complicated with the Washington fish and wildlife commission. Introducing a top apex predator like grizzly bears to our ecosystem is only going to hurt it in the long run. Not to mention, eventually someone is going to have a run in with a grizzly and those usually don't turn out to well .

Don't re-introduce grizzlies back to WA state or the Cascades. It is an incredibly bad idea

Correspondence: I support the reintroduction of grizzly bears into the North Cascades. They are an important part of the ecosystem as an apex predator. If they do get reintroduced, there will need to be a lot of public education to help people understand what to do and how to camp in grizzly country, etc. For example, many campsites in the North Cascades are not set up for pitching a tent in one location and cooking 100 yards away. I think it is important to reintroduce grizzlies because that is what the science supports, and I think we should make our decisions based on science rather than fear.

Correspondence: I love the North Cascades. Although I no longer live in WA, I've camped countless nights in the park and surrounding area. The return of the Grizzlies to the park would be tremendous. I can understand the argument that they're dangerous or that they ought to make a natural recovery, but returning the Cascades to their former glory would be a Conservation victory on par with the wolves in Yellowstone, and probably less controversial. The Cascades are the crown jewel of the US, and returning the ecology to pre-US times (as close as possible anyways) would fulfill the mission of the NPS... to preserve unimpaired the natural and cultural resources and values of the NPS for the enjoyment, education, and inspiration of this and future generations. The Cascades without Grizzlies is a loss for the bears, the Cascadesthemselves, and the Americans (and others) who enjoy the mountains every year. To tune into Nature, without all of Its inhabitants, is impossible.

Correspondence: As someone who frequently recreates in the region, I fully support the reintroduction of Grizzlies into the North Cascades complex.

As someone who has worked in wildlife biology, and ecological research, I believe I have an informed opinion on how the reintroduction of this keystone species can have amazing benefits to the ecosystem at large.

I understand many local ranchers, farmers, and perhaps some recreators will have apprehension or cause for concern about the reintroduction. I believe, however, that any potential threat would be quite minimal and that there are a multitude of various mitigation techniques to help prevent any potential threats to agriculture, livestock, or humans.

I am hopeful that this effort can continue and that we can one day see grizzlies back in this ecosystem they once thrived in.

Correspondence: Thank you for taking public comment on this matter. As an avid outdoor recreationalist I oppose both Alternatives B & C and would opt for Alternative A (no change) to the current Grizzly Bear management plan for the NCE. We as Washingtonians have enough predator conflict to deal with as it is with wolves, cougars and black bears. The last thing we need is 7x grizzly bears a year dropped off in the NCE.

Correspondence: As a long time hiker and backpacker in Washington state, I am against re-introducing Grizzly bears to Washington State.

Western Washington is densely populated, with MANY people who enjoy hiking. Mixing Grizzly bears in areas with large human populations, will undoubtedly cause encounters. Many, which will be detrimental to the humans as well as the bears.

Montana, Idaho, & Wyoming are seeing increased Grizzly bear encounters with humans, due to the increased Grizzly populations in those states. This is happening in states, which do not have our population density, nor do they have the hiker density on trails, that we do on any giving weekend.

We do not need to introduce these issues to Washington, the bears seem to be recovering well in Montana, Idaho, and Wyoming, leave well enough alone!

Correspondence: I'm writing in support of the 2022 North Cascades Ecosystem Grizzly Bear Restoration Plan/Environmental Impact Statement of all goals and objectives. Namely, to

*Avoid the permanent loss of grizzly bears in the NCE

- Contribute to the restoration of biodiversity of the ecosystem for the benefit and enjoyment of present and future generations
- Enhance the probability of long-term survival and conservation of grizzly bears within the NCE and thereby contribute to overall grizzly bear recovery
- Support the recovery of the grizzly bear to the point where it can be removed from the Federal List of Threatened and Endangered Wildlife Species

with the objective to...

- Restore a grizzly bear population as part of the natural and cultural heritage of the North Cascades
- Provide Pacific Northwest residents and visitors with the opportunity to again experience grizzly bears in their native

habitat

- Support Tribal cultural and spiritual values, as well as environmental and natural resource objectives related to the grizzly bear population

A healthy ecosystem requires a sustainable representation of all species. The absence of brown bears over the past decades means that the North Cascades ecosystem is incomplete, negatively affecting all species, including humans.

British Columbia has shown that the presence of bears near humans not only can work but can even benefit local economies through recreation and tourism. Common-sense safety measures including adequate signage, and requirements of hikers and other recreational users to carry bear spray and to travel in groups help address the fear-based, zero-sum logic of "humans vs. bears."

Overcoming ignorance and fear requires ongoing public participation in the project. Websites and social media apps could provide not only educational material but opportunities to report bear sightings and behavior. The hugely popular Cornell eBird app is probably the best model for partnership between wildlife science and public crowdsourcing.

Implementation of the plan must include addressing the legitimate needs and safety concerns of local communities. For example, inevitable losses of livestock due to bear predation must be compensated. A clear and fair plan for such compensation must be included in the implementation of any bear reintroduction plan.

Correspondence: Grizzly bears are an important resource for a healthy eco system. Anyone who is afraid to let 25 bears live on thousands of acres of public land are using faulty logic based on hysteria. It is a small price for ranchers and farmers, who enjoy benefits paid for by public taxes, to THEORETICALLY lose some livestock to predation.

Bears belong here. They should be here.

Correspondence: Grizzly bears were eliminated from this environment many years ago for a reason - they are apex predators that are completely capable of killing humans. Even if bear attacks on humans are very rare, even one human killed by a bear is too much. Is this not how we view safety in our home and workplace? One death is unacceptable and inviting a deadly predator back into an environment with humans is a bad idea.

What is the scale of environmental improvements that will occur by bringing grizzly bears back into this ecosystem and is it truly worth the risk?

Is it not true that Grizzly bear populations have completely recovered in Yellowstone?

And if hunters are not allowed to hunt reintroduced Grizzly bear populations, Grizzlies may not have any natural fear of humans. This would increase their danger to society to a level even higher than when they were first eradicated.

I think that it is wishful thinking not based in reality that has led us to consider reintroducing them to Washington State.

Correspondence: I do not support this grizzly bear reintroduction plan for the North Cascade Ecosystem. Grizzly bears are already in Washington state and I strongly believe that we should let the grizzly bears move into the North Cascades on their own schedule and not force the reintroduction. This seems very similar to wolves getting reintroduced into Colorado when the wolves were already moving there from Wyoming on their own. Perhaps instead of reintroducing grizzly bears the focus should be on improving mule deer herds in North Central Washington. The Methow valley used to have the largest migrating deer herd in the lower 48 and now that herd is a mere fraction (about 1/4) of what it used to be. Maybe focus some of your efforts on rebuilding the deer herds first before reintroducing grizzly bears so that the bears actually have something to eat! If not then 200 grizzly bears will dwindle down that deer herd to almost nothing, which means most of those bears will move closer to homes to try and find food. That would most likely end up with human/bear conflicts which would result in grizzly bears being shot. So I strongly believe that your first efforts should involve rebuilding the struggling mule deer herds in North Central Washington before introducing another apex predator into the mix. And like I stated before, grizzly bears are already in North Central Washington, so perhaps a larger, healthier deer herd would help attract more grizzly bears into North Central Washington? Just some food for thought.

Correspondence: I would advocate strongly against reintroducing grizzlies anywhere in Washington State. Human populations are too large and wide spread now. Bear encounters would have a high likelihood. Also, this species of bear provides no additional benefit to our wildlife ecosystem. We have other types of bears that are providing what is needed to balance things. I worry that reintroduction of grizzlies will have widespread and adverse effects that can just not be predicted.

Thank you.

Correspondence: Hello NPS, I am commenting on the grizzly restoration plan. As a city dweller and HOA board member who has been researching how to keep the huge deer problem down, none of the feasibility study indices I have read suggested reintroducing grizzlies. I must admit, I have not yet read your study and will subsequently, therefore I will not assume you are considering the reintroduction of grizzlies to help citizens, county and city, better manage the overpopulation of the mule deer herds. Having said that (my this is long-winded), I am all for grizzly reintroduction if it will eventually reduce the deer population.

On the other hand, I'm not sure the grizzlies will stay in Eastern Whatcom County if they follow the deer populations. Then there is a problem. I will now read your study outline.

Thank you for considering these comments.

Correspondence: I am against reintroducing Grizzly bears into the north Cascades in Washington state. While the bears were hunted to near extinction in Washington in the 1800's there are grizzly bears on the Canadian side of the north cascades. Grizzly bears can travel quite far in search of food. With no additional hunting there have been I believe two times they've been spotted in the area in the last few decades. If the land and ecosystem was hospitable for them they would have surely migrated back by now or their numbers would have grown. There are several towns and farming communities that are near the foothills of the cascades. I worry that reintroduction will cause there to be contact with livestock, farmers and people. I can't see a reason to spend the time and resources to bring the bears to a part of the cascades that they currently do not reside in large numbers and with little to no migration into the area. Further more we have done a terrible job maintaining our wolf population after reintroducing them into various areas. Clashes with farmers causing more animals to be slaughtered and packs killed. What stands to be any different with these bears? If the grizzly bears migrate and reintroduce themselves into the north cascades of Washington then I am in full support of preservation and protection. Biodiversity makes sense when it makes sense. They have long been absent in large numbers from the ecosystem. Reintroduction causes both risk to the people within the area and the bears themselves.

Correspondence: Grizzly bears are beautiful creatures but dangerous. They are not endangered animals and the plan to restore and grow their population in area's where people hike, etc is flawed. The state has hunting licenses to help control animal populations without introducing an apex predator into an environment that has no experience with an animal of its size and aggressiveness. People; pets; and livestock will die because of this type of effort and for what ? This is a poorly conceived plan that will endanger the public and needs to be struck down before people get hurt.

Correspondence: The proposal to reintroduce grizzlies to the north Cascades is foolish. Predator species are already grossly mismanaged in Washington state, as evidenced by increasing predator/human conflicts, exploding predator populations, and decreasing non-predator big game populations, all in the wake of diminished harvest opportunities caused by an unelected activist commission appointed by a mindless, emotionally driven activist governor. As a hunter and outdoorsman, i LOVE watching bears on the landscape. Some of my favorite times I've spent in the wild of Montana, Wyoming, and Alaska have been watching black and grizzly bears interact with their environment, but the potential for conflict with agriculture, civilization, and existing wildlife make me a firm believer that grizzlies belong in areas where they currently are, not here and not now.

Correspondence: Rarely does it work out well to move wildlife into areas where it isn't already flourishing. You guys moved mountain goats into Olympic National Park and what happened? You had to remove or kill them over the last few years at a cost of millions to us taxpayers, mainly due to human-wildlife conflict. There are reasons why the grizzly hasn't flourished in the Northern Cascades and there are plenty of reasons why this would be a dumb idea now. Human-wildlife conflict, degradation of habitat, changes in the stress on ungulate populations, proximity to human-inhabited areas due to migration related to food source, habitat changes, etc. In addition, when you set numbers for restoration goals toward management, you don't account for (or object to) the fact that law suits prevent necessary management once those goals are met, leading to overpopulation and increasing conflict, as has happened in Montana. As a result of your previous actions, the residents of Montana are stuck with an ever-growing population of extremely dangerous apex predators that can't be controlled.

This program is a mistake and if it is accepted and grows out of control, causing harm to humans, wildlife populations, and

financial security for individuals and industry, those of you who design and implement this strategy need to be held accountable for the negative results.

Correspondence: To Whom it may concern,

Whoever thought this up, needs fired! Anyone who thinks we can "co-exist" with Grizzly's doesn't have a grasp on Reality!! No matter how many Degree's they have.

Just because people think that seeing one in the wild would be cool, doesn't make it so! If their food source was here, THEY'D be here! Wildlife don't have a clue what "borders" mean, Hint: they can't read!

But then we all know now, government is "Agenda" driven, not by science or logic or intelligence!

The wolves YOU allowed to be re-introduced has decimated our local wildlife populations, WHAT you thing having Grizzly's in the mix will do to the remainder???

Its not rocket science!!

Correspondence: I support the reintroduction of grizzly bear to the North Cascades. Biodiversity and predation is important to ecosystem health especially in our changing climate. The northern Cascades host vast amounts of wild land and a monitored population of bears will give us a chance at study and science and a chance for the threatened species to recover and gain genetic diversity across the global population.

We should absolutely take advantage of opportunities like this to preserve or rewild areas and return species to historic ranges.

Correspondence: Biology has long since established that apex predators are critical restoration of our ecosystems. The reintroduction of grizzlies to N Cascades represents a partial step in the right direction. I fully support this effort and believe strongly we need to support our apex predators (both grizzlies and wolves) returning to their original habitat. A healthier ecosystem will benefit both animals and humans as we work toward saving our planet from becoming uninhabitable.

Correspondence: Who cares about grizzly bear restoration? Good riddance! This is a huge waste of taxpayer dollars. I'd like to know the estimated cost for all of this, including the studies already done, implementation and upkeep. If you haven't noticed, people are struggling to survive in this economy, the federal government is shutting down, and we're borrowing money from China to send to Ukraine. But hey, let's spend millions on some grizzly bears that will, without a doubt, result in people being hurt or killed while recreating. People in known grizzly bear areas such as Montana and Wyoming are much more prepared and capable of dealing with grizzly bear encounters. Keep them there. And stop looking for ways to spend taxpayer dollars. I guarantee if this was voted on by the public, it would not pass.

Correspondence: I am in support of returning grizzly bears as soon as possible . They are a vital part of our ecosystem and have a right to exist in their native habitats. The concern of ranchers is in no way Equal to the bears innate right to exist as they were here before any cattle and it is the job of the ranchers and community to live with and support the bears even if it means changing their farming practices and way of life. Please give the bears back their land as they have existed since long ago. There is no question that this is by far more important than a domestic animal and definitely more than some financial loss from a wild animal. The cows do not belong in the wild. The bears do. The bears cannot speak for themselves so try and imagine if you were in their place and a bunch of bears were sitting around deciding if you had a right to exist. We have a responsibility to share the planet with all its creatures. It doesn't belong to only people.

Sincerely. [REDACTED]

Correspondence: The concept of re-introducing grizzly bears into an environment has been a topic of debate among conservationists, policymakers, and the general public for many years. While the idea may seem noble on the surface, it is essential to carefully consider the potential drawbacks and risks associated with such a reintroduction. This essay aims to outline several reasons why re-introducing grizzly bears into an environment can be a bad idea.

Human Safety Concerns

One of the primary concerns surrounding grizzly bear reintroduction is the potential threat to human safety. Grizzlies are apex predators with a formidable presence, and they have the potential to pose a significant risk to humans, particularly in areas where people live, work, and recreate. Encounters between grizzlies and humans can result in injuries or fatalities, as well as property damage. Reintroducing these powerful predators into areas frequented by humans may increase the likelihood of dangerous interactions.

Impact on Livestock and Agriculture

Re-introducing grizzly bears into an environment can have adverse effects on local livestock and agriculture. Grizzlies are opportunistic omnivores that may prey on domestic animals such as cattle, sheep, and poultry. This can lead to financial losses for farmers and ranchers, potentially forcing them to resort to lethal measures to protect their livelihoods. The presence of grizzlies can also disrupt agricultural practices and place an additional burden on local communities.

Disruption of Local Ecosystems

Grizzly bears, as apex predators, play a vital role in shaping and maintaining their ecosystems. However, reintroducing them to areas where they have been absent for years can lead to imbalances in local ecosystems. The presence of grizzlies can affect the behavior of other wildlife species, potentially causing shifts in population dynamics and endangering certain species. It can also disrupt natural food chains and vegetation, impacting the overall health of the ecosystem.

Economic Implications

The reintroduction of grizzlies can have significant economic implications for local communities. Areas that become home to grizzly populations may experience a decline in tourism and outdoor recreation, as visitors may be deterred by the perceived risks associated with bear encounters. Reduced tourism and recreation can lead to financial setbacks for communities that rely on these industries for revenue.

Resource Allocation

The resources required for managing and monitoring grizzly bear populations can be substantial. Funds that could be allocated to other critical conservation efforts or essential community services may need to be diverted to support the management and protection of grizzlies. Additionally, the time and effort dedicated to addressing bear-related issues, such as conflicts with humans or livestock, may strain the capacity of local authorities and conservation organizations.

Conclusion

While the idea of re-introducing grizzly bears into an environment may be driven by noble intentions, it is essential to consider the potential negative consequences and risks associated with such an endeavor. Human safety concerns, impacts on livestock and agriculture, disruptions to local ecosystems, economic implications, and resource allocation challenges are all valid reasons to question the wisdom of reintroducing grizzlies into certain areas. Conservation efforts must prioritize both the protection of wildlife and the well-being of local communities, and careful consideration of these factors is crucial when making decisions about grizzly bear reintroduction.

Correspondence: I heartily support the Draft Grizzly Bear Restoration Plan to restore the presence of the Grizzly Bear to its former home range and health. I don't believe that an ecosystem robbed of one of its apex predators remains in balance. I believe that any human agricultural activity (forestry, ranching, farming) needs to be compliant -- first to the needs of supporting the surrounding natural environment -- if it is to be sustainable. We have made a sorry mess of our world and our future in order to line the pockets of just a few corporate and business interests. This program is just a small part of the vast changes needed as soon as possible to help restore what we have damaged. If that is even possible now.

Correspondence: I strongly support the re-introduction of grizzly bears into the North Cascades ecosystem, using alternative C. While I generally feel that take should be as limited as possible, I am persuaded by the arguments made in favor of increased management flexibility re: Alternative C.

The North Cascades region is one of the most beautiful places in the United States. When you are exploring the area, you are struck by the remoteness of the wilderness - it's not often that we can fully remove ourselves to a place that so free of people. The value of this area is how wild it remains, and we should do everything we can to keep it healthy and a safe home for the creatures that live there. The grizzly once called it home and it would be a real achievement if we could make that true for the bears again.

While there of course risks to humans and livestock with the introduction of an apex predator into the area, I think the ecosystem benefits and the potential for educational and instructional opportunities outweigh those concerns.

Correspondence: I currently live in Oak Harbor but grew up in Skagit County living there my entire life. I spend a lot of time in the North Cascades hiking, exploring and especially deer hunting every year. Yes, I believe Grizzlies should be re-introduced into their natural habitat & environment! They were out here for a reason and help maintain the very delicate ecosystem just as the Wolves do. Though they don't kill nearly the same amount of animals. They mostly eat plants, grains, berries and especially salmon. Animals have a right to be here just as humans & we can all learn to coexist. Humans tend to believe we are the only thing that matters. If anyone has actually been out & explored the North Cascades they'd know just how vast, rugged & remote it is with so much uninhabited space & there's plenty of space to reintroduce Grizzlies. Their population doesn't grow rapidly & they won't explode & multiply while whipping out the numerous prey animals that call North Cascade home. There's more than enough space for all species especially the ones that originate here. Like I said previous, I believe there's a reason they were living here in the first place which tells me they are important & have a valuable role to play here. A role that we might not always understand or see. I think they should be intelligently reintroduced & monitored! Thanks!

Correspondence: I am in favor of the do nothing alternative. Based upon these observations:
1. I think the historical bear population estimates are exaggerated.
2. I think the study area's projected bear carrying capacity is exaggerated.
3. I think the study underestimates the probability of released bears migrating outside of the park and conflicting with the human population and certainly is in error by not explaining cogent mitigation.
4. I think the fact that bears may not be migrating, the study indicates (conclusive evidence was never acquired), is indicative that the quality of the bear habitat in the study area is less friendly than the proponents claim.
5. The study indicates there are physical barriers that degrade the quality of the habitat but does not fully consider the significance of this in preventing a successful re-introduction of the bears, either by migration or release.
6. The study does not fully assess the genetic differentiation between the coastal bears and the rocky mountain bears. There are unexplored implications of releasing rocky mountain bears in the coastal biome many of which could have a deleterious effect on the project and the health of the larger population.
7. The study does not adequately address the issue of state jurisdiction.
8. The study does not explore real economic costs.
9. The study seems to misunderstand the significance of climate change on bear habitat. Wildfire is the primary affective agent of habitat. Forest and range activities are also major secondary effective agents. The study does not properly evaluate these.
10. A major defect of this study is it ignores what is going on north of the 49 parallel both in terms of population just north of the border but also in terms of exploring cooperative management of both sides. As there are so many examples of CDN-USA cooperative management, the lack of cooperation with our neighbors is a glaring and unexcusable omission.

Based upon this, it seems best to see if some time in the future bears will migrate into the study area from the north. That's the best way to see if the study area contains good habitat and the best way to insure the bears will stay inside the park and away from human inhabited areas.

Correspondence: To whom it may concern,

Grizzly bears once occurred in most of Washington, but are now restricted to northeast Washington's Selkirk Mountains ecosystem and are occasionally documented in remote areas near the northern border of eastern Washington. Recent survey data indicates the Selkirk grizzly bear population is slowly increasing.

The North Cascades Ecosystem from Interstate 90 north to the U.S.-Canada border is also a federally-designated Grizzly Bear Recovery Zone (GBRZ), with high-quality bear habitat within North Cascades National Park and surrounding wilderness areas. Grizzly bears have not been documented in the North Cascades since 1996, and wildlife experts believe there is not a functioning grizzly bear population in the North Cascades at this time.

There is no reason to prevent the reintroduction of grizzly bears into GBRZ or other state or federally designated areas. Grizzly bears prefer wilderness areas remote from human activity. Most are solitary. Humans may co-exist with grizzly bears and never see one.

Please do not allow special interests or fears prevent the protection of this species. It is technically extirpated from Washington state due to human fear, greed and activities. Let's work to change that status.

Thank you for your hard work,

Correspondence: This is incredibly exciting and I'm all for it. This will give a boost to our tourism industry, as well as the opportunity for strengthening the bears prey animal's genetics. Apex predators play an extraordinarily important role in keeping the populations of other predators in check (i.e. coyotes). Predation of deer can aid new growth in burn scars, and landslides. They can also help to keep wolf populations stable due to direct competition of resources. Plus, it would just be flat out cool to see them, and right the wrong of their obliteration in the 19th century. Thank you for your time.

Correspondence: There he was

I have 3 seconds from this distance, 25 yards, if he charges. Plus or minus 1 second, I hope it is plus. There is no time to think. The thinking for this particular scenario began over many years ago. My actions, mostly already decided upon, with some minor and not so minor changes over the years. I remember exactly when I first thought of a scenario similar to this. Not my age at the time, but the 'art' of it rendered on a "Winchester Repeating Rifle" advertisement. There's a man with a rifle in his hands coming around a turn in the trail along a ridge. On his left is a ledge leading over the abyss. On his right it is too steep for him to climb, and the rock, I think they call it 'screes', it is small very loose rock. There he was. Ahead of him, no more than 20 feet, a Grizzly Bear. A large mature Boar that is roaring at him! Best rifle advertisement I have ever seen.

I could climb a tree. It needs to be the right size though. Not so big that I cannot wrap my arms and legs around it and shimmy up. Not so small that the big brute wouldn't just push my refuge over. I would need to get up about 15 feet though, and quick. Climbing a tree is a good option for a Grizzly and a real bad one for Black Bears. A Black Bear is a great climber. Probably the best climber for its size in North America. Cubs routinely climb trees when they are afraid or when their mother tells them to. Or just for fun because they can.

I could approach this encounter like a First Nations Brave hundreds of years ago. The only way to survive, according to the elders around the fire, is to immediately run directly at the Great Bear while yelling my 'war cry'. He'll either flee or run directly toward me. If he flees, great, chase him for a moment then get back home or into a tree. If instead he charges, jump to the side at the last moment and get home or into a tree. The claws and teeth of a Grizzly would definitely be a "good death".

I could stand my ground. Waiting until the last moment of his charge to leap to the left...or right. A game of chance, or perhaps luck, or maybe just fate. Sounds like 'fate', but spelled 'faith'.

There was a story from a couple years ago about a guide in Alaska who got to the side of a Grizzly and shot him in the neck with a pistol. Killed the Bear. Most of the story's I have read about since Grizzly's started to come back in the West involve Sow's with cubs or hunters around Elk. There was that really bad story, however, about the campers in Yellowstone that were dragged out of the tent in the middle of the night by a Sow and cubs. They had to hunt the mother down and kill her. The cubs were sent to the zoo. After all, you wouldn't want a cub learning from their mother how to kill people. An even worse one, referred to as, "Night of the Grizzly", happened in BC Canada some years ago. In this case two attacks, miles apart, happened on campers in tents.

I enter my yoga "Warrior Two" pose, left leg forward. I simultaneously lift the flap of my holster and grab my pistol. I chamber a round because I don't like to be in the woods with one chambered. I also consider myself 'badass' enough to "make" the time to rack the slide. I am right hand dominant, but years ago learned how to shoot with my left hand. Not as good with the left as I am with the right, but still pretty good. That is exactly where my pistol is now. I have almost always carried a pistol with me in the woods. I have a lanyard attached at the bottom of the grip and then it is looped around my wide leather belt. The pistol, as already mentioned, is kept in a left-handed leather old style flap holster. I like flap holster due to them keeping the pistol from getting snagged on branches when 'bushwacking'. It is also very comfortable when I switch it to an across the chest 'bandolier'. It sits right on my chest all-comfy like when I am in my sleeping bag. For many years I didn't chamber one while I slept either. But, like most things in life, I changed that too after some serious thought. I may consider

myself a bit of a badass but not so bad that I could, within the tight confines of a mummy sleeping bag, chamber a round that would require both hands.

With my right hand now free to reach for my pepper spray. I grab the 'Big Can'. That is not what brand it is, just what I call it. There's a 'medium can' in one of my spare pistol magazine on my belt next to my holster. Then there is the 'little can' on my backpack chest strap. I would like to think I would want to feel free to both give a Bear chewing on my head a root canal some 'pepper seasoning' with his meal. The Big Can's safety is removed and now it also is pointing down range. I give it just a little press to 'test the wind'. It works perfect, and there is no apparent wind. As I have thought about this moment and read about every Bear encounter I can find, my preparation almost feels complete.

Pepper Spray, when used properly, has deterred curious bears and bears charging. I think I have a better than 50% chance it will work here. Though the pistol is pointing at him, I will not fire it until the last moment. I'll be down on my right knee by then and will only have time to fire once, right in his face. As he charges I will slowly lower my self so as to have both a better angle on the pepper spray and pistol shot. I'll also want to be as close to the ground as possible because that is where I am going to end up anyway when his force hits me. I know, to protect myself I should roll on to my side, in to a ball, and wrap my hands around my neck with my knees up to my chest. Take a beating, stay calm, play dead, and maybe I won't end up being just that. That's not me. I am not going down without a fight. Both my life and his.

This is a Grizzly, not a Black Bear. Generally I have come to believe that you should try and fight off a Black Bear, and not a Grizzly. The former more likely to kill and eat you versus the latter just wanting to kick your ass! Black Bear =Fight. Grizzly =Play Dead. Yes, you can tell I have thought about this a little bit before. Maybe it is because I have had multiple close encounters with Bears and every single time they have wanted to get away from me as fast as possible. They were scared, just like me, but actually 'fleeing', rather than being 'frozen' like I was. The first time was the only time they could have been Grizzly and not Black Bear.

It was in the late 1990's in the North Cascades. The area was the Okanogan. My wife and I had been backpacking all day and had just crossed a footbridge that went across a roaring creek. The campground had a handful of spots. Bordered on one side by a steep hill, the creek we just crossed and the other side by a river. Though small, not a river easily crossed. It was also glacier run off and was damn cold. It was late afternoon in late summer and the first site we came to had other backpackers already in it and so did the second. We took the third one and were sitting down enjoying the view when we look up the side of the hill and see a Cinnamon Sow and cubs heading down trail. She is coming from down the hill. She can either go straight across the creek the opposite way we came or turn left and head in to our camps. My wife and I immediately went and told the other campers. We all decided to make lots of noise. We may have even started a campfire, though I don't recall if fires were allowed. I didn't know to look for the Grizzly 'hump' on her shoulders for identification.

My next encounter with a bear was with a small young Black Bear. He was under 100lbs, and maybe only a couple years old. This time I was on the West Side of the Cascades. I had parked my car on Twin Lakes Road near the Yellow Aster Butte trailhead and was walking the rest of the way up to Twin Lakes. My car neither had the four-wheel drive or the clearance to make it the rest of the way. I thus had a couple hours of hiking and a couple thousand feet in elevation before I reached the top. I was carelessly walking on the very outside edge of the road with thick brush heading down the side on my right. I heard the bear for only a brief moment before I saw him and all I saw was the back of his 'arse' as he was running straight down hill through the brush away from me. I think this little bear heard 'something' coming up the road and thought it might get a small easy meal. Instead it saw the tallest animal it had ever seen and this animal didn't in the least act afraid of it.

The most recent close encounter was once again with my wife while backpacking in the North Cascades. We were on our way back down Hannegan Pass from one of the most beautiful Back-packing trips I have ever taken. The great view had however been given up to THE SWARM of BITING BLACK FLIES. "HORENDOUS". Throughout the weekend I must have killed hundreds of them when they landed on me. I know it was 'hundreds' because I started to count my kills to help me better deal with the psychological impact. The flies had us moving fast and making lots of noise too. We came around a turn in the trail and just beyond a small creek, less than 50 yards away, was a medium sized black bear. We stopped, and started yelling at him so as to let him know we were there. The creeks noise drowned out our yelling and it just kept going down the trail the same direction we were headed. My wife and I decided to move even faster and make even more noise with the hope

that it would hear us and move off the trail. For about 15 minutes this is exactly what we thought had happened. Until, quite suddenly, we heard the bear fleeing into the brush off the trail.

Those were the only 'close encounters'. I have seen them from afar, as anyone who pays attention when in the North Cascades in the summer. Up high on the side of a mountain, down in a draw, or even crossing the road. Always too far away to be of any danger or for just a moment.

I have also encountered bear sign more times than I can remember. A couple in particular stand out. A friend of mine and I were hunting Black Bear once and we came across some scat on the side of a mountain the size of an extremely large "lemon meringue pie". Taller than where my hiking boots came up on my ankle and bigger than the length of my size 12 boots. Berries, lot of lots of berries. My friend, older and more experienced than I was had seen grizzly scat before noted that if it was grizzly it would be three times as big. The other time was most recently when I was hunting Elk south of Mt. Rainier. I am a hammock sleeper, not a tent one. A Western Cedar about the diameter of your thigh my hammock was attached to had bear claw marks down the side of it. It was a great tree for the bear to mark. It was among a handful of boulders the size of your living room and it was a cedar tree. They like marking these types of trees. Bears will also, when encountering big rocks like these, walk their perimeter. They are, after all, a den animal. Always looking for another den option in regards to the inevitable forthcoming winter.

I probably shouldn't forget about the many 'other' encounters. If you have every spent time in the woods, by yourself, all alone, with no one close enough to hear you yell, you have without doubt had 'other' encounters too. Those are the ones where maybe your eyes see it, your ears hear it, or you just feel it. A stump, log, branches, or even leaves, that from this distance, at this angle, in this light, looks exactly like a bear. Perhaps you had even seen bear scat earlier in your trip. Maybe heard something and turning towards where the sound came from you have this 'other' sighting of a bear. Dreamt of bears while in the woods, or at least want to believe you were dreaming after waking up.

This big boy hadn't moved at all since we both suddenly came upon each other. He knew I was there and he knew that I knew he was there.

Though my actions are preparing for an assault, I am still looking right at him, in his eyes. Yes, I am sure it is a, 'him'. I take a big deep breath and then yell, with as much anger and fearlessness as I can muster, "I am not here for you Bear!" And I shake my head when I say it. I have always thought I should yell this to any dangerous predator like Grizzly, Cougar, Wolf, and Bear just to let them know that I am not hunting them, when I am not hunting them. They may not understand what I say, but they may know what I mean. I come in peace.

Pray! I forgot to pray. This is the first thing I should have done, not the last. Out loud, but not yelling, just speaking in a normal voice, I say, "Lord your greatest creations are here, now. Neither of us wants to die. Please help us both get out of here without any injuries and go in peace and humility".

The chances of me being here, with him, though slim, are much greater now than they were years ago. I wonder if he is one of the Grizzly's they relocated from Montana or British Columbia. Maybe instead he was born here from parents that were flew over. Or perhaps he is a true 'native'. Roaming the North Cascades like his parents and grandparents before him.

I remember the Grizzly Open House the US National Park Service had years ago that I attended. My feelings then were skeptical and yet optimistic. The North Cascades doesn't have the same great deer and elk populations that the Montana Grizzly's have. The North Cascades are also much more rugged terrain than BC Manning Park. The mountains in the North Cascades are bigger and thus the summer growing season is shorter. Life for Grizzly's in the North Cascades is harder. They monitored the bears they moved for years, but many removed their collars and were thus lost. Their mortality after the move was higher than expected, and yet I don't recall ever reading about any mortality estimates in the Environmental Impact Statement they issued before the relocation started. The cost of the relocation was never important to me. Hell, look at the Trillions of dollars we have wasted trying to do the right thing in the Middle East. Even if it had cost \$50,000 to move and monitor each Grizzly, it is still only about \$15 Million given they relocated about 300 bears. I hope if this Grizzly now staring eye to eye with me doesn't hold any grudges over being captured, tranquilized, and moved to a more difficult habitat. I remember one story from 2010 that a Grizzly attacked and killed a field biologist. The bear had been trapped and tranquilized earlier in the day. Grizzly's are not just bigger than Black Bears, they also are more likely to have a bad attitude. Perhaps

'ornery' is a better term. 'Ursus arctos horribilis' may not mean much to those who don't know Latin or Greek, but 'horribilis' is clearly understood to be the origin of the English word "horrible". That is exactly why I have never planned on shooting a Grizzly that wasn't charging me. No need to piss off 500 plus pounds if you don't have too. I may not have a choice though. Male Grizzly's, 'Boars', are more carnivorous than female Grizzly's (Sow). Maybe he doesn't see me as food though. Maybe something that big with an equally large appetite is always hungry.

Though my current situation with this Grizzly is dangerous, it could be worse. After all, I could be facing a Sow with cubs. Up until about 200 years ago nothing was more dangerous on terra firma in this entire hemisphere than a Grizzly Sow with cubs. If this was the case I would probably have a smaller % chance than what I have now. Still, a Boar Grizzly, is only, the 2nd most dangerous. They are without question though the largest Omnivore on Terra Firma in this Hemisphere. Meat makes up anywhere from under 10% to 90%, depending on his habitat. Boars eat more meat than sows! APEX predator. Top of the food chain. Top of the pyramid. Did I mention their attitude problem? I guess most of us bipedal hominids have attitude problems too. We after all are the one that almost exterminated them. I'm scared. Breathe. Again, " Bear! I am not here for you." It sounded better to my ears that time, more confident, less angry and scared. A Jaguar in the Amazon would be pretty bad too I guess. Mugger in a dark alley with a shiny pistol would be bad but maybe he just wants your money. Cougars are usually just curious and wouldn't mess with a big guy like myself. A pack of wolves would be a serious problem but I would have already shot a couple of them by now. If it was just a lone wolf it would be different. None of these animals have the world 'horrible' in their name though. I am going to take a slow step backward. I did it. "I am not here for you bear. I don't want any trouble. I am going back the way I came". I slowly shake my head and gesture the way I came. That sounded almost normal. Maybe it sounded confident, respectful, with just a little fear. I am going to take another step backward.

I think I surprised him as much as he surprised me. We saw each other simultaneously. This must be the case. If he had been hunting me, in a 'predatory' fashion, he would have charged me the moment he saw me. He would have been anticipating the moment he encountered me and not be just standing there staring at me

I sure have had a long time to think about the potential danger of a Grizzly. Hollywood has sure helped. "Revenant" (2015) with Leonard DiCaprio. The "Edge" (1997) Anthony Hopkins, and many other great actors and actresses. "Man in the Wilderness" (1971") with Richard Harris. Or how about "Grizzly Adams", the TV series from the 1970's with John "Grizzly" Adams.

After a bear charges they are going to knock you down, turn you over on to your stomach, if you are not already there. He'll bite your face head and shoulders as you are turned over. There is no resisting this bears strength. He can easily lift and roll 300+lb boulders for the moth larvae underneath. Rip up dead logs and tree's for insects. The bear from 'Grizzly Adams' probably could have been trained to push over a Prius. His 500+lbs will be crushing. I won't be able to breathe. I'll be gasping for air. I bet it won't hurt though. I am not scared anymore. Just aware. very aware, of everything. I remember everything.

Only 8 people have been killed in Yellowstone National Park in the last 100 years, though they average about one attack per year. 11 have died in Glacier National Park in the last 100 years. They also average 1-2 non-fatal encounters per year. Based on these numbers, The North Cascades could expect an attack about every 5 years and a fatality about every 20 years. The Life Insurance Institute of America, if one exist, probably would value a human life at \$1-5 Million dollars.

I wonder how much live stock depredation has occurred in the last 20 years. I'm sure there has been some. I know these bears can eat a lot but I am sure they are not going to eat \$1 million per year. Government math can be quite 'fuzzy'. Economics Nobel Prize Winner, Milton Friedman, once said, "If you put the government in charge of the Sahara Desert in 5 years you will have a shortage of sand".

Thus the total financial cost of relocating Grizzly's to the North Cascades over the next 20 years could not possibly, even under the worst circumstances, reach \$100 Million. The EIS estimates years ago was less than \$10 Million.

How long has it been since we started staring at each other? Surely it has been just a moment. Time seems to slow down, but it doesn't. Chemicals have been released from my brain that speeds up my awareness with heightened senses. It has been seconds, not minutes. I am so ready for him now. I would fill him with holes and empty the can on him. I am the only one that knows that. How could he know? "Bear, this will burn your face. " Showing him the Big Can. "This is

loud and burns like claws and teeth." Waiving the pistol. I step back again. "Go...go away Bear! Go in peace".
Again, I step back. "I'm leaving bear."

Correspondence: I am supporting alternative A (No Action). Introducing grizzly bears would threaten the enjoyment of the wilderness by arguably the most important species in the ecosystem, the homo sapiens. Outdoor recreation has been proven to improve both physical and mental well being. Introducing grizzly bears would vastly increase anxieties among visitors and would cause a lot of people to not visit at all.

Correspondence: Why would we want to introduce Grizzlies into Whatcom County? Bears of all kinds tend to roam, and they won't stay in the eastern part of Whatcom County. They will likely roam down into heavily populated areas where they will wreak havoc among crops, pets, and people. Grizzlies are aggressive and will not scare off easily, so there would be a

good chance that they would attack humans. I'm born and raised in Whatcom County and I have never heard of Grizzlies in our county..ever. We have done just fine without them and we don't need them in our county now. Who's brilliant idea was this anyway?

Correspondence: While the idea of grizzly bears coexisting with everyone and everything peacefully sounds phenomenal, it just won't be the case. I'm 100% against reintroducing an apex predator with no plan to control their population or protect families out in the wild. At least with hunting black bears there is the potential to curb extreme population growth and human/bear interaction, but as grizzlies are a protected species there will be nothing stopping them. Not to mention the fact they are larger and more aggressive than black bears as well. I firmly believe this is a bad plan that will ultimately lead to loss of biodiversity in the park and will lead to human death or injury with this unchecked apex predator.

Correspondence: Just say NO to grizzly reintroduction into the North Cascades National Park. Do NOT cave to the environmentalists, please think of the people who live and work in the region, as well as us who visit this area regularly. This endangers all of us who are in this region.

Just because these apex predators historically roamed these regions does not justify their return. When they roamed and were numerous, the human population was a fraction what it is now in this area.

Blood will be on your hands.

Just say NO.

Correspondence: As a resident of Bellingham, I'm lucky to have easy access to the North Cascades and North Cascades National Park, and enjoy hundreds of miles of hiking in the area each year. Backcountry users like me will be impacted by the re-introduction of grizzlies far more than most stakeholders, including front country park guests.

Re-introducing animals like grizzlies to popular recreation areas always brings up a lot of fears in people. But the North Cascades are vast and rugged, and are natural grizzly habitat. They should be here. It's their home, and they've been absent for too long.

The ecosystem and our enjoyment of it will be enriched by the return of the grizzly bear to the North Cascades, and I hope that the Parks Service will engage with local Tribal partners to begin the process of restoring our local grizzly populations.

Correspondence: I am strongly in favor of proposals like this one that seek to restore the ecosystem as much as possible to the way it was before the influx of European settlers. Apex predators help manage the populations of prey, which in turn can affect the balances of other flora and fauna. These ecosystems evolved with bears and returning bears to the ecosystem will help maintain those delicate balances.

Correspondence: Please do not reintroduce grizzly bears into the North Cascades. Although this might seem like a good idea on the surface, the fact remains that people and grizzlies do NOT coexist well. When people and grizzlies meet, the people are often injured or killed and the grizzly is then hunted and killed. This is a no win situation for the grizzlies and for people who already live in that area. Put grizzlies where people do not live so that both may prosper.

Correspondence: Please do not put grizzlies in the Cascades. Please. My family and I beg you to not do so. We already have a low population of deer and elk. We don't need them. There are too many predators as it is already. We need to manage the population of predators we have now before adding to the list. So sad and dark of NPS to even consider such.

Correspondence: You sure ccp didn't twist Joe's arm to do this.

You know how the Chinese people (losely)

Love there gall bladders. 5 to 10 yrs. They

Will have enough to survive in the U.S.A.

Seeing as Joe is a traitor to this country.

He is putting there what's into action.
What did they give him for that request.
I would like to know.
All of you traitors can kiss my ass.
China has over 380,000 acres of our land.
And Joe don't care because he will die
soon. And give his corrupt money to his 6 grandchildren.
Oh sorry 7.

Correspondence: I support reintroduction of Grizzlies to Washington State under Proposal C of the EIS, allowing flexibility in the management of this apex species. I believe that, as with Washington's wolf management, it has been critically important to listen and incorporate the feedback from competing interests and important constituencies in our State such as ranching and farming into the management plan, while still moving ahead. Finally, I respect greatly the lived experience and leadership of the Native American tribal members in the process so far. I would ask that all management plans for Washington Grizzlies include these tribal experts as leaders in the governing body. Thank you

Correspondence: I would like to speak strongly in favor of Alternative B and C, to reintroduce Grizzlies to the Cascades. I believe we impoverish ourselves, our lands, and our ecosystems when we allow human habitation to crowd out the magnificent megafauna that have dwelled here for millennia.

I hope this can be done in conjunction with broader efforts to rewild ecosystems, build migration pathways and crossings, and create corridors and spaces for wild, thriving ecosystems to exist.

Correspondence: As a retired park ranger biologist, naturalist and educator, I am glad to see the grizzly reintroduction process restarted. Research on wolves and other apex predators show that they are key parts of healthy ecosystems. Given the Organic Act's mandate to preserve and protect natural ecosystems, and the inclusion of restoration in that NPS mandate and NPS policies, this is a necessary step for the NPS and the North Cascades ecosystem. There is a growing body of knowledge about how predators and people can co-exist on the landscape. Those tools can and should help assuage opposition. Though in the past, humans have managed wildlife (and habitat) as if only humans mattered and that we and our livestock should take priority and have dominion over all species and natural systems, that, by law, is not the case in national parks. And much of the habitat outside the park is public land, owned by all Americans or Washingtonians, whether we live in an urban area and just visit on a hike, or have a grazing permit to run livestock on public lands.

Over 100 years ago, then again in 1964 with the passage of the Wilderness Act, our society made decisions that there should be wild places where humans are not the dominant force. We eventually stopped bounties on many species we deemed "bad"; and began to learn that natural processes and healthy resilient ecosystems include the full suite of native

species. This knowledge has led to successful reintroductions of species that we humans eradicated such as fishers in Olympic National Park, gray wolves in Yellowstone and Idaho, red wolves in the southeast, peregrines, non-native mountain goats being removed from the Olympic Mountains and translocated to their native habitat in the Cascades, etc

In the face of rapidly changing climate and the shifting of habitat north and upslope, species of all phyla are facing challenges. Restoring extirpated species and healthy ecosystem function is one way we can help our national natural and cultural heritage be more resilient and survive the challenges of our changing world.

Correspondence: Time and time again, when apex predators are removed from ecosystems by man it diminishes the ecosystem. We have seen it time and time again.

Don't make Grizzlies like the Thylacine.

The Thylacine is the, or WAS, the Tasmanian Tiger. Hunted into extinction, the species wasn't even recognized as having a conservation issue until after they were all dead. Now, I'm not saying this same thing is going to happen to Grizzlies, but it already has for North Cascades National Park.

Nature and wildlife do not exist to service humanity. They exist unto themselves and support each other in myriad ways we cannot even totally understand. Placing apex predators like the Grizzlies back where they naturally occurred prior to human intervention will help build a better ecosystem and a better park.

Of course people are against re-introducing bears to virtually anything. People hear 'bear' and think 'bad.' Well, the reality is that people aren't going to be running into these bears often, and if they do it is likely their own fault. We also don't have a circumspect way of knowing how much the loss of bears has degraded the habitat or what effects it has had on other species' populations.

You say your land is too close to where the Grizzlies may go? Well, that's unfortunate that your land was placed there, but the Earth takes priority. With all of the bad things happening everywhere, we as the good stewards of the environment we are supposed to be owe it to the planet and ourselves to support healthy ecosystems whenever and wherever we can--even if it's

an inconvenience for us.

The forests aren't supposed to be a safe place. Introducing bears will not make the forest more dangerous for people. Safety campaigns alerting people of precautions they may take to be better prepared for seeing a bear may even contribute to people being more mindful of the world around them in other ways.

On behalf of the plants, animals and land, as well as all of my likeminded human friends...

RE-INTRODUCE THE GRIZZLIES TO NORTH CASCADES NATIONAL PARK

Correspondence: Humans have altered the shape of this entire country. Part of that being the destruction of wildlife in a very small historical window of time. It is important to do what we can to make it right. I would love to see this take place and re-introduce an animal that should have never been absent from these areas in the first place.

Its also important to acknowledge the diversity in people who may comment on this issue. As an avid outdoor enthusiast, and someone who is more connected with nature than the average American. I think getting opinions from people who hunt, hike, and travel the areas that the bears will be at is far more important than discussing with community members who do not commonly go to these areas.

Bring back an animal that can deepen our communities connection with nature, like we used to have so many years ago.

Correspondence: We do not need grizzlies in the north cascades. We already have wolves and growing numbers of cougars that are hurting the deer and elk populations.
With so many people recreating in the woods (many are inexperienced) this will create a potential threat to their safety. Most

hunters now carry side arms as the cougar and wolf populations have grown to a point where self protection is wise to have. Introducing grizzlies will only serve to increase potential deadly encounters.

Correspondence: I do a lot of hiking and backpacking up in the North Cascades. I understand that Grizzly Bears did occupy this region at one point in time and that there's an environmental interest in restoring the north Cascades to the state that it was in prior to the development of the region. But I don't think that the environmental value of having grizzly bears in the North Cascades is worth the additional risk to humans. I know bear attacks are uncommon, but it's just something that I'd prefer to not have to worry about while I'm out enjoying the wilderness. This doesn't just stand for grizzly bears, I would have similar feelings regarding any effort to intentionally replenish the stock of rattlesnakes, mountain lions, or wolves.

To me, that such a proposition is even under consideration is an indication that the national parks service is out of touch with ordinary folks.

Correspondence: As a frequent visitor to the NCE for recreation purposes, I can tell you that anything other than Alternative A is absolutely unacceptable. First, there are grizzlies in the area; one was just captured a county east and others have been observed. Secondly, if the habitat was still adequate for a larger grizzly population they would already be there in larger numbers, but that is simply not the case. A sizable population is known to exist right across the border which could easily recolonize the NCE in larger numbers.

Too much human impact has happened and the human population adjacent to the NCE is simply too great to make this a

good idea. If the bears should indeed be there, let them seed naturally. Save us all from conflicts that are sure to occur and save the taxpayers the bloated bill that is sure to come attached to this ill-advised idea!

Correspondence: I absolutely believe the restoration of grizzly bears in the North Cascade Ecosystem in a horrible waste of money and resources. With Climate change impacting so much of our natural areas, fires, landslides, roads washed out,

pollution, salmon restoration issues and plenty more....the idea of spending more time and money on the Grizzly bears seems crazy. And there is the issue of more and more people moving closer to the North Cascades Park, more and more people who desperately need more space and beautiful places to hike in....there will be the possibility of increased bear and human confrontations. One of the things I have most enjoyed about hiking in the North Cascades and in Washington in general is the ease that I can move through our forests without (as I did in Yellowstone and Glacier National Parks) always having to be on alert, looking out for Grizzly bears. I do not find it peaceful or a calm restoring get-away to be always wondering about where a bear might surprise me.

I oppose the restoration of Grizzly Bears in the North Cascades.

Thank you for your consideration,

Correspondence: Sirs/Ladies:

I strongly oppose the proposition to reintroduce grizzly bears into the North Cascades. These mountains are heavily traveled by hikers among whom number my own children and grandchildren. We have black bears aplenty; I see no need to reintroduce this apex predator. Should this species be successfully reintroduced and when there occurs subsequently the predictable lethal grizzly-human encounter, I challenge any of you who support this venture to volunteer to explain to the bereaved family just why it was necessary or even remotely desirable to facilitate such a tragedy. I can personally not conceive of a more grotesque end than to be mauled to death during a bear attack. Certainly, it can be argued that such attacks are infrequent, perhaps extremely rare. Regardless: even a single such event when preventable should be prevented. The chances of being mauled to death by a grizzly bear in the North Cascades today are essentially nil, those risks will escalate exponentially if grizzly bears are reintroduced to area from which they have been eliminated.

Respectfully,

Correspondence: This plan to reintroduce Grizzly Bears to the North Cascades will be just as bad as the reintroduction of the Wolf in our state. The ungulate population will greatly suffer and the opportunity for hunting will completely go away. Washington state needs to be able to manage its current predator population before adding more predators. Additionally this State should start listening to the WDFW biologists about the science which shows that there needs to be an increase in predator hunting and not a decrease. The addition of grizzly's will only make things worse.

Thanks for your time.

I am 100% against this.

Correspondence: People in this area are not smart enough to keep away from black bears who are relatively harmless. They kill garter snakes because they are snakes, they are trying to get selfies with a bear and pet coyotes while their kids are around and they are surprised when something bad happens.

People are not even smart enough to put their trash cans away after trash collection day, leaving them in the street for crows, bears etc. to enjoy.

We are consistently being educated by our police department, city hall and other members of our communities, however, instead of listening- most people just ignore. With grizzlies, this will result in people getting killed and you being sued because you knew and ignored the consequences.

Correspondence: Firstly, thank you so much for your efforts to conserve the grizzly bear species. I recognize this is urgent for our ecosystem and that measures must be taken.

With that said, the general populous within and surrounding the East Whatcom Areas are nowhere near prepared to have 5-7 grizzly bears released yearly.

This community already has an issue with homes leaving food and trash around their homes, resulting in almost weekly black bear encounters recently.

I strongly believe that the "cultural habits" of this community would attract and encourage grizzly bears to frequent and inhabit residential areas, rather than the intended rural areas and pose a significant threat to humans, their animals, and the bears themselves negating your efforts to help an endangered species continue to thrive.

I would ask that, in the event there is no better location to conduct this, before implementing this strategy strong fines are put into place regarding open trash and food in residential areas to prevent these areas from becoming attractive as the bears are released and exploring for food sources.

Additionally, I do hope that the plan to build a populous of 200 bears is over multiple locations and states as that is a lot of bears to inhabit just the East Whatcom Area.

Thank you for taking the time to read this and I do hope that we can work together to create an acceptable balance for the needs of the ecosystem and humans.

Correspondence: I believe it is critical to the health and longevity of the North Cascades to restore grizzly bears to their once native territory. Our forests rely on biodiversity to survive our ever-changing climate, and where grizzly bears live, forests thrive. People are able to coexist with brown bears many other places, and native people were able to here in our state for many years. We already coexist with black bears all throughout Washington State- I believe we can manage the same with grizzlies.

Correspondence: I'm a life long resident of whatcom county, living at the base of mount baker. Like most kids that grew up here, I spent much of my time in the outdoors, enjoying this beautiful place. As a father, I bring my baby outside as much as possible and plan to raise him to understand and care about nature. What I do not support is the experimental reintroduction of apex predators in my backyard. The ungulate populations are not dense in the mountains, there are significantly more deer down in the valley near the agricultural lands and in city limits. This will put brown bears down the mountain and encroaching upon human territory. The amount of hikers here from the city who don't even own a firearm and most don't even bring bear spray is astounding. This is a grossly reckless plan and I greatly oppose it.

I will be spreading this as much as possible so people that actually live here that will be affected get in on this. People from outside the area that live in the city should have no voting power on this, as it doesn't affect them.

I hope this is read and carefully considered, thank you for your time.

Correspondence: This is one of the most horrendous ideas I've ever heard. Predators such as black bears and wolves are already excruciatingly miss managed. The deer and elk herd populations are already not as strong as they can be, and this would diminish any light to the population of the deer and elk to continue to grow. Not only is this a terrible idea for the management of our wildlife and our ecosystem as a whole, hope the amount of hikers and inexperienced people with dangerous wildlife like this, would cause disaster. Please diminish any idea of this, as this will ruin the Washington State ecosystem, and alike with other predators in this state, be completely miss-managed.

Correspondence: Reintroducing grizzlies back to north cascades is a terrible idea. If anyone who is purposing this has been to an area with grizzlies should know this. The impact they will have on deer, elk, and black bear as an apex predator will lower numbers drastically. Also the normal person that goes into the North Cascades is not experienced with dealing with grizzlies. With populations growing in Washington and more people in the woods this will definitely lead to unwanted animal and human interactions. We need to look at BC and Montanas grizzly population and either let the bears come into the cascades naturally over time. Or look at the negative impacts the grizzlies have on the ecosystem. Once they are introduced we will then be spending tax dollars on extermination very soon after, guaranteed.

Correspondence: Although I do not live in the cascade range, I do spend a lot of time during summer and fall with friends and family in some surrounding towns. Grizzlies are known to travel up to 40 miles a day, with the already dwindling population of deer and elk in our state due to other predators grizzlies would more steadily start coming into contact in the lower foothills where people are at in search of food. Also people hiking and biking in those Cascade trails would be at great risk of attacks as well. I believe a lot of people that spend time in the outdoors would agree with not wanting grizzlies in our state at the choice of the government.

Correspondence: Grizzly Bears serve an important role in the ecosystem as an apex predator. Grizzly bears will keep both nuisance herbivore populations (such as deer) and nuisance carnivore populations (such as coyote) at appropriate levels within the ecosystems they exist in. Furthermore, grizzly bears deserve to inhabit the space they originally existed in. This ecosystem evolved in the presence of grizzly bears, and reintroducing them will have a positive impact by restoring this ecosystem to closer to the balance it formerly enjoyed without human interference. Some people may be concerned about having grizzlies in the area, but there are plenty of places where these bears already exist alongside people. We would simply have to learn from these places and adapt to live alongside the bears.

Correspondence: Restoring a healthy and robust population of grizzly bears to the North Cascades ecosystem is an excellent idea and should be undertaken immediately with endangered species status for grizzlies to further support these efforts and the continued maintenance of the project in perpetuity. I am in agreement that this plan will play a roll in correcting the ecological imbalances our wild lands have endured. The primacy of the natural world must finally be given our full attention. This project should not get mired in short term complications or the political quagmire that continues to pit the conservation of apex predators against greedy, capitalist "steak" holders. We must rise above the presumption

that the natural world is merely a playground for our amusements. All of us can play a roll as supporters of this project and the continued reinvigoration and eventual expansion of our wild lands if there is a strong emphasis on educating the public about the crucial roll of apex species and how to coexist with them.

Correspondence: I worked closely around grizzlies for 3 summers in AK and MT doing fisheries work. Despite being careful, making noise, and giving the bears a wide berth, I was charged numerous times and several times thought I was going to be killed. I had a friend severely mauled and nearly killed by a grizzly during this time. His scars were gruesome and

he lost an eye. It is not a coincidence that in the last several decades I haven't had similar experiences with black bears, no matter if it was AK, MT or WA. This is despite the fact that my experiences with black bears are over many more years than the few summers I worked around grizzlies.

Based on these experiences, I am strongly against the reintroduction of grizzly bears to the North Cascades. It fundamentally changes backcountry recreation, and not for the better, in my experience. Please stop using tax dollars for this grizzly reintroduction effort that will eventually hurt and kill people. Put the funds towards road and trail maintenance instead.

Thank you for taking public comments for this controversial effort.

Correspondence: This is a terrible idea, the consequences of this decision will have a lasting impact for both our local ecosystem and the safety of those who enjoy the outdoors. As an avid outdoorsman I have witnessed firsthand the current state of our ecosystem, which currently has an overload of predators and is seeing negative impacts as a result. Ungulate numbers are steadily declining and our ecosystem simply cannot support another apex predator.

- the proposed remote location in north cascades national park actually is not great grizzly bear habitat. Any bear planted there will likely move to the east towards Ross lake, or more likely to the west along the mt baker highway. Both of those areas are high recreational use and would be a cause for the safely off hikers and others who venture into wilderness areas. A healthy population of brown bears could be devastating to any local farmers or cattle owners in whatcom and skagit counties. Grizzly bears can easily lose there fear of humans and turn into major problems for people who live around them.
- Another point worth mentioning is any bear transplants are likely to be 'problem bears' from other areas, or at the very least a bear willing to after human food to enter a trap for relocation. Both of these are very bad scenarios, bears without fear of humans will teach there young not to fear humans.
- there are populations of grizzly bears in BC and in NE wa. If our ecosystem could handle these bears, they would move in on there own and we would already have them. My response is NO grizzlies in the north cascades!

Correspondence: I want grizzly bears managed as a threatened species under the Endangered Species Act, and only permit some to be captured, moved or killed under specific circumstances, like the defense of life and scientific or research activities.
I have attended lectures by state wildlife experts and federal fish & wildlife researchers studying the prime remaining grizzly bear zones including the North Cascades. I've also volunteered at Mt. Rainier National Park where naturalists are concerned about the loss of open meadows. A Grizzly bear can plow through a couple acres of meadows eating dozens of ground squirrels in a couple hours. Meadows are restored by their huge claws searching for autumn food sources. Grizzly bears must be restored to all 6 recovery zones, about 200 total, over the next century. Indigenous peoples have coexisted with grizzly bears for thousands of years. So must All Americans.

Correspondence: I have been a licensed eco tour and wilderness guide in Alaska since 1981 and as well at the 2 bear observatories in Southeast, Alaska. Anan and Pack Creek and have taken 1000s of people to observe brown Bears (Grizzlies) in their natural habitats throughout Southeast, Alaska and British Columbia. I think Brown Bears are one of the most misunderstood animals on the planet. My dear friend [REDACTED] (Pack Creek) found an orphaned brown bear cub in 1942 and put out a bowl of porage for the little guy and until he died in 1989 there had been 82 direct to decedents from the little female. He would share his stories with me of living with these animals. As he often said if they were aggressive by nature they would have been exterminated years ago. They tend to be solitary animals once they are adults and in my 45 year experience with these animals in the wild I have never encountered an issue. Just looking at the tourist industry in Alaska it has been such a boon to local towns like Wrangell for Anan Creek and Juneau for Pack Creek as they are the closest proximity to the Bear Observatories. I know there would be concern with livestock and I'm not sure how to properly address that issue obviously it would be part of their normal feeding habits. But at one time in history there must have been a healthy population of Grizzlies in the North Cascades and it was part of their habitat before it was part of ours. So I'm in favor of their reintroduction.
Thank you,
[REDACTED]

Correspondence: After living in Alaska for 21 years, with bears literally in my back yard, it has been nice living in Whatcom County and not having to be "bear smart" all of the time. As an avid hiker, I was lucky to have a hiking buddy with me at all times in Alaska as bears are much less likely to attach two or more people together. Here, I enjoy solo hiking and feel fairly comfortable in doing so as the bear population is so much lower. I would not like to see grizzly bears introduced to our county as I like my rather carefree hiking.

Correspondence: Dear SEPA Officials:

My recommendation would be to support Alternative B: Restoration with Existing Endangered Species Act Protections, as it provides maximum protection for the newly reintroduced brown bear population.

I spend a great deal of time in North American brown bear country, and it would be very positive to see them returned to the North Cascades. They are an essential part of the eco system, and help control ungulate populations, similar to wolf reintroduction in Yellowstone.

Brown bear/human interaction rarely results in injury to people. During the 2020-2022 period there were eight fatal attacks in the US, and an estimated 80 non-fatal attacks. By way of comparison, there are an average of 72 deaths each year from bee and wasp stings in the US.

Thank you for the opportunity to provide input.

Regards,

Correspondence: I lived in WA for over 30 years until I recently returned to my home state of LA temporarily. My family and I plan on moving back WA in 2 years. I am in love with the PNW and all that it has to offer. I am probably the biggest animal lover out there. Grizzlies are at the top of my list. I remember seeing them up close and personal in the Olympics where my great grandfather built a cabin. I loved going to Eastern WA and taking photos of them. I have spent A LOT of time in AK. People can absolutely live with these animals peacefully. Yes, there can be instances with any predator, but it is possible. Please please please follow Alaskas lead in how they all live together. People in WA freak out if a bear is in their neighborhood like where I lived in Snohomish. So many more loved them than those others that reported the poor bears for reasons the neighbors caused. These bears are doing what they do, but humans need to be educated in order for this to happen Proper garbage bins need to be provided, and people need to be taught how to live harmoniously with wildlife. I hope wildlife and fisheries will make more of an effort to transport rather than kill what is said to be a nuisance animal. Not everyone is an animal person, and gives false info. Save the bears!!!!!!

Correspondence: Reintroducing grizzly bears to the N. Cascades is a horrible idea! The North Cascades make up one of the most dramatic and beautiful landscapes Washington has to offer. So many people enjoy the magic that makes up this part of the country. What makes us feel safe exploring this beautiful place is the knowledge that the likelihood of having an aggressive wildlife encounter is very low. While black bears tend to retreat when humans are nearby, grizzly bears are a different animal entirely. Why would anyone think introducing an apex predator into what is now a safe wilderness destination is an acceptable idea? Grizzly bears do nothing for our ecosystem, they would serve no purpose here other than to make those of us who enjoy the outdoors feel unsafe hiking in our own backyard. Please do not reintroduce grizzly bears to the North Cascades, or anywhere else in WA. Please leave in their current habitats where they seem to be doing just fine. Thank you.

Correspondence: I would like to state that I would agree with alternative C for the restoration of the Grizzly Bear into the NCE. I believe this to be the best management system as it provides the FWS with the best options for the control of the bears. I would like to see any Grizzly that is relocated into the area collard for tracking. I also would like to see the public that is using park hiking trails to be provided with Bear Spray and An air horn if requested. for their protection and the protection of the Bears. This could be done at a dispensing station where it could be returned after the hike if not used.

I am a strong believer in the fact that we as mankind are responsible for the eradication of the animals in this particular environment and should do are best to restore the population to an manageable population of Grizzly Bears. I would like to comment that public safety should be priority and that is why I ask that you have Bear Spray stations available to the public as not everyone can afford it and some may forget to bring it.

I heard of problems with the Wolfs and livestock on the east side in Washington State and this could also become a problem with bears like the Grizzly. I would like to suggest a program where DFWS in Washington adopt a protection program for ranchers where possibly trained Shepard dogs could be purchased by the Department of fish and wildlife and lent or just provided to the ranchers to quell the problem. The Department could provide money to feed the dogs instead of paying for lost animals. best non lethal way of dealing with problem bears or Wolfs.

Thanks [REDACTED]

Correspondence: I am in favor of alternative A, take no action. I live in Zone 1, within 1 mile of the "recovery zone". I think it has been a waste of our taxpayer money to continue supporting these proposals and studies, let alone the actual implementation of this action. History shows us the fallacy of our intervention in manipulating our environment. I do not think it has been significantly considered the impact of artificially introducing the grizzly bear into our area on the other wildlife, i.e., black bears, cougars, salmon, bull trout ..that so much money has been spent to protect. The effect on recreation in that area has also not been fully looked at. If the grizzly bear naturally migrates, and occupies the area so be it. Do not waste our money in this effort to artificially introduce this apex predator into my backyard.

Correspondence: It is imperative that we begin reintroduction and support of grizzlies to the North Cascades. Their impact throughout the environment is crucial and we must support this beautiful species. The long-lasting impacts of their absences are yet to be fully understood but based on studies in other National Parks, we know they are a keystone species for many environments including the North Cascades. Furthermore, by reintroducing this species we will have future opportunities for increasing and maintaining genetic diversity for the species. I am a current Fisheries, Wildlife, and Conservation Sciences student at Oregon State University and plan to focus on large carnivore ecology throughout the Pacific Northwest. This is an important cause for me personally and I hope the right choice will be made in reintroducing and supporting a grizzly bear population in North Cascades National Park.

Correspondence: Grizzly Bears are a natural part of our county, our state of Washington, and in so many places around our country. We have a responsibility to provide them the protections they need to be able to live and thrive in their natural habitats. They have as much right to live here as we do. Human beings have encroached upon the natural habitats of animals throughout the history of our country and beyond. We need to learn how to live with them, not euthanize them or relocate them. The residents of Whatcom County can learn to do the basic things necessary to not unintentionally attract the bears by ensuring they do not have access to human food in any kind of structure that they can easily access or in our garbage, our recycling, our compost, etc. We need to do everything we can to help the Grizzly Bears be safe in their home just as we want to be safe in ours. We have an obligation as the current occupants of this planet to do everything in our power to protect and defend wildlife, especially the Grizzly Bears. Thank you for your consideration.

Correspondence: In regards considering restoring grizzly bears to the North Cascades Ecosystem in Washington, this should not be done. Grizzly's present an unnecessary danger to humans and livestock and are simply not necessary for our

ecosystem to thrive. Grizzly's should only become present in the North Cascades if they naturally migrate here on their own. Additionally, the current predator population of cougars, black bear, coyotes and wolves in the cascades has grown disproportionately to prey in the past decade and it would be irresponsible to introduce yet another predator to the mix.

Correspondence: I do not believe this is a good approach for the North Cascades for a myriad of reasons. I have spent a lot of time in the North Cascades hiking, hunting, and camping. I have been part of wildlife management committees and managing the wildlife we already have can be controversial and tenuous at times. Add another predator without a clear management plan if the population exceeds ESA standards exposes the current ungulate population, hikers, and local residents. These bear have a wide geographical range and with the high fish and elk population in the lower Skagit Valley there is a high likelihood some of these bear will end up in this area and create new problems and challenges for farmers and cattlemen. Based on my experience hunting in Libby, Montana this is an unnecessary risk or step. What is the strategy if the population exceeds expectations and it rises to the level that it could be removed from the ESA in Washington. Is there an active management plan from WDFW that will allow the harvest of these bear when they are problem bear or exceed population expectations.

Correspondence: I live in the foothills of "the park" and I certainly don't want (even more) grizzlies in this area than are already here. Seems to be the lions share of people advocating for grizzly bears in the North Cascades, live 100 miles or more from here. I feel like the opinions of ones that this impacts most, should be weighed more heavily. We have a big enough predator problem with the Mountain Lions, especially, we don't need to bolster the predator population. Look at the increase of grizz attacks in the last few years in the Rocky Mountain region. If you add a predator, we should be managing the population of the predator. However, this thinking is going largely to the wayside of Washington's elected officials.

Correspondence: MY comments are my own; I do not speak for any official positions of any government agency. I agree with and fully support the NPS/FWS preferred Alternative C to reintroduce grizzly bears into North Cascade Ecosystem in the State of Washington. Having many decades of first hand experience seeking out and viewing grizzly bears, and also personally assisting in managing human - grizzly bear interactions as a full time volunteer in a National Park, I have observed the benefit to people and local businesses to be significantly positive. With appropriate public education on how to safely coexist and how to promote best practices to encourage natural feeding, these bears in their natural environment provide immense enjoyment for tourists and nature lovers alike. They will become a significant tourist attraction thereby generating new tourism revenue. It would be short sighted to focus only upon the challenges of managing problems between bears and cattle on the fringes of the ecosystem. Those challenges are already being effectively addressed in other areas of the United States. The overall benefits of grizzlies being present far outweighs the costs. As key members of the original ecosystem, it's only natural for grizzly bears to be present in wilderness areas, national parks and national forests. Please move this initiative forward.

Correspondence: Absolutely silly to think that reintroduction of grizzlies is a great idea. Let's define reintroduction. Are we reintroducing these grizzlies in the same environment they existed in 200 years ago? No there is more human population, livestock and wildlife that is used to not having grizzly predation. They will decimate wildlife, livestock and unfortunately a human eventually. Is a loss of human life in the north cascades something everyone supporting this is comfortable with? Are we truly prepared for the hit to deer/elk populations? The ecosystem unfortunately is not the same that it used to be and not prepared for this

Correspondence: If the habitat can sustain a grizzly population they will return on their own. There is a large protected population just north of the border. They don't reestablish in Washington because there are too many people and not enough prey animals. When grizzlies roamed Washington there were significantly less people, there are now over 8 million people and tens of thousands of miles of heavily traveled roads. Washington is already drowning in predators and adding a new apex predator would cripple the Methow Mule Deer herd, which is already a shadow of its former glory. Reintroduction would also endanger the people and livestock of our state. It is irresponsible and reckless to even consider this, which is why this ludicrous proposal has already been shot down a half dozen times. Yet here you are, shamelessly trying to push your agenda through against the will of the people and the advice of wildlife biologists. Asking this every year is pathetic, fix the mountain of problems Washington wildlife faces before trying to add a new one. You people are despicable.

Correspondence: As a hiker and backpacker, one of the things I have appreciated about the North Cascades is not having to worry about Grizzly Bears. The Grizzly Bears in British Columbia, Alberta, Glacier and Yellowstone are the reason why I no longer camp in those areas. And because hotel rates are sky high, I rarely visit those areas at all.

I really do not want to say the same about the North Cascades after Grizzly Bears are reintroduced and become a serious concern like they have elsewhere. Dealing with the annoyances of Black Bears is bad enough, having to worry about aggressive and predatory Grizzlies will turn myself and others away from the North Cascades.

Is that what the NPS wants? To scare individuals and families away from the North Cascades? Sometimes I really have to wonder if the answer is yes.

Correspondence: While I recognize that this is not necessarily the responsibility of the NPS, the reintroduction of grizzlies into Okanogan county and surrounding areas seems incredibly less important than addressing the impacts that the same humans that eliminated the grizzly population have had on the native people of this land, who also lived here thousands of years before us. My hope is that awareness is brought to this fact, as the reintroduction of grizzlies will likely have extreme social consequences on an already-divided county. I strongly believe that our climate, habitat, and ecosystems will continue to suffer unless the people of this area are united in the fight to address this very important issue. Please consider the social consequences of grizzly reintroduction if adequate attention is not paid to the larger context.

Correspondence: Grizzly bears are native to the North Cascades, and their absence is an aberration. There were grizzly bears there relatively recently. It is a land with vast, remote tracts of wilderness where these creatures can live apart from humans. It is a land which deserves to see the restoration of a natural order of life. The bears belong there! Our world is all the less for their absence.

Correspondence: To whom it may concern,

It is of the utmost importance that we take swift action to bring brown bears back to the North Cascades ecosystem. For far too long mismanagement and lack of understanding for the biological and cultural role these bears play has prevented them from thriving in a land that historically has been outstanding bear habitat. I would hope those that have the power to restore these bears to the North Cascades would work tirelessly bring them home.

Correspondence: Look, I was born and raised in a moderately rural area near wildlife. We had school lockdowns at least 3 times because of black bear activity in the school yard. I've had friends and family loose house hold pets to cougar and coyote. I am an avid hiker and outdoorsman. I carry a 10mm handgun with me on trails because I know the potential danger of wildlife. Grizzly bears pose an extreme hazard to people and were hunted to extinction for a reason. Our state already has enough hazard in the wilderness. Our ecosystem has changed. We have seen the absolute disaster that reintegrating wolves into the Cascades has caused on competitive species and lives stock. Do not make the mistake of tossing another apex predator into the mix and reaping havoc on the environment at the cost of the taxpayer.

Correspondence: I'm in staunch opposition to your restoration plan. As one who will be directly affected by the plan--living, working and hiking alone in the mountains of Zone 1--I feel very strongly about this. While many urban dwellers may have romantic visions of these 700 lb apex predators living wild and free in the mountains, it's not the urbanites who live out here, *in* these mountains. Their lives won't be directly impacted. It's the rural residents of these more remote areas and communities who will have to share the mountains and rangeland with these imported animals--not the urbanites.

Grizzly populations have not only met recovery criteria goals in other areas of the US, such as the Greater Yellowstone Ecosystem and Northern Continental Divide Ecosystem, but surpassed them. Their numbers and ranges continue to expand. They're thriving. This isn't a species that's on the brink of extinction. But if you truly believe they need more range here in Washington, bring a few home and let them live in *your* backyard.

Correspondence: I feel it's an excellent idea, since right now all bears are on the move and will be here regardless. That's because of a new law in Alaska, which allows hunters to kill bears with their cubs inside their dens. Bears do not feel safe in their dens anymore. Everyone should carry bear spray and know how to use it. Never run, scream, have direct eye contact, or smile showing your teeth. These are signs of aggression and/or could make a person become prey.

Correspondence: As a Washington resident and avid outdoorswoman, I would like to see grizzly bears returned to the North Cascades, just a small part of their historical, native range. I see the preservation and restoration of natural ecosystems as a critical component of creating a healthy, sustainable Earth. Modern civilization has selfishly and single-mindedly taken possession of the planet (including the United States and Washington state), paving, plowing, logging, ranching, polluting and constructing over complex ecosystems, diminishing the rich diversity of life that once existed. As the world comes to face the devastating consequences of climate change, we must also come to terms with the fact that our determination to bend the world to our desires and comforts has jeopardized the very thing that sustains us. The Upper Skagit Tribe has asked for grizzlies to be reintroduced back into their native habitat. We should respectfully honor their request and have the humility to seek their guidance in the process of reintroduction and ask them to share their knowledge on coexisting with grizzlies. If and when grizzlies return to Washington, it will be critical to educate the public on how to safely and respectfully share the land with a species whose time has come to return home.

Correspondence: Re introducing Grizzlies should not happen in the North Cascades. Unfortunately there is not a lot of room for them to roam like they once did due to human population increase and a large prey population decrease. Our deer herd numbers have been suffering greatly due to wild fires and predator increase. There are also very popular hiking trails such as the Pacific Crest Trail which could lead to multiple human to bear conflicts. People will go hiking and never come back I'm afraid. Hikers and wildlife viewers like to come to Washington State because there are no grizzlies to be worried about. Grizzly human conflicts are on the rise in neighboring states such as Idaho and Montana. We don't need to add Washington to the list of growing bear conflicts. Please let the voices of lifelong Eastern Washington residents be heard!

Correspondence: To whom it may concern,
The ecosystem in Washington state has been uprooted by the reintroduction of wolves. As a life long resident of this state and an outdoor enthusiast and hunter I have personally witnessed the ungulate populations decline and have seen their lives turned upside down. The patterns and movement of both mule deer and moose have been impacted negatively. Both species used to graze the slopes and let you walk passed them. Now they live in constant fear, they spook at the slightest sounds and their populations have dropped dramatically. The state is 100% at fault for this for not controlling a non-native invasive wolf species that was brought in to our state. We already have to deal with the release of non-native mountain goats that were released into the Olympic Park. After all these stupid decisions and millions of dollars wasted trying to fix the problem you want to bring in another species. Are you kidding me? Is it the plan of state and federal agencies to ruin our native ungulate populations? Leave the ecosystem alone, you all have done enough damage and we may not ever recover from the wolves. Leave the grizzlies where they are.

Sincerely [REDACTED]

Correspondence: Please do not reintroduce Grizzly's to the north cascades. Our ungulates are barely surviving as it is. The methow valley deer heard used to be the largest migrating deer herd in the United States and the herd is now a shell of its former self. It's time we start to manage the apex predators we already have in this state rather then introducing more.

Have you guys not seen the number of cougar wolf incidents we have already had? How about the little girl from hunters that was attacked by a cougar last year. Or the forest service employee that was trees by a pack of wolves. Our predators have no fear and don't associate humans with danger which in this state is a huge problem. This isn't rural Montana where the people are ready to protect themselves from a grizzly need by with a side arm. The north cascades is a huge destination for people to hike trails especially the PCT. With no management the PCT will become an all you can buffet of hikers for these bears and kill the small local economies that depend on the camping, hunting, and hiking trips that surround the areas.

Do not reintroduce Grizzly bears.

Correspondence: As an avid hunter/outdoorsman/hiker/camper/fisher/tracker/trapper/furtaker I 100% disagree with the reintroduction of grizzly bears. Look at the issues we are currently having with the wolves we recently introduced with the farmers and cattle. Do a simple search of cougar attacks in the Portland. I fear wolves and would fear a grizzly attack and the legal repercussions of needing to defend myself from an attack that is an "endangered species".

If this goes into place, this will be an absolute disaster with activist community.

Correspondence: I think it is a terrible idea to bring grizzly bears back to the north Cascades. I like to go recreate up there since my girlfriend lives in Arlington and I've also been to Montana where it isn't recommended to use tents in bear habitat areas. I don't want to have to worry about that in the north Cascades. Also I think the deer and elk populations would suffer since they are no longer used to grizzlies being around. Leave the grizzlies out of Washington please

Correspondence: This is a guaranteed threat to human life by purposefully releasing grizzly bears and encouraging population. Whether starting with a few or dozens it does not take much to quickly have a population. All it takes is one bear to destroy a human life. Hiking becomes out of the question. Living on our property becomes a threat. These bears could easily approach us in our forested property and kill us while we are taking the dog out for a walk. Our children and pets are no longer safe playing outside. We don't live in the city. We live in a forested mountainous area in king county where there is commonly wildlife the migrated through from the cascades. Our lives would be in danger as well as our community. We are not supportive of a purposeful effort to repopulate the cascades with grizzly bears.

Correspondence: WA state already has a problem with predators. Adding another apex predator will have negative consequences on the ungulate population. Since introduction of wolves the number of elk and deer have been going down. Cougars numbers are increasing annually and also decimating the ungulate population. Black bear numbers are up. The grizzlies will further devour the population of elk and deer. Not to mention the problem they will have with humans. WA state residents enjoy the outdoors, now with grizzlies around there will be attacks on humans who enjoy the outdoors. We can track grizzly attacks on humans going up in neighboring states that introduced grizzly. The people of WA don't want introduction of grizzlies into out eco system.

Correspondence: Having hiked extensively in Whatcom, Skagit, and Snohomish county for the last 35 years, seeing wildlife is a huge part of the experience. Knowing there is always the possibility of black bear, cougar, and more recently wolf (East of the mountains), I always carry self defense measures for my peace of mind and those I hike with. But grizzly bear is a different type of threat, requiring self defense measures that I believe 95% of hikers either do not possess or will not carry - namely large caliber handguns paired with Pepper spray. With more and more people enjoying wilderness (trailheads are more crowded than ever), and less of them adequately armed to defend themselves and others, purposefully reintroducing

grizzly bear in our wilderness areas is a recipe for death - both bear and human. For the sake of all who already enter the wild foolishly unprepared for encounters with predators, please do not make matters worse by tipping the odds even more against human survival.

Correspondence: Brown bears should be returned to the North Cascades ecosystem. They are a necessary and historical component of this habitat, and their presence (along with wolves and wolverines) will help restore a natural balance that has been missing since these animals were exterminated by the hand of human beings. While the presence of the brown bear will change the equation in the North Cascades for humans and livestock, and "bear aware" education will be very important for all those entering this region, this ultimately means that the North Cascades will now be a more complete wilderness and ecosystem. Just because we have grown accustomed to the lack of brown bears in our state does mean that they should forever be denied a habitat in Washington. Indeed, we must accept responsibility for having decimated their population and therefore disrupted the North Cascades in the first place. The question is once reintroduced, can the bears be protected and not shot as soon as they leave National Park property, as we have seen in other situations. They must not only be reintroduced, but also not exist under threat. As humans, we have done great damage to the wildlife with which we share this planet. Only occasionally do we have the opportunity to right a historic and environmental wrong. In this case, in the North Cascades, we have the chance to do something good, that will not only change how we see the region, the wilderness, and our place in it but give a species a new world to roam.

Correspondence: I understand certain people's desire to try to bring an animal back into a range that previously it has called home. Humans have long been changing the land, for many varied desires. It was this same desire that led to deforestation of the Douglas Fir, the creating of freeways, and the removal of grizzlies from our land. I do believe that letting the land get back to what it was and the biodiversity of our environment is very important. In the same way the people have wished to shape the land to fit their needs, some of us wish to return it back to it's original state. With the best intentions we all wish for the best of our land, but I think it's time we let nature handle it. Nature will correct it. It will take time and we as the inpatient species we are can't handle such subtle slowness, but it's time to let nature take care of itself. Its in my uneducated and likely ignored opinion that we should not put brown bears into the NCE, but let nature take care of itself for once.

Correspondence: As a Volunteer at Mount Rainier National Park, former Park Ranger as well, and an avid hunter, I am opposed to the reintroduction of grizzlies to the North Cascades in Washington state. While advocates believe the introduction will bring back a "natural" balance, I point out the idea of moving mountain goats from North Cascades to Olympic National Park as an example of the usual folly we humans make.

Yes, I realize the goats had no natural minerals available (particularly salt) in Olympic which caused bad behavior toward humans. Grizzlies, being an apex predator, have the habit of having aggressive behavior, because they are the top of the food chain. And humans being what they are, do stupid things around wildlife. Unfortunately I see the reality of aggression toward humans becoming a problem, and then we end up euthanizing the bears due to bad human behavior. Let's not start down that road.

The grizzlies WILL start in one location, but rapidly expand into urban neighborhoods. There is NO WAY you can keep that from happening. Please don't put bears in the position of becoming a victim of human encroachment, ignorance and stupidity, AGAIN. It is a shame we can't coexist, but humans are the problem, not the bears.

Correspondence: I strongly oppose the re-introduction of grizzlies into the North Cascades. I believe it will lead to harmful human/bear interactions that will result in deaths and injuries of both bears and people. Washington has a strong culture of outdoor recreation and having so many people sharing the mountain regions with grizzlies is bound to lead to conflict. Currently grizzlies are in close proximity to the North Cascades just across the border in Canada as well as NE Washington. If the habitat and opportunities are right the bears will be able to re inhabit the North Cascades on their own time and as their growing population and expansion allows.

Correspondence: Dear National Parks Service,
I came to WA state 37 years ago from West Virginia. I was employed at the Boeing Co. for 30 years and retired just 2 years ago.

I am continually amazed by the beauty & wildness of WA state. My father instilled a love of nature, birds and all wild life, in my 3 siblings and I. We had to travel far to other states to see great numbers of wildlife, but he took us every year, on a very limited income, canoeing in the Okefenokee Swamp, Myakka River State Parks, Yellowstone National Park and north to Canadian wilderness, so that we would treasure all nature and wildlife.

In my own back yard, in Issaquah for 27 years, I saw native and flying squirrels, bobcats, racoons, deers, and the adolescent bears that strolled through every spring, along with numerous species of birds, from tiny Nuthatches to hefty Pileated Woodpeckers.

Our WA wilderness and the ability to live and interact so closely with our wild brothers and sisters, is one of the most incredible components of our life in the Northwest.

I am strongly in favor of the reintroduction of Grizzles to the North Cascades wilderness. Protecting and shepherding this reintroduction will be a huge benefit to our future generations. Restoring native species, such as the Grizzlies is the right thing to do for our children's children and for WA state. Studies have shown that these apex predators can coexist with humans, and will, by and large, avoid them. Please move forward with the plans to bring back this amazing species into our state.

Sincerely and with compassion for all wildlife,

Thank you for the opportunity to support this effort.

Correspondence: I grew up in Central Oregon and I'm aware of the tensions between apex predators and locals. I support re-introduction of the "Grizzly" to the North Cascades but only with a "10j" experimental designation with adequate funding to compensate ranchers for livestock losses. Wolves had this designation when restored to "Yellowstone" and the "The Frank" in 1995. I also recommend that grizzlies are transplanted from the "Glacier National Park, Yellowstone, and other areas around Wyoming" to the North Cascades. The reason I suggest this is that there is still a lot of animosity with locals with wolf re-introductions in the 1990's. Many locals from Oregon, Washington, Idaho, Montana, and Wyoming feel that a bigger Canadian wolf was brought in that had the capability of bringing down bigger prey and thus elk herds being decimated throughout the "Rocky Mountain West." The science can say what it wants about the specifics of wolf re-introduced in the 1990's, but locals have their first hand accounts as well through their hunting techniques and campfire stories. Perception is often reality!!! DO NOT TRANSPLANT THE NORTHERN CANADIAN OR ALASKAN COASTAL GRIZZLY/BROWN BEAR TO THE NORTH CASCADES!!! I wish you well with the re-introductions.

Correspondence: i a 100% in support of reintroducing grizzly bears to the North Cascades Ecosystem. for way to long the story of predators and "progress" has been to wipe them out. We now know all these predators, from Pine Martens up to Grizzly Bears play an integral role in the ecosystems, health, not to mention, the social/psycho/spiritual benefits.

the Grizzly is unique in its power, intelligence, religious significance for indigenous peoples. with the threat of climate change, and all it know and unknown impacts, it seems to me the intelligent thing to do is work to create as healthy and intact ecosystem as we can in the Northwest, since our future for our wild lands is unknown at this time.

lastly, i want my grand childrens grand childrens to be able to say, 100 years ago, WA state and Federal Gov. to the unprecedented step to reintroduce grizzly bears.

i also feel strongly if bears are becoming a nuisance or killing livestock, there ought to be a fairly simple way for ranchers and farmers and rural home stealers to get help from the Gov., eliminating problem bears, and more than fairly compensating for the damages and lost revenue. we need to get all folks on board, or this will never work. ██████████

Correspondence: This is an absolutely terrible idea. As an avid outdoorsman my friends, family and I spend hundreds of days in the field. We first hand see the effects of predators on our ungulate populations. They are already diminishing by the year all over our state and a major reason is due to our current predator populations. Predator populations as far as black bears, wolves, mountain lions and coyotes are thriving. Adding MORE grizzly bears to this will hurt the ungulate population to an unrecoverable level in my opinion based on the research and experience I have had, done and seen first hand.

Correspondence: To whom it may concern: releasing grizzlies back into the Cascade Mountain range is a disastrous idea. I was born and raised in Western Washington and to hear that this is what is trying to happen is terrible. The amount of

damage that they would cause will be detrimental to the ecosystem. The wildlife will take a downward spiral in numbers quickly and the ecosystem will not be able to handle it. The Cascade Mountain range is one of the most beautiful ranges in America and is traveled often. It won't just be detrimental to the ecosystem but it will also put all the travelers through the range at risk. All the hunters that hunt that region also will be at risk. You all need to rethink this and not go through with it. Keep the North Cascades safe for all living things.

Correspondence: We have lived in the Foothills of Whatcom County, adjacent to the Mt. Baker/Snoqualmie National Forest, for over 40 years. The return of grizzlies would thrill us. Can't be any more threatening than the cougars that we already see here. Yes, bring them back and let's score a small victory for the ecosystem.

Correspondence: Absolutely not! It's a terrible idea! The eco system is stable without grizzly bears involved. The bears that are there do not stay in the north cascades year around. There is minimum 8ft of snow during winter and that does not leave u til very late spring. That alone forces all animals down to the mountain towns and cougars alone are destroying the deer population and farm animals every year.
The pacific crest trail is one of the most traveled hiking trails through the park alot of it goes through bear territory. Every year I travel alone on my horse through this area without any threats other than the amount of people and long distance hikers I pass. The safety of the outdoorsman of that area will be at risk if grizzly bears are introduced. The bears will venture down into the valleys and not stay in the mountains. 100 years ago that's what happened every year, my grandpa was there. It was not safe late fall or early spring to be up in the passes with out protection and a group. No one in their right mind wants to waste funding to do this project, it is not fair to the bears who will inevitably die or move out of the area anyways nor the citizens who travel this beautiful park year after year.

Correspondence: There is no sane reason to re-introduce Grizzly bear in Washinton State. It will impact the already hurting elk and deer population and the feel good planting of wolves sure has been a problem. I am a hiker and the idea of having to give up safe time in the outdoors just to satisfy a few people who want the bears doesn't make sense. Let the bear people go to Montana if they want to pet a grizzly.

I noticed that a new rule has been put in place regarding storage of food when hiking in the Snoqualmie National Forest. There hasn't been a problem with hikers and bears so this tells me that those in positions of power already have decided that the bears will come.

Have you noticed how many Grizzly bear attacks there have been in Montana this year?

Correspondence: Let's look at history, so we don't repeat the same mistakes again as the government seemingly loves to do. Mountain goats were transplanted into Olympic National Park (well before it was a park) and what happened? You had to remove or kill them over the last few years at a cost of millions to taxpayers, mainly due to human-wildlife conflict and impacts on the ecosystem.

There are reasons why grizzly bears haven't flourished in the Northern Cascades naturally. Human-wildlife conflict, degradation of habitat, overall numbers of predators, changes in the stress on ungulate populations, proximity to human-inhabited areas due to migration related to food source, habitat changes, etc. In addition, when you set numbers for restoration goals toward management, you don't account for (or object to) the fact that lawsuits prevent necessary management once those goals are met, leading to overpopulation and increasing conflict, as has happened in Montana and Wyoming. As a result of your previous actions, the residents of these states are stuck with an ever-growing population of extremely dangerous apex predators that can't be controlled and that have no natural fear of humans. How many more human lives must be lost or severely impacted from grizzly bear encounters before the push to "re-introduce" them to areas there is no evidence they never naturally existed will go by the wayside? This feels like the gray wolves issue all over again as they are about the management threshold and still not actively being managed.

This program is a mistake from the onset and if it is accepted it will grow out of control, causing harm to humans, domesticated livestock, already lacking ungulate populations, and financial security for individuals and industry. Those of you who design and implement this plan lacking these understandings need to be held personally and financially accountable for the negative results.

Correspondence: The residents of Darrington have said no to this time after time. Our community would be deeply affected by bringing Apex Predators into the ecosystem here. We were a city that relied on logging but that has gone away. We now rely on tourism. This could have a severe affect on that, which would severely impact our community. If their was a sustainable food source here the bears would be here, let them migrate on their own, you do not need to step in

Correspondence: Predatory animals such as grizzly bears play a key role in maintaining balance in the natural world. By keeping populations of lower level organisms in check plants and insect populations are able to attain there ideal level of growth, the level they maintained for thousands of years before colonists arrived to the United States and removed the predators. The north cascades is a special place in that it has seen very little human impact compared to many other areas of the United States including other national parks. By reintroducing grizzly bears to this park we will be able to further return this area to the wild status that it held prior to human intervention. This will allow the ecosystem to stabilize and protect all life present in the area, and prevent further harm to the world which benefits all life including humans. While large predators are scary to humans taking simple actions to reduce our interactions can prevent a bear attack; and bears belong in this area entering their home cones with the risk of an interaction with them. Yellowstone saw many levels of improvement in the ecosystem including balancing of herbivore populations and regrowth of natural plants, after the reintroduction of wolves, and I as an avid outdoorsman I am excited to see how this regeneration of grizzly bears can return this space to the way it was prior and to human development.

Correspondence: I would like to comment on grizzly bear reintroduction in the north cascades. I strongly oppose this and hope that you will too. There is not enough wildlife to support them thanks in part to poor management from WDFW. Grizzly bears will decimate the already dwindling herds, affecting the sportsmen that rely on hunting to support themselves and their families. This will create dangerous situations for hunters and hikers as there will be more and more attacks and deaths to the people. I believe there is already a few grizzlies here that migrate from Canada and Idaho and they should be left to naturally reintroduce themselves. They will also prey on livestock affecting ranchers and their livelihoods. Thank you.

Correspondence: Dear National Park Service,

I am writing to express my support for Grizzly Bear Restoration in the North Cascades.

I support introducing large mammal predators because they have a role in maintaining a healthy ecosystem, because their existence is threatened by human activity and because it will preserve the wild character of the region.

My wife and I live in Yakima, WA. We enjoy backpacking 2-4 weeks every year in the rugged and wild country of the North Cascades Ecosystem. I am grateful that the North Cascades NP is managed as a wilderness park, which includes large mammal predators.

Thank you,
[REDACTED]

Correspondence: Are you crazy?

If the bears find their way on their own, then fine. If you put them there and someone is killed, now you have liability and open yourselves to lawsuits. Also , there could be livestock issues as with wolves .

I will feel the need to carry a gun when hiking which opens the possibility of shooting accidents increasing due to more guns then currently are being carried .

Mixing two top predators will result in a 50/50 kill result, Half the time people will die and half the time bears will die. If your ok with that, then bring them on and prepare for the lawyers .

Correspondence: Why do we as humans have to even get involved and keep meddling with mother nature? Isn't this similar to the goats that overpopulated and then screwed up the balance and were flown out? Then there is the Cougars who are now protected and starting to overpopulate. Give that another 10 years and it will be out of control. I like to spend time outside but I am unsure which is more scary a Cougar or a grizzly. I don't hike with my gun, but if grizzlies were brought in that would probably change for safety. Grizzlies are smart animals. Upset the balance of mother nature by meddling and bad things are going to happen, like preventable deaths and lawsuits. You have a whole different entitled population to think about than you did centuries ago.

Correspondence: As a resident within 10 minutes of the North Cascades, I've seen growing issues with wildlife migrating into densely populated housing areas in the search for food. This includes black bears, bobcats, coyotes, etc. My concern with the proposal to reintroduce grizzly bears into the North Cascades does not realistically account for the likelihood that these apex predators will migrate just like the current wildlife is doing. With so many more people living and recreating in the North Cascades and with more people moving to the surrounding areas, this proposal just invites dangerous encounters with a dangerous animal. To be more explicit, vote no on reintroducing grizzly bears to the North Cascades.

Correspondence: I favor reintroduction of Grizzly Bears with certain limits. First, I think their range should initially be kept North of Hwy 20 in the NCES. The area would include: NCNP, Pasayton Wilderness, Mt Baker Wilderness.

As the introduction proceeds, I recommend collaring all grizzlies to monitor and control their outward migration from the areas listed above. As much as possible, grizzlies should be moved away from all permitted grazing allotments, and areas where there is high human activities, i.e. towns, settled WUI areas etc.

As the bear population grows, I recommend limiting the bears North of Hwy 2. with the same limitations on grazing plus, preventing expansion into the Lake Chelan National Recreation area. They should be allowed in the Glacier Peak and Henry M Jackson Wilderness areas.

Due to very high human activities, I don't believe bear expansion should be considered South of Hwy 2.

Finally, USFWS should work COOPERATIVELY with ranchers and private property owners to ensure bear reintroduction does not negatively affect their operations, homes, and property.

Correspondence: It's time to bring grizzlies back to Washington state. We hear the same commercial worries about bringing wolves back but then we hear all the complaints about how elk and deer are overwhelming grazing and crop lands. We need the bears and wolves to rebalance the entire food chain down the line. We also need bears to help spread the nutrients from salmon far and wide in our forests and grizzlies are rock stars in the salmon game. They are a keystone species and we need them doing their jobs. For the commercial interests there are ways to compensate and help with stock predation and the problem is not so huge that an entire species should be restricted from living in Washington. The fears stated in a news report about danger to families is interesting. If you live where bears naturally hang out you should be prepared to share the space. Many, many people live where grizzlies live and we already live with other bears and cougars here in Washington. I'm sorry people are afraid but there are ways to live cautiously, safely and equitably around wildlife. We need to leave the idea that ranchers rule the decisions about keystone animals of any kind in the past. They are the reason why so many essential animals were hunted to near or complete extinction for financial reasons. We've been paying the price for that excess ever since. Bring the grizzlies back and continue to educate people on how to live safely around wildlife.

Correspondence: We already have grizzlies in this state. I don't think it's right to use tax payer dollars to introduce something that is already here. As grizzly bear populations grow across the west they will naturally filter in. I am against this use of resources. Also the population in Washington would lead to more bear conflicts which would mean more bears killed.

Correspondence: Predators are an important part of North American ecosystems, and human intervention has reduced predator populations across North America to a fraction of what it once was. This has destabilized ecosystems across North America and has caused long-term consequences that we have yet to see fully play out.

As Federal Land, the North Cascades National Park belongs to all United States citizens, and as one of the most likely candidates for the reintroduction of important predator populations, the National Park Service and U.S. Fish & Wildlife Service should reintroduce Grizzly Bears to the North Cascades National Park in as great of numbers as is possible until it reaches a sustainable population as would have existed in the area prior to human intervention. This action would benefit all US citizens through tourism, education, and the responsible stewardship of the North American ecosystem.

This is why I support alternative B under the Grizzly Bear Restoration Plan / Environmental Impact Statement. I believe this Action Alternative fits with the spirit of the Endangered Species Act and is the most responsible action for managing a sustainable ecosystem for the benefit of all Americans.

Correspondence: I would like to add my name to the list of citizens opposed to reintroducing grizzly bears to the North Cascades. As one who has spent 50 years hiking in the North Cascades, reintroducing grizzlies in our mountains makes no sense. The issue has been addressed and discussed for many years. Time and again citizens have responded with a resounding no. Washington has the largest population of the Western states with the exception of California. North Central Washington has been flooded in the thousands with hikers since the pandemic. Trailheads are overflowing with vehicles every day in the summer. It is ludicrous to put grizzlies in this mix of humans. Unless you want to scare out many hikers? Unfortunately, support for grizzlies in our mountains comes from those who don't live in our mountains. Often, they live in our population centers in the Puget Sound region and would not be impacted by this decision. Unless all hikers are packing firearms, they are more vulnerable to attack. Threats to existing wildlife and livestock are also reasons to oppose this issue. In conclusion, Use common sense, which isn't all that common anymore. The inevitable clash of humans versus grizzlies is always predictable, Do not increase this problem. Leave well enough alone!

Correspondence: Hello,

I'm an avid bow hunter, fisherman and hiker, and I frequent the north cascades wilderness, national forest and state forest frequently .While I think it is cool to see apex predators on the landscape, I DO NOT support the reintroduction of grizzlies into the north cascades.

A) Grizzlies are already in the north cascades, and have been unable to rebound back naturally to they're original population.

I feel this is a habitat issue. I feel money could be better spent improving habitat

B) Washington had a predator issue, mostly due to WDFW's policy, the ungulates are the ones that are suffering.

Reintroducing grizzlies will only throw fuel on the fire

C) this seems highly politicized, and I feel most people who support this don't frequent the north cascades outside of main trailheads. I don't feel like getting attacked when I'm hunting/ fishing or hiking off trail

Once again I feel habitat is the main issue here, and this is what the main focus should be.

Thanks you for considering my letter

Correspondence: Absolutely not. We do not need more predation in Washington. Look at properly managed states such as Colorado who makes 10 times the revenues Washington makes in tag and hunting sales. Why? Because they keep predators to a low and the game thrives. Please consider residents opinions as the northwest is full of hikers. No one wants grizzlies around. No one who enjoys nature at least.

Correspondence: Sport "hunting" has NEVER lead to the extinction of any game animal! Poachers are not hunters, they simply kill for the sake of killing, none of the animal is used to feed themselves, and is often left to rot. You need to get writers that print the truth no matter how much it goes against your environazi B.S. they may have been hunted to

a point where it was safe for humans to occupy the area, or killed in self defense, but that just means they felt threatened and moved out of the area. Regulations have been in place for centuries, and these regulations were brought on by hunters recognizing that for numbers to stay healthy, there should be limits. Don't blame hunters for lack of numbers, it's usually the governing body that fouls things up. Look at our borders, whose to blame?

Correspondence: As a hiker and conservation ecologist I strongly support the reintroduction of grizzly bears to the North Cascades. They are ecosystem engineers, and would help with the elk overpopulation in the same area. Reducing elk numbers can help reduce the spread of CWD, hoof diseases, and other infections that are running rampant in these herds currently. Some may argue that human hunting can be used in a similar way, but we are not hunting the same elk the bears are, and I think grizzly bears are the best option to allow the North Cascades ecosystem to recover. I would love to live to see the day that grizzlies are back in the Cascades, and if we don't take the chance now we may lose the option forever.

Correspondence: I don't want grizzly bears in the North Cascades national Park or the Cascades at all. The entire range abutts, a heavily populated area and is used very frequently. We've already got a top predator in the Cascades with the black bear and the grizzly serves no unique ecological use. I believe this is just a ploy to keep the grizzly bears on endangered species list because they would be endangered in this area once they're introduced. This move will kill people and not help the environment.

Correspondence: As an avid outdoorsman I want to say that introducing grizzly bears is not a smart idea. We live in a state where camping and hiking is an activity that lots of people do and there are way to many concerns that will follow if these bears are here. There are to many stories or people being attacked or killed from these bears, a man just got his lower jaw ripped off this year and another lady killed. How would you feel having something like that happen when you decided to bring these bears back. Personally if I was to give a vote and a grizzly killed someone's in that area I would feel like part of that persons death or major injury was part of my fault. Please don't bring these animals to my back yard. Thank you

Correspondence: My vote is an emphatic, loud NO to relocating grizzly bears to the North Cascades or anywhere in Washington State. We have black bears that migrate to the lowlands for foraging and fattening up in warm weather months in preparation for the cold winter months. They are highly visible in neighborhoods all over western Whatcom County as far west as Blaine and Birch Bay....but black bears are relatively harmless and timid toward humans and, if left alone, they fill up and move on. Much of Whatcom County is farmland with farm animals roaming the land making them easy prey to a hungry grizzly bear. Grizzly bears would likely migrate into the lowlands in much the same way as black bears do during warm weather months. BUT...grizzly bears are MUCH larger, MUCH stronger, MUCH more aggressive, and MUCH MORE DANGEROUS to humans. Statistics show that grizzly bears are responsible for more human death than all other bears combined. Bringing them here is a foolish and irresponsible idea with no regard to human safety. PLEASE DO NOT DO THIS !!

Correspondence: This is literally a horrible horrible plan and idea. This State is absolutely overrun and overpopulated by predators as it is. An introduction of Grizzly Bears would truly only make matters worse! For the individuals and organizations that feel this is reintroduction of bears is cute or necessary- I can absolutely assure you that it is not! There is literally no food for them as it is. They are a Carnivore. The deer and elk population in this state have dramatically declined due to the number of predators in this state as it is. We are so focused on protecting predators that it is pulverizing and DESTROYING the wildlife population of other species. We do not need grizzly bears introduced into the Cascades.

Correspondence: Early settlers struggled with dangerous and threatening animald for a reason. Grizzlys, wolves, cougars and coyotes were the primary animals that were both troublesome and dangerous. They were eleminatef for common Sense reasons: they preyed on people and their ability to conduct safe activities outdoor. It is more important to protect people and their families as well as the conduct of outdoor activities. Everywhere these dangerous animals are brought back to areas where people live and use the outdoors for whatever reason has resulted to the threat or deaths of people and loss of economic benefit.
I strongly object to this proposed a the idea coming from sime animal activist or environmental group on the East coast suggesting activities they have no idea of the consequences.

Correspondence: This project is not advisable. The likelihood of success is minimal and likely shortlived. The grizzly is gone because the habitat no longer supports it's needs.

What protein sources are still available in the NCE in the same abundance as the source location of the bears? None. The salmon runs have dwindled. There aren't vast herds of mammals. The nature of the terrain is so different (steep, narrow valleys, void of protein), that most relocated bears will suffer malnutrition and disease, and likely end up in human populated areas because that is where the food can be found.

How much of the forest/park access will be removed or closed to human traffic? It is already clear that there is a preference for decommissioning roads rather than maintaining or increasing access. It is rumored that this plan includes expansion of the wilderness boundaries, which in north Whatcom county, would eliminate just about every forest service road and campground. Will the Mt Baker Ski Area be allowed to operate as it has? It seems at odds with the pursiut of this proposal.

Who will be liable when grizzly/human interations occur? As a reintroduced concern, it seems necessary to consider the very serious potential of this occurance and that, outside of the park /wilderness boundaries, that liability would lie squarely on the parks department.

So, if there are guarantees that this project will not lead to less public access, that damage liability from direct interaction or indirect action(decreased access, reduction of business income, or property values) be placed on the NPS, and if these guarantees are codified, then I could be persuaded to look the other way.

All in all, I think this is a misguided pursuit. It has been poorly presented to the public, and will prove to be waste of public tax dollars, which could be used to improve an already deteriorating infrastucture.

Correspondence: I believe restoring Grizzly bears to East Whatcom County would be a HUGE mistake! There is nothing to stop them from coming West to the populated areas where they could cause great harm to property, humans, & other animals. Then we the taxpayer will have to pay to have them removed when they shouldn't of been there in the first place! Also what will you do when they get over populated? Go out & kill Them! That seems counter productive! I am totally against reintroducing grizzlies into Whatcom County, we have enough issues with black bears as it is!

Correspondence: "Engineered" reintroduction plans such as this as an offset to actions by past generations fail to take into consideration that there is nothing stopping the natural reintroduction that nature provides for. With Grizzly bears existing in the same mountain range in Canada and borders a man made, artificial barrier, there is nothing stopping any animal type or population from expanding its range. Why humans believe they can do a better job "fixing or managing" items such as this is arrogant in my view.
Additionally regarding the impact that this will have on the communities that that exist within the reintroduction areas appears to be of no concern. The special interest groups, "environmentalists and bureaucrats who don't live in these areas and regularly ignore the voices of those who do because these smaller communities don't represent large enough political group will never have to deal with the outcome.

Stop these types of programs and protect the people who you are supposed to serve

Correspondence: I'm an avid hiker and also often canoe on Ross lake. As much as I love hiking in Washington's Mountains, there is always a sense of loss as there are no Grizzly Bears. We have a cabin in the Targhee National Forrest of Eastern Idaho where we both hike and canoe knowing Grizzlies are around. Yes, you need to have increased dilligence while recreating. But that sense of the place truly being wild is so much greater with the bears than without.

The plan for a slow reintroduction makes sense. I can't comment on which of the two levels of protection are better for the plan as I don't know all the pros and cons. I do know Wolf Reintroduction has been very successful. Restoring Grizzlies can be just as successful and would return the Cascades to their natural state.

Correspondence: I WHOLEHEARTEDLY support the reintroduction of Grizzlies. The simple reality is that ecosystems are healthier after predators such as wolves and grizzlies have established healthy YET sustainable populations. Impacts to humans are lightyears negligible as compared to lightning strikes, etc. People have a very unhealthy view of grizzlies as they do sharks! Livestock owners have to inalienable or inherent rights to graze on public lands without some risk they and they alone should manage. Put another way, especially IF Native Americans who were absolutely here first support the reintroduction then for once we shouldn't discount their desires.

This park is also very remote with few visitors compared to say Glacier and Yellowstone + surrounding areas outside of those parks. BANFF NP and others in Canada manage a native population of Grizzlies very well (I was just there this past summer).

Americans vested in this decision should be more worried about invasive species such as the giant Asian hornet, zebra mussels etc that are absolutely killing our native ecosystems!

Correspondence: I'm writing in support of the National Park Service's and U.S. Fish and Wildlife Service's draft plan to restore grizzly bears to the North Cascades Ecosystem (NCE), a region they roamed for thousands of years. The North Cascades is one of North America's premier intact ecosystems, but it is incomplete without grizzly bears. As a hiker, nature lover, and longtime WA resident I fully support the reintroduction of grizzlies to the NCE.

Sincerely,

██████████

Correspondence: I cannot emphasize enough the importance of not releasing Grizzlies into the North Cascades ecosystem. The state of the ecosystem is already predator heavy with sustaining or exceeding target numbers per WDFW population reports, all while there is a targeted effort to limit or remove predator management. Increasing apex predator numbers beyond the already present Grizzly population with no plan to manage will be detrimental to other game populations and inevitably will lead to Grizzly/human interaction.

I will also add that Grizzlies are already present in the North Cascades. I have personally seen them on 3 different occasions, and commonly hear of other hunters and hikers seeing them as well. There is no need to increase numbers if populations are naturally occurring on their own.

Correspondence: I am 100 percent in favor of grizzly bear reintroduction into the North Cascades because they belong there. I know that there have been very few confirmed grizzly sightings in the North Cascades over the past 20 years or so, but it is not a viable population able to reproduce. The greater North Cascade ecosystem, including the National Park and surrounding National Forests and Wilderness Areas is large enough to accommodate a grizzly population without adverse affects to nearby human communities. There are very few areas in the lower 48 that have suitable size and habitat to support bear reintroduction where they are not already present, and this is one of them. Please restore this magnificent animal to its previous range and rightful place in the North Cascades.

Thank you for your consideration

Sincerely

Correspondence: Please consider the following regarding re-introduction of grizzly bears into Skagit County. Time and time again our government has done similar with Elk in Alger, Wolves, etc. and each time it has become an unmitigated disaster and yet, here we are, with our county government pushing ahead anyway without regard for human life and/or other forms of wildlife that will be affected. Please reconsider your support for yet another foolish waste of taxpayer dollars and will do nothing.

Grizzly bears already have access to the North Cascades Ecosystem and wander in and out from Montana, Idaho and Canada, so why do we need to artificially bring more bears to our area?

Bringing in more grizzlies would not be sustainable. If the North Cascades ecosystem could support more grizzlies, they would already be living here.

An increase in the grizzly bear population would likely create conflict between the grizzlies and farmers, ranchers and homeowners. Bears looking for food would find easy sources on farms, ranches and homeowners' back yards.

The Canadian First Nations are also planning to introduce grizzlies to their side of the border. If they introduce bears before the US Federal Government makes their introduction, then all the planning, expenditures and work done by our agencies will be for naught. Apparently, then, the whole plan will be scrapped.

This is a political, not an environmental solution to the loss of the grizzly bear. By artificially increasing the amount of wildlife in the North Cascades, resources would become more scarce. According to ecologists, the North Cascades Ecosystem is already degraded, due to political pressures on the WA State Department of Fish and Wildlife. Adding more grizzly would put that much more pressure on the ecosystem and affect other native species. The grizzlies would find little support for their own survival and have to travel elsewhere to find food.

Correspondence: "The grizzly bear is still the consummate North American wildlife icon. The grizzly has immeasurable ecological and cultural value for our ecosystems and communities. We have a unique opportunity and obligation in the PNW to co-author a significant conservation success story - to restore the grizzly to a small but important part of its traditional home."

The North Cascades is one of North America's premier intact ecosystems, but it is incomplete without grizzly bears.

This is the second attempt by the agencies to restore grizzlies to the NCE after a 2015 process was halted by the Trump administration in 2020. At the time, more than 159,000 members of the public wrote comments supporting the reintroduction of grizzlies.

"The time has come for the grizzly bear to return to its habitat to take its place in the indigenous ecosystem," said Scott

Schuyler, policy representative for the Upper Skagit Tribe, whose territory lies within the recovery zone. "The Upper Skagit successfully coexisted with grizzly bears for thousands of years, and we should once more."

Correspondence: I support the plan to have recovery of the grizzly bears in the North Cascade mountain range. The grizzly bears have lived in the North Cascade mountains for thousands of years and therefore have a right to live there in peace. It is a tragedy that the grizzlies were brought to near extinction in the North Cascade mountains. The grizzly bears are an important part of the ecological well being of these mountains. The grizzly bears feed on plants and animals which help these important species prosper. The bears dig the soil which is good for living life. The North Cascade Mountains would feel like something is missing without the grizzly bears. They belong. In these mountains like all other life. People have learned to live with the grizzly bears for thousands of years. The Native American people credit the grizzly bears for helping the native people live with the land. The grizzly bears have given tremendous knowledge and resources to native peoples. The grizzly bears and people get along really well in Glacier National Park and surrounding areas. The people know how to live around these bears in a safe manner. Millions of people stay around the grizzly bears in safety. On rare occasions if a person is hurt, it is the persons fault for not obeying safety rules and precautions. I would like grizzly bears have a recovery in California as well. I hope grizzly bears are brought to the North Cascade Mountains as soon as possible. People do not need to fear the grizzly bear when they learn how this bear lives and they know its behavior. Safety rules and precautions are very easy to find in books and on the internet. Black bears are common all over North America and people get along with them and so

people can also get along with the grizzly bear. I would love to see a nice number of grizzly bears in the North Cascade Mountains. Thank you for helping this happen.

Correspondence: I believe reintroducing grizzlies is not a great decision. Why would we do this if they have free rein to move from Canada to the cascades and yet they don't. This to me says that something is lacking as they don't choose to

inhabit them. Another reason not to is as stated safety, for people, their pets and livestock. As with reintroducing wolves to NE Washington. They are going unchecked and spreading around the Eastside like fire. It has caused resentment from hunters and outdoor enthusiasts who see the damage they do especially going unmanaged as in no season for them other than tribes. Even a special draw or raffle tags. This leads people also taking matters into their own hands and poaching. I feel doing the same with grizzlies you're looking at the same issue. I understand wanting to put a species back where they once were. But times change and so do animal behaviors and where they choose to inhabit.

Correspondence: I'm fully in support of re-introducing grizzly bears to the Cascades region. This is one of their native habitats and they are an integral part of our ecosystem. Their eradication from the area is tragic and I hope that their reintroduction will help restore our natural landscape to the full biodiversity it is supposed to have. Of course, I want for human safety to be at the forefront of whatever plan you decide on, but I see no reason that we can't share our natural areas with the bears who have just as much right to call the Cascades their home as we do.

Thank you for your time and consideration.

Correspondence: Under no circumstance do I support bringing grizzlies back into the north Cascades. These animals are nowhere near extinct and this area has acclimated just fine to living without them. They are magnificent animals, and they are extremely dangerous as well as a hazard to any type of livestock or domestic animals to say nothing of humans who find themselves facing one that feels threatened. They will displace the native black bear population, that will find itself vying for limited food resources and forcing both species to find food ever closer to humans and their livestock. I have no idea who dreamt this up or why, but anyone living in grizzly bear country will tell you they are not something to willingly bring into a region that exists under the pretext it will not have to fight with grizzlies for its survival. If the NPS has extra money, maybe they should put it toward something better. Just say no. Best and thank you.

Correspondence: I am writing to express my objection/disagreement to the North Cascades Grizzly Reintroduction Plan Alternatives B & C. I support Alternative A, current management.

In 2016 WTA estimated the number of hikers at 2.7 million and growing. Currently WA state reports 292 million annual user days . Maulings by grizzly bears seem to be increasing even when hikers are doing the right things. Virtually no backpacking in Glacier National Park or Yellowstone National Park, plus access is often restricted
As a regular hiker and backpacker this will increase my and all other hikers' risk of injury or death. In a time of increasing world population it seems unnecessary to increase the population of aggressive apex predators in our state.

Additionally the population of this state continues to grow and will continue to do so. Having apex predators next large populations is dangerous.

None of this study looks at the impact this would have on our black bears. We have little enough wilderness and wild places to handle the wildlife we have without seriously stressing them by adding grizzly bears.

While I understand the official name of the recovery area is North Cascades, most residents of WA equate North Cascades to the North Cascades National Park without understanding that the proposed recovery area actually extends down to I-90, a much larger area than North Cascades National Park. Thus residents considering this proposal are misled.

Correspondence: Please don't reintroduce Grizzlies into the North Cascades. I used to live in Alaska where they roam freely and belong. Hiking in Alaska was always a nerve racking experience as there were yearly grizzly attacks. Many were fatal. The North Cascades are a heavily trafficked area in the spring, summer and fall months with hikers. This will inevitably lead to encounters. Due to the inability to carry firearms in the Park this would make for risky hiking situations and camping. Many women enjoy backpacking and the scent that a woman can produce during menstruation can lead to bear encounters. I enjoy hiking in North Cascades National park without fear of a grizzly encounter. It is one reason why I moved away from Alaska. While I love Glacier National Park and Yellowstone, the presence of Grizzlies makes it a more stressful experience. The range that grizzlies can cover means they will inevitably leave the Park boundaries and wind up overlapping into towns in the Okanogan and Skagit counties.

The reintroduction of wolves has led to cattle and sheep losses. This will be no different.

Please re-consider this flawed plan.

Thoughtfully,

██████████

Correspondence: Absolutely not! Apex predators like Cougars and Black Bears are already overpopulated and poorly managed in WA. I am 38 years old and have been hunting this state for 24 years. In that time I have seen a decline in blacktail deer and elk populations in Western WA. I went from never seeing a cougar for like 15 years to seeing at least 1 to 3 per year since. Without the proper hunting methods they are extremely difficult to manage. Now they are overpopulated and not in healthy sustainable numbers. They're moving into populated areas near people and starting to get use to being around people. Grizzly bears will do the same. They are beautiful animals and definitely have their place, we just don't have room for them in WA State.

Correspondence: Dear NPS,

Re. Possible Reintroduction of Grizzly Bears to the North Cascades Ecosystem

I have some questions based on the known spring and summer feeding and ranging habits of the grizzly, as they can be expressed in square miles and elevation. Perhaps this information is detailed somewhere in the report, but both features escaped this reader's attempt to detect them.

US Fish and Wildlife (2007) reports that spring and summer feeding ranges for female grizzlies are estimated to be 50-300 square miles, while those for males are estimated to be 200-500 square miles. A 2004 Canadian analysis performed by Ardea Biological Consulting (Smithers, BC) states that spring feeding occurs on "low elevation slopes" and riparian areas of that province, while summer activity occurs on "mid-level slopes" and "low elevation river bottoms". Elevations can range from sea level to 5,900 feet.

Figure 3 on p. 29 of the 2023 USNPS report displays "Staging and Release Areas", with a distance scale of 10 miles. To take one example of a Staging and Release Area, Letter "G" represents a "Potential Staging Area" on the southeastern boundary of the Western Pasayten Release Area, both of which are approximately less than 30 air miles from the settlement of Mazama, Washington.

It's gratifying to learn that released bears will at least initially be radio collared and therefore closely monitored. That said, bears are not cattle and will often go where they please, even if they seek to avoid interaction with human beings, much as the report accurately states.

My question is: How are negative interactions between grizzlies and resident as well as transient humans to be minimized, given what is well known about the feeding ranges of the grizzly ? "A fed bear is a dead bear" is a maxim for a reason with a long, sad record. This respondent generally favors the restoration of the grizzly to the North Cascades as well as other regions, but the well-documented habits of the bears needs to be communicated in a forthright way to avoid any potential misunderstanding of the risks involved.

The question of bear predation on cattle and other livestock is a separate matter. The administrative status of much (but not all) of the North Cascades ecosystem should minimize if not reduce lethal encounters with human-introduced livestock.

Correspondence: Lots of thought, technical expertise, and work went into this EIS, something the contributors should be proud of. I am in favor of Alternative C, informed in part by my own personal experiences with grizzly bears when I lived in Alaska for 11 years in the 1970s and 80s (and before that in Montana). There, I saw grizzlies from a distance in the Actic Wildlife Refuge, and later along the North Fork of the Koyukuk River, and up close (exceedingly so) on the Noatak River. On the Noatak, I had one very threatening encounter with a female grizzly, the memory of which initially gave me pause when I saw the proposal to introduce grizzlies to the North Cascades. However, having now read much of the EIS, and considering the wider ecological benefits on so many levels, I favor the introduction and management of grizzlies in the careful manner detailed in the third Alternative C of the EIS.

Correspondence: Once again, this proposal to reverse natural history is being promoted by who knows who? Wolves expanded into the United States from Canada by natural means; grizzly bears presumably could do the same. The strongest objective to this proposal is that it will inevitably result in bear human contacts that likely will prove fatal, to the bear, if not to the human. The North Cascades ecosystem does not appear to be deteriorating in any important way without the presence of grizzly bears, nor does there appear to be any strong support for the proposal from people who live in or adjacent to the areas that may be affected. In short, it's a bad idea that has been floated many times but never has gained the support necessary to push it through despite widespread opposition. The North Cascades are of great value; do not diminish that value by doing something that will almost certainly affect in a negative way hikers, backpackers, packers, etc. who currently make wide use of the area, and contribute to the economy of adjacent towns.

Correspondence: I went to school for 5 years in WA State (both WSU and SPU) and continued to live there for 10 more years til I moved to Colorado for family.

I was often gone on the weekends exploring the backcountry.

In the 70's and 80's that wasn't as popular, (especially for a female).....so I loved it all the more for the solitude and wild.

I did a fair amount of hiking/backpacking and cross country skiing in the N Cascades.

Occasionally I encountered black bears, never a grizzly, altho I knew they were there in small numbers.

I worked on a NPS Mountain Lion Predation-Rate project summer of 1991 in Yellowstone and hiked the backcountry, occasionally every most of the wild including grizzlies from afar. That was before wolves were reintroduced, but I loved being in a mostly intact eco-system all summer, hardly every seeing people (once you got off the main roads).

Now is the time to reintroduce the grizzly into the N Cascades.

In terms of human interaction, now is the time as the human population increases in the NW, and the backcountry gets busier w/people.

Let's get used to being 100% grizzly-smart in the N Cascades Ecosystem before it becomes like Estes Park/RMNP where the space was too diminished for wolf reintroductio (per the people who were afraid to reintroduce wolves as a way to keep the elk population/RMNP more balanced).

I realize RMNP at 415 sq miles is considerably smaller than the N Cascades Ecosystem, but in Natural Resources we are often 'wishing' we could've acted earlier to preserve/expand ecosystems.

Thank you to everyone who is working towards this reintroduction!

Correspondence: Please do not allow such a ridiculous thought of action on introducing grizzlies into the cascades. This seems like a poorly thought out action. Based on my experience being in the cascades, there are a lot of hikers/backpackers that are not aware of what can happen with a grizzly encounter. I fear that a lot of innocent people, including kids, can be in danger more so if this were to happen. I personally do not see a reason that this is necessary and even considered an acceptable thing to do in this beautiful state we live in.

Thanks for your time.

Correspondence: I am in favor of option A - no action to reintroduce Grizzly Bears in the North Cascades. I believe the human-grizzly interactions would be too frequent and too dangerous. Grizzlies can cover a large territory, so importing them into the wilderness area is no assurance that they will not migrate into more populated areas. Indeed the easy food sources available in populated areas will serve as an attractant. I understand that you plan to educate the population on ways to mitigate interactions, but the human population is not demonstrating that existing education programs are working well with respect to black bears. Just come by on garbage day and see for yourself.

The NCE continues to be a popular area for back country hikers and tourists, who will be unlikely to enjoy an up-close and personal interaction with a grizzly in their natural environment. Grizzlies will also present a risk for individuals working in the NCE.

Grizzlies have the potential for significant predation of endangered salmonids, species with much more advantageous economic and ecological benefits. The comment that fish are not expected to be a primary food source for the grizzlies seems

to be wishful thinking. At a minimum, expected preparation of ESA listed salmonids must be addressed and quantified in the impact statement

As a taxpayer in Washington, I am uncomfortable that this plan anticipates WDFW would be responsible for managing the population once reintroduced. I am also feel that WDFW establishing a target population goal appears to be beyond their legal capacity to do so.

Correspondence: Having skimmed this comprehensive report, I am writing to express my general support for working to recover grizzly bear populations to the NCE recovery zone. It is my belief, as a wildlife biologist, that the habitat where this species once roamed will benefit from having their ecological effects back on the landscape. While some may express concerns over potential conflicts, with so few remaining in the lower 48, these *potential* effects should not be the limiting factor for why a native species should not exist in its native habitat. Additionally, any potential effects are minimal in light of the human-caused alterations already affecting these areas. Thank you for the time spent compiling this information and for consideration of my comment. I do not have a preference for the options for recovery and leave that in the capable hands of the scientific experts.

Correspondence: It makes total sense to be reintroduced grizzly bears into the Eastern most Western Washington Mountain Ranges. Whatcom County should just the start, and they should eventually be reintroduced to all of the Eastern Mountain Ranges in Western Washington.

They are the apex predator that is lacking thus allowing deer and elk populations to continually rise to critical levels where many start starving to death in the winter time because of lack of food for overpopulated herds.

If they are properly reintroduced with a wide ranging plan to keep hikers and remote homes and people safe, I see no reason whatsoever not to move forward with this proposal.

Thank You and Thank You for Allowing all Washingtonians a chance to comment on this proposal...

Correspondence: I think the idea of introducing an apex predator into an area where they do not currently live is a terrible idea.
The population of Washington State continues to grow, but there has been no significant increase in public / park lands. Personally, I have noticed a dramatic increase in the volume of coyotes, moose, and deer over the last three years. It seems likely that as the population has crept into the habitat of these animals, they are getting pushed more into populated areas. Locally, this may also be a result of a wolf pack.
I spend as many as four or five days a week in the local woods here and have also noticed a significant increase in the number of people I encounter.
As the country's population swells, more and more people will visit the woods. Introducing grizzly bears is not a safe decision. The ecosystem has been doing just fine without them, and I question the true motive of anyone who wants grizzly bears reintroduced here.

Correspondence: I oppose the reintroduction of Grizzly bears to the North Cascades via transplanting them. The greater North Cascades has been a grizzly bear recovery zone since the 90's and has had natural grizzly bear migration and visual sightings of their presence since then. So with that being said they are roaming the north cascades and there is no need to reintroduce them since they are here already. They may not be in the numbers advocates want but that really is not their choice as to how many the area can hold comfortably. I do not think we want the foothills of the cascades ending up like the Eastern front of the Rocky Mountain plains areas of Montana where Grizzlies are roaming in towns and neighborhoods threatening a higher population density of the cascade range. Let them reintroduce themselves at their pace not ours!!! If they want to be here so bad they will come on their own there's nothing stopping them!

Correspondence: What a bad idea. This will be a disaster for humans, livestock, other wild species, but most of all for the grizzlies.

Being a long time resident of Washington, and spent time in Alaska and Montana, it's obvious that this won't work in a densely populated area like ours.

Inevitably, a grizzly will kill livestock, a pet dog, or a hiker. Then the bear will have to be tracked down and killed. It's not fair to set them up for failure.

Correspondence: Thank you for soliciting comment on this! I do not think our state should be investing time and money in re-establishing grizzlies in Washington state. We are geographically close to grizzly populations in both British Columbia and Idaho, and if there were a reason for them to migrate back to the north central cascades they would have already. The reality is that North America needs conservation policies, and the idea that we can "re-wild" Washington and make things the way they were is extremely unrealistic and costly. There's far too much for this state to work on already managing existing habitat and ecosystems, some of which are super important (like migratory waterfowl in the pacific flyway, salmon estuaries and more).

Thank you again for opening comment on this and I hope you'll take the passionate voices of those most invested in the long term conservation and health of Washington state's existing wildlife to heart.

Correspondence: First off the introduction of grizzly bears was shot down a few months ago. Second the introduction of them in the north cascades will cause more issues with our deer herds and elk herds which we already have decreasing numbers. We have a increasing predator population. Why would we want to increase that by introducing grizzlies? We have more and more bear and cougar incidents every year. We would just have more and more severe incidents with domestic animals and hikers in this region.

Correspondence: Introducing grizzly bears back into the north cascade would be a terrible mistake if done. Washington state has a hard enough time managing the predators that it already has / has introduced. The commission is in no shape to have that kind of responsibility when they can't even trust the biologist it employs. This would be a huge impact on deer and other wildlife in the area as well as a decline in tourism. Predator/ human conflict have become the norm in Washington and adding a new apex predator would only further this with mortality.

Correspondence: Reintroducing grizzly bears to North Cascade National Park promotes ecological justice by restoring a keystone predator to its native habitat, aiding in maintaining a balanced ecosystem. Grizzlies play a crucial role in regulating

prey populations and vegetation, fostering a healthier environment and promoting biodiversity. This reintroduction aligns with principles of fairness and equity, giving a species a chance to thrive in its natural setting after being displaced. By advocating for the reintroduction of grizzly bears to North Cascade National Park, I aim to align with several Native American tribes that support this initiative. Many indigenous communities, such as the Upper Skagit and Sauk-Suiattle Tribes, have voiced their connection to grizzly bears and the importance of their presence in the ecosystem. Aligning with the goals and vision of these tribes seems like a scientific-best-practice as the tribes have lived here since time immemorial and thus have vast scientific and ecological knowledge. As a life-long Washingtonian and back-packer, I prefer to live and recreate in well-managed, biologically diverse environments.

Correspondence: To hell with that why would we want to bring such a giant majestic killer to our woods. Sure let's take away guns and bring back bears. This makes no sense what are you gonna feed them after all of the salmon rehabilitating streams and bring an animal that could eat hundreds of pounds of fish daily. This sounds like a retarded plan to waste more

money and add more danger to an already dangerous world in the northwest I would sure just like to know why you would want this

Correspondence: Please do not restore bears to the North Cascades. I have love and respect for bears and understand that they once roamed these mountains. However, the restoration would be dangerous to humans and would decimate the ungulate population. I hunt, hike and camp in the north cascades and I do not wish to do so with predators of this magnitude.

Correspondence: To whom this may concern,

Introducing grizzly bears into the northern cascades is a terrible idea. Washington state has booming number of bears. Unfortunately many people don't realize bears need to be managed just like any other game species. If grizzly bears are introduced into the northern cascades there will be no plan to manage these bears and they will quickly overwhelm and decimate many other species in the area. Not to mention this region is very popular for hiking and recreating and there will definitely be an increased danger to the human population. Introducing grizzlies into this area is a terrible idea that will cost people their lives and taxpayer dollars. Please do not do this.

Respectfully,

■

Correspondence: I strongly oppose the reintroduction of grizzlies into the north cascades for 2 main reasons. As an avid backcountry hunter and hiker here in washington state, we already suffer from a lack of predator management do to many governor appointed commissioners on the board of fish and wildlife that are anti-hunting and are affiliated with anti hunting groups. These commissioners have already stripped away our spring bear hunts even though our biologist say that there is a very healthy population of bears. This lack of reasoning with science based data is disturbing to say the least. Our elk and deer populations are already suffering and to introduce another apex predator will only harm them more. Grizzlies in wyoming, Montana and Idaho have reached there recovery numbers many years ago but still there is no management in place for them unless they are a problem bear that has had problems with human interaction.

My worry is that these bears will reach there recovery number or quota and when it is time to start to managing there numbers anti-hunting groups will petition and shut it down just like they have done with wolf management in idaho, montana and in washington. These groups don't spend time in the country these animals live in and have not had interaction with them because I guarantee if a grizzly was wondering around in there neighborhood were there kids play they would demand that grizzly be killed.

Here in washington we have 3 apex predator species and the means of managing them have been largely stripped away so until we get a handle on our predators that we currently have the introduction of another predator needs to be postponed. Thank you for your time

Correspondence: Hello,

As a resident of WA state and conservationist, I am writing in support of Grizzly Bear reintroduction into the N. Cascades, with a preference for Alternative C. As the reason grizzlies are missing from this ecosystem, it is up to us to restore them to their home range where they can provide vital ecosystem, cultural, and spiritual services. There are multiple examples of positive grizzly-human co-existence; let's add WA to that list!

Thank you to the many advocates who have been working on grizzly recovery in WA for the past few decades. You are incredible!

Correspondence: We do not need grizzlies brought into this state. We are already over ran with to many predators. Wdfw has bad policy on managing the predators we have already and our ungulate populations are at a crazy decline because we have to many predators. Also the hikers in this state are hiking around with headphones in and not paying attention. If there is grizzlies around there will be hikers getting attacked. And anyone that wanted to introduce the bears will have to live with the fact that they had a part in some one dying from the bear attacks that will occur.

Correspondence: Not in favor. We do not have the public safety, emergency response, or healthcare infrastructure and expertise in place to deal with the consequences of bear human interactions that are present somewhere with a grizzly population such as Alaska. Releasing a small and isolated population such as this also does not set the species up for success in terms of recovery and survival, while it is very likely to engender additional closures, cautions, loss of valuable opportunities for outdoor recreation in an already limited and competitive environment. If we are going to commit to reintroducing the bears, then we should truly come at it with all the changes, cost, and responsibilities that would entail. An object example of our lack of preparation is the fact that the bears ' main food source, salmon, have had massive population collapse in the areas we are looking at populating. One would think it would be logical to ensure recovery of the primary food source, before setting a population up for failure by locating them in an area where that has not been accomplished, and in fact there is evidence that the decline is ongoing with no arrest of the population free fall. Please complete step one before starting with step 258!

Correspondence: Thank you for asking for comments on the possibility of introducing grizzly bears to the North Cascades. Over the course of my life, I've lived not only in Washington for two decades, but also in Alaska for two decades, along with continued trips around the wilderness of Alaska (and Washington).

I am a lover of wilderness and things that are wild, and understand what is required for the health of ecosystems. I'm also intimately acquainted with fatal interactions between wildlife and humans. It is unclear why there is an interest in reintroducing a markedly dangerous animal into an area which is visited in greater numbers every year by humans, many of whom come from the city (and many of those from other cultures) with little or no experience or understanding of bears.

In articles about the health of ecosystem, there is no indicator that the ecosystem has suffered as a result of no longer having the grizzly present in Washington. Washington has many other apex predators which accomplish the requirements needed for a healthy ecosystem. At the same time, we have noticeably higher number of people taking advantage of public lands and wilderness areas, a positive trend toward an awareness and appreciation that will help us to continue to protect those lands.

Anybody who has lived in grizzly country, especially who spends time outdoors, knows the dangers. Montana gives an excellent case study of a place more heavily visited than Alaska, and has a litany of terrible stories to share-- which are managed only by those working in the public lands who are well trained in managing these animals. Rangers learn to discourage bears through active involvement. We now have public lands which are understaffed, and in the North Cascades harder to access, and we are unprepared for this kind of responsibility.

Why are we considering this reintroduction, putting humans at risk? The ecosystem does not need it. We are not prepared to handle it. It seems likely only that well meaning wilderness lovers are harkening back to earlier times preceding human caused extinctions-- I understand that, of course. But we are to in those days. And more people not only may but will be hurt in interactions in the wild- and discouraged from being IN the wild.

As a lover of the wilderness and wild things, I strongly oppose this reintroduction.

Correspondence: I am a partner in a business and permit holder, Elevated Backcountry, that operates in the Mt. Baker National Forest. We teach mountain skills including avalanche safety, mountain navigation, first aid and riding skills. Our students are members of the motorized winter recreation population.

While this population is relatively small in comparison to non-motorized winter recreationalists, it is a sizable contributor to the winter recreation economy. In 2023, there were 22,929 registered snowmobiles in the state of Washington. We have built our business to serve our community through courses designed to maximize the learning outcomes for students and take advantage of the spectacular and unique venues available to our program in the Mt. Baker area.

I am generally in support of the idea behind this proposal, in that the grizzly bear enjoyed freedom to roam the North Cascades historically, and if possible, should enjoy this again. There are elements in this plan that give me pause.

My primary concern and main point of this comment is to state my opposition to all aspects of this program that have the potential to impact and reduce the size and scope of our existing operating zones, specifically established SnoParks and riding areas in locations adjacent to the North Cascades wilderness areas. This includes provisions in the proposal that are associated with the Endangered Species Act and other rules that may affect permitted businesses and operational options.

Our business, reputation and core course components are built around the terrain accessed in the Canyon Creek, Glacier Creek, Anderson-Watson and Mt. Baker NRA designated riding areas. We oppose any policy changes that could result in reduction in these historically granted riding areas.

I sincerely thank the Forest Service for approaching this plan with the goal of seeking public input. I respectfully submit my comments.

Correspondence: Grizzlies and black bears are different species, and each species has a unique role to play in nature. We need to maintain as much biodiversity as possible in wild places like the North Cascades in order to keep them resilient, especially given threats from climate change.
Although grizzlies are often thought to be voracious predators, most of their omnivorous diet consists of insects, sedges and leafy vegetation, plant roots, and berries, whose seeds are distributed through their droppings. A large portion of the meat that is consumed by grizzlies comprises ground squirrels and other small mammals, and carrion killed by other predators, such as wolves, or harsh winters. Grizzly bears are prolific diggers in their search for roots and burrowing small mammals, thereby aerating the soil and maintaining vibrant meadows.
Culturally and spiritually, grizzly bears are important to many of the Indigenous peoples in the Pacific Northwest, who have coexisted with grizzlies for thousands of years. We are grateful for the knowledge and deep respect these peoples hold on behalf of grizzly bears, who are often seen as teachers, guides, and symbols of strength and wisdom.
Last, we have a moral obligation to restore grizzlies as a wilderness icon and a key part of our natural heritage.

Correspondence: I am in support of restoring a grizzly bear population to the North Cascades. I do not believe that humans should restrict or relocate native species (plants and animals) for selfish reasons. These reasons might include housing, ranching, or recreation areas.

Experts believe that as much as 30 percent of the world's plants and animals could be on a path to extinction within 100 years because of humans. Grizzly bears are currently classified as "threatened" because of human activity. Oil and gas development, recreational development, improper livestock grazing, road expansion, and poorly designed timber harvest all contribute to the human "take over" of grizzly bear habitat.

Please work to restore nature's intended balance of native species by restoring the grizzly bear population to the North Cascades.

Correspondence: As residents of the North Cascades we have seen the impact of the wolf " reintroduction " as an apex predator. The deer , elk and moose populations are suffering. Not to mention the impact on the livestock communities. It is beyond comprehension that someone, most likely living in the city, would want to introduce another predator to the environment! Especially when you are speaking about "problem" bears. If I am hearing this accurately, the "problem " bears would be relocated in the areas surrounding the people (yes,people live here) and they would no longer be a problem. It is ignorant to believe the bears behaviors would change with a relocation. In that instance they would be our problem. Please do your homework and stop making bad decisions that make you feel good about yourself! Consider the others that will be impacted. Both human and wildlife. If there are 3 options , as you have stated, I vote for doing nothing . Let nature do what nature does.

Correspondence: Grizzly Bear introduction into Whatcom county is detrimental to our families, wildlife, and livestock. Grizzlies affect our economic baseline--skiing, mountain biking, ranching. You can only kill a bear, if it kills your livestock first?

In the Maple Falls/Glacier area, we have enough issues with black bears on biking trails, being in people's yards and reported being on back porch.

These communities are trying to positively grow and become a safe haven for families to thrive.

Our area has ENOUGH issues with Ranch Quarry, abundance of pedofiles (7 within 2 miles of my home) and drugs.

We need to solve the social issues before adding grizzlies to the mix.

Correspondence: Humans were responsible for removing grizzlies from the North Cascades and it's our responsibility to bring them back home, and if we don't take action now, we risk losing grizzly bears from the North Cascades forever. I'm a person who cares about wildlife, and I want my future children to experience grizzly bears as an important part of our regional culture. As a conservationist, I know grizzly bears provide important ecological services, like distributing seeds and aerating alpine meadows as well as mitigating overpopulation of various species. Finally, as an avid hiker who values the wildness of the North Cascades. I want grizzly bears to be a part of that wildness again. There is plenty of space for both of us. Proper planning will lead to minimized impacts for everyone involved, and I believe Option C to be our best option. Thank you for your time!

Correspondence: I absolutely do not suppose the introduction of Grizzly Bears to Washington State. Just three days ago WDFW along with Stevens County Sheriff with assistance from the USDFW captured a Grizzly from the Onion creek area approx 10 miles north of Colville Wa. The bear was raiding a homes chicken coops and killed birds. Non lethal methods were tried to no avail. The bear was trapped and relocated.
The bears are already here! No more predators of ANY kind. I've had wolf interactions on my property, cougars and coyotes roam my area along with black bears. The Colville confederate tribes have reintroduced Lynx to Ferry county over the last several years (50)
NO MORE PREDATORS!
My family and pets along with many of my close friends deserve safety and as much as I love our animals
NO MORE PREDATORS!

Correspondence: Our family wholly supports restoration of the grizzly bear population in the North Cascades. It's beyond time to eliminate cattle herds from public land, despite the long tradition of ranching in the West, and economic considerations benefiting humans should be the lowest priority when protection of the environment and wildlife is at stake. The restoration of the wolf population in Yellowstone is a prime example of the benefits of returning apex predators to an ecosystem, and likewise we are greatly heartened by the increase of wolverines and fishers in their natural habitats. Nature first!

Correspondence: First, I am a retired Fish and Wildlife Biologist, GS12, step 10, with over 20 years working with listed species. I was Chief of the Recovery and Habitat Conservation Branch at the NCW USFWS Office in Wenatchee for about 6 years. I also have an MS in Biology, emphasizing Animal Behavior, and an MS Thesis on black bear behavior. I personally have encountered over 2 dozen wild grizzlies and never had a problem. The one "charge"; I have experienced was a male black bear during the term of my thesis study and was a "bluff charge"; by a bear that had previously been antagonized by a junior researcher.

The North Cascades area is sparsely inhabited and visited only by a few backpackers each year. Human-bear interactions will certainly be uncommon and, providing avoidance measures are adhered to, easily avoided.

. Numerous studies have shown the beneficial effects of apex predator re-introduction, by species as diverse as dingoes (Moseby, K.E., Crowther, M.S. & Letnic, M. Ecological Role of an Apex Predator Revealed by a Reintroduction Experiment and Bayesian Statistics. *Ecosystems* 22, 283-295 (2019). <https://doi.org/10.1007/s10021-018-0269-6>); wolves (Wolf reintroduction, predation risk, and cottonwood recovery in Yellowstone National Park Author links open overlay panel) William J. Ripple a, Robert L. Beschta)& Biomass Flow and Scavengers Use of Carcasses after Re-Colonization of an Apex Predator

Camilla Wikenros ,Håkan Sand,Per Ahlqvist,Olof Liberg, Published: October 23, 2013,

<https://doi.org/10.1371/journal.pone.0077373>. A brief search on Google Scholar will quickly provide many more references and sources.

The National Agricultural Statistics Service (NASS) data show that bears were less likely to predate upon livestock than

domestic dogs (<https://downloads.usda.library.cornell.edu/usda-esmis/files/5712m654p/2v23vw87z/j96023321/CattPredLo-05-04-2001.pdf>)

Grizzly bear attacks on humans are statistically rare (Bombieri, G., Naves, J., Penteriani, V. et al. Brown bear attacks on humans: a worldwide perspective. *Sci Rep* 9, 8573 (2019). <https://doi.org/10.1038/s41598-019-44341-w>).

Therefore, I request you do due diligence and avoid being categorized as arbitrary and capricious, and make a decision based on the newest and best data and re-introduce grizzly bears into the north Cascades ecosystem.

Thank you!

Correspondence: Dear National Park Service:

I have read and considered the introduction to the proposal to return grizzly bears to Washington State. I quote from Page vii:

"Restoration actions that result in an increased grizzly bear population could also affect recreational opportunities for visitors who do not wish to encounter grizzly bears."

The wording should be changed from "could" to "will" - if we have grizzly bears re-introduced to Washington, it is inevitable that they will come in contact with humans.

The first dead hiker will make nasty headlines/Facebook/Tweets/etc.

I do not want grizzlies re-introduced to Washington State.

Correspondence: Thank you for the opportunity to comment on the draft plan. I have serious reservations about all three options.

First of all, the concept that we will be restoring the original ecosystem has a serious flaw in it. The original ecosystem did not include a large and developing human presence.

Second, I was quite troubled with the introduction of wolves in the Rockies a few years back. That issue was that the species which was introduced was not the original species, but the large and more aggressive Canadian Timberwolf. The results have not been encouraging and the states now have to hire hunters to control the population.

Third, despite its other challenges, the ecosystem is doing pretty well without the grizzlies. Clearly, they are not a keystone predator as described in the Serengeti Principal. I do not see any pressing need to restore the grizzlies any further than where they have spread at present. The danger of dangerous human encounters, livestock predation and further reduction of the challenged deer and elk herds would argue against introducing more grizzlies.

Sincerely,

Correspondence: Truly personally I believe this idea is very detrimental in many ways

As the impact of grizzly bears in our surrounding areas will also have so many repercussions in tremendous lways. First of all a bit of about who I am. My Grandfather was [REDACTED] and in his year's as a lifetime resident of Darrington he was known as a legendary bear/cougar hunter back prior when hound hunting was permitted... When I was growing up as a youth I sat a listened with open ears of the many amazing situations he undertook while performing the tasks he encountered... Also he was asked for help constantly in helping with nuisance animals that were causing problems locally... The exiting tales he told would have my attention over & over as I was to young to participate and before I could have been of age to participate unfortunately his health declined and all I could do was sit & listen to him tell & repeat his stories over & over again but word for word they never changed a bit... In my opinion from my knowledge & understanding grizzly bears in our surrounding areas would not be beneficial in any way but down right very possibly harmful & ultimately could be very,very dangerous in many ways!! This is my opinion on how. First off when I grew up in Darrington as a youth I spent countless day's in the woods picking cones & mushrooms from daylight to dark! Also yes I know time's have changed but we also spent day's finishing & hunting or hiking in groups of us teens exploring every surrounding highland lake we could find... With grizzlies being returned im sure that the youths now will not be able to have the same experiences we had... Back then we were allowed to fortunately have the ability of protecting our selves but time's unfortunately have changed... No more hunting rifles on our truck's gun racks at school these day's because time's have changed.. Bears don't stay put & will travel many miles in finding their needs! Please for the sake of safety,impact & research how bearspray isn't working as well at all... Thanks!

Correspondence: I think this plan is beyond dumb!

Grizzlies have NEVER had a significant presence in Whatcom County. I've live here for 64-years and hiked these hills since I was a kid, and I have NEVER met anyone who encountered a grizzly. I've encountered black bears when I was young, but never a grizzly in this county. Likewise with all other hikers I met and all the old-timers, much older than me that I've known. Not a single one ever saw a grizzly in Whatcom County!

You say this is because of overhunting in 90s. I call nonsense on that as total disinformation. My period of highest hiking activity was in the seventies and eighties. Never a grizzly did I meet. My dad who worked in the forest service back in the fifties also NEVER saw a grizzly in Whatcom County his entire life! He was born in Washington in 1914 and worked most of his life in the woods for the CCC, the forest service, and as a logger. Neither did my uncle who worked in fire watchtowers in the forties ever see a grizzly in Whatcom County. They all saw plenty of black bear, never a grizzly. So, it has nothing to do with hunting in the 90s. All that did was diminish a few grizzlies that you likely WRONGLY transplanted here based on your belief in your superior college education about grizzlies, and they mostly probably died due to killing each other because you didn't know what you were doing.

I am willing to bet that, other than transplanted grizzlies or the occasional stray from the Canadian Rockies, there have never been grizzlies here. The strays come and go and never choose to stay long. Do you even have a single skeleton that is a hundred years old of a grizzly found in Whatcom County? I am willing to bet no such skeleton exists because grizzlies have always been that rare around here. You may have heard tales from old Indians about them, but they are nothing other than tales, no more reliable than any other tales, if you've heard them at all. I haven't, and I work for the Lummi tribe.

What I love about Whatcom county is that you can hike in the woods without packing a 45 because you never have to fear encountering a mad grizzly. I have, as I said, encountered black bears, and they have never caused me trouble -- not even a mama black bear when I wound up between her and her cub. I backed off, and she called to her cub to come down out of the snag it had run up, and just continued on her way, foraging the berries around me.

We have a shortage of salmon, and your answer is to bring in more salmon eaters? We have no problems due to a lack of this top predator. Deer and elk herds are well managed, and if they did overpopulate, that problem could easily be solved through human hunting. I don't hunt, but it is one of the most natural and longstanding human activities in the world that is true to our basic nature as evolutionists claim that hunting is exactly why we developed superior brains to other apes and an upright stance. We were supposedly the ape that developed a taste for meat, but lacking tooth and claw, we had be be more clever to get it by using tools. So, manage wildlife that way if herds do overpopulated. Keep Whatcom County safe by keeping grizzlies that have never been significant here out.

Correspondence: I'm for introducing a grizzly bear population into the North Cascades with a protected status under the ESA. Ranching and hunting interests in Central and Eastern Washington disproportionately promote the ills of apex predators in Washington ecosystems. Onerous is placed on bears and wolves for even the perception of harm to livestock and deer populations without any consideration for the health of the native ecosystems. As the North Cascades are one of the lesser visited natural areas in the continental United States, they make an excellent home for such large animals. As a Washingtonian and frequent NCNP user I fully support their reintroduction.

Correspondence: As usual with an agency or agencies filled with biologists, the analysis is very complete when it comes to effects on animal species and the ecosystem and short on the analysis and impacts on humans, culture and economics. In fact says that with the introduction of the bears will be favorable to those who like the idea of grizzlies in the wild. I think very few people wish to interact with grizzlies in any sort of uncontrolled outdoor experience, maybe if it is a long distance sighting. Because the possibility of encounters exists, however small, the same regulations, restrictions, and bear resistant containers will be required as if there were many. How has the introduction and repopulation of grizzlies in heavily used recreation areas changed with the increasing number of bears? Even if grizzlies are released in the remote portions of the park, where will they likely expand to as their numbers increase, what is their range, have you modeled that, what has happened in other areas? At what point in the population increase does human encounters become more likely and where? Does the carrying capacity and 200 bear goal consider increasing human activity, development pressures, economic changes, and climate change? The map shows wide expanded of area which are actually dissected by roads, trails, recreation and other facilities and concentrated areas of human use, are there potential conflict areas? It will do no good if the bears are reintroduced and there are more adverse human interactions requiring more regulation. What are the mechanisms for potential changes to the plan if things don't go as planned for whatever reason. Certainly more flexibility with the use of experimental populations is a good one in your preferred alternative. A more thorough analysis of human and social factors is needed.

Correspondence: I want to acknowledge that I'm not a biologist, and I don't have the training to speak to the details of this issue. What I do have is my perspective to share.

My husband and I have lived in Whatcom County for 20 years. We spend a substantial amount of time recreating out of doors and this is one of the reasons we moved to this area. In the summer we backpack almost every weekend when weather and smoke allows and longer trips when possible. I have mixed feelings about the plan to re-introduce grizzlies to the area.

Over the years, our hiking experiences have been negatively impacted by the effects of climate change and overuse of the trails. Climate change has limited the time we can spend in the mountains, shifted where we go, and generally burdened the experience mostly due to wildfire activity and smoke. The overuse of trails combined with technology has forced us deeper into the mountains in order to find and experience of wilderness. The reintroduction of grizzlies would be another element complicating the mountain experience for those of us regularly recreating in the North Cascades.

We see black bears every year during our time in the mountains. We have never had a problematic encounter, and we don't carry gun or spray. I feel that hiking with grizzlies would be a very different experience, and I wouldn't feel comfortable doing many of the trips we do now.

I very much see humans as part of the ecosystem and on a rudimentary level, understand the importance of a healthy ecosystem. The role of grizzlies in a healthy ecosystem is less clear to me. There are already problems with human and wildlife encounters due to habituated bears usually caused by irresponsible human behavior. I feel that adding the grizzlies to an environment where more and more people are frequenting will only add to the risk for problem encounters which then puts the same bears we are trying to help at risk. I would support a plan that protects the grizzly populations that currently exist without reintroducing to new areas.

Correspondence: To quote Joe Scott, International Programs Director for Conservation Northwest, "The grizzly bear is still the consummate North American wildlife icon. The grizzly has immeasurable ecological and cultural value for our ecosystems and communities. We have a unique opportunity and obligation in the PNW to co-author a significant conservation success story - to restore the grizzly to a small but important part of its traditional home."

The North Cascades is one of North America's premier intact ecosystems, but it is incomplete without grizzly bears.

This is the second attempt by the agencies to restore grizzlies to the NCE after a 2015 process was halted by the Trump administration in 2020. At the time, more than 159,000 members of the public wrote comments supporting the reintroduction of grizzlies.

"The time has come for the grizzly bear to return to its habitat to take its place in the indigenous ecosystem," said Scott Schuyler, policy representative for the Upper Skagit Tribe, whose territory lies within the recovery zone. "The Upper Skagit successfully coexisted with grizzly bears for thousands of years, and we should once more."

The two gentlemen I have quoted above have said this better than I can. I could not be any more eloquent on this subject.

Correspondence: Thank you for the opportunity to comment. I have hiked, backpacked and climbed in the North Cascades National park, Mt. Baker and Snoqualmie forests, Cascades, Rockies and many remote areas in British Columbia and Alberta.

I support option C of the grizzly bear restoration plan. For far too long humans have encroached on the habitat needed for a healthy ecosystem. We shot, trapped and eliminated animals based on economic needs, sport or fear. It is time we restore the populations of large apex predators like grizzly bears. I also support financial restitution to ranchers, orchard owners and farmers if there is loss or damage from a grizzly bear. This may help garner support from these groups that have historically been against grizzly bear restoration.

As a hiker, climber and backpacker I have encountered bears over the years and have not had a negative experience. I used to hang food and now use a bear proof food container. I support the forest service installing bear boxes in popular back country camp sites to reduce human / bear contact. It's also my belief that many in the back country use poor judgement and lack basic knowledge to reduce bears becoming used to humans.

Thanks and all the best.

Correspondence: The Eastside has a pretty significant problem with brown bear in the area. Additionally the Seattle Metropolitan growth plan calls out the fact that the region will expect tremendous growth by 2050 and beyond. While I am not opposed to the reintroduction of the grizzly to their ancient lands, you should consider the fact that the area is poised to receive record migration and growth in the coming years and the instances of human and wildlife interactions are only going to increase. If we are going to reintroduce an apex predator we should appropriately fund the agencies involved to ensure that human and wildlife interactions are properly managed

Grizzly bear attack in Canada's Banff National Park leaves two dead. I can think of 2 reasons today why it would be a real bad idea to put these grizzly bears in OUR parks and forests. In the above headline replace the word two with your spouse, children, or siblings and you should get a clue as how asinine this proposal is. I think it would be better to explore why you have funds to pursue such foolishness.

Correspondence: To Whom this comment may reach,

I and my partner are avid backpackers and spent as much time as possible in the back country both in Washington Oregon Montana and Idaho. We travel all over the west to backpack in the back country away from the beaten path . We have hiked in Yellowstone and have seen many Grizzly and encounters a few close up . we are aware of the impact of reintroducing a pro Mary predator back into an eco system, as was done with Wolves, Its usually a positive Impact on the eco system and and does freak out the average hiker somewhat. I am in favor of this reintroduction as is my partner and I understand that ranching folks will put up a huge bus. My hope is that if the ranchers are compensated for the long term effects of a loss of a stock animal they will be satisfied. They are a difficult bunch so good li luck with that part of the equation. You have two YES votes come us in seattle its about time the bears get back to roaming the natural territory they once had !

Correspondence: I definitely think grizzlies should be brought back to their lands. All animals should be allowed to return/roam their natural ranges.
Humans have been taking over the wilderness for decades. The majority of people not giving a second thought to where will the wildlife go now that we (humans) have taken their homes, their food and the secure places in the wilderness they chose to live and raise their children.
If people where in the animals situation they would retaliate. Unfortunately when animals retaliate, humans kill them.
Look at what the world has come to already. It will not get better unless people do the right, responsible thing for all animals.

Correspondence: Until recently I lived in Washington for many years. I felt compelled to voice my concerns about the potential reintroduction of grizzly bears in Washington. It's undeniable that grizzlies are already making their way into the state from neighboring regions. The absence of physical barriers means they can migrate naturally. Given the state's challenges in managing its existing wildlife, introducing another apex predator seems counterproductive. Now living in Montana - and seeing the alarming number of grizzly bear conflicts (many of which are leaving people in critical conditions or causing death) - introducing grizzly bears into Washington, with it's considerably higher population and the density of hikers in any given area at a time, does not read as conducive to public safety.

Correspondence: I am against reintroducing Grizzlies to eastern Whatcom County. The reasons are twofold. One is because the conditions that resulted in their extinction here in the first place are still present and more so, which can only result in an an adverse environment for them to survive in. And two, human populations are closer to their territories than ever. As a result, eastern Whatcom Co. has more recreational visitors than ever. There WILL be dangerous confrontation and human or livestock killings that will put these poor animals directly in someone's crosshairs, either a poacher and their dogs, a DFW agent, or some other nightmare death. Introduce them why? So they can breed beyond their available territory until they're forced into human territory and hunted and shot dead? Over and over? This will be as the wolves in the lower 48 are, mercilessly hunted and terrorized and disrupted in their ability to live a normal Bear life. What do you think the lifespan of a grizzly would be around north Cascades? My guess is 2-4 years of constant fear. Please DON'T BRING THEM HERE. Life would be hell for them, Please.

Correspondence: The Plan document and Impact Statement was very informative and well written. My overall thoughts are that potential negative impacts of reintroducing grizzly bears into the NCE outweigh the potential good. In particular:

-Grizzlies are a highly political point of concern. My basic understanding is that Washington's Dept of Game already have troubles balancing the resource, public perception, and the opportunity from a hunting perspective. While the hunting prospects are nowhere near consideration, I think adding grizzlies to the mix would further complicate the already controversial issue.

-Are prey species strong enough to sustain a potential reintroduction. My understanding is that there is a healthy representation of predators on the landscape already.

-Potential prey, human, and livestock conflict largely outweigh the good of reintroducing grizzlies.

-Money/funding. I don't believe the cost of said reintroduction plans are an effective use of dollars in Washington's current state.

In summary, I am not in favor of the reintroduction plan and think the efforts of bolstering grizzly bears should remain in the existing ecosystems outlined in the Plan.

Correspondence: Strain on Wildlife Management: The WDFW Commission has not maximized recreational opportunities for sportsmen as directed in their mandate. With recent decisions on black bear and potential changes to mountain lion hunting, many conservationists fear the commission is failing to manage its wildlife properly. Introducing more grizzlies would exacerbate this issue. To be clear, reintroduction would not mean a grizzly bear hunting season. The point here is that the state is already under strain from mismanagement of its large population of existing predators beside grizzly bear.

Correspondence: As a life long washington resident and avid outdoors person, I think reintroduction of grizzly bears in the north cascades is a terrible idea. I've spent numerous days back country in and around the north cascades and the lack of grizzly's brings joy to the area that will be permanently lost upon their reintroduction of that apex predator. Human/bear interactions will become a regular occurrence over time and attacks will become a normalcy due to managements inability to reintroduce fear of humans into these animals once they become to comfortable in and around humans, human garbage and food sources derived from human existence. Do not introduce these animals into washington state.

Correspondence: The North Cascades have always been a haven for outdoor enthusiasts like me. It's come to my attention that grizzly bears already exist in this range, as noted by the Washington Department of Fish and Wildlife. Introducing more would not only threaten the fragile mule deer population but also increase the risk for those of us who love the outdoors. I'm against any plans to reintroduce grizzlies in Washington. The recent incident in Stevens County, where a grizzly bear was captured, is a testament to the growing predator challenges in Washington. Our state is already grappling with managing wolves, cougars, black bears, and more. Considering the strain on our ungulate populations, I cannot support the idea of reintroducing grizzlies into the state.

Correspondence: I do not support reintroducing grizzly bears into the north cascades. There are far too many people recreating in the north cascades national park and pasayten wilderness area. The numbers of people continue to rise every year, and will inevitably lead to deadly grizzly bear encounters. There are just too many people - the park and pasayten are

roadless, but they are no longer truly 'wilderness' areas as the frequency and sheer volume of people recreating in the backcountry are too great for animals to behave as they did when it was untouched. Truly, it is impossible to restore these areas, especially with large apex predators - it irresponsible, to say the least, as you know for a fact it would only be a matter of time before a us citizen is killed by a reintroduced grizzly in the NCE. Look at the grizzly/human deaths and injuries in BC, Montana, and Wyoming. Once mostly uninhabited, these states are now developing at a high rate- Grizzlies and humans cannot coexist without lifes being taken. It's sad. But it's true. Those times are long past. There are just too many people in our state.

Correspondence: I have sent comments on the issue of Grizzly introduction before, and have even set up scent stations with hopes of capturing a picture of a Grizzly in the North Cascades with a team lead by Dr. Bill Gaines a few years ago. We never got a picture on the multiple game cameras which was very disappointing. I am very much for re-introducing/restoring Grizzlies to their former habitat in the North Cascades, WA. (I wouldn't mind them also being placed in former ranges in OR and CA, but that's another day.) I know a lot of folks think that Grizzly bears will make humans nervous and scared if they are hiking or backpacking, but Grizzly bears deserve to be in land that they were removed from. I agree with Native Americans that the bears are an important cog in the ecosystem and without them, the North Cascades land isn't in harmony. We can learn to live with them as happens in Montana, AK, Canada and other areas that can support the Grizzly in the wild areas.
Please restore and protect these amazing animals.

Correspondence: Throughout the growth of this nation and especially in the era of westward expansion, grave harm has been done to natural ecosystems and wildlife populations. Much of this damage is irreparable, however when an opportunity to right a long-standing wrong presents itself, it should by all means be taken. The reintroduction of grizzly bears to the North Cascades ecosystem will not restore it to its former state as that is long lost, but it will allow for a healthy renewal of this environment and this species. I speak not only as an avid lover of the natural world, but also as a trained biologist who knows that active conservation is a worthwhile endeavor. You will no doubt hear from many special interest groups who will contend that grizzlies pose a significant risk to their communities and their livelihoods. I can understand how people hold this position, but it is not one based in scientific & historical evidence nor is it based on mutual respect for wildlife and other stakeholders. It is not right to hold hostage the enhanced viability of this ecosystem and its great natural wealth for generations to come based on the ignorance of some and the monetary interests of others. The grizzly bear has a right to

inhabit the ecosystems it was extirpated from wherever possible, and we have an obligation to make that happen so that human and apex predator can coexist as we have done for many thousands of years. Thus, I implore that the Grizzly Bear Restoration Plan be fully supported and that an experimental population of grizzly bears be established in the North Cascades Region. Thank you.

Correspondence: Grizzlies once roamed where Seattle downtown is. They don't coexist easily with people, and the fact that they've been displaced from places where people live is not at all surprising.

Much of North America is completely unspoiled and freely available to grizzlies. Alaska is still 99% wild, and there are many places where grizzlies outnumber people. The northern Canadian provinces are unspoiled too, as is much of British Columbia. But WA is not as wild as these places, and it will be inevitable that predator grizzlies and people will come into conflict, and people will get killed.

A friend of mine was badly mauled by a grizzly while hiking in Yellowstone park, and was lucky to survive. A death of a hiker in the greater Yellowstone Area due to a grizzly encounter occurred just this July. I am a keen hiker myself and have spent time on the PCT in northern Washington, near Ross Lake, and in Mazama and Winthrop. I've greatly appreciated the fact that these kinds of encounters cannot happen in WA, as there are no grizzlies here.

People are precious, more than grizzlies. Grizzlies are not lacking in natural habitat in North America. That is why I oppose the artificial reintroduction of grizzlies to Washington State in the strongest possible terms.

Sincerely,

██████████

Correspondence: The American Bear Foundation, Washington chapter, strongly disapproves of introducing grizzly bear into the North Cascades. Grizzly bear are currently migrating on their own from Idaho and BC. The very popular and busy North Cascades will no doubt lead to lethal removal of grizzly and likely fatalities of hikers and hunters like we have seen in Montana, Wyoming and Idaho. Further more, just this week in Stevens county Washington, a grizzly was captured and

relocated. Lastly, Washington currently has a booming predator population and a struggling ungulate population depending on the species. Adding this apex quickly and unnaturally will only exacerbate this issue. Again, we do not support this rule. Let them migrate naturally.

██████████

Correspondence: I am in favor of either option B or C, in which grizzly bears are reintroduced to the North Cascades. Of the two, I have a weak preference for option B, since option B includes the option to remove problem bears involved in conflicts. Designating the population as experimental/non-essential does not seem needed in order to mitigate conflicts in this ecosystem.

Correspondence: I felt compelled to voice my concerns about the potential reintroduction of grizzly bears in Washington. It's undeniable that grizzlies are already making their way into the state from neighboring regions. The absence of physical barriers means they can migrate naturally. Given the state's challenges in managing its existing wildlife, introducing another apex predator seems counterproductive.

Correspondence: I do not think that a human forced grizzly bear reintroduction into Washington is a good idea for a couple reasons; the first being that grizzlies are already naturally migrating into Washington from surrounding states and provinces making this a wasteful use of taxpayer dollars that could instead be used to benefit public lands and all wildlife as opposed to just one predator species. Second I have personally spent a lot of time in grizzly bear country in Wyoming and Idaho and genuinely do not enjoy those experiences (hiking, backpacking, etc) as much as I do in grizzly free areas like Colorado and Utah. I recommend Washington considers the psychological impact on hikers and other outdoor enthusiasts of reintroducing such a species.

Correspondence: Hello,

Reintroducing Grizzlies to the North Cascades is a mistake and misguided attempt at controlling the planet by looking in the mirror instead of looking forward. The cascades are not the same mountains that they were when Grizzlies thrived there in the past. The human to bear interaction is already high in the area with only black bear. The daily visits of people deep into the cascades is exponentially higher than it used to be and is increasing annually at an accelerating pace which will cause risk to both human and bear populations.

Please do not bring Grizzlies back to the north cascades.

Thank you,

Correspondence: I am always going to fight to advocate for bear welfare. Yet, I cannot support the reintroduction of the grizzly bear. Washington state already hosts this formidable predator. With the challenges the Washington Department of Fish and Wildlife faces in managing the rising numbers of black bear, cougar, and wolves, introducing a larger and more aggressive predator seems like a step in the wrong direction.

Until the commission can properly manage the existing predators in this state adding more would be a detriment to the already struggling ungulate populations. As a conservationist, I am strongly opposed to this proposal.

Correspondence: Washington is already home to a variety of predators including wolves, cougars, black bears, and coyotes. Washington's ungulate populations, such as elk, deer, moose, mountain goats, and the endangered woodland caribou, are under strain. Introducing more apex predators would further imbalance its delicate ecosystem. Again, much of this is a consequence of decisions made within the state to properly manage existing species.

Bringing grizzlies in would also destroy the population of the other animals while the state's Wildlife Commission is out to ban predator hunting altogether.

Correspondence: I am thoroughly against reintroducing grizzly bears to the North Cascades National Park. I have enjoyed the beautiful nature that the North Cascades has to offer for many years and have always felt safe knowing that there weren't any apex predators in the park. I am able to thoroughly be at peace within the park and take in the beauty of it all.

Reintroducing grizzly bears to the park would limit my time there. I do not feel safe in grizzly country even though I carry bear spray and have been trained in how to use it. I've visited many of the US National Parks, including Glacier National Park almost every year. Each time I visit Glacier, I am on alert and in a heightened state of stress because I am aware that I am an intruder to the bears habitat and that they are the apex predator in the ecosystem. I don't feel safe visiting national parks with large grizzly populations. The amount of fatal and gruesome grizzly attacks have been increasing in recent years. As a recent example, a couple and their dog were killed hiking while in Banff National Park of Canada, who were very experienced in the Backcountry.

Please do not reintroduce grizzly bears. There are plenty of areas in nearby proximity to the Pacific Northwest that have grizzly bears if people need to see them and study them. Please leave this beautiful safe and popular area alone and free of Grizzlies. Please also respect the Washington State statute that banned the reintroduction of grizzly bears in the state. Reintroduction is not what the people want.

Correspondence: Don't do it. What are they going to eat? The endangered salmon? The caribou (absent)? The diseased elk herds (dwindling)? Maybe the growing wolf population...? This idea is bad and will cause human-grizzly conflicts that will result in the destruction of problem bears. Let's just allow grizzly bears to expand their territory on their own, which likely already includes Washington state. Doing nothing will save both human and grizzly lives, and it's the least expensive option as well.

Correspondence: Washington State is neither ready, nor in need of grizzlies to be reintroduced into the state. Grizzlies are naturally migrating into the state naturally. Natural migration allows existing ecosystems to adjust to the addition of an additional apex predator to the landscape. In addition, the current department of fish and wildlife commission is neither able nor willing to actively manage the current predator populations in the state. Human and wildlife conflicts are stacking up

while ungulate populations struggle as a result of a commission that is actively disregarding the departments staff and biologist recommendations and making rulings guided by social pressures instead of science or mandate guidance. The commission has violated multiple laws and position guidelines to enact policies benefiting a niche minority of the population who place their personal values above proven management practices and best available science. Recent rulings have eliminated a long-standing Blackbear management hunt in spite of support from the hunt by the departments leading predator biologist and director of the Department of Fish and Wildlife. Blackbear are currently the most successful big game species in North America with populations actively expanding in every area that the bears exist, and Washington ranking in the top 5 Blackbear populations in the country. Currently the department is being burdened with petitions from animal welfare activist groups to further tie the departments hands when responding to depredation cases and calling for elimination of mountain lion recreational hunts when conflict removal numbers continue to climb in the state.

Montana, Wyoming and Idaho, all states who have abundant habitat and prey populations as well as historic support of department management of large predators, are currently unable to adequately manage their existing grizzly populations and are seeing higher numbers of conflict removals as a result. When the grey wolf populations were considered recovered in the Greater Yellowstone Ecosystem (GYE) the state game departments were prevented from effectively managing the predator for 10 years due to litigation from animal welfare activists. Currently, grizzlies in those states have pushed well past recovery objectives and the states are not able to manage them as a game species as was intended. The fact states with adequate prey populations, suitable habitat and historic support of effective management practices are not able to manage these large predators should completely take the proposal to reintroduce this controversial species off the table. How would a state that has none of those essential factors ever have a chance at successfully reintroducing grizzlies to our already imbalanced fragmented ecosystems?

Due to these reasons and many more, I feel that it would be not only inappropriate bur irresponsible to reintroduce Grizzlies into Washington state at this time. With a fish and wildlife commission who is not held accountable to following department guidelines and is enacting policy based on personal agenda and social pressure, the forced reintroduction of an additional apex predator would put further strain on the departments already taxed resources and staff. The department has not yet been able to implement effective means of managing the current populations of the last apex predator that was introduced, the grey wolf, and adding grizzlies to that charge would push the department well past their capacities, setting up not only the department but prey species for catastrophic failure. I hope you take these factors into account when making a decision on whether or not to force the reintroduction of grizzlies into a state who in neither able nor willing to effectively manage their current predator populations.

Correspondence: 2 killed in suspected grizzly bear attack in Canada's Banff National Park

Updated 10:46 AM EDT, Mon October 2, 2023

--

Two people are dead after a suspected grizzly bear attack in Canada's Banff National Park, officials said.

Rescuers were first alerted to the incident around 8 p.m. Friday after receiving "an alert from an inReach/GPS device indicating a bear attack," the national park said in a statement.

The alert said the incident happened in the Red Deer River Valley area of the park, which is in the Canadian Rocky Mountains.

"Parks Canada immediately mobilized a Wildlife Human Attack Response Team whose members are specially trained in responding to wildlife attacks," Banff National Park said in the statement. "Weather conditions at the time did

not allow for helicopter use, and the response team travelled through the night to the location by ground."

Police tape blocks off part of West Yellowstone, Montana, after a fatal bear attack in July.

A grizzly bear that killed a woman earlier this year gets euthanized after breaking into a house with a cub to steal food. The response team arrived at the site around 1 a.m. Saturday and found two people dead and a grizzly bear displaying aggressive behavior, the statement said.

Parks Canada staff euthanized the bear "to ensure public safety," and Royal Canadian Mounted Police officers arrived at the scene to assist in transporting the victims to Sundre, Alberta, about 75 miles northwest of Calgary, officials said.

"This is a tragic incident, and Parks Canada wishes to express its sincere condolences to the families and friends of the victims," the statement said.

The deadly suspected grizzly attack in Canada happened just weeks a grizzly bear linked to the death of a woman in July near West Yellowstone was euthanized in Montana after breaking into a home through a window with a cub and taking a container of dog food.

In 2020, the same bear was also involved in an encounter that injured a person near Henrys Lake State Park in Idaho, Montana Fish, Wildlife & Parks said in a news release.

The male cub who was near the adult grizzly was captured and was being held in Helena at the agency's wildlife rehabilitation center before it was set to be transferred to a zoo, officials said.

And last month, portions of Custer Gallatin National Forest near Big Sky, Montana, were closed after a person was attacked by a grizzly bear while hunting, officials said.

Banff National Park, Canada's first national park, is a popular attraction for tourists, known for its picturesque turquoise waters. Parks Canada notes the park is "home to hundreds of species, including grizzly bears,

Correspondence: Introducing another apex predator into Washingtons eco-system will bring far more problems than we (WA citizens) have now with wolves. Grizzlies also kill people. I just read an article today where a Grizzly bear killed a couple and their dog in Banff National Park Canada. The food supply for this large carnivore will be in direct conflict with the many wolf packs in our state which have already decimated elk and deer populations in many NE Washington counties. The wolves are also pushing cougars into southern counties, another carnivore in competition for food.

Grizzlies will also pose a threat to many hikers, campers, hunters and rural communities in the north cascades, in fact a woman has been dealing with a mother and cubs killing her farm animals for years in Colville. The WDFW told her it wasn't a grizzly. Now a grizzly has been trapped by the WDFW in Colville "the Onion Creek area after killing her chickens. Where did they take this grizzly?

Wolves have already caused hundreds of thousands in livestock damage, what do you think grizzlies will do? They are not afraid of people and people are on the bears menu. BEAR SPRAY does not work against the large carnivores.

This foolishness needs to stop. Washingtonians should decide, not the federal government or some person/ organization living in another state. It won't directly affect them.

Please do not do this.

Correspondence: I support the restoration of grizzly bears into the North Cascades ecosystem. I live in rural Whatcom County in the foothills of Mt. Baker. Since moving here 20 years ago, I have educated myself to learn to live with wildlife, such as black bear and cougar, and how to avoid conflict with them. I believe education is a crucial component to the grizzly bear restoration plan to minimize conflict and harm to humans, the bears themselves, and to domestic animals. Grizzly bears once freely roamed this land and are an important part of the ecosystem, and I believe we need to learn to live among them.

Correspondence: We should be very very hesitant about introducing Grizzlies to the National Park. Grizzlies are already found in WA state and will make their way their eventually, we do not need to encourage them.

Just this last weekend (weekend of 9/30) two people and their dog were killed by a grizzly in a Canadian park. If grizzlies find their way naturally to the park so be it, but we should not be encouraging or wasting our money on such a dangerous pursuit.

Thank you.

Correspondence: Reintroducing Grizzly Bears to the North Cascades could pose a safety concern for campers and hikers. This is especially true around the Lake Diablo and Ross lake area. The North Cascades are also very popular areas for prospecting for minerals and gemstones which are often located off the beaten path deep in the woods where Grizzly Bears are likely to reside if reintroduced into planned areas of the North Cascades. Bear spray will do little if a bear decides to make a meal out of you. I would like to know if there has been a study done on the positive for reintroduction of Grizzlies or someone just decided it's a good idea to bring them back in the areas. The last time there was a population of 100-200 (the number goal fish and game is aiming for in the future) there was a lot less people that visited the areas that fish and game want to release the bears.. I don't think it would be wise to bring back the bears in the North Cascades, too many people doing recreational activities. The moment someones life is lost it will have been to late. Think carefully if this is a smart move. I think the area is too occupied by people most of the year. That's my thoughts, my opinion. I'm sure others share my concern as well, my friends think the same as I do, that's where part of this came from, our discussions about the reintroduction of Grizzlies in the North Cascades. Some of them said they would stop going to campgrounds in those areas as for fear of brown Bears.

Correspondence: Regarding the proposal to reintroduce grizzly bears to the north cascade national park. Grizzly bears should not be brought into the park. If they choose to move into the park more over time so be it, but we should not encourage this. Grizzlies are dangerous to the public when they grow in numbers as they have in much of the west. There are more attacks and negative encounters every year. Their protected status prevents them from being hunted and developing a sense of danger from humans. They also harm the deer, moose, and elk populations. Having hiked and backpacked in heavy bear county throughout the west , Canada and Alaska it is a blessing to not have to worry about grizzlies when hiking in Washington state. We should not encourage more of them until they are better regulated on a national level. There should be experienced predator wildlife biologists involved in this decision as well as the local community around the park . This is a bad idea in my opinion. Please consider my comments as you move forward.

Correspondence: Love me our NP, NCNP, and bears in general. That said, Humans are kinda dumb. You're going to continue to get people leaving food out, taking dogs off leash, and generally creating an environment that is conducive to Grizz threatening the well meaning hikers and families.

I am AGAINST introducing Grizzly to NCNP. For reference I visit the park 4x times per year and recreate between the Puget sound and the Methow Valley on a yearly basis.

If Grizz were introduced, I would be less likely to take my family of 4 to the park for recreation purposes.

Correspondence: I was born and raised in Washington state and I still hunt and fish there on a regular basis. I do not think Washington State is ready for a grizzly bear re-introduction.

Currently and in the recent past WDFW commissioners have proved that they are not qualified to manage large predators. I.e.they voted to cancel spring black bear season even though that scientific data shows that the black bear population can definitely sustain a spring harvest.

Please do not introduce another large predator that Washingtonians will have to deal with, while having a wildlife commission that will not support them in managing this predator even when scientific evidence (or human safety) supports management.

It has been proven in the Yellowstone area and the Glacier park area that it is very difficult to de list grizzly bears, even if they reach set population metrics. With how hard it is to de-list and Washington's anti predator hunting wildlife commission, grizzly bears in Washington would most likely never be able to be managed correctly.

Let Grizzlies come to Washington naturally but do not force us to have to deal with an introduction.

Correspondence: I believe the Grizzly Bears should be allowed to come back into the North Cascade Eco system by Natural Recovery! There is currently opportunity for Grizzly Bears to moved down from British Columbia if they wanted.

The current hunting laws would protect them in order to establish a population.

Moving Grizzly Bears from a different Eco system would impact the current wild life in the Cascade range area. The transplanted bears would not have been imprinted the Cascade Eco system. They would cause decrease food sources whether it be plant based or protein from wildlife or fish! This increase need for protein will force more elk, deer and like animals to move out the mountains down into populated areas within the Cascade range. There is already current issues with the increased Elk herds staying in lower populated areas. In time I believe they would also learn how to seek and catch Salmon as they swim up rivers to spawn. It will change the other predator ranges such as black bear, wolves, cougars and others as they seek food and living spaces.

In closing I would like to say let Nature take her own course! If Grizzly Bears are intended to be in the North Cascade ranges they will come on their own!

Correspondence: I support the draft plan and environmental impact statement that takes a major step in bringing grizzly bears back to a suitable ecosystem spanning from Washington State into British Columbia.

The North Cascades is one of North America's intact ecosystems, but it is incomplete without grizzly bears. The grizzly has immeasurable ecological and cultural value for our ecosystems and communities. We have a unique opportunity and obligation to restore the grizzly to an important part of its traditional home.

The NCE is one of two federal grizzly recovery areas without an established population of bears, and natural bear migration is unlikely to repopulate it. Instead, based on research, wildlife biologists suggest safely relocating existing bears into the North Cascades.

In 2020 more than 159,000 members of the public wrote comments supporting the reintroduction of grizzlies. Grizzlies and humans coexist elsewhere and many people recognize that grizzlies were here before us and we should make room for them.

Correspondence: I am a 4th generation Washingtonian from a family who's recreated in our great outdoors over over 100 years. I grew up in the Cascade mountains and have visited them countless times. I strongly oppose this restoration project.

I have one response to the proposal to reintroduce grizzly bears into the North Cascades: FOR WHOSE BENEFIT? For the bears or for humans? It's abundantly clear that where the bears USED to live has radically changed such that reintroduction equates to not to saving bears but *killing* bears. Restoration is impossible given how radically that ecosystem has changed with people now penetrating every part of what was once wilderness.

The National Park is doing nothing but setting these magnificent animals up for eventual euthanizing because it is CERTAIN that bears will attack the humans who are already occupying what is supposed to become new grizzly bear habitat. We only have to look at the endless euthanizings that occur elsewhere each year to know where this wrong-headed proposal is going:

<https://www.washingtonpost.com/world/2023/10/02/grizzly-bear-killed-couple-national-park-canada-euthanized/>

I ask biologists and park officials and anyone making decisions on this to ask themselves: "For whose benefit?" because the clear answer to this question is not "the bears."

Thank you for considering my concerns,

Correspondence: I downloaded the draft Grizzly Bear Restoration Plan and appreciate the opportunity to comment as a resident of Washington State who enjoys outdoor recreation and appreciates the rights of animal species to live in their traditional range. However, I am writing not in support of the alternatives to reintroduce the bears and instead, support the "No Action" alternative. I base this opinion on two factors: (1) the phrase "wilderness character" is misleading because the heavy use of the region by PCT and other hikers now has inevitably changed the character of the environment. This is one of the flaws in the Wilderness Act because, in a "Heisenberg Principle" manner, people inevitably change the character of a region. (2) the phrase "native habitat" is also used and I am not sure the habitat can now be defined the same way as in the period when the bears were extirpated. It may be that the bears naturally filter in from BC on their own and adapt to changed conditions, but I do believe there is no such things as management of bears or management of the natural habitat. There is only management of people. Until the increasing population of our state and increased demand for outdoor recreation is contained, I do not see a good future for released bears under this plan. I personally am starting to evaluate the potential harm I do by wanting to hike in more remote areas and am trying to limit my hiking to areas closer to population centers.

Correspondence: After reading the EIS. I prefer Alternative A: No Action

I believe natural recovery is the best solution for restoration of this area. Our climate and human population density is completely different from historic times when the bears were present.

The project goal of 200 bears in this area seems excessive considering the current recreation use and the number of campgrounds. Assuming bears and humans can coexist is unrealistic. Just look at Montana, with the increase in bear numbers there is an increase human death and injury.

There is also no mention of how the keep the population at 200.

There is also no mention what the estimated cost to the taxpayer is for this effort. I would like my tax dollars spent on more multiple use projects.

This EIS is a idealistic Disney like approach and the reality is that an apex predator will not follow your idealistic views.

Correspondence: I am against reintroduction of grizzly bear populations in Washington state. While I empathize with the well-meaning ecological intent of this action, grizzly bears pose a real and serious threat to outdoor enthusiasts, as evidenced by the deaths of two hikers and their pet in Banff National Park at the hands of a grizzly his past weekend. The same threats that have eradicated their population will result in pressure (specifically a need for territory, food, etc.) to attack humans if they are reintroduced to the state. This is a bad idea and will needlessly risk lives of WA residents.

Correspondence: Greetings,

I think Alternative A is the best course of action. Do nothing and let recovery happen naturally if it does at all. Understanding that transporting bears out of areas that might already have endemic diseases among the bear population that we might not completely understand how it may affect the limited local population. The resources needed for a reintroduction program and the post reintroduction management can be better allocated to help manage the ecosystem in it's current and most recent state. I would prefer that resources go into caribou preservation in WA, although their historic range in the Selkirks is likely out of NPS management.

I recreate in OR, WA and MT, in areas that have both black bears and grizzlies. I don't mind having grizzly bears on the landscape and appreciate the place they have in the ecosystem. However, I think we have many places that are doing just fine without the re-introduction of grizzlies - and we are not well prepared for the (new) impact it might have. I think Golden Gate Park is a prime example of a place where grizzlies were extirpated, that we wouldn't try to re-introduce them to try to go back to how things used to be.

Respectfully,

Correspondence: I am deeply concerned about the proposal to reintroduce grizzly bears into NCNP, and I believe it poses significant challenges for both the local community and the bears themselves.

For the People:

Lifestyle Adjustments: Washingtonians have cultivated a way of life that embraces the outdoors, often without the looming threat of grizzly encounters. Activities like solo trail runs, hiking without bear spray, or simply enjoying the tranquility of nature without constantly making noise have become second nature. Introducing grizzlies would necessitate a drastic change in these habits.

Accessibility Concerns: While the risk of fatal bear encounters remains statistically low, the mere presence of grizzlies can deter many from exploring the outdoors. This could disproportionately affect families, the elderly, and those new to outdoor activities, creating a psychological barrier that limits their engagement with nature.

Economic Implications: The outdoor recreation industry, a significant contributor to Washington's economy, might face challenges. Tourists unfamiliar with bear-safe practices might opt for destinations perceived as safer, impacting local businesses that rely on tourism.

For the Bears:

Inevitable Human Encounters: With a dense population in Washington, especially around the Puget Sound area, human-bear interactions are not just probable but inevitable. Such frequent encounters can be stressful for the bears and lead to unpredictable behaviors.

Changed Landscape: The Washington of today is vastly different from the time when grizzlies roamed freely. Urban development, highways, and increased human activities have transformed their former habitats, making it challenging for them to thrive.

Relocation and Worse Outcomes: History has shown that when wild animals frequently encounter humans, it often doesn't end well for the animals. Whether it's being captured and relocated multiple times, or, in unfortunate circumstances, being euthanized for posing threats, the bears are likely to face adverse outcomes.

Genetic Considerations: Reintroducing a small population of bears can lead to genetic bottlenecks, which can have long-term implications for the health and diversity of the bear population.

In conclusion, while the idea of reintroducing grizzlies might seem appealing from a conservation standpoint, the practical implications for both humans and bears are concerning. I urge you to reconsider this proposal and evaluate alternative conservation strategies that ensure the safety and well-being of both the community and the bears.

Warm regards,

Correspondence: NPS,

As a hunter I understand the need and desire to continue bring our ecosystem back to the days of wildlife being in all their native range. The unfortunate reality is this isn't always possible.

If you aren't aware of what is going on in WA state with our predators I can give you some insight as to how most hunters feel. We are very upset and have no faith in the WDFW commission. Currently, the WDFW commission has ended black bear spring hunting, which was never on the table to end, with no return in sight. While the WDFW biologists and department as a whole support this hunt and would like this hunt to return seeing as how we have a large population of black bears. This hunt was taken by an old-standing rule saying if they do not have enough votes to completely pass a rule change, the season is cancelled. The rule change that was in question was simply carrying over ever current rule but changing only the year. With an even number of commissioners at the time (Gov. Jay Inslee had failed to fill a commission member seat for nearly a year at this point) the count was tied at 4-4 and the rule change failed, ending a long standing hunt that was around for well over 30+ years. The commission is currently looking at banning cougar and black bear hunting in general in 2024. They have projects showing that the abundance of predators is causing extreme stress on the ungulate population in WA. I feel this re-introduction would only make this problem worse for ungulates. Especially since the WDFW commission is outright anti-hunting and trying to eliminate proven science based game management.

The Northern Cascades area around Okanogan county is a main mule deer migration area and wintering area. I worry grizzlies would cause major problems during the mule deer birthing season and future fawn recruitment. I currently live in Douglas county, but my hunting areas range all along the Cascade Mt Range to the ID-WA border. Grizzly bears are currently in the NE corner of WA, as most people are aware of. I have friends in Colville WA and they are extremely upset with the predator population control in their area.

The hopeful return to all animals back into their native habitat is a cause that I support in general. But not all of the native habitat is available or usable any more due to humans. This causes conflicts, strain on resources and many other negative outcomes.

With grizzly bears carrying an Endangered Species designation it would allow another apex predator onto the landscape with no way to manage these bears properly if the population were to meet objective or surpass objective.

As a hunter, I do believe these animals deserve to be on their home range. Same as elk, buffalo, deer, wolves and every other animal. But I believe these animals need to be managed properly. Currently in WA state we do not have the means to do this with the current commission in place and their desire to abolish hunting in general. I am against this reintroduction until the WDFW commission is not outright trying to ban predator hunting and hunting in general in WA state.

TL:DR

I DO NOT support the reintroduction AT THIS TIME in the North Cascades due to WDFW commission's stance on predator hunting.

Thank you for reading as much or as little as you did!

Correspondence: Grizzly Bears in the North Cascades is a bad idea. We can look at other areas where they have flourished and it's hard to rationalize anything positive coming out of a reintroduction. First of all, our State Dept of Fish and Wildlife has a terrible record of managing the resources that we already have. Washington should be rich with wildlife but currently management has decimated wildlife populations throughout our state. We don't need anything more praying on our already weak deer, elk and other wildlife. Not to mention the dangers to recreationalist that use those areas for hiking and camping. Don't get me wrong, I'm a hunter and would love to bag a nice grizzly if there was a season but I'm fine going somewhere else to it. I just read this morning where two people and a dog were left for dead in Banff National Park in Canada. Why play Russian Roulette with the citizens of Washington. Eventually someone will die but none of the people making these decisions will take responsibility. Bad idea from the get go.

Correspondence: Hello,

I wanted to strongly encourage the Park Service to support the proposed action plans and reintroduce Grizzly bears into the North Cascades. I have followed other reintroduction efforts (such as the Burying Beetle) and have seen the success in the flexibility of the nonessential experimental populations, however I worry that this status may not provide enough financial support for the reintroduction efforts of a large carnivore. I read a great book called the Carnivore Way by Christina Eisenberg and it helped me understand that due to their large range, grizzlies will need more wildlife overpasses/tunnels installed along the highways running through the North Cascades in order for the population to utilize the habitat. Grizzly bears and other large carnivores are a vital part of our ecosystems in Washington and I support their coexistence with the humans that call our state their home. Lets keep Washington Wild!

Thanks for your time,

Correspondence: I strongly support restoring grizzly bear populations in the North Cascades. These omnivores play a critical role in the health of the North Cascades ecosystem. As the climate changes, it is critical that we do all we can to ensure that our remaining natural environments are as healthy as possible and restoring grizzlies should be part of these efforts.

Additionally, as we've seen with other species restoration efforts, revitalizing charismatic megafauna populations can attract tourism which in turn can support local rural communities. This is certainly true of the highly popular Katmai Grizzlies

"Fat Bear Week." There's no reason to expect that grizzly bears in the North Cascades would be any less of a draw for tourism to Northern Washington.

Correspondence: Again and again we, the People, speak out against this concept of bringing a deadly apex predator to live among us in our back yards. Yet again and again, despite overwhelming scientific and public evidence and disdain, the drive to bring Grizzly bears to this state, at the extreme risk to human life continues to resurface.

There is no need nor a want to have these dangerous creatures in the forests and mountains we love to recreate within. Only harm and hurt will be the outcome of this eventuality due to the Federal dollars the politicians crave, all of whom will not be living with bears in their backyards in Olympia.

If they truly believed in this concept they would bring the bears back to Olympia and Seattle but of course they will bring them to Eastern Washington for us to suffer as they kill our livestock, wild game populations and any person foolish enough to go hike within the bears territory.

For the love of God and what is right, please do NOT bring Grizzly bears here!

Correspondence: Grizzly Bear attacks on humans are becoming more frequent and are often deadly to both parties. As a Backpacker in the North Cascades I feel introducing Grizzly Bears back into this habitat is risky and will cause death to humans who frequent this area.

Correspondence: As someone who hunts and spends a lot of time outdoors around big game, I would strongly caution against the reintroduction of Grizzly Bears to the North Cascades. The State of Washington and WDFW struggles to effectively manage the Black Bear population and human to bear encounters are becoming more frequent and dangerous. With the recent closure of the spring bear hunting season, it should be expected that black bear populations will continue to grow impacting the overall ecosystem. Grizzly Bears are apex predators and without an effective management plan (including a viable hunting season), their population will explode, further changing the current ecosystem and causing danger to humans. I was recently in Alberta Canada and was tracked and charged by 2 boar grizzly bears with 24 hours of each other. Their lack of an effective management system is creating a bear population that is not only unafraid of humans, but actively hunting them. If Washington state goes down the same path, people will be in danger.

Correspondence: These Animals eat and kill people. You would be playing with people's lives and safety. As many campers and hikers and fisherman visit the North Cascades each year, this would be completely irresponsible for putting people's lives and safety at risk. This is public safety issue, this cannot happen. Links added below are just a few of many examples. These unfortunate soul's deaths did not happen peacefully, this is a horrific and torturous as well as gruesome way to have your life ended. Think very hard before something this irresponsible is actually carried out and executed against public safety. Thank you

Correspondence: Grizzly bear kills couple and their dog in Canada

Updated Mon, October 2, 2023 at 10:34 AM PDT · 2 min read

3k

A couple was killed by an "aggressive" grizzly bear in Canada's Banff National Park, park officials said Sunday, marking at least the second fatal grizzly attack in North America since July.

At about 8 p.m. on Friday, Parks Canada Dispatch in Banff National Park received an alert of a bear attack from a GPS device. The alert location originated from within Banff National Park, in the Red Deer River Valley, officials said in a news release.

A team specially trained in responding to wildlife attacks was mobilized. Unable to use a helicopter because of poor weather conditions, the team travelled through the night to reach the location by ground. Officials arrived on-site at about 1 a.m. and discovered two people who were already dead. While in the area, the team encountered and euthanized a grizzly bear "that displayed aggressive behavior," officials said.

The Royal Canadian Mounted Police arrived on the scene at 5 a.m. and helped transport the victims to Sundre, Alberta.

Officials did not identify the victims but a family member told CBC News the people who died were a couple who were experienced backcountry hikers. The family member said the couple's dog was also killed in the attack.

"They lived for being in the backcountry and were two of the most cautious people I know. They knew bear protocol and followed it to a tee," the family member told CBC News in a statement.

Kim Titchener, a friend of the family and the founder of Bear Safety and More, told Reuters that only 14% of grizzly bear attacks are fatal, but that human-bear encounters are increasing as more people head outdoors.

"It's really just the reason why we're seeing more attacks, which is more people heading outdoors and unfortunately not being educated on this," she said.

Bow River at Banff National park near Lake Louise. / Credit: JOE KLAMAR/AFP/Getty Images

Last month, a grizzly bear that had fatally mauled a woman on a forest trail west of Yellowstone National Park in July was killed after it broke into a house near West Yellowstone.

Also in July, a 21-year-old woman who was planting trees was seriously injured by a bear in British Columbia, Canada. Officials could not locate the animal but believe it was a grizzly bear that attacked the woman. Earlier this month, a hunter in Montana was severely mauled by a grizzly.

Following the weekend attack at Banff National Park, officials closed an area around Red Deer and Panther valleys, Parks Canada said.

"This is a tragic incident, and Parks Canada wishes to express its sincere condolences to the families and friends of the victims," officials said.

This is what the NPS wants for Washington. The NPS and the Forest Service, and the sick weirdos who work there, salivate at the prospect of Washingtonians being killed by grizzlies.

Correspondence: Apex/keystone predators, yes. Include "grizzlies" but on one condition only and that is severely limiting PEOPLE using the North Cascades. Use a first-come/first served or lottery drawing for issuing permits and make those permits relatively expensive (and add parking fees as well!). Add even steeper fines and possibly mandatory jail time for violations of the kind increasingly reported in the news - harassing any and all wildlife, environmental destruction including by both human-powered and motorized wheels, using the North Cascades back country for illicit purposes including drug manufacture and transporting, etc. Where grizzlies are allowed to balance the ecosystem, humans would continue to disrupt that balance, plus the increasing numbers of North Cascades users mean direct wildlife encounters will be the eventual result - usually to the detriment of any and all wildlife and especially top predators. In the past before moving to Oregon I hiked the North Cascades extensively over two decades, and it was getting over-used even back then. Introduction of grizzly bears would provide the perfect opportunity to start LIMITING human use. Thank you for considering this even though I'm no longer living in the area. Oregon Public Broadcasting brought the issue to the attention of Oregonians and SW Washingtonians.

Correspondence: I'm writing to express my strong support of returning grizzly bears to the North Cascades.

I love the outdoors and visit/camp in the North Cascades many times a year. Its an incredible landscape that I love. Yes, it will be a little scary to think of encountering a grizzly bear because they're an enormous and powerful animal! Ultimately, they're supposed to be there. The ecosystem will benefit from their presence.

Predators are a part of the ecosystem too- -I also support reintroducing wolves to as much of their historic range as makes sense if you guys get around to it, and who cares what ranchers think- -maybe they shouldn't be grazing they cattle on tax payers' land...

Anyway, to be honest, opposition to this proposal seems to come from a neocolonial mindset. We can't wipe out whole populations just to make ourselves more comfortable. That kind of proprietary attitude toward nature is one that needs to be left in the past.

Thank you,
[REDACTED]

Correspondence: I have a cabin in Aeneas Valley. People attract bears with fruit dumps and shoot the bears on the first morning the season opens. No bears near me for four years.
Introduce the brown bears in the N Cascades according to plan. They belong there. Monitor well and closely.
Rumor has it that 400 grizzly bears will be dumped off all at once right where people camp and hike. You have to attend to those rumors if the bears are to survive.
It's a human problem as much as a bear issue.

Correspondence: I believe that the reintroduction of the Grizzly is an important step towards restoring the traditional precolonial ecologies of the Pacific Northwest. In bringing the Grizzly back, we stand to benefit from the special relationship that the bears have with the land as protectors, seed distributors, and as predators. While Grizzlies certainly pose a danger to people who live around them, we live in a time where communicating the risks and relationships we face living around wild animals has never been easier. Through digital communication and intense community collaboration, I believe that we can foster a mutual understanding of the risks of contact between both Grizzlies and Humans, and create a world in the Pacific Northwest that works for both of us.

Correspondence: I oppose reintroduction of grizzly bears into Washington state. Grizzly bears may well be endangered within the state of Washington, but grizzlies are far from endangered in North America. there are healthy populations in Alaska, Canada, Wyoming and Montana. The idea that a species needs to be returned to any habitat where it ever existed is silly. Should we reintroduce cougars to Central Park in New York?

I have regularly camped and hunted in the North Cascades for 38 years. I believe that the safety of myself and my friends will be in jeopardy if grizzlies are reintroduced. If the species find their own way into the area, then so be it, but having the government intentionally endangering people is unacceptable.

Correspondence: There's no guarantee that grizzlies released in to the North Cascades will remain there. I would consider agricultural centers such as the Skagit valley to be at risk. What would be the point of releasing grizzlies to then have to euthanize them after bear v human encounters when they are just being bears. Example:

Correspondence: I support the reintroduction of grizzly bears into the NCE. The disappearance of a keystone species in the NCE will have irreparable, long-term effects. Humans can learn to live with the grizzlies, similar to how other areas in bear habitat have done. To deny reintroduction of grizzly bears to the NCE, based on the business or other human interests, is short-sighted and selfish to future inhabitants of the NCE.

Correspondence: I am writing to express my opposition to the introduction of grizzly bears to the North Cascades National Park.

My reasons are as follows:

1. Grizzly bears are unpredictable and dangerous. While hiking in Alaska we were always tense. The constant call of "hey bear" broke any tranquility to enjoy.
2. The presence of Grizzly bears would preclude for me the opportunity to hike with my grandkids in the North Cascades.
3. Funds for reintroduction of the bears can be better used elsewhere. For example, improved trail maintenance!
4. The recent deaths of a married couple and a dog by a grizzly bear mauling in Banff Provincial Park exemplify my concern.

Correspondence: I am a steward of our natural areas, a conservationist, a nature-nerd, lover of the outdoors and natural ecosystems, but I do NOT support the reintroduction of Grizzly Bears into WA state. This state is way too populated for an aggressive species such as grizzly bears to cohabitate with. I do not trust that the wildlife commissions and agencies will be able to properly handle such a reintroduction in a way that is safe for the people who recreate in our Parks or who live adjacent to them. Grizzly bears have already migrated their way into parts of the state and have already shown to be an issue. I understand they used to be a species that once roamed the mountains here freely, but I think it best for the overall big picture that they no longer have such a presence in Washington. The deer species will decline, more incidences of people and dogs getting attacked will rise, and ultimately bears will have to get put down anyways.

Thank you for your time and consideration.

Correspondence: Strain on Wildlife Management: The WDFW Commission has not maximized recreational opportunities for sportsmen as directed in their mandate. With recent decisions on black bear and potential changes to mountain lion hunting, many conservationists fear the commission is failing to manage its wildlife properly. Introducing more grizzlies would exacerbate this issue. To be clear, reintroduction would not mean a grizzly bear hunting season. The point here is that the state is already under strain from mismanagement of its large population of existing predators beside grizzly bear.

Predator Balance is Essential: Washington is already home to a variety of predators including wolves, cougars, black bears, and coyotes. Washinton's ungulate populations, such as elk, deer, moose, mountain goats, and the endangered woodland caribou, are under strain. Introducing more apex predators would further imbalance its delicate ecosystem. Again, much of this is a consequence of decisions made within the state to properly manage existing species.

I do not support the plan to artificially introduce grizzly bears to the North Cascades.

Correspondence: I've lived in WA all my life, and been an active adventurer exploring the North Cascades since 1970. I started guiding in 1977, leading people on rivers & mountains with boats, boots, bikes, & skis. I feel privileged and blessed to have shared this paradise with others. Many highlights for myself and clients/students have been animal sightings: the Skagit Salmon welcomed me just last week. Bear sightings are rare, but especially memorable-- I've been lucky a few times locally.

Grizzlies are a key link in our ecosystem and must be reintroduced and protected along with the land and resources they need to thrive.

Thank you

Correspondence: You all living in urban areas have no problem "introducing" grizzlies back into rural areas in north central Washington State. You won't have to live with them. My take on this is first introduce grizzlies to the National Mall in Washington D.C. and if that works out to everyone's satisfaction, introduce them to Discovery Park in Seattle as a second test. Then, if everything works well, then let's introduce them to the North Cascades. I am not talking about the grizzlies that move around as they will, I'm talking about the government keeping their inept hands out of the whole grizzly bear issue. Just this past week a grizzly was found near Colville WA and they moved it away -- and you all want to bring more in -- unnaturally. Talk about the left hand not knowing what the right hand is doing.....

Correspondence: The EIS statement is flawed. It mentioned only two attacks of Grizzlies in 42 years. There have been 4 fatal attacks in the US alone since 2021 and many more non-fatal interactions. This was a simple Wikipedia search which has names and dates and locations. I am personally aware of additional attacks (specifically WY elk hunters) in addition to the Wikipedia listings.

With FWS required to investigate these attacks and interactions, I find it implausible that the authors were unaware of these

incidents. This would call the objectivity of the authors into question. Minimizing the safety impact for those of us living in the recovery area.

Correspondence: Grizzly bears have been part of the North Cascades landscape for thousands of years, and I would be so grateful to have this restoration project finally start. As an avid trail runner and backpacker, the North Cascades is a place I visit 7-10 times per year throughout the summer and fall months. This part of the world is so special, and deserves to have a truly wild and connected ecosystem. Grizzly bears are a vital part of creating that web!

I have spent lots of time hiking in Alberta, Alaska, and Montana where grizzly populations are much more robust. Knowing I am hiking and playing among these magnificent creatures actually makes me more aware and responsible. If I am hiking in grizzly country, I take extra special precautions when it comes to food storage and cooking. It also encourages me to hike in groups instead of solo. I believe that having grizzly bears more present in the North Cascades will force all people who use these lands for recreation to be more responsible. Learning to co-exist is an essential part of keeping these lands truly wild, and I think this project deserves to be given a true chance.

Correspondence: I firmly oppose the reintroduction of grizzly bears into the North Cascades. It's evident that grizzlies are already finding their way into the state with recent incidents like the young grizzly in Stevens County. I believe in natural migration and proper management/conservation. The existing challenges with the black bear, cougar, and wolf populations in Washington highlight the need to avoid adding more pressure on our wildlife. As someone who frequently hikes, the thought of an increased grizzly bear population in the North Cascades is concerning. Observing the events in places like Montana and Idaho, it's clear that more bears can lead to more dangerous situations. Grizzlies have every opportunity to migrate from BC or Idaho without human intervention. I urge you to let nature dictate its path. The North Cascades have always been a haven for outdoor enthusiasts like me. With grizzly bears already existing in this range, as noted by the Washington Department of Fish and Wildlife, introducing more would not only threaten the fragile mule deer population but also increase the risk for those of us who love the outdoors. I'm against any plans to reintroduce grizzlies in Washington. The recent incident in Stevens County, where a grizzly bear was captured, is a testament to the growing predator challenges in Washington. Our state is already grappling with managing wolves, cougars, black bears, and more. Considering the strain on our ungulate populations, I cannot support the idea of reintroducing grizzlies into the state. I felt compelled to voice my concerns about the potential reintroduction of grizzly bears in Washington. It's undeniable that grizzlies are already making their way into the state from neighboring regions. The absence of any physical barriers means natural migration can and is occurring. Given the state's challenges in managing its existing wildlife, introducing another apex predator seems counterproductive and an absolute terrible idea for conservation.

Correspondence: I believe that option C would be the most realistic and effective method for restoring the population of Grizzly Bears to the North Cascades. Option A seems the easiest, but least effective. While option B seems like it would be effective in simply restoring Grizzly Bears, I believe that there would not be a lasting effect. Option C, although it holds back slightly on the scale of restoration, it seems to look at the problems that could arise during the process, one of which was human and bear interactions. Option C is a more careful and maybe even slower process, but I believe it would be a smoother process as a whole, not just for the bears, but also for the environment, and the human population.

Correspondence: I am an environmental scientist with a degree in wildlife ecology, a lifelong resident of Washington, and a supporter of healthy wildlife populations. I 100% support the no-action alternative and from a professional perspective could in no way ever support reintroduction. Currently, grizzly bears do inhabit the remote regions of north central and northeast Washington. By introducing bears from out of state, you are destroying the locally adapted genetics and life histories that have evolved in this region. Additionally, grizzly bears from larger populations continue to expand their range each year. Grizzly bears are now present in northern Idaho and occasionally seen in northeast Washington. Population expansion is complex and a natural process, in which range expansion selects for animals capable and adapted to new territories and environments. By short cutting this natural process you are removing natural habitat selection that will 100% occur in time. The desire to have grizzly bears present in higher numbers now is misguided and based on a false understanding of the temporal scale of nature. A decade is nothing in terms of range expansion and population success- though humans often see this as a long time. Grizzly bears are expanding their range naturally, and will occupy suitable habitat throughout Washington in time as no barriers to this migration exist. Releasing bears with different genetics or local adaptations is not necessary and does not result in high performing locally adapted populations. There is no substitute for allowing natural processes occur on their own. Reintroduction also risks the destruction of the local distinct genetics of existing bears, which would be destroyed forever with reintroduction. In addition, reintroducing bears to a new area that they are not well adapted to will likely mean increased reliance on human based food sources and thus increase human-bear conflict.

Correspondence: There is a reason grizzly bears were driven out of Washington state. They are dangerous. We have so many trails and public areas in the forests now, where people love to go to hike and camp, and reintroducing grizzlies into these areas ensures that there will be human-grizzly conflicts. It's bad enough to encounter brown or black bears and cougars, but to encounter a grizzly would be far more terrifying and deadly. Please spare the public and keep the bears in reserves like Yellowstone and out of our state.

Correspondence: I thought this issue was closed last year. As a resident of the town of Darrington I am extremely worried about these bears being released in our area. I don't have the knowledge of the people that have actually hiked the area you are talking about but they commented last time about how there is no food source for them around here. No fish, no berries etc. I asked last time and I'll ask again. When these bears come to our property to get "food"; are we allowed to shoot them to protect ourselves and our pets? Because I sure as hell don't want these damn things near me and mine. We already have black bears in our orchards every fall. Cougars walking thru our front yard. The last thing I want or need is this type of animal in our orchards. I lease property to board horses and do not want to be responsible for anything happening to any of them either. This is a horrid idea to release them too close to a populated town. And they will be coming looking for food that isn't available in the area they were released in. I am as big an animal lover as the next person but not when it comes to killers like this.

Correspondence: As a lifelong resident of Washington State I can assure you that bringing in grizzly bears would hinder the landscape. Washington does not have very good wildlife management as it is and the quantity and quality of our ungulates is the result. Our predator populations are getting worse by the year and the fish and game commission is not doing us any favors. Grizzlies are already present in Washington, bringing more in would only hurt the ecosystem more.

Correspondence: We should not be adding large carnivores into a already disrupted ecosystem. The north cascades are a popular destination for many and the added popularity would only add to human bear interactions. Along with people recreating in the area the wintering habitat should these bears seek lower elevations for food puts them directly into the methow valley which is also an ever popular destination during the fall and winter. If grizzly bears are to show up on there own it is one thing but to purposely place them we should avoid.

Correspondence: I would love nothing more than grizzly bears to be returned to the North Cascades ecosystem. While the North Cascades is one of the least visited and most remote parks in the United States, I have been fortunate enough to take several trips into the North Cascades backcountry and am thus part of a group who might encounter a grizzly should they be reintroduced successfully. I have also been fortunate enough to see a wild grizzly in Montana, an unforgettable highlight of a life outdoors, and I strongly advocate in favor of that opportunity for future visitors to North Cascades, ideally for generations to come. With proper education and equipment, risks of negative human-wildlife interaction involving bears can be successfully mitigated; bear spray is widely available on arrival in the vicinity of Glacier National Park in Montana, and I

would like to see key access points to the North Cascades ecosystem similarly equipped. To conclude, as an avid backcountry enthusiast, I am strongly in favor for the return of grizzly bears to the North Cascades ecosystem.

Correspondence: For the Grizzly Bear Restoration Plan, alternative C, designating the grizzly bears in the US portion of the NCE and surrounding areas as nonessential experimental population (NEP), would allow for greater management flexibility and efficient establishment and conservation of the NEP while promoting social tolerance and human safety. The authorization of research and recovery actions and relocation of the bears allows for conflict to be effectively managed. The grizzly bears have a immense impacts on other wildlife (fish), character of the wilderness, visitor use/recreation experience, safety, socioeconomic, and ethnographic reproduces. In choosing alternative C, these issues and impacts can be mitigated in a mode that is properly catered to the situation.

Correspondence: Incidents like the one reported in this article on 10/2/23 from Banff NP, Canada will be the inevitable result if this misguided proposal is actually adopted and put into effect. This "cautious" couple reportedly "knew the bear protocol and followed it to a tee". That didn't save them, nor did the GPS signalling device or the "specially trained" bear attack response team. The "ecosystem" is doing fine without grizzlies and so are the people of Washington State. There are good reasons why Washington law prohibits WDFW from introducing grizzlies. So abandon this foolhardy proposal and let well enough alone.

Correspondence: I went to a meeting provided for this subject in Okanogan WA and there is no proof grizzly's ever lived in the North Cascades..per National Park Service information. There was a big turn out on this meeting of people that live in the affected areas and the meeting wound up being overwhelming "No Grizzly bear introduction". This is not a reintroduction as I keep reading about this subject such as in <https://www.yahoo.com/news/biden-admin-moves-unleash-apex-165833125.html> but an introduction. There are Farmers, Ranchers, Orchards, Agricultural Production areas that don't want them "introduced" which is what it would be since they are Non Native Bears. We already have apex predators. enough.. black bears, cougars, animals that have always lived in Central Washington... grizzly's would mess up our ecosystem and endanger the people, crops and animals that live their. The majority of people that want this won't live in the mess this would make. Let them be introduced to the areas where these people live.

Correspondence: I'm a big fan of wildlife in general and of grizzly bears in particular, but I find this plan expensive and unwise, considering the current climate. While the thrill of seeing a grizzly in the wild is undeniable, it's also undeniable that grizzlies attack and kill humans, and when it happens, the bear's life is typically taken as well. Not only that, but we continue to see increasing human/wildlife interactions in our national parks that are harmful to the wildlife and the humans alike. Because of this, I suggest that we focus on education on proper behavior when encountering wildlife instead, which needs a lot of attention and improvement before we could safely return grizzlies to the North Cascades--for the safety of grizzlies no less than that of humans. To simply reintroduce grizzlies at a time of increased parks visits from those very new to outdoor recreation is absolute folly.

Correspondence: Thank you for the opportunity to comment.

I am opposed to "restoring" grizzly bears to Whatcom County. Recent Canadian news reports of grizzly bears appearing in two British Columbia towns, Nelson and Quesnel, coupled with the fatal grizzly attack of two hikers and their dog in Banff National Park, serve to reinforce my opposition.

In closing, I offer the modest observation that a well-intentioned initiative to restore grizzly bears to an area they historically populated represents human efforts to tamper with nature as unwittingly arrogant as whatever led to their removal.

Thank you.

Correspondence: As a resident of Washington state I do not want to experience additional risk when recreating outdoors; especially with my family. Washington state already has a predator management problem, adding apex predators to the landscape would be detrimental to the wildlife population of the state, public safety, and agriculture conflict. Other states have large and increasing populations of grizzly bears. These states experience attacks on people recreating in the outdoors, with some people dying in these encounters. There are zero reasons to reintroduce grizzly bears into Washington.

Correspondence ID: 1167Project:112008Document:132104

also allows there to be more protection and management efforts to protect visitors and wildlife if needed. As tourism goes up, the 10(j) plan also works to protect those tourists. Plan C will not only be great for tourists but great for the ecosystems in the Northwest.

Correspondence: I support the preferred alternative, this provides the most flexibility for land managers while working towards grizzly bear and ecosystem recovery. I am a frequent recreational user of the North Cascades wilderness areas, and I feel that the presence of grizzly bears would enhance my appreciation of the area and allow the area to function as a true wilderness. As in other remote and wild parts of the country, recreational users and residents can learn to coexist with grizzly bears.

We owe a significant debt to the Tribal communities and to natural systems which we have irrevocably damaged over the last couple hundred years. This is a small and necessary step towards repairing this historic harm.

Correspondence: A main concern as someone who visits the North Cascades frequently is the population growing to a size that gets out of hand and starts making it difficult to visit, camp and enjoy these locations. Looking at the Montana/Yellowstone area, they restored their grizzly population and are seeing an uptick in deaths and injuries due to grizzly bear attacks. The BC area also has issues with grizzly bear population and management of these bears to keep them away from tourists, campers, and those in the backcountry. They have to place restrictions on camping and increase their management of the situations to try to keep visitors safe. They also have to euthanize certain bears who become a danger to visitors, which doesn't seem fair to the bears.

Choosing to restore a population is human intervention in the ecosystem and there can be unforeseen outcomes of such a situation, it seems the risks outweigh the benefits. If you introduce bears and they become a threat, or start becoming protective of this new land/food sources, it could lead to more potential euthanization which is then creating the opposite effect on what you are trying to achieve.

The North Cascades are made up of both the National park but also the National Forests, and there's less resources in the National Forest to help manage if the grizzly population got out of hand. Those resources/money/workers could be used to help benefit the forests & parks in other ways that have greater benefits.

It doesn't feel like there are any 'stand out' reasons to reintroduce Grizzly bears into the North Cascades, so as a frequent visitor of these lands, I don't stand behind this restoration plan.

Correspondence: There have been human fatalities due to grizzly bear attacks in both Banff NP and near Yellowstone NP this season.

The North Cascades NP is near population centers, and attracts large numbers of recreational backcountry visitors. Black bears in the North Cascades have already learned to take advantage of human food sources, resulting in human-bear conflicts. A reintroduction of grizzly bears to this area is certain to set the stage for even more human-bear encounters, and with grizzlies, those encounters are more likely to be fatal.

As long as humans are present in or near the North Cascades, the presence of grizzlies will result in death for both humans and bears. The human presence in and around the North Cascades means this is NOT an appropriate place to reintroduce an apex predator.

Correspondence: After reading through the different proposed alternatives, I believe that alternative C is the best option. This plan calls for bringing in Grizzly bears to the North Cascades, a species of bear that already exists there, but in low numbers. Since the new bears would be of the same species, I don't think they will have too much of an issue getting acclimated to their new ecosystem. The best part of alternative C is that the bears will be restored under a section from the Endangered Species Act. This will make sure to clearly define what "take" of the bears would mean. With proper planning and some time, I think alternative C would help boost the population of Grizzly bears in the North Cascades.

Correspondence: Grizzly bear restoration is critical for rewilding and establishing self-sustaining ecosystems, pre-Columbus ecosystems. I support this reintroduction program but also I want to make an appeal to make this plan more ambitious. The current plan would take 60-100 years for grizzlies to reach the goal of 200 bears. Also, since grizzlies reproduce slowly and do not expand their ranges quickly, there needs to be consideration for having a plan that allows and encourages grizzlies to expand south through the Cascades. We need healthy grizzly populations.

Correspondence: I am deeply concerned about this given the conflict of black bears and humans in our area. Unfortunately Marblemount is an area where people do not deal properly with their trash and this results in conflict as bears seek out food in human areas. Introducing a more aggressive bear to the area will only create more hazardous interactions between bears and people.

Correspondence: I am responding as an avid backpacker and volunteer backpack leader. I have backpacked in areas with brown bears as well as black bears.

- In general, I am very supportive of reintroducing brown bears back to their native habitat.

- However, if we do this without putting in infrastructure to allow animals and humans to successfully cohabite together, we are being irresponsible.

- As I consider the quality and quantity of bear hangs and bear boxes in Canadian parks where I've backpacked, our bear boxes are far more limited at popular sites. Need to increase facilities to prevent habituated bears at all camping locations in the North Cascades National Park as well as other popular non National Park locations. Consider stronger regulations around use of Ursack/hard sided bear canisters.

Correspondence: We already have grizzlies in Washington state and more will populate in the state over time. We do not need a forced reintroduction. In fact, it is the last thing we need. They are poorly managed in states like Idaho, Montana, and Wyoming and a couple was just killed in Canada from a grizzly. Until states are allowed to responsibly manage grizzlies, Washington state does not need more of them.

Correspondence: I don't believe we should be spending resources to address an an issue that may very well backfire. If the ecosystem in the Pacific Northwest is favorable, then the bears will tend to repopulate naturally. They are a high end predator that will take advantage of what resources they can find most easily. The black bear in the Smokey Mountains are evidence of how the bears can adapt to living with humans in close contact. The thought more aggressive bears being reintroduced to an area of increasing human population is frightening.

I have been in Alaska where you don't dare go out without bear spray and in some situations a fire arm.

It's not the black bears, its the brown. Please don't do something we will regret later.

Correspondence: As a lifetime Washington State resident I strongly oppose restoring grizzly bears in the North Cascades of Washington through intentional relocation. The natural and human world is significantly different than it was when grizzlies were here before. We do not have the ungulate or small prey populations to sustain the current level of apex predators, let alone up to 200 grizzlies as proposed.

There is the occasional bear that wanders in from adjacent states or provinces and that is fine. If those populations are healthy and strong enough and the bears move in and take up residence then I am fine with that. Otherwise, do not waste time, energy, and public funds on a project that is strongly opposed and unwanted by Washington state residents, particularly in and around the areas where you're looking to place them.

On another note, all black & brown bears are omnivores. Just because a bear's diet is largely made up of plants & bugs does not make them "mostly vegetarian" or "more vegetarian" than other bears. By mass, volume %, or kilocalories intake plants may be a higher source of food value but this should not be manipulated and twisted to portray that you are only selecting and placing "mostly vegetarian" grizzlies into Washington State.

Correspondence: I do not want grizzlies reintroduced to the North Cascades. From what I have read their numbers are stable, even thriving, in Alaska, Montana and Canada so do not believe it is necessary to expand to the north cascades. I like that that there are some areas to hike and backpack in the mountains where they are not an issue. If there population was low, it might be necessary, but that doesn't seem to be the case.

Correspondence: I favor the "no action" alternative, letting grizzlies gradually migrate into the US north cascades from the Canadian side, for the following reasons:

1. The unique geography and flora and fauna of the US north Cascades favor grizzlies in the north and disfavor them in the south of the region. The farther south, the more human recreational activities occur such as hiking, mountain biking, fishing, hunting and winter sports, including along highway 540 leading to Mt. Baker and along highway 20. There is also more logging, agriculture, and construction the farther south. The north has larger areas of wilderness with less human changes. If this region is good habitat for grizzlies, they will naturally enter the region from the north. If it is not, grizzlies will not enter the region, perhaps because of inadequate food due to human changes to the ecosystem.

2. Conflicts with humans and livestock are inevitable, and well documented where grizzlies have been reintroduced in Montana and Wyoming. The fewest conflicts are in limited access national parks, like Yellowstone. There are no such limited access parks in the north Cascades.

3. As compared to the grizzly areas in Montana and Wyoming, there are far more nearby large population centers like Bellingham, Mount Vernon, Sedro Wooley, Wenatchee. There are also many small towns right in the path of reintroduction, such as Concrete, Glacier, Mazama and Winthrop. Therefore a slow conservative approach to reintroduction is prudent.

Correspondence: While I generally support environmental actions I am not in support of re-introducing grizzly bears. The ecosystem of the area is doing quite fine as it is without grizzly bears. Introducing grizzlies does not benefit humans as they would rarely have the opportunity to see any grizzly bears. Instead, humans only suffer the negative consequences of grizzlies and non of the benefits. Camping, backpacking, and hiking becomes more complicated and less enjoyable when you always have to be bear aware. It is nicer to enjoy nature when you don't have to fear bear encounters.

Correspondence: I lived in a small town in Oregon for nearly 50 years. I am now living in Seattle for the last 12. I am very much in favor of restoring Grizzlies to the North Cascade. They are very important to that ecosystem. Humans are creating the biggest problems in most areas where people are being killed. That is obviously not the issue in every single case. Many humans think it is fun to interact with bears. They leave their food and trash around and don't use proper containers for food when camping and don't hang it in trees etc, etc. I don't know what the funding amounts to for rangers in the North Cascades National Park. When I hiked deep into Glacier National Park with my, at the time, two preteen kids there were many Rangers present. We went prepared and although we did not camp, we stayed in the Park Chalets. There were Rangers around and paying attention to where the bears actually were on many occasions. Gone were the garbage dumps that were problem in days gone by. Bears belong on this Earth, period, end of story. Humans must learn to be prepared and if they can't , well they go at their own peril.

Thank you

Correspondence: We should absolutely be reintroducing these poor animals back into the wild where THEY belong! They are only gone because selfish and ignorant people killed them all out of fear and greed with not a single shred of possible negative consequences or effects to our ecosystem. To put it simply: if you are wandering around the mountains and get attacked by a bear, it is NOT THE BEAR'S FAULT! The bears lived here long before invading Europeans decided to colonize and massacre the entire continent. WE did that! PEOPLE killed them. And now that we have even a minute chance to fix one of our many, MANY blunders, we are refusing?!?!?! That is unacceptable! Next all of the scared opposers to this reintroduction will be saying we should kill all of the sharks, too, because those evil and malicious creatures "might" hurt someone who feels entitled to their places of living. Why stop there?! Kill all the birds, too! They poop on our cars and that inconveniences us. HOW DARE THEY!!! Cut down ALL the trees as well, because they block the invader's path and view and they "might" fall on someone's house or garage. You know what? I'm sick of all the bugs, too, so let's poison every single thing they depend on so we don't have to be concerned with the pesky things that "might" bite or sting us.

You g**d*mn people are unbelievable. You've got no problems shooting and murdering a human if they trespass on your property or wander into your homes, but the thought of a WILD ANIMAL hurting you or yours when YOU'RE the ones trespassing on THEIR property is just too much to handle. You ignorant, gun-toting fools have your automatic weapons with virtually limitless bullets, but you're all scared sh**less when it comes to the possibility of *actually needing to protect yourselves with those weapons, instead of just stockpiling them to compensate for all your little insecurities.

I'd laugh if I didn't feel so g**d*mn sorry for the lack of folds on your brains. It's pathetic, really. You should be embarrassed for yourselves. Your level of ignorance is astounding and if I didn't see it in person with all the policies and arguments that crazed-right wingers make then I would truly believe that level to be impossibly achievable.

Correspondence: Other national parks like yellowstone and denali national park already coexist with grizzlies. Humans cannot control every aspect of nature and there is some assumed risk when going into the wild. If the parks were to block off everything that was a risk why do they promote self rescue when needed. In regards to livestock loss statistics would need to be presented on how many bears are killing their livestock making significant losses. The ecological benefits in other animal reintroduction programs show that predator reintroduction is possible. Similar to the wolf reintroduction program in yellowstone. Bottom line. Bring back the bears! - [REDACTED]

Correspondence: The North Cascades are good for bears for many reasons, including a plentiful supply of huckleberries, a highly diverse ecosystem, and very few roads, particularly in the core of the region, conservationists said. Grizzlies are "nature's gardeners," spreading nutrients and seeds and helping the ecosystem. Encounters between grizzlies and humans are rare in areas where the bears currently live.

From my understanding of this draft if bears were reintroduced, the plan could bring in 5 to 10 bears every year, with the hope of reaching a population of 25 -- a "minuscule" number for the ecosystem's size. I would love to see the grizzlies back in their natural habitat. Thank you for your time.

Correspondence: Reintroducing grizzly bears to Washington state is being hailed as a noble conservation endeavor, but I will voice dissent and highlight the potential risks it poses to innocent residents, tourists, and hikers.. Grizzly bears, as apex predators, come with inherent unpredictability and their reintroduction into areas frequented by humans is a recipe for peril.

Grizzly bears' territorial instincts and maternal protectiveness can quickly escalate encounters into life-threatening situations for hikers, campers, and residents. This recklessness will undoubtedly result in grievous injuries or even loss of innocent lives.

The potential negative economic ramifications cannot be ignored. Fear of bear encounters may well dissuade tourists from exploring the scenic wilderness of Washington state, causing harm to local businesses and communities dependent on tourism.

The strain on wildlife resources is another grave concern. Grizzlies require vast territories and substantial prey populations, which may disrupt the delicate ecosystem balance, endangering other species.

Lastly, the management of human-grizzly conflicts would demand substantial resources - both financial and time-consuming. Taxpayers would be burdened with funding these endeavors, potentially diverting funds away from more pressing needs.

While conservation efforts are laudable, the heedless reintroduction of grizzly bears to Washington state is a decision fraught with perilous consequences for innocent citizens and the environment.

Correspondence: Washington has enough trouble managing the the predators they already have on their landscape. Adding another apex predator will only exacerbate their issues. Additionally, we've seen significant issues with grizzly bear reintroduction I'm other locations and the inability of controlling agencies to get them off the ESA listing is a strong indication they should not be introduced elsewhere. If they can't be successfully removed and delisted in such suitable habitat as the Greater Yellowstone Ecosystem then they are not likely to be successful here.

If/when you can get them delisted in the areas they have already been reintroduced then maybe it will be appropriate to look at this reintroduction and redirect those resources to this project.

Correspondence: The "need for action" section states that grizzlies should be reintroduced for the benefit and enjoyment of present and future generations of people. In reality, very few people would benefit from grizzly bears being in the NCE. The opportunity to see a grizzly bear is not worth the fear, anxiety and real injury/death that will result from grizzly bears being present in the NCE. I want my children to be able to be outside without the concern of dangerous grizzly bears in the neighborhood.

I live in the NCE, am passionate about the environment and want to see reasonable ecosystem restoration. The NCE is not a pristine habitat- it is degraded by human settlement, logging and hydro-electric projects. Ecosystem restoration should focus on resolving and minimizing those impacts. Grizzly bear re-introduction is not going to result in meaningful ecosystem restoration and is only going to scare and upset the local public.

I have friends who work for the North Cascades National Park Service. I only hear negative things about the funding, staffing levels, management, culture and work environment in the park service. I do not have faith that the park service is adequately staffed or funded to responsibly re-introduce grizzly bears and manage the impacts of said actions.

I would strongly support the "No Action" alternative A.

Correspondence: This comment applies to both the EIS and 10(j) alternatives concerning grizzly bear reintroduction in the North Cascades. I have previously written in opposition to any reintroduction and do so again as proponents keep advocating otherwise.

To kidnap grizzlies from current habitat and plunk them into the North Cascades wilderness is an act of cruelty to the individual animal. They live in their present location because the ecosystem has allowed for their species propagation. The trauma of trapping, transportation, and relocation to a habitat not presently populated by their species in an unconscionable violation of the bear's quality of life.

The North Cascades habitat was once populated by bears, but this is when they could range far and wide into the river valleys and lowland areas that today are populated by humans. Their survival in the wilderness areas of the North Cascades will not be afforded this former access to food and terrain resources because of the human presence. They cannot be confined to the wilderness ecosystem, and their current scarcity in that ecosystem speaks to the lack of viability for survival there. Were it viable, natural populations would have occurred from contiguous habitat.

The North Cascades wilderness is being utilized in ever increasing numbers by humans. There are presently such remote possibilities of grizzly bear encounters that there isn't any culture of preparedness (such as carrying a weapon or bear spray) by those hikers, climbers, etc. To provide for the aforementioned traumatized bear to encounter the unprepared (or for that matter prepared) human is asking for trouble. A lawsuit for damages and harm to humans from such a confrontation would be entirely justifiable. There should not be an acceptance of any loss of human life in pursuit of reintroduction.

Other wildlife that is presently surviving, sometimes precariously, in the proposed reintroduction area may be adversely impacted by the grizzly reintroduction. The wolverine for example, has been able to survive in stressed numbers. Has there been a proper assessment of the impact that the grizzly reintroduction would have on the wolverine? If grizzly bears range into the reintroduction area from currently contiguous habitat, that is a different matter. But if the proposed reintroduction, facilitated by the human interference and use of trapping and transportation technologies adversely affects other wildlife, how is that justified?

There have been more than enough tax dollars spent in pursuit of reintroduction. It is a bad idea, and there should be no further resources spent on this matter.

Correspondence: I believe that the North Cascades National Park is unique because it is true backcountry wilderness that is relatively close to a huge urban area. This provides quick access to wilderness for millions of people that may only have a few days available for an excursion. I have personally taken my family and Scout troops to North Cascades National Park many times for backcountry or dispersed camping. It has been wonderful to have an area where young scouts feel safe to learn and explore outside of a traditional campground. Our Scouts now never want to go to traditional campgrounds. They have learned how to use bear boxes and ropes, how to use backcountry toilets or properly bury waste, how to pack in and pack out everything they need. They learned what to do if they encounter wildlife such as black bears, cougars, etc. However, I feel that this would not have been possible if there were Grizzly Bears in the park. Parents would have been reluctant to send their children and the Scouts would have been so focused on their concern for Grizzly Bears, that they would have spent less time focusing on their experience and perhaps have backed out completely.

We are lucky to live in an area where within a days drive you can get to places that already have Grizzly Bears. This allows for those people interested in that experience to go and seek it out. However, it allows everyone that is not interested in camping or hiking with Grizzlies to enjoy the North Cascades. This is one of the least used national parks in our region and I fear that the reintroduction of large numbers of Grizzly Bears may diminish those number further. Or perhaps draw people to the park that are looking to interact with the Grizzlies in a damaging way.

Correspondence: This is the dumbest idea we've ever had. Where do you think those bears are going to spread to? There aren't any predators to keep them in check.

When the headlines start coming out of all the people getting killed on the PCT I guess we know who to blame.

What was once a safe place to visit will be just like other states with grizzlies. I would be afraid to go on a hike, that is not the point of having a national park for all to enjoy.

It's only a matter of time before the bear population spreads putting more people in danger.

Correspondence: I would like to express my disagreement with the plan to reintroduce grizzly bears into the North Cascades Wilderness Area. I do not understand the logic involved in this decision. One does not have to go far to read news stories about people being mauled and/or killed by grizzly bears in areas where they have been re-introduced or live naturally. We do not need or want to have this happen in the North Cascades by placing bears in that area. As populations of grizzlies increase in other areas, they expand naturally as is evidenced by grizzlies being encountered in areas of Montana where they have not been seen for a century.

Further, there is a healthy population of grizzly bears in British Columbia, which borders Washington to the north. There are no physical barriers on that border and bears do not know or understand political boundaries. It would seem logical that if the bears wanted to live in the North Cascades because it is such wonderful habitat, they would already have crossed from BC and be here. The fact that they have not tells all that needs to be known.

I do not support killing them off if they disperse to this area naturally, however I also am strongly against artificially placing them in the environment to cause physical and economic destruction to those who live and recreate in that area.

Correspondence: Please do not add any Grizzly Bear to our Cascades. Today, two people and their dog were killed in Banff and last week a women in Yellowstone was killed. I have taken my nieces, nephews, and my children, and their friends backpacking into our backcountry here in Washington State for the last forty years. I feel safer in the backcountry than I do my own backyard. People without homes are living in the green spaces near homes in Washington State. When I take youth into our backcountry it lifts their spirits, grounds their soul, invigorates their bodies, ignites their curiosity, and leaves them wanting more. Yes, there are always risks when exploring the backcountry. I am responsible, and do my best to plan, manage, and weigh the risks before choosing our adventures. Let me tell you what our kids are dealing with in our junior highs and high schools. They spend the school day in crowded institutions. Their bathrooms are filled with kids vaping, smoking cigarettes, and weed. Their peers are more interested in saying indoors and playing video games on the couch. These kids are stressed and depressed. Some of the youth that I have taken into the backcountry have dealt with suicidal thoughts. When they get into the wilderness, it changes the scene, allows people to relax and not be inundated by the noise of the city and breathe air that is not tainted by someone else's method of decompression. Honestly, the wilderness has the ability to provide the healing that our youth are desperate for. Adding in Grizzlies to our North Cascades would be a step in the wrong direction for our current and future youth's mental health.

Correspondence: Citizens of the US and Canada have repeatedly made the collective decision to provide amends toward historically marginalized populations of humans. Why wouldn't we do the same for other large mammals? We now realize that eliminating grizzlies from the North Cascades was wrong. We have the resources to facilitate a return to their natural habitat, so we should do it. I am a frequent user of wilderness areas throughout the North Cascades for recreational purposes and am 100% supportive of grizzly reintroduction, even if it may require changes and inconveniences on my part. This has worked in other areas and is the right thing to do here in Washington as well.

While certain groups may oppose the idea of living, working and recreating in grizzly habitat, once this process is set in motion they will quickly adapt to the new normal and realize there was little reason for concern.

Correspondence: While I have a great respect for the objectives as stated in the Draft Restoration Plan, I must also respectfully disagree that human-enabled reintroduction makes sense. The simple fact of the matter is that 2023 is not the 1800s. Habitat encroachment (through both development and recreational use) has reached a point to where there will be guaranteed conflicts with humans. It's not about being rare... it's just a matter of time. Additionally, other animals have filled the roles of the grizzly in the absence... what will happen to the black bears once a superior predator is introduced? They will get pushed into human development or otherwise get squeezed out of the ecosystem. While the intent seems good, it feel irresponsible to intentionally introduce an apex predator manually knowing conflicts will occur. Should bears come back in from Canada and re-establish, that would be different entirely and should not be hindered. But let nature do it if it is meant to be. We cannot just un-do hundreds of years of habitat usurpation by simply air-lifting a few grizzly bears into an area... that simply doesn't make sense.

Correspondence: Dear state wildlife managers,

I appreciate the opportunity for the public to comment on this important piece of proposed conservation legislation.

As a resident of the state of Washington and recreational user of the Cascades, I believe that re-establishing a grizzly bear population in our great state is a necessary piece of conservation work to develop a more resilient Cascades ecosystem. The Cascades need their top predator back, and I hope that lawmakers prioritize the environmental benefits and conversation science over the perceived threats made by ranchers in the area. The bears were here first; we owe the species a shot to repopulate and restore the natural balance of the Cascades that existed for thousands of years before any European colonizers got here.

Correspondence: I support Alternative C described in the DEIS for re-introduction of grizzly bears to the North Cascades Ecosystem. The DEIS provides exhaustive analysis of the environmental effects of reintroduction, and Alternative C provides an efficient process for mitigating possible adverse effects on the trans-located bears and conflicts with ranchers and back-country users, though I think that encounters with bears are exceedingly unlikely even when the population reaches the goal of 200. I believe the primary benefits of re-establishing a bear population in the NCE are ecological, i.e. restoring the historically apex predator, but I fully support the cultural benefits that will accrue to Native Americans who have lived in this area for thousands of years. Thank you for the opportunity to comments.

Correspondence: My comments as a commercial organic farmer in Western WA, regarding reintroducing Grizzly Bears in certain areas:

As I have seen with other species - this is not a harmless, no cost proposal:

- This can result in increased investment in fencing, deterrents, and hazing (which is usually prohibited), which can negatively impact farmers and ranchers like me and neighbors like me who are already working on thin margins.
- The introduction of grizzly bears may increase stress on herds and flocks of many kinds of livestock, leading to reduced fertility (due to the stress) and other immeasurable impacts.
- It may also pose a danger to people's safety during work and recreation activities.
- As usual, since we (real farmers) are only 1% of the population, if enacted this will increase economic burdens on farmers, making it harder for us to diversify, reducing viability and leading to further consolidation.

The Endangered Species Act (ESA) restrictions are quite harsh for farmers and ranchers like me since they may prevent us from making productive use of their primary business assets in and around the farm. Furthermore, the actions of the federal government make it clear that impacts caused by species on the ESA are to be borne entirely by the landowner unless state

governments are willing to step in and help compensate for losses. Loss mitigation efforts by the state fish and game mostly tie the hands of state employees and landowners and take too long to enact so crop and property damage occur. This proposal does not have effective provisions to help landowners and farmers to protect their business assets and crop production.

Please keep me posted on the status of this proposal.

Correspondence: What value does the reintroduction provide to the state of Washington and the local communities that will be affected by there presence. Nothing. This is a total feelgood idea. The predator population is out of control. How bad will our deer and elk populations suffer when these apex predators are released. Between the cougars, wolves and now possibly grizzly bears they stand no chance. If grizzly's come back on there own so be it. But introducing these in a densely populated state is irresponsible and unsustainable for our deer and elk populations. It sounds to me that the people interested in this idea do not spend much time outdoors. This state is overpopulated and recreational users and hunters alike will be put in danger all so the Feds can feel good.

Correspondence: This should not be a political or environmental issue. I am a citizen living in Vancouver WA and one who spends 5 mos per year in Colorado. Colorado is in the midst of reintroducing more wolves into non wolve environments. As usual, many of the voters (primarily in Denver) who approved this measure are not aware of the devastation the wolves will do to elk and deer herds but never the less think it is a great idea. Again, same same in Washington State regarding the grizz.

The North Cascades are one of the most hiked areas in the United States. As the recent incident in Banff highlights, even those who supposedly know what they are doing can be victims of an aggravated bear attack. Throw in protection of a kill or the bear feeling its young is threatened and the entire scenario in Banff is easy to understand.

Please let nature run its course. The bears will find their way into the area. Don't set people up for another incident such as the Banff one. We are no longer living in the 1800's. Recognize that like it or not. population growth makes the decision to re-introduce the grizz back into Washington's North Cascades a bad one but will cost a fortune and eventually, probably lives.

Thank you.

Correspondence: Speaking as a Pacific Crest Trail hiker who's spent time in this area, I think this may lead to dangerous hiker-bear encounters. There have already been sketchy black bear encounters in the region where bears displayed aggression and habituation to hikers based off reports I've heard from other PCT hikers. If this happens to reintroduced grizzlies, the results could be deadly. Unfortunately, I have met numerous PCT hikers and weekend backpackers in this region who do not practice any kind of bear protection for their food. I doubt this will change anytime soon which raises the risk of dangerous grizzly encounters if they are reintroduced.

Correspondence: I am somewhat conflicted, as I know that these beautiful creatures once roamed here before human intervention. My input however, is that many humans who are using our national recreation areas are not equipped/able to handle the intense responsibility that comes with maintaining distance between bears and humans. I worry that either the humans will be at risk without intense oversight, or the bears will be at risk, if they become food aggressive or territorial. I believe that the environment no longer serves their needs, and if it did, there would be a natural migration from areas they are already found.

Correspondence: As a resident of Washington and backcountry recreationalist, I support Alternative A (No Action). I disagree with the dismissal of environmental justice from the analysis because it does not meet the Justice40 requirements or because low income communities are not the focus areas for reintroduction. There is no data or analysis to backup the dismissal. These animals have a range and will undoubtedly disproportionately affect lower income communities.

As a backcountry recreationalist, given the recent fatal attacks in Banff British Columbia, I am not reassured that the use of management will protect my safety or the safety of workers. Bears are not managed until after a human-bear incident occurs. An incident with a large grizzly, while rare, can result in the loss of human life. I do not agree with taking on this risk given that these bears have had the opportunity to be in the North Cascades for decades - there is nothing stopping them - and there is no evidence that they have crossed the border in need of habitat.

As a Washington resident and taxpayer, I do not support any alternatives other than Alternative A (No Action).

Correspondence: The Sauk-Suiattle Indian Tribe is fully and adamantly opposed to the reintroduction of Brown bears (Grizzly's) into the North Cascades. This is a poor idea introducing a know apex predator into a high use recreation area, where it will pose an immediate threat to human life. Further, if reintroduced, their presence will further deplete populations of deer, elk, and fish, that are a guarantied right to the Point Elliott Treaty Tribes under the Point Elliott Treaty of 1855. However if introduced the brown bear would fall under the hunting rights of the tribes as outlined in the 1855 treaty. We would highly encourage the halting of this process. It is ill conceived and will cost lives, resources, and money to ultimately remove them from the area again.

Correspondence: I've spent time hiking in the wilderness in grizzly country, and time hiking in the north Cascades, and I would prefer not to have grizzlies reintroduced in the North Cascades. Brown bears are terrifying predators, and reintroducing them is likely to lead to death and injury of humans by the bears, and while education and other mitigation can reduce the amount of catastrophic bear encounters, it cannot eliminate them. Education and mitigation efforts require resources, of course, and the upshot will be that the forest service budgets will be stretched thinner than they already are, in order to provide an incomplete solution to a problem which is already solved by not having grizzly bears in the North Cascades.

Excluding the cases of death or serious injury, it is worth noting that *any* encounter with a grizzly bear in the back county is going to be terrifying and is likely to ruin the day of both the hiker and the bear. I've been hit by bear spray splashback, and

even that mild dose caused painful burning for days, I can only imagine what the bear must feel. Beyond that, reintroduction of grizzlies will lead to more people carrying bear spray and firearms into the back country, which means more bear spray and firearms accidents, all of which could have been prevented by not reintroducing bears.

Please do not add grizzly bears to the North Cascades.

To Whom It May Concern:

I feel quite strongly that grizzly bears should not be introduced into the North Cascades, but be allowed to repopulate naturally.

1)There are resident grizzlies just north of the North Cascades Complex in Canada. Even more are found farther to the east in the Rockies.

2)There are documented "visits" of grizzlies into the North Cascades.

3)Grizzlies are known to range widely in search of new areas to inhabit.

4)If there isn't a population already in the area by this point in time, maybe it's because of other naturally occurring conditions that preclude their staying/maintaining in the area.

5)With the amount of tourism and hiking done in this area, including the Pacific Crest Trail, I really don't feel these animals should be introduced to the area. If they expand their range from Canada, so be it - but let it occur naturally.

Thank you for taking these points into consideration.

A Concerned Chelan County Resident

Correspondence: I do not agree that we should be introducing Grizzly Bears into Washington State. They are predators! Just two days ago, 2 people were killed by Grizzly Bears in Canada. They would be devastate local farms and wildlife. Introducing Grizzly Bears would also negatively affect tourism and discourage those who love and appreciate the great outdoors. It is time we put people and people's ability to earn a living and enjoy a great quality of life above animals.

Correspondence: I do not wish to see grizzly bears introduced anywhere in Washington. OK if they find their way here from Canada or Idaho in a natural way. My reasons for objecting are: Senator Morton passed a law years ago that grizzlies were NOT to be introduced to Washington from other places. I still agree with this law. An apex predator and hikers, farmers, and ranchers in the area of introduction is a very poor and dangerous situation. Introduced wolves have been extremely bad neighbors for the farmers and ranchers and make hiking dangerous as well. Bears make it worse by far. Neither predator will stay in the high mountains, as wolves have proved, and soon find easy prey on farms and then in towns, eating livestock, pets, garbage, and the constant worry that children will be next. I live in the mountains and do not want to share my land with grizzly bears. Black bears are enough of a worry. Please listen to the people who live in the mountains, not the city folk or those from out of state. They have no "skin in the game" and WE DO! Thank you for the comment period and the meetings.

Sincerely,

Correspondence: There are already grizzlies in the north cascades. Additionally, there is NOTHING preventing even more natural grizzly migration from states with existing populations. ON TOP OF THAT, states w/ growing grizzly populations are experiencing increased human-grizzly conflict and fatal encounters. Any discussion of grizzly re-introduction MUST BE coupled with a grizzly bear hunt. These animals MUST maintain a healthy fear of humans to keep conflict at minimum. All that said, it would be best NOT to re-introduce grizzlies at all.

Correspondence: Option C, which involves designating grizzly bears in the US portion of the North Cascades Ecosystem (NCE) as a nonessential experimental population (NEP) under section 10(j) of the Endangered Species Act (ESA), offers a comprehensive approach to grizzly bear restoration and management. This alternative allows for the careful management of a geographically separate population of grizzly bears distinct from other non-experimental populations. By labelling the population as "nonessential," the focus can remain on the survival of the species while taking into account the effects of establishing an experimental population.

Additionally, under Option C, special regulations govern the management of this experimental population, providing authorized agencies with greater flexibility to address conflict situations, promote social tolerance, and ensure human safety. This flexibility includes management actions, including deterrence, incidental take, research and recovery actions, relocation of grizzly bears, preemptive relocation to prevent conflicts, and even conditioned lethal "take" when necessary.

By delineating three management zones and considering the specific circumstances in which "take" may occur, Option C outlines a well structured approach to managing grizzly bears in the NEP area. This approach is not only essential for addressing human-bear conflicts effectively but also for advancing the recovery and reestablishment of a self-sustaining grizzly bear population in the NCE. The description of management tools and approvals in each management zone, as detailed in the FWS's proposed 10(j) rule, ensures a balanced approach that prioritizes both conservation and human safety.

Correspondence: I'm against Grizzly Bears being planted in the North Cascades for the following reasons:

This action may have significant impacts on the local community closest to the area where the bears would be introduced. One of those factors may include discouraging potential employees from entering the job market in certain commodities due to increased risks, which could reduce the available labor force for employers.

It may also affect a result in increased investment in fencing, deterrents, and hazing, which can negatively impact farmers and ranchers who are already working on thin margins. The introduction of grizzly bears may increase stress on herds and flocks, leading to reduced fertility and other immeasurable impacts on agriculture and our food supply.

These actions will pose a danger to public and private citizen safety during work and recreation activities, which can also further increase economic burdens on farmers, making it harder for them to diversify, reducing viability and leading to further consolidation.

The Endangered Species Act (ESA) restrictions can be particularly harsh for farmers and ranchers since they may prevent them from making productive use of their primary business assets. Furthermore, the actions of the federal government make it clear that impacts caused by species on the ESA are to be borne entirely by the landowner unless state governments are willing to step in and help compensate for losses.

It is essential to note that Section 10(j) specifically violates Washington State law, as RCW 77.12.035 states that "Grizzly bears shall not be transplanted or introduced into the State."

Correspondence: Dear WA State,

Your organization has made a shambles of wildlife management over the years. Please stop introducing or reintroducing animals to our ecosystems (mountain goats in the Olympics... epic disaster... turkeys everywhere... mostly just annoying...).

Grizzly bears already exist here in natural sustainable numbers. Do not introduce more. There have been several grizzly attacks this years across the west, and we don't need to invite attacks here with introduced animals that exist beyond the means of the ecosystem. Their population will continue to grow naturally in the state. Focus your efforts (and our money) on creating recreational opportunities, not meddling with an already intact ecosystem.

No extra grizzlies in WA!

Respectfully, [REDACTED]

Correspondence: Reintroducing the Great Bear to the greater NC Park area is essential to redress the historic harm to the bear and to its former environment. After the wolves were returned to YNP in the mid-90's, the grizzly made a natural comeback there. Today, the Greater Yellowstone Ecosystem (GYE) is home to over a 1000 grizzlies with very little adverse consequences to humans. Any problems have been mitigated due to constant oversight by the State and Federal agencies.

There's no significant reason the same cannot be accomplished in the NC ecosystem which contains over 600,000 acres of the Stephen Mater Wilderness, an excellent place to plant the seed of grizzly reintroduction. If the GYE is as successful as it is with the growing grizzly bear population without any designated wilderness area, there's zero reason the NC cannot be as successful with its large expanse of wilderness. Thank You.

Correspondence: <https://www.npr.org/2023/10/02/1203036630/bear-attack-couple-dies-canada-banff> This is one example of a Grizzly attack that killed a couple and their dog while camping in Alberta Canada just yesterday.

I am FIRMLY against the re-introduction of Grizzly bears to our region.

My reasons include that I and my family do go camping and that there are no means to protect ourselves from these apex predators. Having a complete understanding of the nature of these omnivorous creatures and the history of attacks which highly outnumbers those of mountain lions and wolves respectively. Also seeing the effects of re-introduction of another species of ELK into our region which are on the protected species list and the negative effect upon life and agriculture in my own life as a negative experience. There have been numerous deaths caused by ELK from a herd named Pinelli Herd and their presence is protected meaning they can not be culled or hunted. My wife having been involved directly with a destructive attack on her halted vehicle which our insurance company had to total in Sedro Woolley, Washington. They eat the farmers crops and create a threat directly to myself in my daily life. I have met them crossing the highway as a herd of hundreds entirely at night while going 50 MPH as well after turning down my street and they have been in my yard as an entire herd before. The impact of re-introduction of a species that wasn't even from this region has been detrimental to our ecosystem and has caused the loss of human life and continues to do so. There is NO reason to bring foreign Grizzly bears to our area, if they need to migrate back they will as do all species in this world. They do not need our help as there are thriving populations in other areas and regions of our continent. There has been an ongoing argument between local farmers and the Upper Skagit Indian tribe about fishing rights and elk conservation already that is currently unresolved. This idea proposal further initiates conflict in our region. Nothing good will come from putting Grizzly Bears in our forests. The other species will migrate away from where the relocated foreign species settle and create problems for not only themselves but humans. Regardless of tracking and population control efforts, these auxiliary problems which will only be tracked and studied as problems and addressed after which may cost the lives of human beings and then numerous tax payer dollars to study and resolve problems that currently do not exist and would be created due to the enactment of such proposal. Logic dictates that, "If it isn't broken, don't fix it.". There is no need for relocating Grizzly Bears to Washington state. Furthermore State and Federal rules and treaties with Tribal communities have been preferential toward the tribes hunting rights and restrictive to non-tribal hunters which needs to be addressed as it applies to our waterways. As well the ELK population should be relocated to the North Cascades with precedence to any proposed Grizzly bear re-location or re-population instead . Thank you for reading my comment and taking it into consideration.

I vote when I am allowed and I respectfully vote "NO" on this proposal.

Furthermore as a current F.C.C. Licensed General Class Amateur Radio Operator and G.M.R.S. licensee, I must introduce my concerns as a radio operator. In our society of licensed amateurs we are active in many forms of furthering communication as part of what some call a hobby and others a scientific endeavor. We have radio operators that consistently do what are called P.O.T.A. activations at National Parks as well S.O.T.A. activations which are usually done by hiking through sometimes already dangerous areas to reach a mountain peak where radio operations are done in a contesting manner. I may wish to engage in this activity with my son in the future and the proposal at hand significantly endangers our safety while engaging in hiking to a mountain top. This is my own personal opinion as one multi-licensed radio operator and I make no official representation of the many clubs which I am affiliated.

Thank you for your time,

Correspondence: I am opposed to reintroducing new grizzlies into the North Cascades. The area allows for remote access for recreation and conflict with bears far from services or support would be a significant deterrent to some and would likely encourage others to take overly aggressive measures. After experiencing bears in Alaska there is no good current solution to human and bear coexistence. The bears need to be away from humans no matter how beautiful they are it poses a direct and unnecessary conflict that has been shown over and over again. These animals are beautiful and wonderful when given free reign. The idea of releasing them and then recapturing when they inevitably wander into conflict is cruel and stressful to both humans and the bears.

Bad idea! Best for bears and humans alike to have separate spaces!

Correspondence: As of right now this state doesn't need more apex predators in it. The miss management of predators now, is hurting the game populations in the region they are looking to put these into. With what they are wanting by adding more Grizzly's too there will not be the amount of food to keep balance of the game over predator balance. When I mean add they are not reintroducing them to the area. There are Grizzly's there now, not in abundance but if it had the holding capacity of these animals there would be more now. I grew up in this area and saw two grizzlies with my own eyes years ago (in two completely separate areas), which tells me if the habitat was able to support them then they would already be a growing population. So, until the state can halfway mange the wildlife that is already here, we do not need another APEX predator in this ecosystem.

Correspondence: I support Alternative A. I do not support introduction of more grizzlies into the NCE.

- 1) The historical population is irrelevant to modern day, we have over 8 million people in this state and thousands of miles of highways.
- 2) We don't have the prey populations for the current predators, never mind adding a new apex predator.
- 3) BC is full of grizzly and they can no longer be hunted, they'll move in slowly and naturally should the habitat and prey

ever be healthy enough to sustain a population.

4) The people of Washington have already resoundingly rejected this proposal, trying to force it down our throats every year is truly pathetic.

Correspondence: While the idea of restoring grizzly bears to North Cascades National Park may seem appealing from a conservation perspective, there are legitimate concerns and potential harm that should be considered:

Human Safety: Grizzly bears are apex predators and can pose a significant risk to human safety. Their presence in areas frequented by visitors and park staff could lead to dangerous encounters. This may necessitate increased safety measures, such as bear-proof food storage, which can be inconvenient for park-goers.

Impact on Local Communities: The reintroduction of grizzly bears could affect the livelihoods and safety of local communities surrounding the park. Ranchers, farmers, and residents in the vicinity might experience conflicts with bears damaging property or livestock, leading to potential economic losses.

Disruption of Ecosystem Balance: Grizzly bears are known to have substantial impacts on ecosystems due to their predatory role. The reintroduction could disrupt the existing balance of species within the park, potentially affecting prey populations and vegetation, and even leading to changes in the behavior of other wildlife.

Limited Habitat and Resources: The North Cascades National Park might not have enough suitable habitat and natural food resources to support a healthy grizzly bear population. Insufficient food could lead bears to seek alternative food sources, potentially increasing conflicts with humans.

Costs and Resources: The process of reintroducing grizzly bears is expensive and resource-intensive. It involves monitoring, research, and ongoing management efforts, which could divert resources away from other conservation projects and park maintenance.

Ethical Concerns: Some argue that it may be ethically problematic to reintroduce a species into an environment that has changed significantly since their absence. The original ecological context may no longer exist, and the reintroduction might not be in the best interest of the bears themselves.

Public Opposition: The idea of introducing a large predator into a park may face significant opposition from local communities, park visitors, and interest groups. Public opposition can create challenges in implementation and ongoing management.

Correspondence: Regarding grizzly bears:
I'm against the plan to introduce the grizzly into the North Cascades. I love the area and like to hike on the parks many trails, but people already have to avoid black bear and cougars. While those species are dangerous they come nowhere near the danger posed by grizzlies.
Thank you

RE: Reintroducing grizzly bears in the North Cascades
From: [REDACTED]

Thank you for allowing comments from the public. What is the purpose of the National Park System? If it is to provide enjoyment, education, and inspiration for American citizens and future generations, why would we want to introduce

predatory animals who would endanger citizens and future generations? Grizzlies are dangerous. Is the National Park System trying to go against its purpose and force people to stay away from our national park lands?

This has some similarities to the idea of bringing in more mosquitoes to areas so they can bite humans and other animals to infect them with deadly viruses. Mosquitoes kill more people each year than any other animal. Just because we have been able to remove them from an area to make it safer for people and other animals, does not mean we should now reintroduce them to an area where they are no longer a threat. This seems like a crazy, warped political and/or environmental idea.

Wolves used to be a dominant predator in what is now the Portland metro area. Should we reintroduce wild wolves in neighborhoods throughout Portland because they once lived there?

Reintroducing grizzly bears has far more downsides than up. That is unless the purpose of reintroducing this dominant predator is to reduce the population of other wild animals and keep humans off the public lands that we pay for and which were set aside for us to enjoy.

I think this is a horrible idea and hope you do not reintroduce grizzly bears.

Correspondence: I personally do not support bringing grizzly bears into the north cascades. Grizzly bears rarely wonder down into this area but it has been known to happen and if their population naturally grew into the north cascades I and everyone I know would be in favor of it. In my opinion bringing endangered predators into an area proves to be unsupported by the community and with Washington states terrible politics the grizzly bear population would get out of control. A prime example of this is in Montana where grizzly bears are becoming a problem yet we can't get them off the endangered species list although there is a plenty sustainable population. Allow nature to run its course and the grizzlies will be in the north cascades in a much more acceptable timeline and with a much better public acceptance.

Correspondence: Real wild like science shows that grizzly bears are already in Washington state. Coming from Canada and Washington. This state can't manage the mountains lions in the state with the 2nd highest present of attacks by cougars in the lower 48 states. The wildlife governing body of the wildlife commission manages by political favor not sciences. You are asking for another failed experiment. Favoring popular democrats that want to drive into a park take a picture. They live in a fantasy world that the state hides the truth from. They believe the government takes problem animals and moves them some where else. Where the truth is the animal is destroyed through in to a land fill. This removal is not behind the backs of the clueless. The state is destroying the deer and elk herds in this state with the management of the predator that are already here. The cougar and wolf problem are out of control.

States that truly run a wildlife program with conservation in mind like Alaska and Wyoming that truly have the welfare of the animal in mind work with the hunting community to control over grazing and the control of predators. There have been 5 grizzly attacks this year in the western reagents of the us and Canada.

Put people in charge of the Washington game commission that understands the balance of nature not people that fall under a political agenda. This state can't afford the lawsuits that will come form there miss management of a grizzly populations

Correspondence: I am a biologist, a science educator and a hiker. Grizzly bears are an important part of the Cascade Mountains and Pacific Northwest ecosystem. Grizzly bears were extirpated from the Cascades and most of Washington State due to hunting and ranching. There are concerns, of course, for grazing animals, hikers and others who may encounter grizzlies. Dangerous outcomes are fairly rare when examining encounters in other northern states. This should not be a reason for banning the return of grizzlies to the Northern Cascades. There are far more dangers in the urban world of crime and cars. People who live near or choose adventures into wild areas need to respect animals in nature and act accordingly. I live five minutes from downtown Bothell and downtown Woodinville. I have coyotes, bobcats and an occasional bear visit my property. We need to learn to live with wildlife, not ban them from their natural habitats. The longer we disrupt the natural ecosystems the more problems we will encounter. Education is key. Bring back grizzlies to their natural habitat.

Received: Oct,03 2023 19:01:26

Correspondence Type: Web Form

Correspondence: I live in Skagit County, Washington State, and it appears that we have fallen back on an old childhood adage: If mother says no, ask grandmother. Time and again, the citizens of East Skagit County who are most affected by Grizzlies and elk have said no and hell no.

Now we are presented with a new and different twist in the 10 (j) rule ensuring East Skagitonians that this is a better alternative to the original plan and fewer bears would be turned loose on us. The elk were also transported here in fewer numbers and look at us now! Then, of course, there are the wolves to add to our mixed bag of ecological bliss. This unpleasant state of affairs is hailed by those who do not live in the county or at least, anywhere near where these bears are to be transplanted.

If the Canadian First Nations turn their Grizzlies loose above us, then ultimately, we can expect the 10 (j) rule to turn into the original plan.

[Per wdfw.wa.gov

Most Grizzly populations require huge areas of habitat remote from most human activity.

Grizzly bears are common only where food is abundant and concentrated (salmon runs, caribou calving grounds, etc.)]

[Males roam the most, using areas from 600 to 1,000 square miles. Females use areas up to and beyond 100 square miles. Grizzlies may travel 20 to 40 miles a day.]

Since there is no guarantee that these bears will stay in their safe space and no guarantee that food sources will always be plentiful, the next stop logically would be closer to civilization. Like the elk that have become close to domesticated, why work for food in the wild when you can enjoy the spoils of Skagitonians' habitat by government sanction.

Moreover, using deductive reasoning, one can only conclude that WDFW and supporters of their agenda have no regard for human life as we have seen with the out of control elk population in Skagit County.

Share The Bear Program: An Equal and Impartial Opportunity

In the spirit of social justice and fair and equitable treatment, let's have a Share The Bear program whereby every proponent of this ludicrous plan gets to have a sleepover and host a bear in their backyard for the weekend. We would not want to deprive any bear-watcher of their basic human right for the same opportunity shared by East Skagitonians. Our Food Bank could partner this endeavor and enlist Meals On Wheels to deliver leftover food to backyards for the bear to snack on all weekend.

In conclusion, enthusiasts who don't live here, have no concept of rural living, and make no economic or social contributions to our way of life in Skagit County are bent on forcing their ecological imaginings upon us free of all consequences. Moreover, we have a long history of paying these ecological consequences with little relief from government. Our citizens, their children, and their children's children deserve to live in Skagit County with peace of mind and safety within their own communities. We do not desire Grizzlies in Skagit.

Correspondence: I think bringing Grizzly bears to the North Cascades would be considerably unwise. Washingtonians are not use to grizzly bear mannerisms and it won't be long until humans will encounter bear attacks. Washington has enjoyed its preserved recreational spaces. The population around the North Cascades is much closer to the wild, and much larger than communities In Idaho and Montana. I don't think Washington State should allow any Grizzlies in the area, not with the Pacific Coast Trail, the frequented National Parks and popular state parks within and next to the National Forests. Grizzly Bears are extremely dangerous compared to black bear, our large town of Wenatchee borders the North Cascade Range, the safety of our children hiking and camping is more important than grizzly re-entry. Let's not forget WHY Grizzlies are no longer in Washington. Farmer and agricultural worker safety, crop preservation for the millions and millions our state provides food for (more potatoes than idaho, 95% of all pears the nation has in grocery stores) AND recreational safety... We already deal with Cougars, and they are more recluse than these aggressive glorious creatures!! I love wildlife and want to preserve it, BUT in more remote areas!! Washington, especially the communities most impacted (who love the land and the preservation of it) VOTE NO TO GRIZZLY RE-ENTRY.

Correspondence: Grizzly bears are already migrating here. Reintroduction is a terrible idea. As a life long Elk hunter in this state I've watched our populations continue to fall in huntable areas. This state has already begun wolf reintroduction, another terrible idea. If we continue on this path we will no longer have deer and elk to hunt. These large predators will then move to cattle, domesticated animals and finally people.

There is a reason these bears are no longer here, they kill...

This state has far to many left minded anti hunting people as it is, what will control populations of these reintroduced animals, NOTHING.

Correspondence: The more huge and the more dangerous and the more numerous the huge dangerous predators the better. The thought that you and your family could be disemboweled in your sleep or be ripped apart limb to limb at any moment while hiking a wilderness trail is what makes camping and enjoying wilderness areas fun and exciting. Grizzly bears by the hundreds would be a great start!

Additionally, threatened species the world over need habit. A fantastic and suitable addition to the North Cascades would be at least a small breeding population of Siberian Tigers. They love snow and eat deer. They would fit right in. Now let me tell you,... turn those things loose and by golly you would amp up the excitement factor right off the scale in no time.

Those are my thoughts. Hopefully you will get right on it.

Sincerely, [REDACTED]

Correspondence: NO- do no re-introduce grizzly bears.

They are an apex predator with ch will cause havoc with people, farmers and other animals.

They serve no purpose in the management of the N Cascades.

There are plenty of black bears, cougars, bobcats as apex predators to take care of the balance in the eco system.

The answer is NO.

Correspondence: This is a bad idea, bad idea, bad idea! As a public entity your first and top priority should be public safety, period. This will create inevitable conflicts with the probability of deadly consequences. I use these lands almost every weekend in the summer months. I trail run, hike and bike, all solo, on many of the trail systems in the North Cascades and the Okanogan-Wenatchee national forest. The reintroduction of grizzlies will make it impossible for me to SAFELY use the public lands where I live.
I am appalled that we are having this conversation let alone that it is being pushed by your department.
Public lands are set aside so that all its citizens can safely recreate and enjoy them, not so that fish and game can experiment at the cost of human life.
Perhaps you should reintroduce T-Rex, I understand that they used to roam this area as well.....might be safer.

Correspondence: I think this is a really bad idea, being a hunter the predator population is out of hand in our state. The amount of game for hunting is down considerably because the game department has done such a horrible job of regulating the wolves, cougars, bears and coyotes, to introduce another predator just doesn't make since. Also, more people than ever are using the national forest and wilderness areas for recreation and we all know this will lead to more conflicts and humans being attacked and killed. With the past history of the game departments failure to do their job right when it comes to predator regulation I cannot support the introduction of grizzlies in the state of Washington.

Thank You

Correspondence: I agree with brown bears being moved to Washington. Americas wildlife has been devastated from its once abundant biodiversity. Bear hunting should be banned trophy hunting is immoral. Animals don't exist to be hunted. Alot of Americans want to see the biome thriving and brown bears have always had a cultural significance to the native Americans. Anyone hiking in the wilderness can and should have some type of weapon for self defense however. Finally I don't think bears eating ranchers property should be put down.

Correspondence: I support option A - NO ACTION. This is not the first time public comments have been sought on this issue of reintroducing grizzly bears into the NCE region. Each time, the resounding comments from people who live, work and recreate in that region has been that we do not want the reintroduction of grizzlies in this area. Whenever grizzly bears are introduced the population of deer and elk and salmon is reduced as the bears have to eat. When adequate amounts of the above feed is not available, the bears are apt to seek sustenance by feeding on domestic animals, pets and perhaps even a human. The law requires that the forest system be managed for multiple uses which include ranching/grazing, hunting, fishing, recreation of all kinds, etc. Grizzly bears have the potential to greatly disrupt those activities. Please drop the idea of reintroducing the grizzly to the NCE.

Correspondence: While I can appreciate the efforts to restore and protect the Grizzly Bear population - the North Cascades are now vulnerable to wild fires and the impacts of climate change. This is a vulnerable environment and I would much

prefer that the National Park Service focus on saving the forest. We are in a critical juncture and without forests the bears cannot survive any more than humans can. We need to prioritize issues of climate change and the risks to forest lands. Returning Grizzlies is not the highest priority for the Cascades.

Correspondence: I am strongly against reintroduction of grizzly bears into the North Cascades. There will be a natural introduction of these animals as populations expand in our surrounding areas. Having moved to WA from states with grizzly bear populations and spending time in grizzly bear country as well as many friends; there are plenty of close calls and numerous fatalities caused by these animals. The ability to spend time in these places without a prominent predator, introduced by humans, is a privilege. We need not to interfere with the carrying capacity of a thriving ecosystem to drive tourism to remote areas.

There needs to be a plan to control population if this introduction goes through. Look at wolf introduction in Yellowstone and the effects it had on the ecosystem as well as the business of ranchers, farmers, and hunters.

Correspondence: Please do not bring grizzly bears to our state. We have a lot of families hiking and encounters with grizzly bears are much more dangerous than anything we have here. Introducing this apex predator would increase possibilities for people to be seriously injured or killed. If that happens no "sorry" or "higher environmental goals" would mean anything to grieving families.
Please leave bears where they are and do not bring them here.

Correspondence: I do not support relocation of grizzly bears to the north cascades national park. I believe there will be user bear conflicts in the park similar to what we have seen in Montana and recently Coleville, WA. In the short period of time they have been introduced into Yellowstone there has been a dramatic increase in bear conflicts with users. This will also happen in the north cascades if they are reintroduced.

Correspondence: I do not believe introducing grizzly bears into Washington state is a good idea. I enjoy hiking and recreation within the Wenatchee national forest with my children. Given the recent deaths of two adults while camping by grizzly bear in Canada, and the nine other deadly attacks within the last three years this is a threat to public safety. Grizzly bears can be territorial, protective, and predatory. Park attendance will fall along with revenue from Discover Passes. Please do not reintroduce grizzly bears as proposed.

Correspondence: The historical population is irrelevant to modern day, we have over 8 million people in this state and thousands of miles of highways.

We don't have the prey populations for the current predators, never mind adding a new apex predator.

BC is full of grizzly and they can no longer be hunted, they'll move in slowly and naturally should the habitat and prey ever be healthy enough to sustain a population.

The people of Washington have already resoundingly rejected this proposal, trying to force it down our throats every year is truly pathetic.

Correspondence: The reintroduction of grizzlies to the North Cascades is a stupid, foolhardy plan seemingly designed to please the smug, self-satisfied employees of the Interior as they sit in their air-conditioned offices in Washington DC.

Meanwhile, those of us who have spent our lives recreating in and living near the North Cascades will be saddled with the threat of potentially hundreds of extraordinarily dangerous apex predators. I personally do not look forward to having to carry a 45/70 rifle with me everywhere I go while backpacking on the Crest.

The proposed rules casually dismiss the threat these animals pose. Given how few people actually spend any significant

amount of time in deep wilderness, the threat to the human population at large will certainly be small. But that is little comfort to we few who actually do spend extended periods of time in these mountains.

While the NPS can glibly dismissing any dangers, even a casual observer of news would note that just last week a couple and their dog were killed and partially consumed by a grizzly in Canada while camped in the wilderness. Perhaps instead of the North Cascades we could instead introduce the grizzly to Rock Creek Park in DC and see how the interactions go there?

If one wishes to experience grizzlies up close and in-person, go to Alaska. Leave us be in Washington.

Correspondence: NO MORE PREDATORS!!

We know that Grizzlies already exist in the North Cascades of Washington. Adding to that population just increases competition for an already dwindling ungulate population. Our state has already seen a huge increase of black bear, cougar, and an out of control spread of wolves. Adding another apex predator to the mix will increase danger to humans and increase the amount of money spent to euthanize "problem animals". Our state's WDFW commission has already mismanaged the predator population and this mismanagement is getting worse.

Correspondence: I am in favor of restoring grizzly bears to the North Cascades. We must correct the missteps of previous generations that attempted to and did wipe out these magnificent creatures in order to restore the ecological balance of the wilderness. Just as the wolves in Yellowstone had a great positive impact on the environment, so can the grizzlies in the North Cascades. In addition, the grizzly is an iconic figure for Native Americans.I believe any depredation of grazing stock can be controlled, such that the reintroduction of the grizzly will greatly outweigh any such losses.

Correspondence: I ask that we do not reintroduce grizzlies to North Cascades National Park. I live in Washington State and hike/backpack several times a year in the park. The scenery there is simply breathtaking. While I've enjoyed watching black bears from the trail a number of times on hikes through North Cascades, I really do not want to worry about encountering a grizzly on the trail. I encountered a family of grizzlies once in Glacier National Park, and it was a terrifying experience. They came right out of the woods as we had stopped to eat lunch and somehow ended up with my group in between the mom and the cubs. I really want to keep enjoying the North Cascades without having to worry about a threatening situation like that happening again.

Correspondence: The North Cascades is a natural for grizzly reintroduction. I saw a griz and her cub near Watson Lakes about 50 years ago and, although I'm now 77 and probably won't get that lucky again, I think there is great value in knowing that sons and daughters might have that chance and that old brains can rest assured that the N. Cascades are closer to a point of repose with regard to fauna habitation.

More heavily used areas might turn into zoos or fire public outrage or become traps for the effort if included in the plan.

I think, although the biology and history is of great interest, more summarized narrative always gets people more involved than extensive rafts of detail,

I salute this long awaited effort.

Correspondence: I cannot think of a positive reason to do this. There are three main points to make. First of all, hunting opportunities for deer and elk have greatly diminished thanks to the reintroduction of predatory carnivorous wolves and omnivorous grizzlies in other parts of the state. Mountain lion populations also continue to increase further intensifying the competition for food with other predators. Couple this with human expanding human presence, and humans become the next alternative. This reckless and unsafe idea lacks foresight and consideration on who it will impact the most negatively, namely the human population. This leads to my second point.

We no longer live in the year 1492 when these creatures inhabited the land and had near sole reign over the ecosystem. Humans are not an invasive species and should the Dept. of Interior needs to stop treating us this way. When humans arrived, we altered the environment, true, but this is a natural process since humans are part the natural world. Any notions to REVERSE THE CLOCK are foolish and lack forethought. The romantic notion that we can somehow expand the grizzly bear population to "balance" ecosystem is not a scientific idea. Rather, it is an emotional romantic dream that antisocial people with a chip on their shoulder against white European settlers. Environmentalists have conjured up this retribution as a way to OVERCOMPENSATE for past human practices of hunting wolves and bears. Reintroducing these predators WILL NOT reset the clock back to 1492.

Third, we already have areas where grizzlies and wolves have been reintroduced and are being monitored. This is sufficient in itself already. Wilderness areas and the National Wildlife Refuge system are set up for this purpose and it has already been started. There is no good reason to continue the RECKLESS expansion.

Correspondence: I agree fully with comments submitted by the Chelan County Board of Commissioners. Times have changed a lot around here since grizzly bears once roamed the North Cascades. These days, the mountains are crowded with hikers, almost all of whom are unarmed, and the number of people living in mountain residences has grown exponentially. Grizzly bears are apex predators, and kill people.

There is a population of grizzlies in the North Cascades now, in British Columbia. Nothing is stopping them from expanding their range southward, which they'll do if it appears to them to be good habitat. Please don't meddle.

Correspondence: I commented during the previous period before that restoration plan was halted. Now that the current administration has reopened the comment period, I'd like to say that I sincerely hope that this time the process can be brought to fruition and a limited number (at first) of grizzly bears can be reintroduced into their former home range. The same landscape is still there--mostly within the North Cascades National Park and is wilderness, as wild as one will find in the Lower 48. Return of the bears would only add to the improvement of the landscape, being a keystone species, and grizzlies will have a positive ripple effect on the whole ecosystem.

Correspondence: I am writing these comments as a public citizen even though I am a fishery manager for a resource organization. I am probably bias with my views as would have loved to be a bear biologist if I did not chose aquatics.

I have had positive experiences with Grizzlies throughout my life from Alaska, Canadian, and Montana. I have educated myself on these animals too and I find them curious opportunistic animals.

I am for a limited reintroduction where habitat can support forging opportunities that include tubers and berries.

These introductions should all be collared and monitored. I know this type of monitoring already goes on near ski resorts in Canada where there is close contact with human infrastructure. Presently, we have a very health black bear population in the North Cascade with very little conflict.

Correspondence: I am in full support of reintroducing Grizzly Bears back into their native habitat in the North Cascades. They need a place in this world and the North Cascades is one of their native habitats, and will provide a start to providing them with a home again.

The only concern I have is that when humans go into the Grizzly Bears habitat, which they most definitely will, that a bad encounter because of domestic dogs and bad human behavior will cause those bears to be killed. So I believe there needs to be required education on bear safety to anyone entering the bears habitat, and maybe warnings and disclosures to inform all humans that if they get eaten or mauled by a bear, the bear WILL NOT be killed in repercussion. It seems that every time a

human or livestock gets attacked or killed by any animal the poor animal gets hunted down and killed. Something needs to be put in place to protect the Grizzly Bears that are reintroduced and populate so that the program is successful and not a waste of time, effort, and taxpayer dollars.

Correspondence: Good morning,

I am a proponent of the reintroduction of grizzly bears into North Cascades national park. This was their original home range and a return would be fantastic for the ecosystem and also for tourism, much like how people come from all over to enjoy the wildlife wonders of Yellowstone, which has benefitted from the reintroduction of apex predators.

Beyond that, a reintroduction would also benefit the residents who already live in the Pacific Northwest, such as myself. It is unfortunate that due to our human presence and expansion that we have reduced the natural range of the grizzly bear. To have them return would be a step to returning the location to what it once was.

I also would like to point out as many people probably have, that this reintroduction would not negatively affect farming or ranching as apex predators appear to create balance instead of imbalance. They would not be hunting the cattle or livestock of animals as long as they have ample resources within the park complex ecosystem, which is one of the largest in the parks system. Beyond that they would also help keep the deer and elk populations in check, which would in turn reduce accidents in the road from collisions and also allow areas to recover from overgrazing - which is actually something livestock are guilty of.

One caveat to my positive comments is that since grizzly bears left the range I hope the parks have a plan to provide them what they need to keep them happy, healthy, and able to live in the area with all the human pressures. Otherwise, they will either die or leave again.

Thank you,

Correspondence: I am in favor of reintroduction of grizzly bears. We have been without this magnificent animal for too long. The human population and our development has expanded exponentially, crowding out much of nature in the past 200 years. It is good to try to reestablish a complete ecosystem including top carnivores and native species for the maintenance of the Earth's life support systems. In turn humans benefit from these ecosystem services and enjoy wild places. Canada, Montana and Wyoming have grizzly bears and get along quite well. As a hunter and avid outdoorsman I hope to see a wild grizzly bear. The dangers from bears are highly overrated and pale in comparison to the dangers involved in driving a car or many lifestyle choices people make everyday..

Correspondence: Grizzly Bears are a natural part of the NW environment. While they are feared because of some unfortunate contacts with humans, they generally avoid such encounters. I grew up in the Rocky Mountains of Canada in an area where grizzlies were abundant. The message was to watch out that an encounter did not force the grizzly to attack because you blocked its escape route. The same is true of all bears, especially a mother with cubs. We can live together!

Correspondence: Grizzly reintroduction is a bad idea and not supported by the majority of populace affected by this plan. For one, there are already many grizzlies in the north cascade region of this state. This includes with sitings from north

cascade E/W border all down to conconully, Winthrop, Omak, republic etc all with sitings. They are here naturally already moved down from Canada including Moose and the habitat is supporting it's natural carrying capacity. These regions already have a reduced and critical mule deer population due to expanding human settlement and car impacts and further introducing more Apex predators will continue to pressure this herd. Grizzly are already here and introducing more is going to have a very negative impact instead of letting natural settlement take place as it has. WA state is bad with predator management and balancing populations and many predator attacks to livestock and humans have already occurred. Please refrain from any further human interference and let's focus on safe mule deer migration routes if anything.

Correspondence: Reintroduction of grizzlies bears into the North Cascades will not be managed in conjunction with conservation of other big game. Washington fish and game commission has failed to prioritize the management of predators populations and ungulate populations. The commission is not prepared for the reintroduction of a new predator while maintaining the health of other big game species. The commission does not follow the advice of biologists and continues to vote based of subjectively rather than objective data.

Correspondence: Typical WA DC Bureaucrats deciding what's best for a location more than 2,000 miles away...
"Grizzly bears shall not be transplanted or introduced into the state. Only grizzly bears that are native to Washington state may be utilized by the department for management programs." Seem fairly plan to me that the citizens of the state clearly do not want grizzlies transplanted or relocated into the state.. The few that are here already seem to be fine and so far we haven't had deadly encounters that Wyoming and Montana have had.

10 years ago there were more than enough grizzly bears in Wyoming yet they remain unmanaged.

After crossing paths with a grizzly at less than 25 yards and not being one of the tragic stories is miraculous..

Luck, and a little bit of grace are the only things that saved the three of us from disaster. These 800 fur covered wrecking balls should not be in every possible location. They are already protected and the population is maintaining or growing at a pace quicker than they should be... Leave WA alone and let the bears that are already here do what bears do.. WA does not need your help. Listen to the local voices not Seattle.

Correspondence: Hi,

There's really no need, and no good reason to place more grizzly bears in the cascades. If the habitat remains protected, the grizzly population will continue to grow, and natural growth is far better than introduction efforts. Introduction efforts are expensive, and the bears will not all survive, and those bears are far more likely to cause human conflict in their unfamiliar habitat... please do not do this!

Correspondence: Hello ,

Regarding the plan to reintroduce Grizzly bears to the North Cascades, it seems like a foolhardy and irresponsible action at this time. Grizzly, like many other predators, are naturally expanding their territories. We have seen this with wolves, cougars, and a variety of smaller carnivores. In fact, in the absence of serious trapping and due to carefully managed damage control and hunting opportunities, large predators populations are in a better place overall than they may have been for over a century. If the habitat will support them, Grizzly bears are either already present or will be present shortly as they move in from surrounding states or Canada. The time, money, and resources needed for a Grizzly reintroduction effort could surely be used somewhere else where there is a more dire need. I certainly love the ide of Grizzly bears on the landscape but I also love the reality of healthy predator and ungulate populations and a balanced ecosystem.

Furthermore, Washington state has clearly proven they are unable to objectively follow scientific data in managing large predator populations. The cancellation of the Spring Black bear season is a looming red flag primarily driven by uniformed or biased public opinion. I admit, as a non-resident, have limited voice and input. My concern is the kind of precedence we set state by state as these wildlife trends certainly seem to cross state lines.

There is no doubt that bears and people can coexist as they do in many other states. But why force the issue- it only creates huge divisions in a state where there is already a growing divide between rural and urban/suburban populations. It is clear that some of the folks attempting to force this issue will never need to worry about livestock depredation, wild game depredation or their own personal safety while in the backcountry. Please, at the very least, listen very carefully to the people that will be forced to deal with either naturally occurring or reintroduced Grizzlies. Their opinions must carry a certain weight that should not be ignored.

Correspondence: It is my understanding that the Biden administration and the National Park Service are taking significant steps in bringing grizzly bears back to a productive and wild ecosystem spanning Washington and British Columbia. As a proponent of Northwest Conservation, I have read their reports on the restoration proposal and have taken much of their comments in favor of the proposal into my comments.

The grizzly bear has always been and is still the North American wildlife icon. The grizzly has immeasurable ecological and cultural value for our ecosystems and communities. We have a unique opportunity and obligation in the PNW to co-author a significant conservation success story - to restore the grizzly to a small but important part of its traditional home, as has been stated by the Director of Northwest Conservation.

I understand also, as indicated by Northwest Conservation, that the National Park Service has identified the North Cascades as one of North America's premier intact ecosystems. But the North Cascades is incomplete without grizzly bears. As I understand it, this is the second attempt by the agencies to restore grizzlies to the North Cascades after a 2015 process was halted by the Trump administration in 2020. At the time, more than 159,000 people wrote comments supporting the reintroduction of grizzlies. Thankfully that administration that was a threat to all ecosystem re-establishment attempts has ended and the Biden administration which is more friendly to ecological restoration projects is supporting the proposal for the return of the grizzly.

The NCE is one of two grizzly recovery areas without an established population of bears - and natural bear migration is unlikely to repopulate it. Instead, wildlife biologists, based on decades of thorough research, suggest safely relocating existing bears into the North Cascades. Biologists have not been able to find evidence of a reproducing population in the North Cascades in more than 30 years and chances are near zero that grizzlies will reestablish themselves without human

assistance. That is why this restoration effort is so necessary.

Restoring grizzly bears to the North Cascades Ecosystem is a crucial step in preserving the region's ecological and cultural heritage. We must ensure the successful reintroduction of these iconic animals.

Thank you for the opportunity to comment and I want to thank the US National Park Service and US Fish & Wildlife Service for all their efforts to bring this proposal for grizzly bear recovery and for listening to the public's interest in bringing this plan to fruition.

Correspondence: We strongly support the planned release of 3 to 7 grizzly bears into the NCE (North Cascades Ecosystem) over roughly 5 to 10 years with a goal of establishing an initial population of 25 grizzly bears before switching to adaptive management.

Our preferred alternative is Alternative B as we would wish to see the reintroduced animals receive full protection as a threatened species with the existing special rule (50 CFR 17.40(b)) under section 4(d) of the Endangered Species Act (ESA) governing the regulation of grizzly bears in the lower 48 states.

In particular we have concerns that the more "relaxed" approach to the use of lethal force against individual bears perceived as being a problem would, given the low numbers of animals being released, be very likely to compromise the effectiveness of the plan.

It should be added that while Alternative B is our preferred option we would support Alternative C against Alternative A.

Kind regards,

Executive Director,
Bear Conservation

Correspondence: We hope the magnificent Grizzly Bear is restored to the Northern Cascades of Washington State, including North Cascades National Park. We have enjoyed them for years when living near and visiting Yellowstone and Grand Teton National Parks. As far as we know, they contribute in many ways to the environmental health and public enjoyment of the areas where the bear resides. They are incredible animals and we are in awe of their beauty and behavioral traits. They were a natural part historically of our area. When they were lost, a valuable part of that area was missing. The Grizzly Bear brings grandeur to the areas they reside. I have read that the North Cascades ecosystem is one of the largest areas of uninhabited wild areas in the lower United States, which is wonderful and of which we are blessed. One of the values of the North Cascades, is that there is one main road, Highway 20, running through this region, until you get to Highway 2, Stevens Pass. This is basically, a very large, wild region of country, where the Grizzly Bear could live, and not impact human development much. I could be wrong about my evaluation of this. I don't know much about minor roads, forest service and logging roads. The Grizzly Bear has expanded its range in the last few years into Jackson Hole, and the Northern Wind River Range of Wyoming. I haven't heard that this has cause much problems. Yellowstone National Park has wonderfully managed the Grizzly Bear, since the 1970's, when the Park changed its strategy of trying to manage the bears more naturally, stopping the bear feeding along the Park's roads and responsibly handling the garbage of the Park to avoid bears depending on getting food from the garbage. Now, I have had the incredible privilege and enjoyment of watching Grizzlies in Hayden Valley from a distance, doing incredible things. I have watched them interacting with wolf packs, hunting, and playing in one of the tributaries of the Yellowstone River. It was like watching a child splashing and running its arms through the water creating waves. The bear was just delighting, playing in the water. We have enjoyed the Grizzly Bear Discovery Center in West Yellowstone, Montana. We traveled there, not only to enjoy Yellowstone National Park, but also just to enjoy the Grizzlies and wolves at this public attraction in West Yellowstone. In closing, I would like to say again, the Grizzly Bear is an incredible and valuable part of an ecosystem, and brings so much value to where it is allowed to reside. We would love to have it back to the wild North Cascades and bring more glory to this wild and wonderful area. Sincerely, [REDACTED]

Correspondence: I am a avid outdoorsmen who loves nature and I stand strongly AGAINST bringing the majestic grizzly bear back to the North Cascades. I spend a lot of time hiking in the North Cascades and when doing so I enjoy the area much more knowing that I will not encounter grizzlies. When a I visit Yellowstone, Grand Tetons and Glacier I avoid hiking in areas where there are grizzlies. The death of the 2 experienced backpackers carrying bear spray at the teeth of a grizzly on 9/29/23 in Banff illustrates why we should not bring this danger back to the North Cascades. I urge you, for the safety of your fellow citizens, to end this attempt to bring grizzlies to North Cascades.

Correspondence: Hello. I want to state my opposition to bringing these predators back to Washington State. There is no good reason to do this. If someone wants to see a grizzly bear they should go to Montana or Wyoming. Plenty of people are killed by the desire to go where these Apex Predators live. We don't need that opportunity here in north central Washington. How many of our fore fathers and there family members were killed getting rid of these monsters? We also don't need to be spending our tax dollars supporting these type of ideas. Sent them to Canada not Washington State!

Correspondence: After reading the article in The Wenatchee World by reporter Oscar Rodriguze, I would like to leave a comment.
It seems like we care more about the farmers, ranchers, builders, and real estate developers than we do about the grizzlies. After all, that is probably why there are so few of them left in the North Cascades.

I admire the U.S. Fish&Wildlife Service and the National Park Service employees for wanting to help restore these animals to their natural environment. It seems like they will have to jump through hoops to to accomplish this. Keeping the people with money and power happy is what it amounts to. I think the saddest part is when the article says famers, ranchers can "hazer and kill the bears" when needed,

Why would we do this to this animals? We took their land.

Long comment short, I admire these agencies for what they want to do, I hope it will be successful for all---including the Grizzly bears.

Correspondence: Hello, my name is [REDACTED] I am contacting you regarding the desire to bring grizzly bears into Washington. Currently there is no boarder fence between the USA and Canada and there are grizzly bears in several other states which boarder Washington. If the bears want to come in there is nothing stopping them. The grizzly bear is an omnivore and at the top of the food chain, no other predator without a weapon is able to survive a grizzly bear attack. There are many people who enjoy the Federal Lands that tax payer money purchased, those people will be at great risk of loosing

their lives because of re-introduction of grizzly bears. In 2023 alone there have been several attacks by grizzly bears in the USA and Canada, resulting in death of people as well as grizzly bears. Grizzly bears are intelligent animals who learn that humans usually have food with them or near them, the bears want the food and they take it, usually at the cost of someone's life. A sow may have cubs that she is protecting or feeding and that may be her reason for being aggressive, or it could be a boar who is establishing his territory. All of these are reasons for the grizzly bear to attack. I do not believe that tax payers, whose money was used to establish these parks, voted to have their lives put at risk to enjoy the parks. In Alaska there are parks where people go with a guide to view the grizzly bears feeding along the rivers. These guides have a high powered rifle just in case a grizzly should charge. Is it the plan for the National Park Service to have guided tours through their National Parks with an armed guide to protect the people? Bear spray works at very close range, if a bear is charging you and you spray it in the face it does not stop the charge it only blinds the bear and makes it angrier. You still get run over by 500 to 1000 pounds with claws and teeth. Most humans do not survive that experience, please do not re-introduce grizzly bears to Washington Federal Lands.

Correspondence: I am writing these comments in opposition Grizzly Bear Reintroduction into the North Cascades Ecosystem. As a resident that lives with a sixty mile radius of the reintroduction zone, I know that I won't be affected by the bears right off bat. But as the population increases over time and through the natural process of moving into their own individual territories these bears will eventually find their way into populated areas. And as with almost every interaction between wildlife and humans. The wildlife would come out on the short end. Furthermore, since these bears prefer to solitary animals outside of the breeding season. Mother bears would move farther away from the boar's range and would lead to more interactions with recreationists and with landowners.

The Methow Valley is not that far as the crow flies from the reintroduction zone and cattle operations in that part of world would be impacted by bears when they come in contact with the cattle on summer pasture which even if depredation of livestock didn't occur. Just large predators in close contact with cattle affects their productivity because of the stress placed on them from hypervigilant behavior brought on by the predators. This has been proven in studies involving wolves in the Wallowa Region of Eastern Oregon conducted by extension and BLM personnel. Along the same lines the distance to where sheep are grazed in the forest around Lake Wenatchee is not out of the migratory patterns of the Grizzly Bear and depredation of sheep by bears is well documented in sheep producing states that have Grizzly Bear populations.

The North Cascades National Park and Stehekin provide unequaled recreational opportunities and they are lifeblood of the both the park and the community. Bears especially as the population increases would negatively impact that industry and community itself. I encourage the agencies and individuals involved in this decision to weigh very carefully the adverse economical impacts of this plan against the perceived ecological benefits.

Thank you for your time and consideration of these comments.

Correspondence: As a voter, resident, land owner and avid back country user in one of the affected counties(Chelan) I would like to say that I am very much in favor of reintroducing grizzly bear back into Washington state. Ownership of federal lands is shared by all citizens, bear can be an issue for some use cases but that alone doesn't mean they should not be part of the environment, please take into account all points of view on the matter. Washington is part of their historic range and they should be allowed to exist and protected within that range to create a more full and robust ecosystem. Humans should learn to live with the environment not conquer it simply because it makes life easy, I think we have seen the ramifications of blindly following that thought process too many times now.

Correspondence: Grizzly bears are dangerous animals. I think that if you are going to intentionally place the Cascade hikers in harm's way, it's fair to hold you responsible for the harm the bears do. At the very least, you should be civilly liable, and I think you could make the argument that you are criminally liable since you intentionally introduced the bears here.

If grizzlies make their way here on their own, that's different, but what you're suggesting is no different that harboring a dangerous dog and turning it loose. Be careful here.

Correspondence: OPPOSED. The question that needs to be asked in regards to reintroducing the Grizzly Bear to the Cascade Mountains is "WHY"? The grizzly as the apex predator that not had an impact on this environment for decades. Life and the environment in this area has moved on. There are few areas, with the exception of northern Idaho, parts of Montana and Wyoming, in the west that are now wild and wilderness. All the rest are populated by man. Historically, man's coexistence with the grizzly bear, whether we like it or not, has not been a peaceful one. The bear, just like the wolf, is not going to recognize boundaries. So why and what is going to be accomplished and for who?

It's time to move forward and protect the grizzly habitat that exists. To create more habitat for this large aggressive animal is, in my opinion, a waste of effort, taxpayer money and government resources. Putting a collar on each animal is no different that creating a large zoo. And a bandaid for a bad idea.

Correspondence: I am all for wildlife in their natural habitat however I do see a problem with reintroducing them into the North Cascades. Mainly, if the habitat and prey populations were ideal grizzly bears would come down naturally due to the connectivity in habitat just like the Canadian lynx. So, if this is an option then have there been surveys of deer and other prey species in the range. Is it enough to sustain them? I think we should let grizzly bears come to the North Cascades naturally.

Correspondence: As an outdoor enthusiast who loves to hike, climb and boat in the North Cascades National Park, I love the idea of bringing an apex predator back into the wilderness. Those bears are natural to the ecosystem, and we have damaged the ecosystem when we removed them.

Some argue that the bears would reduce tourism activity, I don't think that would be a problem as there is no problem with tourism to other national parks with much more dense populations of brown bears. There are also concerns about bears encroaching on agricultural lands, that seems to be resolved with collars and tracking.

Correspondence: As an avid recreational visitor of the north cascades, I wholeheartedly oppose the reintroduction of grizzly bears. Recent grizzly bear attacks, including the tragic deaths of Doug Inglis and Jenny Gusse in Canada, and Amie Adamson in Montana, point to the reality that the safety of citizens is not guaranteed in environments where Grizzly bears reside.

Washington is home to thousands of trails that are frequented regularly by both the experienced, and those new to the outdoors. To add an additional risk of harm to these people unethical.

Correspondence: I oppose this dangerous plan to move more grizzly bears into Washington State. Crazy and dangerous. I don't want to have to carry a gun when out in the woods. Pepper spray is not effective against this extremely dangerous wild predator.

In Alaska people typically don't go into the woods without firearms. Construction sites near bears have to have armed guards loaded for bear. It is inherently dangerous, kind of like hiking in lion or tiger habitat with only a can of pepper spray. No one

would do that. The urban greeny liberals driving this dangerous grizzly policy need to get their head out of their ass.

This is so stupid and so unnecessary. Just stop.

Try reintroducing wolves and bears into the urban parks in Seattle instead. See what happens if you the feel the need for a project to study.

Correspondence: I do not support bringing grizzly bears to the North Cascades. I lived in Yellowstone for five years and during that time, at least four people were killed, some of those partially eaten, and my neighbor was severely mauled by grizzly bears. Another neighbor had had hundreds of stitches from an earlier incident. These were people who had the misfortune of encountering these bears while hiking, they weren't taunting the bears or approaching them intentionally. One was sleeping in a tent. These are just the incidents I noticed most, there were other maulings near the park and more deaths since that time in grizzly country.

Little attention was paid to these incidents at the time they occurred.

We were warned not to hike in groups smaller than four people. Do citizens really want to give up solitary hikes in the North Cascades? We also don't know what effects a warming, drier climate will have on bear behavior. Will their hibernation periods be shortened? This may very well lead to desperately hungry bears looking for food wherever they can find it and most likely increased grizzly-human encounters.

Correspondence: You cannot place a higher value on the lives of animals than those of human beings. If the possibility exists for even one person to be hurt or killed by one of these animals, then reintroduction should be off the table. Grizzly bears are one of the only large predators in North America known to actively hunt humans, and if the federal government wants to introduce them in an area that is frequented by humans in spite of the risks (however small from a statistical standpoint) that they pose, then they bear the sole responsibility for any harm to humans that may result from such action. I am not advocating for grizzly bear extermination, but they need to be left in the areas they currently habitate, rather than being transplanted into new areas that lack the necessary controls to protect people.

Correspondence: I strongly favor Alternative A, No Action. Reintroducing grizzly bears into the NCE is irresponsible and ill-advised. The region's population is growing, and increasing numbers of people are living and recreating in the mountains. Reintroducing grizzly bears will risk (a) more human-wildlife conflicts, resulting in injuries and fatalities; (b) greater recreation pressure on nearby areas without a grizzly population; or both. These risks far outweigh the limited ecological benefits of restoration.

When humans come into conflict with existing wildlife or other natural characteristics, responsible management to encourage coexistence makes sense. Adding back a hazardous animal to a well-used area where it does not currently exist does not make sense.

Correspondence: Good Evening,

I am writing this to voice my opposition to plans to reintroduce grizzly bears to Washington state. My biggest concern with reintroducing bears is their negative impact on wildlife and people that live in areas they will live. We've seen the states inability and or reluctance to control predators (wolves, cougars) at the cost of livestock and other wildlife and releasing grizzlies will on add to this issue. Please do not reintroduce grizzlies.

Correspondence: I am writing to express my support for Option C for the North Cascades ecosystem grizzly bear recovery program. As personal background, I am 74 years old, a retired geologist. For the last 57 years, I have enjoyed traveling on foot in the backcountry of the North Cascades, mountain climbing for several decades, and backpacking and hiking in later years. I have lived in Bellingham since 1964, and most of my outdoor travels have been in the North Cascades. However, I have also made trips to areas that have grizzly bear populations (e.g., The Selkirk and Purcell Ranges in Canada, the Canadian Rockies, and the Yellowstone ecosystem). I am aware that large predators have a potential for risks, but public awareness can mitigate most of these issues, providing safety for both humans and bears.

I support all steps that can be taken to preserve and restore the natural character of the North Cascades ecosystem.

Reintroducing grizzly bears in a region that was once their native habitat is an important step toward that goal. Given that their extinction was caused by humans, I believe that restoration of these magnificent animals to the North Cascades is a matter of environmental justice. It saddens me to know that there are people regard animals like bears and cougars as enemies, instead of creatures who play important roles in the natural cycle of wilderness life. This is a situation where a key element for successful grizzly bear reintroduction is an increase in public awareness; I believe that Option C is a step in that direction. The plan is detailed, carefully constructed, and based on many years of study. I hope that it can be implemented.

Correspondence: To whom it may concern,

I am writing to comment on the grizzly reintroduction plan, again. As a former Park Service and Forest Service employee, as well as a lifetime resident of rural Washington state with experience living, working and playing in the North Cascades, I strongly believe that grizzly bears should not be introduced into the Cascades. I urge the agencies involved to choose the "no changes" alternative.

I have reviewed the EIS and am quite concerned that reintroduction is a large experiment with one of the world's most dangerous land predators. Nowhere can I find that grizzlies have been inserted into a habitat without any existing bears. The EIS references some augmentation in the Cabinet Mountains, but there is no experience with dropping grizzlies into an area without any. The National Park Service has an infamous history of "experimenting" with grizzly policy with devastating results. Agencies rush to change policies, sometimes to match the politics of the day. They strive to make things more "natural" often fails to take into account the effects on individual animals, and the people that encounter them. The book Engineering Eden details how the zeal of the Park Service and push close the Yellowstone's garbage dumps did not adequately consider the effect on individual bears. This abrupt policy change contributed two separate grizzly attacks that killed two people. Four grizzlies were ultimately killed by rangers.

I am concerned that something similar could happen if bears are taken from their familiar habitat and surroundings, captured, traumatized, then dropped into a brand-new setting. All of this is to happen to these young animals in the late summer and fall, when they must find massive amounts of food just before hibernation. As any Yellowstone documentary describes, young bears learn all the tricks of survival from their mothers. Famously, bears in Yellowstone climb high into the mountains to search for moths in talus slopes. They also know when to head to the lower areas around Yellowstone Lake to catch spawning trout. These unique food sources, their locations, and the timing to forage for them, is all taught to cubs by their mothers. A translocated animal dropped into a new area could not know where special regional foods are located. This EIS doesn't consider factors, like this, that effect translocated bears.

The problems inherent in transporting any bears to the North Cascades, would be especially severe if bears were brought in from Yellowstone. Bears should never be transported from the greater Yellowstone area to the North Cascades. Yellowstone has vastly more protein-rich food sources, especially elk calves and deer fawns. The North Cascades has very few elk and a declining deer population. These areas are just too different to take a bear from the abundance of Yellowstone and drop it into the less productive North Cascades. The elk in the North Cascades are largely in the Skagit Valley near the towns of Concrete, Birdsvie and Sedro-Woolley. Bear predation on elk here sets up a ready-made conflict with people. The same is true for salmon, which are most available in the populated areas along the Skagit River. The EIS mentions "berries" as a main food source, but some years there are no huckleberries. In these years, even black bears are known to be more aggressive and seek out human food. Taking a bear from Yellowstone and dropping them into the North Cascades would be like forcing a carnivore to be a vegan overnight. This confused, hungry, lost and disoriented bear is likely to also become a dangerous bear very quickly.

The EIS contends over and over that one of the main environmental impacts that must tolerated is the disturbance from

helicopter flights. Seriously? Nobody cares about a helicopter!. The main environmental impact of moving grizzly bears around the country isn't the helicopter sound. The big problem is the on-the-ground presence of confused, lost, homesick and hungry grizzly bears in prime hiking, hunting, camping, ranching, farming and horseback riding areas.

The Park Service and other agencies should have a little humility, and go back to some of their earlier studies of similar translocations of large predators. In college, I helped with a paper on the effects of wolf reintroduction. The paper compared what was predicted in the wolf reintroduction EIS and what actually happened on the ground. The difference between prediction and reality was shocking. The wolf population exploded and the impact on elk herds was catastrophic when compared with the predictions of the EIS. For example, that EIS predicted that 100 wolves in the two release areas would be reached in 2002. In Yellowstone ALONE the population by 2004 was 174. In 2021 the wolf population in Idaho reached 1500, all with hunting, trapping and state management! Because the government essentially dropped a wolf bomb on Idaho, the local communities have not embraced the return of this prime predator, and a deep resentment of wolves exists in the rural communities that must deal with them. Perhaps, if wolves had been allowed to recover more slowly, on their own time, this animosity might not be as pronounced. Of course, grizzly bears will not expand so quickly, but the point is that EIS predictions are just that--predictions--and the agency doesn't have a very accurate crystal ball. The agencies really do not know what these bears will do, how far they will travel, how their behavior will be effected after being dumped into an unfamiliar area, how they will tolerate human interactions, and various other factors.

The EIS fails to really understand the human use in the relocation area, especially on Forest Service land. In the summer and fall the Pacific Crest Trail becomes a superhighway of thru-hikers, who start in the spring in California and end up at the Canadian border. As a local, I have recreated alongside this moving pulse of humanity. These hikers would be completely unprepared and unaware that they are heading into grizzly country. They all travel very light, move quickly, and cover 25-35 miles per day. They don't have extra weight like bear spray and bear canisters. There are no designated Forest Service campsites, like there are in the National Park. Many of these thru-hikers are really outdoor novices, many foreigners from Europe. They are not prepared to be hiking pell-mell through a grizzly reintroduction area. The Pacific Northwest Trail, while less used, is quickly becoming popular as well.

The "no action" or "no change" alternative does not mean there will not be grizzlies in the North Cascades. Grizzly sign is quite common in Horseshoe Basin area already. Keep up the monitoring for bears. A grizzly was just caught killing chickens in Colville, Wa. There is really no reason the bears cannot migrate into the area on their own, just like the wolves have. In fact, if the habitat was so productive, the bears should be there already. But with this marginal habitat, bear numbers will stay low, just like in the similar area north of the border. Let the bears return on their own. Do not transplant grizzly bears into the North Cascades.

Correspondence: I fully support and encourage the draft grizzly bear restoration plan and recovery plan in the North Cascades Ecosystem. The current status and 'do nothing' option is unacceptable. I want my children and future generations to know that these grizzly bears are still here. Previous generations have destroyed so much and removed forever the ecosystems and wildlife that I miss. Gone are the passenger pigeons, nearly wiped out are buffalo, birds numbers have dropped precipitously for the last 50 years. Billions of birds are lost. Without our active care and involvement, the grizzly in their native habitat will be gone too. Please help them recover and rebound as soon as possible.

Correspondence: I love nature, and I love all the animals in it. When I am enjoying the outdoors here in central Washington I carry bear spray and am confident in its effectiveness to deter an attack should I startle a bear or get a little too close to a family unit. I am not so concerned with my safety if grizzly bears are re-introduced to this area. What I am concerned with is the thousands of uneducated and unprepared hikers that visit our area each year to voyage to our beautiful lakes and peaks with their families. Our trails are extremely overcrowded with urban travellers from Seattle who saw Colchuck on Instagram and come here to take a selfie with the lake and Dragontail in the background. They usually know very little about hiking, have very little gear, and aren't even physically prepared for what they just drove two and a half hours to accomplish. Black bears are skittish in my experience, and in the experience of many outdoor enthusiasts I have spoken with. If they are far enough away when they become aware of the presence of a human they will quickly exit the scene. Dangerous encounters

are rare in our area. I have not even heard of one in the fifteen years I have lived here.

My knowledge of grizzly bears is limited, as I have not lived anywhere where they do, but the way they have been portrayed in the media leads me to believe they are not as skittish as the black bear and that they could pose a serious danger to these inexperienced citizens who have become accustomed to the inviting nature of our mountains here in Central Washington.

Correspondence: Grizzly bears originally inhabited land all the way to California. Now that land is heavily populated. I feel that encouraging their return and bringing them in contact with more humans is not in the best interest of the bears or humans. They belong in remote areas that are not frequented by man. Washington state is too populated and has a very strong outdoor recreation industry that would certainly cause conflict with reintroducing these bears to the environment.

Correspondence: Given the choice between endangered animals and endangering children, President Biden is unbelievably siding with the grizzly bears. The President's plan to introduce 200 brown bears into Washington state is unconscionable madness. We only need to look to Alaska, Montana and Canada to see the inevitable human injuries and deaths he is actively pursuing. Additionally, one wonders why Biden is handing gun rights advocates a new reason to need a gun. I'd love to continue to camp, hike and trail run without one. I'm urging my fellow Washington residents to join me in opposing this idiotic proposal from the opposite coast before cougars become the least of our worries.

Correspondence: Thank you for moving forward with the planning process for the critical restoration of grizzly bears to the North Cascades Ecosystem. I appreciate the hard work of the Service and all the stakeholders who had persisted in the advancement of this project over so many years.

I would voice my support for Alternative B. I recognize the desire of some interests to maximize "flexibility" and have "more tools in the toolbox" when it comes to re-establishing grizzlies across this landscape. Unfortunately, as I have seen many times across the West, "flexibility" and "tools" are considered by those opposed to recovering species and preserving wild landscapes as mere euphemisms for killing. Under Alternative C, I am concerned that frontline Service staff managing this project will be under constant pressure to utilize flexibility and move to bear killing at the first sign of conflict.

Some local landholders and politicians have found little reason to temper violent, insurrectionist rhetoric and spread misinformation about endangered species like grizzly bears and wolves. A plan that does not place strict sideboards around bear management could target frontline Service staff with threats and intimidation, not only to manipulate species management but to advance their own broader political agendas.

Grizzlies belong in the North Cascades Ecosystem, but the dedicated staff members of the Service also deserve strong

sideboards to insulate them from the aspirations of parochial interests. I believe Alternative B offers the best support for grizzlies and Service staff.

Correspondence: As a local, who would be directly impacted by this decision, I am asking you to stop with this idea that grizzlies need to be brought into the North Cascades area. The negative impacts on ecosystems, farming, and recreation would severely disrupt the local communities. With the non-native wolves that have been brought in, our prey population has been decimated. The grizzlies would not have an adequate food source as is. This would immediately bring them into local towns and orchards. Cattle ranchers in the area have already been hit with loss with wolves killing their calves. Wolves as you know, teach their pups to kill, taking out mass amounts of animals for fun. Grizzlies would already be here if there was an adequate food source. They are obviously smarter than the government officials and extremist who do not understand the situation, rather than just look at majestic pictures of animals on a computer screen. Imagine the number of hikers, pets, and cattlemen being attacked by being out in nature. Or what about the orchard worker coming across a sow with two cubs in an orchard row? Please stop with these absurd money wasting ideas and do something that will promote our food supply in America. These people you are trying to affect are the ones working every day to make sure the whole country/world is fed.

Correspondence: I am very much in favor of the reintroduction of grizzly bears into the North Cascades. These bears were an essential part of the natural ecosystem for thousands of years. The native peoples shared this region with these bears for many, many generations. Even though there is a much larger human population now, we should still be able to allow grizzly bears to live in the North Cascades wilderness. I frequently hike and lead field trips for the Washington Native Plant Society in the Mount Baker Wilderness, and I am aware of the danger to humans posed by these bears. Even so, the bears belong there and it is up to us to give them space to live.

Thank you for considering my input.

Correspondence: Hello,

I strongly oppose any re introduction efforts of grizzly bears into the North Cascades. There are no guarantees of the outcome of this plan. Grizzlies should be allowed to naturally work there way back to the areas they used to inhabit. Past practices that have contributed to a declining grizzly population have been curtailed greatly allowing for grizzlies to migrate like they once did. We should not be playing God thinking we know what's best. I fear any sort of butterfly effect that could stem from this plan. Thanks for listening.

Correspondence: Millions of people safely hike and coexist with grizzly bears every year in the Rocky Mountains and Alaska. There is more than enough room in the North Cascades for humans and grizzlies to safely coexist, and people can recreate safely in grizzly bear country. Even in Yellowstone National Park, which is much smaller than the North Cascades Ecosystem, hosts millions of visitors each year, and is home to at least 150 grizzlies, bear encounters and especially attacks are exceedingly rare.

Culturally and spiritually, grizzly bears are important to many of the Indigenous peoples in the Pacific Northwest, who have coexisted with grizzlies for thousands of years. We are grateful for the knowledge and deep respect these peoples hold on behalf of grizzly bears, who are often seen as teachers, guides, and symbols of strength and wisdom. Last, we have a moral obligation to restore grizzlies as a wilderness icon and a key part of our natural heritage.

Washingtonians have recognized grizzlies as a vital part of our natural heritage and have overwhelmingly supported this once-in-a-lifetime chance to restore them to the North Cascades. Humans were responsible for killing off grizzlies in the last century, and now we have the moral imperative to bring them back. Washingtonians want to coexist with grizzly bears in the North Cascades.

Correspondence: Please choose Alternative A: No Action. This will keep the North Cascades free from grizzlies. The North Cascade Mountains are within easy driving distance of several large cities, so there will always be large numbers of people walking there. To keep people from being killed by bears, grizzly bear restoration should be accomplished only in areas far removed from large human populations. Please limit grizzly bear restoration to areas that are not a 2-hour drive from large cities, and thus not the Cascade Mountains.

I was charged by a grizzly bear in Glacier National Park. She ran full speed at me from 200-yards away, and stopped 12-feet from me, seemingly without ever having decelerated. It was profoundly frightening. No one should need to endure that type of fright just because they want to stroll on inviting mountain paths. Grizzlies are unpredictable, so although many encounters will not result in human death, some will. We will be causing needless human death if we deliberately restore grizzlies to areas where lots of people can choose to stroll for an afternoon outing near home.

I say "needless" because the ecosystem of the North Cascades has adapted to the lack of grizzly bears for a hundred years, and it is functioning well enough to remain a beautiful place to visit, and well enough for other wildlife populations to thrive. Grizzly bears are not necessary in that area in order to keep the ecosystem functioning adequately. We should not make it a dangerous place for its many human neighbors to visit by reintroducing grizzly bears.

Correspondence: Out of the three options, I would prefer to see alternative C implemented. From the standpoint of someone who loves the outdoors, and especially the North Cascades, I think that reintroducing grizzly bears there is incredible. I think that alternative C is a better option compared to B because classifying the bears as an experimental population seems to give the FWS more jurisdiction in controlling and intervening with the grizzly bears when needed.

Correspondence: I do not support the reintroduction of grizzlies into the north cascades.

My reason for not supporting this proposal is simple. The federal government has not had a robust plan for delisting these animals. Grizzlies and wolves in the American west have been slowly advancing in numbers and territory. NGO/animal rights groups coming in as willing partners for reintroduction and then continuously litigate to keep these animals listed under federal protection even though the populations of animals and territory are justified in removing federal protections. Until the federal bureaucracies can stem the litigation and provide solid bench points for delisting and state management. I am admittedly apposed to any reintroduction of grizzlies.

Correspondence: In my opinion, grizzly bears SHOULD NOT be introduced into the North Cascades.

Look at all of the recent incidents where people have died in an encounter. Just last week a couple and their dog were killed in Banff.

The argument that they are part of the ecosystem is poor. The number that would be introduced and future numbers are not enough to have an impact on the ecosystem.

Grizzly bears are DEADLY. Introducing them is akin to saying "Let's plant land mines in the wilderness so people have to always worry about unexpectedly stepping on them every time they go out";

Please don't do this. It's insanity.

Correspondence: Conservation Northwest and our coalition partners at Friends of the North Cascades Grizzly Bear praise the resumption of the draft plan and environmental impact statement, which takes a major step in bringing grizzly bears back to a suitable ecosystem spanning from Washington into British Columbia.

Joe Scott, International Programs Director for Conservation Northwest, said, "The grizzly bear is still the consummate North American wildlife icon. The grizzly has immeasurable ecological and cultural value for our ecosystems and communities. We have a unique opportunity and obligation in the PNW to co-author a significant conservation success story - to restore the grizzly to a small but important part of its traditional home."

The North Cascades is one of North America's premier intact ecosystems, but it is incomplete without grizzly bears.

This is the second attempt by the agencies to restore grizzlies to the NCE after a 2015 process was halted by the Trump administration in 2020. At the time, more than 159,000 members of the public wrote comments supporting the reintroduction of grizzlies.

"The time has come for the grizzly bear to return to its habitat to take its place in the indigenous ecosystem," said Scott Schuyler, policy representative for the Upper Skagit Tribe, whose territory lies within the recovery zone. "The Upper Skagit successfully coexisted with grizzly bears for thousands of years, and we should once more."

The NCE is one of two federal grizzly recovery areas without an established population of bears, and natural bear migration is unlikely to repopulate it. Instead, based on decades of thorough research, wildlife biologists suggest safely relocating existing bears into the North Cascades.

"Grizzlies and humans coexist elsewhere in the West," said Skagit County local Jack Oelfke, an avid hiker and former National Park Service manager. "We need to muster the courage and humility to bring them back as a critical part of our shared wild landscape here in the North Cascades."

"Many rural residents living in the North Cascades recognize that they are in grizzly bear habitat," said Jasmine Minbashian, executive director of the Methow Valley Citizens Council. "They recognize that as a native species, grizzlies were here before them and we should make room for them to return."

Correspondence: More bears will die, more humans will die.

Are those deaths worth your conservation goals? I do not dispute that in a pure, natural ecosystem, the bears are a vital part and have every right, more rights in fact than we to exist here. Human population and encroachment into habitat is out of control. It would be a lovely change if we could stop polluting, stop expanding, reverse climate change, etc. Maybe one day that will happen, but for now, it is sadly a fantasy. Reality is that we have modified the natural world so far, it is naïve and irresponsible to think that we can start moving apex predators like the grizzly around as if they are pawns on a chessboard.

Have you researched the rate of grizzly attacks in Idaho and Montana in the last decade?

Best regards,,

Correspondence: The restoration attempt is misguided. People do not inter-act well with Grizzlies. The only way to restore the Grizzly population is to remove the human aspect. To do that we would have to close the lands that many of us like to explore, camp, hike, hunt on. I often think that is why these projects emerge. I have witnessed over the last 20 years first hand of how hard it is to keep the National Forest open for access. As a past president of the Whatcom County Snowmobile club our members have spent hundreds of hours ditching, brushing and working with the Forest Service on preventing road damage and closures. It's a shame on how much of their funding has been cut over the years, a huge loss from lack of Logging in our area. I know many who would prefer to shut down access and restoring the Grizzly population would accomplish this. Their habitat has changed we changed it. It is impossible to go back in time when this interaction did not take place. The facts are The Grizzly Bear is not human friendly. Yes a human may surprise the Bear and be attacked and killed. Not the Bear's fault but that person is dead forever. I for one do not want to see our tax money wasted on a project that is designed to remove people from the very land we work so hard to enjoy. As an avid outdoorsman I see these pipe dreams all the time. Many people from the large metro area's see a tv show and think this would be great. They look so friendly. Look how many think its ok to pet the wild Bison in Yellowstone Park. People aren't aware and the majority of people do not understand the dangers. They have a large voice and are very powerful in there numbers, but they don't have a clue. Most have never spent anytime in the wilds. I think its a wonderful idea but an impossible dream. My voice for this project of reintroducing the Grizzly is a NO. Please keep me informed on the process.

Correspondence: As a washington resident I am flabbergasted as to why we need to even consider introducing grizzly bears on the landscape in the North Cascades when there are grizzly bears already on the landscape in the state. Why does the park service need to waste money trying to implement something that will happen naturally over the coming decades. I urge the park service to use their funds for more important wild life....because there are numerous that are more critical than this topic

We are currently seeing the effects of unmanaged grizzly bears in Montana, Wyoming, and Idaho over the past 5 years. Dozens of individuals have been mauled or killed due to the inability to effectively manage a population that has more than reached carrying capacity on the landscape. This will soon happen in washington state if grizzly's are introduced without a management plan that can be executed and not tied up by the court systems.

Do the smart thing and use park service funds elsewhere

Correspondence: I am writing to voice my opposition to any grizzly bear reintroduction efforts. My family has camped, hiked, and backpacked in the Twisp area for over 25 years, and my husband's family has enjoyed the region since the 1970's. The ability to enjoy the wildlife and beautiful scenery has created family memories that we hope to now continue with our grandchildren. Introducing grizzlies into the region is an appalling and wreckless idea.

Why would anyone purposefully choose to do such a dangerous act? Not only would this be putting human lives at risk, but also endangering the livestock that provides a livelihood for the citizens of the region. The misguided notion that an aggressive, predatory animal that was once in an area 200+ years ago should now be placed into the same region with the

new human occupants is absolutely incomprehensible. Are the politicians who are promoting and supporting this idea considering what other predators they will be reintroducing to the Seattle area next, or will the humans in the North Cascades be the only sacrifice? Please consider the potentially lethal consequences to hikers, bikers, and other outdoor enthusiasts if you exercise your political authority from the safety of your offices in Olympia and Washington, DC?

I urge you to please keep the North Cascades grizzly-free. I assume you don't want to purposefully endanger the citizens who call that region home or who enjoy the beauty it has to offer. At least, I hope wanting to protect humans is a safe assumption. Please prove me right and end any discussion about grizzly reintroduction. Thank you!

Correspondence: I think Alternative C is the best. It's almost the same as Alternative B, but it protects the grizzly bears significantly. This is what all animals need that are especially getting transported from another part of the world. If we can slowly reintroduce grizzly bears into NCE and manage them, then I believe that is the right thing to do. We would have to move slowly because this isn't the time to rush anything. Everything has to be precise and on point, one mistake could cost us. We haven't had grizzly bears in over 30 years and if we have an opportunity to bring them back, we should definitely do it with lots of rules and regulations protecting them.

Correspondence: Grizzlies should absolutely be reintroduced into the north Cascades. They were a part of a healthy ecosystem and have therefore demonstrated instrumental value in addition to their intrinsic value, which is to say, "they deserve to be simply because they are." People can still recreate in these wild areas just as they do in the rest of the world where there are brown bears, they simply must learn how. The burden of responsibility is on us to enjoy wild spaces safely, not sanitize and tame the wilderness of all that is natural and potentially dangerous. Plus, a presence of grizzlies means agencies can eventually generate revenue from permits for rednecks who desperately want to shoot stuff.

Correspondence: Putting grizzly bears in the Cascades is a bad idea at best. Unlike black bears, they don't run away from humans. They attack. Way more lethal than any other north American predator, the will be soon associated with death of hikers and back packers. Very recently, a very capable hiking couple just north of Montana in Canada were both killed by a sow grizzly along with their dog. Where bear spray is effective against black bears, grizzly not so much. Two spent cans of spray were found near the couple. The campsite met all of the safety precautions against predators to no avail. Male grizzly bears are even bigger and I'll tempered. This is not a good plan as this is not very remote. Please back away frome this plan if you value human life

Correspondence: This may be one of the dumbest ideas yet to come from the current administration. Grizzley Bears are an apex predator, that means they eat people. People and bears do not co-exist, bears are not good neighbors. They do not lean in the window and try to sell you honey flavored cough syrup like you see on the tv. They rip your car/house/barn doors off and eat everything inside, including you and your spouse/children/pets/livestock, etc.

The cascade are not heavy populated, but they are populated and growing in residents and there are to many people living and visiting there today to mix bears back into that environment. Nothing good will come of this.

If you are in doubt, I'm a no.

Correspondence: Washington State Fish and Wildlife (WSFW) has failed at the reintroduction of wolves the State.....Washington State Fish and Wildlife along with the federal agencies that would partner with Washington, have been unable to protect wolves from poachers (ranchers, hunters, angry citizens who do not want these animals in their neighborhood and just dig a hole, kill the animal and bury it, etc.) and those claiming justification for the "taking" of these animals. Therefore, based on this huge failure, they would be incapable of protecting the grizzlies from this same population. Washington Fish and Wildlife is an agency that needs to be reorganized....and refocused.....Alternate A is the only option at this time. Ranchers and hunters run Washington State Fish and Wildlife and would use this reintroduction to hunt these majestic animals for trophies.....

Correspondence: You should not introduce Grizzly bears into Washington.
Just leave things alone.

Look at what happened in Montana when the forest service introduced wolves and completely wiped out the deer for the most part. The comedy was that all the out of state hunting licences and the in state licences were no longer sold as there was nothing left to hunt so they had a massive layoff in the forest service as they had way less money.

The less the do good folks in the government gets involved the less problems the create for the average person.

Do not introduce Grizzly bears in WA.

Correspondence: I am opposed to introducing grizzly bears into the North Cascades of Washington. There is no good reason to do it. Grizzlies will make the mountains less safe for all the hikers and campers that enjoy the outdoors and the natural beauty of the Cascades. It's only a matter of time before someone will be attacked and killed. We've seen it in Idaho,

Montana and Canada already this year. As there are few natural predators of grizzlies, it is even more dangerous for people. They disappeared from this region for a reason. To reintroduce the grizzly is to repeat what has already happened. I say NO on grizzlies being brought to Washington.

Correspondence: I'm against transplanting more grizzlies into the North Cascades. There are already grizzlies there (in remote areas) and we should let their populations increase naturally. Adding more grizzlies from different regions will put the native population in jeopardy. Just because they aren't roaming about like they do in Yellowstone doesn't mean they aren't there. They are secretive and avoid people, which is their best means of survival. A grizzly that has a healthy fear of humans is a good thing for both the bear and the public.

Correspondence: I am strongly opposed to grizzly bear restoration in the Cascades. Historical range is a justification of semantics and unclear time boundaries - by this definition grizzlies should be reintroduced to Downtown Seattle and Olympia. The Cascade ecosystem and relationship with humans is not suitable for sudden introduction of another apex predator - insufficient prey and human conflict including depredation will make this an exceedingly costly and damaging venture.

Correspondence: In regards to introducing Grizzlies back to the State of Washington, or for that matter anywhere outside of Yellowstone, I am 100% opposed. This is a poorly thought out idea and will lead to the death of farm animals, humans and ultimately the Grizzly, when it is killed for being an apex predator. Please do not follow through with this ill conceived idea. There weren't millions of people living in the traditional hunting areas of these bears 200 years ago. The modern reality is simply too dangerous for us humans and is unfair to the bears natural instincts.

Correspondence: I lived in this area for the previous 27 years in a rural community at the base of the North Cascades. The area being considered for reintroduction is only a short distance away. I've recreated annually in these areas at a very high level those 27 years. Based off my experience in these wild areas, there is not near enough prey in these areas to support the apex predator grizzlies. Since there is not enough prey in these areas and these areas are so small, grizzlies would for sure end up in rural communities and small towns. This puts the public and bears at risk. Every time a grizzly attacks a human, it is seeked out for euthanization. This is a lose lose situation for both the bears and the public. This will be a waste of tax payer dollars that are already stretched thin. If the grizzlies wanted to be there they would already be there. Their is no physical boundaries keeping them from migrating down from BC. The fact that they're not already thier or limited numbers is because of the lack of prey in these areas. This reintroduction plan is a terrible idea and should be dismissed immediately!

Respectfully

Law abiding, registered voter, tax paying, Washington citizen

Correspondence: To whom it may concern:

It is this heavily taxed paying citizen's opinion that reintroduction of grizzlies into the North Cascades is misguided. As someone who lived in the Greater Yellowstone Ecosystem for +5 years, I feel somewhat well-acquainted with the government's often well intentioned but short sighted goals with managing wildlife and reintroducing of species into an area where they were previously eradicated.

The difference between the North Cascades and GYE is the sheer population density of humans in this area. Unlike in the GYE where I could hike, hunt, and recreate without often seeing another soul for multiple days, there does not seem to be one piece of untouched earth in the North Cascades where humans don't go. The hiking trails are packed, backcountry permits for overnight camping sold out, and even camping spots completely booked months and months in advance.

Do we have an unhealthy, disruptive over-population of deer or elk? Or is the reintroduction of grizzlies in the North Cascades simply justified under the oft used but unclear, murky justification of "climate change".

It seems to me there has been a shift in grizzly behavior in the last decade. Whether that be because of climate change, over harvesting of grizzly's natural food resources, or simply that human population are more dense than ever, it is undeniable that grizzly/human encounters have become more frequent and more deadly. While I love and respect the grizzly bear, my love for my fellow human is greater. If grizzlies are reintroduced to the North Cascades, the resultant loss of human life will fall squarely on your shoulders. The grizzlies who are euthanized for livestock/human encounters will fall squarely on your shoulders.

Correspondence: As a lifetime resident of the area I am ONE HUNDRED PERCENT against any and all relocation of Grizz into this area! I have previously had two close encounters with these bears one in MT and another in AK. I'm probably

lucky to still be here. Just look at the recent grizzly attacks - what are you thinking ??? It's not like these bears are going extinct- there are plenty of grizz in other areas. WE DON'T WANT THEM HERE!!! My guess is this is simply another tool that will be used to try and keep humans out of the park and surrounding areas- We all know what's going to happen when bears are in the area- there will be multiple attacks on humans and people will be seriously injured and/or killed. Then the park service will draw a big circle around that area and close it to human use. Pretty soon all the "circles" will overlap and guess what.....park closed. NO to GRIZZ!!!!!!

Also- we already have WAY too many apex predators in this area and our ungulate numbers are really suffering- this will make the predator pit problem even worse.

Correspondence: Oroville County has already said NO loudly and clearly in the past. Have you forgotten??

The grizzlies are moving into Okanogan County from Canada NATURALLY and without outside help. This is the natural progression of all wildlife. If the food supply and creature comforts are there they will come and multiply as they are currently doing. There is NO REASON TO MESS WITH MOTHER NATURE!! Accept that Mother Nature moves slower than you or other grizzly huggers like.

Due to the fires of the past year and loss of grizzly food supply and the constant stream of cross country hikers in the grizzly area, to add more grizzlies in this area could be detrimental to the hikers. But of more concern is the constant increase in wilderness fires and the policy to let them burn, means that this will be an increasing problems as global warming influences the wild fire problem thus making this loss of grizzly habitat more precarious. Why put more grizzlies in an area that is so vulnerable to the weather and already a delicate environment.

Correspondence: The last I knew the LYNX was an enviromentaly endangered species and special efforts have been made to preserve their habitat. With the summer fires due to weather changes and droughts, this environment is compromised for them. The introduction of Grizzlies into their habitat will compromise their food supply and endanger their existence.

Think about it. How many carnivores can the land hold without impacting an already endangered species.

The fires in this area have steadily gotten worse the last several years. This future habitat is a big consideration of preserving existing species without adding more species.

Correspondence: Absolutely not. The park is overrun with careless tourists who will ruin this. There will be attacks if the bears are reintroduced.

Correspondence: Please reconsider the idea of "introducing" more grizzlies into WA state. The bears are already here. Without them being truly regulated, more bears in this region will just cause more negative bear/human encounters. More bears are not a good use of time or money by any of the organizations involved!
Thank you for your time.

Correspondence: They are already here. Look up hunt wa forums there's pictures of them in and around conconully. I've personally seen tracks on funk mountain off road #200 off of road #3810. I know many others who have seen them as well while hunting in that area. Saying no confirmed sightings since 96' is false and everyone knows it. Just look at pictures people post and clear as day they are grizzly (not cinnamon colored black bears we have plenty of those as well that hikers usually misidentify). Reintroduction will cause more conflict, as they are already making small numbers on there own. Wolf population is already mismanaged in our state no need to do that with another predator. I love these animals and would love to see more of them but not by human help, only by the natural way unless you plan on opening hunting seasons to help with the wolf population and same for grizzlies it should not be done. Listen to the ranchers and people who have livestock in those areas, don't listen to the city people who have no concept of wildlife, and wildlife conflict as it doesn't affect there lives it effects the rural communities.

Correspondence: Two dead hikers at Banff national Park last week. Dead hiker at Yellowstone a month earlier. Are you going to set up a compensation fund for the families of dead? It's not a good idea at all.

There's enough hazards and ways to die in the wilderness hiking as it is without adding the stress of having these bears around.

They were killed off for a reason.

Correspondence: Please do not reintroduce grizzly bears to the North Cascades. I am a family co-owner in a ranch in Twisp. We have horses and enjoy the pleasure of riding on public lands, as well as hiking and back country camping. Besides horseback riding, many people partaking in outdoor activities have dogs with them. The population in the Methow Valley is growing, and I believe having grizzly bears living in the North Cascades will pose safety problems for citizens, animals, and even the grizzlies because of fear.

Thank you for accepting my comment on the Draft Grizzly Bear Restoration Plan/Environmental Impact Statement, North Cascades Ecosystem

Sincerely,

██████████

Correspondence: The American Bear Foundation of Washington has always championed the well-being of bears.

However, we firmly oppose the reintroduction of grizzly bears into the North Cascades. It's evident that grizzlies are already finding their way into the region, with recent incidents like the young grizzly in Stevens County. We believe in natural migration and proper management. The existing challenges with the black bear, cougar, and wolf populations in Washington highlight the need to avoid adding more pressure on our wildlife.

As someone who frequently hikes, the thought of an increased grizzly bear population in the North Cascades is concerning. Observing the events in places like Montana and Idaho, it's clear that more bears can lead to more dangers. Grizzlies have every opportunity to migrate from BC or Idaho without human intervention. I urge you to let nature dictate its path.

The North Cascades have always been a haven for outdoor enthusiasts like me. It's come to my attention that grizzly bears already exist in this range, as noted by the Washington Department of Fish and Wildlife. Introducing more would not only threaten the fragile mule deer population but also increase the risk for those of us who love the outdoors. I'm against any plans to reintroduce grizzlies in Washington.

The recent incident in Stevens County, where a grizzly bear was captured, is a testament to the growing predator challenges in Washington. Our state is already grappling with managing wolves, cougars, black bears, and more. Considering the strain on our ungulate populations, I cannot support the idea of reintroducing grizzlies into the state.

I felt compelled to voice my concerns about the potential reintroduction of grizzly bears in Washington. It's undeniable that grizzlies are already making their way into the state from neighboring regions. The absence of physical barriers means they can migrate naturally. Given the state's challenges in managing its existing wildlife, introducing another apex predator seems counterproductive.

The American Bear Foundation of Washington has always been at the forefront of advocating for bear welfare. Yet, we cannot support the reintroduction of the grizzly bear. The state already hosts this formidable predator. With the challenges the Washington Department of Fish and Wildlife faces in managing the rising numbers of black bear, cougar, and wolves, introducing a larger and more aggressive predator seems like a step in the wrong direction.

Correspondence: The Grizzly bear is part of the ecosystem of the north cascades mountains of Washington. It is imperative that we actively support their survival within this mountainous range. I am a hiker and spend a fair amount of time outdoors within the Washington ranges. Yes they are a powerful animal, and can be scary. The grizzly bears here long before our human race and help to balance the environment. I believe that they help to balance the wilderness keeping it as it was intended. It is important to introduce more grizzly bears so to keep the bears in this area strong and vibrant. Their introductions to other western states has shown that they can coexist with humans, and cattle. Educating the people who frequent the north cascades will be essential to keeping humans safe. This is a policy that is good for all. Thank you, [REDACTED]

Correspondence: 1. I firmly oppose the reintroduction of grizzly bears into the North Cascades. It's evident that grizzlies are already finding their way into the region, with recent incidents like the young grizzly in Stevens County. We believe in natural migration and proper management. The existing challenges with the black bear, cougar, and wolf populations in Washington highlight the need to avoid adding more pressure on our wildlife.

2. As someone who frequently hikes, the thought of an increased grizzly bear population in the North Cascades is concerning. Observing the events in places like Montana and Idaho, it's clear that more bears can lead to more dangers. Grizzlies have every opportunity to migrate from BC or Idaho without human intervention. I urge you to let nature dictate its path.

3. The North Cascades have always been a haven for outdoor enthusiasts like me. It's come to my attention that grizzly bears already exist in this range, as noted by the Washington Department of Fish and Wildlife. Introducing more would not only threaten the fragile mule deer population but also increase the risk for those of us who love the outdoors. I'm against any plans to reintroduce grizzlies in Washington.

4. The recent incident in Stevens County, where a grizzly bear was captured, is a testament to the growing predator challenges in Washington. Our state is already grappling with managing wolves, cougars, black bears, and more. Considering the strain on our ungulate populations, I cannot support the idea of reintroducing grizzlies into the state.

5. I felt compelled to voice my concerns about the potential reintroduction of grizzly bears in Washington. It's undeniable that grizzlies are already making their way into the state from neighboring regions. The absence of physical barriers means they can migrate naturally. Given the state's challenges in managing its existing wildlife, introducing another apex predator seems counterproductive.

6. I cannot support the reintroduction of the grizzly bear. The state already hosts this formidable predator. With the challenges the Washington Department of Fish and Wildlife faces in managing the rising numbers of black bear, cougar, and wolves, introducing a larger and more aggressive predator seems like a step in the wrong direction.

7. As a regular visitor to the North Cascades, the potential increase in grizzly bear population is alarming. The incidents in states like Wyoming serve as a cautionary tale. With no barriers preventing grizzlies from migrating from places like BC, it's best to let nature take its course.

8. The beauty of the North Cascades has always drawn me in. However, the knowledge that grizzly bears are already present, as confirmed by the Washington Department of Fish and Wildlife, makes me apprehensive. Introducing more would jeopardize not only the mule deer but also the safety of countless individuals. I'm firmly against the reintroduction proposal.

9. The recent capture of a grizzly bear in Stevens County underscores the challenges Washington faces with its predator populations. With the existing issues surrounding wolves, black bears, and cougars, it seems imprudent to consider adding grizzlies to the mix. I strongly advise against this reintroduction.

10. The presence of grizzly bears migrating into Washington from places like BC and Idaho is undeniable. Without any physical barriers, they can naturally inhabit the state. Given the difficulties in managing the current wildlife populations, I believe it's in the best interest to refrain from reintroducing more apex predators.

11. Reintroducing the grizzly bear is not in the best interest of the state. The challenges posed by the increasing numbers of black bear, cougar, and wolves are evident. Introducing a predator of the grizzly's stature would exacerbate these challenges, putting both humans and wildlife at risk.

12. I wish to express my reservations about reintroducing grizzly bears to the North Cascades. Recent events, such as the grizzly incident in Stevens County, highlight the existing challenges. We advocate for natural migration and believe that the current pressures on our wildlife, especially ungulates, make this reintroduction inadvisable.

13. As a frequent visitor to the North Cascades, the idea of more grizzly bears is concerning. The experiences of states like Montana and Idaho serve as a warning. Grizzlies can naturally migrate from neighboring regions, so I believe we should let nature take its course.

14. The North Cascades offer a unique experience for outdoor lovers. However, the presence of grizzly bears, as confirmed by the Washington Department of Fish and Wildlife, poses a threat. Introducing more bears could harm the mule deer population and increase risks for visitors. I'm against this reintroduction.

15. The recent grizzly bear incident in Stevens County is a clear indication of the challenges we face with predators in Washington. Our state is already stretched thin managing various predators. Given the pressures on our ungulate populations, reintroducing grizzlies seems unwise.

16. I'm writing to express my concerns about reintroducing grizzly bears in Washington. Their natural migration from regions like BC and Idaho is evident. With the state's current wildlife management challenges, adding another apex predator seems ill-advised.

17. I believe that reintroducing the grizzly bear is not in the state's best interest. The challenges posed by the rising numbers of other predators are evident. Introducing grizzlies would only add to these challenges, endangering both humans and wildlife.
18. The North Cascades are a haven for many, but the potential reintroduction of grizzly bears raises safety concerns. The incidents in states like Wyoming are a testament to the risks. Grizzlies can naturally migrate from nearby regions, so human intervention seems unnecessary.
19. The North Cascades are a sanctuary for many outdoor activities. However, the existing grizzly bear population, as noted by the Washington Department of Fish and Wildlife, is already a concern. Adding more bears could jeopardize the mule deer and increase risks for visitors. I oppose this move.
20. The grizzly bear situation in Stevens County highlights the predator challenges in Washington. With the existing predator population and the pressures on our ungulate herds, reintroducing grizzlies seems counterproductive.
21. I wish to voice my concerns about the potential reintroduction of grizzly bears in Washington. Their presence, migrating from regions like BC and Idaho, is already noticeable. Given the state's wildlife management challenges, reintroducing more apex predators is concerning.
22. Reintroducing the grizzly bear poses significant challenges. The state's current predator management issues are evident. Introducing grizzlies would exacerbate these issues, putting both humans and wildlife at risk.
23. The potential reintroduction of grizzly bears in the North Cascades is alarming for many of us who frequent the area. The experiences of states like Montana serve as a cautionary tale. Grizzlies have every opportunity to migrate naturally, so human intervention seems unwarranted.
24. The North Cascades are a favorite for many outdoor enthusiasts. However, the presence of grizzly bears, as confirmed by the Washington Department of Fish and Wildlife, is concerning. Introducing more bears could harm the mule deer population and increase risks for visitors. I'm against this proposal.
25. The recent grizzly bear capture in Stevens County underscores the challenges we face with predators in Washington. Our state is already dealing with various predators. Given the pressures on our ungulate populations, reintroducing grizzlies seems ill-advised.
26. I'm writing to express my reservations about reintroducing grizzly bears in Washington. Their natural migration from regions like BC and Idaho is evident. With the state's current wildlife management challenges, adding another apex predator seems lindane
27. Reintroducing the grizzly bear is not in the state's best interest. The challenges posed by the rising numbers of other predators are evident. Introducing grizzlies would only add to these challenges, endangering both humans and wildlife.
28. The North Cascades are a haven for many, but the potential reintroduction of grizzly bears raises safety concerns. The incidents in states like Wyoming are a testament to the risks. Grizzlies can naturally migrate from nearby regions, so human intervention seems unnecessary.
29. The North Cascades are a sanctuary for many outdoor activities. However, the existing grizzly bear population, as noted by the Washington Department of Fish and Wildlife, is already a concern. Adding more bears could jeopardize the mule deer and increase risks for visitors. I oppose this move.
30. The grizzly bear situation in Stevens County highlights the predator challenges in Washington. With the existing predator population and the pressures on our ungulate herds, reintroducing grizzlies seems counterproductive.
31. I wish to voice my concerns about the potential reintroduction of grizzly bears in Washington. Their presence, migrating from regions like BC and Idaho, is already noticeable. Given the state's wildlife management challenges, reintroducing more apex predators is concerning.
32. Reintroducing the grizzly bear poses significant challenges. The state's current predator management issues are evident. Introducing grizzlies would exacerbate these issues, putting both humans and wildlife at risk.
33. The potential reintroduction of grizzly bears in the North Cascades is alarming for many of us who frequent the area. The experiences of states like Montana serve as a cautionary tale. Grizzlies have every opportunity to migrate naturally, so human intervention seems unwarranted.
34. The North Cascades are a favorite for many outdoor enthusiasts. However, the presence of grizzly bears, as confirmed by the Washington Department of Fish and Wildlife, is concerning. Introducing more bears could harm the mule deer population and increase risks for visitors. I'm against this proposal.
35. The recent grizzly bear capture in Stevens County underscores the challenges we face with predators in Washington. Our state is already dealing with various predators. Given the pressures on our ungulate populations, reintroducing grizzlies seems ill-advised.

Correspondence: Hi, I would like to add my comment as a resident and one who works and plays in the woods of Washington. I do not believe that a grizzly bear reintroduction into our state is a wise or necessary plan. They appear to be moving in naturally, so the cost is unnecessary. There is also serious conflict issues. Unfortunately, WDFW leaders have shown poor predator management and do not follow science or research in regards to population. This impacts outdoor users and heavily impacts other wildlife and increases wildlife-urban interactions. Until there is trust that the agency will be proactive about managing predators, there is absolutely no need to do an intentional reintroduction of the largest predator in the lower 48.
Things like this really have an impact on fringe voters who feel impacted or unheard. I continue to lean to the right as I feel the left gets too strong and pushy with their agenda, this is an example of that, as well as the spring black bear season, of which I don't even participate.
Please consider all reasonable facts when making this decision. Thank you.

Correspondence: Thank you for the opportunity to express my thoughts concerning this important issue. I am strongly against the reintroducing grizzly bears in the North Cascade Mountains. The low number of ungulates, the high number of existing apex predators (i.e. black bears, mountain lions, and wolves), and the high density of humans makes this a clear choice for me. As I've read on this subject, I do not see any truly viable reason for their reintroduction, but there are plenty of reasons to not do it.

Thank you,

██████████

Correspondence: Alternative A is the only reasonable option. The very idea of reintroducing grizzly bears into the North Cascades is absurd when the potential for negative bear/human interaction is taken into account.

Alternative B and C are also directly in conflict with existing state law RCW 77.12.035, Alternative A is also the only legal option unless federal authority is used to super cede state law.

Reintroducing Grizzly bears to Washington State exposes the public and park employees to an unacceptable risk of dangerous human/bear interactions. If there is an ecological upside of reintroducing bears to this geographical region, this is outweighed by the danger posed to PEOPLE and the resource costs of a new ongoing species management program.

Alternative A, final answer.

Correspondence: As a Washington resident, I am not in favor of this proposed plan to reintroduce the grizzly bear into the North Cascades ecosystem for the following reasons.

- 1) Grizzly bears are already present in the northeast corner of Washington, and will continue to migrate into the state naturally. I would prefer that we allow them to do this on their timing.
 - 2) Grizzly bears are an apex predator. The north cascades see a LOT of recreation from Washington residents. Increasing the population here is a recipe for disaster - for people and bears.
 - 3) Due to the political climate of Washington, there is very little chance that management of this species will ever be turned over to the state and de-listed from the ESA. We cannot afford to have a substantial population with no tools to manage their population through hunting.

Correspondence: I do not support reintroduction of grizzlies to the North Cascades. If the habitat could support them they would already be there. There have been multiple attacks and fatalities on humans this year where grizzlies are present. With increased human population and increased human recreation in the North Cascades it is extremely irresponsible to even consider reintroduction. Human bear conflicts will happen! RCW 77.12.035 prohibits translocation/introduction of Grizzlies into Washington state. Please respect the laws of Washington State.

Correspondence: If there's enough room in the North Cascades to support Grizzly Bears, then they absolutely should be introduced. As long as there's room for at least a small population, and I believe there is, then it seems the best thing for both the ecosystem and the bears is to bring the bears back. Yes, Grizzlies are powerful, wild animals, but all of nature is wild, and grizzlies have a place.

Correspondence: I have severe concerns regarding the introduction of grizzly bears into the North Cascades. First, the bear is an apex predator, which means it has no natural enemies. The bears would be able to hunt and kill prey without any recourse, thus depleting the population of other species that normally thrive in the same area. One of the most important species in that part of the state is fish, particularly the trout and salmon that spawn in the rivers and streams of the North Cascades. Battles over the fish have already taken place, and just when the Native Americans and sportsmen have finally found balance, people want to introduce another challenge to the fish population..

Second, the North Cascades is an area that is very popular for recreation, with abundant hiking, camping, and water activities. Encounters with bears would be very dangerous for many people, but especially those with children. Reports already exist of bear attacks on campers and hikers. Introducing grizzly bears into the mix is simply inviting trouble.

Third, the residents of the area have already objected to the proposed introduction. Forging ahead without their approval fractures an already difficult relationship the people of the area have with state government.

Personally, I believe that if grizzly bears naturally migrate into the North Cascades, that would be preferable to a forced introduction. A natural migration would happen slowly over time and allow other people and animals to adapt to their presence. A smaller population of bears would allow fish and other prey to develop a natural environment that includes the bears, and the bears would be less of a threat to sportsmen, ranchers, and residents. Please consider alternatives to the current plan for introduction of grizzly bears. Thank you for your consideration.

Peace,

Correspondence: My family roots go back to 1870 in Washington State. In that time the population of many native species has been decimated.

I have visited and camped in wild lands that are contiguous with the North Cascades.

As a Washington resident I have legal standing in this State.

I am in support of the augmentation of the current estimates of 2 grizzly bears in this enormous forest of our state which is referred to as the North Cascades.

As the Salmo wilderness of northeast Washington also has a small population of Grizzly bears it is important that the North cascades have a stable population of grizzly bears so these populations can travel and exchange genetic variations for the health of the genetic variability of Grizzlies.

Again, my lifetime residency in Washington state insures my standing for the support of the augmentation of the current population of grizzlies in our beautiful state.

Keep Washington Green.

Correspondence: As a avid hunter I understand the risks that involve going into the back country. This last September I took 2 other men on a High buck hunt by the Washington Canadian boarder. I'm the 4 days we where out we seen multiple hikers and not a single one had a side arm or bear mace. Introducing grizzlies to the north cascade is going to cause deadly conflict. It's just a matter of time! As a hunter I know I may someday become the prey. But I'm not the only one using these wilderness areas. It's families, clubs, solo through hikers, and many more. Montana is a great example of the dangers of grizzlies being in the mountains.

Correspondence: Grizzlies should be back in their native habitat range if it's possible. The needs and welfare of the grizzly should be well considered prior to reintroduction - as you're aware they need wide open spaces and long roaming areas. There would need to be ample sources for food and water among other nourishment. Human interactions are always a possibility and that needs to be considered but not denied, wildlife should take precedence before humans in my view, they were here before us! I strongly recommend re-entry of the grizzly back to the cascades.

Correspondence: Introducing grizzly bears into Washington state poses significant challenges and risks that should be carefully considered. Firstly, grizzly bears are apex predators and their presence could disrupt the existing ecosystem, impacting local wildlife populations. Secondly, human-bear conflicts may increase, leading to safety concerns for residents and visitors. Additionally, managing and monitoring these bears would require substantial resources, potentially diverting funding from other important conservation efforts. Therefore, I believe We should Not reintroduce grizzly bears to Washington state.

Correspondence: Please don't bring more grizzly bears to Washington. There was just a couple and their dog killed by a grizzly bear in Canada. They had bear spray and had sent an SOS signal through a GPS, but that did not save them. Grizzly bears are too dangerous. People want to be able to enjoy the wilderness without constantly worrying about grizzly bear attacks. They make it unsafe to hike with dogs, which is super sad. My dogs want to be able to go on wilderness adventures but that only gets riskier with more grizzly bears. We don't want relocated bears in our state.

Correspondence: I do not support the re-introduction of grizzly bears into the North Cascades. This area has seen a massive uptick in people engaged in hiking and backpacking. The Pacific Crest National Scenic Trail has become so busy that permits to hike are now utilized.

I believe that if grizzlies were re-introduced that human / bear interactions would increase, and some of those would result in injury and/or death for recreationists.

Respectfully,
[REDACTED]

Correspondence: As a hiker who loves spending time in the N Cascades I am against the grizzly restoration plan. I hike with other women, none of us pack guns. The most recent grizzly deaths were this year in Banff and could have been prevented only with a gun. I have seen many bears hiking on the trail, some from afar and some too close for comfort but fortunately all were black bears who turned and left once we made eye contact, this would not be so with a grizzly!!! I honestly don't think I will feel safe enough to hike the N Cascades if grizzlies are reintroduced even though it is my all time favorite hiking grounds. Please do not move forward with this plan.

Correspondence: The introduction of grizzly bear to the North Cascades is not a better idea now than the last time it was floated a few years ago. Grizzlies are apex predators, and their introduction to the North Cascades will invariably result in a loss of human life, just as it did in Banff National Park a few days ago. Also a few days ago, a grizzly charged a hunter in northern Idaho, resulting in the death of the grizzly. And a grizzly was trapped and relocated in a separate incident after repeatedly breaking into a chicken coup in Northern Washington State. Humans and grizzly "coexist" only until the grizzly decides not to. To think otherwise is anti-human, not pro-bear.

Correspondence: As a country, we must be able to return our existing natural terrain back to what it was. The grizzly bear was slaughtered by humans. Now in northern Washington, humans must return them. Apex predators are vital piece of any ecosystem. Indigenous people coexisted with these animals. And in many areas we do now. The people of Washington are going to have to learn how. So let's reintroduce them.

Correspondence: NO GRIZZLIES IN THE NORTH CASCADES. Wa state outlawed this in 1997 and using federal land to circumventing states laws and rights is a slippery slope that no group should support. WA state has to many predators, cougars, wolves, bobcats, coyotes, black bears etc, that are already diminishing the deer and wildlife population and creating conflict with farmers. Recently black bears have been killed because they are coming into local town and killing small farm animals and pets. Cougars are spotted near elementary schools and cause lockdowns. The predatory animals in WA are no longer able to be hunted enough to allow the fornpopulation vontrol, the black bear spring season has been canceled several s,pring seasons in a row. Introducing another species if predator to areas frequented by families campers and hikers is setting up the animals for interaction with humans that is unnecessary and cause threats to the humans who live in the areas. Bears WIL come into farms and seek out easy prey (humans in their habitat), as other predators are already doing as the urban sprawl of WA creeps into the wilderness.

We have growing reports of predators attacking farm animals, pets and even children on camping trips over the past several

yaers, adding another predator to the top of this food chaise will push these other predators farther into the urban areas as food resources dwindle.

Correspondence: I am not comfortable with this idea of reintroducing the Grizzlies to the North Cascades. The idea is quaint, going back to the past. In reality we have more people in the back country and more of civilization encroachment into the wilderness boundaries. People as a general rule are still poor at controlling waste and attracting black bears. I can only imagine what this looks like with grizzlies. The best behaved bear is only as good as the worst behaved human. I do a lot of wilderness activities. I've been very comfortable with Wolf reintroduction. The grizzlies I'm not comfortable with. If there is a greater good reason, I'm willing to hear it out and remeasure my consideration. Although, I will plan to learn gun safety and start to carry in the wilderness.

Correspondence: Unless the bears are confined within a designated wilderness area with posted warning signs, the threat to humans remains high. Intentionally releasing an apex predator anywhere near population centers, grazing pastures, and salmon running rivers seems counterintuitive to other conservation measures already underway. The exception rule for killing a rogue bear may seem reasonable, but bears do what bears do and should not be killed for it. (Is it really possible for a wild animal to live by rules which they cannot comprehend?) Sane people do not eat wild bear meat due to roundworm infestations. I believe grizzly bears should continue to live where they are now, isolated and wild and the hunting of bears banned. I do not think they should be "reintroduced" anywhere they have not survived to date as it is clear their biggest enemy is people. If a wild bear attacks or kills a human, it will be because the human did not heed the danger while in the wilderness.

Correspondence: The comment is more aligned with the question of why do we need to bring back an apex predator to an area that can be managed by hunting and trapping? Grizzly bears are well known for wide ranging foraging along with invading residences, livestock and black bear cub kills. The grizzly predation on elk and deer calves is a majority of spring diet in other states as they awake from winter hibernation. Is the elk population so out of control in numbers that we need to populate these again? How easy would this decision be if they rambled through North Bend or Issaquah or Bellingham streets tearing up farms and livestock?

Correspondence: Hello, I just wanted to give my two cents here. Although we all enjoy watching bears and all kinds of wildlife, I think we need to have some places to take our families, ride our horses, raise our livestock and feel safe without having to worry about a grizzly bear attack. I realize this doesn't happen all the time, but it does happen. And I really don't want to have to worry, "will my bear spray work" and I definitely don't want to have to shoot one. I believe we have enough grizzly bears in and around the Yellowstone area and Glacier National Park and other areas where we can go to enjoy seeing the grizzlies there. I don't dislike grizzly bears at all, I actually really enjoy watching films or seeing them alive in their environment. I just feel that the grizzly bears have made a great comeback and we don't need to introduce them all over in the United States.

Thank You,

Correspondence: After much consideration, I feel adding grizzle bears to the North Cascades is not a good idea for the bears. I have hiked and backpacked for many years in the North Cascade Park and experienced run ins with black bears that normally shied from humans. Grizzle's reputation is they have a difficult time tolerating human interference in their area.

- * Who is going to protect the grizzlies from humans?? The National Park does not hire enough personnel to protect the bears that traditionally have a difficult time cohabitating with the ever increasing human population of day hikers and backpackers venturing into backcountry trails.
- * Most grizzlies lack common sense on how to handle an encounter with humans. To the grizzlies this is their turf and they can become angry and belligerent.
- * Is the park service going to protect the grizzle from people when it wanders into the adjacent national forest area in search of food?
- * Is the park service going to protect the grizzlies when more and more day hikers and backpackers carry side arms when hiking versus a can of bear spray?

Conclusion: the grizzle may have roamed the North Cascade area many years ago without humans around, but it doesn't make sense to subject them to a forced existence with humans that don't know how to react to them.

Correspondence: The proposed plan to address the current state of the grizzly bear population in the North Cascade mountains is vital to the improvements of the population. With only 60 individuals in the area, it is important that something be done (FWS, 2023). The proposed alternative A action plan is not a realistic solution to the dire state of the grizzly population in the region. While easy to do nothing, the population is only further hurt by the lack of action. The proposed preferred plan, alternative C, allows agencies the flexibility required to successfully protect and grow the grizzly population. As a hiker and camper, one of my major concerns is the potential interaction I may have with large predators like bears. While there are supplies available to discourage bear attacks, it is still a concern on my mind when I head out on a trail. Increased access to bear mace and information about bears in the area should be provided when entering the park or making

reservations. Increased trash removal from campsites may discourage human and bear interactions, as well as improve the quality of the campgrounds. If backpackers are making reservations, mace should be a requirement and could be sold at visitor centers.

Alternative C allows for the greatest amount of monitoring and human-bear interaction intervention, which is important when recreating. Bears are a vital part of the ecosystem and help manage other wildlife populations. Despite the threat they pose to people, the bear's presence is necessary in the park and intervention is strongly encouraged.

Correspondence: I support the reintroduction of grizzly bears in the North Cascades. They were here before human settlers tried to trap, kill and remove then for their own economic gain. They are apex predators in the wilderness and deserve to continue to have their own habitat. The US government has supported the cattle ranching industry for the benefit of private citizens to the detriment of wildlife and the public for far too long. The National Park service and congress need to allow them to live naturally in their ancestral habitat and they need to educate the public on how to respect, understand and coexist with grizzly bears in the Wilderness. Grizzly bears terrify many people because they are large and powerful. We need to respect them and understand that the root cause of many bad interactions with them are often the result people's actions like diminishing their wild spaces, killing their natural prey, and getting between a mother bear and her cubs. The wilderness needs to be wild and we need to respect and protect it. People in our modern society have become too soft and expect that the

government should remove any hazards outside of their homes. There is a trend where people are not responsible for their actions and tend to blame others for their bad decisions. The mission of the National Park Service is to preserve unimpaired the natural and cultural resources and values of the national park system for the enjoyment, education, and inspiration of this and future generations. Allowing grizzly bears to roam their ancestral range in the North Cascades is a step in the right direction toward helping them exist for future generations.

Correspondence: Grizzly bears in Washington is a bad idea. First of all the predators are already running rampant in our state. The black bears, cougars and now wolves are decimating elk and deer populations. Now you want to reintroduce an apex predator into an ecosystem that has no idea what grizzly bears even are. It is going to take not only the ungulates but also the black bears by complete surprise. If you look at Montana and Wyoming the grizzlies complete dominate whatever ecosystem they're in. On top of that the conflict that'll arise from people and bears will be unavoidable. Through hikers on the PCT will come into contact with an apex predator that exists nowhere else on the trail. Hunters will undoubtedly run into them as grizzlies have no fear of humans, as shown by at least one human being killed every year in Montana during hunting season. Also, knowing this state, there will be no management plan ever put into place even if grizzlies are delisted from federal protection. The deer, elk, and people will be at the whim of grizzlies, black bears, cougars, and wolves by the time this happens and the new bill to get rid of bear and cougar hunting goes through. There will be grizzlies on the landscape, "to make the wild feel more wild" but at what cost?

Correspondence: To whom this may concern,

I have read the EIS for the reintroduction of the Grizzly bear in the North Cascade Ecosystem and am concerned. I am concerned as an outdoorsman, backpacker and WA citizen. I am concerned that while the idea of reintroducing such a magnificent animal is admirable, the idea is lacking a realistic long term end-game and outcome. While, yes, the goals have been stated, the consequences of having an unregulated alpha predator in such a landscape have not fully been studied, discussed and realized.

As an outdoorsman, I actively hunt black bears and blacktailed deer in the northern cascades. I have spent countless nights camping and hiking the ridges and drainages of the Mt Baker wilderness and surrounding areas of the Cascades. I am "bear safe" with hanging my food, being careful about trying not to eat inside my tent. I typically carry a side-arm while bow hunting as an insurance policy but have yet to even come close to having to use it, thankfully. As an outdoorsman, I am an active participant in nature... I am no longer an observer and only there to "experience" nature. I am the alpha predator with my senses on high alert. My quarry is aware and on edge as a result of my historical presence and at the slightest chance of their demise, they leave with haste. What is to happen if an introduced grizzly bear, an

alpha predator, leaves the park, which they DEFINITELY will, and that animal has no sense of fear of humans? What if that alpha predator decides that they would like to now inhabit a new territory where hikers, hikers with dogs and backpackers who enjoy to camp without fear of being attacked, frequent? Any animal that is federally protected and has no fear of humans will certainly begin to create an unacceptable situation between itself and those that recreate in the shared territory.

As a backpacker, I live to see the incredible vistas of the high Cascades. The region is rugged, unforgiving and at times, dangerous. The absolute LAST thing a backpacker needs to worry about is becoming a member at the bottom of the food chain. A hungry Grizzly, without any fear of humans, due to its federal protections, will eventually attack a backpacker and the outcome will be grim. One argument I continually read is that "we need to let nature run its course;" True, while the Grizzly historically was a part of the North Cascades ecosystem, humans are now in much greater numbers, we seek out wild spaces to recreate and most importantly, we are a PART OF NATURE. We cannot blindly and romantically believe that having Grizzlies reintroduced into a highly frequented space will not cause major and potentially catastrophic consequences.

As a Washington state citizen I take issue with any federal protections of an alpha predator especially because historically, any transfer of management of said species to the states is almost always met with lawsuits from animal rights advocates, out of state I might add, and then injunctions which only prolong any management. The legal battles, as you are well aware, are costly, political in nature and most often they only delay a decision. Decisions need to be science based and made, not by politicians and judges, but rather, by educated, expert biologists whom understand the inner workings of not just the species in question but of how that species interacts with its environment and yes, the people in it.

To say that I am apposed to Grizzly reintroduction would be an understatement. Whether or not you take what I am writing into account is entirely up to you. I just could not sit by and "hope" that others will express their opinions and distaste for this potential decision. Thank you for taking the time to read this and I would like to hear back from you if at all possible.

Sincerely,

Correspondence: I realize the biology and reasons for reintroducing grizzlies into the wild are there, but they don't seem to be of enough significance to spend the time and money on it. The "no action" alternative is a better use of resources as it helps existing "management practices," which includes improved sanitation, motorized access management, outreach and educational programs and recreation enhancement for people. Reintroducing grizzlies is going to end up with problems we don't need. "No action" please.

Correspondence: I agree that the Grizzly bears could make a positive change to the ecosystem of the North Cascades, if the bears find their own way back to the area. In other words, I think it's fine if Grizzly bears NATURALLY migrate back into the ecosystem. It's inviting problems to artificially transport them back into the mountains. Humans have a bad track record messing with the natural balance that species create within ecosystems and grizzly bears have the ability to affect this delicate balance if we transport them in. Wolves brought back to British Columbia are a prime example of this. In summary, let the bears come back to the place that they once inhabited naturally, but let's not assume that we can do it artificially without messing up the balance. Oh, did anyone think of how a huge population of bears in the mountains might affect the safety of humans who enjoy hiking, camping, hunting, and recreating?

Correspondence: As an avid outdoors person, i am on the trails biking, hiking, kayaking, orienteering, adventure racing and snow shoeing. I am not highly afraid of local wildlife though I have healthy respect for our resident black bears and cougars. I love seeing animals and respect their presence in our communities. I am not sure that reintroduction of Grizzlies in the North Cascades is the right move. Washington is full of people who are active and out trailheads, green spaces and recreation areas can't keep up. We will only have more people exploring the backcountry trails and campsites as well as housing that is encroaching on natural habitat. There will be many conflicts, some deadly if grizzlies are introduced into highly populated north cascades region. Banff has had 4 deadly bear attacks in the last decade. The north cascade range is even larger with a greater population density.

I am not in support of this reintroduction.

Correspondence: This idea is absurd. Have you completely forgotten history & science?!! These bears cannot coexist with the amount of hikers, hunters, and people just enjoying nature in the northern cascades. They attack. Just look at the

latest attack in Banff and the history of attacks when they roamed the lower 48. Attacks were not rare. The blood and disfigurement will be on the NPS hands and unprovoked attacks will occur 100%. The population will creep into the central cascades they will follow the salmon and livestock. The current keystone predators are doing fine in the Northern Cascades. All I can hope for is someone to get this into litigation as fast as possible to impose an injunction and I will donate whatever I can to stop this because I will be stopping a future mauling that will absolutely happen if this proposal goes forward.

Correspondence: I am concerned about how grizzlies will impact our salmon population. Currently we are already facing devastating effects to our Orca population and behavior due to current salmon levels. Bringing in a new competitor that has not existed in this ecosystem in large numbers for almost 200 years to now eat up the salmon population before they make to our ocean could be devastating for our existing endangered animals that we love. On another note, no one in this area is educated on grizzlies or how to prevent conflict with them. No one in this area will be prepared for grizzlies coming for food in their cars, most don't know they are capable of ripping car doors off in such a pursuit. No one in this area is used to having

to secure their garbage. Most in this area are trained on how to deal with a cougar encounter, which unfortunately will likely be most people's automatic reactions to coming across a grizzly which is the exact OPPOSITE of what is needed and will endanger themselves more. People in this area are a little too used to taking their dogs off leash on the trails, as they have done this their whole life, and will not be prepared for their dogs running up to a grizzly. Everyone will start feeling the need to carry firearms whenever camping, or just living in the cities surrounding the Cascades. This increase of firearms being carried will likely lead to more gun related accidents. If the natives are sad that grizzlies are almost non existent here and they want grizzlies to coexist with humans then maybe they can start by putting them on their reservations in their backyards first. Not in the backyards for populations living in Sedro, Darrington, concrete, mount baker and more. Many of these communities have farm and pasture lands and are a large part of Skagit and whatcom county economies. When I hear the proposal of "experimental introduction" it feels like a way to tell the populations that do not want such experiments or grizzlies here to shut up and not complain because it gives the impression of temporary. So basically don't worry, it doesn't have to be forever. However, how likely is it that endangered species will be removed from this environment once introduced is very slim. We should not be forced to suddenly cohabitate with a species the general public knows nothing about and do not want. Also, children being able to go on camping and hiking trails with their families is one of the vital ways we teach future generations a love for nature. How much less comfortable the parents in this state will be to pursue such activities as a family and how much less funding our parks will receive to maintain such places.

Correspondence: I spend alot of time in the north cascades. Heaven on earth. I believe reintroducing grizzled bears into the region is a bad idea. Around 40 years ago I first hiked the section of the pct from manning Park to stehekin. I try to do Steven's pass to high bridge yearly. My first trip 40 years ago in fall I encountered 5 people. 3 were hunters. Today if I hike this section I may encounter around 500 people.

I truly love nature and this is why I believe this is a terrible idea. The interaction with black bears keeps most of us on our toes alone. Grizzlies are the ultimate apex predator. Not only do you introduce a truly viable threat to humans back into what is a crowded quite small area but you add a level of stress to the local animal population that in my opinion is already struggling. Between climate change, human use and overall incriachment you will upend an already delicate situation. This is going to be a train wreck so to speak. Between bear attacks on humans to the impact on local wildlife this is not a fair ideal. The bears will begin to migrate to local communities creating public outcry with ranchers, black bear and deer populations will be future decimated and the ongoing political issue will be a massive financial drain.

I believe money would be better spent on supporting the local animal population , trail maintenance and overall public services to enhance people's u derstanding of the natural world without undo deadly encounters with grizzlies.

Please DO NOT DO THIS.

sincerely. [REDACTED]

Correspondence: Natural Migration is Already Happening: Grizzly bears are already making their way into Washington. Just last week, a grizzly bear was captured and removed from Stevens County. If they're meant to be in Washington, they'll come on their own.

Safety Concerns for Recreational Users: Hikers, hunters, and outdoor enthusiasts already have to be cautious of black and grizzly bears. Introducing more grizzlies could lead to increased risks, as seen in states like Montana, Idaho, and Wyoming.

Strain on Wildlife Management: The WDFW Commission has not maximized recreational opportunities for sportsmen as directed in their mandate. With recent decisions on black bear and potential changes to mountain lion hunting, many conservationists fear the commission is failing to manage its wildlife properly. Introducing more grizzlies would exacerbate this issue. To be clear, reintroduction would not mean a grizzly bear hunting season. The point here is that the state is already under strain from mismanagement of its large population of existing predators beside grizzly bear.

Predator Balance is Essential: Washington is already home to a variety of predators including wolves, cougars, black bears, and coyotes. Washington's ungulate populations, such as elk, deer, moose, mountain goats, and the endangered woodland caribou, are under strain. Introducing more apex predators would further imbalance its delicate ecosystem. Again, much of this is a consequence of decisions made within the state to properly manage existing species.

Does Historical Presence Justify Reintroduction: While grizzlies once roamed areas like downtown San Francisco (before it was San Francisco), it doesn't mean they should be reintroduced there, or in Washington for example. There is a responsible way to do things. Is it responsible for humans to bring grizzly bear into Washington state when so much mismanagement of wildlife is taking place?

Correspondence: Under no circumstances should NPS be deliberately introducing grizzly bears into the North Cascades. They are a dangerous predator, and NPS should be directly held liable the first time a resident or hiker or hunter is killed by this foolish and unnecessary action. The couple in Banff that was killed by a grizzly bear despite doing all the "right things" and discharging a full can of bear spray to no effect shows that there's no way to ensure grizzlies can be reintroduced safely. NPS should follow the "no action" alternative and simply let nature decide where grizzly bears live and roam. Hopefully it will continue to be "not Washington state".

Correspondence: To whom it may concern,

This comment is AGAINST the North Olympic grizzly plan.

The claim of "If this part of our natural heritage is restored, it should be done in a way that ensures communities, property, and the animals can all coexist peacefully," Hugh Morrison, the regional FWS director, said in a statement on Sept. 28 is asinine because it proposes that the bears won't go wherever the hell they want. 'Peaceful coexistence' with a bear only happens when humans & bears are separated. Which is exactly the point - use the bears to crowd the people back out by regulations of 'free space'. This plan will also be used as precedent to repeat the process elsewhere in the Northern Rockies where i reside. Maybe you drop a few in Lake Tahoe for POTUS' next vacation?

No.

Not 'no', but Hell No ! The people of the area have spoken repeatedly - listen to your Employers, the Citizens who provide your paychecks. We're tired of your boss and his radical environmental tyranny. The bears are NOT endangered anymore & He doesn't have to deal with them at the beach or in his basement. Stop wasting our tax money infringing on our rights to live where we choose.

Correspondence: I felt compelled to voice my concerns about the potential reintroduction of grizzly bears in Washington. It's undeniable that grizzlies are already making their way into the state from neighboring regions. The absence of physical barriers means they can migrate naturally. Given the state's challenges in managing its existing wildlife, introducing another apex predator seems counterproductive. The recent incident in Stevens County, where a grizzly bear was captured, is a testament to the growing predator challenges in Washington. Our state is already grappling with managing wolves, cougars, black bears, and more. Considering the strain on our ungulate populations, I cannot support the idea of reintroducing grizzlies into the state.

Correspondence: I am currently in favor of Alternative A, as this is described as the only alternative which provides for full participation of WDFW. I believe we ought to focus on habitat and increased connectivity overall, not on how to transplant specific animals to and from specific places based off of different political or social opinions at a given time.

Additionally, I thank all involved for their work on this project, and others.

Respectfully,

██████

Correspondence: Greetings,

I am in support of having a healthy population of grizzly bears in the north cascade ecosystem. Having backpacked in Alaska with grizzly bears present one has to respect there space and be bear smart to avoid problems of interaction.

To have a healthy ecosystem in the North Cascades we need apex predators such as the grizzly.

Regards

Correspondence: I want to register my disapproval with plans to reintroduce Grizzly bears in the North Cascades. I live in the forested foothills of the North Cascades outside of Tonasket Washington. I chose to live here because I enjoy the outdoors, especially the frequent encounters with deer, black bear, turkey, grouse and other wildlife. Unfortunately, wolves have recently moved into the area, and while I haven't encountered them, it is a bit unsettling to know they are there, especially when my grandchildren visit. Grizzly bears would be a dramatic escalation in our safety concerns.

While the downside to Grizzly reintroduction is obvious to those at risk, the primary advantage is to be soothe the sensibilities of urban populations that will not be exposed to the dangers that are created. The species is no longer at risk given the robust population that has recovered and spread from Montana through Idaho and into eastern Washington. The population in Canada is also robust, and if additional habitat was needed, Grizzlies could easily migrate south into the North Cascades. Why not let nature take its course rather than force an artificial introduction. While unsettling, at least the arrival of wolves near my home was natural.

With no benefit to the species, it appears that the objective of Grizzly reintroduction is to terrorize rural residents. Until Grizzly populations are restored in Olympia and Sacramento and wolves in and around Washington DC, why don't you just leave us alone.

Correspondence: No, No, & No. Trying to force a predator into an area that is used by people for hiking, hunting, back packing, horseback riding, cattle range, agriculture is not a good predator to re-introduce. I am pretty sure there are few that range into the most northern area on their own & haven't caused much commotion with people or agricultural areas or ranchers with grazing. As far as federal, tribal or state agencies keeping them in check, I don't have alot of faith. I have seen how tribal treat the elk herds in Colockum area... NO Respect for the animal or safe zones put in place for the elk; wasted meat, shooting for antlers only & driving motor vehicles on closed land. Tribal Enforcemnet doesn't do anything. Our State Game dept's hands are apparently tied since nothing is done about it due to the bureaucratic crap in Olympia. I am pretty sure if people want to see Grizzly bears up close they go to parks like Yellow Stone or Glacier Park in Montana where they are set up for grizzly populations. The way I see it it's just one more step in limiting or reducing all together hunting for families who want to provide food for themselves as well as educate their children about the outdoors and how to take care of it for future generations. This is 2023 not 9000 + years ago, too many people are out in those areas enjoying the wilderness without threat of a bear possibly attacking them, ranchers being able know their cattle are safe, farmers with crops not having damage, or deer/elk/fish being reduced due to predation of some grizzly bear. Just a thought maybe Mother Nature takes care of what should be balanced in our ecosystem... seems like every time government gets involved in anything, things go south in a heartbeat.
Thanks for reading my comment.

Correspondence: I can't comprehend the need to bring a top level predators back into areas where they've been gone for quite a while. Montana with a very large state and few people regularly has human and grizzly interactions that generally don't go well for human(s) and later that animal. So now you're wanting to bring grizzlies to a small state with a huge human population. The people that make these decisions should be the ones who have to tell family members and loved ones that they're family member has been mauled to death or severely maimed for life because the notifier's wanted grizzlies reintroduced. These people shouldn't be allowed to hide behind others to make these horrific notifications. They should be the ones who carry the burden of that decision to reintroduce and carry the weight of notifying family members of an attack or mauling. It's not a matter of if it will happen, just how often will it happen with the amount of people in Washington.

Correspondence: I don't believe the re introduction of grizzly bears into our region is the wisest decision. We have already noticed a rapid decline in wildlife numbers dropping since the re introduction of wolves, and the rising number in cougars. We as ranchers love wildlife , nature and our ways to help create a healthy thriving eco system. You can not keep reintroducing predators into those ecosystems that have not even been able to adapt to protect themselves. Growing up we use to see moose , elk , deer , rabbit, grouse even black bears . We hardly if at all get to see any of that anymore. I don't want my kids growing

up only being able to see these in picture books.

I don't think the predator population has been managed at all. They are over taking everything. Why are we repeating history ? Our ancestors obviously knew they was a good reason they had to stay at limited numbers . We will all suffer from this, and already are.

I hope a lot of thought and wisdom goes into how this is really going to impact not just humanity but even the animals .

Correspondence: My children are avid hikers who live in Seattle and frequently hike in Cascades National Park and I travel out west yearly to hike with them I understand the desire to change an environment back to its original state. However, with human population increasing in visiting national parks and such, the chance of encountering a grizzly bear increases. Which is extremely deadly. And for what benefit? An encounter with a black or brown bear may be resolved with bear spray- an encounter with a grizzly would require a gun. I believe grizzly bears should not be reintroduced in the North Cascades.

Correspondence: As a frequent user of most of North Cascades outdoor trails and recreation area, my wife and I plead you to use Alternative A in your posted plan that we have read throughly. While we do not want to see the Grizzly Bear to become extinct, we believe that it will be counter productive to their overall survival to place them in a new location such as the proposed are in the North Cascades.

It will definitely cause us and those we know to not visit the park's areas where the bears will be released. Adverse encounters with Grizzly Bears are too widely publicized on the internet and news often creating hostility to their overall conservation. US populations unfortunately, do not support the reintroduction of all species that are possible in Canada, Yukon and Alaska.

Black bear populations are healthy and they represent the apex predator of biodiversity that our northwest parks thrive on. Black bears are less likely to have adverse incidents with park users.

Any other than Alternative A will divide our communities, increase public safety costs, and because adverse Grizzly interactions are rare, will eventually result in the death of people. As what was seen in the recent interaction in Canada, when the bear has less than the required fat level in the fall, you can do everything according to conventional wisdom and the bear still has to be killed, after significant loss of life.

Who will ultimately responsible for the first person's death as a result of this release?

Respectfully, [REDACTED]

Correspondence: The North Cascades ecosystem is already under strain from mismanagement of large populations of existing predators besides the grizzly bear. Re-introducing grizzly bears would further strain the ecosystem, especially in regards to ungulates. Equally important, hikers, hunters, and the like are already watching their back for grizzly and black bears (myself included), and if safety is a priority, we do not need to more of them on the landscape. After all, they will reproduce on their own. If they belong here, they will come here on their own. Please do not reintroduce these dangerous predators to the landscape.

Correspondence: Prehistorically there were grizzlies in Washington state's North Cascades. Historically they were eliminated by increasing human populations in the region. Proponents of reintroducing the bears into this region tout the ecological benefits, without specifying them.

This proposal smacks of a nostalgia for having things the way "it used to be."

The only obvious ecological change is a reduction in the population of black bears. It is obvious that grizzlies are dangerous to the present human population, domestic animals and humans who recreate in the area. It is well documented that the present areas of extant grizzly populations are sufficient for maintaining a healthy population of grizzly bears.

That leaves the only reason for reintroduction of grizzlies into the North Cascades is that that's the way it used to be.

This same logic can used to deprive women the right to vote. We could say that white egrets should be exterminated in the Pacific NW because they didn't use to be there. Environmental management is good when it is helpful. Environmental nostalgia is environmental nonsense.

Correspondence: I am a large mammal, landscape-level biologist who supports the restoration of grizzly bears to the transboundary North Cascades Ecosystem. I am well versed in the deep backcountry of the North Cascades on Forest & Park Service lands. The region is prime grizzly bear-supporting habitat. My observations over the years sure seem to indicate that black bears are currently functioning as foraging surrogates to grizzly bears. Productive huckleberry patches cloaked by black bears in the North Cascades would be disproportionately used by grizzly bears without the human caused displacement & mortality of grizzlies that the ecosystem has experienced. The Pacific Northwest is dominated by Public Lands, entitled equally to all Americans, so I hope you will make a decision based on collective input from across the nation, while also acknowledging the needs of local residents and their livelihoods. A restored grizzly bear population will benefit the region, Canada included. To be most effective, strong coordination among US and Canadian agencies is needed. A strategy that jump starts the population in Washington's North Cascades, with landscape mitigation measures implemented across major transportation corridors, including Highway 3, is needed. I support relocating 25 bears to the area north of Highway 2 in 2-4 different release areas. Doing this should 'jump start' the population's heartbeat within a decade after releases are completed. Then, let the grizzlies distribute themselves across the rest of the ecosystem. Time is of the essence to implement this strategy, given the trajectory of human population growth along the I-5 corridor. Inaction on this matter at the federal level has occurred for far too long. Thank you for your consideration.

Correspondence: As a born and raised Montanan living in the Methow Valley, I do not think grizzly bears should be reintroduced to the North Cascades. I have seen firsthand the interactions between humans and grizzlies, and it is typically not peaceful.
The Methow Valley is rapidly increasing in population, and more Seattlites are making their way into the Cascades for recreation. If you drive on Highway 20, you'll see miles of parked cars outside of trailheads, the length seemingly increasing with each year - even at the "secret" spots. Many of these cars bring city-dwellers with little to no knowledge of wildlife and often no idea what to do if they come across one of the grizzlies being reintroduced. I think throwing bears into the increasingly popular North Cascades is a recipe for disaster for both human and bear.
The government agencies in the area are woefully understaffed as it is: there is often no one to help if a resident spots a black bear in their chicken coop. What happens when that's a grizzly threatening their property or livestock? The local agencies are not prepared to step up in those situations.
Safety is a huge concern that I believe the Parks Service is brushing off. Being able to recreate alone is a luxury rarely afforded to those living so close to nature, and it breaks my heart to think that soon we may lose that privilege. As the owner of a fruit tree and berry bush loaded property adjacent to public forest, I worry about the safety of my young family in my own backyard when the grizzlies inevitably make their way down from the Cascades into the Methow Valley.
While this discussion is taking place, the Department of Fish and Wildlife is planning on closing a majority of their public land in the Methow Valley due to the decline in mule deer population... I can't help but wonder what the reintroduction of a

major predator will do to their numbers. It's odd to me that these conversations are happening simultaneously. Living in the mountains means coexisting with wildlife - this is just a fact of life that I have been familiar with my entire life. However, adding a predator to an increasingly populated area with an already-strained prey population is a recipe for disaster. I do not think the Parks Service should go forward with the reintroduction of grizzly bears in the North Cascades.

Correspondence: I work as a full time forester in northeast Washington State. I have spent more than 24 years in my occupation and understand these issues very clearly. I began my career in Oregon's Cascade Range. My current area covers all of Ferry County, Pend Oreille County, Stevens County and Spokane County. The idea of reintroducing grizzly bears into northern Washington or anywhere else for that matter, is ABSOLUTELY ABSURD. Just because they once existed here

doesn't mean we can forget about the past 150 years of human expansion into these areas creating recreational opportunities, family outings, natural resource utilization, and peacefully enjoying outdoor experiences.

First of all, our youth and young families will suffer. Psychologists have determined that our youth are plagued with a crisis of not connecting with nature due to exposure to excessive screen time instead of healthy outdoor experiences. This has grown to be such a problem with our youth that the USFS has launched an aggressive "Get Outside" (sic) program to detach our youth from their couches and experience nature. Introducing grizzly bears is only going to chill this important effort. Any apprehensions our vulnerable youth felt about experiencing the outdoors before, will only now be a solid reason for them to stay attached to the security of their screens at home. This would result in a negative result and undermine efforts in expanding any outdoor youth experiences.

Not only are our local youth outdoor at risk, but the lack of forethought concerning ecological function is on display with this decision. Like with prescribed fire, we cannot just light a fire in July at one end and then see what happens in the fall just because we have romantic notions that the land was once a fire dependent ecosystem. This is the same philosophy being applied with grizzly bears. These animals don't confine themselves into a nicely fitted box that radical extreme environmentalists and arrogant managers presume these dangerous apex predators will remain inside of. This concept may work well in greater Yellowstone ecosystem and in Alaska's remote tundra regions, far removed from human populations, but in Chelan County? Are you kidding me? This idea is absurd and needs to be scuttled immediately. Instead, managers should seek to explore opportunities to expand other truly at risk species that are NOT apex predators such as the northern spotted owl by breeding and introducing spotted owls into areas to expand and monitor THEIR numbers.

Next, introducing grizzly bears into fire dependent ecosystems will only delay and interfere the important work for forest restoration. Where grizzlies are sighted, natural resource personnel will be deterred from entering these areas for their own safety. Even with an aggressive bear deterrent effort, this whole concept will only complicate the far greater ecological work that is needed to reduce the risk of catastrophic fire on the landscape. Complicating this important forest restoration effort is the last thing our at risk forests and communities need.

Thank you for considering these comments. Please do not just disregard them with a predecisional mindset that this comment period is simply just a box to check formality.

Correspondence: We thought this issue was settled a couple years ago.

What is the reasoning behind this proposal? The Native American population was so small when the European settlers came into this region and killed the bears. There are SO many more people here now!

Do you know how many people have been killed this summer by grizzlies? Several! The bear was killed. Look it up. How many maulings in the last couple summers? And we have way more hikers and campers I would think. Look at the Yellowstone area, Montana, Wyoming. And these areas are much less populated than the North Cascades. We draw from Seattle and other big cities!

Ask the folks who help run the Pacific Crest Trail. They have a lot of hikers each year. Many of them are young people. Having grizzlies in the park will not be a welcome piece of news for them.

Put them in parks or places where the people want them. We do not. We have enough bears already. We also have cougars, deer, and Big Horn sheep that are all doing very well in our area. Let the hunters and winter do the culling.

Please reconsider. With our population we cannot go back in time to make areas the way they used to be. We are expected to have at least 100,000 people move into Washington state in the next 10 years.

Thank you,

In fact what is the point? There are no diseases affecting our deer population.

Correspondence: I am most definitely against the Grizzly Bear Restoration Plan!! These predators pose a significant and dangerous risk to those who enjoy the unsurpassed beauty of the Pacific Northwest, as hikers, campers, and enjoyers of nature. There are numerous examples of the danger posed to the public by these animals. We do not need or want to bring that risk to an area so enjoyed by families and individuals. Think of the potential dangers rather than enacting such an ill-advised plan. PLEASE!!

Correspondence: I am a retired fish and wildlife biologist so I understand the biological and ecological reasoning to want have grizzly bears in the cascades in WA. However, I think the proposal to introduce grizzly bears into the cascades lacks common sense.

The proposal to bring bears into the state is completely different and has different societal implications than managing them when they come in on their own. If bears come into northcentral WA on their own, then according to state law they would be managed for conservation of the species in WA. Transferring bears into WA does not make sense and would cost the citizens of this state large sums of money for years to come. WA is the smallest western state with the second largest human population in the west. The federal lands in the cascades are relatively close to the high human population areas near Puget Sound and southwest WA, and these bears would not likely remain solely on federal or other public lands. This situation in WA is not like in Montana or Wyoming where large states have relatively small human populations, and NO major large

cities exist anywhere near the primary grizzly areas on federal lands.

Please learn from what happened with wolves in WA. If you consider the huge amount of conflict, lawsuits, and hard feelings created by the natural entry of wolves into WA and what that has cost the citizens of WA and the WA Dept of Fish and Wildlife in terms of many hours of work, meetings, planning, and trying to work with parties with conflicting interests, plus very large expenditures of funds, the management of wolves is likely relatively minor compared to having to deal with introduced grizzly bears, especially off federal lands. Dealing with both wolves and grizzly bears very likely would substantially reduce the WDFW personnel and state funding available to conserve other species in peril in WA (and there are many!). This proposal for introducing bears has tunnel vision when considering trying to save biodiversity and native species in peril in this state. PLEASE reconsider your preferred option so that you would not reintroduce grizzly bears, but you would develop a plan to conserve and manage these bears if, or when, they arrive in the cascades on their own. I hope that you will do the right thing and not introduce these bears in WA.

Correspondence: Hi there,

Please take the time to read through my suggestion.

I strongly disagree to the grizzly bear restoration plan. Let's try to think of what really comes out of this plan. Hunters and conservationists will be extremely impacted, us hunters are already struggling with predators. With grizzly bears introduced I fail to see the positive outcome. These are amazing animals but un needed in the north cascades. It's an improper use of our money and does not Benefit anyone.

Thanks for your time.

Correspondence: I think "introducing" grizzly bears in an already unmanaged bear state is a very poor choice. There are already so many issues with other bears and grizzlies are starting to migrate into WA on their own. I think the introduction of dangerous animals in a heavily human populated state is against better judgement. Let's focus on the things that matter rather than spending funds just for the sake of spending them.

Correspondence: RE: Ecosystem Grizzly Bear Restoration Plan

Leavenworth, Washington, a bustling tourist town with vast areas utilized for recreation around the city. This area has already been dealing with increasing interactions between people and wild animals year after year. Black bears migrate through our area regularly and have learned how to feed in suburban areas by raiding garbage cans. There are also massive pear and apple orchards in this area that entice all sorts of wild animals, including bears, coyotes, cougars, bobcats, and, of course, deer. Once or twice a year a person is injured by a chance encounter with a wild animal. Sometimes a pet is injured or killed.

The people who live in this area and most who visit here love the wildlife in this area and respect this as the animals' place to live, too. However, it is a delicate balance. Allowing grizzlies to roam as close to the city of Leavenworth as is shown on the map in the Ecosystem Grizzly Bear Restoration Plan does not seem like wise planning to me. To the north of the city of Leavenworth is a year round playground in the Ski Hill area. In the summertime, hikers and bikers abound. A chance encounter with a grizzly could be deadly for any unsuspecting person or group of people. Tourists often go into recreational areas often go in unprepared for a day hike nevertheless a possible encounter with a black bear or, now, possibly, a grizzly bear; cougar, bobcat, etc. These animals deserve a wide berth and so do the people in the area. The Enchantments entrance used to be a little busy on the weekends. It is now overcrowded most of the summer with cars parked way down the road from the entrance. Grizzlies in this area might be just new and even more dangerous accident waiting to happen. Yes, grizzlies did exist here in the past. The difference now is nothing is the same as it used to be. Humans have entered the area in droves.

I suggest moving the area further north of Leavenworth, Plain and the Lake Wenatchee area to mitigate possible encounters.

Thank you,

██████████

Correspondence: I believe alternative C is the best option. Though there are concerns about the grizzlies impacting the safety of locals and visitors in the NCE - which would be one of the biggest concerns for many, grizzly bears have been living in canadian rockies and other human populated areas such in many towns in Alaska with very few incidents if any. Bringing them back will restore the historical cultural landscapes of the NCE and hopefully bring them back their population from being threatened to stable.

Correspondence: Changing the Western side of Washington by adding Grizzly Bears would forever change the accessible beauty of the state and the living conditions. These Bears are very aggressive and unpredictable at times. This will disrupt kids walking to and from school, chicken coops and other livestock, and add pressure to the growing black bear population. Grizzly Bears are not welcome by the majority of nature users, fishermen, hunters, bird watchers, hikers, etc. People who do support them do not know the dangers of them and the added problems to the environment. Western Montana and Northern Idaho has begun seeing many many more problems increasingly more than many experts say. Just this year, two hunters were charged by a Grizzly and had to be put down with a handgun in self-defense or they would have been mauled. Western Montana recently had a woman dragged out of her tent right near the post office of a small town without warning. These are acts of nature, but this is not needed to be added back into the Cascades unnaturally through relocation. This a terrible idea and short sided only needing more money spent to manage them and 'study' them. We do not need to study them on the west side if introduced by relocation. Do not support adding the very aggressive and dangerous Grizzly bear by unnatural relocation.

Correspondence: I am a 60-year old avid backpacker living in Washington. I have spent the past 35 years hiking many trails in the NCE and elsewhere. I have hiked the Pacific Crest Trail from Snoqualmie Pass to Stehekin (High Bridge) and intend to hike from Stehekin to Manning Park in B.C. in the next few years. I have read your draft EIS.

I am opposed to any reintroduction of grizzly bears into the NCE. I would never have hiked the portions of the PCT that I did if 280 grizzlies lived in the NCE. The no-action plan is the only reasonable approach to maintaining a decent balance between the existing low-impact human use of the NCE and allowing a bear population.

Reintroduction to promote a balanced ecosystem is nonsense. I have never seen any area overrun by any animals or plants because of the absence of grizzlies.

Reintroduction of grizzlies will undoubtedly lead to injuries and death to humans. It will also seriously inhibit hiking and other good, established recreational uses that currently occur without harm to the environment.

Reintroduction of grizzlies places a higher value on bear life than human life. Under the circumstances, doing so in the NCE would be foolish, detrimental and immoral. The proponents of bear reintroduction must have a distorted world & life view. Any plan beyond the no-action plan would be illogical, ignorant and demented.

Correspondence: I would like to express my support for allowing the existing grizzly populations to expand into No Cascade National Park.

Due to its remote nature and location, the park is an ideal environment for the grizzly. It would be hugely beneficial to build a continuous habitat with northern Idaho and Montana for breeding purposes in the northern US. This should be an immediate and continuing effort so we could safely take the grizzly off the endangered species list.

Correspondence: I am writing in full support of the decades-long efforts to return the grizzly bear back to the North Cascades Ecosystem. Washington State has an amazing opportunity to restore a top predator to their former range and I have full trust in the biologists and ecologists who have been working on this issue for so long to do a thoughtful and careful reintroduction. I am a professional biologist working on other rare species work (much tinier than the grizzly) and fully understand that some conservation-dependent species, such as the grizzly, simply cannot return and establish a healthy breeding population without human intervention. I am also a third-gen Washingtonian and outdoor enthusiast. I know that having grizzly in my beloved North Cascades could add an element of danger-- but it is a risk I fully embrace, knowing that

with smart bear country travel, interactions would be extremely rare. We are losing other species (whitebark pine, etc) due to the loss of the grizzly and to have a fully functioning ecosystem, you simply need these keystone species. Finally, the lobbying by the livestock industry has been a powerful force, but in my opinion, should not be held in higher regard than the animals that are part of the public trust. Grazing livestock on public lands is an antiquated idea (a holdover from an earlier era which makes no sense in modern times-- why does a private commercial livestock grower get to benefit financially from our public lands AND have the loudest voice in the room when it comes to top predator reintroductions?) Claiming financial difficulty is a moot point as there are ample programs to reimburse for livestock loss. PLEASE do not let this loud, vocal minority guide your policy. Those of us who aren't in the rooms shouting OUTNUMBER these folks-- you just don't hear us as loudly. Bring these magnificent, important, animals back to our mountains where they belong-- and thank you for not giving up.

Correspondence: To whom it may concern:

My wife and I are saddened and angered to learn of the National Parks Department's renewed plans to populate our region with grizzly bears. It appears that the Department's drive to do so has led it to again and again reintroduce the issue, even in the face of resident's opposition and logical fears. Statistics which proclaim attacks on humans to be "rare" offer little comfort, especially in the immediate wake of the killing of two grizzly savey hikers in the Banff national park, to the north of us.

Introduction of grizzlies into the north Cascades places these threats much closer to us, despite "reassuring" PR nostrums like "live with grizzlies" or "they are just doing what bears do, and just passing through."
Moreover it would serve to increase anger and division between environmental idealists and those directly affected by the fear and danger introduction would bring.

Since 1967, my family has owned a residence on [REDACTED] at Lake Chelan, Washington. The small house was built in 1928, and sits amidst what is now known as "cougar alley" due to the boom in the cougar population brought on by hunting restrictions. (We just recently had a large cougar cross our deck with impunity, within 20 feet of us.) In addition large black bears abound and have threatened us from as close as 3 feet. Finally, we last year "hosted" three wolves killing a deer within 200 ft of our house. Although the issue here is grizzlies, please consider the extent of worry already in place for grand parents such as we are, both for ourselves and vulnerable grand children.

The project will further divide our region between rural and urban residents. Not only will the National Park Service's involvement alienate many from its other worthwhile efforts, but it will further diminish public support for other forestry and park goals at federal, state, and local levels. If nothing else, support for funding may suffer, and use of campgrounds and forests may well continue to dwindle, given increased dangers. In this day and age, our divided state and nation does not need even more, contentious hot button issues.

The North Cascades is a narrow strip of habitat extending through the heart of our part of the Pacific Northwest. We can not accept the discretionary introduction , artificial or otherwise, of dangerous apex predators into a sanctuary located a short food-hunting wander away from our populated areas.

Thank you [REDACTED]

Correspondence: My family and I have had a seasonal house in Stehekin for 20 years. Our community is terrified of the prospect of introducing grizzly bears locally, and I wanted to comment in strong opposition to the plan. Grizzlies have never been native to the area while we've been around. No one we know locally has ever seen them.

Nonetheless, they do pose a significant threat to humans. Grizzlies are known to stalk and attack humans without provocation. In my life I have been near a grizzly attack in Montana where a hiker was stalked and killed. A couple out hiking with their dog was killed in Alaska within the last several days. We are hoping we do not have to start carrying 10mm handguns as sidearms for safety, but we will have to make this change if grizzlies are introduced. Please, help keep the local population of Stehekin safe and do not introduce grizzly bears into the surrounding area.

Correspondence: I'm in favor of reintroducing grizzly bears into the Cascades. This plan seems fit for relocation of expanding MT populations of bears and the Cascades are perfectly suited to receive them food wise, space wise, and human knowledge wise. I'd suggest looking first at Yellowstone bears due to their high population, to reduce human-bear friction there, and in the interest of breeding farther apart from the British Columbia bears they'd be apt to encounter. Followed by Glacier bear relocations.

Correspondence: Please do not follow through with this choice of reintroduction of Grizzly Bears. We have spent time in Grizzly country (Montana, Wyoming) and it forces us to be extremely careful and cautious being in nature. Walks, hikes, bike rides are no longer casual outings, but they become planned events where we cannot go out without all necessary precautions. Bear bells, air horns and bear spray must be on us at all times.

According to this bear expert, he believes mountain biking and trail running should be banned from grizzly country. With grizzly bears in our local mountains this would limit our ability to be in Nature safely with our small children.

Correspondence: Please rethink the reintroduction of brown bears to the North Cascades.

I believe that past history of human meddling in reintroduction or eradication "solutions" have failed.

Brown bears will move back down into the North Cascades from Canada in their own time, as they see fit. We are not more intelligent than them, nor are we able to fully comprehend all of the nuances and intricacies of their lives.

Taking bears from an environment (Wyoming) far removed and ecologically different from their planned new home is cruel and unnatural. I believe it would create a more hostile animal. Imagine after being sedated and upon waking, finding itself in a completely new and foreign environment. This would completely disorient the animal as well as create trauma association for the bear with humans. If the last thing it sees before waking up in this new place is a human, pointing a gun at it, what would the repercussions be upon seeing a human in the wild once it is in it's new "home"?

I work in Alaska, have spent ample time around brown bears and can't imagine putting them through this process of reintroduction. The benefits (to whom or what?) don't seem to outweigh the risks.

I'm baffled by why humans insist upon knowing what's best for the earth and its creatures. Clearly, by the current state of the world and the environment, it doesn't seem like a stretch to understand that maybe we just don't.

Thank you for your time,

Correspondence: Thank you for taking my comments.

I am concerned about safety while hiking in the Leavenworth and Lake Wenatchee areas.

We have property that borders the NFS property and do not want to encounter Grizzly Bears.

We think the area will be fine without these dangerous animals.

I am against the Grizzly Bear Restoration Plan for the North Cascades. I hope this plan will not go forward.

Thank you,

Correspondence: My vote on this would be neither a yes nor a no, but rather a "First ___, then___":

I am a mother of 2 young children and we love visiting the outdoors near our home. We have learned the tips for black bears, even though we feel nervous in black bear country. Grizzly bear country is another story. I noticed that there seem to be some human-bear problems already in the Cascades such that certain campgrounds must be shut down because the bears that are already there have become too accustomed to finding human food in those locations. It would be nerve-racking to have any bear wander into campgrounds, but especially so with a Grizzly - before reintroducing Grizzlies, I would hope there would be stricter and better enforced regulations on campers in order to prevent bears becoming accustomed to and visiting campgrounds. As a tent-camping and hiking family, we want to feel safe enjoying the outdoors. While I think bears and humans can do this, it is clear that something already isn't working in the black bear-human mix in the Cascades if campers are luring bears in such that campgrounds are already being shut down. I'd like to see that addressed first before a bear that is substantially larger than a black bear is reintroduced.

Ultimately, I want to see Grizzlies survive for my kids and I'm guessing reintroduction to the Cascades is part of making that happen in the face of habitat loss. At the same time, if the bear-human interaction isn't figured out in a healthy and positive way from the get-go, it might be counterproductive. I would hope we can figure that out first, then move forward with reintroduction. :)

Correspondence: I favor alternative A (no action). I am an active hiker and backpacker in the greater North Cascades area. This animal represents a treat to human safety for those in the backcountry that I do not feel is necessary. In addition if bears were in the NC area many persons will feel that they needed to carry firearms with them which can lead to other accidents and issues. If grizzly bears were extinct and this was the only area that it was felt that was proper habit for them then I would probably be for releasing them back into the NC area. However, at this time if you want to see a live grizzly you can visit Yellowstone NP and see them from many different roads.

Correspondence: A bad idea. The North Cascades Ecosystem is very different than Alaska, Canada, and the Rockies. We lack the salmon runs and wildlife to sustain these 1000+ pound creatures. They can and will travel to lower elevations east and west of the Cascades to find food. We are supposed to be reassured because the bears will be collared. However, their cubs will likely not be collared. Also, collars do not prevent bear-human encounters. As a physician, I have personally cared for 3 grizzly attack survivors and one black bear attack survivor. All were severely disfigured years later with missing eyes, ears, and noses. So, yes, I am biased a bit. However, unlike the proponents of this release program, I have witnessed the potential life changing effects that these bears can have on humans.

Correspondence: I strongly oppose the reintroduction of grizzly bears to the NW Cascades and to Washington in general. A grizzly bear is a killing machine. They do not coexist well with humans. How many people will die or be mutilated when accidentally coming upon a brown bear? This decision will profoundly change the safety and enjoyment of people hiking the cascades. I feel that one human life is worth more than an idealized principle.

When I was young, my family vacationed several summers in the spectacular Bob Marshall Wilderness Area of Montana. Each summer there were incidents of people being mauled or killed by grizzlies, for merely coming upon one. How crazy is it to reintroduce this dangerous belligerent animal!!!

My days of enjoying the backcountry are long over, but this old lady thinks reintroducing grizzly bears is an immoral and misguided idea.

Thank you.

Correspondence: WDFW has enough trouble managing the game population currently and is proposing reduced predator management. With added predator pressure this will upset the delicate balance that has been constantly upended by human encroachment and development.

There are no guarantees that the bears will stay in the national park. Also, historical populations doesn't necessarily justify forcible introduction. Black bears and mountain lions were once quite populous in what are now very dense population centers (Seattle, Bellevue, etc.), I don't think anyone would argue it's a good idea to move bears into those areas.

Attacks from grizzly bears are becoming more and more common across North America and we don't need to encourage population development and migration that can happen naturally.

Correspondence: I am all for reintroducing grizzly bears to the North Cascades. I live in the area and do not hesitate to share my landscape with these important animals. In order to bring the ecosystem back into balance we need these bears to dig up meadows and to fill the gaps in the balance of other animals.

If they are threatening livestock I believe that ranchers should be commentated for losses and that bear dogs could be used to protect domesticated animals and other means to control them just like wolves and other bears.

I know there is some small risk to recreators but folks have live in Alaska and deal with it and I have lived in Montatna and lived with them near Glacier National Park.

Please count me as a 'Yay' vote. They are magnificent animals and should be allowed to live where they belong. They have already given up all of the Great Plains. We should leave them something and if it is a problem let our grandchildren have a chance to chose.

Correspondence: The reintroduction on grizzly bears is an irresponsible emotion driven effort. Grizzly bears will migrate into the area from Canada and north eastern Washington. Our limited wilderness spaces are already predator heavy which is hurting prey populations. Artificially introducing another predator will upset the balance and harm the prey populations further with another endangered, unmanageable predator. Allow the natural reintroduction process to occur and stop forcing endangered unmanageable predators in rural residents.

Correspondence: Reintroducing Grizzlies to Washington has to be one of the most irresponsible actions this agency has ever done. The wolf re-introduction across the west was a feel good story that has decimated ungulates across the board. If the agency's agenda is to only have predators on the landscape then they are well on their way.

Honestly, what does this actually accomplish? A success story for people that want to keep their jobs? Other than that there is no scientific (or should I say, realistic impact) other than to kill more ungulates and endanger the public.

As a person that loves to to recreate in North Central and Northeast Washington, this does nothing but add danger. As a Father of a 2 year old and a 6 year old, I can't imagine camping or recreating in these areas if this action goes through. My father was a school teacher in Chewelah and because of that I've always held that area special to my heart from the stories he has told. We spend many days throughout the year camping in that area every year. Not only will I not be doing this anymore because my children's lives are more important, but I won't be spending the money in all these small communities.

This agenda of reintroducing grizzlies only hurts the public at large. I may benefit the few looking to better themselves, but

not for the majority that it affects.

Sincerely,

Correspondence: My wife and I oppose any effort to reintroduce grizzly bears into the North Cascades. That includes opposition to invocation of the 10(j) rule. Our reasons are:

Grizzlies are not at risk of extinction. Rather, the motivation is cultural and political--much as wolf reintroduction was. However, as I understand it (from a professional wildlife bio who has done some bear research in the N Cascades), grizzly bears are not a keystone species as wolves are. Rather many of their ecological functions are fulfilled by black bears.

Human population density is so high the risk of dangerous and deadly encounters is unacceptably high. This is the case throughout the area you propose for reintroduction.

There are also huge political implications. Consider wolf reintroduction--which we both favor--which doesn't have nearly the safety issues as grizzlies. The social turmoil and hostility toward wolves--including killing them-- is not good for our body politic. Imagine how much worse it would be with grizzlies running around.

My wife and I both hike a lot, sometimes alone. We aren't sure it's fair for us to be at risk because there is a segment of the public that really likes the idea of grizzlies in the wild.

thank you

Correspondence: I am a physical therapist and avid hiker serving the communities near Mount rainier. Most of the locals frequent the ranges throughout the state with minimal concerns of fatal bear attacks given the infrequent news of it occurring in Washington and caused by black bears.
Several stories annually come from adjacent states following grizzly bear related deaths.

Why on earth the state would willingly risk the lives of its active population by introducing an apex predator with the capacity and occasional drive to attack humans is beyond me.
Would the same carelessness be used to try to put aggressive shark breeds into the sound? It's careless, and dangerous. At a minimum I hope that this choice Carrie's with it liability for the state for manslaughter when this choice results in death - and as someone who regularly hikes alone this goes double for myself.

Please do not introduce this potentially dangerous animal into our ecosystem.

Correspondence: I am opposed to the reintroduction of grizzly bears under any conditions into the north cascades wilderness area, either now or in the future. I believe that all of those people involved in promoting it or in doing so have a reckless disregard for human health and safety, and should be held legally and financially liable for any death or injury caused by the grizzly bears if they are reintroduced. To introduce a large predator into a recreational area, that has a history of stalking and attacking, maiming and killing defenseless human beings with no provocation or warning, is completely reckless.
As a resident of Washington who has spent time in these areas, often with groups of youth, having a constant fear of being

attacked and maimed or killed by a large predator when in the outdoors would destroy everyone's right to safely enjoy the recreational opportunities in the north cascades, as well as the rights of those people who must live and work in the area. Please stop this proposed grizzly bear reintroduction into the north cascades now and at any time in the future.

Correspondence: You are absolute dumbasses if you bring grizzlies back to Washington. Have you seen how dumb people have gotten? You will have blood on your hands from stupid but innocent people getting mauled. That's not counting family pets and livestock. Species have gone extinct for as long as life has existed on Earth. It is a cycle of life. You want to talk about the importance of nature, then let nature run its course. If you must, limit hunting on the animals you want to protect. Putting animals back in areas they no longer inhabit is irresponsible and a danger to everyone and everything involved. We don't want the grizzly bears back. They don't need to be brought back. How about do something useful with tax payer money instead of thinking up new and stupid ways to get innocent people hurt or killed.

Correspondence: I wish to add my voice in support of restoring grizzly bears to the North Cascades.

We are in the middle of a sixth mass extinction driven by humanity. Biodiversity is crashing due to destruction of natural habitats by humans, by human population overshoot, and by an increasingly de-stabilized climate due to rising carbon emissions.

It's absolutely vital for people to do whatever we can to help restore natural ecosystems and populations. The time is late...humans must learn to give way and co-exist in a web where all life is inter-connected. If we don't, we'll perish along with the grizzlies.

Thank you for doing whatever you can to bring them back.

Correspondence: Dear Sirs,
Introducing Grizzly bears into the north cascades is a very dangerous idea. We have tourists including hikers, campers, skiers, and also many locals that are in the north cascades year round. This would pose a very dangerous idea as Grizzly bears are much more dangerous than black bears. Do you want Grizzly bears attacking humans? Grizzly bears are much more aggressive than black bears. Also look what it would do to our animal population, destroying many animals that are native to the area.

Please do not introduce Grizzly bears into the north cascades.

Thank You ,
[REDACTED]

Correspondence: Please do not release grizzly bears into the The North Cascades eco system.

If they were meant to be here in numbers, they would ALREADY be thriving here in higher numbers. The amount of people who frequent these mountains is reason enough to not introduce more of these bears! There will be confrontations and people will die or get hurt. Women on their monthly cycle will be targets! These bears can be a menace. They are not like black bears and YOU know it.

It makes no common sense to release a Grizzly or Grizzly's where there is high human traffic.

If you must release them, take them somewhere where there is no human presence.

Also, who is going to come and take care of a problem bear? Locally is there a menace bear person? We have one local Game Warden that I am aware of. How are you going to ensure the safety of the public if a bear that you release wanders into a human populated area and starts causing havoc? The persons who release these bears (all the way from the Biologists pushing for it, the specialists etc) will be responsible.

Correspondence: I am a user of the North Cascades and I am so thankful for having access to such an amazing asset. With regards to grizzlies, I believe that man should allow nature to rebalance the North Cascades without interference aside from protections. With time, more grizzlies will find their way into the area. This will come without the costs and controversy of the proposed plan.
In August of 2016 my hiking partners and I encountered what was likely a grizzly near Suiattle Pass. Our inconclusive photo of the bear was reviewed by an Alaskan bear expert that I reached out to. He gave it a 60% chance that it was a grizzly. If it was indeed a grizzly, that was one more grizzly than I have seen cougar, bobcat, and badger combined in the North Cascades.

Regards,

Correspondence: I am opposed to bring Grizzly Bears or Black Bears into the North Cascades. Why?

It will Impact the fish and wildlife populations due to the introduction of an apex predator. There would be potential risks to persons recreating or hunting in proposed area. There would be loss of hunting rights as the state and federal agencies move to protection of grizzlies over management. There are many reasons! We the people have rights too.
Thank you for listening to my comment.

Correspondence: I am strongly in favor of re-introducing grizzly bears into the north cascades ecosystem that includes the National Park, the National Recreation areas and Mount Baker wilderness. This area is perfect for bears given the relatively low human utilization of the National Park. By its very nature this area is remote and provides excellent habitat for bears. Furthermore, due to being wilderness or National Park administered lands there are limited impacts on domesticated livestock operations.

I have just finished watching and voting for "Fat Bears" from the Brooks Falls area of Katmai National Park. It would be nice to someday have a "Fat Bear" experience in the Northern Cascades.

Correspondence: I am opposed to the relocation of grizzly bears to North Cascades for the following reasons:

- I don't believe the north section of NCNP between Baker Lake and Ross Lake is a habitat that will support a population and neither is the Pasayton Wilderness west of the Pacific Crest Trail. The population that currently exists north of the Canadian border in the vicinities of Skagit Valley Provincial Park and Chilliwack Lake Provincial Park has not expanded southward because the terrain and food resources are not conducive to their survival needs.

- The southern portion of NCNP may be a sustainable environment but their food requirements are going to drive them down the Sauk, Suiattle and Skagit Rivers and into an adjacent urban population of 4.3 million people, where there will inevitably be conflicts.

- Climate change has significantly altered the ecosystem of the North Cascades in the past 20 years and given us massive forest fires, this year on Sourdough Mountain above Ross Lake. Glaciers are disappearing rapidly, this year's mountain huckleberries are almost nonexistent, and the salmon runs are endangered. All of these conditions will lead grizzlies down into the lowland populated areas along the rivers.

- The number of people out hiking, hunting, fishing, and mountaineering are orders of magnitude above the areas around Yellowstone, the Selkirk Mountains, and other areas where programs have been implemented to reintroduce grizzly bears. Frequent confrontations between people and bears are inevitable.

- I am in favor of "Alternative A" - no action.

Correspondence: I am against introducing grizzly bears into the north cascade range. From a wildlife perspective the current animals that occupy this range have had no interaction with grizzly bear. Adding the bears to the landscape would result in devastation to our deer and elk numbers. Just look at what happened in Montana, Idaho, and Wyoming. There is plenty of data that shows this. Even if it is just 5 bears for now that is a huge number of deer and elk fawns that will be lost due to the bears being an extremely lethal predator that these animals have never had to deal with. Grizzly bears may naturally over time make their way into this area but at least by then the animals will have had a chance to adept. Releasing them this way will for sure cause destruction that our deer and elk populations will never recover from.

From a human perspective as someone who frequents the North Cascades I would be cautious for my life as well as other hikers, bikers, and outdoor enthusiasts. Where there are grizzly bears there are always human bear conflicts. We have seen a growing number of these conflicts that unfortunately result in death or serious injury. Again all we have to do is look at these

interactions from Idaho, Montana and Wyoming. It's not the bears fault, they are just being bears. I am not anti bear, they are beautiful and majestic creatures who deserve a spot on the landscape, but reintroduction in the Cascade range is not the right way to do it. Again, in time they may eventually return to this area on their own accord. We did not introduce wolves yet here they are. Animals do not have GPS and don't obey our boundary lines.

Correspondence: I strongly oppose reintroducing Grizzlies into WA State, specifically into western WA for the following reasons:

Grizzlies already have access to the North Cascades and bringing more in would not be sustainable.

An increase in Grizzly population would cause conflict between the bears and the citizenry and seriously, negatively impact our ability to recreate.

By artificially increasing the amount of wildlife in the North Cascades, resources would become more scarce and adding more grizzlies would put that much more pressure on the ecosystem, negatively affecting other native species as well as the human population.

To quote our US Representative, Dan Newhouse, "Time and again, our communities have spoken to express staunch opposition to the introduction of these apex predators, which would be detrimental to our families, wildlife, and livestock alike,"

I am an equestrienne who rides the beautiful North Cascades. Please consider carefully how my safety would be jeopardized when confronted by a Grizzly.

Correspondence: I am opposed to introducing grizzly bears into the North Cascades Ecosystem. My concern is for those who live in the large territory grizzlies will cover, most likely including towns and farms. By introducing grizzlies into this territory you will likely see an increase of farm animals killed, and at some point, people injured and killed. This plan is a direct assault on families who earn their living through small farms, families who will lose pets, families who will have family members who are injured or die as a result of this action.

In addition, many of us enjoy the beauty of the North Cascades through hiking and back-packing. By introducing grizzlies you are bringing an apex predator, a dangerous animal directly to those of us who hike and backpack. A quick internet search lists grizzly attacks, including very recently a couple hiking near Banff who were prepared for a bear attack, even using all of their bear spray can, and yet were still attacked and died.

I urge you to not introduce this animal into the North Cascades.

Correspondence: I am in support of reintroducing grizzly bears to their historic range in the North Cascades ecosystem. I live in a very rural area in the east side foothills of the North Cascades, many miles outside of the town of Winthrop. As such I could potentially be in grizzly range, although they would have to cross a major highway to get here. There is currently a large population of black bears and considerable community education and awareness of keeping our home areas free from bear attractants. I'm nervous about grizzly bears but also choose to live in this area and definitely am in favor of restoring and protecting the flora and fauna that make an ecosystem intact and healthy, and that includes it's large predators. We are close enough to the Canadian border and large provincial parks that grizzly bears occasionally do wander into Washington State. I like the idea of a slow re-introduction with regular evaluation of the results and the ability to change course if unforeseen problems are uncovered. Some people here are hysterical about wolves and grizzly bears; there were letters published in the local paper predicting wolves would be snatching kids from school bus stops. Hasn't happened. As long as you also protect the prey and vegetation and large areas that wolves and bears require there should be no reason for them to come into town or heavily populated areas looking for food. I'm aware that fires could change that, as well as continued use of National Forests for livestock. But there are also a range of non-lethal deterrents for both bears and wolves and you need to tout them and encourage people to use them.

Correspondence: I am strongly in favor of Alternative B and C and would very much like to see grizzly bears reintroduced to the North Cascades. I think that their addition to the biodiversity of this landscape is unmeasurable. As someone who studies ecology and naturalism and tries to teach others about it, I am a bit concerned that the document alone that is 300+ pages will be too challenging for everyone to read and to persuade those who are on the fence about this subject. Many people will likely view this as a debate between humans' safety and biodiversity/"cool new animal in the landscape". I think it would be very beneficial for y'all to try coordinating with local organizations to create educational content that describes the multitude of ecological benefits that grizzlies have on the environment. Their benefits far outweigh the potential harm they might do, and this ought to be shown in greater (and simpler) detail to the general public if possible. I hope y'all are successful in this, as Grizzlies are excellent seeds spreaders, plant propagators, forest-health enhancers, nitrogen movers, forest fertilizers, climate improvers, etc. They do many things through a domino effect. I hope they are successfully reintroduced.

Correspondence: I love all animals but I do not support the reintroduction of grizzly bears into Washington State. There are currently more and more issues with the current grizzly bear population not having enough food, leading them to move closer into civilization. There have been several close encounters with grizzly bears, some fatal to humans. We need to work on restoring their natural food sources where they currently reside. Bringing them back to Washington State will only bring the existing problems to our doors. With a lot of my family residing in the rural North Cascades, I do not want this to be yet another issue in their communities. Again, restore their natural food sources but do not reintroduce them here.

Correspondence: I remember seeing a grizzly mom and cub while hiking in the northern Cascades in 1990. It was part of the experience that made it so special, and I remember it to this day. They kept their distance from us and we were responsible backpackers who followed the park rules. It saddens me to think that they are no longer today because of the actions of people. The wilderness belongs to them first.

I fully support bringing grizzlies back. I am an animal conservationist and zoo volunteer. Seeing the grizzly rescue Fern at the Woodland Park Zoo is a wonderful experience, but it shouldn't be the only place to see them. They belong in the PNW wilderness.

Thank you for taking comments.

Correspondence: Enough with Grizzly Bear Reintroduction programs!!
Unless you have a management program including hunting as per the North American Wildlife Model, there is no reason to consider reintroducing another apex predator into the ecosystem. The issues in other western states being caused by Grizzly bears are a cause for alarm. Preservationists groups that fight against bear population control for the safety of people and resident ungulant species create dangerous and expensive control measures when these population interface with humans.
Thank you for your consideration,

Correspondence: I am writing today to support the restoration of grizzly bears to the North Cascades Ecosystem. These big, bold creatures are known to play an essential role in forest ecosystems, churning up and fertilizing forest soils, spreading seeds and controlling the overpopulation of deer, elk, and moose. They are an essential piece of the web of life, and they are facing undue pressures as we lose our forests every year. They bring essential biodiversity to our wild lands and in a place as environmentally conscious as Washington, this is the right thing to do for us and for our future generations.

Correspondence: I support the no action alternative. Under no circumstances should any grizzly bears be purposely relocated into the North Cascades ecosystem. Consider the recent fatal attacks on campers and hikers in Montana and BC. The reason the North Cascades is pristine and uninhabited is because it is harsh and high elevation. Beautiful yes, but any grizzly relocated there would likely head for low elevation greener pastures on both sides of the park. North East Washington grizzlies are already moving West and having negative interactions. Someone will be killed sooner or later by one of these

wandering bears. Does the USFWS really think that grizzly bears will ignore Okanogan County apple orchards, salmon, and stupid cows wandering the State and National Forests?

If the North Cascade habitat is so ideal, grizzlies would have relocated themselves and thrived years ago without USFWS spending millions of dollars. In Montana, Idaho, BC and Alberta recovering grizzly populations are on the move and being documented hundreds of miles from their now peopled past ranges. If grizzlies do wander into the North Cascades and stay, so be it, more power to them. For now, black bears have replaced and successfully filled the environmental niche that any grizzlies that may have had in the North Cascades in the past and it's disingenuous to suggest that they are necessary to maintain the ecosystem. Bison were native to the East coast of North America, transplant some to the parks in Washington DC.

Sorry, thanks,

Correspondence: I strongly oppose the reintroduction of a species with an documented history of mauling and killing humans. This will increase the risk to visitors and residents alike. It will almost certainly increase the practice of carrying firearms for self defense because bear spray is ineffective as demonstrated in the recent killing of an experienced couple practicing appropriate back country protocol near Bamff. We have children, a grandchild, and extended family living in Washington and Oregon so have visited and enjoy the National Parks in the area. Unfortunately, grizzlies and guns in the North Cascades would provide two powerful arguments to stay away.

Correspondence: I am an avid hiker and backpacker, in the Eastern Sierra Nevada mountains of California. My sister lives in Washington state.

I read with distress the plan to bring grizzly bears back into the contiguous USA. Grizzly bears and humans are not compatible in the 48 states. They are far too aggressive and dangerous. And people are far too "populous", even in the back country. If grizzlies are "reinstated", there WILL be human casualties.

I backpack with my husband in mountains known to contain black bears, and we are not afraid. We secure all food as per Ranger recommendations. We have never had a problem. But if grizzlies are brought back - even starting in northern Washington, they would extend their range... and for those hiking in the Cascades, they would pose a serious threat.

The recent news of the experienced backpacking couple and their dog who were killed by a grizzly bear in Banff, even though they were "doing everything right" should be a sober warning to even considering such a plan.

Please, I beg you, do NOT bring grizzly bears back! It would be completely irresponsible to human life, and to the millions of Americans who love to get out into the wilderness areas. There is plenty of open, available wilderness space in Alaska and Canada for grizzly bears.

Correspondence: I believe that alternative C is the plan written in the best interest of the grizzlies and the general population. I think it's necessary to protect these bears while also considering public safety. Grizzly bears are historically important in Native American culture, and important for the health of the NCE. Grizzly bears could be considered a keystone species and apex predator of the NCE, as their absence has shown how profound their impact is on the ecosystem. Grizzlies control the size of other populations living in the NCE, as well as turn soil and scatter seeds.

As I mentioned, Grizzly bears can affect the human population in the NCE as well. The Upper Skagit Tribe has spoken out about the Importance of these bears to their culture and land. Historically, the Upper Skagit Tribe and grizzly bears coexisted in peace. Plan C stood out to me because if grizzly bears were to create any issues, it would give the authority the ability to intervene for safety. Thus, protecting those who might come across a bear, like hikers for example. The reintroduction of grizzlies may also provide education opportunities on the ecosystem.

Correspondence: I oppose the decision to re-introduce grizzly bears into the north cascades. Grizzly bears populations are already rising and continuing in the state of Washington. With no way to legitimately manage overpopulations of grizzly bears, the threat of our state facing the many hurdles that states like Wyoming and Montana face it's a concern to Washington outdoorsmen and women, alongside outdoor enthusiasts of all kinds. We must then be concerned with our ungulate populations, who are already subject to predation with other carnivores, where ethical hunting and management in our state are being reduced.

Correspondence Type: Web Form
Correspondence: Thank you for considering grizzly bear reintroduction. I live in Leavenworth, Chelan County, Washington and I fully support the reintroduction. More specifically I support Alternative C, redesignating grizzlies in the North Cascades as an experimental population.

I have lived, backpacked, camped and hunted in grizzly country, in Montana, Wyoming, Canada and Alaska. One of the draws to those areas, for many residents, tourists and me, is the wildness that results from the presence of grizzly and wolf populations. The possibility of seeing these apex predators is one of the reasons people travel to places like Yellowstone, Glacier and Denali National Parks. The animals' presence does not keep people away, as some people who are opposed to the reintroduction suggest. Those parks are full of hikers, backpackers and campers hoping to encounter a grizzly or even to just

know that they are walking in the same valley or forest as one of these bears.

After generations of exterminating predators, we now know that they are essential to healthy ecosystems. Returning grizzlies to the North Cascades will help rebuild this ecosystem.

Education about living, hiking and camping in grizzly country will be essential for residents and visitors, once reintroduction occurs. It is very important for the safety of the bears as well as the people. There are plenty of examples from other areas that can be followed. The communities, towns and residents in grizzly country have been doing just that, and living with grizzlies for decades.

During my years of living in Montana, Wyoming and Alaska's grizzly country, I spent 1000+ miles on trails, usually backpacking, hiking and camping alone. I had dozens of encounters with grizzlies, one as close as the door of my tent, but never have I had an issue. This past summer I did another solo backpacking trip in Montana, unfortunately I did not get to see a grizzly, as I had hoped, but their sign was everywhere. Yes, one should camp and hike differently when in griz country, but the experience is so very much richer.

Selfishly, I hope to one day encounter a grizzly in the North Cascades. But, I also hope that we as a society can restore that ecosystem to some of its historic grandness, so that future generations can experience it as a true wild place, not the partly sanitized "wilderness" that it is now.

Correspondence: We already have grizzly bears in Washington. I have seen them myself while trying to enjoy the outdoors. Grizzly reintroduction will do nothing but create problems. I have had several other encounters with them in Idaho and Montana, and almost all of them had zero fear of my presence.

Washington State does not need a reintroduction program with this species. Watching reduced hunting methods with black bears and their population spreading into urban areas is the same thing that will happen with this completely protected species. Montana and Idaho are proof what happens when you introduce grizzly bears and have zero management on them. Two more people were killed and eaten by a grizzly bear on the Idaho/Washington border this past week. These interactions are becoming more frequent in the region. Alaska on the other hand gives every resident two free Brown/Grizzly bear tags because there's too many of them and they're becoming a nuisance to both life and property.

There are already enough grizzly bears completely protected in British Columbia, Idaho, and Montana where they can migrate here should their food source become a problem. Washington State is too urbanized and this reintroduction program will create more problems much in the same way it has elsewhere. It will do nothing more than cost the taxpayers of this State more money. Let them come here on their own accord.

Correspondence: I think we should do the alternative plan B. This is because the Grizzly bears are apex predators that can control populations of other animals. Grizzly bears are also known as a keystone species and can greatly affect the ecosystem. I think reintroducing them with the endangered species protection will allow them to get back up to the population goal of

200. Under the Endangered Species Protection Act grizzly bears can not be harmed unless it is in self-defense, allowing them to repopulate.

Grizzly bears can be dangerous. One problem is that they can get into trash cans. Grizzly bears can dig through trash which leaves a mess for people to pick up. They are also dangerous to campers. People go camping all the time, if there are a lot of bears, that means there is a greater chance for them to disturb the campers. They can also destroy property. However, they can bring in more traffic because people can go to parks to try to take photos of them, because they are cool to look at.

Correspondence: Many of us are already increasingly anxious about riding in nearby areas because of the rise in the number of big cats and bears in local areas. I personally have seen two cougars while riding in Arlington this past summer, and one bobcat. Our neighbors nature cam has captured a bobcat and a black bear right on Dutch Hill in Snohomish. At Mann Rd there are 6 black bears (that happen to be brown) residing. Many of us understand that black bears aren't particularly aggressive and won't bother one if we just ride down another trail -- but grizzlies are very different. My best friend's uncle was killed by a grizzly in Yellowstone decades ago. He had no food in his tent, yet was mauled to death in his sleeping bag. You can't spin stories or expect me to believe a bunch of bad advice about how easy it is to avoid troubles with these aggressive animals. They are NOT shy, they are NOT easily avoided, and they are NOT easily discouraged. Introducing them back into Washington is idiotic in my opinion -- literally the idea of naive environmentalists who don't understand that Nature is not gentle. I've already heard a bunch of silly comments about how only idiots have been killed by grizzlies, people who did the wrong thing, or had a dog, or were in the wrong place at the wrong time. Well guess what? More and more casual hikers and their kiddos will get hurt because of imperfectly handled grizzly encounters if we introduce them into the areas we all love to explore. Or, worse yet, they will just stay out of the forests altogether if they have to have specialized equipment and knowledge to handle grizzly encounters. Discourage hiking and family adventuring, and there goes support for environmental protection. People who don't go into the outdoors don't value the outdoors. There will be a backlash of apathy, not only disinterest in protecting species but disinterest in keeping developers out of protected areas..... Keep natural areas safe for the public, and receive public support--make it unsafe and watch how little anyone will care to protect those areas over time. Stupid ideas need to Bo in the rubbish bin.

(I say all this knowing full well that this whole public input process is a sham, and you bureaucrats have already decided to move grizzlies into the state. Thanks for pretending to care.)

Correspondence: It would be unwise to introduce grizzlies back into the north cascades, for a multitude of reasons. First, being the fact that they are already a small number of bears there, despite the fact FWP denies it, while they actually confirm it as well. If there were no grizzlies in our state, then why do hunters have to take a black bear/grizzly identification test to hunt in the north cascades? I know many people who hunt up there and have physical seen grizzlies. Second, yet the proposed introduction only wants to add a few bears to start a breeding population. The number of bears on the landscape will be the straw that breaks the camels back, on our prey species in the region. Those animals are seeing a decreased population from the effects of other unchecked predator populations, since the 90's when dog hunting was outlawed. The population of mountain lions and bears has skyrocketed, also the cancellation of spring bear has not helped at all. And wolves have moved into the area, which have made a huge impact on the deer and elk population, the introduction of another predator, the apex predator of the west in fact, will do nothing but destroy the prey species numbers. Which leads into my third point, with prey species gone, they will turn to domestic livestock. Third, the presence of grizzlies on the landscape will lead to many human be at conflicts that will be deadly for humans, livestock, and bears. There are extensive trails systems through the north cascades, and it will not take long for hikers to deadly interactions with bears. The bears will false charge people who have no knowledge of grizzly behaviors and many bears will be shot and killed because of that, and as seen in places like Yellowstone. Hikers will want to get close and take pictures of the animals getting uncomfortably close, and the animals will kill them for food, and because they feel unsafe with the hum an presence. Bears will roam too, and with them decimating the prey species they will move to find livestock easy pickings. Farmers do not need bears eating livestock, which will take away from their livelihood, and it will be deadly for the bears. Bears that attack and eat livestock will be killed by farmers or by wildlife agents. Overall, it would be unwise to introduce grizzly bears into the north cascades, because they will have massive negative ecosystem impacts.

Correspondence: Reintroducing grizzlies at this time is a terrible idea. The balance of predator to prey is already too far off. Since the reintroduction of wolves, we have seen the deer numbers falling steadily and the predation of livestock grow. This can only mean that the wolves have learned that as they kill off the deer that livestock are an easy target. Not allowing hunting with dogs to keep the cougars in check has added to there being too many of them also. Now they want to add grizzlies. Mother Nature is an amazing thing, if it's left to work, things balance out. When we start messing with nature, we always throw it out of balance. If this ground was still able to support grizzlies, there would be more around. They have moved where the food is. There are still some in the area. We see more black bear here too. We are being told a fairy tale. Why would you need to take a test that proves you can tell a black bear from a grizzly to get a tag if they weren't here?

Correspondence: While not opposed to bears being reintroduce to the North Cascades I do feel that we need to better manage the current population that are already established in Montana, Idaho and Wyoming. Removal of these animals as a "threatened species" so that state game management agencies can decide the best course of management would be a great start. I also feel that the information that is given about current populations is very misleading at best, as it only ever gives or focuses on the population in the "Yellowstone Area". However, Montana Game and Fish considers the entire western half of Montana grizzly country. So what is the entire estimated population of the whole state. Also, encounters between grizzlies and humans is only increasing every year which people are killed or severely injured with the current population and with Washington already closing spring Black Bear season there could not be any way to manage Grizzly in that state in the future. I also feel this in some ways is an emotional move to try and push hunters out due to the fact some hunters will stop based on a fear of these animals. Bottom line I feel that with the current expansion of the current population these animals will find their way into the North Cascades all on their own.

Correspondence: I'm opposed to the idea of reintroducing grizzly bear into Washington state. The greatest concern I have is that grizzlies would have a negative impact on mule deer and elk populations that are already on the decline in the eastern cascade mountains. Grizzly feed on young deer and elk fawns. We don't have an over abundance problem with these ungulates and current game management practices can be utilized to control populations if that became a problem in the future. Grizzly bear should be allowed to migrate into Washington if it occurs naturally but I don't see an upside to introducing them. We don't need them as a game species. Introducing them will inevitably lead to negative human interaction that otherwise could be avoided.

Correspondence: I am a resident of the state of Washington living in Spokane. I frequently go camping to our national parks.

I am in support of the augmentation of the remnant, non sustainable population of grizzly bears in their historic grounds the "North Cascades National Park";

As the Mt. Baker Wilderness Area is contiguous with the North Cascades along with the Payseyton Wilderness across Ross lake there is certainly enough wild land for the augmented population to sustain itself.
Across the Canadian boundary lies more wild lands.

Genetic Diversity will be enhanced with the introduction of new members.

Our beautiful state has had the motto, "Keep Washington Green"; for decades, We should live up to this.

I do not understand Dan Newhouse's efforts to interfere with this comment period.

Correspondence: The American Bear Foundation of Washington opposes the reintroduction of grizzly bears into the North Cascades. As stated by WDFW grizzly bears already exist in this range as they migrate in from Canada and Idaho. Along with an increasing human population, the existing challenges with the black bear, cougar, and wolf populations in Washington highlight the need to avoid adding more pressure on our wildlife. Humans should not be reintroducing more apex predators.

Correspondence: I am a single female avid hiker. Living in the Methow on the edge of the North Cascades provides the ultimate location for this. The introduction of Grizzly bears is a major fear. I hike with dogs, and this would panic me. My safety and the lives of my dogs would all be in jeopardy with these massive bears. People in Alaska, Montana and Wyoming where these bears already live have stories of them killing and endangering people, pets and wildlife. Everyone living where grizzly bears roam wild have guns for protection. When COVID hit, the number of people that are adventuring in the North Cascades has skyrocketed, and only continued to be more populous. People should not have to carry weapons, and we all know bear spray isn't going to keep a grizzly bear at bay.

You currently have cougars and WAY more wolves than anyone at the fish and wildlife department want to recognize. They are demolishing the deer and moose populations in the North Cascades. So adding in another predator will decimate those remaining. When do the animals we already have here, deer, moose, and other small creatures become the priority? And when there is less and less food due to the increase in predators and decrease in their food populations, what will these bears eat? Hikers? Cattle?

Between the safety of the thousands of people that are experiencing the wonder of the north cascades and the animals that are currently trying to beat the predators survive, it seems foolish that anyone would think to reintroduce an animal that would endanger what is already living in the north cascades.

Correspondence: It has come to my attention that there are those who would like to reintroduce Grizzly Bears back into Washington State. With the location being that of Chelan County. While it is a remote location it is also very mountainous and during winter months they will migrate to lower elevations putting them closer to livestock and people. Montana is currently having to deal with ideas others had when they were introduced there. Loss of life for livestock and humans. Is this the path you desire to follow? "A state law prohibits Washington wildlife managers from transplanting or introducing grizzlies in the state"; The other harm that I see with this thought is the impact this would have on the wild salmon population. So please do not let this proposal move forward, stop it in its tracks now.

regards

Correspondence: Thank you for reading my comment. I do not support the reintroduction of Grizzly Bears to this region. Washington State has significantly more human pressure on the landscape than other states with Grizzlies such as Idaho, Montana, and Wyoming. Despite less pressure on the landscape, there are still run-ins between bears and humans resulting in the mangling or death of both parties involved. We have established Grizzly populations in lots of areas across the country, the North Cascades does not need to be one of them, in my personal opinion. Thank you again, and please do not reintroduce these bears.

Correspondence: I am OPPOSED to the reintroduction of grizzlies to our communities. IF there was plenty of food and habitat resources for the bears in this area, they would move in on their own. Your introduction of wolves to our communities have shown that you do not help with long term problems that come with reintroduction of these animals. Our deer populations are dwindling because of the wolf packs and the cougars that aren't being hunted. The bear will also impact the salmon runs in the area. What will you do to help when the bear are in the rivers running through our towns to get to the salmon? The bears will migrate where the food is. Not stay in an area you have designated as appropriate for them. I also DO NOT agree that activists that live in urban areas not effected by the proposals should have a say what happens in other communities. Bringing wolves to our communities were proposed by these same people yet they don't suffer the consequences of the impact of the action. We can discuss bringing grizzlies into our communities when THEY step up and bring wolves to their backyards!
I choose the DO NOTHING option of this EIS.

Correspondence: I am not in favor of reintroducing brown bear into the North Cascades.

For one, I do believe that the grizzlies present North of the Canadian border are expanding their range and are naturally moving down into the park on their own. I have many friends who spend a lot of time in the mountains and several have reported seeing brown bears in Washington over the last decade, some as recent as last year.

Secondly, I do not believe that once reintroduced they will stay within the park. I believe they will start moving down into Skagit Valley and interfering with many of the farming and ag operations down there, as well as the surrounding National Forest areas.

Another concern I have is the effect on Elk and Moose populations. I am aware that preying on Elk and Moose calves consist

of less than 5% of an interior brown bear's diet, however, it does happen, and Western Washington/North Cascades are already struggling with both Elk and Moose populations.

Lastly, as exemplified most recently by the brown bear attack near Banff National Park, in the Red Deer River Valley, they are dangerous even for those who have grown up in grizzly territory and spent a long time co-inhabiting with these animals. I do not believe that most outdoor enthusiasts in Washington are prepared for the reality of recreating in grizzly territory.

Personally, I love brown bears - in fact, they are probably my favorite animal - and I have had the pleasure of spending quite a bit of time around coastal bears in Southeast Alaska. I cherish every opportunity I have to get close to these majestic animals, however, I do believe that coastal bears are typically far less aggressive and are much less likely to display predatory behavior due to having a surplus of food than interior ones.

It is for all of these reasons that I simply do not support the initiative to reintroduce brown bears into the North Cascades.

Correspondence: I am writing to oppose the re-introduction of grizzly bears into the PNW. Having recently read about deadly attacks in Montana and Banff I think the risks (people will get killed) do not justify this action. While they have in the past been part of this ecosystem they have not been in a long time. And this is very different from, for example, reintroducing wolves to Yellowstone and beyond. Wolves have an ecosystem wide impact changing the whole system and the landscape itself, all of which has been well documented. Grizzly bears, on the other hand, present far more risk of death to people - especially people who are in the cascades all the time with NO GRIZZLY BEAR EXPERIENCE. This is a set up for massive problems, bear encounters, people getting hurt, and the bears getting tracked down and killed. Yes our region can support them but that is different from a massive ecosystem benefit (from what I have read there is no major benefit w Grizzly reintroduction - the ecosystem will remain as is mostly but it will include grizzly bears). That's just not worth the risk and there is also no risk that Grizzlies will become extinct - they are increasing in many places and thriving.

Correspondence: I support wild places being left wild. But I must say the idea of introducing Grizzly bears into the WA cAscades sounds scary.

I would not be comfortable camping there in a tent, or even hiking. Especially after hearing about those backpackers in Canada who emptied a big can of bear spray and still got killed by an aggressive Grizzly.

I think it would be better to focus on putting money and effort into restoring the watershed and the salmon.

Leave the grizzlies where they are.

I know they used to be here, but really for the safety and peace of mind of most of the humans who live here, I think this idea of reintroducing this predator should be relinquished.

It just would be a matter of time before a tragic interaction with humans would happen.

Isn't there enough suffering in the world right now?

Correspondence: Ecological Balance: Grizzly bears play a crucial role in maintaining the ecological balance of the North Cascades by regulating prey populations such as deer and elk. Their presence helps prevent overgrazing and allows for a healthier, more diverse ecosystem.

Biodiversity Conservation: Reintroducing grizzly bears would contribute to the conservation of biodiversity in the region, as they are an integral part of the natural food chain. Their presence would promote a more robust and resilient ecosystem, benefiting various plant and animal species that depend on the natural balance.

Cultural and Spiritual Significance: Grizzly bears hold significant cultural and spiritual importance for many Native American tribes in the Pacific Northwest. Reintroducing them would help preserve cultural heritage and traditional values, fostering a stronger connection between indigenous communities and their ancestral lands.

Tourism and Economic Benefits: The presence of grizzly bears in the North Cascades would likely attract wildlife enthusiasts, researchers, and tourists interested in observing these magnificent creatures in their natural habitat. This could stimulate local economies by generating revenue through eco-tourism, outdoor recreational activities, and related businesses, thus supporting sustainable economic growth in the region.

Ecosystem Education and Research: Reintroducing grizzly bears would provide a valuable opportunity for educational and research purposes. Scientists and conservationists could study their behavior, habitat requirements, and interactions with other species, contributing to a better understanding of ecosystem dynamics. This knowledge could inform future conservation efforts and wildlife management strategies not only in the North Cascades but also in other similar habitats globally.

Correspondence: Not a good idea. Restoration projects brings trouble to the area(s). Example: Turkeys "restored" in Stevens County, WA in 1961 have resulted in huge amounts of these peskt birds from Kettle Falls, WA to beyond Spokane. Wolves released in Eastern Washington have brought trouble for owners of cattle and sheep. Grizzly bears could bring a dangerous challenge to hikers and cattle and people living near the proposed drop-off areas. . Recently, a grizzly was relocated from Stevens County (Onion creek area) to Ione, Wa area because it had killed a cow and injured a horse, now it is again causing problems in the Ione area. It sounds like a "romantic" idea, why not introduce white sharks into Priest lake, Idaho? Good idea? Reason it out.

Correspondence: To Whom It May Concern,

I am a local resident in the area affected by the Grizzly Bear Plan(s).

I strongly support the RETURN of Grizzlies to Washington. Predators such as the grizzly are crucial to the ecosystem. An apex predator is key to the balance and additionally with climate change the apex predators will be indicators as to the health of the ecosystem as it changes in response to climate change.

The concerns of ranchers are real, of course, but all plans have some issues and reintroduction does not pose insurmountable burden on the human population.

Grizzlies improve the overall health of the system and the net benefit far outweighs the burden.

Of the plans, I most strongly favor Plan C.

Sincerely,

To: US Fish and Wildlife Service
Address: Some sort of a secret only the FWS knows
Probably somewhere in the US

I am opposed to the release and management of Grizzly Bear into the State of Washington and specifically the North Cascades National Park Complex. Presently, with the active brown bear population, the predator/predation ecosystem is at a suitable balance for the predation species. Introducing the grizzly would upset that system and cause it irreparable harm. In my opinion, the Black Bear is the only bear that can fit into present and future wildlife populations.

Additionally, for more reasons that I can detail in this letter, the Grizzly Bear is not compatible with established long term and area wide travel patterns of Washington State. A good example is the thousands of Pacific Crest Trail hikers who end their trek in the North Cascades south of the Canadian Border, having gotten there by passing over 2,000 miles of non-grizzly populations. Additionally, introducing Grizzly to Washington State will discourage families with young children, older visitors, and handicap. PLEASE, do not introduce or manage Grizzly in Washington State.

Sincerely, ██████████

Correspondence: I have lived in Washington my entire life, studied environmental education and had the privilege of working in the North Cascades NP at the North Cascades Institute. I have studied grizzly bears from an ecological and

cultural perspective and it is abundantly clear to me that they should be reintroduced under "Alternative C". I currently work in Glacier NP where we have grizzlies and to me it is a perfect example of how humans and bears can cohabitate when people are properly educated. The North Cascades is the historic homeland of healthy grizzly bear populations and it only seems right that we reintroduce them to that land for their benefit, the lands benefit and for the benefit of humans as well.

Why this is still being discussed is beyond me. Why the government spends money and time on an EIS to reintroduce a species to their historical landscape that has the carrying capacity for them is beyond me, especially when getting an EIS for pipelines, lithium mines, copper mines, crossing or on indigenous sovereign land isn't often taken seemingly as serious... I digress.

I strongly support "Alternative C" and sincerely hope that Grizzlies will one day soon freely roam and thrive throughout the Northern Cascades. In addition I hope that community education is thorough and far reaching. As someone who worked closely with the public every day I know there are a lot of widely held misconceptions about bears, their behavior and what to do in case of an encounter and I hope that education is heavily emphasized and implemented as part of the reintroduction plan "Alternative C".

Correspondence: This plan seems reckless for park visitors and staff. I understand the rationale from an ecosystem and heritage perspective. But we have a status quo that works, and the most obvious option is to leave this as is. North Cascades is a difficult to access park, and I can't imagine grizzly sightseeing being something the vast majority of visitors along highway 20 would ever experience. I hope there would never be a grizzly down at Cascade pass. I don't buy the argument that this is for the enjoyment of visitors. For those of us who venture into the Backcountry, a grizzly encounter would be dangerous and terrifying experience. I think I this would actively deter visitation to the park. We aren't talking about reintroducing Fishers here. Even if grizzly encounters are rare, it is a matter of when, not if, a visitor or employee of the park will be seriously injured or killed. Our neighbors to the north already deal with this. The difference is that they have a continuous population of bears, and we do not. We don't need to do this. Please stick with the status quo

Correspondence: This is the most stupid idea since bringing wolves back. Why would we spend money to reintroduce them, so we can spend more money to manage and try to control them, then more money to compensate ranchers for damage from them? What is the point? Why would we do this, when they kill the very game that hunters pay a lot of money to harvest, do the bears pay taxes or do they buy licenses to kill our states resources? Hunters do, so why does this department, fish and game, constantly seek to destroy our opportunities? Why does this department continually mismanage the game? In the Blue Mountains, even for archery, the majority of the areas are spike only for elk while huge Bulls die of old age or from Native Americans basically poaching. The any elk areas have no elk in them, and what is the point of 3 point or better for deer, so the 2 pointers can do all the breeding? Maybe it is because the director of the fish and game, is a non hunting liberal that would rather that nobody hunts at all. I wonder if he or she would even have a job if the hunters did not pay for the privilege to hunt?

Correspondence: As a lifelong advocate of wildlife and replenishing endangered species, I have been in support of plans to restore the grizzly bear to the North Cascades Ecosystem since moving to Twisp in the late 1970s. Living 13 miles from town up Twisp River, surrounded by the Okanogan National Forest and Lake Chelan Sawtooth wilderness Area, I got to know my wildlife neighbors quite well. Black bears were annual visitors to the lower meadows and aquatically occupied beaver ponds below my cabin. The only native species not present were those, like grizzly bears, who had been hunted and trapped to

virtual extinction in the previous century.

I had spent time in close proximity of grizzly bears while working in Alaska but had nothing like the countless experiences I've had with them as a wildlife photographer in Alaska, Canada, Montana and Wyoming. I can comfortably say that I've spent more time around more grizzly bears than anyone in this part of the country. I have a healthy respect for them, but I'm not afraid of bears, like so many people have been taught to be (especially by a state representative who makes his home down in Yakima and is actively campaigning against the species).

Grizzly bears prefer wild areas, devoid of people (if possible), so I highly doubt any politicians will have a problem with them breaking into homes around Yakima anytime soon. Personally, I'd much rather live near grizzly bears than anywhere near the crush of humanity in places like Yakima or so much of the country that, sadly, will never see the likes of grizzly bears again.

For these reasons and more, I'm in Support of the Grizzly Bear Restoration Plan for the North Cascades Ecosystem.

Correspondence: I live in the Methow Valley and am a regular user of North Cascades NP and the surrounding NFS wildlands. I support the Grizzly Bear Restoration Plan, specifically alternative C because it will actively restore grizzlies in a slow, carefully-monitored process that includes management flexibility.

Under Alternative A, it is unlikely that grizzlies would return to the North Cascades on their own. Under Alternative B, local communities living in the recovery zone would have more limited access to conflict mitigation resources.

I support grizzly restoration in the North Cascades because:

-If not here then where?

-Grizzly bears have lived on this landscape for thousands of years and deserve to be here.

-Grizzly bears are an endangered species that we must actively recover or risk losing. Not supporting restoration is in effect supporting extinction.

-I hope to see a grizzly bear in the North Cascades one day. But even if I am never fortunate enough to see one, knowing they are there makes me happy and proud to live here.

Correspondence: In Re: Grizzly Bear Reintroduction to the North Cascades Ecosystem

October 13, 2023

Dear National Park Service:

As resident of the North Cascades Ecosystem, I stand in support of the conditional reintroduction of *Ursus Horribilis*, the grizzly Bear, to the wildlands of the North Cascades. I am aware that my comments are part of the public record, and I have no concern over having them accessed by other publics, organizations, or agencies.

The concerns that should be thoroughly examined in the EIS to ensure the successful reintroduction of grizzlies while complying with existing laws are as follows:

- 1) Grizzlies to be reintroduced should be gleaned from areas where their population is presently stable. Alaska comes immediately to mind.
- 2) Every effort should be made to care for bears during the reintroduction process so that the shock of being drugged, transported, and placed in an unfamiliar location does not result in bear mortality.
- 3) The use of helicopters to relocate grizzlies should be minimized, and no helicopter landings should be allowed within designated wilderness. To release bears into desired locations within designated wilderness, a helicopter could be legally used so long as it released the bear from a sling without landing. However, as outlined below, options for reintroduction using only existing roads should be examined. In addition, if management of bears is deemed necessary post-release, access to bears in backcountry should be by foot or pack animals only--no continued use of helicopters for ground examination should be permitted. The EIS should state succinctly what human intervention would be deemed necessary for bear survival after bears have been released. Monitoring of bears can and should be accomplished without using motorized vehicles in wilderness areas.
- 4) The National Park Service and U.S. Forest Service should jointly embark on an intensive public education campaign to minimize potentially dangerous encounters between grizzlies and humans, both in local rural communities and in the backcountry. The local public, and recreationists using backcountry, should be fully informed of what measures to take to avoid grizzlies, and what to do if encountering a grizzly bear. In addition, the State of Washington should educate hunters (bear hunters or pursuers of other game animals) on how to distinguish a grizzly from a black bear. Killing a grizzly bear for any reason other than justifiable self-defense should be met with legal consequences under the Endangered Species Act to be enforced by the respective federal agencies.
- 5) The EIS should analyze the potential for grizzlies reintroduced in the North Cascades Ecosystem to migrate to other areas in Idaho, Montana, Wyoming, British Columbia, and Alberta so that an island population is not created. If natural mixing of separate existing populations seems unlikely, the EIS should state what measures would be needed to facilitate migration to diversify the gene pool, for example, road closures and habitat restoration between island populations. This consideration

should not preclude reintroduction if migration of bears is not likely, only to set the stage for expanding grizzly habitat.

6) Presently unprotected roadless areas within the reintroduction zone should ultimately be permanently protected to ensure activities like road construction and logging do not reduce the quality of undisturbed, secluded habitat grizzlies require. While this may seem to be outside the scope of the EIS analysis, it is not improper to recommend measures to Congress that will better protect grizzlies.

The EIS should endeavor to address the above concerns and principles by establishing a number of alternatives that would eliminate the perceived need for exceptions to existing law, and to facilitate release plans that are more "griz-friendly." I do not believe that two alternatives, as presently proposed, provides for the full range of reasonable options possible.

Some recommendations for reintroduction that would not require helicopter use in designated wilderness would be to release bears (either by helicopter or ground-based vehicle) along roads that separate wilderness areas. For example, roads end on the upper Twisp River Road; Slate Peak north of Hart's Pass; The end of Eightmile Creek Road south of the Pasayten Wilderness; the end of the road along the Chiwawa River near Trinity; and the end of the road at Cascade Pass. Releasing bears by helicopter as deep as possible into backcountry which is designated wilderness, does not reduce the potentials for bear/human contact. Once released, there's no guarantee the bears will remain deep in backcountry, they will presumably go where the habitat leads them to survival.

This concludes my comments. I am grateful for your consideration.

Correspondence: As a Washington state resident, and an avid hiker and backpacker I think this is a horrible idea! Just last week a very experienced backpacking couple and their dog were brutally mauled to DEATH in Banff. By all reports they carried bear spray and had been doing this for many years. Why on earth would you CHOOSE to do this to the outdoor adventurerers in the Pacific Northwest.

I know you will say 'hey, we areonly going to introduce them in remote regions'. And what is your plan when that population breeds,gorws, and expands into regions where we recreate.

The bears in Yellowstone apparently didn't adhere to their required area when that young girl was slaughtered by a Grizzly in west Yellowstone. These are no archived stories. THEY JUST HAPPENED!

And if you do this, it will happen again. Maybe the next time it will be a family with young kids. And when it happens, those deaths are on YOU!!!!!!

Correspondence Type: Web Form

Correspondence: The Stevens County Cattlemen's Association is writing in opposition to the proposed plan to re-introduce grizzlies into the Northern Cascades Region. In reviewing the Draft EIS not only does it ignore many critical details on the impact reintroduction will have, but also has no effective plan on how to manage these animals.

Under Alternative B in the Draft EIS, an estimated figure of 18 to 19 cattle and 3 to 4 sheep depredations per year is used. This estimate was reached by using figures from Montana and their bear population.

We believe this figure to be extremely low for the population goal of 200 bears. Montana is a far more remote state, limiting cattle interactions with predators and has a broader ungulate base to choose from.

Ungulate populations have been pushed to the brink by an ever-increasing apex predator population in our state. We also have seen this in northeast Washington with grey wolves - once ungulate populations become less abundant predators will turn to our livestock. Once livestock predation begins it will increase every year unless severe predator removal actions are taken.

In appendix D a proposed "Guideline for Grizzly Bear Control Action" would require three separate attacks by a grizzly bear on livestock before action would be taken. This is a similar method employed in our region for grey wolves and does not work. Attacks continue to happen every year and escalate in size and frequency. The Draft EIS not only minimizes the scope of possible attacks but proposes to use a failed policy for control of these animals.

Also lacking in the plan is any idea of how to manage the bear population after it reaches the goal of 200 bears and how to manage the population once they spread out of the North Cascade Region. Predators of any type not only reproduce, but over time they will spread. As this population grows, negative interactions with livestock, people or pets will grow and present itself as a larger problem. A plan with no idea or thought of how to control the population of grizzlies over 200 and outside the North Cascade Region will only end in failure and an out-of-control population.

Public safety is also a factor considered seemingly as an afterthought in this plan. Many people work, make their living and recreate in the forest, including ranchers. Oftentimes working alone in highly remote areas ranchers face a good deal of risk from injury or attack. With other apex predators such as wolves and cougars already existing in these areas, adding grizzly bears would only make it more dangerous. Grizzly Bears have proven multiple times that they can and will kill humans. Just a month ago a bear that had previously attacked two separate people and killed one had to be euthanized in West Yellowstone after breaking into someone's home.

As mentioned before, how will these interactions unfold as this population expands? As bears encounter more populated areas there will be more incidents of aggressive behavior and attacks. This can be seen in states with existing populations of grizzlies like Montana. Grizzly bears will get into populated areas and search for food. Several feedlots have had to take preventative measures against bears eating grain and killing cattle - these are workplaces where there is daily human presence and machinery being operated.

The Stevens County Cattlemen's Association strongly supports Alternative A in the Draft EIS which is to take no action. Reintroduction of the Grizzly Bear to the state of Washington provides no benefits to the economy, safety or ecosystem. Ranchers will bear the brunt of financial impact, public safety inside and outside the forest will be greatly affected and ungulate populations will suffer as a result. There is currently no good reason to restore the grizzly bear to the North Cascades, especially with a current plan that would utilize limited and ineffective management tools.

Regards,

SCCA President

Correspondence: Hello,

I am 71 yrs old and have been hiking and backpacking in the PNW for 50 yrs. I also contribute to many conservation and environmental groups. However, as the Grizzly bear population has disappeared in the North Cascades the number of people hiking and backpacking have Greatly increased. It has increased so much that when I hike I often feel like I am in a city park. A substantial amount of folks are also not very attuned to how to respect the land, plants and animals. As much as I have enjoyed hiking in AK where Grizzlies are in great number I think that we are too populated with people to coexist with the grizzlies in the North Cascades. Thank you for the opportunity to give input.

Peacefully

Correspondence: After reading the proposal, it is my opinion that option A is the best, do nothing and continue current preservation efforts. While the idea of introducing more bears may seem novel, there are some serious concerns to be addressed. First, increasing the number of grizzly bears will inevitably increase the number of human and bear encounters. As a person who actually recreates in the north cascades national park, any sunny weekend in the summer will bring large numbers of people all throughout the park wilderness. As someone who has spent a considerable amount of time in the wilderness, black bears and grizzly bears have extremely different temperaments, with grizzly's being much more aggressive toward humans. It's only a matter of time before the first person gets eaten. If the bears are there naturally on their own, it's easy to say that's just nature and the person took a risk going out there. But if you intentionally put those bears there, not ones native to the area, and an incident occurs, some of that responsibility now falls on you. Secondly, grizzly bears are apex predators that require large amounts of food. Consequently, introducing more of them will have unforeseen downstream effects on other animal populations. A similar thing occurred when wolves were reintroduced in Washington, and deer and elk populations have suffered as a result. Thirdly, being the bears are not native to the area and have not been raised by other bears that stay in the park, there is little way of knowing where these implant bears may migrate to and make home, possibly closer to human populations than intended. It's my opinion that often with preservation, when we try to step in and make a human introduced change, there are often downstream consequences that no one saw or thought about. More often than not, the best course of action is to let nature take care of itself and stay out of it.

Correspondence: I'm a 70+ y/o lifelong lover and supporter of wildlife and conservation. I advocated for the restoration of wolf packs in WA and part of me wants to advocate for grizzly restoration. Apex predators belong in our remaining wildlands. The concern I have is that, this year in particular, it seems that bear activity in general has increased, recreators are being attacked and sometimes killed even when prepared. If bears and wolves take down livestock that's one thing and it's natural - but I don't think anyone wants to see humans become prey. So I would encourage moving forward with grizzly restoration very carefully and slowly if it's done at all, in the furthest, wildest reaches possible. Along with restoration must come widespread education regarding bear behavior and how humans can avoid encounters and protect themselves in the event that is needed. Thank you for the opportunity to comment, even if mine isn't a scientific observation.

Correspondence: My purpose for filing my comments is to let it be known that I support the plan to restore grizzly bears to the North Cascades. As a resident of Winthrop, WA I live on the outskirts of the North Cascades National Park.

Grizzly bears are an endangered species that we must actively recover or risk losing. If man had not extirpated them they would still be here. It is man's responsibility to reintroduce them. I want to be able to pass down a wild landscape that includes all native species, including the grizzly to my grandchildren. Among other things grizzly bears provide an ecosystem service, spreading seeds and aerating alpine meadows.

There are few places left in the U.S. where grizzly bears can exist. The North Cascades ecosystem is one of those few protected places and I hope to see a grizzly bear in the North Cascades one day.

I believe the reintroduction of the grizzly bear is the right thing to do considering both environmental and human impacts. Further, I am in support of Alternative C as I believe it is the best way to ensure flexibility of the management of the grizzlies.

Please adopt Alternative C and move forward quickly with the plan to bring these bears back to the North Cascades.

Thank you for your consideration.

Correspondence: Hello my name is [REDACTED] I am a Elk hunter and have been for 40 plus years, I have a very special place where I go hunting, my son and I were hunting there one year up in the cascades and ran into a brown big ass Grizzly bear,

we were bow hunting and that was the time you were not allowed to have a firearm in possession, well we did not have a gun on us, this bear was 112 yards from us and it did not know we were there, It was standing up eating berries and reaching 9 foot high from the side of a hill side, he was on the down side and was about 8 to 9 feet tall, he got down on all 4s a few different times, we watched him for about 40 min, we finally came to the agreement that we should leave the hunting grounds we were at. we are now allowed to carry firearms while bow hunting. I for one am very nervous to go back to the same hunting grounds to this day, that was a big ass bear, so I have a big ass gun just for him, would hate to have to kill it but I would if I had to save my self or some one else. I have run into women on hiking trips up there with there kids and no gun, a lot of them! The black bear that Ive ran into while hunting have always took off running from me, I don't think that a Grizzly bear would, I would have to kill it and you guys would get all mad about that. We hunt in mid October and the bears are trying to fatten up for the winter, they are pretty determined about that from what I know about them. So if you people put them in harms way along with us we have no choice but to defend ourselves and any body else. So whats up with that, there are a lot of hikers and people in general going up there to this majestic place in the Cascade Mountains, it was no problem with out the Grizzly bears there and from what I understand our ancestors killed them out of the lower 48, and now you want to put them BACK...we've been fine without them. The wolfs in Idaho have eaten all the deer and all the Elk and are starting on the moose, I also hunt there, and have up close seen the devastation and the depletion of the game we use to have there, did not see one Elk last year but I did see and heard wolfs there, 32 dogs to a pack, LOOK OUT..now its 35 dollars for a tag not 5 hundred, and they want them out of Idaho, wait till the Grizzly comes down in to towns and kills some one ,how would you feel then?? Just leave it alone let them stay in Canada for god sake. A GRIZZLY BEAR IS A MAN KILLER, you know that and are wanting to put them there for some reason that don't make sense. I am a tax paying citizen and I disagree 100 percent to not put Grizzly bears in the Cascades they are already there. the black bears will be pushed out and have no place to go but down and into the city's, you guys are making a massive mistake that might cause a lot of trouble for everyone, I don't hunt wolfs or bears they're not good to eat, but I will if I have to. #1 APEX predator in the northern continent, PLEASE don't do it.

Correspondence: Alternative A is the only option required. I have lived/worked in the methow valley in Okanagan WA for 10 yrs of my life logging/surveying log roads for the US forest service & private boundary line surveying - I have actually spent several yrs living in the forest while doing so. The grizzlies are in no danger of becoming extinct on the north american continent, the north cascade ecosystem has no compelling need for grizzly reintroduction w/ the attendant risk of grizzly/human/livestock conflicts just because someone wants everything to be back to the way it was before humans moved in. We have YELLOWSTONE NAT'L PK FOR THAT!

Correspondence: I would like to see the Grizzly Bears reinstated into the cascade. This would support a healthy eco system and respect the Native American culture. Humans are over using and demanding land just for themselves. We need to learn how to share. We can not keep taking over lands. We have to learn to make space for all beings in this planet. My grandparents were farmers and I know how hard this can be for ranchers. But there are ways. Educate the public and support businesses to look at this in a more creative way.

I support this plan.

Correspondence: Grizzly Bear reintroduction into the North Cascades:

It's clear that the North Cascade Park, Fish and Wildlife, Environmental Organizations (i.e. Carnivore Conservation), and the Biden Administration have already picked Option C given their statement that it is the "preferred alternative". They're only going through public hearings, and EIS because the law requires them to. However, The PUBLIC is screaming to be heard.

During 2020 the effort to remove the grizzly bear from the "Threatened List" (by increasing population) in the lower 48 was a success, the mandate was removed, during which the North Cascades was not impacted. Why, because contrary to the NCP biologist the purported 5 bear population in the region could not be confirmed within a 2-year study/search, and furthermore that sightings in 1996 were subsequently disproven "not a grizzly". During the 2020 public gatherings a NFS biologist from Montana confirmed that there were no studies supporting reintroduction - as neither absence of grizzlies nor presence had been shown to have a positive impact to the biosphere. He declared that the desire to reintroduce the grizzly was purely emotional. The problem with our wilderness is human intervention - we think we're making it better, but it only gets worse. Just look at the recent failure of wolf reintroduction - within 3 years Fish and Wildlife was shooting wolves due to stock and domestic animal conflicts. It needs to be recognized that the grizzly has been gone from the North Cascades for 100 years and the biosphere has been balanced - doing just fine. If grizzlies cross the Canadian border on their own - ok, but whatever the case nobody wants to come face to face with a grizzly. Reintroduction will simply invite tragedies. Grizzly males wander and in time there's certainly going to be conflicts with the proliferating outdoor user, ranchers, town populations, etc. Today is not like 100 years ago. It makes no sense to facilitate chaos.

In addition, it's against State Law RCW 77.12.035

Under a Washington state law (RCW 77.12.035), the Washington Department of Fish and Wildlife (WDFW) may not transplant or introduce grizzly bears into the state. The law only allows WDFW to use bears native to the state for management programs. However, the law does not prohibit WDFW from taking actions to protect grizzlies, support habitat improvement practices, protect human safety, and protect property once grizzly bears are translocated to the North Cascades. (THERE ARE NO GRIZZLIES IN THE NORTH CACADES)

Choose Alternative A and listen to the Public.

Correspondence: I have read the EIS for restoring a sustainable population of grizzlies to the North Cascades National park.

I am strongly in support of this action. The ecosystem is not complete without all its original members. Using a map I see the enormous size of the native forest in this northern cascades region. Certainly man and bear can live in harmony in this location. I see very few if any towns or cities even close to this vast forest.

I do not approve of the grazing of cattle on our national forests. This is public land and even if allowed the grazing of cattle on this land should be at a true market rate not a pittance of the market rate.

The USFS should not be a branch of the agriculture department.

So in conclusion as a lifetime resident of Washington State fully endorse the reintroduction of grizzly bears into the North Cascade National park to establish a sustainable population of grizzlies.

thank you for your consideration.

Correspondence: Totally opposed to the measure, what's the real benefit? I have been visiting the park for the last 10 years and year after year the amount of wildlife I have seen is so scarce that introducing an apex predators is stupid; not to mention that the safety of visitors and locals will be badly compromised. People will be forced to carry weapons for self defense, attacks and accidents will be inevitable and a series of trickle down effects will follow: investigations, fining people for killing the bears, destruction in private property, etc.

I just not see Any benefit at all, it seems to me another self imposed stupidity from the government.

Correspondence: I agree with plan A: no action taken regarding the reintroduction of grizzly bears to Washington state. I find the need for action on this issue to be weak- simply introducing grizzly bears because they once lived here. Furthermore, I disagree with the potential benefits of tourist coming to "see grizzlies in their natural habit". I believe any potential visitor coming to see a grizzly in the wild will be offset by all the people not wanting to backpack now because they don't want to run into a grizzly bear. As someone who backpacked in Glacier national park, I did so for the beautiful mountains and lakes. All the while I was praying that I would NOT run into a grizzly bear, even when I had bear spray.

As a frequent backpacker in Washington state, especially the north cascades, I enjoy the fact that there are relatively few apex predators that I need to be concerned about. While I pack spray and have other safety measures, it's comforting to know that the worst possibility is only a black bear or cougar, or elk I suppose. And I know that grizzly bear attacks are relatively small, but they do happen and they are more likely to be deadly than a black bear. Just look at what happened to those unfortunate folks in Canada a few weeks ago. While I may be interested in seeing a grizzly, it would only be in the context of a zoo, not when I am in the unpredictability of the mountains.

Also, I can imagine that the idea of reintroducing grizzly bears sounds miserable to all the farmers with live stock. While I am not in that community myself, I can see the future conflicts, just like what happened with wolf reintroduction.

Lastly, as a tax payer there are a plethora of opportunities for my tax money to improve critical issues around Washington state, financing a plan to pay for approximately 144 helicopter rides and capturing bears sounds expensive and is not where I want my taxes to go.

Ultimately, I am in favor of option A because it aligns with my goals regarding outdoor recreation, promotes public safety, and is the most cost effective option.

Correspondence: I would like to voice my objection to the introduction of Grizzly bears into the North Cascades. The North Cascades have been virtually grizzly free for the last 100 years and the ecosystem has survived just fine. My concerns are:

Introducing grizzly bears could upset an already thriving ecosystem and cause a catastrophic impact on the existing wildlife.

Your plan to introduce a small amount of bears per year does not take into consideration that these bears will breed, thus possibly increasing that amount to an unpredictable amount.

The bears could penetrate onto ranch and grazing lands and kill livestock thus starting a major conflict between ranchers/property owners and the local and federal governments and interest groups dedicated to this cause. Case in point is the wolf pack near Lookout Mt near Twisp. Once the ranchers complained, DF&W systematically killed that wolf pack by helicopter, ignoring the current wolf plan passed by the Washington state Legislature.

Since the onslaught of posting on the Internet through social media posts, blogs and articles and post Covid 19, the wilderness has been crushed by a new wave of visitors who are ill prepared to be in the back country let alone know what to do when faced with an encounter with a bad tempered grizzly. As you are aware a couple and their dog were just killed in Banff by a grizzly by no fault of their own. My fear is that same encounters could happen in the North Cascades and beyond once the grizzlies become established.

It is against state law to introduce Grizzlies in Washington state.

This campaign is being made by interests groups that have this unrealistic fantasy that Grizzlies will complete a perfect world in the back country. When in fact it will create conflict with ranchers and property owners, subject hikers to possible risk of severe injury and or even death and possibility disrupt an already thriving ecosystem.

Obviously more study needs to be done that will PROVE that Grizzlies will enhance the ecosystem, not cause harm to stock and not impact humans who choose to venture into the backcountry. So far all I am seeing are environmental groups praising the proposal but not backing it up with scientific evidence that this is a worthwhile, safe endeavor for both the grizzlies and humans.

Thank you for your consideration to my concerns.

Correspondence: I highly suggest we don't have the grizzly bear rehabilitation due to the fact that it would harm the ecosystem. An example being the native salmon population, which is already on the decline. If we add more grizzly bears they will harm native plants and eat and trampled the salmon and their eggs. We are already doing our best to protect the salmon, I would really hate to see our progression on salmon population dwindle to a lower state. Please consider this reasoning and look further into the ecology of this.

Correspondence: I'm 70, retired, having worked for the National Park Service and US Forest Service most of my life.
Consider this comment a big NO, don't do it.

Releasing Grizzly Bears into North Cascades Park is foolish beyond belief. The required ecosystem is long gone. They will be nothing but a threat to people and domestic animals that use the park for recreation. This being a National Park, possession of fire arms is illegal. How many people will die before you realize that this is a bad idea. Wolves were bad enough but these bears will hunt people because they are easy and taste so good. The introduced Grizzly Bears will meet the same fate as the wolves as they stray outside the bounds of the Park and start to forage on someones private property.

Thanks for your consideration of my point of view.

Sincerely

Correspondence: I respectfully and urgently request that our government full restore Grizzly Bears to the North Cascades so that they can take another step towards re-inhabiting their historic range. I agree entirely with the Upper Skagit indigenous peoples, as quoted in the Seattle Times: "yes, they do have a right to exist," he said. "Our history proves that coexistence is possible, our ancestors respected these animals and they thrived up until the point they were driven out." Moreover, I urge my government to fully protect these bears, invoking all protections afforded under the Endangered Species Act. We know that humans are moving into their historic habitat -- and have removed them as a result. In restoring them, we must educate humans who live in their historic habitat that humans, not bears, must act responsibly and reduce bear-domestic animal-people conflicts -- if domestic animals are allowed to range free they are fair game for grizzlies. Likewise the Department of Wildlife must educate people who live in low population areas of the bear's historic range on how to conduct themselves so that bears are not attracted to their homes. We must NOT develop a plan that allows some "surplus" bears to be brought back to Washington to "see how it goes," and if these bears end up in conflicts with domestic livestock or pets we shoot them. Again, we must adopt a plan that gives them full protection under the ESA and educates the public that chooses to live in their habitat on proper conduct. We are at a point in the history of humankind where we must start learning to live with all the other species, who we are currently bringing to the brink of extinction. What kind of a future will the next generation have not knowing so many of the creatures we had the privilege of seeing? The time for action is now. I believe Option 1 is the strongest option -- protection and reintroduction. Nothing less is acceptable. Thank you for your work.

Correspondence: Dear Superintendent Don Striker and Supervisor Brad Thompson,

I am writing to support the restoration of a healthy population of grizzly bears to the North Cascades, their home for thousands of years.

I strongly support the agencies' proposal to bring grizzly bears into remote areas of the North Cascades over the next decade to establish a thriving population in their natural habitat.

The draft EIS's action alternatives provide the best opportunity for the survival of grizzly bears in the North Cascades and will also benefit people who live in and visit the North Cascades. The plans are modeled on what's worked in Montana where grizzlies are recovering with few problems and with the acceptance and involvement of local communities.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Most importantly, the native peoples of this land also support restoring the grizzlies to their ancestral lands. To quote Scott Schuyler, Policy Representative for the Upper Skagit Tribe, whose territory lies within the recovery zone, urging people to accept that grizzlies belong in the North Cascades: "The Upper Skagit people coexisted with grizzly bears in the region for nearly 10,000 years pre-contact. The grizzly has profound cultural significance and its restoration will enrich our ancestral lands and help restore the foundations of our cultural practices. We thank Secretary Haaland for leading this effort and look forward to welcoming grizzlies back home."

Please bring back this native species to our state through the strategy laid out in the action alternatives. Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage. Thank you for all your efforts to keep our North Cascades wild!

Correspondence: Grizzly bears will and are naturally migrating into Washington. If the habitat will support them they'll inhabit the area. Also public safety should be number one, the ranchers that border the North Cascades Wilderness area are very concerned with their families safety. Should grizzlies be released their children who are very big parts in the ranching day to day tasks could no longer be on their own or out there at all.

Correspondence: I would like to go on record in supporting the NPS proposal for restoration and protection of grizzly bear populations in the North Cascades. As a frequent hiker of tree Pacific Crest Trail and other trails in the North cascades, I believe that the grizzly bear restoration program will benefit ecosystem balance in the region without undue threat to recreational users or to commercial interests in North Central Washington. After all, protection of the grizzly bear within Yellowstone NP has been ultimately successful for the environment and has promoted greater recreational use of the resources of Yellowstone along with greater economic revenue benefits to the surrounding commercial communities. Thank you for your consideration of my opinion.

Correspondence: Please do not reintroduce grizzly bears into the North Cascades. While it's true grizzly bears used to lived in the North Cascades, there are now people recreating, living, and making their livelihood farming in the area who could potentially be hurt/killed by grizzlies. Just in the last few months, people have been killed by grizzlies in Banff & Yellowstone National Parks. Plus, there have been others who were maimed by them. We can't make everyone vacate the North Cascades just because you want to introduce a deadly animal.

Correspondence: Let them have them, my opinion is there's probably 100 to spare in Northwest Montana. Washington barely allows hunting anymore anyway so there should be too many elk hunters mauled. Maybe a few tourists I'm sure they'll be bummed out meeting Yogi in the woods.

Seriously though, this decision should be made by local communities only period end of story, Seattle and DC need to stay out of this . Ask the folks that live in and around North Cascades and let them decide they want griz in their back yard. Everyone else should shut up and listen to those impacted by the decision.

Correspondence: The American Bear Foundation of Washington believes that introducing more grizzlies into the state is not in Washington's best interest. The challenges posed by the rising numbers of other predators in the state are evident. Introducing grizzlies would only add to these challenges, endangering both humans and wildlife. Washington states human population of 7 million plus is significantly greater than other western states where grizzly bear conflicts are on the rise. More grizzlies in Washington isn't fair to the bears or the humans.

Correspondence: Reintroduction of grizzly bears as part of natural heritage in NCE is desirable but the objective to reintroduce bears mainly for the enjoyment of people is highly objectionable, especially from the bear's perspective and leads to an undesirable habitat for the bear. Past generations of people's enjoyments have driven the bears out of NCE. I find it selfish of us to forcefully relocate the bears now for the enjoyment of current and future generations of people.

I do not think the EIS has adequately assessed the impact of increased and steadily increasing recreational impact in the NCE. The immense increase of visitors to the parks and forests in the last couple of years will continue with the expected population growth in Washington. Studies have shown that bears in highly frequented areas by people are underweight and suffer on nutrition. I cannot believe this would be a suitable environment for a bear.

Furthermore, I am highly concerned that the bears will be exposed to trophy hunting in the near future. The EIS has not addressed this likely possibility at all. In all three states, where grizzlies have had a successful recovery path, efforts are underway to take them off the Endangered Species Act to allow for hunting. When that happens in Washington the area for the bears will shrink to the National Park which represents 10% of your addressed area in the EIS. Does that mean we would

only have habitat available for 10% of your goal of 200 bears in the future? Is this still a viable population?

I strongly suggest taking into account my 2 major concerns of anticipated visitor pressures and the likelihood of hunting the bears to determine the impact and detriment of habitat quality for the bears. If it turns out as I expect, then I do not support the relocation of bears into the NCE. The energy and money required for this activity should be spent to ensure the bears strive in their current locations (4 recovery zones, Canada and Alaska). Maybe it would be worthwhile to concentrate in establishing corridors between the currently successful recovery areas.

The homing behavior leading to unsuccessful translocations of 25% to 70% as mentioned on page 66 of the EIS is highly concerning and raises the question if the action is worth the sufferings of the bears.

Correspondence: Re-introducing grizzly bears to the North Cascades National Park is an extremely bad idea. Restoring this dangerous carnivore into Washington State will not improve the eco-system. It will, however, endanger human life. Hikers and campers, inside and outside of the North Cascades National Park, will find their lives in peril when encountering these bears in the wild. Introducing the grizzly bear back to Washington State will create many unforeseen situations during interactions with citizens and visitors in the Pacific Northwest. Sportsmen, primarily licensed hunters, will be in a number of counties surrounding the national park. The Washington Department of Fish and Wildlife issues permits for the hunting of deer, elk, cougar and black bear in game managment units bordering the North Cascades National Park. There certainly is no guarantee that grizzly bears will remain within the national park boundaries, once being introduced there. There is a reason why the genus & species classification of "Ursus arcos horribilis" was established for these gruesome bears. Naturalist George Ord formally classified it in 1815 as U. horribilis, for it's character. I strongly urge you to never bring the grizzly bear back into Washington State and primarily the North Cascades National Park.

Correspondence: Grizzly bears are an important part of the ecosystem of the North Cascade due to being a keystone species that provide a positive effect by regulating healthy populations of the animals they prey on, such as elk and moose, and keep forests healthy by dispersing seeds, berries and nutrition providers through their feces. As an endangered animal in the Cascades, we need to restore the grizzly bear population and must take an active role in aiding recovery of this magnificent animal to its native lands.

Correspondence: To Whom It May Concern:

I expressed support for a North Cascades grizzly reintroduction program with a letter in the spring of 2017, and I reiterated my support with a comment note in October 2019.

I continue to support the idea of reintroducing grizzly bears in the North Cascades for the sake of the species as well as the ecosystem. This includes their designation as a so-called "experimental population" if warranted.

I realize there's concern on the part of some that human-bear (and livestock) negative interactions will result. But I think if the introduced population can be monitored reasonably well, really serious problems can probably be avoided.

BTW, I once camped at Lake McDonald in Glacier Park some years ago. We had the experience of having a young male grizzly wander through the campground around lunchtime. While he certainly got everybody's attention (and made us keep our bear spray handy), the rangers monitored his movements until he was out of the area and there were no incidents. I think having more people who are experienced in the ways of grizzlies will help better inform the public and prevent some of those negative interactions.

Thank you for the opportunity to comment,

Correspondence: I live in the Methow Valley and enjoy the privilege of recreating in the Pasayten Wilderness, the North Cascades National Park, and surrounding wild lands.

I am in support of the restoration plan, alternative C, due to the isolated nature of this landscape, and the low likelihood that bears from other regions will migrate to the North Cascades. The 10j rule is critical to giving agencies the flexibility to manage bears and bear encounters.

I dream of living to see a grizzly bear in the wildlands of my back yard, and if not me, then I want this privilege for future generations. Grizzlies are native to this place and deserve to live here again.

Correspondence: While I don't believe any aid should be given to the reintroduction of grizzly bears, the 'best' option being presented is option A. Of the options presented I strongly support action A (no action). I believe it is a terrible mistake to encourage the reintroduction of an animal that was extricated for good reason. One example of an impact on every day activities in a place with a fair grizzly population is in parts of Wyoming where you can't leave coolers in vehicles. These bears will destroy a vehicle to get at the food. Why would you want to create this situation and countless other dangerous situations. These are not soft cuddly teddy bears. As a person who enjoys spending time outdoors I find it hard to believe that anyone else who enjoys camping, hiking, etc. would be in support of any level of aiding reintroduction. While I'm sure this feedback won't change anything, that's my 2 cents as someone who recreates and works outdoors, and not someone who lives in an urban area that will never have any interaction with such animals. Consider the people this will effect, and give them an actual say in the outcome.

Correspondence: While the Northern Cascade Region may be in the historical range of the Grizzly Bear, it is no longer suitable for them, anymore than the San Fransisco region. The Northern Cascade have been settled with families that have farms, cattle, horses, sheep, and dogs. All of the animals are targets for the Grizzly, as has been shown in the Greater Yellowstone area. Additionally, human recreation abounds in the region. This recreation is also at odds with the Grizzly bears presence, as has been evidenced by the numerous mauling and killing of humans that has occurred at the hands of the Grizzly Bear this summer. I urge you to choose the "No Action" option regarding the Grizzly Bear reintroduction.

Correspondence: The old timers killed the grizzlies off for a reason.
They are apex predators and will kill everything they can...dogs, livestock, humans.

This land has long been altered by man's presence and decisions need to be made from our present reality.

Consider that perhaps Grizzlies would be more prone to livestock predation due to the fact that much of thier habitat has already been altered by man forcing them to seek alternative food sources and shelters.

I beleive that any reintroduction attempt is foolish and will prove to be harmful to the citizens of the state, as well as dangerous to visitors to the area.

I am hoping that the lives and livelihoods of Washington state citizens are found to be more important than this experiment. Please do nothing and do not conduct this experiment.

Thank you

Correspondence: I vote a BIG NO on grizzly introduction to the North Cascades.
I am a retired 32 year USFS employee I worked most of my career in the recreation dept.
The public does not need any more danger while visiting our National Park National forest.
The Bears WILL NOT stay in the park or Nat.Forest they will also find the easiest place to make a living like campgrounds, trail heads and back country camp sites.

They will prey on Elk, Deer and livestock both pack animals and cattle.
Ranching is hard enough without Grizzly Bears to worry about.
Thanks for your time .

Write me a letter to the Washington State department of fish and wildlife opposing the reintroduction of grizzly bears

ChatGPT

[Your Name]

[Your Address]

[City,

Dear Sir/Madam,

I am writing to express my strong opposition to the proposed reintroduction of grizzly bears in Washington State. While I understand the importance of wildlife conservation and the efforts to restore the natural balance of ecosystems, I believe that the reintroduction of grizzly bears poses significant risks to both our environment and public safety.

First and foremost, grizzly bears are large, powerful predators that can pose a threat to human safety and livestock. The potential for dangerous encounters between grizzly bears and residents, hikers, and outdoor enthusiasts is a significant concern. These confrontations could lead to injuries or even fatalities, thereby jeopardizing public safety.

Additionally, the presence of grizzly bears could have a detrimental impact on local agriculture and livestock industries. Bear attacks on livestock can result in financial losses for farmers, which may not be adequately compensated through existing programs.

Furthermore, grizzly bears may have a detrimental impact on local wildlife populations, including endangered species. The reintroduction of a top predator like the grizzly bear can disrupt the existing ecological balance and potentially harm the populations of other species, which could have unintended and negative consequences for our ecosystems.

In light of these concerns, I urge the Washington State to reconsider the decision to reintroduce grizzly bears. While conservation efforts are important, it is crucial to prioritize the safety and well-being of the residents of Washington State and the sustainability of local industries.

I request that a thorough and transparent evaluation of the potential risks and benefits of grizzly bear reintroduction be conducted, and that the concerns of local communities and stakeholders be taken into account during the decision-making process. Alternatives to grizzly bear reintroduction should also be explored to achieve conservation goals without compromising public safety and livelihoods.

Thank you for considering my viewpoint on this matter. I hope that you will make decisions that prioritize the best interests of the people of Washington State and the delicate balance of our environment.

Sincerely,

██████████

Correspondence: To whom it may concern, I am NOT for the reintroduction of grizzlies. Not because I dislike them, but because I want to enjoy the outdoors without fearing for mine and my kids life. As the population of grizzly in Wyoming and Montana continue to grow, so have the number of attacks on people. I would like to be able to enjoy my outdoor experiences without the anxiety of wondering if a sow and cubs is around the corner or over the hill?? Not to mention grizzly are naturally more aggressive and larger than any carnivore in the lower 48. I have to ask myself, why are you guys considering putting your outdoor community in danger?! Along with rural communities. There are lots of grizzlies in Yellowstone, Wyoming and Montana. We can travel there to witness there beauty. Couple this with the lack of predator management for black bear, cougar and wolves. There soon won't be a sustainable ungulate population within this state, predators will turn to the next source of food. Humans! We have forever fragmented the habitats across this nation our animals need to survive. Urban development within wintering grounds, 4 to 6 lane freeways that are impossible to cross, fire and the increase of our population have taken a serious toll on animal populations. Let's put our time and effort into restoring habitat, creating highway crossing and controlling predator populations instead introducing another apex predator. I love the outdoors and the animals that call in home, ungulate populations are in trouble. Let's not compound the issue along with endangering people's lives.

Correspondence: I worked for the USFS, BLM, and USNPS in my 20's and 30's. I worked at Yellowstone when Wolves were being reintroduced. I understand the issue of balancing the ecosystem. I am now in my 60's. I live in North Central Washington and as a hiker and climber, I have traveled all over the North Cascades. I extensively use the North Cascades mountains.

I feel we have to be reasonable on what we do when "refurbishing" the ecosystem. Just like we cannot "burn the valleys" like the Native Americans did as they left their summer used lands because those same valleys now contain homes and structures, we cannot just state that the Grizzly Bear was present before and so needs to be brought back to "complete" the ecosystem. There is a good reason why top tier predators like the Grizzly Bear and the Wolves were fought and eventually exterminated. It is because as top tier predators, they are a threat to the health and safety to humans. Yes. Statistically it is rare such a top tier predator kills a human being. But they do. And it is not because someone is messing with their offspring or otherwise threatening their being. It is because as top tier predators, they (Grizzlies solo and Wolves only in packs) recognize their relative strength and dominance over humans.

I am sorry the present Washington State environment has become so human occupied that there is no room anymore for Grizzlies. But I adamantly DO NOT want to see Grizzlies reintroduced into Washington State.

Correspondence: I support the re-introduction of grizzly bears into the North Cascades Ecosystem. As a mother, biologist, science educator, and frequent visitor to the North Cascades, I am thrilled to know that the 26-year effort to restore the grizzly in the North Cascades may finally be completed. I grew up in western Montana where four generations of my family successfully co-existed with grizzlies, as we lived, worked, and recreated in shared habitat, rarely encountering one another. The restart of the grizzly restoration plan gives me hope that my husband and I, and our children and grandchildren will have the opportunity to see grizzlies in the North
This report:
The Climate Change Implications for Grizzly Bears (Ursus arctos) in the North Cascades Ecosystem
Natural Resource Report NPS/NOCA/NRR--2018/1814
Provides best available science guidance regarding the likely success that grizzly bears will thrive in future changed environments.

The 10(j) rule will provide maximum flexibility to land managers to a toolbox of options for dealing with human-bear conflicts that may arise. As a community, we need to implement bear-proofing behaviors to minimize black bear and human conflicts. These same conflict minimizing actions pertain to grizzly bears as well.

Thank you for this opportunity to express my support for grizzly bear re-introduction.

Outside Organization: USFS - Colville NF- Tonasket RD administration Unaffiliated Individual
Received: Oct,17 2023 09:07:58
Correspondence Type: Web Form
Correspondence: Good day,

Table 5, the Colville NF administers the Tonasket RD and therefore a portion of the Pasayten Wilderness Area, like the Glacier Peak wilderness area is jointly managed by the Okanogan-Wenatchee National Forest / Colville National Forest.

(DEIS at 99). The Tonasket RD and the Colville administered lands end at the Tonasket / MVRD District line which lays a mile or so east of the Chewuch River. All the potential release area and the potential staging area west of Mazama lies on the Okanogan-Wenatchee NF administered lands.

I also want to mention briefly that in Appendix B, the discussion of NFMA as it applies to USFS lands in the NCE Grizzly Bear Restoration plan. If the additional NEPA that would be required for bears to be released on USFS lands, requires a plan amendment for any of the existing LMPs, then that amendment would be conducted under the 2012 Planning Rule, not the 1982 Planning Rule. The 2012 Planning Rule replaces the concept of MIS from NFMA (described at B-6) with the concept of focal species. See Federal Register Vol. 77 No 68 4/9/2012 at 21175 and 21233 Discussing challenges in monitoring for MIS and subsequent use of focal species.

If additional USFS NEPA planning involved a Forest Plan amendment to the Okanogan Plan the Colville National Forest, administering the Tonasket RD would like to be consulted on that action.

Amendments could affect various programs on the Ranger District that the Colville NF administers.

In looking at the DEIS it takes a bit of digging in my opinion to understand that bears will only be released on NPS land at NOCA. The map on page 29 showing potential release areas, on NPS NOCA, MBS USFS, and OKAWEN USFS, suggests that bears could be released on all that land. I was able to find the statement at page 33 that shows Grizzly bears would be released at multiple sites in remote areas on NPS land. Release sites on USFS lands could be included once USFS completes its own environmental compliance. My suggestion is to make this a bit clearer, maybe as a footnote to the map of release sites, or in the next FAQ document that's published?

Thanks for taking the time to consider comments, please feel free to reach out if there are follow up questions.

Correspondence: Hello

I would like to advocate for the release of these bears to benefit the local ecosystem. I have one request, though. I would appreciate a greater emphasis on the education and outreach portions of the project.

People have so many fears and inaccurate information about large carnivores. Every hometown Facebook page is filled with carnivore sightings in and around communities, and the comments range from distasteful to dangerous. We need the general public to be educated about the presence of carnivores, their importance to our ecosystem, and how we can deter them from our homes and towns. There are so many wonderful resources to pull from, including Oregon and Washington's universities.

A more robust outreach and education plan would benefit not only the humans, it will save the bears from humans' gaze.

Thank you for your time.

Correspondence: I am opposed to reintroduction of grizzly bears in any capacity and support Alternative A (no action). Introduction of another apex predator in the NW will have negative consequences for ungulate populations, given plenty of wolves, cougars, and black bears already on the landscape. Eventually, conflicts with livestock and humans can be expected

resulting in the controversial response to euthanize offending animals. Historically, earlier pioneers were the victims of attacks by grizzlies which presented a terrifying situation when encountered unexpectedly. This same outcome has occurred in modern times in the Rockies with human lives lost-not something we need to duplicate with NW hikers, backpackers, and hunters.

Correspondence: This plan only makes sense to urbanites and government officials sitting at their desks who believe they are forwarding some great ideal: "Restoring the grizzly bear to its natural habitat". Here is an alternative plan to that being "planned" by urbanites and government officials sitting at their desks. King and Thurston counties are woefully lacking any grizzly bear population, which is not true of northern Washington. Thus the first load of grizzly bears should be unloaded in those counties where a greater portion of the population could enjoy them. If grizzlies are not available, how about importing M13 gang members from Central America and their girlfriends. We could give them places to stay and food and make rules that no one could bother them. This is no more ridiculous than this NPS plan which is remarkably reckless to the folks who live, ranch, work and recreate in North Cascade Park regions. Your dream of "restoring grizzly bear habitat" is neglecting a fact: that habitat is now more highly populated by people. They don't want grizzly bears any more than they want violent gang members imported into their habitat. That fact is evidenced by a 1995 state law that states "grizzly bears should not be transplanted...into the state". Please give up this thoughtless idea that is highly resisted by the people who live here. Let's focus on the M13 idea in Washington DC first.

Correspondence: To whom it may concern,

I've been informed you are planning to release Grizzly bears in the Cascades. As a person/family who loves to hike, camp, and just generally be out in our beautiful country, this immediately causes me great anxiety. Grizzlies are one of the main reasons that my family and I would not live in Alaska or even do outdoor activities there either. I know that we're not the only ones who feel this way, so please consider your WA residents and others who come here to enjoy our beautiful country before following through with this.

And, considering that we already have black bears in the area, what could possibly be the incentive to drive this action?

Perhaps I don't completely understand all the dynamics, but that would be like releasing Great White sharks into the our Puget Sound to compete with our Orcas.

Please do not release Grizzlies into our state, and take away one of the main reasons we moved here.

Thank you for your time,

Correspondence: To Whom It May Concern:

I am strongly in support of reintroducing grizzly bears to the North Cascades National Park. The protected areas in the park are in lands that were once prime grizzly bear habitat. These wild landscapes are part of the grizzly bear's natural range, and National Park staff have demonstrated at many other national parks that they are capable of managing public lands where grizzly bears live. The North Cascades is a very special national treasure; it offers unique opportunities for our nation to invest in supporting biodiversity and conservation in the face of accelerating climate change. Megafauna like the grizzly bear will need our support to continue to recover and thrive. There are few areas like the North Cascades that allow us to invest in their recovery.

As staff evaluate various alternative approaches for reintroducing grizzly bears to the North Cascades, I encourage and support the efforts to select an approach that accelerates the likelihood that bears will thrive and be able to grow their population in the North Cascades National Park as quickly as possible.

Thank you for your time and work on this effort!

Correspondence: Thanks for asking for public comment about grizzly bears in our area. Before commenting on this specific issue, some pertinent information will be provided. Our family lives in the wilderness on 55 acres off the White River road by Lake Wenatchee. It is commonplace for us to see bears, deer, elk, an occasional moose, bobcat and less commonly cougar and porcupine. We enjoy the wildlife and live in harmony with them. However, we oppose the

reinstitution of grizzly bears into the area for some sound reasons.

The major reason is a shortage of food.

Our rivers and lakes in the area used to be teeming with fish, one of the main food sources for grizzlies in the wild. The fish are much fewer now in both the rivers and lakes. The black bears in the area are much skinnier than in past years, and some have taken to dumpster diving to get at people's garbage. It is tragic when they have to be euthanized because of human's irresponsibility, but it occurs in our area.

My husband and I would be happy to provide additional feedback if necessary.

Kind Regards,

Correspondence: I support option 3 for grizzly reintroduction into the Cascades. I live in Grizzly country just outside Yellowstone National Park. I've had grizzlies in my yard, I hike in the GYE weekly. Only once have I encountered a grizzly that charged. We were prepared with bear spray. Bear ran away with no need to spray. Sure, there are things we must do to

avoid encouraging bears on our property: We harvest our apples immediately, we do not leave trash outside at all, our communities use bear proof trash containers. It is well worth the bit of extra effort we need to do in order to have grizzly bears in our ecosystem. At one time, there was plenty of non-human space where wild animals could roam. No more. We humans have invaded all lands, and now we MUST learn to share. we must, as a species, learn to allow other species space to roam. A world without grizzly bears would be a sad world indeed.

Correspondence: Grizzly bears were historically present in and have been long gone from the North Cascades Ecosystem for generations.

The process to restore a viable population of grizzly bears as required by the Endangered Species Act began way back in 1997 when federal scientists determined the North Cascades Ecosystem (NCE) has sufficient quality habitat to support a grizzly bear population. Grizzly bears are an important keystone species for this ecosystem. Additionally, the NEC is the only designated recovery area on the entire west coast of the lower 48 states.

The preferred action alternative is "C"; which would release 3 to 7 bears annually over approximately 5-10 years into the six million acre NCE. This gradual and modest approach seeks to establish an initial population of 25 bears before switching to adaptive management strategies. A successful recovery program could establish a population of 200 bears over 60-100 years in the six million acre NCE.

The recovery and reintroduction of grizzly bears to the North Cascades Ecosystem should be accomplished without further delays and it would seem that alternative "C" is the best choice.

Sincerely,
[REDACTED]

Correspondence: I'm thrilled to hear that there is a proposed plan for grizzly restoration to the Northern Cascades. This amazing mammal, once numbered in the tens of thousands, now has less than 2,000 animals in the lower 48, where they once roamed. As so many Americans suffer emotional issues in our world of concrete and lights, I really believe that our National Parks and wild spaces and wild denizens bring joy and awe, and can restore health to us. So many people enjoy getting out to the parks, and grizzly bears are THE major attraction in some regions of the west and Alaska. It will be great for the ecosystem, and I would imagine it would be great economically as well. Please do continue with a restoration, not only here, but in other areas where they once roamed. Humans need to share better than we have. We hunted so many animals to near extinction, and we need to fix that.

Correspondence: 1) The Wildlife Crossovers Program, introduced by U.S. Transportation Secretary Pete Buttigieg in April 2023, needs to be implemented preceding, or at least in conjunction with, the re-introduction of the Grizzlies. Otherwise, the Grizzlies will be re-introduced into a high density area further endangering them instead of conserving them. There needs to be coordination amongst the Federal Government and local governments with the plan to re-introduce the Grizzlies and the Wildlife Crossings Program. However, my attempts at this have received nothing but the silent treatment from the City of Bellingham and Whatcom County. In April and May of 2023, and numerous times throughout the summer and fall, I have brought this matter of the Federal grants being available for wildlife crossovers, citing 'Biden-Harris Administration Launches First-Ever Program to Improve Safety on America's Roadways by Preventing Wildlife-Vehicle Collisions', etc., before Bellingham City and Whatcom County Council's during public comment and public hearings, as well as the City of Bellingham Transportation Committee (May of 2023). Unfortunately, neither Bellingham or Whatcom County are interested, nor as far as I can tell, has the State of Washington attempted to implement the Wildlife Crossings Program.

2) Bear Spray is not enough for a bear attack. I have addressed this in letters published in the Anchorage Daily News repeatedly over the years, also USA Today and Outdoors Magazine, etc. The late [REDACTED] and myself were attacked by a Brown Bear (Grizzly) on the Kenai Peninsula in Alaska 9/15/96. Please see Anchorage Daily News article regarding this attack: 'A Can of Spray and A lot of Luck'; 9/29/96; C. Medred. I used bear spray correctly in the attack but was knocked down by the bear with a side-arm swipe to my chest; the bear growling and snarling in my face as I sprayed the rest of the canister into its wide open mouth and throat, while it was, according to [REDACTED] swinging its paw threateningly at my head. It could have killed me then if it wanted to, but believe it simply wanted to assert domination. The bear was protecting the salmon it was eating when we came upon it, so it reacted like a dog protecting its dog bowl. But had it been in destruction mode, bear spray would not have stopped it from destroying myself and perhaps [REDACTED] as well. This message is reiterated by me over the years as a sort of public service announcement, but by far the message the public receives is for bear spray to be used for defense in a bear attack. And because it's the National Parks and wildlife officials advising that, it tends to carry more weight than me warning otherwise, particularly as I'm presently homeless.

Thank you...Sincerely, [REDACTED] P.S.: E-mail outdated but required field

Correspondence: I am in support of reintroducing Grizzlies into the NCNP. I believe that these bears will help the ecosystem, and overall are not a threat to humanity and do not limit my access to this beautiful park. I am afraid of these bears and do believe that I will not feel comfortable backpacking alone anymore in this. Beautiful park knowing that these bears may be reintroduced. I also believe that these bears would help the ecosystem and that they have been here and existed

with Native Americans in this area for thousands of years. I know that bears eat 80% of plants in their diet and that it is very rare to see them.

Correspondence: My concerns are similar to those mentioned about public safety when recreating. I hunted the Selkirk Unit in NW Washington in 2008. Even then there were warning signs of Grizzley Bears in the area and to know the difference between Black and Grizzley Bear. The state has already introcued wolves which are taking a a toll on the ungulates (Deer Elk etc). Thus causing many hunters to leave the state to hunt elsewhere. Thus a loss in funding to the state, and to businesses that pay state taxes..

Thanks, [REDACTED]

Correspondence: To whom it may concern,

Thank you for taking my comment on the 2022 North Cascades Ecosystem Grizzly Bear Restoration Plan/Environmental Impact Statement. My name is [REDACTED], and I am an environmental professional with over thirteen years of professional environmental consulting experience. In addition to my professional experience, I have a Bachelor of Arts in Environmental Studies from the [REDACTED] and am currently in the process of earning my Master of Science in Environmental Policy and Management from the [REDACTED].

I would like to take this opportunity to provide support for the Grizzly Bear Restoration Plan. However, I would urge the National Park Service and U.S. Fish and Wildlife Service to support the plan with Alternative B as opposed to preferred Alternative C which designates grizzly bears as an experimental population as defined under section 10(j) of the Endangered Species Act (ESA). While I understand that this designation would help alleviate some local landowner concerns regarding protection of private property, including livestock, in my opinion this relaxation of the ESA goes against the goals of the restoration plan by not enhancing "the probability of long-term survival of grizzly bears." In effect, this designation could ultimately cause harm to the grizzly bear population that is relocated to the North Cascades by making it easier to "take" the grizzly bear and reducing the repercussions for doing so. This would be especially true with the "Unintentional" taking of a bear. In effect, the 10(j) designation could potentially result in two separate take events. The first when bears are relocated from other locations to North Cascades, and a second take when bears are relocated or euthanized for any reason outside the normal protections of the ESA.

While I commend the agencies for the desire to restore grizzly bears to their former habitat in the North Cascades, I disagree that the protection of personal property should be given priority over the protection of an endangered species. If the goal of this program is to restore these beings to their natural habitat and bring an integral part of the ecosystem back into the equation, I would urge the agencies to follow alternative B. Otherwise, the goals of the program should be revised to include an "except when local landowners and property disagree" to each of the goals stated in the plan.

I appreciate you taking the time to read this comment. Thank you.

Correspondence: I support re-introduction of grizzly bears in the North Cascades greater ecosystem. They are an iconic species that needs to be there, and I think we can find ways to live with them. People in the Rockies, particularly Yellowstone National Park have figured it out and that area has a lot more people with a lot more grizzlies in a small area. So it makes sense to introduce a small population up in the North Cascades.

I am an active hiker and know that with responsible awareness and food management, we can recreate safely where grizzly bears live. Most bears avoid humans and I believe the plan is to collar these bears, so they can be tracked. Any problem bears can be dealt with.

These are the last of the large mammals missing from the North Cascades. Environments are enriched when there is diversity of species. The grizzlies belongs there. It is good for us and them. The world will be enriched by them. Tourism and recreation bring dollars to communities, and the presence of bears is always a draw, even if the chance of seeing one is remote. So, it's good for humans and good for bears to have them back.

Correspondence: The same problem exists as did the last time you asked about this. The rules of engagement are that the bear can do whatever it wants up to the point where it's actually eating you.

A grizzly getting to my place is unlikely, but I do substantial back country camping up around the Methow valley. It is not my habit to carry a firearm on these trips, but if I'm going to be facing a grizzly that may have to change. You are correct in that black bears seldom attack, but it wasn't that long ago that a Grizzly killed and partially ate a ranger in Yellowstone. He certainly knew the bear protocols, but it didn't save him.

Just earlier this month a grizzly bear killed two people in Banff National Park. In the end it preferred to eat their dog.

I would suggest that rules of engagement be modified to; 1) If the bear in the wilderness area then it may be shot only for self preservation, including the horse you need to get back out. 2) any bear not in the wilderness area may be shot by anyone at any time, no particular reason needed.

This will still reduce the number of people going camping in the national forests, as not everyone has a firearm powerful enough to take down a grizzly, but at least it evens up the odds and you wouldn't have to worry about getting dragged to court if you are attacked.

One last point, if the people of Seattle and the other cities want the grizzlies, then they should have them. Release them in the San Juan Islands, Bainbridge island, Vashon Island, and the outskirts of Seattle. The Protected Class stuck rural folk with the cost of the timberwolves while they sit safe signaling their virtue. I don't want the situation repeated.

Thank you.

Correspondence: Dear Superintendent Don Striker and Supervisor Brad Thompson,

I am writing to support the restoration of a healthy population of grizzly bears to the North Cascades, their home for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations.

I support the agencies' proposal to bring up to 25 non-problem grizzly bears into remote areas of the North Cascades over the next decade.

The draft EIS's action alternatives provide the best opportunity for the survival of grizzly bears in the North Cascades and will also benefit people who live in and visit the North Cascades. The plans are modeled on what's worked in Montana where grizzlies are recovering in the Cabinet-Yaak mountains with few problems and with the acceptance and involvement of local communities.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please bring back this native species to our state through the strategy laid out in the action alternatives. Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

Thank you for taking the time to keep our North Cascades wild!

Sincerely

██████████

Correspondence: Hello,

As a resident of Skagit County who also owns property in Okanogan County, I am in favor of reintroducing grizzly bears to the North Cascades. Driving across Hwy 20 between our properties, the beauty of the North Cascades is something I treasure. There are so few places left where grizzlies can be re-established in their historic territories, that I am humbled to realize the region I call home is a place where we can re-invite them to come home, as well. I've done a fair bit of hiking & backpacking in Glacier N.P., and I feel there can be a successfully managed relationship between human enjoyment of the backcountry with minimal negative human-bear interactions, and the bear density in that area is far greater than it's anticipated to become here. Please mark me down as "in favor" of reintroduction!

Thank you,

Correspondence: Hello,

I'm moving back to the area in a month, and I plan to spend every weekend in the cascade mountains. I've lived, hiked, camped, fished, and hunted in the area extensively. Why would you dump more grizzly bears in this area?!?! What's wrong with the ecosystem there?!?! You've gotta have better ideas than this (Ex. Fire prevention, invasive plant removal, Wilderness expansion, road maintenance... goodness, restore the elk before you think about bears!). I get it, bears are cool, but the idea of introducing extra bears is insane. It's time to stop meddling with the ecosystem. If more bears are supposed to be there, then they'll come. What's stopping them?!?! Nothing!

Thanks, and please seriously consider not putting grizzlies in the area.

Correspondence: Please don't reintroduce grizzlies into the North Cascades!

I spend a great deal of time, along with my family, in the North Cascades and the local communities in the area each summer...camping, hiking, staying in hotels, eating at restaurants, gassing up vehicles, shopping, and enjoying family vacation time. It usually amounts to 10-20 days per year in total, spending a great deal of money between all of us.

With the threat of running running into a grizzly, we will go elsewhere with our money. I can't put myself and my extended family in danger like that. Grizzlies are aggressive predators. It's already bad enough with the packs of wolves out there that pose potential danger. This would be the final nail in the coffin.

I want my kids and grandkids to continue to learn about and enjoy our wonderful North Cascades and get outdoors. If grizzlies are reintroduced, we will take our money elsewhere (which unfortunately hurts many people outside of the National Park).

Correspondence: I am a Pacific NW resident, an environmental advocate, and lover of nature. And I am against the reintroduction of grizzly bears in the NCE. I hope the NPS weighs heavily the public comments of the actual residents in and around North Cascades in Washington, as those are the US citizens you will most affect with this proposal.

The purported benefits are vague, unscientific and tug at the nostalgic heartstrings of nature lovers like myself. Saying it is a "recovery" plan, or it's "how it used to be" evokes positive feelings, but is devoid of concrete positive outcomes to the current ecosystem. Nostalgia is not a reason to spend valuable resources to bring an apex predator to an ecosystem.

The question should not be "how was it in the past", but rather "how will it be in the future if we proceed"? The answer is that grizzly bear reintroduction will displace current black bear populations and negatively affect residents, farmers, and recreators. As for concrete positive effects, There was not a single one enumerated in the entire text of this proposed rule, excepting "more grizzlies". Do we need more grizzlies? While considering individual NCEs/GBPUs in isolation can seem to raise alarm bells on grizzly bear sustainability, overall extant grizzly bear populations across US and Canada are proven abundant enough to be self-sustaining for the overall species.

A giveaway is in the proposed rule title itself: Nonessential. Let us spend our limited resources on more essential environmental projects.

"Recovery" and "restorative" is bad logic. We don't recover the grizzly population of San Francisco, though they once roamed the area. We don't try to restore of a mile-thick ice sheet on top of New York city, though it was there the last ice age.

Grizzly bears should not be forcibly reintroduced to NCE, via 10(j) designation or otherwise. Living in the past is the wrong way to develop good environmental plans for the future.

Correspondence: We are fully supportive of reintroducing grizzly bears into North Cascade NP. They are magnificent creatures that need lots of room to roam, and this area was their home. We've had amazing encounters up close with grizzly bears and cubs, and it truly is something we never will forget!! We need to do the responsible thing and ensure that these wondrous mammals have a safe and secure existence in the back country. As Thoreau said, "In wildness, is the preservation of the world". And these bears are an important part of that. We love our national parks, and hope the right decision will be made to allow these grizzly bears to return to their rightful and deserving habitat.

Correspondence: I want to preface this by saying I am an avid bear lover and recognize that Grizzlies historically lived in the North Cascades and human activity has pushed them out. I am all for the bears and protecting them, however I do not believe relocating Grizzlies into the north Cascades is a good idea.
At this point in time, the Pacific Northwest has a high volume of people moving here, and the growth shows no sign of slowing down. The mountains and surrounding areas are continually being built or logged into, habitats for all animals becoming destroyed. This year more than ever, we see black bears moving lower, getting relocated or euthanized because they get habituated to food and people and have less and less space to roam. I feel like what is happening in Montana with the Grizzlies is a precursor to what will happen here. There are many more people who go into the mountains in this area, raising concern for more human-bear conflicts as well. At this point I don't believe the North Cascades are a big enough, undisturbed area to safely home Grizzlies without repercussions on human life and subsequently the bears will suffer for that. There are Grizzlies just over the border in Canada and Idaho, if the bears really wanted couldn't they just come down? If they are not, I feel as though there may be a reason. I just think it's too populated down here to make this plan successful without devastation and loss for bears.
Thank you for listening.

Correspondence: Introducing another apex predator into Washington state is a huge mistake which would be detrimental to tourism, agriculture, and hunting/fishing. Grizzlies are not endangered and already exist in Washington state. I have personally had an encounter with a grizzly while archery hunting in Stevens County. Frankly, it is sheer luck I am alive. Even people who are bear aware have been injured and killed by these bears, unleashing them into a very popular tourism area will cause nothing but heartache. There are already trailheads closed for black bears who have learned humans equal a meal and stocking these same areas with grizzlies will result in more closures.
The national cow herd population is already at its lowest since the 1960s, why bring in yet another predator when ranchers

are already plagued by wolves? The same can be said for sheep ranchers. Wolves have progressively moved the dwindling elk and deer populations towards urban areas and grizzlies will only add to this problem.

The mammals and fish grizzlies eat are all facing their own challenges, none are overstocked, so they do not need to be "managed" by grizzlies. Bringing in the bears will only further stress deer, elk, salmon, etc.

This idea has been brought up several times. After biologists look into the effects and outcomes, they have decided against it time and time again. This time is no different, please do not bring any more grizzlies into Washington.

Correspondence: I prefer the no action plan. I believe that there aren't any grizzlies in this area because over time the environment became inhospitable to them. Probably because they were killed due to human interaction and didn't find enough food. I question whether we as humans could now manage to bring them back.

My son owns forestry land in central Whatcom county and we would not want to see grizzlies anywhere near where we work and spend time. On reading the preferred proposal it sounds like quite a lot of expense (i.e. helicopter flights) and human

interference would be necessary if grizzlies are re-introduced. I believe nature is better served with less involvement and human contact rather than more. Thank you, sincerely [REDACTED]

Correspondence: Grizzly Bears were hunted to near extinction because of their position at the top of the food chain and the white settlers desire to "Tame" the land. The Bears are an important part of a healthy N Cascades Eco-System and pose far less danger to human beings than other human made factors. Potential loss of livestock as a defense against their return is an offense to all who love and enjoy the great outdoors. Is the existence of open range fed European Cows and or Sheep more important than animals that are trying to exist in their native habitat? I say No!
A far bigger concern to the harmony of the Cascade Wilderness is off leash dogs harassing and even killing native species. Dogs bite people every day yet there is no great fear and or condemnation of them.

I would love to have the Bears back in the North Cascades. Please do all possible to return them to this great park.

Correspondence: I am a resident of the upper Methow Valley, living just outside the town of Winthrop and within the boundaries of the North Cascades Ecosystem (NCE). I am writing to express my support for the reintroduction of grizzly bears to the NCE as proposed in Alternative C of the DEIS by the National Park Service and US Fish and Wildlife Service.

I am an active user of the public lands within the NCE, including hiking, bicycling, canoeing, skiing and snowshoeing in the North Cascades National Park Complex as well as adjacent wilderness areas, national forest, and state lands. Upon initially hearing about the plan to reintroduce grizzlies into this area, I was skeptical if not opposed, primarily due to my concern about negative bear-human interactions. However, I kept an open mind, attending meetings to learn about the plan and reading as much as I could--both pro and con--including the executive summary of the Draft Grizzly Bear Restoration Plan /

Environmental Impact Statement. My position changed as a result, as I came to understand that the North Cascades is one of the few places left in our country with suitable habitat for grizzlies and to recognize that restoring grizzlies contributes to biodiversity and restores the grizzly bears' beneficial contributions to the ecosystem. We already live in an area that supports other predators such as cougars as well as black bears, and I believe that those of us living in the area proposed for reintroduction can also learn to live with and respect the rights of the grizzly bears to coexist with humans here.

I am also supportive of the designation of this population as a 10(j) nonessential population, as I believe the management tools afforded by this designation will reduce human-bear conflicts and increase the likelihood of successful establishment of a population.

Correspondence: Dear Superintendent Don Striker and Supervisor Brad Thompson,

As an avid camper, outdoorsman and hiker living in Washington State I am writing to support the restoration of a healthy population of grizzly bears to the North Cascades, their home for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations. I know there are concerns over safety when it comes to Grizzly bears and I wanted to weigh in and say that the proposed restoration will not effect my feeling of personal safety while enjoying the Northern Cascades region.

I support the agencies' proposal to bring up to 25 non-problem grizzly bears into remote areas of the North Cascades over the next decade.

The draft EIS's action alternatives provide the best opportunity for the survival of grizzly bears in the North Cascades and will also benefit people who live in and visit the North Cascades. The plans are modeled on what's worked in Montana where grizzlies are recovering in the Cabinet-Yaak mountains with few problems and with the acceptance and involvement of local communities.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please bring back this native species to our state through the strategy laid out in the action alternatives. Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

Thank you for taking the time to keep our North Cascades wild!

Correspondence: Re: 2022 North Cascades Ecosystem Grizzly Bear Restoration Plan/ Environmental Impact Statement (Docket No. FWS-R1-ES-2023-0074)

Dear Mr. Striker,

I'd like to thank you and your team at the National Park Service for your thoughtful work preparing the draft Environmental

Impact Statement (EIS).

I am writing in strong support of alternative B of the EIS. Bears belong in the Northern Cascades, they should be reintroduced to their home range, and they should receive the full protections they deserve under the Endangered Species Act (ESA) when they are.

Grizzly bears were very recently extirpated in the Northern Cascades. They fill an ecological niche that has remained empty since the last bear was killed in 1996. The Northern Cascades ecosystem is considered one of the only nearly intact ecosystems in the United States. Grizzly bears will help complete the picture; they belong here.

Although I most strongly support alternative B, I recognize that section 10(j) of the ESA has been used to successfully reintroduce keystone predator species in the past. Alternative C is therefore acceptable, but will leave the new population unnecessarily vulnerable to human threats.

I am a wildlife enthusiast recreational nature photographer from Massachusetts. I have taken multiple trips to Yellowstone, Grand Teton, and the Katmai Peninsula to photograph grizzly bears. I have not visited North Cascades National Park, but I, and many, many others, will if grizzly bears are reintroduced. Every time I visit a park to see grizzlies, the rangers share that more and more people are coming every year just for the bears. Bears will help - not hurt - the tourism economy of Northern Washington. In bear country, people can live safely, the outdoors can be enjoyed safely, and the bears can even be viewed safely.

Our National Parks belong to all of us, and we have a shared responsibility to care for the ecosystems they protect. I urge that NPS do the right thing, and take the necessary steps to fully restore the North Cascades ecosystem. It is one of the last ecosystems in the lower 48 states that one day be able to call intact, but that requires the reintroduction of grizzly bears.

Thank you for taking my comments into consideration.

Best,

Correspondence: I am all for the reintroducing of grizzlies in the North Cascades. I believe, as someone who is apart of the hiking community, that there is so much wilderness for these grizzlies to risk in that they will not pose a big threat causing human grizzly interactions. I think the biggest hurdle is going to be keeping climbers from unintentionally feeding the bears much like the black bears now.

Correspondence: I am against grizzly bear reintroduction in the North Cascades. The North Cascades and the Pasayten Wilderness have had many fires over the last few years destroying habitat for many wildlife including bears. There are grizzly bears in Canada could relocate themselves here if they found the food source and habitat desirable. If the grizzly bears don't have the food sources they need, they will be down in the valley to close to our population. The grizzly bears will impact the declining deer population due to fires.

The Methow Valley has had a increase in population and an extreme increase in visitors to the North Cascades in hiking and backpacking. Too many people and grizzly bears are not compatible.
I do not support the reintroduction of grizzly bears to the North Cascades.

Correspondence: This is a terrible idea and the cascades and just outside will end up much like a large chunk of yellowstone, where there is no longer any life. These bears will take out all animals then move to neighborhoods for food and then this "brilliant" idea will then get to a point on the state going in and just killing the bears to decrease the numbers.

If those bears migrate south, let them, but DO NOT give them a massive head start. Let nature actually do its job and quickly playing politics and nature.

Correspondence: While introducing a previously, nearly decimated, wildlife creature back into the environment might seem like a noble gesture, it should be understood why it was hunted to near extinction.

Read the journals of the Lewis and Clark expedition to understand how the backwoods savvy members of the expedition viewed Grizzlies. They were apex carnivores then and they are now.

Just recently a couple and their dog, who were experienced in wilderness camping, encountered a grizzly and all were killed. The authorities had to find the animal and kill it. Imagine if an inexperienced group of hikers encountered Grizzlies.

I believe if the Park service wants to introduce Grizzlies in the North Cascades it should be put on the ballot for the voters of Washington State to decide.

I see signs all over NC Park banning drones because they are dangerous to NP helicopters. The NPS wanting to create a much more dangerous Park experience is ironic. Please count me as vigorously opposed to Grizzlies.

Regards,

Ferndale, WA

Correspondence: Why? Seriously, what good can come from it? I get it, you're trying to give them their ecosystem back. No good can come from this. People at the park are going to think they're cute and fuzzy and try to take a picture with them. People who have animals and livestock and live in closest to NCE are going to now have to worry about grizzlies getting into their animals. What about those whose livestock is a means for their livelihood. How long until they stop fearing humans as much and someone gets mauled. The salmon population is going to be effected, and prey animals in general are going to be pressured out of the more secluded areas, which can drive them to hunters and they will be killed one way or another. What then? Will you reintroduce deer and elk to the NCE? You will never convince me that, being that close to BC, there are not already Grizzlies migrating back and forth into the NCE. Enough is enough. We don't need more apex predators in the US than are already there. Let nature take its course as it is. Please. Do not introduce more grizzlies.

Correspondence: As 30-year cabin owners on property facing the Wenatchee National Forest, we must voice our grave concerns regarding the introduction of grizzly to the North Cascades. More families are moving to the area, many with very young children and pets. We share our forest properties with a growing population of black bear, deer, and the mostly-invisible-but-ever-present mountain lion. Human/black bear interactions reported among the neighbors noted a resurgence this year. These mostly safe bears are becoming more confident and disorderly around people. So what then of the unpredictable and more violent nature of the grizzly?

This summer there has been an alarming number of brutal and often fatal grizzly bear encounters in the Northwest and

Canada. And THESE from bears naturally residing on their home turf! To make matters worse, the defense strategies when confronted by these different species of bear are polar opposites. We oppose introduction of grizzly to the N. Cascades in any form. It is a case of doing the wrong thing for the right reason, and the likely repercussions to vulnerable families is unthinkable.

VOTE "NO"; re: the introduction of grizzly to the North Cascades.

Correspondence: My name is [REDACTED]. My wife and I live at [REDACTED], Winthrop, WA. I am a registered voter in Okanogan County, Washington State. I DO NOT SUPPORT the Draft Grizzly Bear Restoration Plan / Environmental Impact Statement, North Cascades Ecosystem that has been circulated by the National Park Service for Comment by November 13, 2023.

I have substantial experience in close proximity to Brown (Grizzly) Bears while fly fishing in Alaska over several years. While I do not fear these animals, they must be regarded as apex predators, and are fully capable of catching and killing the largest prey animals in North America. Accordingly, they must be treated with great respect by all persons who are located in the territory where they live. Being in their area brings with it the risk of injury and/or death related to an encounter that goes bad. They have no natural predators.

My wife and I live and recreate in Winthrop and the surrounding area, including in the North Cascades. I have hunted, fished, and camped in the North Cascades for many years. Our children and grandchildren enjoy visiting us in Winthrop, and they also enjoy recreating in the area in which we live.

It is my view that reintroducing Brown (Grizzly) Bears into the North Cascades will expose the residents of Okanogan County, and those who visit here, to unnecessary risks to personal safety. Less than a month ago two experienced campers and their dog were killed by a Brown Bear in Banff National Park in Alberta, Canada. Reportedly, they were killed at their campsite, and had done nothing wrong. The bear was found and euthanized. In early September a deer hunter was badly mauled by a Brown Bear in Montana. There are many other examples.

For these reasons, I am opposed to the risks to the public that bringing Brown (Grizzly) Bears into the North Cascades National Park poses.

Thank you,

[REDACTED]

Correspondence: I strongly support the reintroduction of the Grizzly Bear into the North Cascades National Park. The reestablishment of the natural wildlife within regions where they have been removed provides a balance to the environment. These proofs have been shown in Yellowstone with the reintroduction of wolves, the regulations to assist in population growth for otters on the Olympic Peninsula as well as understanding the suitability and support beavers provide to a habitat. Protective reintroduction regulations support the growth of our wildlife and natural resources. Balance between predator and prey provide support for a stronger natural ecosystem. I am in strong support of the plan and thank you for considering this and providing the public to comment.

Correspondence: I am asking you to please reintroduce grizzlies to one of their original habitats - the North Cascades Ecosystem. I believe the efforts of FWP in Montana where I live could serve as a an example of how to successfully return these bears to a place they once lived. Humans and grizzlies can coexist. And to counter the argument that grizzlies will lay waste to stock on ranches, first it is an exaggerated claim, and second, should a grizzly kill a cow, the rancher gets compensated and the bear likely euthanized. I assume the same tools FWP has in Montana would also be available in Washington. At the very least, cows and grizzlies should be on equal footing. One shouldn't have priority over the other. To take the argument further, grizzlies inhabited the area first and I have read that ecosystem is healthier when it has apex predators like grizzlies in it. Please return the North Cascades Ecosystem closer to its natural state - please reintroduce grizzlies. Thank you.

Correspondence: I am writing in support of efforts to bring grizzlies back to their historic home in the mountains of northern Washington.

With over 9,000 square miles of quality habitat, the North Cascades Ecosystem is one of six designated recovery zones for grizzly bears. Grizzlies belong in the North Cascades, part of their historic range. With fires destroying habitat at ever-increasing intervals, development expanding into rural areas of Montana and Idaho, and rising temperatures causing food shortages, grizzlies need as many footholds as they can get in order to flourish in an uncertain future.

While there is understandable apprehension about living alongside such powerful creatures, local communities have been preparing for years for the possibility of grizzlies returning to the landscape once again. In the Rocky Mountain region, successful efforts to ensure coexistence have included spreading tools, information, and awareness across the shifting boundaries of grizzly country so that adaptation can be a privilege rather than a burden.

The natural heritage of the Northern Cascades region is an immense and unmeasurable gift. Though much of the continent's recent history has been marked by loss of wildlife, we can still shift the tide toward a future of abundance.

Correspondence: I would like to voice my support for Alternative C as the best plan for the north cascades ecosystem. I have hiked, backpacked and camped for over 50 years in bear country in Alaska, Canada and Montana, Wyoming and Idaho. The presence of bears, both Black and Brown, enhances the wilderness experience, sharpens the senses, and forces humans to respect the complete ecosystem. Reintroducing Grizzlies to their natural habitat of the north cascades is the right thing to do for the ecosystems health, the survival of Grizzlies, and also to enhance the wilderness experience for people.

Correspondence: I am a wildlife photographer. I have been what many might consider frighteningly close to bears, wolves, venomous snakes, all size and variety of predator and prey, yet I remain unscathed. These animals are not hunting us. They are not seeking out humans for meals. They are simply surviving in the territories upon which we have infringed, and sometimes we cross paths. That shouldn't be seen as a cause to eradicate them. We must stop seeing projects such as this proposed reintroduction as "bringing in predators" and see them for what they are, which is bringing the equilibrium back to the environment.

In consideration for the planned reintroduction of Grizzly Bears to the North Cascades, I beseech the Parks Service, the Public, and all involved in the Planning Commission to consider the successes of the Yellowstone Wolf Project. The reintroduction of Wolves to the Yellowstone ecosystem caused immediate and healthy changes across the region. The riverbanks were stabilized and strengthened by the foliage that was able to grow in greater volume due to the balancing of the elk and deer populations, other species which had dwindled returned, such as beavers. The beaver dams allowed increased populations in native fish species by restoring spawning areas, scavengers thrived on kills and increased the population of small prey, which allowed increase in the populations of animals such as eagles and foxes. These are just a few of the many benefits the region has seen since.

The project had been met with hesitation and fear mongering, antiquated views of wolves as merciless killers still prevail today, even so, the wolves have grown in population. The land is healthy. The wildlife are thriving. Today, the only threat to the wolf is the same threat that decimated them decades ago; human ego, fear, and greed.

Bring back the bears. Not everyone will see eye to eye, some will be in support, some will fight it and ignorance will prevail just as it has alongside the Yellowstone wolves. But ignorance will not hinder the benefits that will come from reintroducing the bears.

We cannot let our arrogant and ignorant views of predators as competition for use of land and fear mongering determine whether or not a species deserves to live and thrive where it is native. If the consideration was for the reintroduction of a species of deer, or bird, or even otters, badgers, or beavers, it would not be controversial. People are choosing to see the bears as threats, as fearsome predators that are out to attack, as blood thirsty hiker hunters. They are neither. They are large omnivores that are necessary in the ecosystem. Their territory should be respected and humans should take necessary precautions when entering their territory in the Cascades just as they would in the Yukon, Yellowstone, or Teton.

We are at a crucial point where we either learn from past mistakes, and choose to respect the ecosystems which we survive within and protect the species that subsist in them, or, we ignore everything we have learned throughout history and choose to facilitate the decimation of ecosystems by eliminating species we feel threatened by. Enough of the planet is suffering. Returning the bears to the Cascades on the macro scale, is a small gesture. For the bears and the Cascades ecosystem, their reintroduction is a tremendous advance towards preserving the health of the land and to rebalancing native wildlife populations.

The Grizzly bears belong in the Cascades, we are responsible for their absence, we are responsible for returning them.

Correspondence Type: Web Form
Correspondence: Mr. Superintendent Don Striker,

Thank you for the opportunity to comment on the Draft Grizzly Bear Restoration Plan-Environmental Impact Assessment (EIS). I am currently a resident of Wenatchee, WA that lies just outside the Northern Cascades Ecosystem (NCE). I also have a background in Fish and Wildlife Management and have several concerns regarding the Draft EIS that I would like to bring to your attention.

My first concern is regarding Table 10 and the populations of gateway communities. Even though these communities are smaller than the greater urban areas of Seattle, it would seem an injustice to downplay these populations as the EIS does on page 134. Additionally, your information seems to be inconsistent, drawing on recent US Census information, yet using mapping information from Almack et al. (1993) and Gaines et al. (1994) to establish that 68% of the NCE is free of human activity, when in fact according to USA Facts, there has been a 46.6% increase in the population (USA Facts, 2023). Chelan County and Kittitas County, the two counties closest to the NCE according to Figure 14 of the NCE, have population increases of 40.7% and 55.7% since 1993 respectively (USA Facts, 2023). A re-evaluation of the area free of human activity seems warranted given the population increases and disparities in information.

Another concern is the potential economic impacts that seem to be lacking in the plan. Recently wolves have had economic impacts on ranchers and livestock owners. Under new regulations ranchers can be compensated up to \$1,500 per cow killed that is determined "probable" (WDFW, 2012). However, most ranchers claim that wolves have caused more damage than they are being compensated for, as a "probable" determination is only available if enough flesh from livestock remains from a kill (Jenkins, 2018). The plan addresses Grizzly Bear Depredation Compensation in Appendix C but lacks a funding source or a known amount of funding. Who will that burden fall upon? Also, in other Grizzly Bear populations there have been significant issues with livestock predation. In 2019, 46% of depredation claims in Wyoming were due to Grizzly Bears, resulting in \$646,168 in depredation payouts. The proposed implementation budget is only \$90,000 for this plan and additional action alternatives equate to a comparable cost. Also, the plan states that the cost for Livestock Damage Preventative Cooperative Measures will be shared with landowners. This seems to place an unfair burden on those property owners, many of whom will be subject to the greatest risk of bear interactions, to accrue additional annual costs due to a species that has extirpated naturally from the area.

Lastly, I think that the ecosystem and the bears ability to select these ecosystems is undervalued in this plan. I have had the privilege of working with Brown Bears in Alaska with the Alaska Department of Fish and Game and their ranges are extremely impressive, as is their ability to move within these ranges at a rapid pace. According to the Yellowstone National Park, male Grizzly Bears have a lifetime range of 800-2000 square miles (NPS, 2023). According to the draft EIS on page 4, the NCE is only 9,800 square miles and surrounded by populated areas. I think the likelihood of these bears wandering into populated areas is high given the circumstances. Also, the proposed area has been affected by climate change. In 2018, there was a 45% increase in wildfires in Eastern Washington over the previous 10-year period (Results Washington, 2018). This could result in pushing wildlife into populated areas.

I believe the Department of Interior should take a cautious approach in reintroducing bears into this area. Given the bears' range, they have the opportunity to select the NCE as suitable habitat and have not over the past 40 years. I would support Alternative A, No Action, and let the natural attenuation of bear populations select their suitable habitat.

Correspondence: As a senior citizen who spends a lot of time hiking and backpacking in the North Cascades, the Grizzly bear restoration seems to be ill conceived. It is difficult to understand how the environment of this beautiful area has suffered from their absence. Some of the reasons given in the press (Seattle Times) in support of their restoration, such as aerating the soil with their long claws, seem almost laughable. Other reasons offered in the EIS, such as providing "Pacific Northwest residents and visitors with the opportunity to again experience grizzly bears in their native habitat", are actually frightening in light of very recent fatal human/grizzly encounters. If grizzlies return to the North Cascades on their own, then so be it. But proactive efforts to introduce them into the area would seem to have little purpose other than fulfilling gauzy romantic dreams about decolonizing the natural environment.

Correspondence: I am totally against the man-made plan to "restore" grizzlies to this area. We have enough bear problems here now. Had a woman nearly killed here by a black bear in her yard last year. A few years ago while riding my horse in the hills above our place a large cinnamon-colored bear came out of the bushes, turned and saw us, and came running toward me and my horse. My horse was terrified and whirled around and ran, but after we rounded a switchback I saw that the bear was taking the shortcut and coming down the hill after us again. With my horse at a dead run and me screaming, we made it back to East Leavenworth Road and safety. There is so much recreational activity in these mountains and grizzlies would add an unwanted and unneeded danger to humans. If the grizzlies WANTED to be here, there is nothing stopping them from coming here. Have not heard of a fence at the Canadian border.

Correspondence: My wife and I are in our 70's and every year we hike sections of the Pacific Crest Trail. Please do not reintroduce grizzly bears into the north Cascades. There are already enough dangerous issues involved with any camping & hiking in the region without adding an apex predator. I know enough people who have worked in Alaska, in the bush areas, who have had very dangerous encounters with grizzlies, and I have to ask myself, why are you trying to discourage people from hiking and camping in the area.

DO NOT REINTRODUCE GRIZZLY BEARS INTO THE NORTH CASCADES.

Correspondence: Dear Superintendent Don Striker and Supervisor Brad Thompson,

I am writing to support the restoration of a healthy population of grizzly bears to the North Cascades, their home for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations.

I support Alternative C: Restoration with Section 10(j) Designation. The proposal would bring up to 25 non-problem grizzly bears into remote areas of the North Cascades over the next decade and manage them as an experimental population.

Alternative C is the best choice for bears and the people who live and visit the North Cascades Ecosystem. The plan is wisely modeled on what's worked in Montana where grizzlies are recovering in the Cabinet-Yaak mountains with few problems and with the acceptance and involvement of local communities. Furthermore, the 10(j) rule will give people more management tools to reduce, prevent, and sometimes respond to human-bear conflict. I believe that the 10(j) rule if properly implemented, will help increase human acceptance of grizzly bears as they return to the landscape.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please bring back this native species to our state through the strategy laid out in Alternative C. Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

Thank you for taking the time to keep our North Cascades wild!

Sincerely,

Correspondence: This idea is why WA state residents need their constitutional rights to arms - including the scary ones..

Here is one story from one back country guide. Re-introducing a highly predatory, highly aggressive animal into an area they have selectively removed their population from over time is an accident waiting to happen. Whoever is killed, their family will sue the national parks system - as they should.

I have been considering whether or not to post this issue we deal with as outdoorsman. I have decided to tell my experience and go over a few ways we can deal with the situation at the political level. Many of you know, I have been guiding in Wyoming for the last 6 years. This year, we have had more issues with grizzlies than any other year I've been in the back country. It's looking like many others are dealing with more grizzly issues as well in surrounding states like Montana and Idaho.

Keeping it short, on September 29th, we were charged by a grizzly while trying to recover a bull elk. Before we could lay eyes on the elk, we had a griz charge us. We first set eyes on the bear at about 20 yards and he was already charging. With little time to react, my hunter and I had to shoot the bear. With the hunters first shot out of his 45 hitting the bear in the head at about 15 yards. The bear kept on coming after three shots and getting bear sprayed. Because of the angle the bear came in, I had a broad side shot between a couple pines so I shot him in the shoulder three times passing through and through. After my shots were fired the bear slowed but continued to go after my clients. I stepped around the tree to intervene between the bear and my hunters while I continued to fire, hitting the bear in the neck and head. After the hunter and I shot the bear multiple times, the bear finally died about 5 feet from us. As this was going down everything was slow motion. Felt like a lifetime but according to a group that heard it all go down, it lasted about 5 seconds.

Being involved in an incident like this and hearing about multiple other bears being killed do to aggressive behavior, it is apparent that there is a greater issue that needs to be brought to the federal governments attention. It is on the federal level because these bears are still on the endangered species list and they need to be taken off. After this whole ordeal, I asked the warden doing the investigation if there was anything we could do as a community to get a season opened in these units where we have an abundance of bears. He said there was nothing we could do because of the bear enthusiasts. There are groups out there with a lot of funding that keep shutting us down. We have these people and groups controlling how we maintain our wildlife and control our predators. As I listen to a lot of hunting podcasts, the issue with game and fish being controlled by non-hunters is mentioned a lot. Most of us blame the state for hunting laws and seasons but at the end of the day, it is beyond them. Especially when it comes to wolves and grizzlies. Do to the pressure on our politicians by hunters, ranchers, and farmers, we were able to open a season on the over population of wolves. We need to stand up against these people and groups funding the protection of grizzlies and put a stop to it. If you have had a negative bear experience, write a story on it. Get a hold of Rocky Mountain Elk Foundation, Sportsmans Alliance, Mule Deer Foundation, and any other foundation that fights for our rights and safety in the outdoors, along with your local representatives. They do work for you. Tell them your story. The more people that reach out to share their experience, the more serious this issue is going to be taken. Contact you local and state legislation and give them your story along with your ideas about how we can go about this. They can all ignore an army of one. They can't look past an army of many. Let's be the army of many and make a change.

On a side note, make sure you do your research on ammunition and weapon caliber before you venture into grizzly country. The hunter firing with me was shooting a self defense +P hollow point. The first shot that hit the bear between the eyes, didn't even scratch the skull. Atleast two other shots of his didn't pass through the fat. I was shooting the Buffalo Bore Dangerous

Game 190 grain mono-metal rounds which passed through with every shot besides the shots to the skull which went through, but did not exit. I wont bash on revolvers and limited rounds but I will say that I am super thankful we each had 15 round mags. Don't disregard anything when researching your caliber and ammo. Look into all pros and cons to choose the right weapon for you. Don't just pick a weapon and go with it. PRACTICE!!

Correspondence: These animals are one of the most dangerous creatures on the planet. Washington state is no longer a "wilderness". Many Innocent ignorant people wander the trails and mountains of our region like never before. Our mountains and forests are now a playground. Some will be victims in the most horrible way. The almost constant press about new tragedies pouring in to the media from grizzly populated states is heart wrenching. Please do not pretend that a creature like this that populates other more remote states naturally and in large numbers with fewer people that are killed regularly needs to do so here again simply because someone has a romantic notion that it should because it once did. I understand that they had a natural function here. Small reward for the many souls who will watch one of these killers eat them alive. URSES ARCTOS HORRIBILIS SAYS IT ALL.

I see there are EST. 60,000 of these in North America. Only 1500 in the 48 states and yet that is enough to create constant tragedy.

Hunters, Wolves Black Bear and lion have filled their nich quite nicely if perhaps not as perfectly.

This not the 1800's anymore. Millions of people now enjoy the wilderness in carefree fashion. You can't change it back.

Correspondence: As an avid hiker in the North Cascades, I am very opposed to adding grizzly bears to the area. The black bears are scary enough let alone having grizzlies. I understand the need for them to have habitat to live and prosper, but why choose a national park known for the best hiking and backpacking areas in the PNW? Maybe the idea is to keep people out of the National Park instead of having people there to enjoy it.

I've lived in Winthrop for 23 years and have seen my share of black bears. Many are not afraid of people having been around us for so long. Often they don't move off the trail, come repeatedly to our homes, and, at times, have to be removed because they are too "friendly." Imagine the terror of hikers in the mountains and residents in their valley homes when a grizzly approaches. Please, please don't introduce grizzlies. It will ruin the magical and peaceful place that is our backyard ... and the reason many of us moved to the Methow Valley to begin with.

Correspondence: Bring back the grizzly bear, a symbol of our beautiful country. Over 6 million square acres of untouched land in Washington is more than enough space for a grizzly bear population. Grizzly bears are made out to be villains when in reality they rarely ever bother humans. They are a keystone species, they need to be reintroduced to bring back the natural balance to the ecosystem. They will control the deer population, they will keep the wolves in check, they will fish the salmon out of the streams like they once did. Tourism will help the state knowing you gave the grizzly bear a second chance. The grizzly bear is what I think of when I picture this country, they deserve respect and a second chance. We wiped them out years ago, why not attempt to bring them back? Let the experts do their job, we've seen countless success stories with other animals such as the wolf, wood bison, and cougar. Don't let the grizzly bear disappear. Let's teach this country that America is still wild, let the grizzly bear come back to his home in Washington. Let's right the wrongs of our past, let's rewild America! Thank you.

Correspondence: I fully support the reintroduction of grizzly bears into the NCE as described in the two action alternatives as described in the draft EIS. I would prefer management of the population as Threatened under the Endangered Species Act with a more strict allowance for take in only certain situations. That being said I realize that wildlife politics are sensitive and human wildlife conflicts can occur. I would support reintroduction under either of the described action alternative options.

What I do not support is a continuation of the no action option or status quo. I have lived in Washington State for the majority of my 37 years of life and Grizzly bears are sorely missing piece of our states ecosystem. I am an avid outdoorsman backpacker, hunter and camper who gets into the woods every chance I get. I am aware of the risks and would appreciate recreating in and living in a state where this keystone species is a part of the environment in which I live. Thank you.

Correspondence: I live in Leavenworth, Washington and recreate in the NCE and I support Grizzly bear reintroduction and action alternative C. I would like more information on where the actual reintroductions would take place. I would also like to know whether the reintroduction will be accompanied by federal resources to help make communities on the edge of zone 1 more bearwise? Within our community we have had ongoing conflicts with black bears and such resources could help to mitigate conflict with both black bears and a recovering grizzly bear population going forward.

Correspondence: Hello,

I am completely in favor of restoring Grizzly bears to the North Cascades. This is a wider area that the bears once called home and thrived in until white settlers came to the area and changed that. It is clear that the ecosystem is currently out of balance due to the bears not being present. I also believe the plan does well to minimize the risk of human to bear interactions. I see this because of the size of the area the bears are to be introduced into and the rural nature of the surrounding populace. Coming back to the ecosystems being out of balance. We can take lessons from Yellowstone and the surrounding area. How introduction of once decimated species, see bears and wolves, can help restore balance to an ecosystem. Also how humans can be part of the ecosystem in responsible ways versus looking to dominate the ecosystem. I encourage you to adopt the plan as is without the 10(j) designation. Do not be swayed by a small yet vocal minority crying out about their way of life. Humans can change and adapt. We have been doing it for thousands of years.

Correspondence: We do not need an aggressive and dangerous apex predator introduced into North Central Washington. Every year, hikers, campers, hunters and outdoor enthusiasts are attacked and killed or maimed by *Ursus arctos horribilis*. Most recently a couple in Banff National Park, Canada were killed in their tent, despite "doing everything right." Each year in Montana hunters are attacked and mauled. There was a recent attack on the Colville Reservation. I fished and hiked on the Kenai Peninsula of Alaska, owning a house in the town of Sterling. Encountering Brown Bears was a regular occurrence. It is much more enjoyable recreating, without the constant thought of the risk of a grizzly around the next corner of the trail or bend of the river. Since reintroduction of the European Brown Bear to the Alps, human ursine encounters are increasing. In Tyrol and Trentino areas of the alps 3-5% of the bear population, are what's known as 'problematic'. Keep Grizzly Bears out of the North Cascades. We do not need, or desire them in our back yard. Please listen to the residents of the effected area.

Correspondence: To National Park Service

I am a parent, educator, hiker, zoo volunteer, conservationist and gardener. I fully support repairing the North Cascades ecosystem by reintroducing the grizzly bear.

Grizzlies were the apex predator in this eco-system until their removal by rampant hunting. They provide many benefits to the landscape such as seed distribution and meadow aeration. They feed opportunistically and remove dead elk and other animals in the spring thaw.

When I saw a grizzly bear for the first time in the 70's, I was overwhelmed with their majestic beauty, and grace. I want future generations to be able to experience that feeling.

There is room for grizzlies in our North Cascades landscape; smart precaution and following reasonable rules when hiking or foraging can protect people and grizzlies from each other.

Please make the wisest decision to follow the controlled reintroduction o Grizzly Bears to the North Cascades.

Thank you.

Sincerely,

Correspondence: I am against bringing Grizzly Bears into North Cascades. We already have enough bears & problems with attacks in Winthrop, & near Leavenworth, & Mt Baker area in WA
Please leave Grizzly bears in the current habitat.

I live in Anacortes, but hang out on some property I have in the Okanogan area near Winthrop . There are plenty of bears in the Cascades & coming into the populated areas of people now. One does NOT need to add more Grizzlies to the area in any of the Cascades...

NO on GRIZZLIES

I also want to comment on some aggressive Mt Goats that Wildlife brought to the Methow area from the Peninsula. The population was getting too great there & literally attacking hikers on Peninsula trails. Why on earth would you bring aggressive goats to the Okanogan County area??

Correspondence: We are opposed to the introduction of grizzly bears into North Cascades. It is our understanding that there have not been any officially documented sighting / encounters with grizzly bears in the North Cascades ecosystem for over 50 years. Additionally, grizzly bears are present not too far from North Cascades and can migrate toward the NC ecosystem without human interference. The plan does not properly mitigate the risks to park users. Those who want grizzly bears introduced are not users of the ecosystem. This is not an effective use of the limited budget made available from taxpayer dollars and not representative of stakeholders' desires.

Correspondence: Dear NPS:

I am in COMPLETE *SUPPORT* of the reintroduction of grizzly bears to North Cascades.

The bears belong there; it was their home at least tens of thousands of years before the destructive European colonials showed up. The indigenous peoples who came and populated the land revered and lived in harmony with the grizzlies. Ranchers around Yellowstone, where a reasonably healthier population of grizzlies has recovered, state no problem with the big bears. Some have even commented that they lose FAR more cattle to rattlesnakes. One rancher even woke up one morning to find a big grizzly next to his cattle with its head in the grain trough munching away.

The population of grizzlies in the North Cascades used to number in the tens of thousands; now there are sadly MAYBE 20-25. They deserve their home land back. They have had a very bad rep from the press and peoples' ignorance. You are far more likely to be hit by lightning or an automobile collision than a grizzly.

Please bring them home again!

Thank you for your time and, i hope, positive consideration.

Correspondence: Dear Reader,

In this comment, I will explore the intriguing topic of grizzly bear reintroduction in the North Cascades Ecosystem (NCE) with a particular focus on Alternative Action C. As a graduate student deeply passionate about environmental and climate change issues, my research led me to the conclusion that Alternative Action C, which leverages section 10(j) of the Endangered Species Act (ESA), presents the most viable approach for grizzly bear reintroductions in the NCE.

My journey into this subject matter was not merely academic; it was driven by personal interest and a desire to contribute meaningfully to the ongoing conversation surrounding wildlife conservation. Having previously examined other reintroduction programs, I was drawn to the complexity of decisions revolving around the size of the bear population and the methods of their reintroduction. The NCE, an area I aspire to explore and potentially reside near, became a focal point for my research endeavors.

Utilizing resources like Google Scholar and local newspapers, I delved into the depths of information available on this topic. Surprisingly, I stumbled upon a newspaper article that cited a study I had previously uncovered, highlighting the interconnectedness of research efforts and the importance of multidisciplinary perspectives in wildlife management. The study focused on the exact issue at hand and had an interesting quote that may or may not sway the outcome of the NPS's decision on alternatives, "The potential carrying capacity for grizzly bears in the NCE has been estimated as approximately 274 bears (Mowat et al. 2013) and 250-300 bears (Lyons et al. 2018) using different methods" (Ransom et al. 2023). According to Ransom et al. 2023, their study suggests that the NCE has the potential to start with a larger grizzly bear population than the NPS is suggesting in this current EIS plan. Therefore, the population can grow at a much faster rate. An important thing to consider as well is that, as I suggest later, Yellowstone National Park, started with a similarly small population (about 136 in 1975) and more recently, has just over a thousand as of 2021, showing that conservation management plans have had some success with the reintroduction of grizzly bears over the same amount of time that this current management plan in question has, which is about 60-80 years (NPS 2023).

One of the pivotal aspects of this debate lies in determining the appropriate size of the grizzly bear population and devising a strategic plan for their reintroduction. Alternative Action C, operating under section 10(j) of the ESA, offers a solution that grants federal agencies enhanced control over the management plan. A good example of this can be found in a Fish and Wildlife Service paper on section 10(j) of the ESA. The paper includes valuable information regarding rule 10(j) which allows the FWS to have more flexible regulations regarding take prohibitions and consultation requirements associated with following the Endangered Species Act (Fraser & USFWS 2018). Despite the relatively minor impact on private landowners, given that only 7% of the suggested habitat is privately owned, this approach proves to be effective ("Draft Grizzly Bear Restoration Plan", 4). Yellowstone National Park, with its similar beginnings and subsequent growth in the grizzly bear population, stands as a testament to the success of conservation management strategies over several decades. By designating the NCE grizzly bear population as an "experimental population," federal agencies, particularly the Fish and Wildlife Service, can relocate bears from the Greater Yellowstone Ecosystem to suitable natural habitats outside

the species' current range. The vast expanse of untouched land in the NCE, where the last confirmed sighting of a grizzly bear occurred in 1996, further supports the feasibility of this endeavor. With careful planning and consideration, grizzly bear reintroduction can occur successfully in this region, reinvigorating the ecosystem and contributing to the broader conversation on wildlife conservation.

In summary, my research leads me to advocate for Alternative Action C in the grizzly bear reintroduction plan for the North Cascades Ecosystem. Through section 10(j) of the ESA, we have an opportunity to shape a sustainable future for grizzly bears in this region. I am hopeful that this paper will spark further discussions, encouraging stakeholders to work collaboratively towards the preservation of our natural heritage.

Sincerely,

Correspondence: About 4 or 5 years ago, the USDOJ determined that the grizzly bear (*Ursus arctos horribilis*: I have noticed some document writers omit "horribilis"; attempting to deceptively soften the GB's image) population had recovered in the USA. Has their population actually declined that much between then & now? Is it CRITICALLY necessary to restore them in the NCE? How many times must decision-makers, according to NEPA regulations, make decisions about GB's status and reintroduction plans? The EIS Alternatives B & C provide no convincing arguments to move forward with reintroduction; it only mentions fuzzy spiritual or otherwise intangible benefits, such as "Seek to support Tribal cultural and spiritual values related to the grizzly bear," and "restoration of biodiversity of the ecosystem to build ecological resilience and for the benefit and enjoyment of present and future generations of people." These are subjective and can never be definitively measured or demonstrated.

I agree with those who are not persuaded of the need for grizzly bears to be reintroduced to the NCE simply because this area is suitable habitat and that they used to live in it. Should malaria also be reintroduced to the USA? Mention is made of "Provid(ing) Pacific Northwest residents and visitors with the opportunity to again experience grizzly bears in their native habitat." So ALL visitors to this area will be educated and therefor enjoy GB? Will "ecological resilience" be gauged strictly by GB populations alone? Is there some demonstrable deficiency in the NCE or is there harm that is occurring to this ecosystem that can be directly traced to their absence? Is there valid proof that this ecosystem benefited or was in better condition as a direct result of their presence prior to their population decline? Has there been any tangible harm or significant departure from historical variability in the NCE that can be unquestionably traced ONLY to the bear's population decline? (other than the bear's population decline itself?) Have other species declined concurrently with the GB? Has the lack of GB in the NCE caused harm to the resident human population?

These newly released bears will undoubtedly stray from the federal or other public lands in the NCE which will inevitably result in confrontations with people. The results of these confrontations will almost always be detrimental to these bears. This is eerily similar to the reintroduction of wolves in Idaho in 1993 which has since resulted in more than one "take"; primarily due to their interference with livestock range activities. If Alternative B or C is implemented, are we morally and ethically OK with the inevitable "takes" of these artificially and reluctantly reintroduced grizzly bears that were non-existent in the NCE from the time of their decline until this plan? Apparently so, according to Alternative B, "This rule allows grizzly bears to be taken under specific circumstances, as long as such take is reported promptly to the FWS. These circumstances include defense of life; federal, state, or Tribal scientific or research activities; or removal of grizzly bears involved in conflicts by authorized federal, state, or Tribal authorities." No GB have been killed in Washington because there haven't been any to "trigger" a self-defense reaction. However, some of these reintroduced bears or their offspring will be killed because of self defense or protection in and around the NCE as a DIRECT result of this proposed reintroduction. Why introduce an aggressive species, that has no value to hunters, knowing that an unknown number will be killed in acts of self defense or protection? As stated in the "Background" section: "As human population density increases, the frequency of encounters between humans and grizzly bears also increases, resulting in more human-caused grizzly bear mor(t)alities because of a perceived or real threat to human life or property." Are we also OK with accepting human casualties or injuries from unexpected surprise encounters? Casualties that would NOT occur if Alternative A is implemented?

Have cumulative effects been considered? Some parts within and many areas around the NCE are populated (with people) and well used. A percentage of these GB are likely to stray from the NCE into these lands. Most, if not all, animal species that are native to Washington flee when they detect people (outside of their mating seasons): grizzly bears generally do not. Doesn't this place both GB and people in danger of one another? Is this "collateral damage" worth it? As stated earlier, it's as if some of these bears are going to be sent to their deaths as a result of Alternatives B or C.

Grizzly bears are plentiful in Alaska, Montana, and western Canada where they have always resided, even though government agencies consider them to be threatened or endangered. People who grew up in or have chosen to live in these areas see or encounter them with regularity and have learned to (more or less) live with them. Reintroducing a notoriously ornery apex predator to an area (NCE) whose culture has changed considerably since they were last seen or detected centuries ago will be an unnecessarily brutal upheaval. While injuries to and, God forbid, deaths of people who inadvertently startle or suddenly encounter a GB in the NCE, where there used to be none, will take place, an equal or greater toll on these newly introduced GB will also take place. To reiterate a little differently, releasing GB into the NCE is an UNNECESSARY plan for their deaths, for human tragedies, and for renewed conflicts in an ecosystem (that includes people) which never lamented the absence of GB.

I don't pretend to speak for Tribal Members in and near the NCE (their opinions of this subject are diverse). I have worked with a number of tribal members for the better part of the past 20 to 40 years. Most of the individuals whom I have met during this span are avid outdoorsmen who take advantage of their "Treaty Rights." Not one of these individuals have expressed a desire to see GB "reintroduced" into Washington State. Some have claimed to witness this species here in Washington and discussed "what I would do" if encountered. What these individuals "would do" would not benefit the GB.

Has any thought been given to other reasons why GB are not extant in this area these days? Other than they "have been functionally extirpated"? Perhaps they do not inhabit the NCE for other reasons? (EIS p. 6: "Therefore, it is unlikely that grizzly bears from areas within British Columbia would naturally emigrate to the NCE.") Will the people who attend their releases into the NCE be armed just in case? Will these bears eventually migrate north across the border to the better habitat? Perhaps extensive use by people in the NCE who hike, gather food, hunt, drive, ski, fish, use ORVs, snowshoe, snowmobile, ride horses, swim, camp, climb mountains, use watercraft, river raft, etc. might just drive them away again over the years? Not to mention higher road densities and human habitation than when they were last there? The Alaskan and British Columbia GB "habitats," which effectively extend into Montana, are incomparably larger and do not experience the relatively heavy concentration of use that the smaller NCE does. Are there any barriers between the NCE and BC GB habitat that have effectively prevented them under their own cognition from moving back in since their "extirpation"? Will the GB that are reintroduced into the NCE just ignore whatever factors that have prevented them from migrating south into the NCE and carry on with their proliferation because Alternatives B & C said that they are supposed to? Or are the proponents of Alternatives B & C counting on recreation (and human habitation) in the NCE to nosedive after news of the GB reintroduction becomes widespread?

I work outside in eastern Washington forests year-round. My "bias" against Alternatives B & C are well supported by the points made above. I know that an EIS analyzes a proposal and reports its impacts on the environment of the project area and its surroundings (cumulative effects). It is supposed to be objective and science based. To me, the actual facts presented in the 100+ pages of this EIS, and NOT the unproven speculation, support Alternative A. The majority of the US population do NOT venture into American forests every day. In eastern Washington, cougars, bobcats, rattlesnakes, moose in the north, hornets from August until the snow flies, and even black bears during the spring and fall (and, to a lesser extent, badgers and wolverines) already make these forests an unsettling environment. However, these species have always been there and we therefore know what we are dealing with. When I stumble upon a black bear, or when they detect me and feel threatened, they may hiss, stand on their hind legs, and sometimes charge, BUT their charges are a brief warning which eventually ceases (this typically occurs during their "rutting" seasons) if they notice me walking away from them. I have heard enough true stories and seen enough videos to conclude that GB do NOT cease or back off. While those wildlife biologists who are in favor of this reintroduction desperately try to persuade the American public that the many unpleasant accounts of aggressive GB encounters are not to be believed, those of us who make our living "in the land" know better (many from personal experiences) than to be misled by these advocates of Alternatives B & C.

PLEASE select Alternative A (no action) to protect both the people AND the GB! Thank you for reading these comments.

Correspondence: As a conservationist, I know grizzly bears provide important ecological services, like distributing seeds and aerating alpine meadow. Humans are responsible for the disappearance of grizzlies and it is our responsibility to bring them back. They are an umbrella species. If we do right by them, we do right by so many other species. I work at Brookfield Zoo and the story of how our grizzly bear brothers came to be at the zoo resonates with people. They want to see these bears thriving in the wild. Grizzlies are magnificent and such a special part of our eco system. Reintroducing them to the Cascades is a must. We need to realize that there are wild areas where wildlife can thrive without the threat of human destruction. This is an amazing opportunity to educate folks on grizzly bears and help the world to understand why conservation efforts like these are crucial to the betterment of our wild spaces.

Correspondence: I am in support of the necessary re-introduction of Grizzlies into the North Cascades. Please note this is a re-introduction. Grizzlies were in this prime habitat space to begin with until humans eradicated them. Grizzlies are necessary for the health of our ecosystems and the overall health of this planet that is declining swiftly. Please do take immediate action to re-introduce grizzlies to the northern Cascades in hopes that their natural territory will continue to expand, similar to the re-introduction of gray wolves into northern states.

Correspondence: Hello, I am [REDACTED], a graduate student at the University of Denver. I wholeheartedly endorse the reintroduction of animals, particularly carnivores, to their native habitats in the contiguous United States. The North Cascades is an area of immense significance, and it's essential to recognize that national parks serve not only as destinations for tourism and sightseeing but also as vital arenas for the restoration and proliferation of native species.

In light of this project, certain valid concerns arise, drawing valuable lessons from past reintroduction efforts, such as the reintroduction of wolves into Yellowstone National Park in the mid-1990s. It's imperative for agencies to exercise caution, particularly regarding the impact on ranchers around national parks and the enhancement of safety measures for tourists visiting the North Cascades National Park.

I firmly believe that the presence of an apex predator like grizzly bears in the North Cascades will contribute significantly to the restoration of ecological balance, particularly in relation to the elk and deer populations. Nonetheless, I hold concerns about the potential risks associated with increased tourism within the National Park system. While I acknowledge that the project plan anticipates an influx of tourists due to the bears, it also brings with it an increased risk of dangerous encounters from human negligence regarding wildlife in these national parks. The last thing that should occur is the removal of a bear due to a negative encounter brought about by human neglect. Therefore, we must carefully consider if this project is worth the associated risks and potential consequences.

I understand that only three to seven bears will be released per year over a span of five to ten years. However, it is important to inquire if the findings of the study will be made available to the public, explaining how the bears contribute to the ecosystem within the park. Moreover, there is a pressing need for a method, such as educational initiatives or stricter fines, to dissuade people from approaching wildlife in these parks, as the current system appears inadequate in discouraging such behavior.

My final concern pertains to the need for a delicate balance between conservation and tourism. It is crucial that people are educated about the importance and the potential dangers associated with these animals as they are reintroduced into the area. In conclusion, I am a strong proponent of the potential success of grizzly bear restoration in the National Park. However, it is vital to emphasize the importance of controlling the bear population, garnering local support, and establishing clear future goals for their conservation. The project's merits should be carefully weighed against the challenges it presents, with a strong emphasis on the responsible management of both wildlife and visitor experiences.

Correspondence: I would like to lend my voice in support for reintroducing Grizzly bears to the North Cascades region. I think we owe this opportunity to the specie considering our treatment, as humans, of this great animal historically. If reintroducing this animal also means lending a hand to one of the last remaining wild open, natural spaces in the USA, then I think we ought to do so, too. I would absolutely support my tax dollars being spent on this potential project.

Correspondence: I am neither for nor against the reintroduction of grizzly bears in the north Cascades, but offer some considerations if this proposal goes through.

While the legal requirements of the ESA are clear and the North Cascades is unlikely to establish a population of grizzly bears on its own, the sociopolitical backlash against a reintroduction effort should be considered before moving on. Wolves were reintroduced 30 years ago, and residents of the intermountain west are still reeling over the government's 'intrusion'. Not only would this impact the reintroduction itself, but also hinder state and federal wildlife management agencies relationship with the public. Including as much public input as possible in any plan should be considered.

Prior to reintroduction, USFWS/NPS should ensure bear-human conflict potential is reduced and should provide funding to other agencies as well as local governments. While the Mt Baker-Snoqualmie NF has moved forward with bear conflict reduction measures, the Okanogan-Wenatchee NF has not. Current amount of bear proof garbage dumpsters are not adequate and consistent black bear-human conflict continues. Additional measures related to hunting carcasses, food storage, etc. need to also be implemented.

While Ransom 2023 suggests that climate change will improve grizzly bear habitat, current research/observations from black bears suggests otherwise. Summer drought can cause significant food failures as occurred in 2022. That year black bears from all over the eastern north cascades made their way into towns and outlying areas to search for human provided foods. This is a very commonly observed phenomenon with bear populations and is likely to cause grizzly bears to move into human occupied areas. Data from GPS collared bears in the Leavenworth area shows bear moving up to 20 miles to human development and orchards in the fall prior to hibernation and there is no reason to suspect that grizzlies would be any different. Human-bear conflict measures need to be taken in the surrounding communities prior to reintroduction to ensure bears are not killed in conflict.

I understand that bears have been moved in similar scenarios, but moving bears in traps and helicopters during the peak of summer seems irresponsible. Culvert traps get very hot and can easily kill bears if inside too long. All planning should ensure that stringent animal safety measures are taken, including forgoing trapping and transfer if temperatures are too high.

Correspondence: "Those who live in grizzly country tend to take precautions against adverse encounters, and some live in a constant or frequent state of increased vigilance."

"Although the benefits of having large carnivores on the landscape accrue to society at large, these are often disproportionately borne by a small number of people whose livelihoods may be negatively affected by these animals."

"Attacks are rare, and fatalities from attacks are even rarer, but grizzly bears do occasionally injure or kill people. In recent decades, grizzlies in North America have been responsible for an average of 11 attacks and one to two fatalities per year (Bombieri 2019; Herrero and Fleck 1990; Herrero 1970). We can thus describe the risk of living with grizzlies as small but real: harms to people (as well as to bears and other beings) will result from reintroduction efforts."

These statements are taken from "The Ethics of Reintroducing Large Carnivores: The Case of the California Grizzly". They precisely represent my thoughts. We do not want, or need Grizzly Bears (*Ursus arctos horribilis*) introduced into our environment. We the residents of North Central Washington will bear the repercussions of this action, not the "environmentalists" who live in large metropolitan megalopolises.

Correspondence: I oppose the Grizzly Bear Project, primarily because it is not necessary to preserve the species. DNA tests have shown that the Canadian Grizzly population is increasing despite climate change and its effect on the grizzlies' food sources. A major factor in grizzly bear mortality is motor vehicle collisions, not lack of environment. Grizzlies are at the top of the food chain and therefore can move into any area they choose. Since they're attracted to the same environments as humans, that means that they'll soon inhabit areas populated by humans. Additionally, there is a cost to the taxpayers associated with introduction of grizzlies. I might add that I have not seen any hard evidence that grizzlies ever inhabited the Cascades region proposed.

Correspondence: I am in favor of the reintroduction and recovery of grizzly bears within the NCE and provide the prohibitions and exceptions under the Act necessary and appropriate to conserve the species within a defined NEP area."

Redesignation of the species in the North Cascades as an experimental population will allow land managers to prevent conflict before it happens and address it when it happens. Reducing and addressing conflict will help bears bounce back and help people accept them on the landscape.

The 10(j) map imagines future expansion of grizzly bear populations into Zone #2. This expansion could contribute to the conservation of the species as a whole, and potentially create connectivity between populations if more habitat is protected and corridors are developed.

The 10(j) is responsive to local community concerns and requests for more management certainty, as the 10(j) clearly defines what kinds of management actions can take place in and around Washington state. This is critical!

The agencies have defined an active restoration and grizzly population augmentation effort as part and parcel of a 10(j) rule. The 10(j) provides a clear and intentional management plan in the event that Canadian bears wander into Zones 1, 2, or 3 from British Columbia.

Suggestions to improve the 10(j):

I oppose the use of written time-limited conditional take permits for private landowners to kill bears. People are already allowed to kill bears in self-defense. Livestock and other property loss can and should be compensated through a variety of existing government and NGO programs.

Bears that continue to damage livestock and other property, and bears that become habituated should be dealt with by professional agency staff. Professionals will ensure the right bear is targeted and, when necessary, humanely euthanized.

I worry about private landowners injuring bears and that injured bear becoming a safety hazard. If landowners kill the wrong bear, the conflict will continue.

The agencies should clarify that Selkirk and BC bears will be managed under 10(j) if they wander into Zone 1, 2, or 3.

Correspondence: Dear Superintendent Don Striker and Supervisor Brad Thompson,

My family and I strongly support the restoration of a healthy population of grizzly bears to the North Cascades. Wherever grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations. Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades.

We also strongly support Alternative C: Restoration with Section 10(j) Designation. The proposal would bring up to 25 non-problem grizzly bears into remote areas of the North Cascades over the next decade and manage them as an experimental population.

Alternative C is the best choice for bears and the people who live and visit the North Cascades Ecosystem. My family and I often do, and believe it is the most beautiful area in the US. The plan is modeled on what's worked in Montana where grizzlies are recovering in the Cabinet-Yaak mountains with few problems and with the acceptance and involvement of local communities. Also, the 10(j) rule will give people more management tools to reduce, prevent, and sometimes respond to human-bear conflict. The 10(j) rule will help increase human acceptance of grizzly bears as they return to the landscape.

Please bring back this native species to our state through the strategy laid out in Alternative C. It is our moral obligation to restore an important piece of our ecosystem, regional culture, and natural heritage.

Thank you for taking the time to keep our North Cascades wild!

Sincerely,

[REDACTED]
La Conner, Washington

Correspondence: First, thank you for receiving my comment and making this forum available for concerned residents like myself.

Over the last thirty years I have observed the human visitors to the No. Cascades and adjoining public lands increase tremendously. Of particular note is that a large percentage are very unskilled and naive to nature's ways. I suspect their vulnerability exposes this population to high risk if the Grizzly Bear is introduced.

I ask that this bear species NOT be reintroduced. I have not hear a viable reason for this other than that it is believed this bear species once inhabited this area.

As was referenced, once introduced the Grizzly Bear will have protective rights, even though the land will become more used by the public. Extrapolate the involvement of humans over the next decade and, please, make decisions based on this current and future perspective.

Correspondence: Dear NPS,
I write to express my full support of grizzly bear restoration in the North Cascades Ecosystem. As one who has enjoyed the beauty and wildness of the North Cascades for over 20 years, I am excited about the prospect of grizzly bears returning to this region. The North Cascades has long been a conservation victory for wilderness and the grizzly bear would fulfill its status as a truly wild area. The reintroduction would also reestablish the bears' vital role in the North Cascades ecosystem. Thank you,

Correspondence: Hi,

As a volunteer at Woodland Park Zoo I am learning about the importance of reintroducing grizzly bears back in to the North Cascades. I love Washington state for it's beauty and landscape and all of the creatures that inhabit it. I want grizzly bears to be a part of that wildness again. There is plenty of space for both of us. Humans were responsible for removing grizzlies from the North Cascades and it's our responsibility to bring them back home. I am also a parent and want my child to grow up knowing that grizzlies have been returned back into their natural environment. I want him to have that experience. Also, I know grizzly bears provide important ecological services, like distributing seeds and aerating alpine meadows. They are critical to our area. If we don't take action now, we risk losing grizzly bears from the North Cascades forever.

Thank you for your time.

Correspondence: I am writing about the recent proposal to reintroduce Grizzly Bears into the North Cascades Park and surrounding areas. Grizzlies historically ranged in the North Cascades; however, very few sitings have been confirmed

recently. The North Cascades and surrounding areas have over 9,000 square miles of prime Grizzly habitat. This prime ecosystem includes steep, remote mountainsides, deep winter snowpack, lush meadows, vegetation and open canopies. Grizzlies are habitat generalists and have an ability to adapt to various habitats. As the environment warms with climate change, the bears seek cooler temperatures by increasing their range by moving up in elevation. These habitat adaptations also bring the bears further away from urban areas, reducing the risks for conflicts with humans or livestock.

Grizzly bears are a characteristic of a healthy ecosystem. It is time we assist with Grizzly reintroduction to this area where they historically ranged. We also need to connect these wildlife communities with more corridors in which Grizzlies may travel. Other states such as Montana, Idaho, and Wyoming have proven to be models for how people can work together to restore Grizzly populations. It is time for Washington state to do the same.

Thank you for the opportunity to comment.

Correspondence: I don't know what idiot thought this was a great idea. The ecosystem has adapted to not having grizzly bears. There is an entire domino effect of introducing these animals that no one can possibly anticipate. I'm personally convinced the government is intentionally making the wilderness somewhere we cannot visit and enjoy any longer and wants to keep us corralled in larger cities. There are many ranchers that allow their cattle to graze on public lands. Their cattle will be decimated by this idiotic plan. Part of what is really special about Washington state is that we don't have a lot of scary animals, reptiles, dangerous insects, and natural disasters like most other states do. Leave our beautiful state alone!! Allow the citizens YOU SERVE to enjoy the wilderness unmolested by the stupidity you public serpents introduce.

Correspondence: I do not support the re-introduction of grizzlies to the North Cascades. The North Cascades area is one of my favorite destinations for backpacking and hiking. I love the rugged terrain.

I recognize that grizzly were once a part of this ecosystem, but that doesn't mean they should be reintroduced. There's nothing stopping grizzly from arriving on their own from Canada, and when that happens, we should let it. However, we have already modified the ecosystem by removing grizzly. Leave it be! Adding grizzly back in modifies an ecosystem that is already going through changes due to climate change. This area is continuously adapting, and we need to stop trying to control it.

I would be dishonest if I didn't also add that having an increased population of grizzly would make me nervous. Unlike the Greater Yellowstone Ecosystem, there's not an obvious ranger station where people are required to check in and rent bear-proof canisters for backpacking. There are so many tourists from Seattle that hike in the N Cascades, and it will take some serious education to adapt practices to those compatible with the reintroduction of an apex predator. I'm not a fan of backpacking in areas with grizzlies and stupid people because even if I store my food as advised, others may habituate bears to people/food.

Let's spend our government money on thinning projects to deal with our wildfire problem, NOT reintroducing a species that will certainly arrive on its own in due time.

Respectfully,

██████████

Correspondence: We already have natural apex predators in the state of Washington i.e. black bears, cougars and wolves. We do not need the introduction of another apex predator to mess with our current eco system. NPS has problems with wolves moving down into areas in Washington from other areas such as as Canada .. killing livestock and entire packs having to be eradicated. Now you want to purposely add another apex predator a Grizzly Bear.. that does not and there is no proof it ever has lived in Washington? We do not need the addition of Grizzly Bears.. they will kill livestock, damage orchards and agriculture and endanger people living in any areas you introduce them too. I don't see how you can feel right about supporting this as a vast majority of people have already made it clear that live in the areas you want to introduce them to that they don't want them.

Correspondence: I oppose activate re-introduction of grizzly bears to the North Cascades National Park (NOCA). It's a bad idea for multiple reasons. The human population of Washington is growing. Public lands are being surrounded by increasing development. Visitation, even in remote backcountry will increase or remain steady even with the park's restrictive backcountry permit system. If the reintroduction is successful, there will be conflicts between grizzly bears and hikers and climbers. Having grizzly bears in NOCA isn't worth one hiker or bushwhacking climber getting attacked, wounded, maimed or killed (even if rare). I believe this having spent 2 summers in Glacier National Park and backpacking vacations in Banff and Jasper and other areas with grizzlies.

There's a reason grizzlies don't migrate in from Canada naturally. Some claim otherwise but the North Cascades is poor grizzly habitat since much lowland habitat is developed. The salmon runs in Skagit and Nooksack watersheds are a tiny fraction of the 1800s and early 1900s. Rocky Mountain grizzlies have access to carcasses and live animals in large big game herds. NOCA does not have that many deer or elk. One shouldn't conclude just because NOCA is wild that it's good grizzly habitat. I suspect most transplanted grizzlies will leave the park or die. This is cruel to the bear especially after having been anesthetized and dumped in an unfamiliar area. So, I oppose re-introduction on animal welfare grounds as well.

Re-introducing grizzlies to NOCA is unsafe, expensive and cruel to the bears. It also doesn't improve my wilderness experience or appreciation if the park.

Correspondence: In regards to the re entry of Grizzlies Bears into the Cascades, I'm for it People have mentioned that they haven't been there before which is bull .We as people put them out of the mountains by killing them off, if not for that they would still be in there home in the cascades . People are stating that they will interfere with recreation and threaten people, hamper there development, etc. Well to that I say stay out of there home . Have they not realized that all of this land in the U.S. was once there's and we continue to take more and more. People complain about bear, cougars, coyotes, wolf's and yet this was there natural land . The more and more we push to develop and push into there home ranges the more we are going to have more and more encounters in there home ranges. So the answer is stay out of there home, stop development in there home and stop the empedment in there, recreation and development! Let them come back to there home . People think that wildlife is the problem and to that I say hell no, stay out !!!!

Correspondence: While most of the time'm in favor of reintroduction or protection of endangered species, I have to say that I am totally opposed to the reintroduction of Grizzzlies. There are just far too many people living and recreating in the North Cascades and the bears are simply not compatible. Almost no one would be prepared to meet up with a grizzly in the woods, myself included, even though I'm an outdoors person. Grizzlies will just result in far more human deaths which will ultimately result in deaths of the bears as well.

Correspondence: I welcome the introduction of Grizzly Bears to the Cascades. My only concern is will they end up like so many of the Grey Wolves after their intro from the brink only to be shot, trapped and poisoned. And, bears & wolves being carnivores will take advantage of irresponsible ranchers allowing their cattle to graze on public land with no supervision, that goes day and night.

This is my concern, if someone has an answer, please let me know as to alleviate my fears of this.

Thank You

Correspondence: The thought of reintroducing grizzly bears into the ecosystem from which they have either been removed or removed themselves troubles me. First, just because we once had Grizzly Bear in this area, does that mean it is a good idea to bring them back? Is it being considered just because we can? The implications need to be considered, particularly from the viewpoints of fairness and kindness to the animals themselves. Will this be successful or are we considering an experiment with the potential for really negative consequences?

If we consider that, we ought to consider the idea that bears left this landscape for a reason. Yes, attitudes toward wildlife were different in the past, but the question remains why they left - negative human interactions, range constriction, and habitat loss - and what is different now?

Second, though the North Cascades is thought a large enough habitat I worry they are not large enough. We know bears can traverse immense swaths of landscape. Unless they stay in a secluded pocket, and that is not the nature of bears I have interacted with, there are a great many areas where a bear disturbed and pushed out by negative human interaction will relocate only to find themselves in another area with significant human interactions. Roads, hiking routes, industrial uses, climbing routes, and off trail traverses criss cross the North Cascades. I fear that this will initiate a cycle of negative interactions that will then beg action to remove the "troubled bear" that we produced by introducing them in the first place.

Third, bears have a remarkable ability to adapt, particularly to easy food. If the risk of human bear interaction is significant, the natural risk is that bears will position themselves to easy food sources - hiker and climber camps, edges of habitat with forays into easy food sources. Since the habitat is not vast, there will be numerous situations - unfairly caused by humans - that will habituate and make dangerous bears.

I am not in favor of introducing Grizzly Bears unnaturally. If bears choose to migrate in because the habitat suits them, that I support. I consider introducing Grizzly Bears an experiment that, at its core, appears motivated from the viewpoint of "because we can" rather than carefully considering why bears left and what the habitat is now. I consider this unfair to the animals themselves.

Finally, if the NPS does reintroduce, I strongly suggest managing the "Grizzly Reintroduction Experiment" as an experimental population so that they have flexibility in managing the population in the ways that are most fair to wildlife (bears) and meets the NPS mandates and mission.

I oppose introducing Grizzly Bears into the North Cascades.

Correspondence: I am writing to you in support of bringing back Grizzly bears to the North Cascades National Park and the surrounding wilderness areas. What is a wilderness without its wild animals? Grizzly bears were previous inhabitants here. Studies have shown that this area should be able to support a healthy Grizzly bear population. I am in favor of alternative B for the introduction of Grizzlies. I think that this option gives more flexibility in the administering of this process.

I also believe that this proposal should not include the Alpine Lakes Wilderness Area, which lies south of Stevens Pass. This area is a heavily used and less regulated recreation area, which increases the risks of human / bear interactions. I would like to see the early bear movements to be centered in the North Cascades National Park. The Park Service is better equipped to provide the necessary education and regulations for safe human activity.

Correspondence: Do not introduce grizzlies to the Northern Cascades. Let nature take its course and let these bears expand naturally as their numbers increase and they are delisted. Washington state is not ready for these predators to expand relatively near one of the largest population centers. To some degree, the potential human, wildlife, and livestock conflicts will be negative for these animals. In a state where a legitimate argument can be made that its regulatory game agency does not prioritize the interests of its primary stakeholders and removes opportunities for hunting and fishing for (apparently) social reasons and not population based management, hunters and anglers need all the help they can get to protect their right to pursue game and to do this, game species' populations need protected and closely managed, and introducing more predatory species to the landscape will be counterproductive to some degree.

Correspondence: I am writing to protest the introduction of grizzly bears in the North Cascades region. How are people supposed to protect themselves if they are not allowed to shoot the bears? Are we supposed to wait until the bear attacks us or our animals? Too late. Remove the protected status and fines if you are going to load us up with Apex predators. We will all need to carry heavy arms to protect ourselves. The bears will be attracted to the residential areas with plenty of pets, hobby farms, orchards and garbage to dine on. I will be afraid to walk my dog on any of the local trails. Hikers will be severely impacted in the Enchantments area. Forget the salmon run - it will be gone forever. Grizzly bears are not endangered in North America!

Correspondence: I write as a resident of Okanogan County and the Okanogan Valley to express my strong support for grizzly bear restoration in the North Cascades Ecosystem. I regularly hike, ski, camp, and hunt in the Pasayten Wilderness area and grizzly bear restoration would greatly enhance my backcountry experience.

Grizzly bears once thrived in the North Cascades and are vital to maintaining a complete, ecologically-functional ecosystem. As the American ecologist Aldo Leopold once remarked, "the first precept of intelligent tinkering is to keep all the pieces." I believe that the United States acting by and through its administrative agencies has a moral obligation to restore grizzly bears to the North Cascades Ecosystem.

Grizzly bear range in the contiguous U.S. has been reduced by 98 percent. Restoring grizzly bears to the North Cascades will help to maintain the animal's distribution on the West Coast (the only Grizzly Bear Recovery Zone outside of the Rocky Mountains). We know that people and grizzly bears can and do coexist in other areas where the bears are much more abundant, and local economies are supported by tourism, backcountry

recreation, and ranching, among other activities.

Grizzly bears won't recover on their own because the North Cascades is isolated from larger, more well-connected grizzly bear populations in the U.S. and Canada. In the decades since the grizzly was protected by the Endangered Species Act, grizzlies have not recovered in the North Cascades.

I also support the designation of North Cascades Ecosystem grizzly bears as a non-essential experimental population under ESA section 10(j). So doing could give the NPS, USFWS, USFS, and other wildlife and land management agencies management flexibility through the promulgation and application of ESA section 4(d) protective regulations thereby increasing the success and social acceptance of the grizzly bear reintroduction effort.

I encourage you to support efforts to bring back this native species and restore an important species in the North Cascades Ecosystem and part of our regional culture and natural heritage.

Thank you,

Correspondence: This is a terrible idea. We already have Grizzly bears coming from BC and Idaho in Washington. Just because a species inhabited an area in the past does not mean we need to reintroduce them. We have enough predators in this state already. Our Ungulate and small game populations are suffering and on the decline and do not need to add another predator to that. I also have family that hikes in the North cascades and are anti gun. I feel there safety will dramatically decrease with another apex predator located near the trails they hike. There was just a couple of hikers killed in Banff by a grizzly bear. They unloaded a whole can of bear spray, that did not deter the bear. Please reconsider.

Thank you

Correspondence: Dear Superintendent Don Striker and Supervisor Brad Thompson,
I am writing to support the restoration of a healthy population of grizzly bears to the North Cascades, their home for thousands of years.

Where grizzly bears thrive, ecosystems thrive. These bears regulate populations of the animals upon which they prey and keep forests healthy by dispersing seeds and berries. In addition, they are expert diggers and their massive claws help aerate

soils to facilitate wildflower growth. As grizzlies churn soils, they create seed beds for flowering plants and grasses and prevent conifer encroachment on both alpine and subalpine meadows.

I live in Wenatchee and use the North Cascade to hike and backcountry ski. For this reason, I support Alternative C: Restoration with Section 10(j) Designation. The proposal would bring up to 25 non-problem grizzly bears into remote areas of the North Cascades over the next decade and manage them as an experimental population. Thank you for consideration of this request.

Correspondence: I am writing to express my opinion that Alternative C will provide the best path forward for both people and grizzlies in our region. As an avid hiker and wildlife protector, I would like to see the grizzly bears come back to the North Cascades and keep the wild, wild.
After more than two centuries of a war on predators, including grizzly bears, black bears, cougars, wolves, coyotes, eagles, and hawks, we have learned that ecosystems function better and wildlife populations are healthier when predators are a part of the system.
In addition, areas that are big enough and wild enough to support grizzlies will benefit human communities by providing clean air, clean water, and other resources we depend on.
Most importantly, grizzly bears are an important part of our cultural and natural heritage. I want my children and grandchildren to have a chance to see grizzlies, black bears, cougars, wolverines, and other wildlife in the North Cascades. Unfortunately, grizzlies will not be able to repopulate the North Cascades on their own. There are no grizzly populations in the United States or Canada that are large enough or close enough to serve as a source to naturally repopulate the North Cascades.
Today people are coexisting with grizzly bears in Montana and Canada, and we can do the same here. In fact, one of the primary reasons people go to Yellowstone National Park and Glacier National Park is to see grizzly bears and this has given local communities a huge economic boost.
I am confident this effort will succeed and will be one of the greatest wildlife conservation efforts in the history of this region. We exterminated grizzly bears in the North Cascades, and now we have an opportunity and a well-crafted plan to bring them back.
Thank you for your consideration in this important matter.

Correspondence: Greetings from New England,

As I live outside the proposed territory, I realize my comments will likely have less weight (correctly) - but as a fellow occupant of the planet, I really do hope that Grizzlies are brought back into the Cascades. It would be so astounding to see the ecosystem rebalance with these massive, impressive bears as a part of it.

My one hesitation would be that the folks who live there agree. Not because I think our opinions ought to determine the animals, but because we are the ones with guns and opposable thumbs so if the end result is going to be bears shot by angry locals, let's not. But if we can do this without endangering the animals - how thrilling!

Correspondence: If the western part of the park were truly that desirable for grizzlies, why wouldn't they be back there now? I hunt black bear outside the park and the bears that are in that region travel great distances and are often found down in the areas where many visitors hike and camp. I have real concern that grizzlies would begin to move down into the lower valleys (in Yellowstone, 1/3 of all elk calves are eaten by grizzlies in the spring before food is out) where more interactions with people and livestock will occur. I don't want to see any grizzlies shot because they are following their food source nor do I want our hiking trails closed for weeks on end due to "bear activity". Let them move back into these areas naturally. If they don't then clearly there isn't enough there to entice them to stay.

Correspondence: I greatly appreciate this very thorough, comprehensive, and professional DEIS. Kudos to the NPS staff who prepared it.

In reviewing the options, I vigorously support Alternative C, the NPS preferred alternative. I believe that the greater management flexibility with an ESA Section 10(j) designation will help to advance successful grizzly reintroduction.

Grizzlies are a key species that are important for maintaining ecological health and biological diversity. They were once abundant in this North Cascades Ecosystem. They deserve and need to be returned to this ecosystem.

I commend NPS for this significant conservation work and I wish NPS every success in this work

Thank you very much for your kind consideration of my comments.

Correspondence: Grizzly re-introduction is not a good idea.

1. Prey animals are under populated already with wolf and cougar populations exploding.
2. Having a apex predator like grizzly bear in the Cascade mountains will cause a safety concern for all who enjoy recreation in our public spaces. It has everywhere else, it will here too.
3. The public sector is plenty large currently and managing a grizzly reintro will only require more useless overhead competing for state budget resources better used elsewhere.
4. Just like the wolf and cougar, it won't take long for the grizzly to figure out that it's much easier living just off the valleys and not deep in the cascades. They will learn that livestock are easier to kill and taste better than wild game.
5. Just like the wolf reintro, at first the damage these predators caused were compensated by the state. Now it's up to the landowner to ensure that the wolf does not get to his livestock.

No to grizzlies in the Cascades.

Correspondence: To Whom It May Concern:

As a long-time member of the Pacific NW and NC Washington I am adamantly against reintroducing grizzly bears to the US portion of the NCE.

I haven't read anything that states the US portion of the NCE is suffering from lack of grizzly bears. The only reason this seems to be important is because of the National Environmental Policy Act of 1969 and it's amendments.

Population and trail use has increased in such a way that negative encounters will be immanent. Outcomes will be deadly as these are not black bears!

I for one do not want to have to hike with a riffle for fear of grizzly bears! You said it yourself in the report I read, grizzly bears are opportunistic omnivores!

Sincerely,

A tax paying, voting member of Chlan County and Washington State

Correspondence: I'm fortunate that I get to go to an area of Montana frequently. I've been going there for over 20 years. Grizzly bears have moved into the area. It is not as enjoyable as our early days there. As of a month ago there were 2 bears for sure and possibly 3 in area of the cabins, one is a mature grizzly with the silver back. In spring there are more bears when the calving season is in progress. I have hunted in the Bob Marshall and Skape Goat areas, I had a grizzly bear come to my "shot" at an elk and then lost an elk to a grizzly bear. I quit hunting in Montana because of grizzlies. There are just too many in the Northern Rockies. That is what I fear will happen here in WA. WA. is the smallest western state, but has the most people, many who use the back country. If the bear population isn't controlled much of the North Cascades will see very limited people use. I'm also concerned about the funding, WDGf doesn't have enough funding now. In Wyoming hunters have spent over \$4 million of license money on grizzly bear management, WDGf can't afford that. There have been 3 grizzly attacks in Montana and Idaho this year since Sept. I'm 81, bears in WA. won't affect me, I'm worried about other people. I'm sure you know about the lady that was killed by a grizzly in Orvando, MT. that is general area I visit.

Correspondence: Very good idea to restoration grizzly and anyone else that we need out there. As long as they have been trained to live there. I'm sure that you all know how to take care of them. I do hope there is a way to keep a eye on them, making sure they are ok. Grew up going to Woodland Park Zoo they went from bad (cages and being indoors) to the best viewing and outdoor habitats. It is the next best place for the animals if they are not able to be trained for restoration. Good luck!

Correspondence: After reading through the North Cascades Ecosystem Grizzly Bear Restoration Plan / Draft Environmental Impact Statement, I strongly support the National Park Service's preferred Alternative C: Restoration with Endangered Species Act Section 10(j) Designation. While I would prefer Alternative B, which would provide the greatest chances of success in reintroducing a viable long-term population of grizzlies with full Endangered Species protection, I am also pragmatic enough to understand the advantages of a more flexible experimental population.

Given grizzlies have been effectively extirpated from this region for several decades, reintroduction must be done carefully and with the best available science and understanding of possible impacts on surrounding communities. Alternative C will both effectively restore grizzly bears in North Cascades National Park and give people the tools they need to thrive in and around grizzly bear country. Grizzlies are a key stone species of the American West, including the North Cascades, as they will enhance the park's overall ecological integrity, maintain crucial predator prey dynamics, increase more and contribute to the areas essential wilderness characteristics. Grizzly bears play a vital role in maintaining ecosystem balance, cycling nutrients, dispersing seeds, and changing the behavior of species around them through the so-called "landscape of

“As one of the last remaining in-tact landscapes of sufficient size to host a viable population of these animals, restoring them would benefit the park, the people who use it, and confer long-term population stability for grizzlies in the United States.

Given the general decline of large wildlife nation wide and increased interest from citizens in using public lands, a restored population of grizzlies will boost the park's appeal and attract nature enthusiasts, scientists, and tourists from around the world. This would provide economic benefits to local communities and support the park's mission to protect park resources in perpetuity.

Alternative C, with the 10(j) rule, provides managers flexibility to address community concerns while protecting the grizzly population. Modern understanding of wildlife conservation science has gradually understood that cohabitation with neighboring populations is key to maintaining sustainable wildlife populations. The 10(j) rules helps ensure coexistence between humans and grizzlies.

With an understanding that Alternative B may not be practical given conflicting interests in the area, please consider the positive ecological and economic benefits and support Alternative C. Restoring grizzly bears will secure the park's natural heritage and conserve an iconic species for current and future generations.

Correspondence: I do not believe Grizzlies should be re instated in the north cascades. The Eco system has changed such they would not thrive and population has increased so much it would be dangerous. We have a declining deer population which they are already shutting down recreation areas in the winter to help. Salmon population is down, elk population is not thriving. The amount of people who live and recreate in the established zone area has increased to the point where someone will for sure be hurt or killed in a matter of time. Recreation areas will be shut down if a bear is in the area. The argument that they were here is not enough for me.... What if it actually hinders the new eco system then helps? It will also take more money and man/women power to manage, which we do not have. Please No for grizzlies!

Correspondence: I oppose reintroduction of the grizzly in Washington state's North Cascades National Park.

Reintroduction will mean an enhanced conflict between humans and bears. National Parks are not created to emulate pre-human conditions, but rather as a place set aside for humans to gain exposure to natural places. They are to bring us closer to the the land and grow an appreciation of natural places. By reintroducing grizzlies, we will undermine that premise. Instead of appreciating natural landscapes, we will grow to fear them. There will be an uptick in fear-driven sensational media when humans and grizzlies interact. People will visit less frequently, driven by this frenzied sensationalism. Visitors will arm themselves out of fear for their safety. The net result will be fewer public support for our national parks and growing pressure to carry arms in National Parks. I would prefer to continue experiencing the North Cascades as they are. I cannot help but think the North Cascades with grizzlies are no longer for humans to enjoy and recreate in... and that would undermine my support for the National Park System generally.

Correspondence: Grizzly bears should NOT be reintroduced in Washington's North Cascades for following reasons:

1) During the past year Washington's population increased by 250,000 people and is closing in on 8 million. Many North Cascades visitors come from greater Vancouver BC which is experiencing similar population growth. I have been recreating in the Cascades and Olympics for nearly 40 years and have observed exponential growth in the number of people on roads and trails with each passing year. The grizzly/human interaction track record of the past 180 years unequivocally confirms that sans human population growth measures, introducing grizzlies in populated areas creates far more problems than it solves.

2) Historically, throughout the West, grizzlies lived in the lower elevations. Those lower elevation locations were the first places settled as the non-indigenous population moved west, driving the grizzlies out of existence (by 1924 in California), or into the higher elevations where they have survived with varying degrees of success. Grizzlies driven to the higher elevations in the Cascades appear to have experienced a much lower degree of success than they have in the ranges that compromise the Rocky Mountains. Decades of stats confirm that grizzlies don't want to be in the Cascades.

For the sake of humans AND grizzlies, please abandon the effort to reintroduce grizzlies in the Cascades.

Correspondence: this state already has a serious predator problem. The deer and elk herds are getting hammered by the over abundance of wolves, cougars and bears. Since WDFW refuses to properly manage our existing predators and herds, the last thing we need is another apex predator.

also going to add a serious risk to the recreational users of the north cascades NP, pasayten and mount baker wilderness. when you add more starving predators to an ecosystem with inadequate food resources you are going to drive them into more contact with humans.

Plenty of bears already north of this area in BC, if they wanted to inhabit the north cascades then they are/will be there. They

do not need our interference in spreading their range. The only animals that need our help are the ungulate herds which have cratered in numbers over the past decade.

NO GRIZZLIES, NO MORE PREDATOR PROTECTIONS! go back to the proven North American model of wildlife conservation. It was the best system in the world before anti-hunting commissioners ended up in WDFW.

Correspondence: If we decide to go forward with the Grizzly Bear Reintroduction we should go in with power. Considering the bears a nonessential population would likely be the safest option for our environment and those living in and around the North Cascades Grizzly reintroduction zone. This should come with some rules though. If something were to come up where the bears needed to be moved or eradicated from the reintroduction area, killing would not be permitted but the movement or change of location of the bears would be permitted. Also, if the government and organizers of this reintroduction decide to go forward with the plan, free classes to improve our knowledge of bear safety should be organized and improved animal control facilities should be put in place if the need to control a bear or bears should arise.

Correspondence: Please return Grizzly Bears to the North Cascade Ecosystem to help them fight against extinction. The area seems remote, however, there will need to be plenty of food (fruits, berries, roots, native grasses, forbs, salmon and other fish, native rodents, moose, elk, caribou, deer) available so that they don't wander into areas where they could get into trouble. Any ranching in the area needs to be addressed and hopefully they won't encounter losses, but if they do, then perhaps compensation can occur. Issues might need to be addressed to contain the bears to certain boundaries. Please find a way to make it safe for grizzly bears and any people that might be in the area.

Thank you!

Correspondence: Thank you for the opportunity to comment on the draft EIS. I'm writing in support of Alternative C and action to reintroduce grizzly bears into the North Cascades Ecosystem. I strongly believe the grizzly bear belongs in this area and deserves to be reintroduced and expand its range. I also believe the ecosystem itself deserves to be restored closer to its original condition, and that the desires of regional tribes should be of utmost importance and consideration. That said, as an avid hiker backpacker, having grizzlies in our area will instill a healthy dose of fear in me. Nonetheless, I feel the intrinsic health and integrity of the ecosystem is critically important. We humans can learn to coexist. Thank you for considering this reintroduction.

Correspondence: I live in Wenatchee and am a [REDACTED] Surgeon (one of only two in central Washington)

One of the major reasons we moved to the area is the outdoor activities including hiking, backpacking, and mountain biking.

I have two young boys 9 and 11. We have 3 dogs that frequently spend time with us out in the woods.

I do not agree with introducing Grizzly bears to this area. I would no longer feel comfortable doing many of these activities. I am aware of our current risk and carry bear spray due to the amount of black bear and cougar sightings and attacks around Levanworth where we frequent.

Grizzly bears are a different story. These bears need even more space and are not afraid of humans.

There are hundreds of bikers in this area. It is easy to turn around a corner and suppose a bear. I have spoken to locals in Glacier national park and other areas of Montana, Alaska, and northern Idaho (Preist lake) and would not mountain bike in these areas. I would also be leary of hiking and especially backpacking.

I am absolutely not in favor of this nor are the locals here in Wenatchee who love to go outside without fearing a Grizzly bear encounter.

Correspondence: The population of grizzly bears in the North Cascades was decimated through "direct killing," with the last sighting in 1996, according to the U.S. Fish & Wildlife Service and the National Park Service.

As part of their plan, approximately three to seven captured grizzly bears would be released into the North Cascades yearly over a five- to 10-year period. I support grizzly bear reintroduction into the North Cascades. The bears might be able to gain a foothold there, in spite of the misplaced opposition. Repeatedly, it has been shown that the removal of a species from an area has negative consequences for the balance of nature, and the health of the environment.

Correspondence: To whom it may concern,

I'm writing in support of reintroduction of the grizzly bear to the North Cascades ecosystem. It is a keystone species and it's absence leaves a vacuum in the heart of the Pacific North West. I think introduction as an experimental population strikes a suitable compromise given the stakeholder conflict over the issue. With a mass extinction now occurring due to human activity on our planet (particularly large mammals), it seems we all need to reserve part of our world for wilderness and the species that rely on it. No species in North America epitomizes and needs wilderness more than the grizzly.

Frankly, we need a space in the world for wildness more than we need cattle ranching on public land. A suitable compensation scheme is adequate for ameliorating any predation that may occur. To step into a forest knowing that something like a grizzly is out there somewhere is a primal feeling. It makes one alert and respectful of one's environment knowing that something more powerful and larger than ourselves walks the woods. As a hiker, backpacker and fisherman, I'm aware of how people will need to change their behavior around resource usage once the bears are back. If they are collared, then GPS should help prevent though not totally eliminate conflicts that may occur in heavily used areas of the National Park.

As a resident of "Cascadia" return of the bears will represent an important part of our ecosystem's restoration and bring a sense of wholeness to this part of our world, just as the return of the Condor and Sea Otter will too.

Thanks for your consideration,

██████████

North Cascades National Park Service Complex
810 State Route 20
Sedro-Woolley, Washington 98284

Dear Don Striker:

The U.S. Environmental Protection Agency has reviewed the National Park Service's September 2023 Draft Environmental Impact Statement for the North Cascades Ecosystem Grizzly Bear Restoration Plan (EPA Project Number 22-0058-NPS). EPA has conducted its review pursuant to the National Environmental Policy Act and our review authority under Section 309 of the Clean Air Act. The CAA Section 309 role is unique to EPA and requires EPA to review and comment publicly on any proposed federal action subject to NEPA's environmental impact statement requirement.

The DEIS assesses the environmental impacts of restoring grizzly bears to the North Cascade Ecosystem. Co-lead agencies, NPS and U.S. Fish and Wildlife Service, along with cooperating agency Washington Department of Fish and Wildlife, are proposing to restore the grizzly bear to the North Cascades Ecosystem, a portion of their historic range from which they are

currently functionally extirpated. NPS anticipates releasing approximately 3-6 grizzly bears into the ecosystem over the next 5-10 years, with an end goal of approximately 200 grizzly bears inhabiting the area within 60-100 years.

EPA does not have significant concerns to be addressed in the Final EIS. EPA appreciates the thorough analysis provided in the DEIS, including addressing EPA concerns in our December 2022 letter on the Notice of Intent. EPA supports the greater management flexibility in the Preferred Alternative should conflict situations arise.

Given the high public interest in this project, EPA recommends the FEIS include a summary table or narrative of all substantive (i.e., non-editorial) changes made from the DEIS to the FEIS. This summary will help the public understand what proposed project changes have been made to the document after considering DEIS public comments. Including a summary of changes to the FEIS alleviates the public's burden to review all individual responses to comments. EO 14096 Revitalizing Our Nation's Commitment to Environmental Justice for All highlights the importance of meaningful public involvement and ensures that the public has adequate access to information.

Thank you for the opportunity to provide comments for this project. If you have questions about this review, please contact Caitlin Roesler of my staff at (206) 553-6518 and roesler.caitlin@epa.gov, or me, at (206) 553-1774 or at chu.rebecca@epa.gov.

Sincerely,
Rebecca Chu, Chief
Policy and Environmental Review Branch

Correspondence: This comment is against bringing grizzlies back to the Cascadia Mountains. There are many roads and hiking trails in the foothills and mountains of Washington and Oregon. There will be bear encounters that can prove deadly to both grizzlies and humans. Please read the British Columbia article: 'This B.C. valley has become a death trap for young grizzly bears report'. The website is: <https://www.cbc.ca/news/canada/british-columbia/elk-valley-grizzly...> It appears that 2-6 year olds are not surviving well. They are being hit by cars, even killed by humans. The older bears seem to have gotten smart enough to avoid cars and people. There are no grizzlies now and there should not be any planted in the Cascadia Mountains. Yellow Stone Park is a safe place for them, not in the Washington/Oregon mountains!

Correspondence: Please reintroduce grizzly bears to North Cascades National Park! It is perfect habitat for them. Reintroduction will help reverse the consequences to the ecosystem of their removal. I am an avid hiker and spend time backpacking every year in the North Cascades. No matter how much time and effort I spend exploring, I will never enter 95% of the park because it is so rugged and remote. Apex predators like grizzlies have vast landscapes to live and hunt without encountering humans. The North Cascades already enforces hiker practices for bears; food must be stored in bear canisters or hung correctly and bear boxes are often available. Hikers are ready for grizzly introduction. I am upset that my representative is so adamantly against this. Bears don't give enough to his campaign so special interests with money dictate policy. Please give nature equal voice and help restore it to it's proper balance. Thank you!

Correspondence: With such a large population of Washington residents recreating in the North Cascades my concern would be how long after introduction of grizzlies is it anticipated that a human conflict will begin? Which we know will lead to bear relocation or the animal being dispatched. We already have a growing population in Eastern Washington and have seen more and more human conflict the last couple years. Will the Eastern Washington bears be what is relocated to the North Cascades or will the introductory bears be from out of state? Overall, I am very concerned and against the reintroduction of bears in the North Cascades do to the inevitable human conflict it will bring and also the impact to the already suffering ungulate population do to poor predator management in Washington state.

Correspondence: Though not a resident of Okanogan County, I feel concerned about the reintroduction of grizzly bears into the state. I enjoy outside activities and I like the freedom to do so without fear of yet another massive predator. I believe that grizzlies will quickly spread to the rest of the state, endangering the balance of nature that currently exists. I would also

feel less safe camping and hiking, especially with young children, if I knew grizzlies were around. If the bears spread naturally from other areas, that is according to nature, but man's reintroduction artificially could spiral out of control. Please do not intentionally reintroduce grizzly bears to WA state.

Correspondence: I do not want or need "the opportunity to again experience grizzly bears in their native habitat" as is stated in the Draft Grizzly Bear Restoration Plan/EIS on page ii. Alternative A should be the only option. Grizzlies can pose a serious problem for anyone who may be unfortunate enough to come in contact with them in the wild. Washington state, and especially the Cascade Range area, contains a vast number of hiking and other outdoor opportunities. Voluntarily introducing the animals will increase the probability of humans accidentally coming into contact with them. Their range is massive and they can easily travel much farther than intended. Leave the grizzly population alone and do not introduce them into the habitat. If they make it on their own then so be it, but we do not need to bring them here just see them roaming in the woods or into our streets and homes. I do not want to encounter a grizzly in the woods, nor do I want my children to encounter one.

Correspondence: I am writing to ask that Grizzly bears do not be re-introduced into the North Cascades Region.

We, the taxpayers, are already paying WDFW a very large amount to handle the wolves in the North Eastern section of the state. Tracking, Monitoring, paying for cattle depredation, etc. Even paying citizens to watch herds of cattle to chase of wolves.

Now you want to add Grizzly bears to the taxpayer cost....not to mention the cost to pay when one person is killed, which is only a matter of time....a when not an if.

They belong in the wilds of Alaska and Canada now because of human development.

You would be directly impacting the hikers of the North Cascades....I wonder what they say about this/

OK....Well I am a NO GRIZZLIES IN WA STATE

Thank you

Correspondence: I urge the US Fish and Wildlife Service and National Park Service to abandon the plan of physically reintroducing grizzly bears into North Cascades National Park. As you are well aware, these bears can range hundreds of miles from where they are introduced and conflicts with both humans and livestock will certainly take place on ranches, in

orchards, and in hiking areas some distance away from North Cascades National Park.

If there was a way to keep them in the park I'd be all for it because this is rugged and remote country and I would love to see grizzly bears there. The problem is, they won't just stay there. They will spread out, just like they have in Montana and other places, and eventually, humans will be hurt and killed.

If the bears come back to this range by themselves from Canada, that's fine. But physically reintroducing these apex predators, knowing the conflicts that will occur, is reckless.

Correspondence: Grizzly bears belong in the North Cascades where they historically lived. They are seed dispersers, plant diversity encouragers, and spiritually and culturally significant to Pacific Northwest native peoples. I believe we have a moral and legal obligation to restore grizzlies to their natural landscape.

The North Cascades is a vast wilderness in which there will be minimal contact and conflict between bears and humans. With education, all stakeholders should be safe.

As a designated endangered species, Grizzly bears have a right to a safe home where they used to roam.

Correspondence: Please do not reintroduce grizzly bears in Washington State!
My family hikes with children a lot and this would make us hike and exercise less. I have hiked the Northern Loop of Mt Rainier's Wonderland Trail and have seen black bears. We are careful but not usually in trepidation. I have hiked in states with grizzly bears and we always have to be on high alert, particularly with children. We have always said that we are so lucky that we do not have to worry about grizzly bears. As a former teacher, I want to do everything I can to help children and families get outdoors and hiking. This will make even less parents feel safe taking their kids hiking. Please keep kids safe and grizzlies out of our state.

Correspondence: I strongly support the National Park Services preferred Alternative C: Restoration with Endangered Species Act Section 10(j) Designation.

This plan will both effectively restore grizzly bears in North Cascades National Park and give people the tools they need to thrive in and around grizzly bear country. Grizzlies belong in the North Cascades, as they enhance the park's ecological integrity and contribute to its wildness.

Grizzly bears play a vital role in maintaining ecosystem balance, cycling nutrients, dispersing seeds, and changing the behavior of species around them. Restoring them would benefit the park and the people who use it.

A restored population of grizzlies will boost the park's appeal and attract nature enthusiasts, scientists, and tourists from around the world. This would provide economic benefits to local communities and support the park's mission to protect park resources in perpetuity.

Alternative C, with the 10(j) rule, provides managers flexibility to address community concerns while protecting the grizzly population. It ensures coexistence between humans and bears.

Please consider the positive ecological and economic benefits and support Alternative C. Restoring grizzly bears will secure the park's natural heritage and conserve an iconic species for current and future generations.

Thank you for your dedication to our national parks.

Correspondence: I am writing in opposition to the plan to reintroduce grizzly bears to the Northern Cascades. This is a well used hiking area and includes among others the Pacific Crest Trail. The risk for human- bear encounters during late summer is high especially with ripe huckleberries and other berries in late August/early September. During our hikes in this region we have seen abundant bear scat on the trails at this time and heard reports of encounters with black bears from other hikers. None of these have resulted in attacks on humans, but the record for much more aggressive Grizzlies is different. This year alone several deaths have occurred (MT) when grizzlies attacked hikers or back packers. Introducing Grizzly bears to the Northern Cascades will inevitably lead to such incidents in Washington state. These deaths are preventable if Grizzlies are not reintroduced to this region.

Correspondence: From the "Draft Grizzly Bear Restoration Plan /Environmental Impact Statement":

(1) The scientific name of the Grizzly bear is "Ursus arctos horribilis". Can you image why the word "horribilis" appears here?

(2) An objective is to "Provide Pacific Northwest residents and visitors with the opportunity to again experience grizzly bears in their native habitat." What sort of experience is being alluded to here? Fear? Surprise? Worry? Running for one's life? Are these to be considered positives? Good grief.

(3) So when hikers (and their kids) are out hiking in the WA State northern Cascades National Forests, they'll have to wear bells on their shoes, so as not to surprise any nearby Grizzly. I would also carry bear spray (at least) and more likely carry a handgun. Studies indicate that bear spray is ineffective as compared to handguns: "Seven times as many people have been killed by bears when bear spray has been sprayed in defense than have been killed by bears when a handgun has been fired in defense." (<https://www.ammoland.com/2023/06/bear-spray-is-human-seasoning-take-a-gun-if-you-want-to-survive-a-bear-attack/>). Therefore, many hikers will now have to carry firearms on their hikes. Is this really what the

administrators' want - more firearms in the National Forests?

These proposals are, at heart, anti-human and cruel and will discourage hiking and camping.

If us hikers and campers want to experience Grizzly bears, we will go to Alaska or Glacier National Park.

I emphatically oppose this Draft.

Thank you.

Correspondence: I favor restoring grizzlies to the North Cascades under the alternative "C" option (guided by the 10(j) rule) in order to support a more diversified and balanced ecosystem. The North Cascades are among the few remaining places in the US that are suitable to safely maintain a healthy grizzly population. The Methow Valley in particular, with its supportive populace and measures aimed at coexistence including bear-proof garbage, electric fencing, carcass composting programs, and range riding, is an ideal community to demonstrate how coexistence can work with this majestic creature.

For comparison, the Greater Yellowstone Ecosystem which includes Yellowstone Park supports over 1100 grizzlies today, far more than the 200 that the North Cascades may support a hundred years from now. Nearly 5 million people visited Yellowstone in 2021. With so many people and bears, grizzly encounters and especially attacks in Yellowstone have remained very rare.

Humans created this grizzly gap in the North Cascades ecosystem and humans can repair it. It is my fervent hope that we can move forward with this re-wilding project as soon as safely possible.

Correspondence: Sirs, I've reviewed the documents provided relating to the reintroduction of grizzly bears into the North Cascades ecosystem and I hereby submit the following comments.
One of the stated reasons for reintroduction is that the presence of grizzlies would increase human presence in the NCE as

visitors would be drawn to have a direct experience of the bears. While the purported purpose of reintroduction is to create a "local" population of grizzlies to avoid their extinction, reintroduction for the recreational pleasure of humans seems at odds with this purpose. Increased recreational visits to the NCE will not benefit the grizzly bear as a species as it will likely create more human/bear interactions and conflicts with the likely result of humans being killed by the bears as very few visitors to the NCE will be familiar with appropriate behavior when crossing paths with a grizzly. This generally leads to human deaths and the resultant killing of the offending bear(s). With bears taken from another ecosystem and brought to the NCE, the bears will be under extreme stress after being captured and transported to the NCE, they will be unfamiliar with the NCE environment and will be in an adaptive situation learning the terrain, the fluxes of weather and climate in their new "home", available foraging sites, other local species vying for the same or similar resources and the location of human habitation and areas where potential conflict may result. It is not a good situation to relocate bears to an unknown environment with only a few months to adapt before winter hibernation. These elements do not provide encouragement that such reintroduction will be successful

Another concern is the likelihood that reintroduced bears will be collared and tracked in essence making them guinea pigs in a human based experiment. Is this about the prevention of extinction or a case of making humans feel better after bringing the bears to the brink of extinction and making some effort, regardless of the outcome, to extend the survival of grizzly bears as a species? With human caused climate chaos creating an uncertain environment in the NCE where the proposed reintroduction will occur, this reintroduction is likely to fail. With the inclusion of the 10(j) rule, it is obvious that this experiment is just that, an experiment with the ability of humans to consider the reintroduced bears as expendable. This further strengthens the argument that this is more about making humans feel better about themselves rather than the successful prevention of grizzly bear extinction.

To my mind, as one who has lived adjacent to and spent much of my time wandering the NCE for the last 47 years, the most viable means of successfully staving off the extinction of the grizzly is to allow for natural reintroduction and allowing the bears to be protected under the full authority of the ESA. This could be facilitated through the creation of wildlife crossings at highways and railroads or other human created barriers to natural dispersion and expansion from areas with current populations of grizzly bears. This would allow the bears time to adapt to a new ecosystem without the stress of capture and relocation providing a much better chance of their successful survival in new surroundings. It would also allow the human population to adapt over time as naturally relocated bears arrive in the NCE and reduce human/bear conflicts.

I encourage the NPS and the USFWS to select alternative A, the No Action alternative. I support this alternative as the best and most rational way to allow the natural reintroduction of grizzly bears in the NCE and prevent the extinction of this iconic species.

Correspondence: I am writing to comment on the reintroduction of grizzly bears to the North Cascades. It is vital to protect grizzly bears as they return to the lands they originally inhabited before they were killed off by settlers. Their return indicates the health of the environment: The return of grizzlies to the North Cascades means the environment is healing. Only the most healthy ecosystems can support apex predators. It is vital to educate people about these animals, there will be conflict with them and people as there always has been but the Cascades suffer greater in their absence. It is crucial that we no longer continue to demonize these creatures and find new ways to mitigate conflict between humans and bear and set the bar for environmental restoration worldwide. They must be allowed to return to the North Cascades and thrive with the proper protections, with the involvement of the tribes. Thank you

Correspondence: NPS--

I live in the Methow Valley and am in favor of alternative A, the no-action alternative. While the North Cascades may be prime grizzly bear habitat, part of the species' historical range, I do not understand the wisdom of rebuilding this apex predator's population in a recreation-forward region. Many residents of and visitors to this area are accustomed to hiking, running, skiing, biking, camping, hunting, fishing, backpacking, and horsepacking in non-grizzly habitat; why invite the potential for negative grizzly-human encounters? Why introduce a new management conundrum and all the bureaucracy--and helicopter flights--it will entail? I'm not seeing how the hoped-for benefits put forward in the restoration plan could outweigh the likely downsides.

Thank you for your consideration of these concerns.

Correspondence: Please do not introduce grizzlies back into the Washington Cascades. They are capable of moving there on their own if their current numbers determine that need, just as we saw the wolves do. There are too many people who utilize the area now to be able to do so safely with that reintroduction. Our family enjoys hiking, biking, and camping all over our state, including the North Cascades, and it is disturbing to hear that we may now have to avoid certain areas for personal safety. Outdoor activities are already becoming overly crowded, and this will put more people in danger, and limit the areas open for safe recreation. It's upsetting that people who do not even live in the Northwest are making decisions that do not affect them, but affect many rancher, farmers, homeowners, and recreational users in Washington state. If it must happen, then at least allow legislation that we can have local control of management. Thank you for listening to my concerns.

Correspondence: I agree with plan A: no action taken regarding the reintroduction of grizzly bears to Washington state. I find the need for action on this issue to be weak as they are not an endangered species at the federal level. Furthermore, I disagree with the potential benefits of tourist coming to "see grizzlies in their natural habit". I believe any potential visitor coming to see a grizzly in the wild will be offset by all the people not wanting to recreate now because they don't want to run into a grizzly bear. I also see a huge potential for risk of people interacting with grizzly territory without the proper education as Washington has not had grizzlies for so long.

As a frequent backpacker in Washington state, especially the north cascades, I enjoy the fact that there are relatively few apex predators that I need to be concerned about. While I pack spray and have other safety measures, it's comforting to know that the worst possibility is a black bear or cougar. While grizzly bear attacks are relatively small, but they do happen and they are

more likely to be deadly than a black bear, even for those who are prepared for a worst case scenario (which is a very small portion of Washington hikers).

Lastly, as a tax payer there are a plethora of opportunities for my tax money to improve critical issues around Washington state, financing a plan to pay for approximately 144 helicopter rides and capturing bears sounds expensive and is not where I want my taxes to go.

Ultimately, I am in favor of option A because it aligns with my goals regarding outdoor recreation, promotes public safety, and is the most cost effective option.

Correspondence: I am absolutely opposed to introducing an apex and very dangerous predator into the North Cascades ecosystem. That will change forever how comfortable recreationalists are in the woods. Once grizzly bears are introduced and start creating problems there will be no way to bring them back under control. Every attempt will lead to court battles that interfere with and/or kill any such attempts. The courts will end up managing grizzlies instead of trained biologists. Wolf control and resulting lawsuits are a good example of how that works. So, please don't even start us down that slippery slope with a dangerous predator.

Correspondence: I strongly support the National Park Services preferred Alternative C: Restoration with Endangered Species Act Section 10(j) Designation.

I have lived and hiked in the North Cascades for the past 12 years. The park is vast and I will never be able to explore all of it. There are so many areas that people cannot readily access unless you are an ardent backpacker and even then it would be difficult. We need these bears to restore our ecosystem. They help manage their prey and keep them at healthy population levels. They dig and forage so that the soil is regenerated so that flowers and plants can thrive. They are seed spreaders and will enhance the food supply for other species. The North Cascades is bear territory. They were here historically and need to be brought back to enhance the biodiversity and restore ecological balance to the park.

This plan will give people the tools they need to thrive in and around grizzly bear country and will contribute to its wild nature.

Grizzly bears will play a vital role here and restoring them would benefit the park and the people who use it.

A restored population of grizzlies will boost the park's appeal and attract nature enthusiasts, scientists, and tourists from around the world. This would provide economic benefits to local communities and support the park's mission to protect park resources in perpetuity.

Alternative C, with the 10(j) rule, provides managers flexibility to address community concerns while protecting the grizzly population. It ensures coexistence between humans and bears.

Please consider the positive ecological and economic benefits and support Alternative C. Restoring grizzly bears will secure the park's natural heritage and conserve an iconic species for current and future generations.

Thank you for your dedication to our national parks.

Correspondence Type: Web Form

Correspondence: I am writing to voice my support for restoring a healthy population of grizzly bears to the North Cascades in Northern Washington, their home for thousands of years. Wherever grizzlies thrive, so does wildness, clean water, and abundant native fish and wildlife.

Specifically, I support Alternative C: Restoration with Endangered Species Act Section 10(j) Designation for the following reasons:

Under Alternative C, the grizzly bears would fall under the Endangered Species Act (ESA) 10(j) designation. According to the regulation, this would designate the population of grizzly bears an experiments species. This would be beneficial because they would be released into a suitable natural habitat outside of their normal range but within what we consider a probable range. According to the Fish and Wildlife Service (FWS), treating the experimental population as threatened would allow the FWS the discretion to devise management programs and special regulations for that population. Alternative C is more flexible than Alternative B and would allow for more flexible management by the FWS.

With similar impacts between Alternatives B and C, and Alternative A (no action) ineffective to recover the grizzly bears, the clear answer is Alternative C.

Grizzly bears have a slow reproduction cycle that take a long time to establish. Alternative C accounts for the necessary time and strikes a balance to meet mutual goals. Adding bears over time to sustain population growth ensures progress towards recovery. Biologists in northwest Montana have been using similar strategies successfully for over 30 years to help their own grizzly bear populations recover.

Montana and Idaho have passed legislation that allow violent or unethical hunting practices such as hound hunting or trapping of black bears that would surely be extended to grizzly bears. These are concerns that need to be addressed by the close monitoring possible with Alternative C.

I believe the best science and community involvement should be used to recover the grizzly bears to ensure a sustainable, wild, natural environment in the North Cascades.

Please bring back this native species through the strategy laid out in Alternative C with additional bear transplants as needed to ensure genetic diversity and sustain population growth. Doing so will restore an important piece of the Northern Cascade ecosystem, regional culture, and natural heritage. They deserve our respect, and the highest level of protection - not to become a trophy on a wall.

Sincerely,

██████████

Correspondence: To Whom It May Concern:

I am writing to voice my opposition to the proposal to reintroduce grizzly bears into the North Cascades ecosystem. While I understand the desire to restore native species, I believe this plan fails to adequately consider the risks to local communities.

Grizzly bears pose a serious threat to human safety. As apex predators, they are well-known for their aggressive behavior and lethal capacity. Their powerful bites and sharp claws make them capable of easily overcoming a human. Introducing them to an area where residents are unaccustomed to them exposes people to danger.

As climate changes and bears find drought interfering with their food sources, we might sadly see more aggressive behavior. That might explain a recent tragedy in Canada.

Two experienced hikers in Canada's Banff National Park were attacked in their tent, despite not storing food and taking proper precautions. The couple and their dog were killed in an entirely unprovoked bear attack. The bear even tried to attack emergency responders, showing a strong inclination toward aggression with humans. Intentionally reintroducing more grizzlies will needlessly put people at risk.

In summary, I urge you to consider the hazards posed by grizzly bears to local residents, as evidenced by attacks like the one in Canada, and reject the proposal to reintroduce them to the North Cascades. Thank you for the opportunity to provide input.

Sincerely,

██████

Correspondence: The North Cascades is my home.. I visit the park almost weekly in the 3 seasons of the year. I enjoy the wake up of Spring until the snow sets in during Fall. I have seen bear, elk, grouse, ptarmigan, hawks butterflies so many other species. I cant imagine life without this special place. Now we have a chance to return a species, the Grizzly bear, back to its natve lands and I encourage you to make this happen. I hiked this year in Glacier National Park and actually saw grizzlies and put my foot in their tracks. I was vigilant on our hike and followed all the safety precautions. It was a wonderful day.

Grizzlies belong in the North Cascades. They were here before white settlers came and hunted them to extinction here. They contribute to the enviroment by foraging, spreading seeds, digging in the earth to loosen soils for flora to establish. They keep the predator prey relationship in balance and so much more. In addition they will add to the enjoyment of people who come to the North Cascades as we now travel to GNP and the Canadian Rockies for tourism.

Please allow us to restore our balance in nature. The Grizzly Bear is a native to the North Cascades and must be returned here.

Correspondence: To whom this may concern

I don't agree with grizzlies being reintroduced or transplanted. If there was food and habitat the bears would already be there. For hikers that hike up in the north cascades could potentially at some point run into them. When they do run out of food they will move either down further into farms and domestic animals or they will go up to Canada anyway. The people in these areas have said no over and over and there is a state law of 1996 that prohibits you from bringing back grizzlies.

Let the bears come and go if there was food they would already be there in big numbers and they are not. We hike sometimes up in the north cascades and I don't want to run into a grizzly . You all admit there is a danger of doing this for the public so why endanger people's lives. If people want to see them they can go to Alaska or Montana a woman was killed in Yellowstone and they were never able to find which bear did it.

So do what the public wants overwhelmingly said no to these areas we already have some bears in the state of Washington.

Thank you

Correspondence: This member of Friends of the North Cascades Grizzly Bear is an old retired national park and forest backcountry ranger, helicopter ski guide, and ski instructor. My encounters with grizzly bears mostly involved keeping backpackers aware of, and away from them.

Actually I had more interaction with Moose in this regard. A mama Moose used to sleep right next to my cabin at Sanctuary in Denali National Park, so her baby would be safe from the grizzlies. In this way, and in these jobs, I became intimately familiar with both the North Cascades and bears. Dr. Sharsmith used to stay in my cabin at Sanctuary, and his extensive knowledge of bears in Yosemite and elsewhere, was also very educational for me.

Dr. Gordon Haber had a wolf den in my territory too, and I used to carry his shotgun when we had to go through areas with grizzlies. This was before spray cans of bear repellent were available, and of course I usually patrolled alone and with no firearms. The grizzlies seemed to know Gordy and were not alarmed by our passage. They probably knew me too as their ability to smell had familiarized them with me on my many patrols. I currently live near Lost River, deep in the east side of the North Cascades, near a handy prospective reintroduction site for grizzlies. We look forward to sharing our woods with these bears. So please count me in favor of grizzly reintroduction.

Correspondence: I am an avid hiker and outdoor enthusiast who travels the North Cascades (Mount Baker Area/Mountain Loop Highway/Highway 2/I-90 Corridor).

I love the wildlife but I DO NOT support the reintroduction of the Grizzly Bear to these parts of Washington State. This proposal to do so does not take into account the changes in human population that now populates these areas-and the hazard it would bring to human life/development.

The recent uptick of black bears being found roaming in Everett, Mill Creek, and the Eastside demonstrates that these bears are coming into contact with humans more than ever before even in the lowlands/city areas. These bears have a general fear of humans. Grizzly bears do not and are often aggressive.

Honestly, I'm a bit surprised that this fact is not being recognized. It seems, I might be wrong, that someone's agenda to reintroduce the Grizzly Bear to the North Cascades is not considering the detriment to human life/residence who choose to live in rural communities/and hikers who would like to be free from aggressive bears.

It seems this issue is brought up about every 2 years by the Park Service, and it is always shut down by public outcry. Please stop bringing this issue up.

No common sense science has proven that the Grizzly bear is necessary to the eco structure of the North Cascades. The Cascades have been fine without them and there have been no humans mauled by Grizzlies in WA. State as a result. It is the case in other states who have an abundance of Grizzlies.

Please perhaps put a focus on returning the mountain goats back to the North Cascades-they being less aggressive unless taunted would be a nice reintroduction to the North Cascades.

Thank you for hearing this public rejection of reintroducing the Grizzly Bear to the North Cascades. I will be expecting common sense action on this-as are many others who employ you.

Correspondence: We commented in previous years, as feel grizzly bears will be a disastrous and unwelcome reintroduction to the North Cascades, since we hike frequently with both pack animals and children in the mountains. We want to continue to feel safe.

Particularly, in the Stehekin Valley, it is a ridiculous idea to bring grizzly bears as these bears would disseminate our kokanee run in Lake Chelan. The bears would feed on the spawning kokanee, reducing the fish run on the lake. People are not allowed to fish out the spawning kokanee and bears should not be either.

For both humans and animals, our eco system has done just fine since the grizzlies disappeared. Do not bring them back in!

Correspondence: The information provided indicates Grizzly Bears inhabited the North Cascades in pastimes, having conflicted with humans and eventually killed to extinction in the area. Were Grizzly Bears planted here before, or was this their natural habitat? What is it that makes people outside of this area, think planting Grizzly Bear here will go well now? With the population of humans growing in this Washington State, the idea that the same outcome will not occur is ridiculous. Grizzly Bear would have populated the area naturally, if the habitat was friendly. It is required that back country hikers acquire permits to use some areas, as the population of people increases. The number of people who want to enjoy the natural beauty of the North Cascades, will only grow. Conflict with all wildlife will increase. If the Grizzly Bear are living in a friendly habitat now, leave them alone. What good will come for replanting them in a hostile environment? None.

Correspondence: I have spent many summers in Alaska and am very familiar with how sockeye salmon spawning runs attract large numbers of grizzly bears. There are an estimated 50 around Brooks River alone. The Stehekin River supports a large spawning run of landlocked sockeye salmon, locally known as Kokanee. One can easily assume this would attract any grizzlies living in the North Cascades.

Once attracted to the area, which is heavily traveled by tourists and locals, the bears would find pets and livestock attractive. The same applies to local gardens and fruit trees as well as dwellings when no one was there to protect them. Once established in the Stehekin Valley, human encounters with grizzlies are sure to follow.

Correspondence: I wholeheartedly endorse the Draft Grizzly Bear Restoration Plan/EIS for the North Cascades Ecosystem. The Plan shows ample viable habitat and an excellent plan for restoration. In Montana all carnivores (grizzly bears, wolves and mountain lions) are under attack from political forces. The Cabinet/ Selkirk restoration zone is under extreme stress and if the delisting process moves forward in either the GYE or the NCDE grizzly bears will be in much greater jeopardy. The North Cascades Ecosystem restoration would add an additional zone that might help offset the negative impacts occurring in Montana at this time and in the future. The North Cascades Restoration would greatly enhance the long term viability of the grizzly bear recovery. Thank You.

Correspondence: I think reintroduction is a great idea, any steps taken to rewild our natural spaces are steps in the right direction. I come to NCNP at least once per summer for backpacking, and already take the extra precautions needed in bear county. Because that place IS bear county, humans changed that. We should do what we can to restore what once was.

Correspondence: The reintroduction of Grizzle Bears in the Washington State Cascades is like pouring gasoline on a fire. All it takes is one person getting killed or mauled and the fire is lit. This is the most insane plan I have heard of in a very long time. I live in a neighborhood in the Sunnyslope area of Wenatchee and I have seen black bears go through my yard. What is it that people don't understand about bears roaming through miles and miles from the reintroduction site to a neighborhood searching for food? The last thing I want is facing a Grizzly Bear in my yard let alone hikers that come across one that could prove fatal. I don't want to carry a gun when I put my garbage out but if this insane plan is adopted I will do just that. Do the right thing and listen to the folks that want NO part of this plan to come to fruition. Sincerely, [REDACTED]

Correspondence: Introduction of an apex predator in my backyard is one of the most misguided attempts to remake nature as it was 200 years ago without any regard to the safety of the millions of people who live, work, visit and/or recreate in the designated reintroduction area. I lived in Montana for many years where every year some number of hunters or fishermen would have encounters with grizzlies that leave them anywhere from maimed to suffering a horrible death. Why does the government think that is something we should strive to put into place here in Washington State. Wouldn't be surprised if at one time grizzlies roamed N America in the bureaucrats' backyards in Virginia, West Virginia and Maryland. Doesn't seem to be any effort to place apex predators near them. Listen to the locals who know what they need to feel safe and secure while living and caring for this wonderful place. Statistically, the odds of an encounter may be relatively remote until it is one of your loved ones or friends that suffers the fate of a deadly encounter. Stop this effort to put us in harm's way.

Correspondence: An October 27 article in the WENATCHEE WORLD newspaper about the North Cascades grizzly bear reintroduction plan by the U.S. Department of the Interior, U.S. Fish & Wildlife Service and National Park Service includes, "...The restoration of the grizzly bear population is also for the "benefit and enjoyment of present and future generations of people" and would allow residents and visitors 'the opportunity to again experience grizzly bears in their native habitat'."

Given the potential ferocity of grizzly bear/human contact (with humans on the losing side), it's hard for me to see a net benefit and enjoyment from reintroduction of grizzlies in the North Cascades. The population of grizzlies in the greater Glacier & Yellowstone parks areas, as well as in Alaska, seems to me to be sufficient to provide benefits and enjoyment (from grizzly bear presence) to present and future generations of people in the United States.

Sincerely,

██████████

Correspondence: As resident of WA State, I support reintroduction of Ursus arctos into the NCE. We need more fish & wildlife in the USA. Animals that have been essentially wiped out by human activity deserve special treatment and help to recover & augment populations in historic habitats.

I support

Alternative B: Restoration with Existing Endangered Species Act Protections

Under alternative B, grizzly bears restored to the NCE would be managed as a threatened species with the special rule (50 CFR 17.40(b)) under section 4(d) of the ESA governing the regulation of grizzly bears in the lower 48 states and NPS regulations in 36 CFR, chapter 1, governing resource management in areas within the NPS's jurisdiction. This rule allows grizzly bears to be taken under specific circumstances, as long as such take is reported promptly to the FWS. These circumstances include defense of life; federal, state, or Tribal scientific or research activities; or removal of grizzly bears involved in conflicts by authorized federal, state, or Tribal authorities.

My second choice is Alternative C, if B has less support than C. I am against, do not support

Sincerely yours,
Concerned citizen in White Salmon, WA

Correspondence: While I support the re-introducing of native species to their former home ranges, I believe this the impact to humans would be greater than the benefit to Grizzly Bear re-habilitation. Grizzly are a keystone species and play an important role in ecosystems in the North Cascades, the Black Bear had done a relatively good job at filling the void that the absence of the Grizzly Bear. Many Washingtonian's do not know how to react to a Black Bear much less a Grizzly which are much larger and potentially more harmful. In conclusion, I believe it is in the best interest of human safety to allow Grizzly Bears to naturally migrate back into the North Cascades.

Correspondence: Three introduction of grizzly bears is a very bad mistake. Number one, it is against Washington states constitution to do so. Number two, it will further decline our declining deer and elk populations to add another Apex predator with the addition of wolves re-staking claims in Washington. Both grizzly bears and wolves population will grow unchecked as there's no conservation measure in place to help control this. Washington state has also shown, very poor management of predators with the example of the sea line problem, mountain lion problem, wolf problem, and now what seems to be a grizzly bear problem in the future. The state also has been having a push to outlaw all predator hunting as early as 2024. The WDFW is complicit in the matter and not standing up for our and my right as a hunter. Number three reason this is a bad idea, amongst many others, is that farmers with livestock will suffer tremendously. For many years, farmers, as well as avid outdoorsman have been sounding the alarm that this is a bad idea. It might be time to listen to them. Lastly, look at glacier Park, and there grizzly bear attacks with fatalities. Now look at Banff and their fatalities from grizzly bear attacks. Now go and try to tell the families of the people that unfortunately were mauled by grizzly bears that this is a good idea. It is only a matter of time before a grizzly bear gets a hold of a hiker on the Pacific Northwest trails. This needs to be stopped!

Correspondence: Because the grizzly bear is our top apex predator...putting it in an area with any other animals raised by man would be asking for a disaster!!!!!! It has been shown in the past and will continue to be shown as a poor idea and one which puts several of our industries at risk including the raising of any animals,inclusion of any human beings and other animals in the same territory as them!!!!!!! You would be asking for trouble if they were put in these same territories and would be putting people and businesses at risk!! The only way to reintroduce them would be to keep them in areas where there would be no human contact and sharing the same land with farm animals.....putting a 50 mile safe area around them and keeping them away from these areas!!!!!!! Introduction into the extreme north and interior areas of the north cascades would be the only way they could be left to survive!!!!!!

Correspondence: As residents, campers, hikers and hunters of the Methow Valley for over 30 years, my husband and I absolutely oppose any efforts to re-establish the grizzly bear population in North Central Washington. We hope that our children and grandchildren will also be able to safely enjoy the great outdoors of North Central Washington as we have. I do understand that they were once native to this area - but it was before it was a populated recreational area. Our area has become far to popular to outdoor enthusiasts and has lost so much wildlife habitat to recent wildfires that it seems that the possibility of the bears moving down to residential areas would be a likelihood in their search for food. Please do not bring grizzly bears to this area - I feel it would be a recipe for disaster.
Thank you!

Hugh Morrison, Regional Director, U.S. Fish & Wildlife Service, Pacific Region
RE: Draft Grizzly Bear Restoration Plan/Environmental Impact Statement, North Cascades Ecosystem (NCE)

Bears keep me humble. They help me to keep the world in perspective and to understand where I fit on the spectrum of life.

[REDACTED]

Thank you for the opportunity to comment. I am writing in support of safely relocating existing grizzly bears into the North Cascades, an historic range in which these bears coexisted with indigenous peoples for thousands of years. Specifically, I strongly support action alternatives B and C in the Draft Restoration Plan.

After retiring from more than forty years of land and water conservation nonprofit work, I am now a landscape and wildlife photographer specializing in the Pacific Northwest and Northern Rockies Regions. You can view my images at the web link above. I have documented and photographed both black and grizzly bears in Yellowstone, Glacier, Denali, Katmai, and Lake Clark National Parks, at Pack and Fish Creeks in Alaska (both managed by the US Forest Service), and most recently in British Columbia's Khutzeymateen Provincial Park and along the Atnarko, Nusatsum, and Salloomt Rivers. It is my deepest wish to know (or for my daughter and granddaughter to know) that the grizzly bear again resides here in Washington's NCE!

The bear in Northwest Coastal Native culture represents strength, family, and healing. For me, grizzly bears are as well a symbol of grace, environmental health, wilderness, and everything wild. They once roamed most of North America, from Alaska to Mexico and as far east as Ontario and the American Midwest. Today, grizzlies occupy less than six percent of their historic range in the lower 48, and they exist in isolated populations. A "keystone" species, grizzlies help regulate prey and disperse seeds, maintain plant and forest health (aerating soil as they dig for roots, pine nuts and squirrels), and help to move spawning salmon carcasses into the forest to fertilize trees, plants, and forest growth by providing high levels of nitrogen. As the NCE is one of North America's premier intact ecosystems, one of two federal grizzly recovery areas without an established population of bears and given that there may be no grizzly here today, we have ample evidence that Alternative A, the no-action alternative using only existing management practices, will fail to result in the future restoration of this species in the North Cascades. Based on current grizzly numbers (zero?) and the on-going degradation of habitat, dwindling

numbers of salmon (a primary source of food for both black and grizzly bears), the increasing impact of a warming climate, and from the slowest reproductive rate of any terrestrial mammal (one to four cubs only every two to four years), we clearly must look at new practices, solutions, and education regarding our coexistence with other species.

My preference are the action Alternatives B or C, where grizzly bears under either alternative would be protected under the Endangered Species Act (ESA) which governs the regulation of grizzly bears in the lower 48 states. I understand that in some rare instances, lethal action is required, but this should be the last solution if the plan is to move towards its eventual goal of restoration Of this iconic species.

I understand the value and need for greater management flexibility in restoring species where superstition, fear, and where both real and perceived conflicts may play a role. While I have spent time with wild grizzly populations and do not share those feelings, I would support Alternative C which designates grizzly bears in the US portion of the NCE and surrounding areas as a 10(j) nonessential experimental population (NEP) under section 10 of the ESA. Under either action alternative, my primary concern is how the issue of "take" is managed under the action alternatives (defense of life, non-lethal scientific and research activities, and removal when conflicts occur).

While I am not a hunter, I do believe in hunting for those who provide food and sustenance for their families, and as an important part of native culture and heritage. Under no circumstance would I support trophy hunting of grizzlies in the NCE. I am concerned how hunting can or will be managed with restoration [Opportunities for hunting are available in the NPS national recreation areas and on the national forests and state-owned lands (USFS 2016a, b)], especially since we are looking to eventually move from zero to two hundred grizzlies. I would like to see the final plan describe in detail how and/or under what limited conditions hunting will be allowed or managed. I would prefer that no hunting be allowed until we reach the target designation.

Finally, while the NCE is prime habitat for grizzly restoration, and is surrounded by other restoration and wonderful wilderness areas, adequate protections for grizzly (or wolf or bison) do not exist. The final NCE plan must detail how restoration in this area will be different than in neighboring states, and even just a step outside of NCE boundaries. There are currently four bills under consideration in Congress that would remove grizzly bears from ESA protections in Montana, Wyoming, and Idaho. In addition, the governors of those states are pushing the U.S. Fish and Wildlife Service (USFWS) to prematurely delist grizzlies from the ESA and turn management over to the states. How will the USFWS protect grizzlies in the NCE with this Congressional and neighboring state pressure? Given the killing of so many bears, wolves, and bison just outside the boundaries of Yellowstone National Park (NPS), what regulations and planning will the National Park Service implement in the final NCE plan to make sure newly restored grizzlies are not killed if they step outside the designated boundary lines? How can the final restoration plan be strengthened to assure that ESA listing deters lethal take from individuals and nearby state and local governments?

While I thank, applaud and support NPS and USFWS efforts to restore grizzlies to the NCE, any final plan must, to the highest degree possible, address real world issues that will affect long-term restoration. No better example exists than the former administration's 2020 stoppage of the previous restoration plan, a plan supported by more than 159,000 public comments.

Thank you, once again, for the opportunity to comment on the Draft Restoration Plan.

Those who have packed far up into grizzly country know that the presence of even one grizzly on the land elevates the mountains, deepens the canyons, chills the winds, brightens the stars, darkens the forest, and quickens the pulse of all who enter it. They know that when a bear dies, something sacred in every living thing interconnected with that realm... also dies."

Correspondence: This is at least the third time I've submitted comments over the last decade in opposition to the proposal to introduce grizzly bear into the North Cascades National Park area. It sure feels like the process is intended to wear down the opposition until we give up.

From my readings, and testimony of experts, there is no proof that the North Cascades subject area was ever populated by a significant number of grizzly bear. The best the historic record shows is an occasional lone grizzly sighting, probably migrating through from the Selkirk Mountains in Idaho. From someone who is familiar with the North Cascades, it is counter intuitive that there is enough food (salmon) in this food barren wild country to sustain a grizzly population. The notion of introducing the bear to his area to correct to an alleged ecological imbalance is not backed by science and wrong headed. It's also dangerous and destined to failure. The bears will starve and end up in the Methow attacking livestock. It's a recipe for disaster and a very real danger to the ever increasing backpacking population (PCT hikers). Those who have designed and executed this misguided plan will ultimately be responsible for the ensuing mauling and death of hikers from grizzly attacks in this area.

Correspondence: Hikers, hunters, and outdoor enthusiasts already have to be cautious of black and grizzly bears. Introducing more grizzlies could lead to increased risks, as seen in states like Montana, Idaho, and Wyoming. The presence of grizzly bears migrating into Washington from places like BC and Idaho is undeniable. Without any physical barriers, they can naturally inhabit the state. Given the difficulties in managing the current wildlife populations, I believe it's in the best interest to refrain from reintroducing more apex predators.

Correspondence: I read about your potential to reintroduce grizzly bears to the North Cascades. While I do understand the importance of environmental impacts and food chains, I am writing to oppose their introduction. Myself and my friends love to hike and camp in the area with our young children. I have hiked and camp in the Rockies in Montana where grizzlies are present and there is a different level of expertise and preparation needed there due to the risk with grizzlies. While it is sad they are no longer here, I think that a reintroduction will make it more difficult for families to enjoy nature securely. If there is an attack then you will need to euthanize the grizzly that you introduced to the area. Seems better to leave be for now and let families enjoy nature and then those children will grow up to be stewards of nature.

Correspondence: Re-introducing grizzly bears is not in the best interest of the people of Washington State or the bears themselves. There is no food source available in the proposed areas. The biologist involved are over inflating the pro-bear statistics to justify their jobs. The deer herds are very low as well as other potential food sources. This is merely a pet project for the biologist and other employees involved. I do not agree with introducing grizzly bears to Washington State or anywhere else that may be considered. How about working on bringing back our deer population? Maybe once a sustainable deer population is restored, then consider introducing Alpha predators.

Sincerely,

Long time Twisp Washington and Alaska resident,

Correspondence: Grizzly bears are a native species in the North Cascades Ecosystem (NCE), and like all other native species, they belong there. They benefit the ecosystem in a variety of ways, from seed dispersion to prey species population management to disrupting and "tilling" soil which allow for healthier soils and plant growth... the list goes on and on. The bears would most certainly have a positive impact on the NCE. Grizzly bears are listed under the Endangered Species Act as well, and per the Endangered Species Act, the federal government is required to make an effort to recover this species within critical habitat areas. The NCE is certainly critical habitat for this species, as it's one of a small number of places left where these bears can still thrive in the USA. In addition to this, grizzlies are a public resource, and given that 97% of the NCE is lies within public lands, the public has a right to decide which species roam this land. If the people want these animals on the landscape (like myself), they should be on the landscape.

Correspondence: I am writing to oppose the restoration of grizzlies to North Cascades National Park and Recreation Area.

As an avid hiker and backpacker of the area, I do not like the idea of encountering a dangerous predator like a grizzly.

The population of Puget Sound has exploded and shows no signs of letting up. These mountains are right in the backyard of a major metropolitan region. The number of hikers exploring the Cascades has also vastly increased. With the increased number of people in the wild, repopulating the mountains with an apex predator will result in injury and death. It will be only a matter of time, should this project move forward.

Grizzlies have been gone from these mountains for decades. With the population increase of Puget Sound, putting grizzlies in the North Cascades is a very bad idea. Every year, Yellowstone National Park reports an innocent hiker killed or mauled by a grizzly. I don't want that to happen in Washington state. I oppose the the restoration of grizzlies to North Cascades.

Thank you for reading and your time,

Correspondence: I am writing to you today to voice my support for the reintroductions of grizzly bears into the greater North Cascade ecosystem. It is time to repair this area and bring it back to a complete ecosystem. I do not have a preference between either of the active introduction methods you have outlined in the EIS.

I have lived and recreated in all the current grizzly regions of the lower 48 (Yellowstone, Glacier and the Yaak/Cabinets) and have managed to see these amazing creatures at a respectful distance while hiking, camping and bicycling. Like most people I do understand and fear what these animals are capable of. I've always been careful with camp hygiene and carrying bear spray. I know that with good skills we can live in proximity to these animals. I also know that farmers and ranchers can mitigate the risk of interacting with grizzlies. The benefits to society of having a complete ecosystem in the North Cascades and the opportunity to see these animals in the wild outweighs any cost of mitigation.

I also believe that 25 bears over the next decade in this enormous area means that there is not going to be a whole lot of conflict. Even 100 bears over the next 75-100 years is a drop in the bucket when you consider the entirety of the North Cascades, and the Pasayten and Mt Baker wildernesses, not to mention the Canadian land north of the introduction site. It will be exceedingly rare for humans to see, much less come in conflict with, these reclusive animals.

I am now a resident of Winthrop, WA and I wish to see this area returned to a full and complete ecosystem. Please reintroduce grizzlies into the North Cascades by whichever method you think is best.

Rocco Altobelli

Correspondence: I wish to express ambivalence toward reintroduction of Grizzly Bear Restoration in the North Cascades Ecosystem. On the one hand, if the professional biologists and other knowledgeable personnel think the ecosystem can support them, then I have no objection. I think that, similar to Glacier National Park, hikers/backpackers can co-exist with the bears. On the other hand, the ecosystem has functioned just fine without them for many decades, so I don't see this as a necessary exercise. There are plenty of ursus americanus already in the North Cascades that serve a similar ecological purpose.

I'm very much in favor of wildlife corridors where animals can navigate around human constructions that prevent their normal migration. Such corridors are much needed for ecosystem health and maintenance of healthy wildlife populations. Of the options presented, I would be very much in favor of use of such corridors that would allow natural reintroduction. I do understand, though, that natural migration may be difficult due to geographic limitations.

I have a problem with forced reintroduction. This may come across as silly, but who is going to ask the bears selected to move from their existing habitat? What sort of logic will they understand to go along with the move? What sort of stress will forced removal from their existing homes place on their well-being? Is this exercise necessary for bear and habitat health, or is it an anthropomorphic guilt trip meant to make up for past human atrocities?

With forced Grizzly reintroduction, similar to the experience with Fisher reintroduction in the North Cascades, it can be expected that many bears will perish before they can reproduce. And if the habitat is isolated such that there is no wildlife corridor to bring new animals into the area, what effect will lack of genetic diversity have on long-term viability of the isolated population?

My concern is for the long-term health of the animals. If forced reintroduction is assured to be successful, then proceed. If not, it appears to me that we're getting the proverbial cart-before-the-horse by not first establishing wildlife migration corridors, which from my perspective is the higher order of priorities for the expense and effort required.

Correspondence: Greeting

Yet again the effort to import Grizzly Bears (G-B) into the North Cascades (NC) is playing-out.

What is it these folks do not realize about the G-B by their virtual absence from this region, they recognize the NC as an undesirable region to 'make a living'. They may make infrequent trips into the zone and then - apparently - move on to better places.

Here it was stated ==>

=====
"Fish & Wildlife wrote that reintroduction would also go toward removing the grizzly bear from the Federal List of Endangered and Threatened Wildlife where it's listed as a threatened species in 48 states.

The restoration of the grizzly bear population is also for the "" and would allow residents and visitors "the opportunity to again experience grizzly bears in their native habitat."

The plan acknowledged that grizzly bear restoration does pose certain "safety risks to backcountry recreational visitors and residents of the (North Cascades)." "

=====
"Endangered and Threatened in 48 States" ! Huh? Seems to me Florida/Georgia/Alabama/South Carolina, among other States. have never had in recent times - say 1700-to-present - a G-B population (guessing here) so why do those promoting G-B transfers to the N-C present the impression G-B's were hunted-out all across America?

"... benefit and enjoyment of present and future generations of people..." Hmmm - what about those populations in the proposed affected areas who do NOT want to deal with the G-B in their back yards?

The previous effort a few years ago to promote moving G-Bs to the N-C TOTALLY omitted the presence of Stehekin on their maps of areas to receive these Bears. Such incompetence in research and planning really scares me as do these words ==>

" "...safety risks to backcountry recreational visitors and residents of the (North Cascades... ".

The community at Stehekin presently enjoys living and recreating in a safe environment where the children can range-about on foot and bicycle freely around the valley never having to worry about a top predator seeing them as small prey as they scamper about.

WAY TOO MANY accounts out of Glacier National Park of visitors being mauled/killed by G-Bs.

What kind of stress will be put upon G-Bs drugged/captured and moved to the N-C region? Will the apparent lack of decent foraging (why else would they NOT be here already?) stress them to predate upon campers cooking their meals, upon family dogs/cats or livestock ? OR will these transferred G-Bs become virtual garbage-dump-fed critters getting meal-drops from those who would dump them into the NC?

IF the G-B moves in by itself, I am all for that event. I am curious how the poor little "Black Bear" will deal with a Mean-Uncle G-B when their habitat is invaded - poorly I suspect.

Don't mess with Mother-Nature! The G-B will move in when THEY determine it is a great place to live.

Correspondence: Having worked and spent many years in Yellowstone National Park, I have seen that bears and people can coexist without issues. The grizzly bear is an integral part of an intact ecosystem. North Cascades National Park would greatly benefit from the reintroduction of grizzlies, as this encourages healthy natural populations of many other species as well.

Thank you

Correspondence: Dear Superintendent Don Striker and Supervisor Brad Thompson,

My family and I are writing in support of Alternative C for the proposal to restore a healthy population of grizzly bears to the North Cascaes. My husband and I have been backpackers for 55 years (our entire adult lives) in all of the protected wilderness areas, national parks, and US Forest Service public lands of Washington State. We have had experience with Black Bears, carnivores (coyotes and wolves), and deer and mountain goats throughout our half century of wilderness hiking and camping. We have been active and engaged with many campaigns to protect and secure wild public lands in our state and elsewhere in the US, and we know that, where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations.

I support Alternative C: Restoration with Section 10(j) Designation. The proposal would bring up to 25 non-problem grizzly bears into remote areas of the North Cascades over the next decade and manage them as an experimental population. The area in the remote areas of the North Cascades where this re-introduction would take place is far from any human settlements or agricultural or ranching lands and activities. Alternative C would support re-introduction over a deliberate and gradual timeline into optimal areas for grizzly bears where any human contact would be absolutely minimal, and where prey for the bears would be abundant.

We are age 78 and have no fear of any potential contacts we or our family members or friends might have with grizzly bears to be re-introduced into the North Cascades. We have hiked in the Rocky Mountains (Glacier NP, and Yellowstone and Teton NPs) where grizzlies are more abundant, and have had no contact or conflicts with bears in these wilderness areas. In the North Cascades National Park and Recreation Areas, we have hiked and camped frequently in the Ross Lake area, Copper Mountain Trails, on the Pacific Crest Trail (PCTs) throughout Washington State, particularly in the North Cascaes, and in the Pasayten Wilderness. Our wilderness mountain cabin abuts the US Forest Service lands adjacent to the Pasayten Wilderness.

We have also traveled to Katmai National Park in Alaska, where we had the opportunity to hike with and observe Alaska Brown Bears (same species as the grizzlies to be re-introduced to the North Cascades) in close proximity. This was our first chance to observe and be close to these magnificent animals, as we watched them live and fish in the salmon-rich streams of the Brooks River. We want all Americans and visitors to our vast country to have the knowledge that we are protecting these large mammals and, if they are lucky, the chance to observe them in the wild.

Alternative C is the best choice for bears and the people who live and visit the North Cascades Ecosystem. (I have a large map of the North Cascades Ecosystem in our outdoor facilities, where it reminds us of the importance of this large ecosystem we share with Canada, and the value of wildlife protection in this huge wild area.)

Alternative C is modeled on what's worked in Montana where grizzlies are recovering in the Cabinet-Yaak mountains with few problems and with the acceptance and involvement of local communities. Furthermore, the 10(j) rule will give people more management tools to reduce, prevent, and sometimes respond to human-bear conflict. I believe that the 10(j) rule if properly implemented, will help increase human acceptance of grizzly bears as they return to the landscape.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who, like

us, live and own property adjacent to these precious wilderness areas, and for those who are full-time residents in the North Cascades. Please bring back this native species to our state through the strategy laid out in Alternative C. Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

Let all of us be the ones to help restore this apex animal to the North Cascades.
We join all of you who are engaged in helping to keep our North Cascades wild!

Sincerely,

██████████ (retired judge and teacher), lifetime conservationist, environmental activist, and advocate for healing our Earth

Correspondence: Hello and thank you. My husband and I are wildlife lovers and enjoy hiking and walking in the lower Enchantments and foothills of the North Cascades. I write to express serious concerns over the reintroduction of Grizzlies in our area. When hiking we are already well prepared for encountering black bears, we even have black bears visiting our home. But the thought of encountering a Grizzly on one of our walks is cause for us to probably just stay home. We would like you to reconsider the safety of not only these Grizzlies but the people out enjoying our natural surroundings. Most hikers may not be well prepared for an encounter, especially in the autumn when these bears may be hungry and predatory. Many hikers in our area also bring dogs along on hikes, most are off leash even though the signs say to keep them leashed, thereby potentially causing dangerous encounters. Please rethink this reintroduction.

Correspondence: I oppose introducing (or reintroducing) Grizzly Bears in to the Northern Cascades, in Washington State. I live in south central Washington.

Grizzly Bears are an Apex predator that can roam 500 miles or more. There is a lot of Grizzlies in Canada, they will come on their own.

I have nothing new to add to the long list of reasons why not to add more Apex predators closer to human populations. I've watched with interest the reintroduction of the grey wolf.

I do believe the restoration of the Grizzly Bear populations in the Yellowstone region is awesome, but let's keep them there.

Sincerely,

Correspondence: Dear Sir/Madam,

I have lived in Washington State 60+ years , of those years 39 in Wenatchee Wa. I've done hiking, camping, berry picking with family and backpacking trips in this beautiful state I call home. I am against the release of grizzly bears into the North Cascades and the roaming ranges projected for the bears.

There is a variety of Outdoor Recreation in the Chelan, Douglas, Okanogan, that would suffer a negative impact from the grizzly restoration program. There are already a few grizzly bears in the North Cascades area. A natural increase for the the grizzly population over the years is a better plan than to unnaturally increase the grizzly population by the above restoration program . This maybe be a good intention (?) by the powers that be , BUT it is a bad idea for the grizzly bears already in established roaming territories. To unnaturally increase the population of grizzly will most likely push some of the black bears and recently introduced grizzlies to seek plant and animal meats in to populated areas beyond the boundaries projected.(Black bears are already roaming into towns for food sources) The Chelan County boundary is a few miles from my home on Burch Mountain. This area has Forest and DNR land but currently the private land below the DNR land has become a prime area for home building and residential areas in the last 5 years. Grizzly are Apex predators that are wild animals that don't conform to mapped boundaries.

Please base your decisions by the voices of Washingtonians who actually live and work in the areas effected by this proposed restoration plan.

Correspondence: Alternative C would redesignate the North Cascades grizzly as an experimental population allowing wildlife managers more options to reduce, prevent, and confront human-bear conflict. The National Park Service, the U.S. Fish and Wildlife Service, and many locals believe Alternative C will provide the best path forward for both people and grizzlies in our region. Taking active steps to recover their population is necessary.

Correspondence: I support the restoration of grizzlies to the North Cascades, and that the restoration must be done in ways that don't violate the Wilderness Act and harm the area's wilderness character. This is good for bears and Wilderness. Both of the action alternatives as they now stand would violate the Wilderness Act. The action alternatives should be modified to avoid helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and steer clear of heavy-handed management of bears. There are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites without the use of helicopters inside Wilderness. I oppose the use of a 10(j) rule for the grizzlies in the restoration work. This would mean grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana would be taken from their homes, dropped into the North Cascades, and lose their previous protection. Montana doesn't have any "extra" grizzlies to lose to the North Cascades. Montana grizzlies are not yet recovered under the ESA, and any dispersing grizzlies from Glacier or Yellowstone are needed to naturally recover areas like the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest. A natural recovery alternative must be fully developed and analyzed, even if recovery would take longer than active repopulation. The new information presented by Superintendent Striker regarding the likelihood of naturally migrating bears from Canada suggests active repopulation urgency may be more about protecting agency discretion than protecting Wilderness and creating the best environment for grizzly bears to migrate, live, and thrive. For the long-term success of grizzly restoration, natural recovery measures must also be included in both action alternatives thus reducing the need for wilderness degrading activities that are also ultimately bad for bears. This requires work with partners in British Columbia to ensure that grizzlies have corridors to move back and forth across the international border and to prevent a small North Cascades grizzly population from shrinking over time and becoming inbred. An alternative that combines natural recovery with population augmentation under full ESA protections should also be analyzed. The no action alternative has many good Bear Smart components on how people and communities can coexist with grizzly bears and these coexistence measures should also be included in both of the action alternatives. All possible measures must be taken to prepare residents and visitors for bears, particularly given the dramatic growth of the human population in the region and rapidly increasing recreation pressures in the Park.

Correspondence: I strongly urge you to protect grizzlies across the country. Specific to this area, the restoration of grizzlies to the North Cascades is vital, but must be done in ways that don't violate the Wilderness Act and harm the area's wilderness character. This is good for bears and Wilderness in general.

The action alternatives being considered have not been thought through, as both alternatives as they now stand would violate the Wilderness Act. The action alternatives should be modified to avoid helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and in no way involve heavy-handed management of bears. There are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites without the use of helicopters inside Wilderness.

I oppose the use of a 10(j) rule for the grizzlies in the restoration work. It's an extremely underhanded tactic and must not be allowed. If implemented, grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana would be taken from their homes, dropped into the North Cascades, and lose their previous protection. Then, of course, they can be killed in the new location.

Montana doesn't have any "extra" grizzlies to lose to the North Cascades. Montana grizzlies are not yet recovered under the ESA, and any dispersing grizzlies from Glacier or Yellowstone are needed to naturally recover areas like the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest.

A natural recovery alternative must be fully developed and analyzed, even if recovery would take longer than active repopulation. The new information presented by Superintendent Striker regarding the likelihood of naturally migrating bears from Canada suggests active repopulation urgency may be more about protecting agency discretion than protecting Wilderness and creating the best environment for grizzly bears to migrate, live, and thrive.

All possible measures must be taken to prepare residents and visitors for bears, particularly given the dramatic growth of the human population in the region and rapidly increasing recreation pressures in the Park.

Grizzlies and wildlife in general should not be killed or punished due to human population growth. It's their territory - they were their first. People need to learn to live with wildlife when they choose to encroach on their territory.

Correspondence: I support the restoration of grizzly bears in the North Cascades and that restoration must be done in a way that does not violate the Law of the Wild and harm the wild character of the area. This is good for bears and nature. Both alternative courses of action, as they now stand, would violate the Law of Nature. Action alternatives must be modified to avoid helicopter landings and flights in the wilderness, the placement and use of telemetry facilities, and avoid heavy management of bears. There are many roads that cut through or penetrate the recovery area or dead ends near the wilderness that could provide release sites without the use of helicopters into the wilderness. I oppose the use of a 10(j) rule for grizzly bears in restoration work. This would mean that grizzly bears that are fully protected under the Endangered Species Act (ESA) in places like Montana would be removed from their homes, dumped in the North Cascades, and lose their previous protection. Montana doesn't have any "extra" grizzly bears to lose to the North Cascades. Montana grizzly bears have not yet been recovered by the ESA, and any grizzly bears dispersing from Glacier or Yellowstone are needed to naturally recover areas such as the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest. A natural recovery alternative must be fully developed and analyzed, even if recovery takes longer than active repopulation. New information presented by Superintendent Striker about the likelihood of natural bear migration from Canada suggests that the urgency of active repopulation may be more about protecting the agency's discretion than protecting nature and creating the best environment for grizzly bears to migrate. , live and prosper. For the long-term success of grizzly bear restoration, natural recovery measures must also be included in both action alternatives, thereby reducing the need for wilderness-degrading activities that are also ultimately bad for grizzly bears. bears. This requires working with partners in British Columbia to ensure that grizzly bears have corridors to move back and forth across the international border and to prevent a small population of North

Cascades grizzly bears from declining over time and becoming become inbred. An alternative that combines natural recovery with an increase in the population under full ESA protection must also be analyzed. The no-action alternative has many good Bear Smart components about how people and communities can coexist with grizzly bears, and these coexistence measures should also be included in both action alternatives. All possible measures should be taken to prepare residents and visitors for bears, especially given the dramatic growth of the human population in the region and the rapidly increasing recreational pressures in the Park.

Correspondence: I live part-time in the Yellowstone ecosystem and follow these issues closely.I support the restoration of grizzlies to the North Cascades, and that the restoration must be done in ways that don't violate the Wilderness Act and harm

the area's wilderness character. This is good for bears and Wilderness.

Both of the action alternatives as they now stand would violate the Wilderness Act. The action alternatives should be modified to avoid helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and steer clear of heavy-handed management of bears. Apparently, there are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites without the use of helicopters inside Wilderness.

I oppose the use of a 10(j) rule for the grizzlies in the restoration work. This would mean grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana would be taken from their homes, dropped into the North Cascades, and lose their previous protection, which is unreasonable.

Our area of Montana doesn't have any "extra" grizzlies to lose to the North Cascades. Montana grizzlies are not yet recovered under the ESA, and any dispersing grizzlies from Glacier or Yellowstone are needed to naturally recover areas like the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest.

A natural recovery alternative must be fully developed and analyzed, even if recovery would take longer than active repopulation. The new information presented by Superintendent Striker regarding the likelihood of naturally migrating bears from Canada suggests active repopulation urgency may be more about protecting agency discretion than protecting Wilderness and creating the best environment for grizzly bears to migrate, live, and thrive.

For the long-term success of grizzly restoration, natural recovery measures must also be included in both action alternatives thus reducing the need for wilderness degrading activities that are also ultimately bad for bears. This requires work with partners in British Columbia to ensure that grizzlies have corridors to move back and forth across the international border and to prevent a small North Cascades grizzly population from shrinking over time and becoming inbred. Consider this:

An alternative that combines natural recovery with population augmentation under full ESA protections should also be analyzed.

The no action alternative has many good Bear Smart components on how people and communities can coexist with grizzly bears and these coexistence measures should also be included in both of the action alternatives. All possible measures must be taken to prepare residents and visitors for bears, particularly given the dramatic growth of the human population in the region and rapidly increasing recreation pressures in the Park. Please revise your proposal for these reasons. Thanks.

Correspondence: One of my fondest memories is traveling through the cascades and watching momma grizzly bears with their cubs. Such a wonderful site. These animals need to be protected. Anyone with a brain knows we are constantly killing off our precious wildlife. Enough of this garbage. Save them all. I've never been chased by any wild animals and I've been around hundreds of them. From grizzly to black bears to mountain lions and even a real African Lion bit my bumper and dragged my car around like a ragdoll. I know what to do and how to stay safe. Just wish these horrible humans would stop destroying wild life.

Correspondence: I support grizzly reintroduction to the North Cascades. My strong preference would be the creation of protected corridors so that the grizzlies could migrate to the North Cascades in WA by themselves. That seems the best way to avoid traumatizing the bears, increase their odds of survival (as many as one-third of forcibly relocated bears don't survive six months after relocation according to North Cascades Conservation Council), and lessen the likelihood of future negative interactions with humans. If that remains an impossible policy choice (might it still be considered?), then I do support the adoption of rule 10(j) to increase management flexibility of the bears. Thank you for listening.

Correspondence: To the National Park Service,

I completely support the restoration of grizzlies to the North Cascades, and that the restoration must be done in ways that don't violate the Wilderness Act and harm the area's wilderness character. This is good for bears and Wilderness.

Both of the action alternatives as they now stand would violate the Wilderness Act. The action alternatives should be modified to avoid helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and steer clear of heavy-handed management of bears. There are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites without the use of helicopters inside Wilderness.

I am against the use of a 10(j) rule for the grizzlies in the restoration work. This would mean grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana would be taken from their homes, dropped into the North Cascades, and lose their previous protection. This is ludicrous.

Montana doesn't have any "extra" grizzlies to lose to the North Cascades. Montana grizzlies are not yet recovered under the ESA, and any dispersing grizzlies from Glacier or Yellowstone are needed to naturally recover areas like the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest.

It would be cruel to trap Grizzlies out of their homes to move them to an entirely different state and environment. This is a no brainer.

A natural recovery alternative must be fully developed and analyzed, even if recovery would take longer than active repopulation. The new information presented by Superintendent Striker regarding the likelihood of naturally migrating bears from Canada suggests active repopulation urgency may be more about protecting agency discretion than protecting Wilderness and creating the best environment for grizzly bears to migrate, live, and thrive. It would be a more normal process of wildlife.

For the long-term success of grizzly restoration, natural recovery measures must also be included in both action alternatives

thus reducing the need for wilderness degrading activities that are also ultimately bad for bears. This requires work with partners in British Columbia to ensure that grizzlies have corridors to move back and forth across the international border and to prevent a small North Cascades grizzly population from shrinking over time and becoming inbred.

An alternative that combines natural recovery with population augmentation under full ESA protections should also be analyzed.

The no action alternative has many good Bear Smart components on how people and communities can coexist with grizzly bears and these coexistence measures should also be included in both of the action alternatives. All possible measures must be taken to prepare residents and visitors for bears, particularly given the dramatic growth of the human population in the region and rapidly increasing recreation pressures in the Park.

Thank you for listening, please seriously take my comments into consideration.

Correspondence: I keep reading about RULES RULES RULES....that can be bent and provoked in order to destroy what it was meant to protect in the first place. Leave the bears aloneand their lands alone. JUST LEAVE THEM ALONE....and they will be fine. No one should be tracking them , collaring them, killing them. Would you like that done to you? Leave them alone and they will manage....if their food supply is not tainted, poisoned by humans..... or their air contaminated.....or noisy coppers in the air all over the place and other vehicles.....All they want is to be left alone, in peace, the way God intended them to live. Do not keep inventing plans to mess with them... pretending you are doing it to help them.....when the exact opposite is true. I am sick of people who are supposed to be caretakers of our planet and animals being in fact destroyers...always inventing new rules to do it. Stop this madness and leave them in peace.....away from humans and their interference. May God protect the animals....especially our beloved bears... I hope He does in fact see everything that people do... and one day be held accountable for their actions.

Correspondence: I would appear that the current push is to move animals from their home where they are protected into an area where they can be experimented upon. Any human related push into wilderness with the heavy handed "management" these alternatives would entail would only serve to breakup Wilderness and the wildlife that lives there.

What is needed is protection and enchancement of the area's Wilderness character AND that also absolutely MINIMIZES the human handling and harassment of grizzlies.

All, it would seem, just to make sure the present Park Superintendent isnt going to be "stuck with normal fish and wildlife rules that say you pretty much can't do anything" to the bears.

Seriously - in this day of species extinction and climate change - is that the attitude towards another species in danger of extinction? Really?

I oppose the use of a 10(j) rule for the grizzlies in the restoration work. This would mean grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana would be taken from their homes, dropped into the North Cascades, and lose their previous protection.

Montana doesn't have any "extra" grizzlies to lose to the North Cascades. Montana grizzlies are not yet recovered under the ESA, and any dispersing grizzlies from Glacier or Yellowstone are needed to naturally recover areas like the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest.

A natural recovery alternative must be fully developed and analyzed, even if recovery would take longer than active repopulation. The new information presented by Superintendent Striker regarding the likelihood of naturally migrating bears from Canada suggests active repopulation urgency may be more about protecting agency discretion than protecting Wilderness and creating the best environment for grizzly bears to migrate, live, and thrive.

Correspondence: I support the restoration of grizzlies to the North Cascades, but the restoration must be done in ways that don't reduce protections for brars or violate the Wilderness Act and harm the area's wilderness character.

Both of the action alternatives as they now stand would violate the Wilderness Act. There should be no helicopter landings and flights in Wilderness, telemetry installations, and no heavy-handed management of bears. There is already many roads next to Wildernesses that could provide release sites without the use of helicopters inside Wilderness.

I oppose the use of a 10(j) rule for the grizzlies in the restoration work. This would mean grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana would be taken from their homes, dropped into the North Cascades, and lose their previous protection.

No bears from Montana should be used in this project. Montana doesn't have any "extra" grizzlies to lose to the North Cascades. Montana grizzlies are not yet recovered under the ESA, and any dispersing grizzlies from Glacier or Yellowstone are needed to naturally recover areas like the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest.

A natural recovery alternative must be fully developed and analyzed, even if recovery would take longer than active repopulation. The goal should be protecting Wilderness and creating the best environment for grizzly bears to migrate, live, and thrive.

For the long-term success of grizzly restoration, natural recovery measures must be included in both action alternatives. We must reduce the need for wilderness degrading activities that are also ultimately bad for bears. This requires work with partners in British Columbia to ensure that grizzlies have corridors to move back and forth across the international border and to prevent a small North Cascades grizzly population from shrinking over time and becoming inbred.

An alternative that combines natural recovery with population augmentation under full ESA protections should also be analyzed.

The no-action alternative has many good Bear Smart components on how people and communities can coexist with grizzly bears and these coexistence measures should also be included in both of the action alternatives. All possible measures must be taken to prepare residents and visitors for bears, particularly given the dramatic growth of the human population in the region and rapidly increasing recreation pressures in the Park.

Correspondence: I fully support recovering a healthy grizzly bear population in the North Cascades, but the effort must be done in a way that PROTECTS and ENHANCES the area's wilderness character and that also MINIMIZES the human HANDLING and HARASSMENT of grizzlies.

Grizzlies historically roamed what today is North Cascade National Park and the surrounding Wilderness and wildlands of north-central Washington--and we should help grizzlies return to this landscape.

Wilderness protection requires seeking ways to RECOVERS the area's grizzly population that AVOIDS the use of helicopters, motor vehicles and equipment, electronic installations, and trammeling or manipulating the landscape or its wildlife.

Both of the action alternatives as they now stand would violate the Wilderness Act. They are unacceptable.

The current action alternatives would involve about 50 to 400 helicopter landings and twice that many helicopter flights. All, or almost all, landings would apparently be in Wilderness, either in North Cascades National Park or in surrounding national

forests. The extensive use of helicopters would continue indefinitely for monitoring and managing bear movement and numbers. This heavy-handed management would be detrimental to Wilderness and bears alike. Grizzly bears would be collared, drugged, samples taken, released in Wilderness, re-collared and re-sampled, if determined necessary, for many years. Any young grizzlies born in the Wildernesses may also be subjected to this invasive management.

Moving forward :

- The action alternatives should be modified to avoid helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and steer clear of heavy-handed management of bears. There are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites without the use of helicopters inside Wilderness.
- I oppose the use of a 10(j) rule for the grizzlies in the restoration work. This would mean grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana would be taken from their homes, dropped into the North Cascades, and lose their previous protection.
- Montana doesn't have any "extra" grizzlies to lose to the North Cascades. Montana grizzlies are not yet recovered under the ESA, and any dispersing grizzlies from Glacier or Yellowstone are needed to naturally recover areas like the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest.

Correspondence: Thank you for this opportunity to provide public comment.

I support the restoration of grizzlies to the North Cascades and strongly believe that the restoration must be done in ways that do not violate the Wilderness Act and harm the area's wilderness character. This would be the best approach for bears and Wilderness.

However, both of the action alternatives as they now stand would violate the Wilderness Act. The action alternatives should be modified to avoid helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and steer clear of heavy-handed management of bears. There are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites without the use of helicopters inside Wilderness.

I oppose the use of a 10(j) rule for the grizzlies in the restoration work. This would mean grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana would be taken from their homes, dropped into the North Cascades, and lose their previous protection. That would not constitute a sound plan for recovery.

Montana doesn't have any "extra" grizzlies to lose to the North Cascades. Montana grizzlies are not yet recovered under the ESA, and any dispersing grizzlies from Glacier or Yellowstone are needed to naturally recover areas like the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest.

A natural recovery alternative must be fully developed and analyzed, even if recovery would take longer than active repopulation. The new information presented by Superintendent Striker regarding the likelihood of naturally migrating bears from Canada suggests active repopulation urgency may be more about protecting agency discretion than protecting Wilderness and creating the best environment for grizzly bears to migrate, live, and thrive.

For the long-term success of grizzly restoration, natural recovery measures must also be included in both action alternatives thus reducing the need for wilderness degrading activities that are also ultimately bad for bears. This requires work with partners in British Columbia to ensure that grizzlies have corridors to move back and forth across the international border and to prevent a small North Cascades grizzly population from shrinking over time and becoming inbred.

Additionally, an alternative that combines natural recovery with population augmentation under full ESA protections should also be analyzed.

The 'no action' alternative has many good Bear Smart components on how people and communities can coexist with grizzly bears and these coexistence measures should also be included in both of the action alternatives. Here in Western North Carolina, residents have been taught to become "Bear Wise". Education is key when it comes to successful coexistence.

All possible measures must be taken to prepare residents and visitors for bears, particularly given the dramatic growth of the human population in the region and rapidly increasing recreation pressures in the Park.

Thank you for your time and consideration.

Correspondence: I want grizzly bears to return naturally to the North Cascades and have full protection and absolutely no hunting and trapping of them allowed. We - our federal government and agencies need to do so much more to expand and protect our wild lands and species.

I am totally opposed to road building and machine intrusion - helicopter, truck, car etc., in the North Cascades and wilderness areas and also as feasible our national parks. We the people cherish and value beyond measure our Wilderness areas, our national forests and parks. I want these protected to the utmost. My family and people make it a priority and take their precious vacation time and funds to visit and support these places. We want the sounds of nature and no mechanical sounds; we want to know that these lands and waters are totally safe and preserved and that our wild flora and fauna have these in which to thrive.

I support the restoration of grizzlies to the North Cascades, and that the restoration must be done in ways that don't violate the Wilderness Act and harm the area's wilderness character. This is good for bears and Wilderness.

Correspondence: I have traveled much in the North Country of Canada and Alaska and have seen directly the beauty and majesty of the Grizzly Bear. The bears have every right to coexist with humans and it is we who must make accommodations for them as they are unprepared for interactions with a modern human world.

Still, I strongly support restoration of the grizzly to the North Cascades. Those areas there that retain wilderness designation and those potentially included in such designations should remain as such so as to preserve them for generations and importantly for the bears and stable, healthy ecosystems, ecosystems upon which humans depend.

My review of the alternatives suggests to me that both would whittle away at the Wilderness Act, an Act which specifically denies entry of any motorized vehicles including helicopters within their boundaries. The Act also denies roads, electrical equipment which should never be used in any restoration project in Wilderness areas.

I also strongly oppose the use of a 10(j) rule for the grizzlies in any restoration effort. Any action that leads to the delisting of animals from endangered status is a non-starter. Let me be clear. Grizzlies must retain protections under the ESA in every location in which they live. Period.

Finally, given the risks to humans, pets and livestock, it is critical to develop protections for them, recognizing that Grizzlies do not abide by any laws or boundaries. Acknowledging that, we must also develop reasonable ways to fully compensate ranchers for any losses of livestock that can be directly attributed to Grizzly activity. Further, institution of the stiffest of penalties for the killing of Grizzlies must also be implemented.

Evaluating and implementing approaches to minimizing contact between humans, their vehicles and Grizzlies will also be

key.

We need apex predators for healthy ecosystems. They have every right, indeed, every requirement to be living where they do, every bit as much as do we.

A natural recovery alternative must be fully developed and analyzed, even if recovery would take longer than active

repopulation. The new information presented by Superintendent Striker regarding the likelihood of naturally migrating bears from Canada suggests active repopulation urgency may be more about protecting agency discretion than protecting Wilderness and creating the best environment for grizzly bears to migrate, live, and thrive.

Correspondence: I strongly support the restoration of grizzlies to the North Cascades, and that the restoration must be done in ways that don't violate the Wilderness Act and harm the area's wilderness character. This is good for bears and Wilderness. Both of the action alternatives as they now stand would violate the Wilderness Act. The action alternatives should be modified to avoid helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and steer clear of heavy-handed management of bears. There are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites without the use of helicopters inside Wilderness. Montana doesn't have any "extra" grizzlies to lose to the North Cascades. Montana grizzlies are not yet recovered under the ESA, and any dispersing grizzlies from Glacier or Yellowstone are needed to naturally recover areas like the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest.

Correspondence: Please know that I fully support recovering a healthy grizzly bear population in the North Cascades, but the effort MUST be done in a way that protects and enhances the area's wilderness character and that also minimizes the human handling and harassment of grizzlies. They need to be restored to this region, and they need protections from the predations and cruelty of human beings for nonessential reasons! Thank you so much.

Correspondence: I am in favor of the primary goal of the 10(j) rule, to: "support reintroduction and recovery of grizzly bears within the NCE and provide the prohibitions and exceptions under the Act necessary and appropriate to conserve the species within a defined NEP area."

Redesignation of the species in the North Cascades as an experimental population will allow land managers to prevent conflict before it happens and address it when it happens. Reducing and addressing conflict will help bears bounce back and

help people accept them on the landscape.

The 10(j) map imagines future

expansion of grizzly bear populations into Zone #2. This expansion could contribute to the conservation of the species as a whole, and potentially create connectivity between populations if more habitat is protected and corridors are developed.

The 10(j) is responsive to local community concerns and requests for more management certainty, as the 10(j) clearly defines what kinds of management actions can take place in and around Washington state.

The agencies have defined an active restoration and grizzly population augmentation effort as part and parcel of a 10(j) rule.

The 10(j) provides a clear and intentional management plan in the event that Canadian bears wander into Zones 1, 2, or 3 from British Columbia.

Correspondence: Grizzlies historically roamed what today is North Cascade National Park and the surrounding Wilderness and wildlands of north-central Washington--and we should help grizzlies return to this landscape. I support the restoration of grizzlies to the North Cascades, and that the restoration must be done in ways that don't violate the Wilderness Act and harm the area's wilderness character. This is good for bears and Wilderness.

Both of the action alternatives as they now stand would violate the Wilderness Act. The action alternatives should be modified to avoid helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and steer clear of heavy-handed management of bears. There are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites without the use of helicopters inside Wilderness.
